In its most basic meaning *from* marks the source location, contrasting with *to*, marking goal, as discussed in §6.1: *She drove from London to Carlisle*. Like *to*, it extends to duration in time (*It lasted from Sunday to Friday*), and change of state (*It went from bad to worse*). Other metaphorical extensions include that where *from* marks cause, as in *They died from malnutrition*. This use is highly restricted, however, for causes are not in general expressed by a *from* PP: if a tornado is the cause of the destruction of a house, we cannot therefore use *from* in a passive clause (*\*The house was destroyed from a tornado*). *From* has not been grammaticised in this role.

### Complementation of verbs

Bivalent and trivalent verbs selecting *from* are illustrated in [12i–ii] respectively:

- [12] i *My copy differs from yours. Have you heard from Sue? I couldn't keep from laughing. Please refrain from smoking. Kim suffers from asthma.*  
ii *The rules bar employees from entering the competition. He hid it from me. Keep everyone from talking. I learnt it from Ed. She saved him from death.*

With such verbs as *hear* and *learn*, *from* marks the source in the sense of the one from whom the message/information comes. There are a considerable number of verbs of prevention and abstention (to characterise the range of meanings very roughly), where the use of *from* derives via the fairly transparent metaphor of intended actions as spatial goals. To hold someone back from an object or location is to physically hold them in a place that is back away from that object or location, and to hold someone back from doing something is to hold them back so that they will not perform the action. Verbs (and verbal idioms) expressing prevention are listed in [13i]. Similar remarks hold for abstention, which is holding oneself back from some action. Verbs (and verbal idioms) expressing abstention are listed in [13ii].

[13] i	<i>ban</i>	<i>bar</i>	<i>block</i>	<i>delay</i>	<i>discourage</i>	<i>disqualify</i>
	<i>dissuade</i>	<i>distract</i>	<i>divert</i>	<i>enjoin</i>	<i>exclude</i>	<i>exempt</i>
	<i>forbid</i>	<i>hinder</i>	<i>hold back</i>	<i>inhibit</i>	<i>keep</i>	<i>preclude</i>
	<i>prevent</i>	<i>prohibit</i>	<i>protect</i>	<i>restrain</i>	<i>restrict</i>	<i>stop</i>
ii	<i>abstain</i>	<i>back away</i>	<i>back off</i>	<i>cease</i>	<i>desist</i>	<i>draw back</i>
	<i>hang back</i>	<i>hold back</i>	<i>hold off</i>	<i>keep</i>	<i>recoil</i>	<i>refrain</i>
	<i>shrink</i>	<i>shy away</i>	<i>step back</i>	<i>withdraw</i>		

Many of the prevention verbs permit not only a direct object denoting the preventee (*prevent him from seeing it*) but also, alternatively, a direct object denoting the action prevented (*prevent it*). However, not all do: *They dissuaded him from doing it*, but not *\*They dissuaded his action*. Some of the prevention verbs allow a gerund-participial clausal complement without the *from*: *prevent the boy leaving*, *stop them doing it*. *Keep* differs from the others in that without a *from* complement it has a continuative sense: compare [12], for example, with *Keep everyone talking* and *I kept crying*.

### Complementation of other categories

[14] i	<i>abstention from sex</i>	<i>freedom from harassment</i>	<i>protection from the sun's rays</i>
ii	<i>different from other people</i>	<i>free from intimidation</i>	<i>immune from prosecution</i>
iii	<i>apart from anything else</i>	<i>aside from these advantages</i>	<i>far from being contrite</i>

In some cases *from* alternates with other prepositions – e.g. *protection* (and the base verb *protect*) takes *against*, *different* takes *to* or *than*, and so on. Complements with adverbs are rare, but a very few adverbs, e.g. *separately*, take *from* PPs (*separately from the rest*; see Ch. 6, §6.1).

### ■ *In*

*In* is the basic preposition for expressing interior location (*in the box*). It extends through the usual temporal metaphor to mark a time period conceived as a container within which an event is located (*That happened in the winter*, “at a time included in the winter”) or to mark a time period used to provide an upper bound on a delay, a period during which, hence by the end of which, an event will occur (*I'll be ready in a few minutes*, “by the end of a period consisting of a few minutes”).

### Complement in the structure of AdjPs and AdvPs

Like nouns, adjectives do not (with very few exceptions) take NPs as post-head complement. Subordinate NPs are related to the head adjective by means of a preposition, and again *of* can be regarded as the default preposition in this construction. A list of adjectives selecting *of* is given in Ch. 6, §3.1; further examples are as follows:

- [18] *I feel ashamed of myself. They seem bereft of ideas. She is convinced of his guilt.  
It is full of water. It is good of you to help. We're short of money.*

Adverbs seldom take complements, but at least one – *independently* – inherits from its adjectival base the property of selecting an *of* complement (see Ch. 6, §6.1).

### Complement in the structure of VPs and PPs

Verbs and prepositions, by contrast, do take NP complements, so prepositions in general, and *of* in particular, play a smaller role in their complementation. Nevertheless, there are a number of verbs and prepositions which do select *of* complements; they are illustrated in [19], the verbs in [i] being bivalent, those in [ii] trivalent:

- [19] i *She approves of the plan. Beware of the dog. He disposed of the old bulb.  
We partook of a simple meal. The book treats of the fauna of New Zealand.*  
ii *We apprised her of the facts. I convinced her of his guilt. They deprived him of his liberty.  
You expect too much of them. He robbed me of my wallet.*  
iii *ahead of her rivals because of the danger instead of tea out of the box*

*Of* indicating cause may be included here as it is virtually restricted to occurrence with *die*: *He died of a broken heart*. With *expect* (and likewise *demand*) *of* alternates with *from*. There are also cases where it alternates with *about*, which has its ordinary lexical meaning: *They had spoken of/about their wartime experiences*; *He's thinking of/about moving to Sydney*.

### Other functions of *of* PPs

There are a few cases where *of* is not selected by the head and thus makes an independent contribution to the meaning. In [20i–iii] the *of* phrase is respectively modifier in NP structure, predicative complement, and adjunct in clause structure:

- [20] i *a matter of no importance a frame of steel a girl of a sunny disposition  
a man of honour a boy of sixteen the best novelist of her time*  
ii *It is of no importance. The frame is of steel. She is of a sunny disposition.*  
iii *We like to go to the beach of a week-end. He did it of his own accord.*

The predicative complements in [ii] match the modifiers in [i], but the predicative construction allows a narrower range of semantic types. Compare, for example, *\*The man is of honour* or *\*The boy is of sixteen*. Leaving aside idioms and fixed phrases such as *of course*, *of late*, *of necessity*, etc., *of* PPs are rarely found as clause adjuncts. The only productive case is for indicating time in multiple situations, as in the *of a week-end* example in [iii]: the NP denotes a time period and must begin with the indefinite article.

### ■ On

The spatial use of *on* was discussed in §6.1. The temporal use is seen in such phrases as *on Tuesday*, *on the first of June*, *on hearing this news*. It is found with a limited range of NPs indicating ongoing actions or states (*on fire*, *on the march*, *on your guard*), or reason (*on her advice*).

### On PPs in complement function

*On* is selected in the complementation of various verbs, nouns, and adjectives, as illustrated in [21i–iii] respectively:

- [21] i *We can't decide on a colour. It depends on the cost. We feed them on raw meat. I can't improve on that. Look on her as a friend. Don't rely on him. He spent it on drink. The stress will tell on her. They're waging war on us.*  
 ii *an attack on my honour a ban on gambling their expenditure on drink an improvement on his first attempt reliance on his parents war on want*  
 iii *dependent on his parents hard on the poor intent on revenge keen on golf*

### Adjunct of disadvantage

- [22] *I was looking after the neighbours' dog for the week-end, and it died on me.*

One special use of *on* is to indicate that the referent of its complement is adversely affected by the event expressed in the clause: in this example, I'm going to have to give bad news to the neighbours (and might even be thought to be responsible).<sup>25</sup>

### ■ To

*To* is the basic English preposition for indicating the goal in physical movement: *She went to Paris*. Secondary senses include the endpoint in a change of state: *I came to my senses*; *He went to sleep*; *They beat him to death*; *The snow turned to water*; *The lights turned from red to green*. In the temporal domain it can be used for the endpoint in a period of duration (*I'll be available from two to three*), and in clock times (*ten to six* – AmE also has *ten of/before six*). Other kinds of endpoint or limit are seen in such expressions as *wet to the skin*, *generous to a fault*, *notes to the value of \$100*.

### Complementation of verbs

A large number of verbs and verbal idioms select complements with *to*, with varying degrees of similarity to the basic goal meaning. Examples are as follows:

- [23] i *It doesn't matter to me what you do. Does that seem reasonable to you?*  
 ii *He apologised to us. They lied to me. I'm speaking to you. Talk to me.*  
 iii *Give it to me. I lent it to your wife. He transferred his assets to his children.*  
 iv *Does this apply to them all? This belongs to me. I can't compare it to yours. She devotes herself to her work. It'll expose you to ridicule. Listen to me. They lost to United. It reduced him to a wreck. Please see to the guests.*

The *to* phrase is associated in [i] with the role of experiencer (in the sense of Ch. 4, §2.2), in [ii] with the addressee in an act of communication, and in [iii] with the recipient in situations of giving, transfer, and the like. Many trivalent verbs in the fields of communication and giving/transfer show alternation between a construction with object + *to* PP and one with two objects: *She showed the new draft to her tutor* ~ *She showed her tutor the new draft*; see Ch. 4, §8.2.1 for discussion.

### Other *to* complements

*To* is selected by a good number of nouns and adjectives and a few prepositions:

<sup>25</sup>It is common for languages to express this meaning by a dative case rather than a prepositional construction; this is the basis for the terms 'ethic dative' and 'dative of disadvantage' that are used for such expressions. We do not apply these terms to English in accordance with our policy of distinguishing between case and function: English has no dative case.

- [24] i *an answer to the question a burden to us all cruelty to animals the entrance to the cave a hindrance to progress the key to the safe his marriage to Sue*  
 ii *answerable to no one kind to us similar to yours susceptible to flooding*  
 iii *according to you owing to the rain prior to the exam thanks to this delay*

Note that some of the *to* complements of nouns correspond to direct objects of verbs: compare *She answered the question*; *They entered the cave*. One or two *-ly* adverbs, such as *similarly*, inherit the *to* complementation from the base adjective.

### ■ *With*

*With* has as its most basic meaning the notion of accompaniment, as expressed by **comitative** adjuncts – e.g. *Christopher Robin went down with Alice*, meaning roughly “Christopher Robin and Alice went down together”. From this root meaning, via associations between copresence and various kinds of involvement, metaphorical extensions spread out into notions like location (*I left the keys with my neighbour*); properties (*a boy with black hair, someone with intelligence, a car with a powerful engine*); means or instrument (*undo it with a pin, achieve it with military force*); manner (*skated with skill, writes with passion, spent money with gay abandon*); agreement (*I’m with you on this matter*). The distinction between modifiers and complements is not easy to draw in the case of *with* phrases, and some of the complements illustrated below certainly have strong affinities with these meanings.

#### Complementation of verbs

- [25] i *I agree with you. They charged him with perjury. I’ll deal with it myself. Let’s dispense with the formalities. Will you help me with my homework? Please don’t mess with my stuff. I wouldn’t trust them with my car.*  
 ii *We covered the floor with sawdust. They supplied the terrorists with guns. The garden was swarming with bees.*

The NP complement of *with* in [ii] can occur as a direct complement of the verb in related constructions: *Sawdust covered the floor*; *They supplied guns to the terrorists*; *Bees were swarming in the garden* (see Ch. 4, §8.3).

#### Other *with* complements

- [26] i *comparison with the first version contact with outer space help with my taxes*  
 ii *angry with you familiar with the rules riddled with corruption*

## 1 Preliminaries

This chapter continues the description of clause structure begun in Ch. 4. The latter introduced the primary functions of predicator, complement, and adjunct. The predicator is the head of the clause, the function realised by the verb. Within the category of complement we distinguished between core and non-core complements: characteristically core complements have the form of NPs while non-core ones are realised by PPs. The major focus of Ch. 4 was on the core complements, subjects, objects, and predicatives; predicatives are semantically comparable to predicators, while subject and object are associated with a fairly wide range of semantic roles such that the interpretation in particular cases is largely dependent on the semantic properties of the predicator. In this chapter, by contrast, our focus is on those elements (primarily adjuncts but also certain less central kinds of complement) that express relatively constant kinds of meaning, such as manner, spatial or temporal location, duration, condition, and so on. As explained in Ch. 15, §5, the term ‘adjunct’ covers modifiers in the VP or clause together with related supplements.

### ■ Semantic categories

The elements concerned express a very wide range of semantic categories, and we cannot hope to provide a fully comprehensive coverage. The following examples illustrate the main categories that will be dealt with in this chapter, with the annotation on the right giving the name and the section or subsection in which it is discussed:

- |       |   |                           |
|-------|---|---------------------------|
| [1] i | <i>She presented her case <u>very eloquently</u>.</i>                   | [manner: §2.1]            |
| ii    | <i>They opened it <u>with a tin-opener</u>.</i>                         | [instrument: §2.2]        |
| iii   | <i>We solved the problem <u>by omitting the section altogether</u>.</i> | [means: §2.2]             |
| iv    | <i>I <u>foolishly omitted to lock the back-door</u>.</i>                | [act-related: §3]         |
| v     | <i>He slept <u>in the TV room</u>.</i>                                  | [spatial location: §§4–5] |
| vi    | <i>He hurried <u>from the scene</u>.</i>                                | [source: §4–5]            |
| vii   | <i>She went <u>to New York</u> for Christmas.</i>                       | [goal: §4–5]              |
| viii  | <i>We made the mistake of travelling <u>via Heathrow</u>.</i>           | [path: §4–5]              |
| ix    | <i>I crawled <u>towards the door</u>.</i>                               | [direction: §4.4]         |
| x     | <i>They walked <u>five miles</u>.</i>                                   | [extent: §5]              |
| xi    | <i>I woke up <u>at five</u>.</i>  | [temporal location: §6]   |
| xii   | <i>Ken slept <u>for ten hours</u>.</i>                                  | [duration: §7]            |

xiii	<i>It was <u>already</u> light.</i>	[aspectuality: §8]
xiv	<i>I <u>often</u> read in bed.</i>	[frequency: §9]
xv	<i>She read the book <u>for the third time</u>.</i>	[serial order: §10]
xvi	<i>We enjoyed it <u>very much</u>.</i>	[degree: §11]
xvii	<i>He left the door open <u>in order to allow late-comers to enter</u>.</i>	[purpose: §12.2]
xviii	<i>They had to walk <u>because of the bus-strike</u>.</i>	[reason: §12.3]
xix	<i>As the sun sank, the light intensified <u>so that the hills glowed</u>.</i>	[result: §12.4]
xx	<i>I'll come along, <u>though I can't stay very long</u>.</i>	[concession: §13]
xxi	<i>We'll get there before dinner <u>if the train is on time</u>.</i>	[condition: §14]
xxii	<i><u>Technically</u>, he did not commit an offence.</i>	[domain: §15]
xxiii	<i>The accident was <u>probably</u> due to a short-circuit.</i>	[modality: §16]
xxiv	<i><u>Fortunately</u>, we got there on time.</i>	[evaluation: §17]
xxv	<i><u>Frankly</u>, I'm disappointed.</i>	[speech act-related: §18]
xxvi	<i>There is, <u>moreover</u>, no justification for making an exception.</i>	[connective: §19]

### ■ Organising principles

Broadly speaking, elements belonging to the later categories in this list are less tightly integrated into the structure of the containing clause than the earlier ones. Thus elements which qualify as complements by the criteria of Ch. 4 are found only among those in the top part of the list, while those in the bottom part often have the status of supplements, prosodically detached from the rest of the sentence.

#### Partial overlap of categories

For the most part the categories in [1] are mutually exclusive: a given complement or adjunct in an unambiguous clause will not generally belong to more than one category. There are, however, a small number of exceptions, as illustrated in:

[2]	i	a.	<i>He's going to buy the house <u>if he can afford it</u>.</i>	[basic conditional]
		b.	<i>He's going to buy the house <u>if I'm not mistaken</u>.</i>	[modal conditional]
		c.	<i>He's going to buy the house, <u>if you must know</u>.</i>	[speech act-related conditional]
	ii	a.	<i>She has gone home <u>because she was feeling ill</u>.</i>	[basic reason]
		b.	<i>She has gone home, <u>because her light is off</u>.</i>	[speech act-related reason]

In [ia] the *if* phrase is a basic, or ordinary, conditional adjunct, giving a condition on his buying the house. In [ib] it expresses a modal qualification to the proposition that he is going to buy the house. And in [ic] it relates to my act of assertion: "If you must know, I'll tell you". Similarly, in [iia] the *because* phrase is a basic, or ordinary, reason adjunct, saying why she has gone home, while in [iib] it relates to my speech act in that it gives the reason why I am able to assert that she has gone home.

### ■ Descriptive parameters

Among the issues we will consider in looking at the various types of complement and adjunct are the following.

#### (a) Focus potential

Most, but by no means all, of the elements to be considered can be the informational focus (marked by the main stress) in such constructions as interrogatives expressing alternative questions, contrastive negation, and *it*-clefts. Compare:

- [3] i a. *He returned yesterday.* [temporal location]  
 b. *Did he return yesterday or on Tuesday?* [alternative question]  
 c. *He didn't return yesterday but on Tuesday.* [contrastive negation]  
 d. *It was yesterday that he returned.* [cleft]
- ii a. *He returned, fortunately.* [evaluation]  
 b. *\*Did he return fortunately or surprisingly.* [alternative question]  
 c. *\*He didn't return fortunately but surprisingly.* [contrastive negation]  
 d. *\*It was fortunately that he returned.* [cleft]

The cleft construction allows a narrower range of elements to be focused than alternative questions and contrastive negation. For example, adverbs in *-ly* are less readily focused in a cleft: compare *Did they grow quickly or reasonably fast?* and *Was it quickly that they grew?*<sup>1</sup> Elements that cannot be focused in any of these constructions are adjuncts rather than complements, and in many cases are supplements rather than modifiers. Thus while *yesterday* in [ia] is a modifier within the VP, *fortunately* in [iia] is not: it is a supplement with the clause *he returned* as its 'anchor'.

### (b) Restrictiveness

A further, and related, difference between *yesterday* in [3ia] and *fortunately* in [iia] is that the latter has no bearing on the truth of the utterance. Example [ia] is true only if he returned yesterday: if he returned not yesterday but the day before, it is false. We will say, then, that *yesterday* is **restrictive**. But [iia] is true if he returned: if you respond *That's not true* you are denying that he returned, not disputing my evaluation of the event as fortunate. *Fortunately* is therefore said to be **non-restrictive**. Elements that are inherently non-restrictive in this way are again always adjuncts, but they do not wholly coincide with those that lack focus potential. A modal adjunct like *probably*, for example, cannot be focused (*\*Did he return probably or possibly?*), but it is clearly relevant to the truth of the proposition expressed: while [iia] entails that he returned, *He probably returned* obviously does not.

### (c) Questioning

Most types of adjunct can be questioned. For example, an interrogative phrase can function as adjunct of temporal location, as in *When did he return?* But again, the evaluation adjunct of [3iia] behaves differently: interrogative phrases cannot have this function. Where questioning is possible, it is relevant to ask further what form the interrogative phrase takes. Use of the same interrogative word indicates a degree of likeness between categories that in other respects may be different. For example, we will see that there are grounds for distinguishing purpose and reason, but they nevertheless have it in common that both can be questioned by *why*: compare [1xvii–xviii] with *Why did he leave the door open?* ("for what purpose?") and *Why did they have to walk?* ("for what reason?").

<sup>1</sup>The complement of *be* in the cleft construction – what we call the 'foregrounded element' – need not carry the focal stress, as explained in Ch. 16, §9.4.1, but for the purposes of the present chapter we can simplify by considering only the prototypical case where it does. The unmodified term 'focus' in this chapter is to be understood as informational focus, as distinct from the scopal focus of adverbs such as *only* and *even*: see Ch. 6, §7.3, for this distinction.

## (d) Relative scope

In many cases it is important to determine the scope of a dependent relative to other elements in the clause. One important issue concerns the scope of an element relative to a negative. Compare, for example:

- [4] i *I didn't buy it because it was too expensive.* [adjunct has wider scope]  
 ii *I didn't appoint him just because he was my son.* [negative has wider scope]

Scope is the semantic analogue of constituent structure in syntax: it has to do with the way the meaning of the whole sentence is built up from the meanings of its parts. In [i] the negation applies to my buying it, and then the adjunct applies to my not buying it. We say, therefore, that the adjunct here has scope over the negation (or has wider scope than the negation). This can be brought out by such a gloss as “The fact that it was too expensive is the reason why I didn't buy it”, where the negative is in a subordinate clause and “reason” is in the matrix. In [ii] the negation doesn't apply to my appointing him but to my doing so just because he was my son: the sentence implicates that I did appoint him, but for some other reason.<sup>2</sup> Here then the negation has scope over the reason adjunct, and we can gloss as “It is not the case that I appointed him just because he was my son”, with the negative in the matrix and the reason in the subordinate clause. In abstraction from prosody, a clause may be ambiguous as to the relative scope of adjunct and negative. *I didn't appoint him because he was my son*, for example, can be interpreted like [i] (“That's the reason why I didn't appoint him”), or like [ii] without the *just*.

There are also places where we need to consider the scope of one adjunct relative to another:

- [5] i *He usually doesn't attend departmental meetings, fortunately.*  
 ii *He probably sees them regularly.*

In [i] *fortunately* has scope over *usually* (“It is fortunate that he usually doesn't attend departmental meetings”, not “It is usually fortunate that he doesn't attend departmental meetings”). In [ii] *probably* has scope over *regularly* (“It is probable that he sees them regularly”, not “It is regularly probable that he sees them”). In both these examples, the element with narrow scope is a frequency adjunct, while the one with wide scope belongs to one of the categories towards the end of our list in [1]: evaluation and modality respectively.

## (e) Bounding potential

Some types of dependent are closely related to the aspectuality of the clause, and our discussion will draw on the aspectual categories of perfective vs imperfective and the situation types states, activities, accomplishments, and achievements presented in Ch. 3, §3.2. In particular, some elements have a bounding effect. Compare, for example:

- [6] i *She ran.* [unbounded: activity]  
 ii *She ran to the station / two miles.* [bounded: accomplishment]

Example [i] is unbounded and can take a duration adjunct with *for* but not *in*: *She ran for ten minutes* / \**in ten minutes*. But adding a goal such as *to the station* or an extent adjunct such as *two miles* makes the clause bounded, and this is reflected in the fact

<sup>2</sup>That this is an implicature, not an entailment, is evident from the acceptability of examples like *I don't know whether I will appoint him at all, but I certainly won't appoint him just because he's my son*.

that we can now have *in* but not *for* in the duration adjunct: *She ran to the station in twenty minutes / \*for twenty minutes.*

#### (f) Syntactic realisation

We are concerned under this heading with the internal form of the complement or adjunct. The main categories are as follows:

- |       |  |                     |
|-------|--|---------------------|
| [7] i | <i>She folded the napkins <u>carefully</u>.</i>                        | [AdvP]              |
| ii    | <i>She cut it <u>with a razor-blade</u>.</i>                           | }                   |
| iii   | <i>I was annoyed <u>because they had overcharged me</u>.</i>           |                     |
| iv    | <i>She didn't consult us <u>before signing the contract</u>.</i>       |                     |
| v     | <i>I hadn't seen them <u>before</u>.</i>                               |                     |
| vi    | <i>They arrived <u>last week</u>.</i>                                  | [NP]                |
| vii   | <i><u>Had I known this at the time</u>, I wouldn't have bought it.</i> | [finite clause]     |
| viii  | <i>We were saving up <u>to buy a new car</u>.</i>                      | }                   |
| ix    | <i><u>Realising he couldn't win</u>, Tom began to lose heart.</i>      |                     |
| x     | <i><u>His assignment completed</u>, Ed went down to the pub.</i>       |                     |
| xi    | <i><u>Hands on their heads</u>, the prisoners filed from the room.</i> | [non-finite clause] |
|       |  | [verbless clause]   |

Example [i] illustrates the common case of an adjunct realised by an AdvP. Prototypically, the adverb is derived from an adjective by suffixation of *-ly*, and the relation between such adverbs and their head or anchor is comparable to that between a predicative adjective and its predicand. Thus here the folding is careful, and in *Fortunately, no one was injured* the fact that no one was injured is fortunate. In [ii–v] the adjuncts are realised by PPs of various kinds: the complement of the preposition is an NP in [ii], a content clause in [iii], a gerund-participial in [iv], while in [v] there is no complement at all. It will be recalled that the category of prepositions we are working with includes many items that are traditionally analysed as subordinating conjunctions or adverbs.

While AdvPs and PPs constitute the bulk of adjuncts, there are other possibilities. A small number of categories allow NPs, as in [7vi] (temporal location). Finite (content) clauses are even more restricted in their range; [vii] illustrates the case of a clause with subject–auxiliary inversion functioning as conditional adjunct, alternating with the *if* PP *if I had known this at the time*. The remaining examples in [7] involve non-finite clauses (infinitival, gerund-participial, and past-participial) and verbless clauses. Infinitivals can function as purpose adjuncts, as in [viii] (where the clause alternates with the PP *in order to buy a new car*), but for the rest non-finite and verbless clauses generally have a less specific semantic function in the clause. The examples in [ix–x] can be construed as indicating temporal location and/or reason, that in [xi] as manner perhaps, but this is a matter of pragmatic inference: the semantic category is not explicitly marked either grammatically or lexically. For this reason, relatively little attention will be given to adjuncts of this kind in the present chapter.

#### (g) Linear position

We discuss the linear position of adjuncts in the final section of the chapter. The primary distinction we draw is between **front**, **central**, and **end** position:

- |       |  |           |
|-------|--|-----------|
| [8] i | <i><u>Fortunately</u> there was plenty of time.</i>  | [front]   |
| ii    | <i>There was <u>fortunately</u> plenty of time.</i>  | [central] |
| iii   | <i>There was plenty of time, <u>fortunately</u>.</i> | [end]     |

## ■ Manner complements

With some verbs a manner dependent has the syntactic status of a complement:

- [4] a. *She behaved outrageously.*      b. *They treated her pretty shabbily.*

In the senses they have here, these verbs require a manner dependent, for *She behaved* on its own means approximately “She behaved well”, while the sense of *treat* in *They treated her* is quite different from that of [b] (involving medical treatment or paying for her). Other verbs where a manner complement is more or less obligatory for the sense in question are *word* (*We worded the motion carefully*) and *dress* (*He dresses very shabbily*; *dress* on its own generally means “get dressed”). With *live* a manner phrase is one of a range of permitted complement types (*live frugally*, *live in Durham*, *live in the fifteenth century*). And with *give* the manner complement *generously* can occur instead of the usual object.

## ■ NPs and PPs

Manner elements may also have the form of NPs (*Do it this way*) or, more often, PPs. Prepositions heading manner phrases include *with* and *without*:

- [5] i *She handled it with great care.*  
 ii *They treated us without much consideration.*

Manner PPs and AdvPs readily coordinate: *She handled the situation skilfully and with great tact*. PPs like those in [5] occur predominantly in clauses expressing human actions. When they have concrete NPs as complement, *with* and *without* often have instrumental function (as in [1iii]) – and indeed the use of these prepositions in both functions is a reflection of the similarity between manner and instrument. A further reflection of the similarity is that clauses with a manner *with* phrase, like those with an instrumental *with* phrase, may have a close paraphrase with the verb *use*: compare *She handled the situation with great skill* (manner) ~ *She used great skill in handling the situation* and *She cut it with a scalpel* (instrument) ~ *She used a scalpel to cut it*.

One major class of manner PPs have *in* with an NP complement headed by such nouns as *manner*, *way*, *style*, *fashion*:

- [6] i *He had responded in a studiously nonchalant manner.*  
 ii *They had been behaving in the usual way.*  
 iii *We’re furnishing the house in a modern style / the Italian fashion.*

There is partial overlap between this kind of phrase and the *·ly* AdvP. We find numerous equivalent pairs like *intelligently* ~ *in an intelligent way* or *spontaneously* ~ *in a spontaneous manner*, and so on. But *I found it easily*, *He speaks too quickly*, *Drive slowly*, and the like do not have natural counterparts with *manner* or *way*, whereas the PPs in [6] do not have natural counterparts with the form of AdvPs. For [i] *studiously nonchalantly* is possible but likely to be avoided because of the sequence of two quite long *·ly* adverbs. *Usually* is not available as a replacement in [ii] because it has a frequency rather than a manner meaning, and [iii] illustrates the case where there is no adverb at all derived from the adjective (*\*modernly*, *\*Italianly*). *Way* NPs can occur as manner dependents on their own, without the governing preposition *in*: *Do it this way*; *I cooked it (in) the Italian way*.

Another common type of manner PP (discussed in more detail in Ch. 13, §§5–6) has comparative *as* or *like* as head: *I did it exactly as you told me to*; *He talks just like his father*.

In addition we need to recognise a miscellaneous group of manner PPs, such as *in a loud voice*, *at maximum volume*, *under his breath*.

### ■ Implications for resultant state

Manner adjuncts typically give information about how a process is carried out, but in some cases this will have implications for the state resulting from the process. Compare:

- [7] a. *He shut the door noisily.*                      b. *He sealed the window hermetically.*

In [a] *noisily* describes the manner of shutting the door, but has no bearing on the resultant state: the door is simply shut. But in [b] the window ended up not just sealed, but hermetically sealed. Similarly *They painted the house badly* (resulting in a badly painted house), *I tied the knot loosely* (yielding a loose knot), *You've mended the dress perfectly*, and so on. The entity that ends up in the relevant state is not always overtly expressed, as in *He wrote illegibly* (resulting in illegible writing).

### ■ Adverbs having both manner and other uses

Most *-ly* adverbs that occur as manner dependents can also occur with one or more other meanings, as illustrated in:

- |     |   |   |
|-----|---|---|
| [8] | MANNER                                      | OTHER USE   |
| i   | a. <i>He sang <u>badly</u>.</i>             | b. <i>They wounded him <u>badly</u>.</i>                      |
| ii  | a. <i>He behaved <u>rudely</u>.</i>         | b. <i><u>Rudely</u>, he turned his back on them.</i>          |
| iii | a. <i>He'll behave <u>typically</u>.</i>    | b. <i><u>This typically</u> happens after a long drought.</i> |
| iv  | a. <i>I can't think <u>politically</u>.</i> | b. <i><u>Politically</u>, it was a disaster.</i>              |
| v   | a. <i>She explained it <u>clearly</u>.</i>  | b. <i>She is <u>clearly</u> a great asset.</i>                |
| vi  | a. <i>She smiled <u>happily</u>.</i>        | b. <i><u>Happily</u>, I was able to get my money back.</i>    |
| vii | a. <i>They discussed it <u>frankly</u>.</i> | b. <i><u>Frankly</u>, it's a disgrace.</i>                    |

In the [b] examples, the AdvP belongs to one of the semantic categories discussed elsewhere in this chapter: *badly* here indicates degree, *rudely* belongs to the act-related category, *typically* indicates frequency, *politically* is a domain adjunct, *clearly* is modal, *happily* is evaluative, and *frankly* speech act-related. In the manner use, the adverb modifies just the verb together with any internal complements, while in most of the other uses it has a broader application. In [iib], for example, *rudely* applies to the act wherein he turned his back on them. Similarly *politically* specifies the domain within which *it was a disaster* is true, while in [viib] *frankly* relates to the illocutionary act of saying *it's a disgrace*.

### ■ Secondary manner adjuncts

There is a class of adverbs derived from adjectives denoting feelings or moods that have a double use comparable to that exemplified in [8], except that the 'other use' still has very much to do with manner. We therefore call this other semantic category **secondary manner**, with **primary manner** the term now used for the manner adverbs of the [a] examples. Adverbs belonging to this type include *angrily*, *bitterly*, *gloomily*, *moodily*, *serenely*:

- |     |  |   |
|-----|--|---|
| [9] | PRIMARY MANNER                               | SECONDARY MANNER  |
| i   | a. <i>He shouted <u>angrily</u> at them.</i> | b. <i><u>Angrily</u>, he stormed out of the room.</i>         |
| ii  | a. <i>He peered <u>gloomily</u> at her.</i>  | b. <i><u>Gloomily</u> they packed their bags.</i>             |
| iii | a. <i>She smiled <u>serenely</u>.</i>        | b. <i><u>Serenely</u> she led the premier onto the stage.</i> |

Like the [b] examples in [8ii–vii], the secondary manner adjuncts can have scope over a primary manner adjunct:

- [10] i *Angrily*, Ed grasped her *tightly* by the wrist.  
 ii *Cleverly*, Ed spoke *loudly enough* for the neighbours to hear.

*Cleverly* belongs to the act-related category, and the secondary manner adjuncts are undoubtedly very similar to these. Note, however, that *cleverly* applies to the act of speaking but not to the manner of doing so: Ed didn't speak in a clever way, he simply spoke loudly, and that was a clever thing to do (presumably because it enabled the neighbours to hear). *Angrily* gives information about Ed's mood, but it seems that this will be reflected in some way in the manner in which the act is performed.

Secondary manner dependents differ from primary ones in that they cannot be complements (\**Angrily he worded the letter*) and cannot be focused. They normally occupy front position, a position where primary manner adjuncts are rarely found. Such adverbs as *happily* and *sadly* can indicate either secondary manner or evaluation. *Sadly Kim left the room*, for example, is ambiguous according as it is Kim or me, the speaker, who is sad.

### ■ Implied manner: the cognate object construction

- [11] a. *She fought a heroic fight.* b. *He died a long and agonising death.*

A cognate object is one where the head noun is a nominalisation of the verb: *fight* and *death* are nominalisations of the verbs *fight* and *die*. As the head noun itself is already implied by the verb it does not normally occur on its own: \**He died a death*. Rather, the noun is modified in some way, as by the adjectives in these examples. And these adjectives typically describe the process expressed in the clause and thus have the same kind of function as a manner adverb. Thus [i] means essentially the same as *She fought heroically*; [ii] likewise describes the manner of his dying but in this case there is no adverb *longly* available to express the same meaning in a manner adjunct.

## 2.2 Means and instrument

### ■ By and with phrases

Means and instrument adjuncts are characteristically realised by PPs headed by *by* (or *by means*) and *with* (or *without*) respectively:

- [12] i a. *She travels to work by bus.*  
 b. *Sometimes you have to translate a noun in one language by a verb in another.*  
 c. *He had gained access to the board by highly dubious means.*  
 d. *They communicate by means of sign language.*  
 e. *Ed annoyed them by constantly interrupting.*  
 ii a. *She opened my door with the master-key.*  
 b. *She managed to gain entry without a key.*  
 c. *They ate with chopsticks / with their fingers.*  
 d. *I translated the passage with the help of a dictionary.*  
 e. *You can see the star with the naked eye.*

The instrumental NP is normally concrete, those denoting body-parts being a special case. (In [iid] the *help* NP is abstract, but it contains the concrete NP *a dictionary* within

it.) Instruments normally occur in clauses where the subject (in the case of active clauses) has an agent role, as in [ia–d]. *See* doesn't require an agent role for its subject, but it is consistent with one, and the instrumental in [iie] makes an agent interpretation more likely. There are also constructions (besides the obvious short passives), however, where the agent is implicit rather than overtly expressed:

- [13] a. *The master-key opened the door.*      b. *The door opened with the master-key.*

Both of these convey that someone used the master-key to open the door; for further discussion of these constructions see Ch. 4, §8.3.3.

Means adjuncts likewise occur most often with an agentive subject (where the clause is active), but there is no semantic requirement for an explicit or implicit agent. A non-agent subject is readily permitted when *by* has a gerund-participial as complement, as in [12ie]; note that this could apply equally to situations where Ed deliberately or unintentionally annoyed them. Note also that the verb in the gerund-participial complement of *by* can be *use*, which can give rise to a means adjunct effectively equivalent to an instrument: *They got in by using the master-key / with the master-key.*

### ■ Other forms

Other prepositions are sometimes found, but with a restricted range of complements. In *he wrote it by hand* the *by* has an instrumental function. In *She went there on foot* and *She worked it all out on the computer*, the *on* phrases are interpreted respectively as means and instrument. In a few cases we find NPs rather than PPs:

- [14] a. *I'll send it (by) airmail.*      b. *Next time we're going to fly Qantas.*

In addition means and instrument can be realised by adverbs in such expressions as *lift mechanically*, *analyse statistically*, *examine spectroscopically*. This, however, is extremely limited; note, for example, that while *treat surgically* and *communicate electronically* are perfectly possible, we could not replace the adverbs here with *pharmaceutically* or *postally*, even though in both cases there are adjectives from which the adverbs could be derived.

### ■ The internalised complement in passive clauses

We use the term **internalised complement** for the element in a passive clause that corresponds to the subject (the external complement) of the active counterpart. Its semantic role is the same as that of the active subject, and varies according to the meaning of the verb, as explained in Ch. 4, §2: agent in *They were questioned by the police*, experiencer in *They were despised by the police*, and so on. In general, therefore, it falls outside the scope of the present chapter, but there are two brief points to be made about it here.

#### Marking of the internalised complement

The prepositional marker of the internalised complement, *by*, is the same as the marker of means. Compare, then:

- [15] i *The information was obtained by their competitors.* [internalised complement]  
 ii *The information was obtained by subterfuge.* [means]

The *by* phrase in [i] is an internalised complement, that in [ii] a means adjunct. *By subterfuge*, but not *by their competitors*, could answer a *how* question. The two *by* phrases

can easily combine: *A great deal of information was obtained by their competitors by subterfuge.* The distinction is less straightforward when *by* has a subjectless gerund-participial complement:

- [16] i *The plan had been sabotaged by leaking the report to the media.*  
 ii *He had sabotaged the plan by leaking the report to the media.*  
 iii *Leaking the report to the media had sabotaged the plan.*

Example [i] has an analysis in which the *by* phrase is a means adjunct, matching that in the active clause [ii]; here the understood subject of the gerund-participial is the same as the understood internalised complement. Yet the gerund-participial can itself function as the subject of an active clause, as in [iii]. This suggests that the *by* phrase in [i] could be an internalised complement. We do not perceive [i] to be ambiguous, however, because [iii] itself is understood with the subject indicating means: whoever leaked the report had sabotaged the plan by doing so.

#### AdvP in lieu of internalised complement

A number of verbs allow an AdvP instead of a quantified complement:

- [17] i *It was widely believed that the proposal had been leaked by the minister herself.*  
 ii *It is popularly known as ‘Singapore daisy’.*

*Widely* is understood as “by many people”, and *popularly* as “by most ordinary/lay people”. Similarly: *She was universally admired*, “by everyone”. The verbs concerned are generally stative, with the understood complement having the semantic role of experiencer (but note also *The land is publicly owned / owned by the public*).

## 3 Act-related adjuncts

### ■ Contrast between manner adjuncts and act-related adjuncts

We noted in §2.1 that most adverbs that can function as manner adjunct can also appear in some other semantic category. In particular, there are some – such as *carefully*, *carelessly*, *discreetly*, *ostentatiously*, *stupidly*, etc. – that function as manner adjuncts to verbs denoting actions of animate beings (mainly humans) and which also belong to what we refer to as the act-related category. The distinction between the manner and act-related categories is illustrated in the following pairs:

- | [1] MANNER ADJUNCT  | ACT-RELATED ADJUNCT   |
|---|---|
| i a. <i>He spoke to them quite rudely.</i>                                | b. <i>Rudely, he spoke only to her husband.</i>                       |
| ii a. <i>He answered the question foolishly.</i>                          | b. <i>Foolishly, he answered two questions.</i>                       |
| iii a. <i>He closed the door carefully and then answered my question.</i> | b. <i>Carefully, he closed the door before answering my question.</i> |

In [ia] it was the **way** he spoke to them that was rude, whereas in [ib] it was the **act** of speaking only to her husband that was rude – it may be that he spoke to her husband quite politely, while rudely ignoring her. Similarly, in [iia] *foolishly* describes the way he answered the question (he gave a foolish answer), whereas in [iib] it evaluates the act of answering two questions. In this latter case the answers may have been clever, but perhaps he was only asked to answer one question. In [iiia] he closed the door in a careful way – taking care to make the minimum noise perhaps, or in such a way as to ensure

that the door wouldn't spring open again. In [iiib] it was the very act of closing the door that was careful: he may well have been taking care to ensure that no one would overhear his answer. The act-related adjuncts are thus concerned with the act in abstraction from its manner. Another way of bringing out the difference is to consider the comparison classes: in [iiia], for example, closing the door carefully may be compared with closing it noisily, slamming it, and so on, whereas in [iiib] the act of closing the door may be compared with other possible acts in the context, such as opening the door or leaving it open, closing the window, and the like.

In these examples, the semantic difference is reflected in the different syntactic positions. Front position normally allows only the act-related interpretation; end position usually indicates the manner interpretation, but could generally allow the act-related reading if set apart from the residue prosodically or by punctuation (as in *He answered two questions, foolishly*). That position would hardly be possible for *carefully*, which is probably due to the fact that *carefully* is much more oriented towards manner than *foolishly* or *rudely*: one would be unlikely to use [iiib] if he had slammed the door, whereas [ib] and [iib], as noted, are quite compatible with his having spoken politely and answered cleverly (*carefully* is thus not so clearly distinguished as the others from the secondary manner adjuncts of §2.1). With adverbs like *rudely* and *foolishly* central position gives the act-related reading, while with *carefully*, for the reasons just suggested, the distinction is somewhat blurred:

- [2] a. *He foolishly answered two questions.*      b. *He carefully closed the door.*

The two kinds of adjunct can combine in a single clause, with the act-related one having scope over the manner:

- [3] i *He foolishly spoke rather impolitely to the boss's husband.*  
ii *She carefully dresses sloppily.*

The fact that *careful* and *sloppy* are more or less opposites brings out sharply the difference between the two kinds of adjunct, for there is no contradiction in [ii]: we understand that she takes care to give the appearance of being sloppily dressed.

### ■ Subjective and volitional subtypes of act-related adjuncts

The act-related adjuncts cited in [1] are **subjective** in that they involve an evaluation of the act by the speaker. It's my judgement that his speaking only to her husband was rude, that it was foolish to answer two questions, that closing the door before answering my question was a careful thing to do. Note, however, that in making an evaluation of the act, I am also making one of the actor: he was rude to speak only to her husband and foolish to answer two questions, and he was being careful in closing the door. This distinguishes the act-related adjuncts from evaluative proposition-related ones like *Unfortunately he answered two questions* (see §17).

There is a second type of act-related adjunct that does not involve this kind of subjective evaluation. We refer to these as **volitional**:

- [4] i *The clerk deliberately gave her the wrong change.*  
ii *Reluctantly the clerk later gave her another five pounds.*

The adverbs here belong in the act-related category since we are not concerned with the manner in which the act was performed; they do not, however, reflect a subjective evaluation of the act but relate to the intentions or willingness of the agent, the clerk.

## ■ Realisation

Act-related adjuncts most often have the form of adverbs, such as:

- [5] SUBJECTIVE
- |                        |                       |                   |                        |                   |
|------------------------|-----------------------|-------------------|------------------------|-------------------|
| <i>carefully</i>       | <i>carelessly</i>     | <i>cleverly</i>   | <i>considerately</i>   | <i>delicately</i> |
| <i>discreetly</i>      | <i>foolishly</i>      | <i>immaturely</i> | <i>lavishly</i>        | <i>manfully</i>   |
| <i>nonchalantly</i>    | <i>ostentatiously</i> | <i>prudently</i>  | <i>studiously</i>      | <i>stupidly</i>   |
| <i>surreptitiously</i> | <i>tactfully</i>      | <i>tactlessly</i> | <i>unceremoniously</i> | <i>wisely</i>     |
- [6] VOLITIONAL
- |                     |                     |                    |                      |                  |
|---------------------|---------------------|--------------------|----------------------|------------------|
| <i>accidentally</i> | <i>deliberately</i> | <i>freely</i>      | <i>inadvertently</i> | <i>knowingly</i> |
| <i>purposely</i>    | <i>reluctantly</i>  | <i>unwittingly</i> | <i>voluntarily</i>   | <i>willingly</i> |

PBs are also found: *with his usual tact*, *without any consideration for the rest of us* (subjective), *by accident*, *on purpose*, *under duress*, *with reluctance* (volitional).

The adverbs in [5] occur also as manner adjuncts, as illustrated in [1], while those in [6] are very largely specialised to the act-related category. *Deliberately* indicates manner with such verbs as *speak*, but with a somewhat different sense (“carefully and slowly”), while *reluctantly* and several others have a manner interpretation in construction with such verbs as *act*.

A good number of the subjective adverbs allow paraphrases where the adjective from which they are derived is used predicatively: *It was foolish of him to answer two questions*; *He was foolish to answer two questions*. Such paraphrases are not available with the volitional adverbs. Compare, for example, *\*It was deliberate of the clerk to give her the wrong change*. We do have *He was reluctant/willing to answer the question* but since this does not entail that he answered the question the meaning is quite different from that of *He reluctantly/willingly answered the question*.

## ■ Restrictiveness and focus

The main difference between the two subtypes is that the subjective ones are always non-restrictive, while the volitional ones can be restrictive. Only the latter, therefore, can be focus of an interrogative or of contrastive negation:

- [7] i a. *Did he close the door CAREFULLY?* [manner reading only]  
 b. *Did he go WILLINGLY?* [act-related: volitional]  
 ii a. *\*He didn't answer two questions foolishly but wisely.* [subjective]  
 b. *He didn't mislead us inadvertently but quite deliberately.* [volitional]

Instead of [iia] we need one of the adjectival versions, such as *It wasn't foolish but wise of him to answer two questions*.

The subjective ones, indeed, do not readily occur in closed interrogatives even in non-focus position. Compare:

- [8] i *?Did he rudely speak only to her husband?* [subjective]  
 ii *Did you deliberately leave me the smallest piece?* [volitional]

The open interrogative *Who so rudely interrupted the speaker?* is perfectly acceptable, because here there is a presupposition that someone interrupted the speaker, and this act can therefore be evaluated as rude.

Imperative clauses do not accommodate subjective act-related adjuncts. Volitional ones are very rare, but not wholly excluded, particularly in negatives: *Don't deliberately offend any of them*.

Both types can have scope over a negative: *I foolishly didn't pay enough attention to what she said*; *The director deliberately didn't mention any names*. But with some of the subjective ones (e.g. *carefully*), it would be more usual to select a verb such as *refrain*, *omit*, *avoid* that incorporates the negative meaning within it than to use a syntactically negative clause. Thus *The director carefully refrained from mentioning any names* is somewhat more natural than *The director carefully didn't mention any names*.

### ■ The agent

An act implies an agent, and the adjuncts discussed in this section are related to the agent via the act. We have seen that clauses containing an adjunct of the subjective subtype can generally be quite closely paraphrased with a clause containing a predicative adjective whose predicand refers to the agent: *Ed rudely interrupted* ~ *Ed was rude to interrupt* or *It was rude of Ed to interrupt*. Even though such paraphrases are not available with the volitional ones, the latter are still concerned with attitudes, intentions, etc., on the part of the agent: *Ed deliberately misled us*, for example, ascribes intention to Ed.

We have so far confined our attention to active-voice clauses describing actions. We must now turn to some less straightforward cases.

#### States

- [9] i *Jill rightly / mistakenly / foolishly believes/thinks that Nigel had told the police.*  
 ii *Jill wisely / foolishly / deliberately lives a long way from her place of work.*

Here the clauses describe states, not acts, but a restricted subset of the adjuncts listed above can occur in clauses of this kind. What sanctions them is that the subject-referent is assumed to be responsible for the state. This is reflected in the fact that we again have approximate paraphrases with a predicative adjective: *Jill is right/mistaken/foolish to believe . . .*; *It is wise/foolish of Jill to live (such) a long way from her place of work*.

#### Long passive clauses (passive clauses containing an internalised complement)

- [10] i *The gate was carelessly left open by the hikers.*  
 ii *The lecturer was rudely interrupted by several members of the audience.*  
 iii *Dick was wisely taught the tricks of the trade by Donald.*  
 iv *Ed was reluctantly sent to boarding-school by his stepfather.*

In passive clauses the complement of *by* corresponds to the subject of the active, and in the default case it is therefore this NP that refers to the agent to which the adjunct relates. In [i], for example, carelessness is attributed to the hikers. In this example, the subject is inanimate and hence could not be associated with the agent role. In [ii] the subject is human, but again the rudeness is attributed to several members of the audience, not the lecturer: being interrupted is not (normally) something over which one has control and hence the subject of the passive is not associated with an agent role. Examples [iii–iv] also have a default reading in which the wisdom and reluctance are attributed to the agent expressed by the complement of *by*, i.e. to Donald and Ed's stepfather. But they also have a less salient reading in which the default is overridden, with the wisdom and reluctance being attributed to Dick and Ed, the referents of the passive subject.<sup>3</sup> Here we

<sup>3</sup>For some speakers this second reading is more readily available if the adjunct is positioned before the passive auxiliary: *Dick wisely was taught the tricks of the trade by Donald*.

understand that Dick had an agent role in initiating Donald's teaching him the tricks of the trade, that Ed likewise had an agent role in agreeing to go to boarding-school (or at least accepting the decision). From the point of view of meaning, therefore, we effectively have two acts, and two agents, in such cases – and the act-related adjunct applies to the one that is implicit rather than the one that is explicitly expressed. The two acts are both explicitly expressed in structures like *Dick wisely got himself taught the tricks of the trade by David* or *Ed reluctantly allowed his stepfather to send him to boarding-school*. In this second interpretation [iii–iv] are comparable to the embedded passive of examples like *They advised the twins not to be photographed together*, discussed in Ch. 4, fn. 16, where the understood subject is assigned an agent role by virtue of being embedded as complement to the verb *advise*.

#### Short passives (those without an internalised complement)

- [11] i *The letter was inadvertently posted without a stamp.*  
 ii *The lecturer was rudely interrupted several times.*  
 iii *Dick was wisely taught the tricks of the trade.*

In examples like these the internalised complement is implicit rather than overtly expressed, and the default interpretation relates the adjunct to the understood agent – to the person who posted the letter, the people who interrupted, the one who taught Dick the tricks of the trade. But the default reading can be overridden in examples like [iii] in the same way as in [10iii].

#### Other cases of an implicit act

We suggested that in the non-default reading of [10iii–iv] and [11iii] there is an implicit act (and hence agent) in addition to the one overtly expressed in the passive clause. There are also active voice clauses in which an adjunct relates to an implicit act and agent:

- [12] i *The document may have unintentionally got into Soviet hands.*  
 ii *The four brands found unwittingly to contain 'Enterococcus faecium' were supplied by a different laboratory.*

In [i] we understand *unintentionally* to apply to the act of allowing the document to get into Soviet hands, and in [ii] *unwittingly* in the *contain* clause likewise applies to the implicit act of manufacturing the brands. Examples of this kind will tend to be avoided in carefully monitored text, but they certainly occur in less formal styles.

## 4 Location and change of location in space

The term 'location' applies primarily to the domain of space, but it is common practice, both in linguistics and in the ordinary use of language, to extend the concept to other domains, especially time. This extension is motivated by the clear parallels in the use of prepositions in the two domains (see Ch. 19, §5.4, where we examine the role of prepositional elements in lexical morphology). In this section we look at spatial location and change of location, but precisely because this is the primary domain for the application of the concept of location, we will largely omit the specification 'spatial'.

### 4.1 Overview of categories

Adjuncts and complements expressing location and change of location in space are very frequent and quite varied in form and meaning. The most elementary case is that of spatial location itself, without any motion from one place to another:

- [1] i *We met under the station clock.* } [(spatial) location]  
 ii *George remained at home.* }

We analyse the underlined elements as adjuncts or complements of **spatial location**, or simply **location**.

More complex is the case where we have a change of location, or motion.

- [2] i *John ran from the attic to the kitchen.* [source + goal]  
 ii *She took her passport out of the drawer.* [source]  
 iii *Kim put the key under the mat.* [goal]

Example [i] specifies two locations: John began in the attic and ended in the kitchen. *From the attic* indicates the **starting-point**, *to the kitchen* the **endpoint**; we will refer to them in the domain of space as respectively **source** and **goal**. In [ii] only the source is specified (her passport was initially in the drawer), and in [iii] only the goal (the key was finally under the mat).

It is also possible to specify an intermediate location (or indeed more than one), which we call **path**:

- [3] i *Don't travel via London if you can avoid it.* [path]  
 ii *I drove from school through the tunnel to the station.* [source + path + goal]  
 iii *John ran down the stairs into the kitchen.* [path + goal]  
 iv *She has come from London via Singapore.* [source + path]

In addition, one can indicate the **direction** of motion:

- [4] i *We are travelling north.* [direction]  
 ii *She ran from the car towards the house.* [source + direction]  
 iii *They turned left onto the main highway.* [direction + goal]

### 4.2 Location

Location elements can be complements or adjuncts:

- | [5] | COMPLEMENT  | ADJUNCT   |
|-----|---|---|
| i   | a. <i>The stew is <u>in the oven.</u></i>             | b. <i>We had breakfast <u>in the kitchen.</u></i> |
| ii  | a. <i>The books are stored <u>next door.</u></i>      | b. <i><u>Next door</u> they sell jewellery.</i>   |
| iii | a. <i>The accident occurred <u>at the corner.</u></i> | b. <i>I read the report <u>at home.</u></i>       |

The underlined elements in the [a] examples are part of the complementation of the verb. In some cases they are obligatory, not omissible without loss of grammaticality (though they might be replaceable by complements of a different kind). In [ia], for example, *\*The stew is* is not an admissible clause on its own (leaving aside the case of ellipsis: *The vegetables aren't in the oven, but the stew is \_*). Elsewhere, as in [iia/iiia], the complement is not strictly obligatory, but nevertheless has a strong link with the verb: it represents an integral feature of the situation expressed in the clause. The adjuncts in the [b] examples

are all optional and do not depend for their admissibility on the presence of a particular class of verb. Note also the difference with respect to the *do so* test (Ch. 4, §1.2):

- [6] i *I read the report at home and Henry did so at the office.*  
 ii *\*The first accident occurred at the corner and the second did so at the roundabout.*

#### ■ Location of situation or location of theme

- [7] i *I saw your father in London.* [location of situation]  
 ii *I saw your father at the window.* [location of theme]  
 iii *I saw your father on the bus.* [ambiguous]

In the natural interpretation of [i] the adjunct *in London* indicates where the event as a whole took place. In [ii], however, *at the window* is likely to be construed as saying where your father was when I saw him: I myself was elsewhere – in the road, perhaps. Example [iii] can then be interpreted in either way, as saying where the event took place or where your father was. The element whose location is described in cases like [ii] has the semantic role of theme (cf. Ch. 4, §2.2).

The theme may be aligned with the subject or object of the clause, and the locative can then be said to have either subject or object orientation:

- |     |  |  |
|-----|--|--|
| [8] | SUBJECT ORIENTATION                              | OBJECT ORIENTATION                                       |
| i   | a. <i>The key remained <u>in my pocket</u>.</i>  | b. <i>I found <u>the key in my pocket</u>.</i>           |
| ii  | a. <i>The child was <u>on her shoulders</u>.</i> | b. <i>She carried <u>the child on her shoulders</u>.</i> |

It is also possible for the theme to be the object of a preposition, as in *I caught a glimpse of her at the window*.

#### ■ Some special cases of location elements

##### Contact with body-part

- [9] i a. *She poked him in the ribs.* b. *She poked his ribs.*  
 ii a. *He patted her on the shoulder.* b. *He patted her shoulder.*  
 iii a. *He was wounded in the foot.* b. *His foot was wounded.*

The locatives in the [a] examples do not specify the location of either participant (or of the event as a whole), but indicate which part of the patient's body was affected. These examples with two complements in the VP are approximately equivalent to their counterparts in [b], which have just one, with the body-part noun heading the object NP.<sup>4</sup> Note that where the location is questioned, as in *Where did he hit you?*, there is no corresponding [b] version: we need something like *What part of your body did he hit?* (see Ch. 4, §7.4, for further discussion of the alternation in [9]).

##### Temporal interpretation of locatives

- [10] i *She wrote the book in Cape Town.*  
 ii *I was ill in Calcutta.*  
 iii *In the zoo he wanted an ice-cream.*

Location adjuncts can often be used to give, by implication, the time of an event. A purely spatial interpretation might apply in [i] if, for example, Cape Town is connected with the content of the book. But it can also be taken as a shorthand way of saying *She*

<sup>4</sup>The qualification 'approximately' is needed because in certain cases the two constructions are not interchangeable. A doctor, for example, might poke your ribs as part of a medical examination, but we would not describe this situation as 'poking you in the ribs'.

wrote the book when she was in Cape Town. Such a temporal interpretation is especially common for locatives in construction with stative verbs, as in [ii–iii].

### Metonymic locatives

- [11] i *I met her at Jill's 21st birthday party.*  
 ii *There may well be some unpleasantness at the meeting.*

The NP complements of *at* here refer to events, but the association between such events and their venue yields a spatial location interpretation of the whole PP. (There is, however, some blurring of the distinction between space and time here: these examples can also be taken as giving the time of the event – cf. the discussion of [10] above.)

### Metaphorical locatives

- [12] i *Nobody would dare talk in Smith's class.*  
 ii *I read this in a book on wild flowers.*  
 iii *In our family birthdays are not celebrated.*  
 iv *In medicine you can't afford to make mistakes.*

Locative phrases with *in* often denote some metaphorical space. In [i] Smith's class is not a physical location, but a social location. In [ii] it is the book as an abstract rather than a physical location that provided the information I obtained. And so on. Physical and metaphorical locations can combine: *In my dream, I was walking with Paula in Hyde Park.*

## Iteration of location adjuncts and complements

- [13] i a. *I heard him at the Albert Hall, in London.*  
 b. *I heard him in London, at the Albert Hall.*  
 c. *In London I heard him at the Albert Hall.*  
 d. *#At the Albert Hall I heard him in London.*  
 ii *He is staying in the annexe, on the top floor, in Room 201.*

Location may be given by a series of phrases differing in their degree of specificity: *at the Albert Hall* is more specific than *in London*, and *in Room 201* is more specific than *on the top floor*, which is in turn more specific than *in the annexe*. The examples in [i] illustrate the relative positions of the phrases: note that preposing applies to the less specific, as shown by the contrast between [ic] and [id].

## Combination of location adjunct with locative complements

- [14] i *In Brisbane we keep our cats indoors at night.*  
 ii *Here lots of people go to the beach every week-end.*

These examples have a location adjunct combining with a location complement in [i], and a goal in [ii]. The adjunct is less specific than the complement.

## Questioning

Location dependents can generally be questioned by *where*:

- [15] i *Where did you have lunch today?* [adjunct]  
 ii *Where are you living these days?* [complement with subject orientation]  
 iii *Where do you keep the stickytape?* [complement with object orientation]

## ■ Realisation

Most location dependents have the form of a PP. A sample of prepositions (and prepositional idioms) heading such phrases is given in:

[16]	i	<i>abroad</i>	<i>downhill</i>	<i>downstairs</i>	<i>here</i>	<i>hereabouts</i>	<i>home</i>
		<i>indoors</i>	<i>nearby</i>	<i>overseas</i>	<i>there</i>	<i>where</i>	
	ii	<i>above</i>	<i>across</i>	<i>against</i>	<i>around</i>	<i>at</i>	<i>away</i>
		<i>before</i>	<i>behind</i>	<i>below</i>	<i>between</i>	<i>beyond</i>	<i>by</i>
		<i>down</i>	<i>east</i>	<i>in</i>	<i>in front</i>	<i>inside</i>	<i>near</i>
		<i>next</i>	<i>off</i>	<i>on</i>	<i>on top</i>	<i>opposite</i>	<i>out</i>
		<i>outside</i>	<i>over</i>	<i>past</i>	<i>through</i>	<i>throughout</i>	<i>under</i>
	iii	<i>back</i>	<i>into</i>	<i>to</i>	<i>towards</i>		

The items in [i] occur without complements in the PP: *He lives abroad*; *Nearby, some children were playing cricket*. For *here* and *there* see Ch. 17, §9.1. *Home* marks location only as a subject-oriented complement: *Are you home?*, *We stayed home*, but not *\*I keep my computer home* or *\*Home, the children were playing cricket*. Besides *where* we have the compound determinatives *anywhere*, *everywhere*, *nowhere*, *somewhere*. *Where* commonly introduces PPs with the form of fused relatives: *The keys aren't where they should be*. Similarly *wherever*: *You can sleep wherever you like*.

The prepositions in [16ii] take complements (NPs or further PPs), though most can also occur without: *They were playing outside (the caravan)*; *She is out (of the country)*. For a number of them, however, the construction without a complement is largely excluded from location function. Compare:

[17]		LOCATION		GOAL
	i	a. <i>She was working <u>across the road</u>.</i>		b. <i>She swam <u>across the river</u>.</i>
		ii a. <i>*She was working <u>across</u>.</i>		b. <i>She swam <u>across</u>.</i>
		iii a. <i>She was <u>across</u>.</i>		b. <i>She got <u>across</u>.</i>

Intransitive *across* can express location only in examples like [17iii a], where it indicates the location resulting from movement. *Before* is much more commonly used in the temporal domain than in the spatial, where *in front* is more usual (*before the altar*, *in front of her brother*).

The prepositions in [16iii], *back*, *into*, *to*, *towards*, occur predominantly with change of location, but they are not completely excluded from simple location:

- [18] i *They camped five miles into the forest.*  
 ii *Liz is back from London already.*  
 iii *The entrance is to the right of the letter-box.*  
 iv *The school is situated towards the end of the highway.*

Example [18i] is similar to [17iii a] in that the location is understood as the endpoint of motion not expressed in the clause itself: they had been travelling into the forest and stopped to camp after covering five miles. Example [18ii] likewise implies prior motion: Liz went to London and has now returned. In [18iii–iv] the implied movement is conceptual or potential rather than actual. Locate the letter-box and then move to the right: that is where the entrance is. Imagine yourself travelling along the highway: some place near the end of it is where the school is situated. *Onto* is not used in this way, though it has a metaphorical locative sense in *The police are onto him already*.

Location is also expressed by a handful of adverbs, such as *locally*, *internationally*, *nationally*, *regionally*, *worldwide*: *They work locally*.

### 4.3 Change of location: goal, source, path, and direction

The dependents having to do with change of location are normally complements, requiring the presence of some verb expressing motion, or the causation of motion. Note again that these elements have to be included in the scope of *do so*: \**Kim went to London and Pat did so to New York*.

The central cases of complements of source and goal are found in clauses expressing the change of location of a theme element. The source gives the initial location of the theme, and the goal the final location:

- [19] i *Angela drove from Berlin to Bonn.* [subject orientation]  
 ii *Angela took the TV from the lounge into her bedroom.* [object orientation]

The theme role is aligned with the subject in [i], and the object in [ii], so we may again distinguish between subject and object orientation (cf. [8] above).

In [19i] Angela was originally in Berlin and finally in Bonn. Similarly in [ii] the TV started off in the lounge and ended up in Angela's bedroom. Note, then, that *from* and *to* are not part of the description of the initial and final locations. The initial locations are Berlin and the lounge (or 'in Berlin' and 'in the lounge'): *from* serves, rather, as a marker of the source category, indicating that its complement represents the initial location. Similarly, the final locations are (in) Bonn and in her bedroom, with *to* being a marker of the goal category.

#### ■ Omission of contextually understood source and goal

With some verbs of directed motion, especially but by no means only the deictic verbs *come* and *go*, a source and/or goal may be left unexpressed but contextually implied:

- [20] i a. *He has gone.* b. *Are you going?*  
 ii a. *I'm coming.* b. *Are you coming?*  
 iii a. *Have they arrived yet?* b. *We'll be arriving at seven.*

Example [ia] will often be interpreted in a face-to-face conversation as "He has gone from here" (understood source), and in a context mentioning a party, for example, [ib] is likely to imply "Are you going to the party?" (understood goal). Example [iia] will often imply movement from where I currently am to where you are; [iib] might involve your coming to where I am or our both going to a party or whatever. In a face-to-face conversation [iiia] will most likely be understood as "Have they arrived here yet?"; while in [iiib] the goal will probably be some other place, but it will have to be recoverable from the context. (See also Ch. 17, §9.2.)

#### ■ Bounding potential of goal

With most verbs of motion, including all verbs expressing manner of motion (*walk*, *drive*, *swim*, *fly*, etc.) the presence of a goal has the effect of making the clause bounded; the other change of location elements do not have this effect. Compare:

- [21] i *She drove to Berlin in/for eight hours.* [goal]  
 ii *She drove from Bonn in/for eight hours.* [source]  
 iii *She walked through the forest for/in eight hours.* [path (for) or goal (in)]

In [i] the source, although not expressed, is contextually implied. This means that the length of the trip is delimited, and driving this distance must be an accomplishment, must be bounded. We can therefore have a duration adjunct with *in* but not with *for* (see §1 above). In [ii] we have a source but no overt goal. A goal can be implied by the context yielding a bounded process, which sanctions the duration adjunct with *in*; but there need not be a contextually derivable goal, and in the absence of an implied goal the clause expresses an unbounded situation, an activity, which sanctions the adjunct with *for*. In [iii] *through the forest* can express path or goal. In the former case there is no implication that she reached the end of the forest; here walking along this path is an unbounded activity, which sanctions *for*. In the goal interpretation the end of the forest is reached; the journey was from one end of the forest to the other, which means that it was bounded, so that *in* is sanctioned.

### ■ Licensing of change of location complements

Goal, source, path, and direction complements are generally licensed by verbs expressing motion, including causative verbs of movement such as *put* or *send*. Three further special cases merit brief mention.

#### Verbs of sound emission

The primary meaning of such verbs as *roar* and *whistle* has to do with the emission of various kinds of sound rather than with motion, but they can be used in a secondary sense to indicate motion accompanying or causing such sounds:

- [22] i a. A bullet whistled past my head.      b. The motor bikes roared up the hill.  
 ii a. She rustled out of the room.      b. The train chugged into the station.

#### The way construction

- [23] a. We made our way to the station.      b. Jill had to elbow her way to the exit.

The verb *make* on its own does not license change of location complements, but it forms an idiom with an object NP of the form *x's way*, meaning approximately “progress”, and this does license them, as in [a]. This provides the basis for a fairly productive construction in which *make* is replaced by verbs giving information about the manner of progress. In [b] Jill’s progress to the exit was achieved by using her elbows (cf. also *She elbowed me out of her way*). The movement denoted by the *way* construction has to be one that consists of a series of stops and starts, rather than being continuous movement.

#### Be + goal

The verb *be* can have a motional sense in construction with the perfect. Compare:

- [24] i a. Jill has been to Moscow.      b. Jill has gone to Moscow.  
 ii a. \*Jill was to Moscow twice.      b. Jill went to Moscow twice.

The difference between *be* and *go* (apart from the restriction of *be* to the perfect, as shown in [iia]) is that *be* entails subsequent departure from the goal location. In [ib] Jill could still be in Moscow (indeed the most likely scenario is that she is), but in [ia] she can’t. Typically she will have returned to the original source location, but it is possible for her to have moved to some third location.

### ■ Omission of goal marker

Goal is much the most frequent of the change of location elements, and the specific goal marker *to* is often omissible. Compare, for example, source and goal in the following pairs:

- | [25] | SOURCE                                       | GOAL                                    |
|------|--|---|
| i    | a. <i>Where did she come from?</i>           | b. <i>Where did she go (to)?</i>        |
| ii   | a. <i>She's travelling from here by car.</i> | b. <i>She's travelling here by car.</i> |
| iii  | a. <i>He emerged from under the bridge.</i>  | b. <i>He swam under the bridge.</i>     |
| iv   | a. <i>He came out of the room.</i>           | b. <i>He went in(to) the room.</i>      |

The source in all these examples is marked – by *from* or *out of*. As for the goal, the marker *to* is optional with *where*: in *Where did she go?* the *where* questions the final location, just as it does in *Where did she go to?* The *to* is generally impossible with *here* and *there*: *She's travelling to here by car.*<sup>5</sup> In [iiib] the preposition *under* is part of the description of the location, not a marker of its status as goal. *Under the bridge* can express location without motion or change, as in *He was camping under the bridge*. And indeed precisely because there is no goal marker in [iiib] itself, the example is ambiguous between the goal reading (He wasn't under the bridge to start with but was at the end of the event described) and a location reading (roughly, “He was swimming around under the bridge”).<sup>6</sup> In [iv] the goal marker *to* is again optional, though this time it is not a separate word but part of a compound. As we remarked in Ch. 4, §5.2, the position of *to* in the compound doesn't match the interpretation of the phrase: the final location is “in the room”, so conceptually we have “to + in the room”. *To* is likewise an optional component of the compound *onto*: *She jumped on(to) the platform*.

*Whence* and *whither* are relative and interrogative words for source and goal respectively; *whither* is archaic, *whence* somewhat less so in relative constructions. Even here the source as often as not is marked by *from*: *the place from whence he came*.

### ■ Realisation of goal

The prototypical goal is marked by the preposition *to*, as a word on its own or compounded with *in* or *on*. In either case the preposition requires an overt complement; if the final location is omissible by virtue of being contextually recoverable, as discussed in connection with [20], then the marker *to* is omitted as well as the complement expressing the final location. Compare then:

- [26] i *Kim went to the meeting, and Pat went as well.*  
 ii *Kim went into the church but Pat wouldn't go in with her.*

Because the goal marker *to* is omissible, most of the expressions that can function as location can also function as goal:

- [27] i a. *I found it next to the garage.*                      b. *I put it next to the garage.*  
 ii a. *It was lying between the posts.*                      b. *It fell between the posts.*

<sup>5</sup>This might be acceptable if *here*, accompanied by a gesture, refers to a location on a map. For some speakers, *to* can also occur after *back*: *%She's coming back to here*.

<sup>6</sup>There is also a salient reading of [25iiib] in which *under the bridge* indicates the path: he was swimming along a river and passed under the bridge. In languages where prepositions govern a range of cases, the goal and location interpretations of the preposition are often distinguished by the case of the complement NP. For example, Latin and German have accusative case for the goal and path readings, and respectively ablative and dative case for the location reading.

One important exception is *at*. Instead of \**He went to at school*, we have an NP complement: *He went to school*. A different kind of exception is *out*, which with verbs of motion is restricted to source: *She stayed out of the room* (location); *She went out of the room* (source, not goal). (*From* is also excluded from goals, but doesn't occur in location either.) Some prepositions which occur predominantly in source or direction expressions are found as goal under restricted conditions: *It landed just off the highway*; *Place it well away from the fire*; *The bomb dropped towards the end of the highway*; *They moved south*. The latter (certainly in its salient interpretation) says that they moved to a new location, in the south; it may be contrasted with *They walked south*, where *south* indicates direction (cf. *They walked south for two hours*).

A few verbs are exceptional in that they do not take *to* as a marker of goal. *Arrive* takes *at* instead of *to*: *They'll be arriving at Heathrow from Paris shortly after noon*. It does, however, allow *into* (as well as *in* and *on*): *They arrived into Heathrow in the middle of the night*. *Put* (and similar verbs such as *place*) take *in(to)* and *on(to)*, but normally not *to* alone: *He put it in(to) the cupboard / on(to) the top shelf / \*to the cupboard*.

Fused relatives with *where* or *wherever* occur as goal, alone or with a governing preposition: *Put it back where you found it*; *She swam to where the river divides*. The verb *reach* assigns a goal interpretation to its object, which is obligatory: *She reached Bonn at six*; \**She reached at six*.

#### ■ Realisation of source

Source complements generally have the form of PPs headed by *from*, *away*, *off*, *out*. *From* takes as complement an NP or a PP headed by a locative preposition: *She emerged from the garden / from behind the wall / from under the bridge*. But again *at* is dropped: *He came home from school*, not \**from at school*. Like the goal marker *to*, *from* requires an overt complement. *Away* occurs alone (*She walked away*) or with a *from* phrase as complement (*She walked away from him*). *Off* and *out* occur alone or with complements, NP and of PP respectively: *Kim jumped off (the pier)*; *He came out (of the room)*. *Out* can combine with a *from* phrase: *She came out from behind the bush*.

#### ■ Realisation of path

*Via* is the prototypical preposition marking path: in the domain of space it occurs uniquely with paths. It takes an NP as complement, not a locative PP: *She came via the bridge / \*via over the bridge*. *Along* is usually associated with path too: *They strolled along the castle wall* (which doesn't specify where the stroll started or finished); it can, however, also be used for location, as in *He lives just along the corridor*. NPs headed by *way* also commonly occur in path function: *Don't go that way to the beach, go this way*.

In addition, many PPs that can express simple location or initial and final locations can also express intermediate location, and hence path. Compare, for example:

- [28] i a. *I ran across the bridge.* [goal]  
       b. *I ran across the bridge to the old church.* [path]  
       ii a. *The noise came from up the hill.* [source]  
        b. *They walked from the station up the hill to the new Civic Centre.* [path]

In [ia] *across the bridge* gives the final location whereas in [ib] it gives an intermediate location.<sup>7</sup> In [iia] *up the hill* gives the initial location (*from* being the source marker), while in [iib] it is an intermediate location within the journey from station to Civic Centre.

### ■ Realisation of direction

Direction elements can be prospective or retrospective in orientation, with the former very much the more common. The prospective type are oriented towards a later location, the retrospective type towards an earlier location.

The morphological base *-wards* is a distinctive component of a number of prospective direction phrases: *eastwards, northwards, forwards, backwards, inwards, outwards*, etc., and *towards*, where *-wards* is compounded with the goal marker *to*.<sup>8</sup> While *to* alone marks goal, *towards* marks direction: the complement of the preposition is only a potential final location. The compass terms are also used without *-wards*: *They went south/southwards*. Other prospective direction phrases include *left* and *right* (or *to the left/right*). The preposition *at* occurs with a good number of verbs (*He shot an arrow at the rabbit*) and *for* with a few (*The ship made for the harbour*). These are closely related to goals: the intention was that the arrow hit the target, that the ship reach the harbour.

NPs with *way* as head can function as direction as well as path – compare:

- [29] i *Which way did you come?* [path]  
 ii *Which way did he go?* [direction (or path)]

Example [i] has an implied goal (“here”) and *which way* asks about the route taken to get here. Example [ii] can be interpreted likewise with an implied goal (though not “here”, of course), but a very salient interpretation has the goal unspecified, and the question asking about direction, equivalent to *In which direction did he go?*

Retrospective direction elements are not distinct in form from source. Compare:

- [30] i *Get away from it.*  
 ii A: *Can you tell me the way to the station?*      B: *You are walking away from it.*

In [i] *away from it* expresses source: the initial location is where ‘it’ is. In [ii], however, *away from it* expresses direction: the station doesn’t give your initial location. Rather, your unspecified initial location was closer to the station than your current one.

### ■ Constituency of source + goal constructions

Source and goal can certainly be treated syntactically as separate elements of clause structure, as is evident from examples like:

- [31] i *From London she went to New York.*  
 ii *It was to New York that she went next from London.*

But there is a close relationship between them, and they can also be construed as forming a unit together:

- [32] i *We walked from Sunshine Beach to Noosa, which is a beautiful stretch of coast.*  
 ii *We drove from Manchester to London, a distance of 180 miles.*

<sup>7</sup>There is a sense in which the goal in [28i] incorporates a path: the final location is on the other side of the bridge, but *across the bridge* also indicates the path taken to get there. Prepositions like *across, through, up, down* differ from *at, in, on* in combining path with goal in this way.

<sup>8</sup>An alternant of *-wards* is *-ward*, found primarily in AmE.

The antecedent for the relative pronoun *which* in [i] is *from Sunshine Beach to Noosa*, and expressions of this kind can function as subject: *From Sunshine Beach to Noosa is a beautiful stretch of coast*. Similarly, [ii] may be compared to *From Manchester to London is a distance of 180 miles*.

#### 4.4 Metaphorical extension of the locative categories to other domains

We observed at the beginning of this section that there are conceptual and linguistic similarities between the domain of space and various other domains, such as time. For this reason, the categories introduced above have a broader application than has been described so far. Source and goal especially, representing primarily the terminal points in spatial movement, can be applied to many other processes conceived of as involving progression. Compare, for example:

- [33] i *I read the article from page 15 to page 60.*  
 ii *The dressmaker took in the skirt from the waist down.*  
 iii *We drank our way through a magnum bottle of whisky.*  
 iv *We came to a decision / arrived at a decision / reached a decision.*  
 v *We managed to get through that meeting without any mishap.*  
 vi *The tradition is transmitted from father to son and from teacher to pupil.*  
 vii *I couldn't get the message across.*

In [i] the process is one of reading rather than movement of a theme element, but the relationship with the central case of movement is very close. The article has physical form, and *page 15* and *page 60* refer to places within it. In [ii] the process of taking the skirt in applies to an area of the skirt and the waist is a place in that area where the process began. Example [iii], involving the *way* construction of [23] above, expresses a process of drinking a bottle of whisky, with completion of that process treated like reaching a spatial goal. And in [iv] the process of deciding is conceptualised like movement to a goal. Analogously with [v–vii].

The concepts of location, source, and goal can be applied to states:

- |      |  |  |
|------|--|--|
| [34] | SPACE  | STATES   |
| i    | a. <i>Liz is <u>in London</u>.</i>                 | b. <i>The situation is <u>bad</u>.</i>                 |
| ii   | a. <i>Liz went <u>from London to New York</u>.</i> | b. <i>The situation went <u>from bad to worse</u>.</i> |

In [ib] we have location in a state, and in [iib] change from one state to another. On the basis of such parallels between space and states we can talk of state location, state source, and state goal, as discussed in Ch. 4, §5.2.

#### ■ Orientation and topography

We also find, within the general domain of space, that the categories associated primarily with change of location can apply without there being any movement:

- [35] i *The house faces towards the forest.* [direction]  
 ii *The arrow points north / to the exit.* [direction/goal]  
 iii *The road runs from the village to the castle.* [source + goal]  
 iv *The valley broadens out into a fertile plain.* [goal]  
 v *The track winds its way along the banks of the river.* [path]

These do not involve any change of location, but express static situations. The adjuncts are therefore not bounding. There is, however, a very clear connection between these

static situations and dynamic ones involving motion. In [iii] and [v], for example, the road and the track do not themselves move, but one can move from one location to another by travelling along them. And similarly in [iv] one could walk along the valley, coming to the fertile plain as goal. In [i], if I start walking in a straight line from the front of the house I will be walking towards the forest. In [ii] we can envisage an extension of the arrow, and if we go along this imaginary line, starting at the arrow-head, we will go north or to the exit. The terms ‘source’ and ‘goal’ have their primary application in the field of motion, but given this conceptual similarity and the similarity of form (reflected in the prepositions used) we can generalise the categories so that they apply in both the dynamic and static cases.

One difference between the static and dynamic types is that [iii] is equivalent to *The road runs from the castle to the village*, whereas *Kim ran from the village to the castle* is not equivalent to *Kim ran from the castle to the village*. These latter examples describe movement in opposite directions, whereas the road examples describe the same situation from different perspectives. As a consequence of this feature of [35iii], it is also equivalent to *The road runs between the village and the castle*. Here *the village* and *the castle* are coordinated, indicating that the locations expressed have equal status. They are not differentiated as source and goal, and can be thought of as terminal points or locations that define an extent of space.<sup>9</sup> Expressions of extent are the topic of our next section.

## 5 Spatial extent and scalar change

### 5.1 Overall extent and terminal-point extent

Consider the following set of examples:

- [1] i *She walked to Hyde Park Corner.*  
 ii *She walked from her hotel to Hyde Park Corner.*  
 iii *She walked three miles.*

We have discussed clauses like [i–ii] as involving change of location, with *from her hotel* as source and *to Hyde Park Corner* as goal. From that point of view, they answer *where* questions: *Where did she walk to?*; *Where did she walk to Hyde Park Corner from?* But (assuming that in [i] the source is contextually implied) they can also be thought of as answering *how far* questions: *How far did she walk?* From this point of view they indicate spatial extent. A measure phrase like *three miles* in [iii] will normally unequivocally indicate extent. We will say that phrases like *three miles* express **overall extent**, while those in [i–ii] can express **terminal-point extent**, i.e. extent defined by specification of one or both of the terminal points, source and goal.

Overall extent is commonly expressed by measure phrases, as in [1iii], but measure phrases can also appear in the specification of the terminal points:

- [2] i *She dived from a height of 30 feet above the pool.* [source]  
 ii *The plane soared to a height of 35,000 feet.* [goal]

<sup>9</sup>A *between* phrase is not incompatible with the dynamic sense of *run*. The most obvious use is in what we are calling multiple situations, as in *The tram runs between the village and the castle*. Here the tram makes multiple journeys, some starting at the village, others at the castle. Again, then, we have terminal locations without differentiation as source and goal.

From and to here mark source and goal, as usual, with the complement of the preposition specifying an initial location 30 feet above the pool and a final location 35,000 feet above sea-level.

## 5.2 Extent in various domains

Like location, extent can apply in the domain of time as well as space:

- [3] i *The kite rose several hundred metres.* [spatial extent]  
 ii *The meeting lasted three hours.* [temporal extent: duration]

The standard term for temporal extent is ‘duration’, and these elements will be discussed under that heading in §7, after a consideration of temporal location: in this section, therefore, we confine our attention to non-temporal extent.

### ■ Dynamic and static spatial extent

As with spatial location, we find expressions of spatial extent in both dynamic and static situations. The above examples are all dynamic, while [4i–ii] are static:

- [4] i *The tower rises to a height of 200 metres.*  
 ii *The road runs along the river for 20 miles / as far as the eye can see.*

### ■ Spatial dimensions

- [5] i *He fell several metres, landing in a bed of nettles.* } [vertical]  
 ii *The tree has grown to its maximum height.* }  
 iii *The children cycled another three miles.* } [horizontal]  
 iv *They had to push their bicycles (for) half a mile up the hill.* }  
 v *The oil slick expanded to an area of thousands of square miles.* } [area]  
 vi *They extended the grounds by 5 acres / to a total of 55 acres.* }

These examples illustrate various dimensions of spatial extent. The differences are purely lexical, the range of grammatical constructions being the same throughout. The term ‘distance’ is commonly used for the category of spatial extent elements in the one-dimensional, especially horizontal, sphere.

### ■ Extension of spatial extent to scalar change

The same kinds of construction are found in such examples as:

- [6] i *The price / A jar of coffee has gone up another two dollars.*  
 ii *The Dow Jones industrial average rose from 9892 through the psychological barrier of 10000 to a record level of 10073.*  
 iii *The temperature dropped to 5°.*  
 iv *She increased her philosophy mark from 70% to 85%.*

These do not involve movement in physical space, but change in value along some scale – increase or decrease. We refer to this therefore as the domain of **scalar change**. Although there is no change of physical location, the verbs used include many whose primary meaning has to do with spatial movement, as in [i–iii], and the extent of change is expressed in the same way as spatial extent. In [i], then, we have *another two dollars* expressing overall extent, while [ii–iv] have expressions of terminal-point extent, and again we can talk of *to* as marking the goal of scalar change, *from* the source. Example

[iii] even has a path, marked by *through*. The semantic role of theme likewise generalises to the element that moves along the scale in this figurative way: the price or a jar of coffee, the Dow Jones industrial average, and so on.

#### Overall extent in scalar change

One respect in which the scalar change constructions differ from those considered earlier concerns the expression of overall extent:

- |     |   |  |
|-----|---|--|
| [7] | SCALAR CHANGE                                 | SPATIAL MOVEMENT                           |
| i   | a. <i>The temperature fell <u>10°</u>.</i>    | b. <i>She cycled <u>ten miles</u>.</i>     |
| ii  | a. <i>The temperature fell <u>by 10°</u>.</i> | b. <i>She cycled <u>for ten miles</u>.</i> |

In [i] overall extent is expressed by NPs, and in [ii] by PPs, but the preposition for scalar change is *by*, while that for spatial movement is *for*. Note that the scale may incidentally have to do with spatial measurement (*They have widened the road by two metres*) or indeed with measurement of temporal duration (*They have shortened the semester by a week*): in terms of meaning and form, these clearly belong in the scalar change construction.

### 5.3 Non-temporal extent: further syntactic and semantic issues

#### ■ Complement status of non-temporal extent elements

While elements expressing extent in the temporal domain (duration) are generally adjuncts, those in the spatial and scalar change domains have the properties of complements.

##### (a) Licensing by verb

The presence of these extent elements is strongly dependent on the presence of an appropriate verb. To take just a few examples, replacement of *fall*, *grow*, *cycle* in [5i–iii] by such verbs as *sit*, *die*, *think* would clearly lead to ungrammaticality.

##### (b) Do so anaphora

In general, extent elements cannot fall outside the scope of anaphoric *do so*:

- [8] i \**Jill pushed her bicycle half a mile and Liz did so even further.*  
 ii \**Last week the Dow Jones share index fell 3%; this week it did so another 2%.*  
 iii \**Coles have raised the price by \$5, while the corner shop has done so by \$8.50.*

#### ■ Bounding potential

Adding an extent element to a clause expressing a process has the effect of making it bounded (and this too, indeed, is a property more characteristic of complements than of adjuncts). Note, then, the change from *for* to *in*:

- [9] i a. *The temperature rose for four days.* b. *The temperature rose 20° in four days.*  
 ii a. *The share price went up for weeks.* b. *It went up from £3 to £5 in a week.*  
 iii a. *The shrub grew for years.* b. *The shrub grew a whole foot in a year.*

Extent complements do not have this effect with stative clauses: examples like [4] are unbounded.

#### ■ Realisation

##### (a) PPs

Extent complements commonly have the form of PPs. As we have noted, terminal-point extent has source marked by *from* and goal by *to*, and in overall extent *for* is used in the spatial domain, *by* in scalar change – see [7].

with *what* or *how much*: *What / How much does it cost?* (except that *how long*, etc., would be more likely than *how much* with *measure*).

## 6 Temporal location

### 6.1 Adjuncts and complements

We turn now to the domain of time, where we find many similarities with the domain of space. There are also important differences, the most important of which is that time is indicated not only by phrasal elements, but also by the verbal category of tense.

Temporal location is the analogue of spatial location, and like their spatial counterparts elements of temporal location are predominantly adjuncts, but with a few verbs they have the status of complements, with either subject or object orientation:

- [1] i *I read your thesis last week.* [adjunct]  
 ii *The staff meeting is tomorrow.* [complement: subject orientation]  
 iii *I've arranged a meeting for Tuesday at ten.* [complement: object orientation]

Adjuncts normally locate in time the situation expressed by the verb together with its complements, e.g. the situation of my reading your thesis in [i]. Complements give the temporal location of the theme element, as expressed by the subject in [ii] and the object in [iii]. Such themes are normally events: we can have *The staff meeting is tomorrow* or *The accident occurred around lunch-time*, but not *\*Jill is tomorrow* or *\*My car occurred around lunch-time*.<sup>10</sup> The exception is with the verb *live*, as in *Voltaire lived in the eighteenth century*. (One might prefer to say that this gives the temporal location of Voltaire's life rather than Voltaire himself, but *live* is still exceptional in taking a human theme in combination with a temporal complement.)

Only a small number of verbs (or verbal idioms) take complements of temporal location; clear examples include:

- [2] i *be*            *happen*    *live*        *occur*    *take place*        [S orientation]  
 ii *arrange*    *fix*            *keep*        *put*        *schedule*        [O orientation]

An adjunct of temporal location can co-occur with a complement:

- [3] i *Christmas falls on a Tuesday this year.*  
 ii *He later scheduled yet another meeting for the following Tuesday.*

### ■ Change of temporal location

While many verbs express change of spatial location, very few express change of temporal location:

- [4] i *The meeting has (been) moved from Tuesday morning to Thursday afternoon.*  
 ii *We have postponed our holiday until the end of September.*  
 iii *They adjourned the meeting until next week.*

Cases of this kind are restricted to situations involving the scheduling of events. While spatial expressions of the kind *from X to Y* are readily used to indicate either change of location or extent, temporal expressions of this kind are almost always used for extent,

<sup>10</sup>Examples like *Jill is tomorrow* might in fact occur in casual speech as a shorthand way of giving the temporal location of some event involving Jill; for example, at a conference it might be used to convey "Jill's paper is (scheduled for) tomorrow".

i.e. for duration (see §7). Nothing further need be said about the change of temporal location construction [4], and hence this section is called simply ‘temporal location’.

## 6.2 Semantic types

Situations (or themes) are located in time in three different ways.

### (a) Deictically – in relation to the time of utterance

- [5] i *I saw her yesterday.*  
 ii *It’ll be all over a year from now.*

*Yesterday* refers to the day preceding the one when I utter [i], and *a year from now* identifies a period a year later than the time I utter [ii] (see Ch. 17, §10, for a fuller account of temporal deixis). The range of temporal deictic expressions is illustrated in:

- [6] *now*                      *yesterday*                      *today*                      *tomorrow*                      *this morning*  
*tonight*                      *last night*                      *tomorrow night*                      *last week*                      *next week*  
*two days ago*                      *in two weeks*                      *in a week’s time*                      *these days*                      *in earlier times*

The temporal counterparts of spatial *here* and *there* are *now* and *then*, but while *there* is readily used both deictically and anaphorically, *then* is almost always anaphoric. Such expressions as *in two weeks*, *in a week’s time*, *in earlier times* can be used anaphorically as well as deictically. The deictic use is seen in *She’s arriving in two weeks* (“in two weeks from now”), the non-deictic in *She was due to arrive in two weeks* (“in two weeks from some contextually given point of orientation”). This kind of expression can also have a durational rather than locational meaning: *She wrote the report in two weeks*.

### (b) In relation to calendar and clock times and comparable points of orientation

- [7] i a. *He lived in the third century BC.*  
 b. *The Company was founded on 1 January 1978.*  
 ii a. *Sarah is arriving at three o’clock / on 3 May / on Monday.*  
 b. *We finished the job at noon / at the end of May / at the week-end.*

The examples in [i] provide an absolute, or context-independent, specification of temporal location. The year of the birth of Christ was adopted by convention precisely as a point of orientation that would permit such context-independent time specification. The expressions in [ii] are context-dependent: the times concerned, 3 o’clock, 3 May, Monday, etc., recur cyclically and to understand their reference we need to know which cycle is intended. In the default case this is determined deictically, by means of the tense and the time of utterance in combination. In [iia] the tense is present and the adjunct is interpreted as referring to the next cyclic occurrence of the point or period in question following the time of utterance. In [iib] the tense is past, and the reference is to the last cyclic occurrence preceding the time of utterance.

Expressions like those in [7ii] thus have a default use in which they are interpreted deictically. But they are also commonly used non-deictically, especially in combination with preterite tense. Here the relevant cycle is determined by other features of the context. Elementary examples are:

- [8] i *Mary arrived yesterday at three o’clock.*  
 ii *We all met in Paris last Monday. I got there at 3 o’clock, the others at four.*

In [i] there are two time expressions in the one clause – *yesterday* is deictic, but *at three o’clock* is not: its reference is determined relative to yesterday, not to the day of speaking.

In [ii] *last Monday* in the first sentence is deictic, the other adjuncts non-deictic: again we interpret them as referring to Monday's cycle, not today's.

Other expressions referring to cyclic or otherwise recurrent times or events work in the same way: festivals (*at Christmas/Easter, for Ramadan*), seasons (*in the spring*), meals (*after lunch*), regular sporting events (*during the Olympic Games*), political events (*before the Federal election*), and so on. The default interpretations of *I'll see you at the Olympics* and *I met her at the Olympics* have reference to the next and last Olympic Games relative to the time of utterance. But again the default deictic interpretation can easily be overridden: *I came back to England in 1948 and got a job in London shortly before the Olympic Games*. The periods or events may be familiar only locally: *on sports day* for a school, perhaps, *during Orientation Week* for a university.

### (c) In relation to other times or situations

- [9] i *The company collapsed during the Second World War.*  
 ii *She became a recluse after the death of her husband.*  
 iii *He retired to his study when the guests arrived.*  
 iv *They arrived earlier than we had expected.*  
 v *She made a complaint about his behaviour and soon afterwards she was sacked.*  
 vi *By a strange coincidence Kim and I got engaged on the same day.*

In [i] the company's collapse is related temporally to the Second World War, and so on. Example [iv] illustrates the quite common case when the time of an event is related to a time at which it might have taken place. In [v] *soon afterwards* is interpreted anaphorically: the first clause, the antecedent, describes an event and the following adjunct locates the time of the sacking by reference to that event, "soon after she made her complaint".<sup>11</sup> Example [vi] can also have an anaphoric interpretation ("the same day as the event described in the previous sentence"), but in the more salient interpretation *on the same day* relates the times of Kim's getting engaged and my getting engaged to each other.

## 6.3 The form of temporal location expressions

### ■ PPs

The most common form is that of a PP; further distinctions can be made according to the complementation of the PP. In the following survey we first list head prepositions, and then give examples containing full PPs.

#### (a) With NP complement

- [10] *after ago at before between by*  
*during in into on since toward(s)*
- [11] i *I spoke to her before the meeting / during the interval.*  
 ii *They must have escaped between 9 a.m. and noon.*  
 iii *We're leaving in three weeks / in three weeks' time.*  
 iv *The accident happened three weeks into the vacation.*

<sup>11</sup>The antecedent for an anaphoric expression can also be a temporal location dependent of the kinds mentioned in (a) and (b). In *I met Jill yesterday; she had spent the previous day in court*, deictic *yesterday* provides the antecedent for anaphoric *the previous day* ("the day before yesterday"). And similarly in *They married in 1980 and the following year they moved to Rome* the context-independent *in 1980* is the antecedent for anaphoric *the following year* ("the year following 1980"). See Ch. 17, §10, for a detailed discussion of temporal anaphora.

*Into* requires a measure phrase modifier, such as *three weeks* in [iv]. *After* and *before* take a semantically wider range of complements than the others, including NPs denoting human beings: *Sarah arrived before me*. This is equivalent to *Sarah arrived before I did*, with a clause as complement. *The Examiners' Meeting finished before the Selection Committee Meeting* is ambiguous between this kind of clausal interpretation (“before the Selection Committee Meeting finished”) and one like [11i] (where one meeting finished before the other began). *Ago* follows its complement (*a year ago*): see Ch. 7, §4.2.

#### (b) With declarative content clause complement

[12] *after as as soon as before once since*

[13] i *Jill has sold over 200 policies since she joined the company.*

ii *I want to leave before it gets dark.*

iii *We'll invite you over once we are settled in.*

iv *She phoned just as I was leaving.*

*Since*, irrespective of the type of complement, is largely restricted in BrE to occurrence with the perfect, as in [13i]; it can, however, be used with simple tenses in the construction *It is now nearly a year since he died*. AmE allows preterites rather more widely: <sup>%</sup>*Since you went home we redecorated our bedroom*.

The content of the subordinate clause is usually presupposed, taken for granted: [i] presupposes that she joined the company, [ii] that it will get dark, and so on; see Ch. 11, §7.4. *Before* is sometimes used, especially in directives, to indicate purpose and avoidance: *Come away from there before you get hurt* conveys that you are in danger of getting hurt and directs you to come away so as to avoid that happening. This of course is one case where the presupposition relation does not hold: it doesn't presuppose that you will get hurt, for you won't if you come away. When the subordinate clause refers to future time, as in [ii–iii], we usually have a non-modal present tense (compare <sup>#</sup>*I want to leave before it will get dark*).

The construction illustrated in [13] has no analogue in the spatial domain. Spatial prepositions do not take content clause complements – compare, for example, <sup>\*</sup>*He found it near she was sitting* (we need a fused relative: *near where she was sitting*). The event described in a clause can implicitly define a time, but it cannot define a place.

#### (c) With non-finite or verbless complement

[14] *after before between on once since*

These take gerund-participials, and in addition *once* licenses past-participial or verbless clauses:

[15] i *I must have lost it between getting on the train and going to the buffet-car.*

ii *On hearing them return, he hid under the bed.*

iii *Once in bed they usually fall asleep pretty soon.*

#### (d) With no complement

[16] *after afterward(s) before beforehand now*  
*since then throughout when*

[17] a. *I had seen her several times since.* b. *When are they coming?*

*Afterward* is generally restricted to AmE; *afterwards* is also found in AmE as an alternant and is the only form used elsewhere. *After*, as an alternant of *afterwards*, occurs with

premodifiers such as *shortly* (*Kim came at 6 and Pat arrived shortly after*); on its own it is somewhat non-standard (<sup>1</sup>*I never saw her after*).

(e) PPs introduced by *when, whenever, while*

- [18] a. *His heart sank when he heard the news.*      b. *You can leave whenever you like.*

The internal structure of the underlined PPs is not entirely clear. For the most part they can be regarded as fused relatives (comparable to the fused relative NP in *What he had bought was worthless*), but in some respects the initial words are like prepositions governing content clauses. We discuss this issue in Ch. 12, §6.4; here we will simply refer to them as *when* PPs, etc.

*When* PPs are among the most common and central temporal location expressions. *Whenever*, on the other hand, is quite restricted in this function: it mostly occurs in phrases expressing frequency. In addition to the finite constructions shown in [18] we find the following:

- [19] i *While waiting for the bus I read the paper.* [gerund-participial]  
 ii *When asked to step forward, he blushed.* [past-participial]  
 iii *I can't read when/while on duty.* [verbless]

#### ■ NPs

The following nouns are illustrative of those that head temporal location NPs:

- [20] i *yesterday      today      tomorrow      tonight      Sunday      Monday*  
 ii *morning      afternoon      evening      day      night      week*  
     *month      year      instant      moment      second      minute*

Those in [i] can stand alone without dependents: *I saw her yesterday*. The use of the names of days of the week in this way (*They arrive Sunday*) is commoner in AmE than in BrE. The nouns in [ii] require dependents, such as the demonstratives *this* and *that*. *Next* and *last* occur widely, but with restrictions. *Last* is always deictic and doesn't occur with *morning* and *afternoon* (instead we have *yesterday morning/afternoon*). *Next week* is deictic, while *next day* is non-deictic (instead of the deictic version we have *tomorrow*) and <sup>2</sup>*next night* is hardly possible at all (cf. again deictic *tomorrow night*). *The* occurs only in combination with another dependent: *the following year, the night we first met, the day before yesterday*,<sup>12</sup> but not *\*She resigned the day*. Most temporal location NPs are definite, but indefinites are possible, e.g. with *some, one, or another* as determiner: *Some days she felt quite elated; One day I'll get my revenge; We can do that another day*.

Some NP structures are specialised to time location: *tomorrow week* "(in) a week from tomorrow", *three weeks next Tuesday* "(in) three weeks from next Tuesday", *a week on Monday* "(in) a week from next Monday", and so on.

#### ■ AdvPs

Heads of temporal location AdvPs include the following:

- [21] *currently      earlier      early      formerly      immediately      late*  
     *lately      later      nowadays      recently      soon      subsequently*

We list *earlier* and *later* separately from *early* and *late* because, in addition to their ordinary comparative uses (*Kim arrived earlier/later than Pat*), they have lexicalised uses meaning "before" and "afterwards" (*She had resigned three days earlier/later*).

<sup>12</sup>Note the structural contrast between this latter NP (with *day* as head) and the PP *two days before yesterday* (with *before* as head).

### ■ Gerund-participial and past-participial clauses

We observed in §1 that with clauses of this form in adjunct function the nature of the relation of the subordinate clause to the matrix is not explicitly marked but has to be pragmatically inferred. In examples like the following, it is plausible to infer a temporal relation:

- [22] i *Driving along the highway, we passed a long line of lorries.* [“as we drove . . .”]  
 ii *This done, he walked off without another word.* [“when this was done”]

## 6.4 Further issues

### ■ Referential vs non-referential

Most temporal location expressions are referential, but some are not:

- [23] i *I'd rather have had the party last Sunday.* [referential]  
 ii *I'd rather have had the party on a Sunday.* [non-referential]

In [i] *last Sunday* is deictic and refers to one particular Sunday, the last one before today, the day of speaking. In [ii], by contrast, I am not referring to a certain Sunday – other things being equal, any Sunday would do or would have done.

In these examples, the distinction is marked in the form of the adjunct itself. Many expressions are like *last Sunday* in that they always refer to a particular time (e.g. *yesterday, tomorrow, a week ago, during the Second World War*, etc.). Some, however, can be interpreted in either way:

- [24] i *I'm going to Paris in (the) spring if I can finish this report in time.* [referential]  
 ii *Have you ever been to Paris in (the) spring?* [non-referential]  
 iii *I'd like to go to Paris in (the) spring.* [ambiguous]

In [i] I'm referring to the spring following the time of utterance, and in [ii] to springtime in general, while [iii] allows both interpretations.

The distinction between referential and non-referential is relevant to constraints on the use of the present perfect. This compound tense is incompatible with referential temporal location in the past (see Ch. 3, §5.3): *\*I haven't been to a party last Sunday*. The non-referential *I haven't been to a party on a Sunday*, however, is admissible.

### ■ Temporal location and causation

Temporal location adjuncts are often accompanied by an implicature of causation:

- [25] i *When John attacked Bill the police arrested him.*  
 ii *On hearing this news, he phoned his solicitor.*

The natural interpretation is that the police arrested John because he attacked Bill, and that he phoned his solicitor as a result of hearing the news.

### ■ Intervals of time vs points of time

An expression of temporal location can denote either an interval or a point of time:

- [26] i *Mary arrived yesterday.* [interval]  
 ii *Mary arrived at four o'clock.* [point]

An interval (period, stretch) of time has duration, while a point of time is not conceived of as having duration. *Yesterday* in [i] denotes a 24-hour interval of time, and Mary's arrival took place some time during that interval. *At four o'clock* in [ii], by contrast, gives the point of time at which Mary arrived, not an interval during which she did.

Most temporal location expressions denote intervals: *on Monday, while I was in*

*America, after dinner, before John arrived.* Temporal location expressions denoting points of time, moments, commonly have the form of PPs with *at* as head: *at midnight, at that very moment.* *At* tends not to occur with nouns denoting periods such as *day, week, etc.:* we have *on that day*, not *\*at that day*. It is not, however, restricted to point expressions: *at lunch-time, at the end of her life.* *At that time* is anaphoric, and could be interpreted in either way, depending on the antecedent. Nor is *on* restricted to intervals: *on the stroke of midnight, on the hour.*

### ■ Temporal location adjuncts and aspectuality

The temporal relation between the adjunct and the situation denoted by the rest of the clause depends on: (a) the nature of the adjunct, whether it denotes an interval or a point of time; and (b) the aspectuality of the situation. Compare:

[27]	ADJUNCT	SITUATION
i	<i>I lived in New York <u>last year</u>.</i>	interval imperfective
ii	<i>I arrived <u>on Monday</u>.</i>	interval perfective
iii	<i>I was still awake <u>at midnight</u>.</i>	point imperfective
iv	<i>I arrived <u>at midnight</u>.</i>	point perfective

Example [i] is readily understood as indicating that my living in New York filled the whole of last year, and is compatible with my living there earlier and/or later.<sup>13</sup> In [ii] my arrival occupies only a small part of Monday: the time occupied by the situation is included in that denoted by the adjunct. In [iii] we have the opposite effect: the time of the adjunct is included in that of the situation. Finally, in [iv] the times of the adjunct and of the situation are simultaneous.

The same kind of interaction applies when the adjunct has the form of a *when* PP:

[28] i	<i><u>When I was at school</u> I was friends with Kim.</i>	interval	imperfective
ii	<i><u>When we were on holiday</u> Kim came to see us.</i>	interval	perfective
iii	<i><u>When Kim arrived</u>, we were having lunch.</i>	point	imperfective
iv	<i><u>When the clock struck twelve</u>, the bomb exploded.</i>	point	perfective

The aspectuality labels apply to the matrix clause, but the subordinate clause is imperfective in [i–ii], perfective in [iii–iv]: hence the interpretation of the adjunct as denoting an interval in [i–ii] and a point in [iii–iv]. Again, then, in [i] we interpret the subordinate and matrix situations as largely coinciding. In [ii] the time of the matrix situation (Kim's coming to see us) is included in the time of the subordinate situation (our being on holiday). Conversely, in [iii] the time of the subordinate situation (Kim's arriving) is included in that of the matrix situation (our having lunch). Finally, [iv] is interpreted with the two situations simultaneous.

The simultaneity in the case where both clauses are perfective does not have to be interpreted too strictly, however. Consider such examples as the following:

[29] i	<i><u>When he caught Atherton</u> he broke the record for the highest number of catches in test cricket.</i>
ii	<i><u>When I read her thesis</u> I realised why you think so highly of her.</i>
iii	<i><u>When the principal came in</u>, everybody stood up.</i>
iv	<i><u>*When she wrote her thesis</u> she applied for a job at Harvard.</i>

<sup>13</sup>Interval adjuncts may, however, be contextually restricted. In *Were you at the University on Monday?*, the question may relate to only part of Monday – for example, the hours when you are usually there.

In [i] matrix and subordinate situations are different facets of a single instantaneous event: he broke the record in catching Atherton. Here then we necessarily have strict simultaneity. In [ii] my reading her thesis will have taken a significant amount of time, but we can conceptualise my coming to the realisation that she merits your high regard as occupying the same time. But in [iii] the most likely scenario is that the standing up was in response to the principal's arrival. This belongs with the examples in [25]: everybody stood up because the principal came in. In this case the events can't be strictly simultaneous: the standing up must be fractionally later. It does not follow, however, that *when* means "immediately after": it expresses simultaneity, but a certain amount of leeway is allowed as to what constitutes simultaneity. This is why [iv] is anomalous even if she applied for the job immediately after writing the thesis. The two situations cannot be conceptualised as simultaneous, and hence we need either to replace *when* by *after*, or else to use a preterite perfect: *When she had finished her thesis she applied for a job at Harvard.*

### ■ Deictic location expressions and deictic tense

We have seen that temporal location is often achieved by means of deictic expressions. At the same time, primary tense is usually interpreted deictically (Ch. 3, §4.1). There is then normally a requirement that a deictic tense not conflict with a deictic adjunct: \**Her uncle died tomorrow*. Some constructions that merit brief comment in the light of this constraint are illustrated in:

- [30] i *John was coming tomorrow but he has now postponed his visit.*  
 ii *They fixed the interview for tomorrow.*  
 iii *They wanted the flat tomorrow.*  
 iv *I thought the match started tomorrow.*  
 v *... it was getting late; they must waste no more time; Cassandra arrived tonight for dinner ...*

The first clause of [i] contains a futurate progressive: at some time in the past there was a plan for John to come tomorrow (but that plan has subsequently been changed). There is no semantic conflict here because the preterite relates to the past time at which the schedule obtained and *tomorrow* relates to the time of coming. Example [ii] belongs to the construction discussed in §6.1 above (see [1iii]): the verb tense gives the time of the fixing, but *tomorrow* is a complement with object orientation, giving the temporal location of the theme, the interview. Example [30iii] looks as though it might likewise belong to this construction, but in fact it does not. There is no sense in which it locates the flat in time: \**The flat is tomorrow* (unlike *The interview is tomorrow*) is incoherent. We have to recognise here a clash between syntactic form and meaning: *want* here means "want to have", and while there is only one clause, the preterite relates to the wanting and *tomorrow* to the implicit having. In [iv] the preterite in *started* is not deictic: the tense here is backshifted, matching the ordinary deictic tense of *thought*. In [v] we have a shift of the deictic centre in free indirect style: see Ch. 17, §10.2

### ■ Negation

In general, subordinate clauses contained within temporal location expressions are positive. Compare, for example:

- [31] i *I left home before my parents divorced*  
 ii \**I left home before my parents didn't divorce.*

My parents getting divorced defines a time relative to which I can locate my leaving home, but their not getting divorced does not, hence the anomaly of [ii]. Negatives are not wholly inadmissible, however, and [ii] certainly does not violate any rule of grammar. Consider:

- [32] i *I'll be pleased when I no longer have to get up at this ungodly hour.*  
 ii *When/After Liz didn't come home, we alerted the police.*

In [i] the negative subordinate clause represents a change of state, and such a change can readily define a time. Example [ii] suggests that Liz had been expected to come home within some time interval; there is therefore a time at which she failed to come home – or a time at which her absence was conceptualised as a failure to come home. This type of example is another case where temporal location has a causal implicature: we alerted the police because she didn't come home.

## 7 Temporal extent: duration

### 7.1 Similarities and differences between the temporal and spatial domains

#### ■ Parallels

When we turn to extent in time, duration, we again find striking similarities in conceptualisation and expression between the temporal and spatial domains. In particular, such concepts as starting-point and endpoint, terminal-point extent and overall extent, are applicable to duration as well as to spatial extent. Compare, for example:

- | [1] | SPATIAL EXTENT  | TEMPORAL EXTENT   |
|-----|---|---|
| i   | a. <i>The path goes <u>from the village past the castle to the lake.</u></i>    | b. <i>The session ran <u>from 10 a.m. through lunch to 5 p.m.</u></i>               |
| ii  | a. <i>The path runs <u>from under the bridge to just beyond the castle.</u></i> | b. <i>The meeting lasted <u>from just after lunch to shortly before dinner.</u></i> |
| iii | a. <i>The path goes (<u>for</u>) <u>another mile.</u></i>                       | b. <i>We are staying (<u>for</u>) <u>another week.</u></i>                          |

In [i–ii] we have a starting-point marked by *from* and an endpoint marked by *to*, and in [i] there is also an intermediate point. The complement of *from* and *to* is in [i] an NP, in [ii] a PP of the type that could be used for spatial or temporal location. In both domains, locational *at* is dropped in starting-point and endpoint locations: *from the village*, *from 10 a.m.*, not *\*from at the village*, *\*from at 10 a.m.* In [i–ii] the extent is specified by reference to terminal points, while in [iii] it is specified by an overall measure, expressed in both domains by an NP or a PP headed by *for*. Notice, moreover, that some verbs whose primary meaning involves spatial movement can be used for duration – see *run* in [ib] or *go* itself, as in *The teaching semester goes from the end of February to the beginning of June.*

#### ■ Differences between the domains

The syntax and semantics of duration is, however, far from identical to that of spatial extent, and for this reason we are not generalising the categories of source, goal, and path to duration, but will use the more general categories of starting-point, endpoint, and intermediate point.

#### Starting-point and endpoint prepositions

One of the most obvious differences concerns the prepositions. *Since* is commonly used (in clauses in the perfect) to mark the durational starting-point, while *until/till* is the most

usual preposition for the endpoint, with *to* largely restricted to constructions containing a *from* phrase as well: compare *She was in hospital from Monday until/to Thursday* and *She was in hospital until/\*to Thursday*.<sup>14</sup>

### Complements and adjuncts

A second important difference is that duration expressions most often function as adjuncts rather than complements. The contrasting adjuncts and complements in the following examples match those given for temporal location in [1] of §6:

- [2] i *I was in Hong Kong all week.* [adjunct]  
 ii *The staff meeting lasted (for) five hours.* [complement: S orientation]  
 iii *I've scheduled the course from 1 May to 15 June.* [complement: O orientation]

The adjunct gives the duration of the situation as a whole, while the complements give the duration of the theme, expressed by the subject in [ii] and the object in [iii]. As with temporal location, such themes are normally events, but some verbs allow physical object themes: *He lived from 1848 to 1912*; *That cheese won't last long*.

### Intermediate point

Time is envisaged as a straight line, so that for duration we cannot have alternative routes between the terminal points, as we can in the domain of space. When an intermediate point is expressed, therefore, it does not specify the path taken but indicates continuity, the absence of intermission. This is seen in the *through lunch* adjunct in [11b]: the session continued right through from 10 a.m. to 5 p.m. without any break for lunch.

## 7.2 The contrast between bounding and non-bounding duration elements

An important distinction is to be drawn between **bounding** and **non-bounding** duration elements:

- |     |   |   |
|-----|---|---|
| [3] | BOUNDING                                      | NON-BOUNDING  |
| i   | a. <i>I studied law <u>for six years</u>.</i> | b. <i>I reached the summit <u>in two hours</u>.</i> |
| ii  | a. <i>I lived in College <u>all year</u>.</i> | b. <i>I wrote the report <u>in two days</u>.</i>    |

The situations in [ia/ii], considered in abstraction from the duration adjunct, are imperfective: studying law is an activity, and living in College is a state. Adding the adjunct has the effect of bounding the situation, making it perfective. Precisely because the temporal extent is specified, the situation is presented in its totality. In [ib/iib], by contrast, the situations considered in abstraction from the adjunct are perfective: reaching the summit is an achievement, and writing the report is an accomplishment. Since the situations are already bounded, therefore, adding a duration adjunct cannot have the bounding effect that it has in the [a] cases.

There are in many cases approximate paraphrases in which duration is expressed by an NP in object function:

- [4] i a. *I spent six years studying law.* b. *It took me an hour to reach the summit.*  
 ii a. *\*I spent all year living in College.* b. *It took me two days to write the report.*

<sup>14</sup>It is worth noting, however, that the *until* is not incompatible with complements expressing spatial location, as in *I had a good flight: I was able to sleep from Berlin until Bahrain*. This is shorthand for *I was able to sleep from when we left Berlin until we arrived in Bahrain*; it is analogous to the use of spatial location to indicate temporal location illustrated in [10] of §4.

The *spend* construction implies activity by an agent, and hence doesn't provide a paraphrase for the *living in College* example. *Spend* can also be used with expressions like *write the report*, but in that case the expression does not count as bounded. Example [3iib] entails that I completed the work, but *I spent two days writing the report* does not (though there will often be an implicature that I did). We could say, for example, *I spent the next two days writing the report but had to break off before I had finished because my mother was taken ill*. For variants of the *take* construction, see Ch. 14, §6.3.<sup>15</sup>

Some combinations of verb + complements are compatible with either type of duration adjunct:

- |     |  |   |
|-----|--|---|
| [5] | BOUNDING   | NON-BOUNDING  |
| i   | a. <i>The fruit ripened <u>for four weeks</u>.</i>   | b. <i>The fruit ripened <u>in four weeks</u>.</i>   |
| ii  | a. <i>He cleaned the house <u>for two hours</u>.</i> | b. <i>He cleaned the house <u>in two hours</u>.</i> |

This is because the ripening of the fruit and his cleaning the house can be viewed either perfectly or imperfectly. In the perfective case the fruit got to the stage of being ripe, he completed the job of cleaning the house. Here a non-bounding adjunct is allowed, giving the time taken to reach these final states: "It took the fruit four weeks to ripen"; "It took him two hours to clean the house". In the imperfective the inherent endpoint is not necessarily reached: the process could have continued beyond the period given in the duration adjunct.

### 7.3 Bounding duration elements

#### ■ Overall vs terminal-point extent

Like spatial and scalar change extent, duration may be specified overall or by means of endpoints:

- |     |  |  |
|-----|--|--|
| [6] | OVERALL SPECIFICATION                                  | TERMINAL POINT SPECIFICATION                             |
| i   | a. <i>He did housework <u>all morning</u>.</i>         | b. <i>He did housework <u>from 9 until 12</u>.</i>       |
| ii  | a. <i>I have been here (<u>for</u>) <u>a week</u>.</i> | b. <i>I have been here <u>since Monday</u>.</i>          |
| iii | a. <i>Mary wrote letters <u>for half an hour</u>.</i>  | b. <i>Mary read in bed <u>until she fell asleep</u>.</i> |

In [ib] both terminal points are specified. In [iib] *since Monday* specifies the starting-point; no endpoint can be expressed and the present perfect indicates that the situation continues to obtain at the time of utterance. And in [iib] *until she fell asleep* specifies the endpoint, with the starting-point being left implicit (a plausible inference is that she read from the time she went to bed).

#### ■ Questioning

The usual way of questioning bounding duration is with *how long*: *How long did she live in College?*; *How long did she study medicine?* We also find *for how long*, but it is much less usual. It is in principle possible to question the complement in a terminal-point expression: *From when will the price be increasing?*; *Until when can I keep it?* But such forms are not common; in many cases it would be more natural to use questions with *start* and *stop*: *When did he start/stop doing housework?* *Since when* is mainly confined to indirect speech acts, as in *Since when have you been in charge here?* This conveys that you are behaving as though you were in charge when in fact you are not.

<sup>15</sup>There is a construction comparable to [4i] involving a special use of the verb *be*: *She was two weeks finishing the report*.

### ■ Restrictions on dependents of the verb

With clauses containing process verbs, the status as perfective or imperfective is usually determined by dependents of the verb. In [6iii], for example, Mary's writing letters is imperfective because the number of letters isn't specified. If we add a determiner expressing or implying a specified quantity, the result is ill-formed: \**Mary wrote a letter / the letters for an hour*. Compare, similarly:

- [7] i *Mary drove along country lanes for half an hour.*  
 ii \**Mary drove ten miles along country lanes for half an hour.*  
 iii \**Mary drove along country lanes to the village for half an hour.*

Mary's driving along country lanes is an imperfective situation, but specifying the spatial extent (distance) in [ii] or the goal in [iii] makes it perfective and hence incompatible with the bounding duration adjunct.

### ■ Duration of resultant state

Achievements are punctual, i.e. have no duration; except in special circumstances, therefore, they are incompatible with bounding duration adjuncts:

- [8] a. \**She noticed my error all morning.*      b. \**I spotted a hawk for five minutes.*

One case in which such adjuncts are permitted with punctual verbs is when the adjunct can be understood as measuring the state resulting from the achievement, if this state can be taken as planned or intended by the agent of the achievement:

- [9] a. *I borrowed the book for a week.*      b. *I sent him out for half an hour.*

The result of borrowing the book was that I had it, and this state lasted for a week.<sup>16</sup> The result of sending him out was that he was out (of the room, let us assume), and again the adjunct gives the duration of this state. The examples in [8] do not lend themselves to this kind of interpretation, since noticing and spotting are not subject to control.

### ■ Bounding duration adjuncts with multiple situations

So far we have only considered singulary situations; multiple situations involve what we have called serial states (Ch. 3, §3.2.4), and like singulary states they are imperfective and therefore allow bounding adjuncts. Note then that while a single occurrence of my cycling to school is an accomplishment, incompatible with a bounding adjunct, the multiple situation of my repeatedly cycling to school permits an adjunct of this kind:

- [10] i \**I cycled to school this morning for half an hour.*  
 ii *I cycled to school for the next three years.*

The adjunct in [ii] gives the duration of the state of affairs in which I went to school by bicycle.

Punctual verbs can likewise occur with bounding duration adjuncts if the clause expresses a multiple situation:

- [11] i *I spotted a hawk every morning for a month.*  
 ii *I woke up with a headache all last week.*

Here we have repeated, multiple, hawk-spotting and waking up, not singulary situations. Spotting a hawk every morning and waking up of a morning are imperfective, and hence

<sup>16</sup>There is also an interpretation where it is a matter of permission or an arrangement to have the book for a week (a library book, say): here, it could be that I returned it early, or that the week has not yet elapsed.

permit bounding by a duration adjunct. In [i] the multiple nature of the situation is indicated by the frequency adjunct *every morning*; without it, it would be very difficult to get a multiple situation interpretation, and hence *?I spotted a hawk for a week* will generally be considered anomalous, like [8b]. In [11iii] the duration adjunct itself is sufficient to supply the multiple situation interpretation: a single waking up with a headache can't last all week.

### ■ Two sources for bounding duration adjuncts

There are thus two factors that can make a bounding adjunct admissible: it can serve to bound a singular situation that would otherwise be imperfective, and it can bound a multiple situation. It is therefore possible for a clause to contain two bounding duration adjuncts, one of each kind:

[12] *She broadcast for half an hour every Sunday for forty years.*

*For half an hour* gives the duration of the individual broadcasts, while *for forty years* gives the duration of the multiple situation.

### ■ Bounding duration elements and scope in negative clauses

In negative clauses a bounding duration element may fall within the scope of the negative or may itself have scope over the negation. Compare:

- [13] i a. *The strike lasted two days.*  
       b. *The strike didn't last two days.* [negative has scope over adjunct]  
    ii a. *\*I noticed my error until later.*  
       b. *I didn't notice my error until later.* [adjunct has scope over negative]

In [i] *two days* is part of the complementation of *last*, and [ib] is straightforwardly the negation of [ia]: "It is not the case that the strike lasted two days". Here, then, the duration dependent is within the scope of the negative: it is part of what is negated. Example [iia] is anomalous for reasons given above: my noticing my error is punctual and doesn't permit an interpretation where the duration adjunct applies to a resultant state. By contrast, [iib] is perfectly well-formed, and cannot therefore be the direct negation of [iia]: it does not have the anomalous meaning "It is not the case that I noticed my error until later". Rather, *until later* gives the duration of my not noticing my error. Unlike its positive counterpart, the negative *I didn't notice my error* can be construed as imperfective, and hence permits a bounding duration adjunct, saying how long this negative state of affairs lasted.

Ambiguities can then arise according to whether it is the duration adjunct or the negative that has the wider scope:

- [14] i a. *The family lived in the house for a year / until 1990.*  
       b. *The family didn't live in the house for a year / until 1990.* [ambiguous]  
    ii a. *He went to New York for two weeks.*  
       b. *He didn't go to New York for two weeks.* [ambiguous]

If we interpret [ib] with the negative having the wider scope, it says that [ia] is not true: it might be, for example, that they stayed only six months, or moved out before 1990. If the adjunct has wider scope it means that the situation of their not living in the house

lasted for a year or until 1990; here there is an implicature that they started living in the house at the end of the year, or in 1990. Example [iia] has a resultant state interpretation, and the wide scope negative interpretation of [iib] denies that he went to New York for a stay of two weeks (perhaps he went for only one). When the adjunct has scope over the negation it applies to the state of his not going: it may be, for example, that he had to postpone his departure, and went only at the end of the two weeks.

The scope of the adjunct can interact in this way with a negative that is implied rather than overtly expressed:

- [15] i *I doubt whether the family have lived in the house all year.*  
 ii *I don't think the family have lived in the house all year.*

There is no negative marker in [i], but it means the same as [ii], and displays the same scope ambiguity.

### ■ Realisation of overall extent duration elements

#### (a) PPs

PPs in this function usually consist of *for* plus an NP denoting an interval of time: *for three weeks, for a long time, for the rest of his life, for the duration of the festival*. *For* can also take certain adverbs as complement: *for ever, for long*. *In* can occur in place of *for* in negative perfect clauses, especially in AmE: *I haven't been to Scotland in ten years*. Other prepositions found here are *over, through, and throughout*: *She worked on her thesis over/through/throughout the Christmas break*.

#### (b) NPs

NPs have as head a noun denoting a time interval, such as *hour, day, week, etc.*:

- [16] i *two days*                    *a week*                    *three months*                    *the whole year*  
 ii *all day*                    *all year round*                    *this week*                    *next month*

Expressions like those in [i] can also occur as complement to *for*, while those in [ii], certainly the ones with initial *all*, cannot. Moreover, NPs like the first three of [i] cannot be too far separated from the verb. Compare:

- [17] i a. *He stayed (here) a month.*                    b. *He stayed (here) for a month.*  
 ii a. *\*I studied the report two days.*                    b. *I studied the report for two days.*  
 iii a. *We argued about it all weekend.*                    b. *\*We argued about it for all weekend.*

Duration NPs can be found in constructions like *What was the total number of hours slept?*; *The long hours worked by the miners had clearly exacerbated the problem* (or abbreviated versions in a statistical table, for example: *Number of hours slept, etc.*). *Slept* and *worked* here are past-participial passive clauses, with a duration phrase as understood subject. The comparable main clause construction, however, is not possible: *\*Over ten hours was slept by one of the patients*.

#### (c) AdvPs

Duration is also expressed by a number of adverbs, most of them with the *-ly* suffix:

- [18] *always*                    *briefly*                    *indefinitely*                    *long*                    *momentarily*  
*permanently*                    *provisionally*                    *temporarily*
- [19] i *I have always known that things would turn out OK in the end.*  
 ii *She has been working here longer than the others.*

*Always* is more often used for frequency, but in examples like [i] it indicates how long, not how often. In its plain form *long* is generally a non-affirmative item: *They didn't stay long*, but not *\*They stayed long*.

### ■ Realisation of terminal-point duration elements

As noted in §7.1, the prepositions *from* and *to* used for the starting-point and endpoint in spatial extent are used for duration too (*They are open from 9 to 5*), though *to* is hardly used except in combination with *from*. In addition there are three prepositions specialised to the temporal domain. *Since* is used with the perfect to mark the starting-point, with the endpoint obligatorily left implicit. *Until* and its somewhat more informal variant *till* mark the endpoint, with the starting-point either implicit or marked by *from*:

- [20] i a. *He'd been in Paris since 1962.*                      b. *\*He'd been in Paris since 1962 till 1970.*  
 ii a. *He'll be here until/till 10.*                              b. *He'll be here from 3 until/till 10.*

The complements of the prepositions can be PPs instead of NPs: *from shortly before lunch until a little after dinner*. The complement of *from* often contains *on* or *onwards* (*from that time on/onwards*) – and an alternant of *from now on* is the intransitive preposition *henceforth*. *Since* and *until/till*, unlike *from* and *to*, take content clause complements: *since I last saw her*, *until it stops raining*. *Since* can occur without a complement with the interpretation “since then”: *We met in 1990 and have been friends ever since*. *Since* can take a gerund-participial (*I haven't spoken to him since leaving home*), while *until/till* can take a past-participial (*Stay until ordered to leave*) or a verbless clause (*It should not be touched until dry* “until it is dry”). In AmE *through* is often used for the endpoint in preference to *until/till*. It has the advantage of being more explicit: *We'll be in Paris from May through July* makes clear that the endpoint is the end of July, whereas *We'll be in Paris from May until July* does not say whether the endpoint is the beginning or end of July (or some time in the middle).

### ■ Duration vs location

#### Location with a durational implicature

PBs headed by *during* and *between* and with a temporal NP as complement express location in time, but may imply duration. Compare, for example:

- [21] i a. *My son was born during the recess.*                      b. *He died between 8 a.m. and 1 p.m.*  
 ii a. *I worked at home during the recess.*                      b. *He rested between 8 a.m. and 1 p.m.*

In [i] the PP expresses a time interval within which the birth/death occurred: clearly the latter did not occupy the whole of the interval. In [ii], however, there is an implicature that the situation did last for the whole of the interval. This durational implicature can, however, be cancelled: *I worked at home several times during the recess* and *He rested between 8 a.m. and 1 p.m. for two periods of about thirty minutes each*. *During* phrases do not normally provide answers to *how long* questions (e.g. *During the recess* is not an answer to *How long were you in Paris?*); for many speakers the same applies with *between*, while for others the implicature can be strong enough to allow it to answer such a question (A: *How long were you in the library?* B: *%Between three and about half past four*).

### Since phrases can express location or duration

With *since*, however, there is a clear contrast between the two categories of adjunct:

- [22] i *I've moved house since you left.* [temporal location]  
 ii *I've been here since four o'clock.* [duration]  
 iii *He's been ill again since then.* [ambiguous]

Example [iii] can be interpreted as locating his illness at some time between then and now or as saying that he has been ill throughout this period. Durational *since* allows *ever* (*I've been lonely ever since you left*) and provides answers to *how long* questions (A: *How long have you been here?* B: *Since four o'clock*).

## 7.4 Non-bounding duration adjuncts

These adjuncts have the form of PPs with *in* or *within* as head and a temporal NP as complement. They are found in clauses expressing singulary achievements or accomplishments:

- [23] i *The doctor arrived in/within half an hour.* [achievement]  
 ii *They built the house in/within a year.* [accomplishment]

An achievement itself has no duration: the adjunct therefore measures a period that ends at the time of the achievement and begins at the time when it was in some sense set in train or at a time that is a relevant point of orientation in some other way. In [i] the starting-point is likely to be the time the doctor was called. In *She reached the summit in two hours* the default interpretation is that the starting-point was when she set out on the climb. But it doesn't have to be: compare *We should reach the summit in another two hours*. Here we may well have already done part of the climb and I am taking the moment of utterance as the starting-point of the two-hour period.

Accomplishments do have duration, and the adjunct measures that. In a context where the builders have already been working on a house for some months, we would normally use an achievement expression, *They will finish building the house in another year*, rather than the accomplishment *build the house* itself. But there may be indeterminacy over the location of the starting-point: the interval could begin with a subinterval that was merely preparatory, rather than strictly part of the building as such.

Just as bounding duration adjuncts are incompatible with clauses denoting singulary perfective situations (accomplishments and achievements), so non-bounding duration adjuncts cannot appear with clauses denoting imperfective situations (activities and states): <sup>#</sup>*I wrote letters in an hour*.

Non-bounding duration adjuncts can hardly be questioned directly: <sup>?</sup>*Within how long a period did they build the house?* Instead we use the *take* construction: *How long did it take them to build the house?*

### ■ Shortness implicature

The construction with *in/within* suggests that the duration was somewhat short relative to some norm or expectation. This is reflected in the fact that it is infelicitous to modify with *at least*: *They will build the house in at most a year / \*at least a year*; *The doctor will arrive in at most an hour / \*at least an hour*. No such implicature is associated with the *take* construction: *It will take at least a year to build the house*.

### ■ Durational and locational *in*

There is a clear semantic affinity between the *in* considered here and the one used for temporal location, as in *They'll be arriving in ten days*. In the latter *ten days* gives the length of the period between now and their arrival, but the clause isn't interpreted as saying how long they will take to arrive. The distinction between the durational and locational senses is seen in the ambiguity of:

[24] *I'll write the report in two weeks.* [ambiguous: duration or location]

The durational sense tells how long I'll take, the locational sense tells when I'll write it – at the end of the two weeks. The locational sense usually involves future time: *I wrote the report in two weeks*, for example, will normally have a durational interpretation. *Write the report* is an accomplishment expression; if we replace it by an achievement expression, as in *I'll complete the report in two weeks*, there is little effective difference between the two readings. A clear contrast is found with the expression *in time*: compare *We managed to finish in time* ("within the time allotted") and *In time he will realise how much he owes you* ("eventually").

## 8 Polarity-sensitive aspectual adjuncts

We are concerned in this section with a small class of adverbs or AdvPs consisting of *still* and *already*, *yet* and *any longer/more*. These are polarity-sensitive items of the kind discussed in detail in Ch. 9, §4; *still* and *already* characteristically occur in positive clauses, *yet* (in its main use) and *any longer/more* in negatives.

### ■ Primary use of *still* and *already*: continuation and inception

#### Non-perfect affirmative constructions

- |     |     |  |  |
|-----|-----|--|--|
| [1] | i   | a. <i>Liz is/was still here.</i>           | b. <i>Liz is/was already here.</i>           |
|     | ii  | a. <i>Liz still goes/went to school.</i>   | b. <i>Liz already goes/went to school.</i>   |
|     | iii | a. <i>Liz is/was still cooking dinner.</i> | b. <i>Liz is/was already cooking dinner.</i> |

The situations here are all imperfective: in [i] we have a singular state, in [ii] a serial state (a multiple situation, with the going to school repeated habitually), while [iii] is progressive. *Still* and *already* are not adjuncts of temporal location: the time referred to in the clause is precisely the same as it would be if the adjuncts were omitted. Very often, the clause contains another adjunct which does serve to locate the situation in time: *Liz was still/already here at eight o'clock*. The meaning of *still* and *already* is aspectual rather than simply temporal: it has to do with what we have referred to as the 'internal temporal constituency of the situation' (Ch. 3, §3.1). With *still* it is a matter of the situation continuing to obtain, while with *already* we are concerned with the time of the situation's inception, beginning.

*Still* emphasises that the situation obtains/obtained at the time referred to, and involves an implicit or explicit contrast – generally with what might have been expected or with some comparable situation:

- |     |    |  |
|-----|----|--|
| [2] | i  | <i>Liz was still here at eight o'clock – she usually goes home around seven.</i> |
|     | ii | <i>Liz has sold her flat in London but she still has a house in the country.</i> |

The situation in the *still* clause lasted till later than might have been expected or than the contrasted situation. Like the aspectual verb *continue*, *still* carries a presupposition that the situation also obtained prior to the time referred to: *I continue to think / still think it was a mistake* asserts that I think this now and presupposes that I did so earlier, too.

*Already* also emphasises that the situation obtains at the time referred to, and again there is an implicit or explicit contrast, but this time it is a matter of the *already* situation beginning earlier. *Liz is already here* suggests that I (or you, or someone else) might have expected her not to be here until later. Compare, then:

- [3] i *Liz was already here at eight o'clock; she usually gets here around nine.*  
 ii *Liz has bought a flat in Paris though she already has a house in the country.*  
 iii *Jill still goes to school, whereas Liz is already at university.*

Example [iii] shows *still* and *already* in successive clauses contrasting the stage in life that Jill and Liz have reached. The school stage has lasted later for Jill, and the university stage has begun earlier for Liz.

### ■ Negation

- [4] i a. *She still isn't here.* b. <sup>#</sup>*She already isn't here.*  
 ii a. <sup>?</sup>*She isn't still here.* b. <sup>?</sup>*She isn't already here.*  
 iii a. *She isn't here any more.* b. *She isn't here yet.*

*Still* readily has scope over a negative, as in [ia]: we simply have continuation of a negative state of affairs. In the primary sense we are concerned with here, *already* can't have scope over a negative, as seen in [ib]. In [ii] the negative has scope over the aspectual adjunct. These examples are of doubtful acceptability: they could hardly be used except to contradict a prior assertion of the corresponding positives. It is on this basis that *still* and *already* are included in the class of positively-oriented polarity-sensitive items. Normally, one would use the corresponding negatively-oriented items *any more/longer* and *yet*, as in [iii]. Here [iiia] presupposes that she formerly was here and carries the implicit suggestion that this situation might have been thought to still obtain. And [iiib] suggests that she will be here in the (not very distant) future.

*Still* and *already* are certainly not wholly excluded from falling within the scope of a negative, but they do so only under restricted conditions, as illustrated in:

- [5] i a. *You don't still believe it, do you?* b. *You're not already a member, are you?*  
 ii a. *I hope you don't still read comics.* b. *I hope you don't already subscribe.*  
 iii a. *If you're not still a member, now's the time to rejoin.* b. *If you're not already a member, do consider joining.*

In [i–ii] the positive situation seems likely to obtain or at least to be a real possibility. In [ia] it looks as though you still believe it (though you shouldn't), and in [ib] it looks as though you might already be a member (a pity, because I was thinking of offering you a subscription). In [iia] I have some reason to think you may still read comics (but I hope that isn't so, given your age), while in [iib] it could be that you already subscribe (but I hope not). The examples in [iii] are conditional, with [iiia] hardly possible unless the issue of your being still a member has already been raised; compare also relative clauses in construction with *anyone*, etc.: *Anyone who isn't still/already a member should consider taking advantage of this offer.*

- [10] i *He already owns two newspapers and a TV station: this takeover must be stopped.*  
 ii *There is now at least an even chance that this nation of almost 200 million people will shortly erupt in murderous violence. Already, protests of various sorts have taken place, mostly in provincial cities.*  
 iii *It isn't clear whether Brazil, which already wasn't making payments on the principal of its foreign debt, will come out of the moratorium in a better state to service its debt.*

An undesirable situation obtains at the time in question, and it is envisaged that things may get worse. In this use *already* can be placed in front position, as in [ii], or have scope over a negative, as in [iii].

#### ■ *Already* and *yet* with a perfective

In BrE, and some varieties of AmE, the aspectual adjuncts are restricted to imperfective situations, as illustrated above. Other varieties of AmE, however, allow *already* and *yet* to occur in perfective examples, as in:

- [11] i A: *Can I speak to Ed, please?* B: %*He already left yesterday.*  
 ii %*Did he leave yet?*

*Already* may also follow the verb: %*He left already* (with main stress on *left*). This use of *yet* (criticised in some usage manuals) is restricted to informal style.

#### ■ *Yet* in affirmative contexts

- [12] i *I have yet to see a better account than the one you proposed ten years ago.*  
 ii *There may yet be an election before Christmas.*

*Yet* can occur with essentially the meaning of *still* in a quite restricted range of affirmative contexts. Example [i] illustrates its use with *have* + infinitival; it entails that I haven't yet seen a better account. The significant feature of [ii] is the modal *may*: the construction indicates that a possibility still exists. Another case is seen in *There's hope for me / you / . . . yet*, but this is a more or less fixed formula. Some varieties of English, however, allow *yet* with the sense "still" in a wider range of structures, such as %*Her father is here yet*.

## 9 Adjuncts of frequency

Adjuncts of frequency express quantification in the clause in a way which is comparable to that of quantifiers in the structure of NPs:

- | [1] | FREQUENCY ADJUNCT IN CLAUSE   | QUANTIFIER IN NP  |
|-----|---|---|
| i   | a. <i>She lectured <u>twice</u>.</i>  | b. <i>She gave <u>two</u> lectures.</i>                   |
| ii  | a. <i>She <u>always</u> wins.</i>   | b. <i>She wins <u>every</u> match.</i>                    |
| iii | a. <i>People <u>sometimes</u> misunderstand this question.<sup>18</sup></i> | b. <i><u>Some</u> people misunderstand this question.</i> |
| iv  | a. <i>Students <u>usually</u> prefer assignments.</i>                       | b. <i><u>Most</u> students prefer assignments.</i>        |

<sup>18</sup> *Sometimes* can also convey much the same meaning as modal *may*: compare *These animals sometimes bite* and *These animals may bite*.

### ■ Frequency modification generally indicates a multiple situation

Frequency adjuncts quantify situations, and except in the special case of one or zero quantity, therefore, they serve to mark that the clause expresses a multiple situation. Compare:

- [2] i *She cycled to work.* [singularly or multiple]  
 ii *She cycled to work three times / every day / quite often.* [multiple]  
 iii *She cycled to work just once.* [singularly]

Clauses that express permanent states or non-repeatable occurrences such as *Barbara is from Cardiff* or *Fred was born on New Year's Day 1965* do not therefore permit the addition of frequency adjuncts.

### ■ Bounding vs non-bounding frequency adjuncts

Frequency adjuncts can be subdivided into two main types:

- [3] i *She lectured ten times.* [bounding]  
 ii *She lectured regularly / quite frequently / every day.* [non-bounding]

Multiple situations are inherently imperfective, regardless of whether the subsituation is imperfective or perfective. A **bounding frequency adjunct** in its turn makes the imperfective multiple situation perfective, whereas a non-bounding adjunct leaves it imperfective. The bounding type cannot therefore be in the scope of bounding duration adjuncts:

- [4] i \**She lectured ten times for one semester.*  
 ii *She lectured regularly / quite frequently / every day for one semester.*

With bounding adjuncts it is a matter of how many times, while with non-bounding ones it is characteristically a matter of how often. Note, however, that an expression like *three times a week* is non-bounding: it specifies how many times per week, but not how many times in an absolute sense. Compare:

- [5] i A: *How many times did you meet?* B: *We met twice.* [bounding]  
 ii A: *How often / How many times a week did you meet?* B: *We met twice a week.* [non-bounding]

A non-bounding frequency adjunct can have scope over a bounding one:

- [6] *I always proofread an article three times.* [non-bounding + bounding]

Here the subsituations of the multiple situation modified by *always* are themselves multiple situations as they involve three occurrences of the singularly subsituation of reading an article.

#### Iterative verbs

Verbs such as *cough*, *hit*, *kick*, *kiss*, *knock*, *nod*, *pat*, *wink* are potentially iterative. *She knocked at the door* can apply to a situation where she gave a single knock or to one where she gave several knocks (see Ch. 3, §3.2.4). When a bounding frequency adjunct combines with such a verb it can be interpreted in either of two ways, as in:

- [7] *Ben kicked Beth twice.* [ambiguous]

In one interpretation, he gave her two kicks (in more or less immediate succession); in the other, there were two occasions on which he gave her an unspecified number of kicks.

### ■ The form of bounding frequency adjuncts

The class of bounding frequency expressions contains the adverbs *once* and *twice* (and archaic *thrice*), NPs with *times* as head, PPs consisting of *on* + NP with ***occasion*** as head.<sup>19</sup> *Once* and *on one occasion* can indicate either frequency or temporal location:

- |     |  |   |
|-----|--|---|
| [8] | FREQUENCY  | TEMPORAL LOCATION                                 |
|     | i a. <i>We only met <u>once</u>.</i>             | b. <i>I <u>once</u> liked this kind of music.</i> |
|     | ii a. <i>We met <u>on just one occasion</u>.</i> | b. <i><u>On one occasion</u> it caught fire.</i>  |

In [a] we are concerned with how many times, while in [b] the adjunct locates the situation at some indefinite time in the past. The idiom *once upon a time* has only the temporal location use.

### ■ The form of non-bounding frequency adjuncts

These display a much wider and more varied range of forms, illustrated in:

- [9] i *always, constantly, continually, ever, frequently, intermittently, invariably, never, normally, occasionally, often, periodically, rarely, regularly, repeatedly, seldom, sometimes, sporadically, usually*
- ii *each/every day, every two weeks, every other/second week, every time; whenever . . .*
- iii *once a day, once every half-hour, twice a year, three times each month, four times per year, on three occasions each year, on several occasions per year*
- iv *now and again, again and again, off and on, on and off, from time to time, as a rule, for the most part*

Those in [i] are adverbs. The universally quantified *always* can indicate frequency (*She always won*) or duration (*I've always liked her*). *Never* usually indicates frequency (*He never answers my letters*, “always doesn't”), but can also be used for temporal location (*He never answered my last letter*, “at no time”). *Ever* is polarity-sensitive, as discussed in Ch. 9, §4.3; like *never* it can be used for frequency (*Do you ever go to the movies?*) or temporal location (*Did you ever see 'Gone with the Wind'?*).

In [9ii] we have NPs with a time-interval noun as head and *each* or *every* as quantifier; there may be a postmodifier (*every day when it isn't raining*, *every time I see her*). There are also expressions where such NPs are embedded within larger phrases, as in *on the first Sunday of every month*. We also include *whenever* in this group, since in its main use it is interpreted as *every time*: *He blushes whenever / every time she speaks to him*. It can also be used under restricted conditions for non-referential temporal location with the sense “at any time”: *You can let me have it back whenever you like*.

The expressions in [9iii] consist of those that function as bounding frequency adjuncts (other than *never*) together with a postmodifier that cancels the bounding effect – compare *We met twice* (bounding) and *We met twice a week* (non-bounding) in [5] above. In the *on three occasions each year* type, *each year* is probably a separate adjunct rather than a postmodifier (as suggested by its position in *Each year we had lunch together on about three occasions*), but it still serves to cancel the bounding effect: *For the next several years we had lunch together on about three occasions every month*. The clear postmodifiers are NPs introduced by *a* or else PPs with *per* as head (cf. Ch. 5, §8.4). Example [9iv]

<sup>19</sup>Instead of being head of their respective NPs, *times* and *occasion* may occur in the complement of quantificational nouns.

contains a variety of frequency idioms. In addition NPs like *a great deal*, *a lot*, etc., may blend frequency with duration and degree: see §11.

### ■ Frequency and time

The subsituations of a multiple situation are typically located at different times. In the salient, serial-state interpretation of *She cycles to work*, for example, the individual events of her cycling to work will necessarily take place at different times – very likely, different days. Particularly when the subsituations take place at regular intervals, there is then a close relation between the expression of frequency and the expression of temporal location. Compare then:

- [10] i *He visits his parents every Christmas.* [frequency]  
 ii *He visits his parents at Christmas.* [temporal location]  
 iii *He always visits his parents at Christmas.* [frequency + temporal location]

*Every Christmas* in [i] is a frequency adjunct, indicating how often. But at the same time, it gives the temporal location of the subsituations: it could therefore be used in answer to the question *When does he visit his parents?* In [ii] *at Christmas* is an adjunct of temporal location, giving the time of the subsituations. The meaning of [ii] is not the same as that of [i], since [ii] does not explicitly say that the visiting takes place every year; this is made explicit in [iii], which combines a frequency adjunct with one of temporal location. Nevertheless, clauses like [ii] that contain just an adjunct of temporal location will often be interpreted as conveying regularity and hence frequency (the implicature being strengthened if *at Christmas* is placed at the front of the clause: *At Christmas he visits his parents*). Compare, similarly, the minimal difference between *George phones my mother on the first Sunday of every month / every other Sunday* (frequency) and *George phones my mother on the first Sunday of the month / on alternate Sundays* (temporal location). Both versions could answer either a frequency question (*how often?*) or a temporal location question (*when?*).

This kind of relation between frequency and temporal location is not confined to cases of repetition at regular intervals. The same pattern is found with *whenever* or *every time* and *when*:

- [11] i *He blushes whenever / every time she speaks to him.* [frequency]  
 ii *He blushes when she speaks to him.* [temporal location]  
 iii *He always blushes when she speaks to him.* [frequency + temporal location]

No doubt as a result of such close relationships, many grammars treat frequency adjuncts as a subtype of time adjunct. Conceptualisation of frequency as being a matter of time is encouraged by the fact that the word ‘time’ itself is used in frequency expressions such as *three times* or *every time it rains*. Nevertheless, there are compelling grounds for treating frequency as conceptually distinct from time. Frequency adjuncts quantify (sub)situations, and that is not the same as quantifying times. Consider first the following examples with bounding frequency adjuncts:

- [12] i *This quartet has only been performed twice, once in Bath and once in Glasgow.*  
 ii *This question, which the examiners include in the paper every year, has been answered correctly just three times.*  
 iii *The victim was stabbed three times.*

The most likely scenario for [i] is that the performances took place at different times, but this is not a necessity: it is perfectly possible that both were held on the same evening. Similarly in [ii]: it could be that the three correct answers were all given at the same time – in last year’s exam, held on 1 November, let us say. And in [iii] it is possible, certainly for some speakers, that the three stabbings were carried out simultaneously by three different assailants.

The same applies with the non-bounding type:

- [13] i *Parents usually love their children.*  
 ii *A quadratic equation usually has two different solutions.*

In its most likely interpretation [i] is saying something about most parents, not most times. And since [ii] expresses a timeless truth, the quantification can only be over situations, not times.

### ■ Scope in negative clauses

In general, frequency adjuncts can have scope over a negative or fall within its scope, but there are restrictions concerning linear position and particular items. Some examples are given in:

- |      |  |   |
|------|--|---|
| [14] | ADJUNCT HAS WIDER SCOPE                                      | NEGATIVE HAS WIDER SCOPE                                  |
| i    | a. <i>I <u>always</u> <u>didn't</u> answer the phone.</i>    | b. <i>I <u>didn't</u> <u>always</u> answer the phone.</i> |
| ii   | a. <i>I <u>sometimes</u> <u>didn't</u> answer the phone.</i> | b. <i>I <u>didn't</u> <u>ever</u> answer the phone.</i>   |
| iii  | a. <i>I <u>usually</u> <u>didn't</u> worry about it.</i>     | b. <i>I <u>didn't</u> <u>usually</u> worry about it.</i>  |
| iv   | a. <i><u>Every Sunday</u> he <u>didn't</u> shave.</i>        | b. <i>He <u>didn't</u> see her <u>every week-end</u>.</i> |

In [i–iii], the scope depends on linear order: the first of the underlined items has scope over the second. Thus [ia] is logically equivalent to *I never answered the phone* and [ib] is equivalent to [iia]. *Sometimes* is strongly polarity-sensitive, and can hardly fall within the scope of negation: instead we have *ever*, as in [iib]. With *usually* the two constructions are pragmatically equivalent (in the absence of contrastive stress), as in [iii]. In [iva] it’s a matter of how often he omitted to shave; the adjunct could occur at the end, but front position makes the scope clearer. In [ivb] he saw her less frequently than every week-end; here the adjunct could not be fronted.

Bounding adjuncts like *four times* can have wide or narrow scope:

- [15] *He didn't vote four times.* [ambiguous as to scope]

It can be interpreted as “Four times he failed to vote”, with the adjunct having wider scope; or it can be read as “It’s not the case that he voted four times” (he only voted twice, let us say), and here the negation has wider scope.

### ■ Scope relations with quantified NPs

Frequency adjuncts quantify situations and if the clause also contains a quantified NP the issue arises as to which quantifier has the wider scope. Consider the following pairs:

- [16] QUANTIFIED NP HAS SCOPE OVER FREQUENCY ADJUNCT
- i *One of my friends has been sacked two or three times in the last few months.*
- ii *Some people were late much more often than me.*

- [17] FREQUENCY ADJUNCT HAS SCOPE OVER QUANTIFIED NP
- i *If you sack someone two or three times a year the public will lose confidence.*
  - ii *People in ex-communist countries kill themselves more often than others in Europe.*

In [16i] it is the same person who was sacked on two or three different occasions, and in [16ii] there is a group of people each of whom was late much more often than me. In these examples, then, the quantified NP has scope over the adjunct: we ascribe a property involving a frequency quantification to the referent(s) of the NP. By contrast, in [17i–ii] (both attested examples) it is not the same person who is sacked, we may assume, and it is not particular individuals within the set of people in ex-communist countries who commit suicide more often than other people. Here we start with the quantification of situations: each subsituation may involve a different person being sacked or committing suicide.

### ■ Contextual restrictions on the domain of non-bounding frequency quantification

Compare the interpretation of *always* in:

- [18] i *There is always somewhere where it is raining.*  
 ii *I always handwash this blouse.*

Example [i] illustrates the relatively rare case where the frequency adjunct is interpreted without restriction: at every moment of every day of every year there is somewhere where it is raining. By contrast, [ii] does not entail that I spend my life handwashing the blouse: *always* here is interpreted with an unexpressed restriction, “on all occasions when I wash this blouse I do so by hand”. Again, this is comparable to quantification in NPs. In *All students take Introduction to Phonology*, for example, we interpret the subject NP as containing some pragmatically recoverable restriction on the domain – typically, all students in a particular department of a particular institution.

The restriction is often stated explicitly, usually by an adjunct of temporal location or condition applying to the subsituations:

- [19] i *The teacher sometimes gives us a hint when /if he sets a difficult problem.*  
 ii *Pamela usually sets the alarm clock before she goes to sleep.*

#### Association with focus

The effect of the hidden restriction may be to cause differences in truth value between clauses with contrastive stress associated with different elements. Compare:

- [20] i a. *FIDO barked at the postman today.*      b. *Fido barked at the POSTMAN today.*  
 ii a. *FIDO usually barked at the postman.*      b. *FIDO usually barked at the POSTMAN.*

In [i], where there is no frequency quantification, the [a] and [b] versions have the same truth value. But the addition of *usually* in [ii] destroys the equivalence between the two versions. Suppose, for example, that the postman came 120 times, and that Fido barked at him 50 times, while our other dog, Whisky, barked at him 110 times: in this scenario, [iia] (with focus on *Fido*) will be false, but [iib] (with focus on *postman*) can still be true if most of Fido’s barking was provoked by the arrival of the postman in contrast with other visitors. In [iia], therefore, the hidden restriction is “when the postman came”, whereas in [iib] it is “when people came”, or perhaps just “when he barked”.

### ■ Frequency adjuncts with the progressive

Except where there are explicit or implicit indications to the contrary, clauses with progressive aspect characteristically denote singularity rather than multiple situations and hence resist modification by frequency adjuncts. Compare:

- [21] i a. *She cycles to work.*                      b. *She is cycling to work.*  
 ii a. *She usually cycles to work.*                b. <sup>?</sup>*She is usually cycling to work.*

The salient interpretation of [ia] involves a multiple situation (repeated cycling to work), and hence it readily accommodates the addition of *usually* in [iia]. The salient interpretation of [ib], by contrast, is singularity, so that it resists the addition of *usually*. A multiple reading of [ib] can be obtained by adding an adjunct of temporal location such as *this week*, but the short time span involved leaves *usually* infelicitous. However, [iib] is acceptable with an overt or covert adjunct giving the temporal location of the subsituations: *She is usually cycling to work at this time of the morning.*

The combination of the progressive with such adjuncts as *always* generally has an idiomatic interpretation, as in *She is always/constantly filing her fingernails*. In the absence of any evident restriction, this conveys a subjective judgement, usually negative, suggesting excessive frequency.

## 10 Adjuncts of serial order

These characteristically pick out one of a series of repeated events, indicating its temporal order relative to others in the series:

- [1] i *I went to New York for the second time in 1976.*  
 ii *The oratorio was first performed in 1856.*  
 iii *The oratorio was performed again the following year.*  
 iv *The oratorio was performed yet again yesterday.*

These examples all express singularity situations, but these singularity situations are related to an implied multiple situation. In general the existence of such a multiple situation is entailed: [i], for example, entails that I went to New York at least twice. In the case of *first*, however, its existence is merely implicated: [ii] implicates, but does not entail, that there were further performances after the first.

*Again*, as in [iiiii], places the repeated event anywhere after its first occurrence. *Yet again* places it anywhere after its second occurrence, with the suggestion that this degree of repetition is in some way surprising or notable.

Adjuncts of serial order cannot be directly questioned. They have the form of PPs or AdvPs. The PPs prototypically consist of *for + the X time*, where X is an ordinal numeral or *last*. The adverbs are *first*, *next*, *last*, and *again*.

### ■ Scope

Adjuncts of this type may or may not have scope over the subject of the clause. Compare:

- [2] i *Mary Smith performed the sonata for the third time last year.*  
 ii *A woman has been elected president for the second time.*  
 iii *People are dying of TB again.*

In the reading of [i] where the subject is inside the scope of *for the third time* it was Mary Smith herself who performed on all three occasions, whereas when the subject is outside the scope of the adjunct there is no indication of who performed before. The ambiguity is thus a matter of whether what was repeated was Mary's performing the sonata, or *x*'s performing it. Similarly in [ii]: it may or (much more likely) may not have been the same woman. In the only pragmatically plausible interpretation of [iii] the adjunct has wider scope than the subject: we can assume that people do not die twice.

*Again* can also be used to indicate restoration of a previous state:

- [3] i *Ann opened the window, and then a few minutes later she closed it again.*  
 ii *The lawnmower broke down, and I couldn't get it going again.*

What is repeated here is not the events (Ann's closing the window, my getting the lawnmower going) but earlier states (the window being closed, the lawnmower operating).

## 11 Degree

### ■ Degree as a kind of quantification

Among the categories considered so far, a number inherently involve quantification:

- [1] i *She walked a long way.* [spatial extent (distance)]  
 ii *The price has gone up a lot.* [scalar change extent]  
 iii *The strike lasted a long time.* [temporal extent: duration]  
 iv *They go out very often.* [frequency]

In this section we take up other kinds of quantification, such as are illustrated in:

- [2] i *She likes it a lot.*  
 ii *I've completely finished marking these assignments.*  
 iii *He almost forgot the doctor's appointment.*

We will use the traditional term **degree** as a cover term for all of these, though its intuitive applicability is greater for some than for others. *A lot* in [2i] represents the prototypical case: *like* denotes a gradable property that can apply with varying levels of intensity, and the degree adjunct indicates the level that applies in the situation in question. *Finish marking these assignments* in [ii] denotes an accomplishment, and *completely* emphasises that the terminal point was reached. In [iii] we are concerned with the conditions that must be satisfied in order for "He forgot the doctor's appointment" to be true: *almost* indicates the extent to which these conditions were satisfied. Example [i] differs from [ii–iii] in that it can be seen as an answer to a *how much* question, and hence is a more central member of the degree category. We can say *How much does she like it?* but not *\*How much have you finished marking these assignments?* or *\*How much did he forget the doctor's appointment?*

In some cases we find a blending of degree with frequency and duration. *Ed talks a great deal*, for example, could answer a *how much* question and the NP *a great deal* occurs as a prototypical degree adjunct in such clauses as *I like it a great deal*. At the same time, however, there is a clear affinity with duration (*You've talked a great deal already* implies that you've talked for a long time) and frequency (*Ed talks a great deal* denotes a multiple situation and strongly suggests that Ed talks often as well as long).

### ■ Subgroups of degree adjuncts

We will divide degree adjuncts into seven subgroups, illustrated as follows:

- [3] i I *absolutely* reject that suggestion. [maximal]  
 ii I *much* regret confiding in her. [multal]  
 iii I *rather* like that idea. [moderate]  
 iv I had modified it *slightly*. [paucal]  
 v I doubt whether he understood it *at all*. [minimal]  
 vi I *nearly* made a serious mistake. [approximating]  
 vii I trusted her *enough* to let her borrow the file. [relative]

We will examine the subgroups in turn, providing further examples without attempting to be exhaustive. But first, two general points should be made. As with many other categories, we find adverbs that can appear now with manner function, now with degree function:

- |     |  |  |  |
|-----|--|--|--|
| [4] | MANNER   |  | DEGREE   |
|     | i a. He sang rather <i>badly</i> .                 |  | b. He <i>badly</i> misrepresented my position.   |
|     | ii a. She answered the question <i>perfectly</i> . |  | b. I <i>perfectly</i> understand your reasoning. |

Secondly, some members of the class of degree adverbs are often quite restricted with respect to the type of verb or VP they can modify. We have, for example, I *completely* forgot, I *badly* needed it, I *greatly* admire her, I *deeply* dislike them, but not \*I *thoroughly* forgot, \*I *utterly* needed it, \*I *perfectly* admire her, \*I *deeply* like it. Some items are found only in one or two idiomatic combinations: *roundly* condemn/defeat, *clean* forget, and so on.

#### (a) The maximal subgroup

- [5] *altogether*    *absolutely*    *completely*    *entirely*    *fully*    *perfectly*  
*quite*    *thoroughly*    *totally*    *utterly*    *wholly*
- [6] i She finally eliminated the problem *altogether/completely/entirely*.  
 ii I *absolutely/fully/quite/thoroughly* agree with you.

These items indicate a degree at the top end of the scale. For the most part they do not permit further intensification by a degree adverb (\**very absolutely/utterly*), but we can have *very fully*, *more completely than ever before*, etc. *Thoroughly* readily takes intensification in *They examined it very thoroughly*, but here it is probably best regarded as a manner adjunct (and certainly does not itself indicate maximal degree). Most can indicate either completion of an accomplishment, as in [6i], or extremely high degree of a gradable property, as in [ii]. Again, however, there are idiosyncratic restrictions applying: compare *She utterly eliminated the problem* and \**She utterly finished the work*. In such pairs as *calculate* ~ *miscalculate*, *estimate* ~ *overestimate*, *behave* ~ *misbehave*, the second member differs from the first in having a gradable sense that permits this kind of degree modification:

- [7] i a. \**He utterly calculated her response*.    b. *He utterly miscalculated her response*.  
 ii a. \**I completely estimated his strength*.    b. *I completely overestimated his strength*.

*Quite* belongs in this group when modifying an accomplishment (*Have you quite finished?*) or – more often – a gradable property that inherently involves high degree. But

with gradable properties such as are expressed by *like*, it marks moderate degree:

- [8] i *She quite adores them.* [maximal]  
 ii *She quite likes them.* [moderate]

Note also the maximal interpretation in *I quite understand*.

The maximal items can generally be positioned centrally or at the end of the clause (though *quite* is limited to central position). In end position they will typically carry the stress, reinforcing their height on the scale of degree; the contrast is particularly noticeable in such pairs as *I absolutely agree with you* and *I agree with you absolutely* or *This totally ruined the evening* and *This ruined the evening totally*.

### (b) The multal subgroup

- [9] *badly bitterly deeply far greatly immensely*  
*largely much particularly profoundly so strongly*  
*tremendously vastly well a great deal a lot for the most part*
- [10] i *He badly needs a haircut.*  
 ii *She bitterly/deeply/strongly resents the way she has been treated.*  
 iii *I would far/much prefer to do it myself.*  
 iv *He had for the most part understood what they said.*  
 v *I do so hope everything works out as you would wish.*

This subgroup covers a range on the scale from above the midpoint to near the top end. Items such as *immensely* and *tremendously* belong in the upper region and resemble the maximal ones in that they hardly admit further intensification themselves (\**very immensely*). *Far* generally indicates distance, but is used by extension for degree when it is a matter of scalar difference, as in comparison (*far prefer* – note that it also occurs as a modifier of adjectives and adverbs in comparatives like *far better*, *far more consistently*) or with such verbs as *exceed* (*It far exceeded her expectations*). In some cases, manner and degree seem to merge: *laugh heartily*, *squeeze tightly*, *work hard*. *So* may license a result clause: *He grieved so, (that) we thought he would never recover* (some speakers would find *so much* more natural). Without such a result clause, *so* tends to be found primarily in informal style: *Do you have to stare so?*

One item that is noticeably absent from the list in [9] is *very*, which modifies adjectives and adverbs but not verbs. Instead we have *much*, but this is subject to considerable restrictions. In end position it normally behaves as a non-affirmative item unless it is itself modified by a degree adverb: *I don't like it much*, *I like it very much*, but not \**I like it much*. It can occur in central position in affirmative contexts with a limited range of verbs such as *appreciate*, *enjoy*, *outrank*, *prefer*, *surpass*, *underestimate*: *I much appreciate your concern*. In some cases, we find that unmodified affirmative *much* is permitted in passives but not in the corresponding active:

- [11] i *She had been much abused by her stepfather.*  
 ii \**Her stepfather had much abused her.*

### (c) The moderate subgroup

- [12] *moderately partially partly quite rather somewhat*
- [13] i *Things have changed somewhat.*  
 ii *I rather think you're right.*

This subgroup, like the following, has significantly fewer members than (a)–(b): there is greater lexical variation at the upper end of the scale (the list given in [9], in particular, could easily be extended).

(d) The paucal subgroup

- [14] *a bit*      *a little*      *little*      *slightly*  
 [15] i *I slightly regret not accepting their offer.*  
 ii *We discussed it a little.*  
 iii *He little realised what he was letting himself in for.*

*Little* represents a lower degree than *a little*, and is the antonym of *much* (as it is in NP quantification). It generally behaves as a negative, as explained in Ch. 9, §3.3. In end position it tends to require its own modifier: *She likes him very little*, but not \**She likes him little*; note, however, that we can have *It matters little (what you say now)*. Paucal adjuncts tend not to occur with verbs which inherently involve a high degree: *He liked<sup>2</sup> adored her a little*; *It had slightly damaged/#ruined her prospects*.

(e) The minimal subgroup

- [16] i *at all*      *in the least*      *in the slightest*      *so much as*  
 ii *barely*      *hardly*      *scarcely*  
 [17] i *If it rains at all, we'll move to the church hall.*  
 ii *He hardly understood what she was saying.*

The items in [16i] are non-affirmative: *I didn't like it in the least*, but not \**I liked it in the least*. Those in [16ii], by contrast, are negative: [17ii], for example, could be continued: *and nor indeed did I*. It does not entail that he didn't understand, but the degree to which he did understand was so small that it is treated syntactically as negative. These negative items readily occur with non-affirmative *at all*: *We hardly enjoyed it at all*. The non-affirmative set include some items restricted to idiomatic combinations, as in *I don't care a damn/fig*. A variant of this is *I don't give a damn/fig*, where the final NP is syntactically object rather than adjunct, and indeed there are other cases of non-affirmative objects that are pragmatically equivalent to *at all* – compare *I didn't understand a word*.

(f) The approximating subgroup

- [18] *all but*      *almost*      *as good as*      *kind of*      *more or less*      *nearly*  
           *practically*      *sort of*      *virtually*  
 [19] i *He almost lost his balance.*  
 ii *Ed as good as / more or less admitted it was his fault.*  
 iii *She had sort of promised to help him.*

*Almost*, *nearly*, and *practically* trigger a strong negative implicature: [19i], for example, conveys that he didn't in fact lose his balance, but came very close to doing so.<sup>20</sup> The complex expressions *more or less*, *as good as*, *kind of*, *sort of* (belonging to informal style, especially the last three) indicate that the conditions for application of the verbal expression are approximately satisfied: what is conveyed here is not so much that an

<sup>20</sup>The implicature is of the scalar type discussed in Ch. 5, §5.2. If I bet that Sue will have almost finished her thesis by the end of the year and in fact she has completely finished it by then, I will be deemed to have won my bet, just as if I bet that she will have written most of her thesis by the end of the year.

admission and promise were not in fact made, as that the acts did not qualify as an admission and promise in the strictest sense.

(g) The relative subgroup

[20] *enough less/least more/most sufficiently too much*

[21] i *He had studied enough to scrape a pass.*

ii *I understood it more than I'd expected, but that isn't saying very much.*

iii *He needed the money too much to be able to turn down such an offer.*

We call these the 'relative' subgroup because they do not identify some constant area of the scale but quantify the degree relative to some other situation. *Enough* and *sufficiently* indicate a lower bound: in [21i] the degree or extent to which he had studied was not lower than that required to scrape a pass. *More/most* and *less/least* are inflectional forms of ***much*** and ***little*** (discussed in detail in Ch. 13, §4.1.1); in [ii] the degree of understanding is compared to that of the expected understanding, which could in principle be almost anywhere on the scale, though the following clause happens to suggest it was quite low. *Too much* indicates an upper bound: the degree of need was above the highest level at which he would be able to turn down the offer, so that [iii] entails that he wasn't able to turn it down. Again, however, we don't know whereabouts on the scale this upper bound lies.

*Too*, like *very*, can't modify verbs: *much* is therefore required in [21iii]. *Too*, and the other items in [20], can modify adverbs, so AdvPs consisting of one of the earlier adverbs as head and one of these as modifier will to some extent belong in the relative subgroup. The qualification 'to some extent' is needed because most of the adverbs in subgroups (a)–(b) that permit modification by these items are not neutral, but will still mark a high position on the scale. *Ed resented it more bitterly than I did*, for example, does indicate that Ed resented it to quite a high degree.

## ■ Negation

To the extent that degree adjuncts can combine with clausal negation, they normally fall within its scope:

[22] *I don't fully understand what you mean.* [adjunct in scope of negation]

The meaning here is "It is not the case that I fully understand what you mean", not "I fully fail to understand what you mean". Where there is a need to quantify the degree of a negative situation it is usually expressed lexically rather than by clausal negation:

[23] i a. *He very much dislikes them.* b. *?He very much doesn't like them.*

ii a. *I absolutely reject the idea.* b. *?I absolutely don't accept the idea.*

Nevertheless, narrow scope negation is not entirely excluded:

[24] *I very much don't want you to go with them.* [negation in scope of adjunct]

Where the adjunct is within the scope of the negative, we need to distinguish between ordinary and metalinguistic negation (see Ch. 9, §1.2):

[25] i *I don't like her much.* [ordinary negation]

ii *I don't rather like her: I absolutely adore her.* [metalinguistic negation]

The first clause in [ii] could normally only be used in a context where it had been suggested that I rather like her: the negative rejects that proposition not because it is false

but because it falls short of indicating the degree of my liking her. In what follows we ignore cases of this kind and consider below only narrow scope ordinary negation.

### Maximal degree

One case is illustrated in [22]: the negative indicates “less than fully”, with an implicature that the degree is still high (i.e. not very much less than fully). Negation of *quite* implicates “almost”: *I don't quite agree* entails that I don't agree, but suggests that I'm not far from doing so. This is also the interpretation when it's a matter of reaching some endpoint, as in *I haven't completely finished*. Examples like *I absolutely adore her*, where the verb itself indicates high degree, do not permit ordinary negation.

### Multal and moderate degree

The multal case is illustrated in [25i], and similarly *They don't meet a great deal* or *He wasn't badly wounded*. Negation indicates a lower degree than that expressed by the adjunct – and this will usually be interpreted as quite low, in the paucal range. Thus while [25i] is consistent with my liking her moderately, it generally implicates a lower degree than that. Many of the multal degree adverbs resist ordinary negation. Take *He bitterly regretted it*, for example: in the negative we would be much more likely to use *much* than *bitterly*, giving *He didn't regret it much*. The moderate degree items are also unlikely to occur with a negative; note here that *quite* has the maximal interpretation in negation, not the moderate one.

### Paucal, minimal, and approximating degrees

*A little* and *slightly* likewise resist negation. *A bit*, by contrast, is commonly negated, and then behaves like the minimal items *at all*, etc. *They didn't enjoy it a bit / at all* indicates a zero degree of enjoyment, as does the less emphatic *They didn't enjoy it*. *Little*, *barely*, *hardly*, *scarcely*, being themselves negative, do not occur in the scope of another negative. Ordinary negation is also normally incompatible with the approximating items *almost*, etc.

### The relative subgroup

These readily undergo negation. *He hadn't studied enough to scrape a pass*, the negative of [21i], indicates a lower degree than the lower bound defined by the positive and hence entails that he didn't scrape a pass. *He hadn't been worrying too much to be able to sleep* indicates a lower degree than the upper bound defined by the positive and hence entails that he could sleep. But *too much* can occur in the negative with a paucal meaning when there is no explicit or implicit infinitival complement: *I didn't enjoy it too much* is simply an informal alternant of *I didn't enjoy it very much*.

## 12 Cause and result

In this section we are concerned with adjuncts of the kinds illustrated in:

- [1] i *We booked early so that we could be sure of getting good seats.* [purpose]  
 ii *Two of us couldn't get on the plane because the airline had overbooked.* [reason]  
 iii *The airline had overbooked, so that two of us couldn't get on the plane.* [result]

We take purpose and reason to be subtypes of a more general category ‘cause’: they have it in common, for example, that they can be questioned by *why*. Thus [1i] provides

an answer to the question *Why did you book early?* and [ii] to *Why couldn't two of you get on the plane?*

The examples also illustrate connections between cause and result. *So* is used to indicate either purpose or result, as in [i/i]. And the semantic equivalence between [ii] and [iii] shows that cause of the reason subtype stands in a converse relationship with result: if *X* caused *Y*, then *Y* resulted from *X*, and vice versa. The difference is a matter of which of the situations is presented as superordinate and which as subordinate. In [ii] the airline's overbooking is treated as subordinate and expressed within an adjunct of cause (more specifically, of reason), whereas in [iii] it is the other situation, our not being able to get on the plane, that is expressed as a subordinate clause, this time within an adjunct of result.

It must be emphasised, however, that from a grammatical point of view adjuncts of cause are very much more important than those of result, in terms of both frequency and the range of constructions available for expressing them. One aspect of this is illustrated in the following examples, where both situations are expressed in main clauses:

- [2] i *Two of us couldn't get on the plane: the airline had overbooked.*  
 ii *The airline had overbooked: two of us couldn't get on the plane.*  
 iii *The airline had overbooked; for this reason / as a result / because of this / consequently two of us couldn't get on the plane.*

In [i–ii] the cause–result relationship is not expressed, but left to be pragmatically inferred. In [iii] the second clause begins with an adjunct related anaphorically to the first clause, and in this construction the adjunct belongs to the cause (reason) category. Note that although *as a result* contains the noun *result* it is an adjunct of cause: we understand “as a result of the airline having overbooked”; the adjunct itself, therefore, gives the cause, and indicates that what follows is the result.

### 12.1 The two subtypes of adjuncts of cause

Cause can in general be questioned by *why* or *what...for*, but as noted above such questions can elicit two different kinds of answer, purpose or reason:

- [3] i *Why did you get up so early? / What did you get up so early for?*  
 ii *(I got up early) in order to do some gardening while it was still cool.* [purpose]  
 iii *(I got up early) because I couldn't sleep.* [reason]

#### ■ Differences between purpose and reason

The central cases of purpose imply intention and design – usually on the part of the agent of the matrix clause. As a result, purpose adjuncts differ from those of reason in the following respects.

##### Temporal relations

The time of the situation expressed or implied in a purpose adjunct is characteristically later than that of the matrix situation: purpose is generally future-oriented. It is also possible for the two situations to be simultaneous.

- [4] i *He borrowed \$50 from me in order to pay his rent.* [later]  
 ii *He walked home in order to save the bus fare.* [simultaneous]

With reason, by contrast, the subordinate situation is usually earlier or simultaneous with the matrix, though it is also possible for it to be later:

- [5] i *He was angry because he couldn't find his keys.* [simultaneous]  
 ii *He was late because he had overslept.* [earlier]  
 iii *He didn't want to go with them because it would be dark soon.* [later]

### Entailment

The proposition expressed in the subordinate clause is entailed in the case of reason adjuncts but not with purpose, when the situation time is later than that of the matrix. Example [3iii] entails that I couldn't sleep, while [5i–iii] entail respectively that he couldn't find his keys, that he had overslept, and that it would be dark soon. By contrast, [3ii] implicates that I did some gardening, but certainly does not entail it: maybe a sudden thunderstorm forced me to change my plans. Similarly [4i] does not entail that he paid his rent: maybe he was unable to resist the temptation to spend the money on drink. These future-oriented purpose adjuncts involve aims and intentions, and there is no guarantee that aims and intentions are realised.

### Reason may implicate purpose

The close relation between purpose and reason is reflected in the fact that a clause with a reason adjunct very often implicates one with a purpose adjunct, and vice versa. For example, [3ii] implicates and is implicated by [6i], and there is a similar relation in [6ii]:

- [6] i *I got up early because I wanted to do some gardening while it was still cool.*  
 ii a. *He got up at 4.30 because his plane left at six.* [reason]  
 b. *He got up at 4.30 in order to catch the six o'clock plane.* [purpose]

Note, however, that the differences mentioned above concerning entailments still apply: the complement of *because* expresses an entailment, but that of *in order* does not. Thus [6i] entails that I wanted to do some gardening while it was still cool (though not, of course, that I actually did do some). The subordinate clause in [6iia] is a preterite futurate, interpreted as “his plane was scheduled to leave at six”, and again this is an entailment, whereas [iib] does not entail that he caught the plane.

## 12.2 Purpose

### Realisation

#### (a) PPs with clausal complements – finite clauses or infinitivals

The prepositions found here are *in order* (finite or infinitival), *so* (finite), *so as* (infinitival):

- [7] i *May I request a postponement in order that I might make adequate preparation?*  
 ii *He withdrew the remark in order to appease his colleagues.*  
 iii *Please phone everybody before the meeting so that we can be sure of a quorum.*  
 iv *He phoned everybody before the meeting so as to be sure of a quorum.*

In the finite construction, the subordinator *that* is readily omissible after *so*, but hardly after *in order*, which is somewhat more formal and considerably less frequent. The finite construction usually contains a modal auxiliary, such as *might* in [i], *can* in [iii]; clauses without modals are certainly possible, however, especially in the negative, and we also find examples of the subjunctive construction with *in order*:

- [8] i *We think we have to fight in order that Cuba is integrated into the Latin American system.*  
 ii *I'll try and get home a little earlier than usual so we don't have to rush.*  
 iii *The administration had to show resolve in order that he not be considered a lame-duck president.*

(b) Ungoverned clauses: infinitivals or finites with *may/might*

- [9] i *We left early to miss the rush-hour.*  
 ii *He requested an adjournment that he might have adequate time to study the documents.*

Here the subordinate clause functions as purpose adjunct itself, rather than being governed by a preposition. Example [i] illustrates the most frequent type of purpose adjunct, while [ii] by contrast is very rare and formal: instead of the content clause that we have here, we would usually have a PP headed by *in order* or *so*.<sup>21</sup> Ungoverned infinitivals are always positive: a negative requires a governing preposition. In *He modified the story somewhat in order not to offend his parents*, for example, we cannot omit *in order*.

(c) PPs with NP complements

- [10] i *I did it for fun / for your sake / for her benefit.*  
 ii *He called in Kim [with a view to / with the intention of obtaining some professional advice].*

Example [i] illustrates the purposive use of *for*, while the construction in [ii] depends for its purposive meaning on the lexical content of the head noun, and the noun *purpose* itself could of course substitute for *intention*.

## ■ Syntactic function

Purpose elements are usually adjuncts, but they are also found as predicative complements: *This is in order that the local delegates can be officially informed*.

## ■ Further remarks on infinitival clauses

### (a) Infinitivals with an overt subject

Infinitivals governed by *so* + *as* cannot contain a subject: if a subject has to be expressed after *so*, the finite construction is required. Both infinitivals that are governed by *in order* and those that are ungoverned may have a subject preceded by the subordinator *for*, though this construction is much less common than the subjectless one:

- [11] *(In order) for the flavours to mingle properly, the dish should be cooked very slowly in a low oven.*

### (b) Governed infinitivals with no subject

In subjectless clauses governed by *in order* or *so as*, the antecedent for the missing subject is the subject of the matrix clause:

- [12] *He resigned in order /so as to avoid any conflict of interest.*

<sup>21</sup>In traditional grammar the term 'final clause' is used for the type of subordinate clause illustrated in [7–9]. *In order*, *so (that)*, and *so as* are treated as subordinating conjunctions constituting part of the subordinate clause.

## (c) Ungoverned subjectless infinitivals with no other missing element

- [13] i He resigned to avoid any conflict of interest.  
 ii They sent Sue to New York to manage the photography department.  
 iii The meeting was adjourned by the Head of Department to provide time for consultation with course committees.  
 iv The goods were sold at a loss to make room for new stock.  
 v The new prison has no outside windows to make it more secure.

The default case is illustrated in [i], where the matrix subject provides the antecedent for the missing subordinate subject. But in ungoverned clauses there are other possibilities. In [ii] the antecedent is matrix object: it is Sue who is to manage the photography department. The matrix clause in [iii] is passive; it can be interpreted with the complement of *by, the Head of Department*, as antecedent, but we can also take the whole matrix situation as providing the interpretation. This reflects the fact that *The Head of Department provided time for consultation by adjourning the meeting* entails *Adjourning the meeting provided time for consultation*. There is no *by* phrase in [iv], but we can still interpret it with either the seller of the goods or the selling of the goods as making room for new stock. In [v] the matrix is active: it's the design or building of the prison with no outside walls that was intended to make it more secure. These examples indicate that the missing subject in a purpose infinitival does not have to be syntactically controlled.

## (d) Ungoverned infinitivals with a missing non-subject

- [14] i I bought them<sub>i</sub> for the children to play with \_\_<sub>i</sub>.  
 ii I bought them<sub>i</sub> to read \_\_<sub>i</sub> on the train.  
 iii She gave me this box<sub>i</sub> to put the loose change in \_\_<sub>i</sub>.  
 iv They gave the flowers<sub>i</sub> to Linda to present \_\_<sub>i</sub> to the soloist.  
 v The flat<sub>i</sub> was bought (by Ralph) to use \_\_<sub>i</sub> as a pied à terre in London.

The subordinate clauses here are 'hollow' non-finites in the sense of Ch. 14, §6: the '\_\_<sub>i</sub>' marks the position of a missing object, of the verb or of a preposition, that is linked to the element in the matrix bearing the same index. This element is object of the matrix in [i–iv], subject in [v]. In [i] the infinitival has its own subject, but in the others the subject is missing too. The antecedent for the missing subordinate subject is marked by double underlining. This construction is found only with ungoverned infinitivals: we cannot insert *in order* or *so as* in these examples.

## ■ Purpose infinitivals and unbounded dependency constructions

- [15] i Who have they gone to Paris to see \_\_ this time?  
 ii These are the kinds of student [that this school exists to cater for \_\_].

Non-subject elements in infinitival purpose adjuncts can be questioned or relativised, as in these examples, where it is the matrix clause, not the infinitival, that is interrogative or relative. This construction occurs most readily, but by no means exclusively, when the matrix clause expresses motion, as in [i].

## ■ Infinitivals in clause and NP structure

- [16] i Two other books to read on holiday were lent to me by Fay. [NP modifier]  
 ii She lent me them to read on holiday. [clause adjunct]  
 iii She lent me two books to read on holiday. [ambiguous]

Infinitival clauses similar to the ones we have been considering are also found as modifier in the structure of NPs, as in [i]. The position of the clause here rules out an analysis as an adjunct in clause structure: it can only be part of the subject NP. In [ii] the infinitival must be an adjunct in clause structure because the pronoun *them* cannot take such dependents. Examples like [iii] can then be analysed in either way, but with little effective difference in meaning. As a clause adjunct it specifies her purpose in lending me two books, as an NP modifier it gives descriptive information about the books – “books which were for reading on holiday”.

### ■ Implicit purpose

We noted above that reason adjuncts often implicate purpose: for example, [6iia], *He got up at 4.30 because his plane left at six*, implicates that he got up then in order to catch the six o'clock plane. The same kind of implicature may be triggered by a conditional:

- [17] i *If you want to catch the six o'clock plane, you will have to get up at 4.30.*  
 ii *In order to catch the six o'clock plane, you will have to get up at 4.30.*

A purpose implicature is particularly common where it is a matter of avoiding some undesirable situation:

- [18] i *Come in before you get wet.*  
 ii *The children had to be watched carefully lest they stray with their new rubber surf-floats beyond the orange and yellow flags.*  
 iii *Keep well away in case you get hurt.*  
 iv *He delayed his departure for fear of missing something.*

The underlined adjuncts might be interpreted as “so that you don't get wet”, “so that they wouldn't stray . . . beyond the orange and yellow flags”, “so that you don't get hurt”, “so that he wouldn't miss anything”. But the prepositions that introduce them do not themselves mean “so that . . . not”: the purpose interpretation arises only if the content of the subordinate and matrix clauses is conducive to it. Compare the above with, for example:

- [19] i *Come in before your father gets home.*  
 ii *He trembled lest they should see through his disguise.*  
 iii *Take your umbrella in case it rains.*  
 iv *She was never game to join in for fear of being ridiculed.*

These clearly cannot be glossed in terms of “so that . . . not”, but there is no reason to say that the prepositions have a different meaning here than in [18]. Notice, moreover, that [19iii] still implicates purpose, but a purpose whose content is not so simply derivable from what is expressed: we understand something like “Take your umbrella in order to avoid getting wet if it rains”. Depending on the context, there could likewise be a purpose implicature in [19i]: “Come in before your father comes home in order to avoid possible unpleasant consequences if he comes home and finds that you are not yet in”.

### ■ Purpose and deontic necessity

Purpose adjuncts are commonly found with matrix clauses expressing deontic necessity, one special case being that where it is a matter of satisfying rules and regulations:

- [20] i *Significantly more permanent positions will have to be created to fulfill the requirements of the day-to-day running of the museum from 1988.*  
 ii *How many credit points are needed to obtain a degree?*

### ■ Scope and focus

In negative clauses purpose adjuncts may have wider or narrower scope than the negative; in the latter case they can be the focus, as they can also be in alternative questions:

- [21] i *He doesn't eat much, to keep his weight down.* [adjunct has wider scope]  
 ii *I didn't come here to have a quarrel.* [negative has wider scope]  
 iii *Did you say that to please her or to annoy her?*

## 12.3 Reason

### ■ Realisation

Adjuncts that explicitly express reason mostly have the form of PPs, though there are also a few adverbs, such as *consequently*, *therefore*, *thus*, that express reason as well as having a connective function.

#### (a) Preposition + declarative content clause

The following prepositions take finite clauses as complement:

- [22] *as because for inasmuch as seeing since*

All except *seeing* take a non-expandable content clause, i.e. one not permitting the subordinator *that*. The relatively formal *for* has certain syntactic properties in common with coordinators, including the impossibility of fronting the phrase it introduces (see Ch. 15, §2.11). *Because* has been illustrated above, the others are seen in:

- [23] i *As I still have work to do, I can't come to the film tonight.*  
 ii *He avoided answering, for he was afraid of implicating his wife.*  
 iii *Inasmuch as they have apologised, I consider the matter closed.*  
 iv *Seeing (that) you have come, you might as well stay.*  
 v *Since Mars has an elliptical orbit its distance from the sun varies considerably.*

*Because* is the most central and versatile of the reason prepositions. A PP with *because* as head can occur in subject or predicative complement function as well as adjunct:

- [24] i *Because some body parts have already been turned into commodities does not mean that an increasing trade in kidneys is desirable.*  
 ii *The reason I didn't call you was because the phone was out of order.*

*Because* could be replaced by *the fact that* in [i], *that* in [ii], and these latter versions would be widely preferred in formal style. In the subject structure [i], *because* is often modified by *just*, and the matrix VP is more or less restricted to *doesn't mean*: *Just because you're older than me doesn't mean you can order me around.*

#### (b) Preposition + PP or NP

- [25] *because [of] due [to] for from in view [of]  
 on account [of] out [of] owing [to] through*

- [26] i *The lecture was cancelled [due to / owing to / on account of her indisposition].*  
 ii *[Because of / In view of her political activities,] they treated her with suspicion.*  
 iii *He said it out of sheer spite.*  
 iv *They were unable to concentrate [for / through lack of sleep]*

*Of* is also found, as in *He died of a heart attack*, but the PP here is a complement of *die* and would not generally be thought of as answering a *why* question.

## (c) Implicated reason

There are also, as so often, various constructions which have a more general circumstantial meaning, but which may be interpreted in appropriate contexts as giving a reason for the matrix situation:

- [27] i *Having known the candidate for ten years, I can vouch for his reliability.*  
 ii *With six people away sick, we can't meet the deadline.*

## ■ Scope and focus

Reason adjuncts may fall within the scope of a negative or have scope over it. Compare:

- [28] i *I'm not going just because Sue will be there.* [negative has scope over adjunct]  
 ii *I'm not going because I can't afford to.* [adjunct has scope over negative]  
 iii *I'm not going because Sue will be there.* [ambiguous]

In [i] the negative has wide scope: the fact that Sue will be there is not the reason why I'm going. In [ii] the adjunct has wide scope: the fact that I can't afford it is the reason why I'm not going. And [iii] can be interpreted in either way. The scope will normally be indicated prosodically – see Ch. 9, §1.3.2.

This does not apply to all the reason prepositions, however. Of those taking clausal complements, only *because* can fall within the scope of a negative: *I'm not going since Kim suggested it*, for example, is unambiguously interpreted like [28ii]. Those taking phrasal complements mostly behave like *because*, but the *of* complement of *die* cannot have scope over a negative: *He didn't die of a broken heart*, but not *\*He didn't die, of a new wonder drug*.

The PPs that cannot fall within the scope of a negative cannot be focused either, and nor can they be used in answer to a *why* question. Compare:

- [29] i *It was [because/\*since/\*as he lied] that he was sacked.*  
 ii *Are you going [because/\*since/\*as Sue will be there]?*  
 iii A: *Why aren't you coming with us?* B: [*Because/\*Since/\*As I'm not well.*]

These restrictions indicate that the PPs headed by *since*, *as*, etc. are not as integrated into the structure of the clause as *because* PPs: they are not constituents of the VP, but are attached at a higher position in the constituent structure, or else have the status of supplements.

*Why* can have scope over a negative, which is relatively unusual for interrogative adjuncts; *what . . . for*, however, cannot occur in the negative construction:

- [30] i a. *Why did you miss the lecture?* b. *Why didn't you go to the lecture?*  
 ii a. *What did you miss the lecture for?* b. *\*What didn't you go to the lecture for?*

## 12.4 Result

Adjuncts of result are characteristically expressed either by a PP with *so* as head and a content clause as complement, or by a PP with *with* as head and an NP complement with the form *the result* + content clause:

- [31] *They had gambled away all their money, [so /with the result] that they didn't even have the fare to get home].*

Nothing further need be said about the *with the result* type, where the result meaning is indicated lexically by the head noun within the complement of the PP. The resultative *so* construction merits examination, however, because this preposition is also used to express purpose. We thus have a contrast between:

- [32] i *He left early so that he could have some time with his son.* [purpose]  
 ii *He had to work late so that he couldn't have any time with his son.* [result]

In [i] the *so* PP says why he left early, what his purpose was in doing so, whereas in [ii] it gives the result or consequence of his having to work late.<sup>22</sup>

#### ■ Semantic differences between the result and purpose constructions

- [33] i The subordinate clause is entailed with result but generally not with purpose.  
 ii Result does not imply intentionality or agentivity.

We noted in §12.1 that with prototypical purpose adjuncts there is no entailment that the purpose was achieved. For example, [32i] does not entail that he was able to have time with his son: we could without inconsistency add *but when he got home he found that his son had gone to visit some friends*. By contrast, [32ii] does entail that he couldn't have any time with his son, and such an entailment relation always holds in the case of result adjuncts. Purpose, we have seen, implies intention (though this is not always overtly expressed in the matrix clause), but result does not, as evident from examples like:

- [34] *We'd had 6 inches of rain overnight, so that the track was completely flooded.*

#### ■ Syntactic differences between result and purpose

- [35] i Resultative *so* is not replaceable by *in order*.  
 ii Result adjuncts cannot be fronted: they occur in end position.  
 iii Modality: result adjuncts do not permit the subjunctive construction, and they occur freely without modal auxiliaries.  
 iv Result adjuncts are characteristically prosodically detached, with the status of supplements.  
 v Omission of the subordinator *that* from the resultative construction affects the syntactic status of *so*: see Ch. 15, §§10–11.

Unlike *so*, *in order* is restricted to purpose: it can substitute for *so* in [32i], but not in [ii]. We have noted that purpose *so* PPs are occasionally fronted, but this is not possible with result. Point [35iii] reflects the semantic fact that the content of a result adjunct is entailed: there is therefore no need for any modal qualification, as illustrated in [34]. Point [35iv] is reflected in the inability of result adjuncts to fall within the scope of negation or to be focused:

- [36] i *He has never spent much, so that he now has a tidy sum saved up.*  
 ii *\*It's so that the track was completely flooded that we'd had six inches of rain overnight.*

In [i] the adjunct has to have scope over the negative: it gives the result of his not spending much.

<sup>22</sup>The term 'consecutive clause' is thus traditionally applied to adjuncts like that in [32ii] (where *so that* is again treated as a subordinating conjunction).

### Ambiguity and blurring of the distinction between result and purpose

The syntactic differences given in [35] are not sufficient to indicate in all cases whether a *so* PP is an adjunct of purpose or result. Compare:

- [37] i *He's come home early so we can all go to the movies together.*  
 ii *A relatively simple switching mechanism reverses the cycle so that the machine literally runs backward, and the heat is extracted from outdoor air and turned indoors.*

In abstraction from prosody, [i] is ambiguous, with a sharp difference between the result and purpose interpretations. But in [ii] the difference is somewhat blurred. We understand this to entail the subordinate clause governed by *so*, which makes it like a result construction, but at the same time the subordinate situation came about by design: the purpose or intention was realised.

#### ■ So as a marker of result and as a degree adverb

There is also a close semantic relationship between the constructions shown in:

- [38] i *He loves her passionately, so that he is even willing to give up his job for her.*  
 ii *He loves her so passionately that he is even willing to give up his job for her.*

In [i] *so* is head of a PP functioning as adjunct of result: this is the construction we have been discussing. In [ii] *so* is an adverb of degree modifying *passionately*; it licenses the content clause following *passionately*, which expresses the result of his loving her to the degree he does. The net effect is thus essentially the same.

#### ■ Implicit result with *until*

A content clause complement of *until* often implicates result:

- [39] *He drank until he couldn't walk in a straight line any more.*

The *until* PP is a duration adjunct, indicating the endpoint of the period during which he drank. At the same time, there is an implicature that his being unable to walk in a straight line was the result of his drinking.

## 13 Adjuncts of concession

### 13.1 Concessive meaning

An elementary example of a clause containing a concessive adjunct is:

- [1] *Sonia doesn't speak French although she grew up in Paris.*

The concessive preposition *although* expresses a contrast between the subordinate clause *she grew up in Paris* and the superordinate clause *she doesn't speak French*. The meaning involves the following three features:

- [2] i The subordinate clause is entailed.  
 ii The truth of the subordinate clause might lead one to expect that the superordinate clause would be false.  
 iii In fact, the truth of the subordinate clause does not detract from the truth of the superordinate clause.

This gives the following three components in the meaning of [1]: she grew up in Paris; the fact that she grew up in Paris might very well lead you to expect that she would (have learnt to) speak French (the language spoken by native inhabitants of Paris); in fact, she doesn't speak French.

Since it follows from [1] both that Sonia grew up in Paris and that she doesn't speak French, it is possible to switch the two clauses:

[3] *Sonia grew up in Paris, although she doesn't speak French.*

What was originally the subordinate clause is now the head one, and vice versa: the difference between the versions is primarily a matter of information packaging, of which piece of information is given greater prominence by virtue of being made the head. The implicature of course changes: for [3] we have "the fact that she doesn't speak French might lead one to expect that she did not grow up in Paris".

It is also possible to have a juxtaposition of two main clauses, with the semantic relationship between them expressed by a concessive adverb in the second:

- [4] i *Sonia doesn't speak French; nevertheless, she grew up in Paris.*  
 ii *Sonia grew up in Paris; nonetheless, she doesn't speak French.*

The internal form of these adverbs reflects fairly transparently the concessive meaning given above as [2iii].

#### ■ Variation in the strength of the contrary-to-expectation implicature

In the example we began with there was a very sharp conflict between the subordinate and superordinate clauses, in that Sonia's having grown up in Paris provides strong grounds for expecting that she would speak French. But the implicature that one might expect the superordinate clause to be false need not be as strong as this. Compare (this time with the concessive adjunct in front position):

- [5] i *Although Sam was extremely rude to her, Beth defended him.*  
 ii *Although many Gurkhas speak English, almost none speak Cantonese.*  
 iii *Although carrots are good for you, eating too many can actually be harmful.*

In [i] the fact that Sam was extremely rude to Beth provides reasonable grounds for thinking she might not defend him. In [ii] (taken from an article dealing with the employment of Gurkhas as private bodyguards in Hong Kong) the fact that many Gurkhas speak English doesn't provide very strong grounds for expecting that some Gurkhas (more precisely, a number greater than almost none) would speak Cantonese: what is important here is the contrast between English and Cantonese. In [iii] the fact that carrots are good for you is obviously a good reason for thinking that eating them won't be harmful, but the superordinate clause here contains the *too* of excess: eating too much of anything is likely to be harmful. Again, then, it's primarily a matter of contrasting the beneficial effects of carrots in general with the harmful effects of carrots in excess.

## 13.2 Syntactic issues

### ■ Realisation

Concessive adjuncts have the form of PPs, mainly headed by the items in [6i], or adverbs, as in [6ii]:

- [6] i *although*      *though*      *despite*    *in spite*    *notwithstanding*    *albeit*  
 ii *nevertheless*    *nonetheless*    *still*      *yet*

The adverbs behave as connective adjuncts: they are considered further in §19.

### *Although and though*

*Although* and *though* are alternants, the latter slightly more informal. Their complement may be a full content clause (as in [1] and [5]) or it may be reduced to a participial and verbless clause:

- [7] i *Though living in Holland he works in Germany.*  
 ii *Although elected to the Council he can't take up his seat.*  
 iii *Though an American citizen, he has never lived in the States.*

*Though* commonly occurs with *even*, which serves to reinforce the concessive meaning:

- [8] *He knew they were there even though he couldn't see them.*

### *Despite, in spite, notwithstanding, for, albeit*

- [9] i [*In spite of / Despite the recession,*] *travel agents seem to be doing well.*  
 ii [*In spite of / Despite having grown up in Paris,*] *Sonia doesn't speak French.*  
 iii [*Notwithstanding Ed's reservations,*] *the agreement is the best I could hope for.*  
 iv [*For all our good intentions,*] *the meeting soon broke up in acrimony.*  
 v *The book covers the whole field, [albeit somewhat superficially].*

*Despite* takes an NP complement, *in spite* a PP with *of* + NP, and in either case a gerund-participial can replace the NP. *Notwithstanding* usually takes an NP complement (which can precede the head: see Ch. 7, §4.2). In its concessive use, *for* takes an NP complement beginning with *all*. *Albeit* is restricted to formal style, and takes only a verbless clause as complement.

## ■ Scope, focus, and questioning

Concessive adjuncts cannot be directly questioned: there is, for example, no (ordinary) question to which *although she was ill* is an answer. For the most part, they cannot fall within the scope of an element in the matrix, but there are two constructions where they can:

- [10] i *She didn't reject his offer in spite of his wealth but because of it.*  
 ii *Shall we go for a walk even though it does look like rain?*

In [i] we have a contrast between concession and reason: his wealth wasn't something that detracted from, or stopped, her rejecting his offer but the reason why she did. Such a contrast reflects the fact that a concessive construction can be roughly paraphrased in terms of reason in combination with two negatives: *She rejected his offer in spite of his wealth* conveys "His wealth was not (as you might have expected) a reason for not rejecting his offer". This construction is possible only with *in spite* or *despite*, and is generally restricted to cases where the speaker is contradicting another remark or being jocular.

In [10ii] the matrix has question force and the adjunct falls within the scope of the question. Such questions, however, are biased (in the sense discussed in Ch. 10, §4.7): I'm suggesting that we go for a walk. This construction also allows *in spite / despite*, but hardly *though* without the *even*, or *although*.

### 13.3 Semantically related constructions

#### (a) *Whereas, while/whilst, when*

- [11] i *Whereas many Gurkhas speak English, almost none speak Cantonese.*  
 ii *While/Whilst the first act was excellent, the second seemed rather dull.*  
 iii *He gave me a beer when what I'd asked for was a shandy.*

*Whereas* can substitute for *although* in most cases, but not felicitously in ones like our original example: \**Sonia doesn't speak French, whereas she grew up in Paris*. It expresses contrast, but hardly conveys the suggestion that the superordinate clause might be expected to be false; it might be regarded as a peripheral member of the class of concessive prepositions. The primary meaning of *while* and *whilst* is durational, but they have a secondary sense equivalent to *whereas*, as in [ii]: the meaning expressed here is contrast, not co-duration. *When* normally has a temporal meaning, but it too conveys contrast in cases like [iii]. This use is quite restricted; the *when* PP must come at the end and it could not be used in examples like [i–ii]. It seems to require a context that is consistent with the primary temporal meaning, so that the contrastive, concessive meaning is probably best handled as an implicature, rather than a distinct sense of *when*.

#### (b) Coordination with *but*

The contrast expressed in clauses containing concessional adjuncts can also be expressed in a coordinative construction with *but*:

- [12] i *Sonia doesn't speak French although she grew up in Paris.* } [subordination]  
 ii *Although she grew up in Paris, Sonia doesn't speak French.* }  
 iii *Sonia grew up in Paris but she doesn't speak French.* [coordination]

While the *although* PP can occur in either of the positions shown, the corresponding main clause always occupies first position in the coordination. For the syntactic differences between *although*, a preposition, and *but*, a coordinator, see Ch. 15, §2.1. *But* has a somewhat wider range of use than *although*; most notably, *but*-coordinations involving contrastive negation (with *but* expandable as *but rather*) do not have counterparts with *although*:

- [14] i *She doesn't sit and mope but (rather) makes the best of the situation.*  
 ii \**Although she doesn't sit and mope, she makes the best of the situation.*

#### (c) Conditionals

There is quite a close relation between *though*, which is primarily concessive, and *if*, which is primarily conditional. In combination with *even* they typically contrast as in:

- [14] i *I'm going out, even if it rains.* [conditional]  
 ii *I'm going out, even though it's going to rain.* [concessive]

Example [ii] says that it is going to rain (but I'm going out nevertheless), while [i] leaves it open as to whether it will rain (but I'm going out whether it does or not). *Even if* may be used, however, in a context where the complement of *if* is known to be true, and *even though* is occasionally found where the complement is not presented as true:

- [15] i *You don't have to defend everything Ed does, even if he is your brother.*  
 ii *Will mere debate on that proposition, even though it be free and untrammelled, remove the dross and leave a residue of refined gold?*

In [i] there will normally be no doubt that Ed is your brother, so that the conditional is pragmatically equivalent to a concessive. In [ii] the non-factual status of the subordinate clause is reflected in its subjunctive form.

*If* is also interpreted concessively in the following construction:

- [16] i *The respect he inspires demonstrates the moral authority of his heroic, if contradictory, personality.*  
 ii *It's funny, it's good, and it's a parody, if a little blunt.*

*If* is here equivalent to concessive *though* (or *albeit*): [i] entails that his personality is contradictory, [ii] that 'it' is a little blunt. This concessive meaning arises when *if* links attributive modifiers or predicative complements. Note finally that *if* and *though* are interchangeable in idiomatic combination with *as*: *He behaves as if/though he owned the place.*

## 14 Conditional adjuncts and conditional constructions

### ■ Protasis and apodosis

The prototypical conditional adjunct consists of a PP with *if* as head and a content clause as complement:

- |  |  |
|--|--|
| <p>[1] i [<u><i>If you touch that wire,</i></u> <u><i>you will get an electric shock.</i></u>]<br/>         ii [<u><i>If she earns \$1,000 a week,</i></u> <u><i>she is better off than me.</i></u>]<br/>         iii [<u><i>If she bought it at that price,</i></u> <u><i>she got a bargain.</i></u>]</p> | <p>} [if + <u>protasis</u> +<br/> <u>apodosis</u>]</p> |
|--|--|

The subordinate clause functioning as complement of *if* (marked here by single underlining) we call the **protasis**, and the matrix clause minus the adjunct (marked by double underlining) is the **apodosis**. We use the term **conditional construction** for the matrix including the adjunct.<sup>23</sup>

### ■ Application of the concepts of true and false to protasis and apodosis

As is evident from the examples in [1] protasis and apodosis can refer to future, present, or past time. The time sphere does have some limited bearing on the interpretation, but the basic meaning is the same in all three cases, and we want to be able to make general statements that apply irrespective of the time sphere. The terms true and false can be applied straightforwardly to examples like [1ii–1iii], and it will be convenient to extend them to [1i] as well. A context in which the protasis of [1ii] or [1iii] is true is one in which she does in fact earn \$1,000 a week or did in fact buy it at that price, and a context in which the protasis of [1i] is true is a future context in which you do in fact touch that wire – one in which the condition comes to be **satisfied**. Analogously for the apodoses.

<sup>23</sup>Traditional grammar takes *if* to be a subordinating conjunction, not a preposition, and many modern works follow this analysis; *if* is therefore commonly regarded as forming part of the protasis. We are using 'conditional adjunct' for the constituent including *if*, and protasis just for the subordinate clause. Protasis and apodosis derive from Greek; it may be helpful to note that the *pro*-prefix means "before" (as also in *prologue*, etc.): the protasis is logically prior to the apodosis. In logic the terms 'antecedent' and 'consequent' generally correspond to protasis and apodosis respectively, but we will see that the correspondence is not complete. (This sense of 'antecedent' is quite different from the grammatical one, but the prefix *ante*·, this time Latin, again means "before".) Note also that we use 'conditional construction' rather than 'conditional clause', because the latter could be understood as applying to either the subordinate clause or the superordinate one.

### ■ The distinction between open and remote conditional constructions

One important distinction within the rather wide variety of conditional constructions is that between **open** and **remote** versions. This is illustrated in [2i–ii], interpreted with the time of the protasis respectively future and present:

- |     |  |  |
|-----|--|--|
| [2] | OPEN   | REMOTE   |
|     | i a. <i>If you get it right, you'll win \$100.</i> | b. <i>If you got it right, you'd win \$100.</i>  |
|     | ii a. <i>If Ed is here he can come too.</i>        | b. <i>If Ed was/were here he could come too.</i> |

A remote conditional must have a modal auxiliary as the apodosis verb (usually *would*, *should*, *could*, or *might*) and a modal preterite or irrealis *were* in the protasis.

The open conditional can be regarded as the default conditional construction: we will examine it first, returning to remote conditionals in §14.2.

## 14.1 Open conditional constructions

### 14.1.1 Meaning and implicatures of open *if* conditionals

Let us, for convenience, represent the *if* conditional construction schematically as ‘*If P (then) Q*’, with the understanding that this covers not only cases where the adjunct is at the front (*If it rains we'll cancel the match*) but also those where it is at the end (*We'll cancel the match if it rains*). The interpretation of open conditional constructions then involves the following components:

- [3]
- i Invariant meaning: the truth values of *P* and *Q* are related in such a way as to exclude the combination where *P* is true and *Q* false.
  - ii Consequence implicature: *Q* is a consequence of *P*.
  - iii Only-if implicature: if not-*P*, then not-*Q*.
  - iv Don't-know implicature: the speaker doesn't know whether *P* and *Q* are true or false.

#### ■ Invariant meaning: excludes the combination of a true *P* and a false *Q*

What is common to all constructions fitting the *If P (then) Q* schema is that they exclude the case where *P* is true and *Q* false. Take the examples in [1]. Suppose you touch the wire and don't get a shock, or she earns \$1,000 a week and is not better off than me, or she bought it at that price and didn't get a bargain: in such cases [1i–iii] are unquestionably false.

#### ■ Consequence implicature: *Q* is a consequence of *P*

In most cases it is not simply a matter of *Q* being true when *P* is true: the conditional construction generally conveys that *Q* is a consequence of *P*, that *Q* follows from *P*. Very often, the relationship is one of cause and effect. An obvious example is [1i]: touching the wire will cause you to get an electric shock. Similarly in [2ia]: getting it right (correctly answering a question, let us assume) will earn you \$100. In these examples the time is future, but the cause–effect relationship can of course apply in other time spheres: *If they touched the wire they (invariably) got an electric shock*.

A second common type of consequence is inference. Here the truth of *Q* is seen as following from that of *P*:

- [4] i *If Ed is your brother and Max is Ed's son, then Max is your nephew.*  
 ii *If the key is not in my pocket, I have left it in the door.*  
 iii *If Jill was at the meeting she probably told / may have told him the news.*

In [i] the inference is a necessary one, given the meanings of *brother*, *son*, and *nephew*, but typically the grounds for inferring *Q* from *P* are not as strong as this. In [ii], for example, there could in principle be many other places where the key might be, but I tacitly exclude all possibilities other than the two expressed in *P* and *Q*. Example [iii] illustrates the frequent case where the apodosis contains an expression of epistemic modality (cf. §14.1.2).

The consequence relation has to be treated as an implicature rather than an entailment because there are certain special uses of *if* where it does not apply:

- [5] i *If he won the coveted prize, it was because of his divine playing of the rondo.*  
 ii *If our house was spacious, the place next door was immense.*

In the intended context for [i] it has been established that he won the prize: the apodosis here gives the reason for his having done so, not a consequence. In [ii] we understand that both *P* and *Q* are true, but the immensity of the place next door is not a consequence of the spaciousness of our house. It differs from *Our house was spacious and/but the place next door was immense* in that the first clause is syntactically and informationally subordinate: the context is likely to be one where I have been talking about our house and am now turning to the size of the house next door. A characteristic feature of this construction is that the clause ascribes a scalar property to two entities, such that the second outdoes the first.

The consequence implicature differs from those considered below in that it doesn't normally allow explicit cancellation: there are here no close analogues of the cancellation of the only-if implicature seen in [8] or that of the don't-know implicature seen in [11].

### Relevance protases

One further special case where *Q* is not a consequence of *P* involves 'relevance protases':

- [6] i *If you need some help, Helen is willing to lend a hand.*  
 ii *If you're interested, Dick's coming to the party too.*

Here *Q* is true independently of whether *P* is true. Nevertheless, such examples are consistent with the invariant meaning of *if*, which excludes only the case where *Q* is false and *P* true. In uttering [6] I'm asserting *Q*, with *P* expressing a condition on the **relevance** of *Q*. Such examples might be regarded as a shorthand way of saying something like *If you need some help you will be interested to know that Helen is willing to lend a hand* or *If you're interested it is worth telling you that Dick is coming to the party*. There is thus some implicit predication in which the actually expressed *Q* is an argument.

### ■ The only-if implicature: if not-*P*, then not-*Q*

A conditional construction generally implicates that if the condition is not satisfied the matrix situation does not or will not obtain either – that if *P* is not true, then *Q* is not true either. This implicature is related to the last. If there is a cause and effect relation between *P* and *Q* then in the absence of the cause there will be no effect. If you don't

touch the wire you won't get an electric shock, if you don't get the answer right you won't win \$100. The inferential consequence case commonly involves two mutually exclusive possibilities. So if the key is in my pocket I haven't left it in the door. More generally, this implicature derives from the fact that *If P (then) Q* is a weaker statement than *Q* on its own. Compare:

- [7] i *I'm going to the beach this week-end if it's fine.*  
 ii *I'm going to the beach this week-end.*

Clause [i] is weaker, more restrictive, than [ii], so if I'm going to the beach whether it's fine or not I would be expected to say [ii], not [i]. So [i] implicates that I'm going only if it's fine.

This, however, is a matter of conversational informativeness, not of truth conditions. *If P (then) Q* does not entail *If not-P (then) not-Q*. There is no inconsistency in:

- [8] i *If it's fine this week-end I'm going to the beach, and in fact I'll probably go even if it's wet.*  
 ii *If you invite the Smiths as well, there won't be enough room for everybody – indeed I think you've already invited too many as it is.*

And clearly the relevance protasis construction seen in [6] likewise does not have the truth of *Q* dependent on that of *P*.

The only-if implicature brings *if* PPs within the domain of what we would think of as conditions in the ordinary sense of that word. For example, [7i] will generally be interpreted as "I'm going to the beach this week-end on condition that it's fine". But this kind of gloss is inapplicable in cases like [8], [6], [5]; as usual, then, it must be borne in mind that the general term 'conditional' is assigned to the *if* construction on the basis of its characteristic use and that there are some less central uses of *if* that do not impose conditions in the everyday sense of that term.

#### ■ The don't-know implicature: the speaker doesn't know whether *P* and *Q* are true or false

Many conditionals relate to future time and here it will normally be the case that at the time of utterance I can't know whether or not the condition will be satisfied. For example, in [2ia], I don't know whether you will get it right, but I do know that if you do you will win \$100. The same implicature is found in other time spheres:

- [9] i *If Jill is still here, she is / will be in her office.*  
 ii *If she bought it, she got a bargain.*

Example [i] implicates that I don't know whether Jill is still here, whether she is in her office, and analogously for [ii]. Again, this implicature relates to the issue of informational strength: *If P (then) Q* is weaker than *P and Q*, so if I choose the weaker version this is likely to be because I haven't the knowledge to justify the stronger. Compare, for example, *Jill is still here: she's in her office* or *She bought it and got a bargain*. These are much more informative than the conditional versions, and something along these lines is therefore what I could be expected to say if I knew that *P* was true.

As before, my not knowing whether *P* is true or false is an implicature, not an entailment, and in the present and past time spheres it is significantly weaker than the consequence and only-if implicatures. Indeed we have already encountered examples where it does not apply – the examples given in [5]. One common case where there is no

such implicature is where *P* has just been asserted or established, and I use a conditional construction to make a comment on it or draw an inference from it. For example, [1iii] (*If she bought it at that price, she got a bargain*) might well be said on learning that she bought it at such-and-such a price. There is also a special use of the conditional construction where *P* is self-evidently true:

[10] *She's eighty if she's a day.*

This is an emphatic way of asserting that she's eighty: since she is obviously a day old it follows from [10] that she's eighty. Note that this is another case where the consequence implicature doesn't apply: her being eighty is not a result of her being a day old, nor a reasonable inference from it. The 'don't know' implicature can also be explicitly cancelled:

[11] *If he proposes – and he will – she'll probably turn him down.*

In demonstrating that the 'don't know' component is an implicature, not an entailment, we have so far been concentrating on the case where I know that *P* is true. If I know that *P* is false I would normally use a remote rather than an open conditional. Compare:

[11] i a. #*If I am you I will accept the offer.*      b. *If I were you I would accept the offer.*  
 ii a. *If Ed broke it he will have told her.*      b. *If Ed had broken it he'd have told her.*

Example [ia] is pragmatically anomalous. It can be assumed that I know that I am not you, and there is no apparent reason for not using the remote version [ib]. Example [iia] is perfectly acceptable – but it will normally carry the don't-know implicature: it suggests that I don't know whether or not he told her he had broken it. If I know, or am confident, that he didn't break it, I would normally use the remote [iib].

The open construction, however, is not inconsistent with a context in which I know that *P* is false. There is in fact one use of an *if* construction that has the falsity of *P* as an implicature:

[13] *If that is Princess Anne, I'm a Dutchman.*

This is a conventional emphatic way of saying that that is not Princess Anne. Since I'm obviously not a Dutchman (if I were I'd have to use some other patently absurd apodosis such as *pigs can fly*), *P* must be false too. We will take up in §14.2.1 the question of why a remote conditional would be inappropriate here.

### ■ Logical equivalences

With respect to the invariant meaning stated in [3i], *If P (then) Q* is equivalent to *If not-Q (then) not-P* and also to *Q or not-P*. Compare, for example:

[14] i *If Jill is here she is in her office.*      [If *P (then) Q*]  
 ii *If Jill is not in her office then she is not here.*      [If *not-Q (then) not-P*]  
 iii *Jill is in her office, or she is not here.*      [*Q or not-P*]

These all exclude the scenario where Jill is here but not in her office. But because of the implicatures typically associated with *if* conditionals, switching from one of these constructions to another will often have a major effect on the interpretation. Compare this time:

[15] i *If she leaves, I leave.*      [If *P (then) Q*]  
 ii *If I don't leave, she doesn't leave.*      [If *not-Q (then) not-P*]  
 iii *I leave or she doesn't leave.*      [*Q or not-P*]

These are pragmatically very different. In the singular future interpretation we understand from [i] that my leaving will be a consequence of her leaving. One scenario, for example, is where I'm making a threat: if you sack her, you'll lose me too. But in [ii] (and [iii]) the consequence relation is quite different: her not leaving will be a consequence of my not leaving.

### ■ Multiple situations

All but one of the examples considered so far have expressed singular situations. With multiple situations the conditional adjunct generally has narrow scope relative to the multiple quantification:

[16] *She cycled to work if she got up early enough.*

In the salient interpretation we are concerned here with habitual cycling to work, and the condition applies to the individual events. We thus have multiple instances of cycling-to-work-if-she-got-up-early-enough. In cases like this, *if* implies *when*, and as with adjuncts of temporal location like *when* phrases there will often be an accompanying frequency adjunct (making the multiple quantification explicit rather than implicit, as in [16]): *She always/often/sometimes cycled to work if she got up early enough.* Example [16] conveys that there were at least some occasions when she got up early enough and cycled to work, but the construction doesn't actually entail that the condition is sometimes satisfied. You will infer from [16] that she sometimes got up early enough because if she hadn't done so I wouldn't have enough evidence for my assertion. But it would be possible to say, for example, *These machines switch themselves off if the temperature rises above 40° Celsius* in a context where they had been designed to do that but hadn't actually been tested.<sup>24</sup>

## 14.1.2 Issues of time, modality, and polarity

### ■ Time of apodosis situation independent of that of protasis situation

In most of the examples considered so far the protasis and apodosis situations have been in the same time-sphere, both future, both present, or both past. But they do not need to be: all combinations are possible, though some are much more frequent than others. Compare, then:

[17]		PROTASIS	APODOSIS
	i	<i>If she leaves, I leave too.</i>	future
	ii	<i>If they don't come, we're wasting our time.</i>	present
	iii	<i>If it doesn't rise, you didn't put enough bicarb in.</i>	past
	iv	<i>If that's Jill over there, I'll ask her to join us.</i>	future
	v	<i>If she's here, she's in her office.</i>	present
	vi	<i>If he knows the answer, he got it from you.</i>	past
	vii	<i>If they batted first they will probably win.</i>	future
	viii	<i>If Kim said that, you are entitled to compensation.</i>	present
	ix	<i>If Kim didn't do it, Pat did.</i>	past

(We ignore the time of the modality in [vii]: it is the winning that is in the future.)

<sup>24</sup>It is possible for a conditional adjunct to have scope over a multiple situation, as in *She cycled to work if I remember correctly.* The adjunct here, however, belongs to the modal category discussed in §18.

### ■ Non-modal present tense in future time protases

A future time protasis usually has a non-modal present tense:

- [18] i *If you see Ed at tomorrow's meeting, tell him I'll phone him at the week-end.*  
 ii *If it rains tomorrow, we'll postpone the match until next week-end.*

There are no main clauses that have precisely the same interpretation as the underlined subordinate clauses. Compare:

- [19] i a. *You see Ed at tomorrow's meeting.*      b. *You will see Ed at tomorrow's meeting.*  
 ii a. *<sup>#</sup>It rains tomorrow.*                              b. *It will rain tomorrow.*

The interpretation of [19ia] is present futurate – roughly “The arrangement is that you see him then”. Example [19iia] is pragmatically anomalous, because the situation concerned isn't one that is arranged or scheduled in advance. The [b] versions differ from the subordinate clauses in [18] by virtue of containing a modal auxiliary that serves to qualify the assertion being made. (See Ch. 3, §10.1, for arguments that *will* expresses modal rather than temporal meaning.)

In general, epistemic modals are not used in conditional protases, but they are certainly not excluded:

- [20] *If we will have an unusually wet winter (as the meteorological office predicts), the threat of a serious water shortage will recede, for the time being at least.*

The bracketed phrase suggests the kind of context in which this might be used. The proposition that we will have an unusually wet winter has been put forward by the meteorological office, and I am entertaining it conditionally and drawing a conclusion from it. The modality is here part of the proposition expressed by *P*: we could paraphrase as *If it is true that we will have an unusually wet winter, . . .* This type of construction is discussed in more detail in Ch. 3, §9.5.1.

### ■ Modal qualification in the apodosis

We have observed that in remote conditionals the apodosis verb must be a modal auxiliary. No such requirement applies with open conditionals, but modals are nevertheless very common in open apodoses: the conditional construction is conducive to the expression of modality. Examples are given in:

- [21] i *If it rains tomorrow it will/may make things very difficult for us.* [future]  
 ii *If he is not at work he will/may be watching the cricket.* [present]  
 iii *If the meeting finished on time, he will/may have caught the 3.15 train.* [past]

Other modals are of course used too; *must*, for example, is often used when *Q* is a conclusion deduced or inferred from *P*. In [i], a modal is required, in accordance with general constraints applying to future time situations in main clauses. We could have *If the report isn't ready by tomorrow, you lose your job*, but *lose* here is a present futurate: the decision about your losing your job in the circumstances described has already been made, so that the contingent future situation is arranged at present time. This may be felt to make the threat marginally stronger than in the version with *will*. A non-modal version of [ii] would be very natural: it would indicate a slightly higher degree of confidence in the conclusion than with *will* (and much higher than with *may*) – a higher degree of confidence that the only possible scenarios are that he is at work and that he is watching the cricket. Non-modal preterites are also unproblematic in principle. An example was

given in [1iii]: *If she bought it at that price, she got a bargain.* My judgement here is that at the price in question it was undoubtedly a bargain. *Caught* could substitute for *will/may have caught* in [21iii], but seems less likely than a modalised version; it indicates complete confidence that nothing could have interfered with his presumed intention of catching the 3.15 train provided the meeting finished on time.

### ■ Subjunctive construction in the protasis

Consistently with its non-factual status, the protasis verb may be in the plain form, marking the subjunctive construction:

[22] *If such a demonstration be made, it will not find support or countenance from any of the men whose names are recognised as having a right to speak for Providence.*

In Present-day English, however, this construction is very rare and formal (not comparable to the use of irrealis *were* in remote conditionals). It is virtually restricted to the verb *be*.

### ■ Polarity-sensitive items

*If* adjuncts have much in common, semantically and syntactically, with interrogatives. *If Jill is here, she's in her office*, for example, implicitly raises the question of whether Jill is here, but leaves the question unanswered. And *if* sanctions polarity-sensitive items in very much the same way as interrogatives.

- [23] i a. *It will give us an advantage if they are already here.*  
 b. *I'll be surprised if they are here yet.*  
 ii a. *If anyone has a solution to this problem, please let me know.*  
 b. *If someone has a solution to this problem, please let me know.*

*Already* is positively-oriented, *yet* negatively-oriented and both can occur in interrogatives: *Are they already here?*, *Are they here yet?* Example [ia] is oriented towards a positive answer (it's their being here already that will give us the advantage), while [ib] is oriented towards the negative: *I'll be surprised* suggests an expectation that they are not here yet. The difference between [iia] with non-affirmative *anyone* and [iib] with affirmative *someone* matches that between *Has anyone a solution to this problem?* and *Has someone a solution to this problem?*, where the latter suggests a slightly greater inclination to think that the answer could be positive.

Factors of this kind account for the differences in:

- [24] i *If you are at all worried about the project, don't get involved.*  
 ii *?If you were at all worried about the project, why didn't you let me know?*  
 iii *?If you improve your performance at all, we give you a bonus.*

Example [i] readily accepts non-affirmative *at all*: you may well not be worried at all. But the reproachful *why didn't you* in [ii] conveys that I think you were worried (and should have let me know), and so *at all* is here infelicitous. Similarly in [iii] we're making a conditional offer, and this suggests a positive orientation to the satisfaction of the condition.

14.1.3 *If in combination with only and even*■ *Only if*

- [25] i *I'll cook only if you clean up.*  
 ii *Students are admitted into the second year only if they achieve a grade of 5 or higher in the first year.*  
 iii *She cycled to work only if it was fine.*

An *if* phrase is often the scopal focus of *only*, which as usual may immediately precede (as in these examples) or be separated (*I'll only cook if you clean up*, etc.). In the former case, the whole *only if* phrase may precede the apodosis (*Only if you clean up will I cook*), but the order shown in [25] is much more usual, and we will therefore describe the meaning with reference to the schematic representation *Q only if P*.

- [26] i Invariant meaning: The truth values of *P* and *Q* are related in such a way as to exclude the combination where *P* is false and *Q* is true.  
 ii Sufficient condition implicature: *Q if P*.

**Invariant meaning: excludes combination of false *P* and true *Q***

The *Q only if P* construction rules out the case where *P* is false and *Q* true. Thus [25i] rules out the case where I cook and you don't clean up; [ii] rules out that where students are admitted into second year without achieving a grade of 5 or higher in the first year; [iii] rules out that where she cycled to work in bad weather. *P* thus expresses a **necessary condition**, a condition that must be satisfied if *Q* is to be true.

**Sufficient condition implicature: *Q if P***

Besides expressing a necessary condition, *P* is characteristically taken to express a sufficient condition, one whose satisfaction is all that is required for *Q* to be true. The natural interpretation of [25i] is that I'm offering to cook provided you agree to clean up. Similarly we will assume from [ii] that any student obtaining a first-year grade of 5 will be admitted into second year. And [iii] conveys that she did cycle to work when it was fine. But it is clear that *Q only if P* does not actually **entail** *Q if P*. Consider, for example:

- [27] i *A will is valid only if it has been signed in the presence of two witnesses.*  
 ii *You are entitled to a pension only if you are a permanent resident.*  
 iii *The red light goes on only if the blue light is on, but it doesn't go on if the green light is also on.*

It is common knowledge that there are other conditions on the validity of a will than the one expressed in [i] – for example, the testator must be of sound mind and not acting under duress. Example [ii] omits the obvious condition on pensions concerning age (or health): we don't assume that all permanent residents are currently entitled to a pension. And in [iii] the second coordinate adds a second condition but is not judged to be inconsistent with the first. To make explicit that *P* expresses a condition that is both necessary and sufficient we need to combine *if* and *only if* (or use some equivalent formulation): *I will accept your proposal if and only if my lawyer assures me that it is legal.*

### Logical equivalences

By virtue of the invariant meaning [26i], *Q only if P* is equivalent to *If not-P (then) not-Q* and *If Q (then) P*. Compare:

- [28] i *You qualify for a rebate only if your annual income is less than \$70,000.*  
 ii *If your annual income is not less than \$70,000 you don't qualify for a rebate.*  
 iii *If you qualify for a rebate your annual income is less than \$70,000.*

The third version, however, will again often be pragmatically very different from the others. Compare the following examples with modal *will*:

- [29] a. *I'll do it only if you pay me.*      b. *You'll pay me if I do it.*

Version [a] will tend to be construed as giving you a choice as to whether you pay me or not (though if you don't I won't do it). Version [b], by contrast, would then sound very peremptory: I'm not giving you a choice, but telling you.

We have seen that adding *only* to *Q if P* is logically equivalent to switching the protasis and apodosis: *Q only if P* is logically equivalent to *P if Q*. This may at first appear puzzling, but it is in fact predictable from the meanings of *if* and *only*: there is no need to regard *only if* as an idiom. Consider the meaning contribution of *only* in the non-conditional *Only permanent residents qualify for a rebate*. This entails that people other than permanent residents do not qualify for a rebate (cf. Ch. 6, §7.3). Similarly, [28i] entails that you don't qualify for a rebate in other situations than that in which your annual income is less than \$70,000. In other words, it excludes the scenario in which "You qualify for a rebate" is true, and "Your annual income is less than \$70,000" is false. But we have seen that the invariant meaning of *if* is that it excludes the combination of a true protasis and a false apodosis, so we arrive at *If you qualify for a rebate, your annual income is less than \$70,000*, i.e. [28iii].

### ■ Even if

- [30] i *I'm going to the party even if Kim is going too.*  
 ii *I'm going to the party if Kim is going too.* [entailment of [i]]  
 iii *I'm going to the party.* [implicature of [i]]

*Q even if P* entails *Q if P*: [i] entails [ii]. In addition it implicates *Q* by itself: [i] conveys that I'm going to the party. *Even* has as scopal focus the whole content clause *Kim is going too*; it indicates that my going to the party is less expected if Kim is going too than if Kim is not going (cf. Ch. 6, §7.3). But if I'm going in the less expected case, it can be inferred that I'm also going in the more expected one – so I'm going in either case.

This implicature does not go through if the scopal focus of *even* is not the content clause as a whole, but a scalar element within it:

- [31] i *You'll have to repeat the whole year even if you fail (just) ONE exam.*  
 ii *You'll have to repeat the whole year.* [not an implicature of [i]]

Here we understand having to repeat if you fail (just) one exam to be less expected than having to repeat if you fail more than one – but not than having to repeat if you don't fail any. In [30] the comparison is between positive and negative (Kim is going vs Kim is not going), but in [31] it is between points on a scale (one vs more than one). This gives the following interpretations:

- [32] i "I'm going whether Kim is going or not."  
 ii "You'll have to repeat the year whether you fail one exam or more."

The scale may be an implicit one. *You'll have to repeat the whole year even if you fail PE* does not imply that you'll have to repeat the whole year whether you fail PE or not, but that you have to repeat it whether you fail PE or some more important part of the course.

As noted in §14.1.1, *even if P* may be used in a context where the truth of *P* is not in question: *Even if you are my elder brother, you haven't the right to tell me what to do.* In such cases the conditional implies a concessive: *Although you are my elder brother you haven't the right to tell me what to do.*

## 14.2 Remote conditional constructions

### 14.2.1 Meaning and implicatures

Let us consider now the difference in interpretation between remote and open conditionals. Further examples illustrating the contrast are given in:

- |      |  |   |
|------|--|---|
| [33] | OPEN   | REMOTE  |
|      | i a. <i>If he tells her she will be furious.</i>               | b. <i>If he told her she would be furious.</i>                            |
|      | ii a. <i>If you are under 18 you need parental approval.</i>   | b. <i>If you were under 18 you would need parental approval.</i>          |
|      | iii a. <i>If he bought it at that price, he got a bargain.</i> | b. <i>If he had bought it at that price, he would have got a bargain.</i> |

In [3] we presented four components involved in the interpretation of open conditionals, and the first three of these apply equally to the remote construction. In the first place, the remote conditional, like the open, excludes the case where *P* is true and *Q* false. Thus [ib] no less than [ia] excludes the case where he tells her and she is not furious; similarly, both versions of [ii] and [iii] exclude the case where you are under 18 and don't need parental approval, where he bought it at that price and didn't get a bargain. Secondly, the remote construction implicates that *Q* is a consequence of *P*. Thirdly, it again has the only-if implicature: if you weren't under 18 you wouldn't need parental approval, and so on.

The remote construction differs from the open in that it entertains the condition as being satisfied in a world which is potentially different from the actual world.

#### ■ Present and past time protases

Let us consider first cases where the time of the protasis situation is present or past, as in [33ii–iii]. Remote conditionals of this type generally implicate that *P* is false, or at least likely to be. And by the only-if implicature *Q* will likewise be false, or probably false. A salient context for [iiib], for example, is one where I know that he missed the opportunity of buying it at the price in question: *P* is false, the condition is not satisfied in the world as it actually is. I thus imagine a world differing from the actual one by virtue of *P* being true in that world, and draw conclusions about other features of this imaginary world – namely that *Q* is also true, that he got a bargain. Very often, we reason about the properties of worlds potentially different from the actual world in order to make inferences about the latter:

- [34] *If Ed had been here at ten o'clock, it wouldn't have been possible for him to attend the departmental staff meeting at 10.30, as he did. So it wasn't Ed who committed the crime.*

I imagine a world in which Ed was here at ten o'clock: in this world (which I assume to be like the actual world in other respects as far as is consistent with Ed's being here at ten o'clock) he can't have been at the staff meeting. In the actual world he was, so the actual world must differ from the imaginary world with respect to the truth of *P*: in the actual world *P* must be false. And since (let us assume this to have been established) the crime was committed here at ten o'clock, it can't have been Ed who committed it.

It is important to emphasise, however, that a present or past time remote conditional does not entail that *P* is false (in the actual world): this is why we spoke above of the condition being satisfied in a world which is **potentially** different from the actual world. In the first place, it may well be that I don't know whether *P* is true or false:

[35] *I don't know whether he broke it or not, but I doubt it; if he had done he would probably have told her about it.*

Secondly, there is one use of the remote construction, not common but nevertheless clearly established, where I know or am confident that *P* is in fact true:

[36] *If he had escaped by jumping out of the window he would have left footprints in the flower-bed beneath. And that is precisely what we found.*

I begin by presenting the world in which he jumped out of the window as potentially different from the actual world. But it turns out that the consequential property *Q* obtains in the real world as well as the imaginary one – and the natural explanation for *Q* is *P*, so the inference is that *P* does in fact hold of the actual world. The strategy here, then, is to reconstruct what happened by working back from consequences to their causes.<sup>25</sup>

Note also that there are occasions where a remote conditional would be inappropriate even though I know that *P* is actually false:

[37] a. *If Grannie is here she is invisible.*      b. *If Grannie were here she'd be invisible.*

The context here is one where someone has suggested that Grannie is here and I wish to pour scorn on the idea. This is achieved by the open conditional [a], where I show that that suggestion has an absurd consequence: since *Q* ("Grannie is invisible") is patently false, *P* ("She is here") must be false too. The rhetorical effect is drastically diminished in the remote version. Here I imagine a world differing from the actual one in that *P* is true. But once we envisage a world that differs in this respect from the actual one, the possibility arises that it could differ in other respects too: perhaps in this imaginary world people can be invisible. One can still argue from [b] that Grannie is not actually here (in the same way as one argues from [34] that Ed wasn't here at ten o'clock), but the demonstration is less immediate, less direct than in the open version. Similarly with [13] above: *If that's Princess Anne, I'm a Dutchman* is a conventional way of ridiculing the idea that that is Princess Anne, but we do not say *#If that were Princess Anne I would be a Dutchman*.

The remote construction is of course also inappropriate in those cases considered in §14.1.1 where the truth of *P* is contextually given, or self-evident:

<sup>25</sup>For this reason the commonly used term 'counterfactual conditional' is not an appropriate one for the grammatical class of remote conditionals (even if restricted to those with a past or present time protasis): it is best applied to **uses** of remote conditionals when the protasis situation is false.

- [38] i a. *If our house was spacious, the place next door was immense.*      b. *If our house had been spacious, the place next door would have been immense.*  
 ii a. *Even if you are my elder brother you haven't the right to tell me what to do.*      b. *Even if you were my elder brother you wouldn't have the right to tell me what to do.*  
 iii a. *She's eighty if she's a day.*      b. *\*She'd be eighty if she were a day.*

Examples [ib] and [iib] are possible, but would not be used in a context where it is taken for granted that our house is spacious, or where I'm talking to my elder brother.

### ■ Future time protases

Where the time of the protasis is future, the remote conditional generally conveys that satisfaction of the condition in the actual world is relatively unlikely. In [33i], for example, the remote version suggests a lesser likelihood of his telling her than does the open one. And it is the remote construction that would normally be used following an assertion that the condition will not be satisfied:

- [39] *He won't resign. If he did he would lose most of his superannuation entitlement.*

Again, however, unlikelihood is an implicature, and provides neither a necessary nor a sufficient condition for selecting the remote construction in preference to the open. Compare:

- [40] i *I would be most grateful if you would/could give me the benefit of your advice.*  
 ii *If we offered you the post, when could you start?*  
 iii *If you die in a few minutes that was an overdose you just took.*

Example [i] does not convey that I regard it as unlikely that you will – much less that you can – give me the benefit of your advice. The reason for choosing the remote construction in such cases will generally be that it is considered more polite than the open version, *I will be most grateful if you will/can give me the benefit of your advice*. It is more polite in that it more clearly allows for your not wanting to give the advice. Similarly, [ii] does not convey that we are unlikely to offer you the post, though it remains somewhat less encouraging than its open counterpart with *offer* and *can*. On the other hand, the open conditional [iii] is perfectly consistent with a context in which I think it unlikely that you will die: the reason for preferring the open construction here is essentially the same as with [37] above. The remote *If you died in a few minutes that would have been an overdose you just took* conjures up a world potentially different from the actual one, but we don't want the issue to be confused by other possible differences between this imaginary world and the actual one. The issue is simply whether what you took was an overdose, and that can be settled by waiting to see whether you die in a few minutes in the actual world.

### ■ Only if and even if

The remote vs open contrast is the same in combination with *only* and *if* as in the examples given in [33]. Compare, then:

- [41] i a. *I'll cook only if you clean up.*      b. *I'd cook only if you cleaned up.*  
 ii a. *I'm going to the party even if Kim is going too.*      b. *I'd be going to the party even if Kim was going too.*  
 iii a. *You'll have to repeat the whole year even if you fail just ONE exam.*      b. *You'd have to repeat the whole year even if you failed just ONE exam.*

The open versions were discussed as [25i], [30i], and [31i] above. The remote [41ib] makes greater allowance for your not cleaning up than [ia], perhaps out of politeness/diffidence, perhaps because it seems unlikely that you will agree. But there's still an implicature that satisfaction of the condition will be sufficient to ensure that I cook. *Even* likewise has the same interpretation in the remote versions as in the open ones. Thus [iib] implicates that Kim is not going to the party, whereas [iia] leaves it open, but both versions convey that I am in fact going to the party. Example [iiib] suggests that your failing one exam is relatively unlikely, while [iiia] again leaves it open; both indicate that repetition will be required in the event of failure in one or more exams but not otherwise.

### ■ *If only*

Quite distinct from *only if* is the construction where *only* occurs in the protasis indicating something like a wish for the satisfaction of the condition:

- [12] i *He would get a distinction if only he would buckle down to some hard work.*  
 ii *I could have solved the problem myself if only I'd had a little more time.*

The wish meaning is particularly evident when the apodosis is omitted: *If only I'd had a little more time!* In this idiomatic sense *if only* occurs predominantly in remote conditionals, but it is found also in the open type: *He'll get a distinction if he will only buckle down to some hard work.*

## 14.2.2 The form of remote conditionals

### ■ Tense and mood restrictions

The verb of the protasis must be the irrealis form *were* or a preterite with the modal remoteness meaning. The verb of the apodosis must be a modal auxiliary; this too must be a modally remote preterite, except where the modal has only a present tense form.

With 1st/3rd person singular subjects preterite *was* is somewhat informal in comparison with irrealis *were*. The most common modal auxiliaries occurring in the apodosis are *would*, *should*, *could*, and *might*; for other modal forms, see Ch. 3, §§5, 9.8.4.<sup>26</sup>

### ■ Protasis and apodosis times

As with open conditionals, all combinations of protasis and apodosis times are possible.

[43]		PROTASIS	APODOSIS
	i	<i>If I went tomorrow, I would have more time in Paris.</i>	future
	ii	<i>If they didn't carry out tomorrow's inspection after all we would be wasting our time cleaning up like this.</i>	present
	iii	<i>If tomorrow's experiment didn't work, the Russians' original prediction would <u>have</u> been wholly accurate.</i>	past

<sup>26</sup>Philosophers sometimes use the terms 'indicative conditional' and 'subjunctive conditionals' for open and remote conditionals respectively. These terms reflect the way in which the distinction is characteristically marked in Latin, but in English it is marked quite differently. Given that the grammatical marking of the distinction varies considerably across languages, appropriate general terms should be based on the common meaning difference.

iv	<i>If you loved me you would come with me.</i>	}	present	future
v	<i>If she were here she would be in her office.</i>			present
vi	<i>If I were ill I would <u>have</u> stayed at home.</i>	}	past	past
vii	<i>If I <u>had</u> won the lottery I would buy a sports car.</i>			future
viii	<i>If I <u>had</u> followed your advice, I would be rich now.</i>	}	past	present
ix	<i>If Kim <u>hadn't</u> told her, I would <u>have</u> done so.</i>			past

The combination of a present or past apodosis with a future protasis, as in [ii–iii], is very rare. In [iii], for example, it would be more natural to say something like *would have been vindicated*: the vindication is future, simultaneous with the imagined failure of the experiment.

The preterite verb forms express modal remoteness, not past time; past time therefore has to be marked by the secondary past tense, the perfect, as shown by the underlining of *have* in [43]. In a past time apodosis, perfect *have* appears in the plain form following *would* (or other modal); in a past time protasis, perfect *have* itself carries the modal preterite inflection. A variant form for the protasis has *had've*: *If I had've followed your advice, I would be rich now*; we also find *I'd've*, etc., where it is debatable whether the *'d* might also be construed as a cliticised form of *would*. These variants are increasingly common in informal speech, but are still generally regarded as non-standard. The preterite perfect can also occur with future time reference: this is the doubly remote construction which we take up below.

#### ■ The modal apodosis requirement

The fact that the apodosis must contain a modal auxiliary means that a high proportion of open conditionals do not have remote counterparts. Note, for example, that imperatives have the verb in the plain form, which excludes the possibility of a modal:

- [44] a. *If it rains, bring the washing in.* b. [no remote counterpart]

Consider also the case of declaratives, as illustrated in:

- [45] i a. *If Ed's still here, he'll be in his office.* b. *If Ed were still here, he'd be in his office.*  
 ii a. *If Ed's still here, he's in his office.* b. [no remote counterpart]  
 iii a. *If Jill didn't sign the cheque, her husband will have.* b. *If Jill hadn't signed the cheque, her husband would have.*  
 iv a. *If Jill didn't sign the cheque, her husband did.* b. [no remote counterpart]

In [i–ii] the time of the protasis is present. Version [ib] is the remote counterpart of [ia], with both apodoses containing modal *will*; compare similarly *If Ed's still here he may be in his office* and *If Ed were still here he might be in his office*. In [iia] there is no modal in the apodosis and therefore no remote counterpart. In this case, there is relatively little difference between [ia] and [iia], and [ib] is commonly regarded as the remote version of [iia] (or of both [ia] and [iia]): grammars tend not to be very explicit on this point).

In [45iii–iv] the time of the protasis is past. The grammatical differences between the four versions are the same as in [i–ii], but this time there is a potentially greater pragmatic difference between [iia] and [iva]. Suppose Jill and her husband have a bank account in their joint names with either of them able to sign cheques. Then if I know the cheque was signed (and have no reason to suspect forgery), I can say [iva]: there is no need for any modal

qualification. The *will* in [iiia] suggests, therefore, that I don't actually know whether the cheque was signed. In [iiia], then, her husband's having signed the cheque doesn't follow so securely from Jill's not having done so as it does in [iva]. Now in [iiib] the salient interpretation is that Jill did in fact sign the cheque (i.e. that *P* is false). But I'm imagining a world in which she didn't, and in this imaginary world, I don't have the same grounds for concluding that her husband did sign it as I do in [iva], because it isn't necessarily a property of this world that the cheque was signed. In terms of the basis for concluding *Q* from *P*, therefore, [iiib] is closer to [iiia] than to [iva], and this correlates with the fact that it differs from [iiia] in only one respect (remote vs open), whereas it differs from [iva] in two (remote vs open, and presence vs absence of *will* in the apodosis). Note that it would be quite reasonable in the context proposed to take the view that [iva] was true while [iiib] was false.<sup>27</sup>

The open construction with *will*, [45iiia], is not a common one: there are various other ways of expressing roughly the same meaning, e.g. by means of modal adjuncts such as *probably*, *surely*, etc. But these alternatives are not available in the remote construction because of the modal auxiliary requirement, so that the *would* construction is, by contrast, of very high frequency. The view taken here, however, is that this difference in frequency does not invalidate an analysis in which [iiib] is formally and semantically more closely or directly related to [iiia] than to [iva].

#### ■ Protases with *be* + *to* and *should*

- [46] i a. <sup>#</sup>*If it is to rain, I'll cancel the show.*      b. *If it were to rain, I'd cancel the show.*  
 ii a. *If Kim should die, Ed will take over.*      b. *If Kim should die, Ed would take over.*

There is an idiomatic use of what we call 'quasi-modal *be*' that occurs only in remote conditionals like [ib]. In the open conditional *If we are to survive we'll have to drastically reduce expenditure* the protasis suggests purpose ("In order to survive, we'll have to drastically reduce expenditure"), which is why [ia] is pragmatically anomalous. In the remote conditional, this quasi-modal *be* serves merely to reinforce the remote meaning: the protasis of [ib] means "if it rained" but with a slightly stronger implicature of unlikelihood. It occurs predominantly in future time protases.<sup>28</sup> The examples in [ii] illustrate the special conditional use of *should*, which is found without any difference in the form of the protasis itself in both open and remote conditionals.

#### ■ Omission of *if* and subject–auxiliary inversion

In the examples above, the protasis has the form of a PP with *if* as head and a content clause as complement; under certain conditions it can instead take the form of an ungoverned content clause with subject–auxiliary inversion:

- [47] i *Had I had any inkling of this, I would have acted differently.*  
 ii *Were that to happen we would be in a very difficult situation.*

These are equivalent to *If I had had any inkling of this, . . .* and *If that were to happen, . . .* This construction is found mainly with *had* and *were*, though a few other auxiliaries are also possible (cf. Ch. 11, §4.7). It excludes negative verb-forms: *had Jill not signed the cheque*, but not <sup>\*</sup>*hadn't Jill signed the cheque*. It is restricted to remote conditionals

<sup>27</sup>This point reinforces what was said above in connection with [37], *If Grannie is here she's invisible* and *If Grannie were here she'd be invisible*. See also the discussion in Ch. 3, §9.8.3, of the contrast between *If Oswald didn't shoot Kennedy someone else did* and *If Oswald hadn't shot Kennedy someone else would have*.

<sup>28</sup>Another use of *be* that is restricted to remote conditionals is seen in *If it hadn't been for you, I would have missed the train*: "but for you".

except that the special conditional *should* allows inversion in both open and remote constructions. *If Kim should die*, for example, is replaceable by *should Kim die* in [46iia] as well as [iib].

### ■ The doubly remote conditional construction

- [48] i *If you had told me you were busy I would have come tomorrow.*  
 ii *If you had come tomorrow you would have seen the carnival.*  
 iii *If your father had been alive today he would have been distraught to see his business disintegrating like this.*

Ordinary remote conditionals have preterite tenses (or irrealis mood) expressing modal remoteness, not past time. In [48] the underlined perfect auxiliaries **have** also express modal rather than temporal meaning. In [i] the apodosis situation is future; in [ii] both protasis and apodosis situations are future; and in [iii] both situations are located in present time. We refer to this, therefore, as the **doubly remote conditional**: the remoteness is signalled twice, once by the preterite inflection, once by perfect **have**.

Where the time is future the doubly remote construction indicates not only that P and Q are false, but also that the possibility of the future situation being actualised has already been foreclosed by a past event. In [i–ii], for example, it might be that I or you have come today, with the assumption that that precludes our coming again tomorrow.

### ■ Modal preterites vs other preterites

There may be ambiguity between a remote conditional and an open one with preterites expressing past time rather than modal remoteness:

- [49] *If we weren't home by ten o'clock the landlady would lock us out.*

This can be a remote conditional corresponding to the open *If we aren't home by ten o'clock the landlady will lock us out*. In this case the salient interpretation refers to a singularity situation in the future (cf. *If we weren't home by ten o'clock tonight, . . .*). But [49] can also be an open conditional expressing a multiple situation in the past: “Whenever we weren't home by ten o'clock, . . .”. With a non-modal apodosis such as *the landlady locked us out* only the open reading is possible – and an irrealis protasis such as *if I weren't home by ten o'clock* permits only the remote reading. The meaning contrast is very sharp: it is a clear case of ambiguity.

Less straightforward is the distinction between a preterite marking a remote conditional and one that arises through backshift. Compare:

- [50] i *He said that if they were convicted they would be liable to a life sentence.*  
 ii *He said that if Sue hadn't signed the cheque her husband would have.*

Here [i] could be a backshifted report of the open conditional *If they are convicted they will be liable to a life sentence* or a report (necessarily without backshift) of remote *If they were convicted they would be liable to a life sentence*. Example [ii] could likewise be a backshifted report of open *If Sue didn't sign / hasn't signed the cheque her husband will have* or a non-backshifted report of remote *If Sue hadn't signed the cheque her husband would have*. But it can also be a backshifted report of remote *If Sue didn't sign the cheque her husband would*. In cases like [50] the meaning differences are much more subtle than in [49], a matter of the modality of the conditional rather than of time; it is likely that speakers will in many cases be unaware of the fact that the grammar makes available these different interpretations.

### Mixed constructions

In some cases we find a modal preterite in the protasis but not in the apodosis:

- [51] i *If you needed some help, Helen is willing to lend a hand.*  
 ii *I'll come on Tuesday if that would suit you better.*

Example [i] has what we have called a relevance protasis: it is the remote counterpart of [6i] above (*If you need some help, Helen is willing to lend a hand*). It doesn't look like a remote conditional because the apodosis doesn't have a preterite verb, but if we fill in the unexpressed superordinate structure we get the usual form for a remote apodosis: *If you needed some help, you would be interested to know that Helen is willing to lend a hand*. The remote version would be pragmatically more likely with past time reference: *If you'd needed some help, Helen was willing to lend a hand*. In [ii] we have an implicit remote conditional embedded within an open one: "I will come on Tuesday if it would suit you better if I came on Tuesday". The overt protasis in [ii] contains a modal auxiliary and hence belongs with the type illustrated in [20].

## 14.3 Unless

*Unless* occurs in open conditionals and, less freely, remote ones:

- [52] i *The report will be ready soon unless the printer breaks down again.*  
 ii *He will be in London now, unless the plane was delayed.*  
 iii *She always cycled to work unless it was raining.*  
 iv *I wouldn't suggest such a plan unless I thought it was feasible.*
- } [open]  
 } [remote]

*Unless* means "except if" or, more explicitly, "in all circumstances except if". *Q unless P* thus has the following entailments:

- [53] a. If not-*P*, then *Q*.                      b. If *P*, then not-*Q*.

In other words, not-*P* is a sufficient and necessary condition for *Q*. For example, [52i] entails that if the printer doesn't break down again the report will be ready soon and that if the printer does break down again the report won't be ready soon. The implicature of the remote version, as in [iv], is that not-*P* is false or probably false: [iv] conveys that I do think it is feasible.

An *unless* conditional is often pragmatically equivalent to an *if* conditional with a negative protasis. Compare [52i], for example, with:

- [54] *The report will be ready soon if the printer doesn't break down again.*

If we take *P* and *Q* to have the same values as in [52i] (i.e. *P* = "the printer breaks down again", *Q* = "the report will be ready soon"), then [54] clearly expresses component [a] of [53]: if not-*P*, then *Q*. The [b] component – If *P*, then not-*Q* – comes from what we have called the only-if implicature – hence the pragmatic equivalence between *Q unless P* and *Q if not P*. But there are numerous differences between the two constructions, many places where *unless* cannot replace *if not* and a few where *if not* can't replace *unless*.

### ■ Where *if not* cannot be replaced by *unless*

- [55] i *We're going to the beach this week-end if it doesn't rain – and indeed we may still go even if it does.*  
 ii *If it wasn't exactly a bargain, it wasn't unreasonably expensive either.*  
 iii *I'm cancelling the order if the goods aren't ready yet.*  
 iv *Will you be going to the beach if it isn't fine / if it isn't raining?*  
 v *It'll be better if you don't say where you're going.*  
 vi *If Philip doesn't find a better job and if Paula doesn't get a substantial pay-rise, they won't be able to pay the mortgage.*  
 vii *I'll invite Jill only/even if Kim isn't coming.*

Examples [i–ii] are cases where the only-if implicature doesn't apply: they are therefore inconsistent with the meaning of *unless*. The inadmissibility of *unless* in [iii] is due to *yet*, a non-affirmative item. While *yet* is permitted in the “If not-*P*, then *Q*” part of the meaning of *unless* conditionals (the part expressed in [55iii]), it is not compatible with the other component, “If *P*, then not-*Q*”: \**If the goods are ready yet I'm not cancelling the order*. In [iv] the conditional adjunct falls within the scope of a question – but the question relates only to the “If not-*P*, then *Q*” component, not to “If *P*, then not-*Q*”. *Unless* is not wholly excluded from questions, but it occurs only in biased ones, such as *How can you ever face them again unless you apologise?*, which conveys that I think you won't be able to face them again unless you apologise. Example [v] involves a comparison between the current state of affairs and one in which the condition is satisfied: again, then, it is only the “If not-*P*, then *Q*” component that is of concern. The inability of *unless* to substitute for *if not* in [vi–vii] matches the general behaviour of *except*. For [vi] compare \**Unless Philip finds a better job and unless Paula gets a substantial pay-rise, they won't be able to pay the mortgage* and \**They've questioned everybody except Kim and except Pat*. Instead the coordination has to be within the complement of the preposition: *unless Philip finds a better job and Paula gets a substantial pay-rise and except Kim and Pat*. Similarly, [vii] may be compared with \**They are inviting only/even everybody except Jill*.

### ■ Where *unless* can't be replaced by *if not*

- [56] i *I'm going climbing tomorrow unless it's wet, in which case I'll do my tax-return.*  
 ii *We can go now unless you would rather wait till it stops raining.*

In [i] *in which case* is a relative phrase with the positive clause *it's wet* as its antecedent: the relative clause is interpreted as “If it is wet I'll do my tax-return”. The version with *if it's not wet* as adjunct has a negative subordinate clause and hence would not provide the appropriate antecedent. In [ii] *would rather* is a positively oriented polarity-sensitive item: it is not normally possible with negatives, and hence not with *if not*.

## 14.4 Other explicitly or implicitly conditional constructions

### (a) Reduction of the complement of the conditional preposition

We have been concerned so far with constructions where *if* (or *unless*) has a full content clause as complement. Other possibilities are illustrated in:

- [57] i *This product will/would stay fresh for two weeks, if kept refrigerated.*  
 ii *There'll probably be a vacancy in June; if so, we'll let you know.*  
 iii *We may be able to finish tomorrow; if not it will certainly be done by Friday.*

- iv *You won't get your money till next month, if then.*
- v *Some, if not all, of your colleagues will disagree with that view.*
- vi *We'll get it finished by tomorrow if necessary/possible.*

In [i] the protasis has the form of a past-participial. This is found in both open and remote constructions: the full versions would be *if it is kept refrigerated* and *if it were kept refrigerated*. Past-participials are found also with *unless*: *Do not take any further action unless requested to do so*. In [ii–iii] the protasis is a pro-form standing for a clause (cf. Ch. 17, §7.7.2) with *so* positive and *not* its negative counterpart. *If so* is interpreted as “if there is a vacancy in June”, *if not* as “if we aren’t able to finish tomorrow”. Examples [iv–v] illustrate the construction where an *if* phrase serves to cancel an implicature of the apodosis. On its own, *you won't get your money till next month*, for example, implicates that you will get your money next month: *if then* indicates that you may not get it even then. In [vi] the protasis is an AdjP headed by one or other of the modal adjectives *necessary* and *possible*. They can be modified (*if absolutely necessary*, *if at all possible*), but not replaced by other adjectives (*\*if useful*). The understood clausal subject can be reconstructed from the apodosis: “if getting it finished by tomorrow is necessary/possible”.

#### Condition and concession

With other predicative elements than *necessary* and *possible*, the adjunct may have a concessive interpretation. Compare:

- [58] i *The house is sumptuous, if slightly smaller than we'd have liked.*
- ii *She is bright, if not a genius.*

Example [i] has only a concessive reading, with *if* equivalent to *though*. In [ii], where both apodosis and protasis contain related scalar predicatives and the protasis is negative, two clearly distinct interpretations are available. One is concessive, matching that of [i]: “She is bright, though she is not a genius”. The other is conditional: it can be glossed as “She is bright, perhaps even a genius” or “If she is not a genius, she is at least bright”. In the concessive reading *P* is assumed to be true, while the conditional reading leaves it open whether *P* is true or false.

#### If only

- [59] i *I'll go with them, if only to get some exercise.*
- ii *It was hard work, if only because of the searing heat.*

There is a use of *if only* distinct from that considered in §14.1.3 above, one where the scopal focus of *only* is a single element of clause structure – a purpose adjunct in [i], a reason adjunct in [ii]. Example [i] says that I will go with them, but concedes that my only purpose might be to get some exercise. Similarly [ii] says it was hard work, though maybe the only reason was that it was so hot. The same meaning can be expressed by the form *if for no other reason than . . .*

#### (b) If . . . then

When placed at the front of the matrix an *if* adjunct is often followed by a correlative *then*, especially in cases where the connection is inferential:

- [60] *If it wasn't Jill who left the gate open then it must have been Nat.*

This *then* occurs predominantly in main clauses; in embedded contexts it is often of questionable acceptability: *‘Since if it wasn’t Jill who left the gate open, then it must have been Nat, we’d better call him in for questioning.’*

### (c) Other items governing content clause protases

A handful of words or expressions can be used instead of *if* in conditional adjuncts:

- [61] i *provided*      *as/so long as* –T      *on condition*  
 ii *assuming*      *supposing*                      *in the event*      *in case* –T
- [62] i *The meeting will start at 5.30, provided (that) there is a quorum.*  
 ii *You can go wherever you like, as long as you are back by 7.*  
 iii *You may borrow the book on condition (that) you return it tonight.*  
 iv *Assuming (that) everybody agrees, the project will get under way next month.*  
 v *The announcement would look well in ‘The Times’, supposing (that) one were to waste money in that way.*  
 vi *In the event (that) they are again indicted their case will be randomly assigned to a federal judge.*  
 vii *You can call this toll-free number in case you need emergency service.*

Items in [61] marked ‘–T’ exclude the subordinator *that* in the content clause; with the others it is optional. The underlined expressions in [i–iii] express necessary and sufficient conditions: they are equivalent to *if and only if*. *Assuming* and *supposing* are verbs heading gerund-participial clauses. The conditional use of *in case* is rare (especially in BrE) in comparison with its use as head of a reason adjunct (with an implicature of purpose): *Many shoppers are starting to hold back on spending in case the economy falters*, “because of / to guard against the possibility that the economy might falter”. The close relation between the two uses is seen in an example like:

- [63] *All major airlines that travel between Canada and Britain have contingency plans to reroute airplanes in case negotiations fail.*

The *in case* phrase can be construed as a reason adjunct in the *have* clause (saying why they have contingency plans), or a conditional adjunct in the *reroute* clause (giving the condition under which the planes would be rerouted).

### (d) Constructions with phrases rather than clauses

The expressions *in the event* and *in case* from [61] can license PP complements as well as content clauses (*In the event of a tie, the chair shall have a casting vote*) – and the verb *assuming* can take an NP (*assuming favourable weather*, “if the weather is favourable”). Other conditional expressions taking phrasal complements include *barring* and *but + for* (this latter occurring in the remote construction), and there are also PPs whose conditional role derives from the meaning of a noun contained within them, such as *case* or *condition*:

- [64] i *Barring any further delays, the project should be completed on time.*  
 ii *But for this hitch, the project would have been completed on time.*  
 iii *In that case / On that condition I will / would accept your offer.*

## (e) Relative constructions with conditional interpretations

- [65] i *Anyone who thinks they can take advantage of us will be disappointed.*  
 ii *Anyone who thought they could take advantage of us would be disappointed.*

Constructions where a relative clause is embedded within an NP with *any* as determiner can be paraphrased by conditional constructions: *If anyone thinks they can take advantage of us, they will be disappointed.* It is just possible to have modal preterites in the relative and matrix clauses, as in [ii], which corresponds to the remote conditional *If anyone thought they could take advantage of us they would be mistaken.*

## (f) Coordinate and juxtaposed constructions with conditional interpretations

- [66] i *Say that again and you're fired.*  
 ii *Ask them to stay after five, they'll demand 50% overtime.*  
 iii *One more remark like that and you're fired.*  
 iv *Hurry up or we'll miss the train.*  
 v *Either you agree to my terms or the deal is off.*  
 vi *Suppose I had the same number of peas as there are atoms in my body, how large an area would they cover?*

Constructions such as these do not have the form or literal meaning of conditionals, but they serve indirectly to convey conditional meaning. In [i] we have an *and*-coordination where the first coordinate is an imperative; it is not taken as a directive to say that again, however, but as a conditional threat: “If you say that again you’re fired”. Example [ii] is similar except that the clauses are merely juxtaposed rather than coordinated: “If you ask them to stay after five they’ll demand 50% overtime”. In [iii] the first coordinate is simply an NP, but we understand “If you make one more remark like that, you’re fired”. In [iv] the coordinator is *or*, and this time the implicated conditional is arrived at by negating the first coordinate: “If you don’t hurry up, we’ll miss the train”. Similarly in [v], where the first coordinate is declarative: “If you don’t agree to my terms the deal is off”. (See Ch. 10, §9.5, and Ch. 15, §§2.2.3–4, for further analysis of such indirect speech acts.)

Example [66vi] illustrates a special use of the verb *suppose*. The first clause is again syntactically imperative, but it is pragmatically equivalent to an *if* phrase: “If I had the same number of peas as there are atoms in my body, how large an area would they cover?” The clause following the imperative *suppose* clause is characteristically interrogative. Indeed, the *suppose* clause often stands on its own with question force: *Suppose I hadn't brought along enough money?*, “What would we do if I hadn’t brought along enough money?” *Supposing* is often used in this way too: *Supposing he was seen?*, “What would happen if he was seen?”

## (g) NPs

- [67] i *The appointment of his nephew as finance minister will/would be a mistake.*  
 ii *A ban on federal funding for stem cell research will/would be very damaging.*  
 iii *Any contribution towards defraying our costs will/would be most appreciated.*  
 iv *With another \$100,000 he will/would be able to buy that luxurious town-house.*

The NPs functioning as subject in [i–iii] and complement of *with* in [iv] do not refer to any actual appointment, ban, contribution, or sum of money, and the clauses are again interpreted as conditionals – open or remote according to the form of the verb. Example [i], for instance, can be glossed as “If his nephew is appointed finance minister, this will be a

mistake” (open) or “If his nephew were appointed finance minister, this would be a mistake” (remote). Compare [iv] with non-conditional *With the \$500,000 inherited from his father he bought a luxurious town-house*, where the underlined NP is referential.

### 14.5 Scope, focus, and stacking

A conditional adjunct generally has scope over a negative in the matrix, but there are also cases where the negative has scope over the adjunct. Compare, then:

- [68] i *We won't go bankrupt if we budget carefully.* [wide scope adjunct]  
 ii *We won't go bankrupt if we get the carpets cleaned.* [wide scope negative]

We understand from [i] that our not going bankrupt will be a consequence of our budgeting carefully; the negative is entirely within the apodosis, and we could substitute a pragmatically equivalent positive: *We will overcome our financial problems if we budget carefully*. But the interpretation of [ii] is that going bankrupt will not be a consequence of getting the carpets cleaned. Example [i] can be analysed as “If P, then Q”, where Q happens to be negative, but [ii] has the meaning “not [If P, then Q]”.<sup>29</sup> In [ii] *if* could be replaced by *because*. Wide scope negation is not possible with *only/even if, unless*, or *provided*.

Because conditional adjuncts generally have wide scope, they do not readily occur as focus in alternative questions, contrastive negation, or clefts:

- [69] i *Do you fill in this form if you're a citizen or if you're an alien?*  
 ii *Here you don't get promoted if you show initiative but if you put in long hours.*  
 iii *It's if Herbert is appointed that I foresee trouble.*

Such constructions tend to be avoided in favour of non-conditionals – e.g. *Is this form for citizens or for aliens?*; *Here you don't get promoted for showing initiative but for putting in long hours*; etc. The cleft type is greatly improved by the addition of *only*: *It's only if Herbert is appointed that I foresee trouble*. *Unless* is impossible in all three constructions.

There is no interrogative word with conditional meaning: questioning requires a PP containing a noun with the appropriate meaning: *Under what conditions / On what terms would you agree to sell?*

#### Stacking

The conditional construction is recursive in that an *if* phrase can occur at successive layers in the constituent hierarchy:

- [70] *If the proposal is adopted prisoners will be entitled to a personal TV set if they enrol for a course at the Open University.*

*If the proposal is adopted* functions at the first layer, having scope over the rest of the sentence, while *if they enrol for a course at the Open University* functions at the second layer, modifying *prisoners will be entitled to a personal TV*. Recursion of this kind is known as **stacking**. Stacking of conditional adjuncts is comparatively rare: the resultant construction tends to be somewhat hard to process, especially if the conditional adjuncts are adjacent.

<sup>29</sup>This then is one of the cases alluded to in footnote 20, where the grammatical apodosis doesn't match the logical consequent: *we won't go bankrupt* is the apodosis but it doesn't express the consequent. Another case is that where the conditional adjunct is within the scope of the quantification implied in a multiple situation as in [16], *She cycled to work if she got up early enough*.

## 14.6 Exhaustive conditionals

The exhaustive conditional construction is illustrated in:

- |      |  |  |
|------|--|--|
| [71] | GOVERNED   | UNGOVERNED   |
|      | i a. <i>I'm buying it [regardless of <u>whether we can really afford it (or not)</u>].</i> | b. <i>I'm buying it [<u>whether we can really afford it or not</u>].</i> |
|      | ii a. <i>The business will fail [no matter <u>who takes over as manager</u>].</i>          | b. <i>The business will fail [<u>whoever takes over as manager</u>].</i> |

Both versions of [i] are equivalent to *I'm buying it if we can really afford it and I'm buying it if we can't really afford it*: I'm buying it under either of these two conditions. These two conditions constitute an exhaustive set: one of them must be satisfied. This is the motivation for applying the term **exhaustive conditional** to this construction. This type of adjunct is semantically non-restrictive (i.e. it can be dropped without affecting the truth of the proposition expressed): [ia/b] both entail that I'm buying it.

All four of the examples in [71] contain a subordinate clause, but in [ia/iiia] the subordinate clause is complement of a preposition while in [ib/iib] it functions immediately, directly, as an adjunct in clause structure. We will therefore distinguish these two subtypes of exhaustive conditional as respectively **governed** and **ungoverned**. We will look first at the syntactically more straightforward governed construction, and then return to the ungoverned one in §14.6.2.

### 14.6.1 The governed construction

Here the adjunct has as head one of the items in [72]:

- [72] *independently*                      *irrespective*                      *regardless*                      *no matter*

*Independently* is an adverb, *irrespective* and *regardless* (as used here) prepositions, while *no matter* is an idiom with the form of an NP which might be regarded as having been reanalysed as a preposition. *No matter* takes a subordinate clause as complement, as in [71iia], while the others normally take *of* + subordinate clause, as in [ia].

The subordinate clauses are uncontroversially interrogative. They can be either closed, marked by *whether*, or open, marked by one of the interrogative words *who*, *what*, *which*, *when*, *where*, etc. By virtue of the meaning of the items in [72] the adjunct indicates that the answer to the question corresponding to the subordinate interrogative has no bearing on the matrix. Thus [71ia], with a closed interrogative, allows for two possibilities, one where we can afford it, one where we can't, but in either case I'm buying it. The open interrogative in [iia] allows for an open-ended set of possibilities, one for each possible new manager, but in any of these cases the business will fail.

#### ■ The exhaustiveness presupposition

The answers to the question corresponding to the interrogative clause define an exhaustive set of cases in the sense that one of them must apply. For example, [71iia] presupposes that someone will take over as manager, just like the corresponding question "Who will take over as manager?" Or consider such an example as *I'll be attending the meeting regardless of whether it is held on Thursday or Friday*. In one salient interpretation the interrogative corresponds to the alternative question "Will the meeting be held on Thursday or Friday?", where the answers are "Thursday" and "Friday". Although there are in

principle other possible days, the presupposition here is that the meeting will in fact be held on one or other of these two days, so again all real possibilities are provided for, and it follows that I will be attending the meeting.

#### ■ Definite NP complement in lieu of open interrogative clause

[73] *I'm buying it [regardless of what the price is] / [regardless of the price].*

We also find definite NPs in the governed construction. The alternation seen in [73] is the same as we have in other environments permitting subordinate interrogatives: *I don't know what the price is / the price*. The NP is interpreted in the same way as the interrogative, and for this reason it is sometimes referred to as a 'concealed question' (cf. Ch. 11, §5.3).

### 14.6.2 The ungoverned construction

Here the adjunct has the form of a subordinate clause (or clause-coordination). The syntactic analysis of these clauses is discussed in Ch. 11, §5.3.6, where it is argued that they are best treated as interrogative, with the open type, however, displaying significant formal resemblances to fused relatives, giving them something of the character of a relative–interrogative blend. The exhaustive conditional is the only place where interrogative clauses function as adjunct rather than complement.

#### ■ The closed type

Closed interrogatives in the ungoverned construction are a subset of those found in the governed one: they must contain an *or*-coordination. Compare:

[74]	GOVERNED	UNGOVERNED
i	a. <i>I'm buying it [regardless of <u>whether we can afford it</u>].</i>	b. * <i>I'm buying it [<u>whether we can afford it</u>].</i>
ii	a. <i>I'm buying it [regardless of <u>whether we can afford it or not</u>].</i>	b. <i>I'm buying it [<u>whether we can afford it or not</u>].</i>
iii	a. <i>He'll resign [regardless of <u>whether he is found guilty or innocent</u>].</i>	b. <i>He'll resign [<u>whether he is found guilty or innocent</u>].</i>

Closed interrogatives characteristically express questions that can be distinguished as polar or alternative on the basis of how they define the set of answers (cf. Ch. 10, §§4.3–5). Compare the main clauses:

[75]	i <i>Can we afford it?</i>	[polar]
	ii <i>Can we afford it or not?</i>	} [alternative]
	iii <i>Will he be found guilty or innocent?</i>	

The answers to a polar question consist of the proposition expressed in the question itself together with its polar opposite. The answers to the question in [i], for example, are "We can afford it" and "We can't afford it". The answers to an alternative question are all expressed in the question itself: it contains an *or*-coordination where each coordinate represents one answer. In the case of [iii], for example, the answers are "He will be found guilty" and "He will be found innocent". Example [ii] belongs with [iii] rather than [i] in that the answers are given by the coordinates linked by *or*, just as they are in [iii].

The constraint that excludes [74ib] while allowing [74iib/iiib] can therefore be stated as follows:

[76] The closed interrogative in the ungoverned construction must correspond to an alternative question.

The presence of an *or*-coordination is not itself sufficient. *Will one or other of your colleagues be elected?*, for example, can only express a polar question: the answers are “Yes, one or other of them will be elected” and “No, one or other of them won’t be elected”, not “One of them will be elected” and “\*Other of them will be elected”. The corresponding ungoverned exhaustive conditional is therefore excluded: *\*I’ll be happy whether one or other of your colleagues is elected.*

It should also be noted that in the alternative question type, the interrogative subordinator can only be *whether*, not *if*. In conditionals, *if* can only have its primary, conditional meaning, so that *I won’t serve on the committee if you’re on it or if I’d be expected to chair it* does not belong to the exhaustive conditional construction. *If* is excluded from the governed construction too, but that follows from the general rule that *whether* is normally required in closed interrogatives functioning as complement of a preposition.

### ■ The open type

In the open construction there is a major difference in form between the governed and ungoverned subordinate clauses: the interrogative word in the latter is compounded with *·ever*. Elsewhere *ever* is associated with interrogative words only in an emotive sense (and is usually though not always written as a separate word), but in the exhaustive conditional it has a ‘free choice’ sense. Compare:

[77] i *What ever did she give him?* [emotive *ever*]  
 ii *Whatever she gave him, he grumbled.* [free choice *ever*]

In [i] *ever* is comparable to *on earth* and suchlike expressions, whereas in [ii] the meaning is comparable to that of *any* in its free choice sense: for any value of *x* in “she gave him *x*”, he grumbled.<sup>30</sup> In the governed construction this free choice meaning is expressed by the governing item, *regardless, irrespective, no matter, independently*; in the ungoverned construction it is expressed within the interrogative word. The meaning of [ii] is thus the same as that of *No matter what she gave him, he grumbled.*

#### Relationship with fused relatives

Free choice *·ever*, we have noted, does not appear elsewhere in interrogative clauses, but it is found in fused relatives. In terms of its form the ungoverned open exhaustive conditional resembles a fused relative, but it differs sharply in its external syntax and meaning. Compare:

[78] i a. *The business will fail whoever takes over as manager.* [conditional]  
 b. *Whoever takes over as manager will have a hard job ahead.* [fused relative]  
 ii a. *Whatever she gave him, he grumbled.* [conditional]  
 b. *Whatever she gave him he devoured voraciously.* [fused relative]

In [i], the conditional is a clause functioning as adjunct while the fused relative is an NP functioning as subject. Unlike the conditional, the fused relative here denotes a person: it

<sup>30</sup>The matrix may restrict the range to which the free choice applies, as in *Whatever (else) that bird is, it isn’t a kookaburra*. The implicature here is that I don’t know what the bird is, but I do know it isn’t a kookaburra.

might be roughly analysed as “the/any person  $x$  such that  $x$  takes over as manager”. Unlike the fused relative, the conditional contrasts on one dimension with a closed interrogative (cf. *The business will fail whether Smith or Jones takes over as manager*) and on another with a governed construction containing an open interrogative (cf. *The business will fail irrespective of who takes over as manager*). Similarly in [ii]; here the fused relative is interpreted (by virtue of its relation to the matrix verb *devour*) as denoting food. We noted in §14.4 a close relationship between (non-fused) relative constructions containing free choice *any* and ordinary conditionals, and there is likewise a close relationship between fused relatives with free choice *ever* and exhaustive conditionals. Thus [ib] is equivalent to *The person, whoever it is, who takes over as manager will have a hard job ahead*, where the underlined sequence is an interrogative in exhaustive conditional function.

With *wherever* and *whenever* the difference in meaning between the exhaustive conditional and fused relative constructions is less obvious but nonetheless real:

- [79] i a. *You must get this message to him, wherever he is.* [conditional]  
 b. *Put it back wherever you found it.* [fused relative]  
 ii a. *I’m determined to go to the wedding, whenever it is.* [conditional]  
 b. *He blushes whenever he sees her.* [fused relative]

Example [ia] means “Irrespective of where he is, you must get this message to him”, while [ib] means “Put it back in the place where you found it”. Similarly [iia] means “I’m determined to go to the wedding, no matter when it is held”, and [iib] means “He blushes on any occasion when he sees her”.

#### Restricted range of interrogative words

- [80] i \**Whyever he behaved as he did, he owes us an apology.*  
 ii *Regardless of why he behaved as he did, he owes us an apology.*

Free choice *ever* cannot combine with *why* in ungoverned exhaustive conditionals any more than it can in fused relatives; in [80], therefore, only the governed version is available. The ungoverned conditional further resembles the fused relative in that it allows only one *ever* compound (except in coordination).

### 14.6.3 Further issues

#### ■ Reduction of the subordinate clause

- [81] i a. *However arbitrary the decision, you can’t change it.*  
 b. *Such proposals, however promising, must be uncompromisingly rejected.*  
 ii a. *Whether eaten raw or cooked, fennel is good for you.*  
 b. *Whether intentionally or not, she had deeply offended him.*

The subordinate clause may be reduced to a non-finite or verbless construction. Example [ia] is reduced by the omission of the verb *be* to a structure consisting of predicative + subject, while the subordinate clause in [ib] consists just of the predicative element: we understand “however promising they might be”. The adjunct in [iia] is a past-participial, while that in [iib] is verbless. These examples are of the ungoverned construction; to a lesser extent reduction is found also in the governed construction, especially with *no matter* (cf. *Such proposals, no matter how promising, must be uncompromisingly rejected*).<sup>31</sup>

<sup>31</sup>*No matter* also allows the interrogative to be reduced idiomatically to *what*: *He wouldn’t go back, no matter what*, “no matter what might happen”.

### ■ Subjunctive form and modal *may*

The subordinate clause in an exhaustive conditional may have subjunctive form:

- [82] i *Whenever and wherever a number of human beings are gathered for a common purpose – whether it be a sporting club or a multinational corporation, a Kindergarten committee or a state – there will inevitably be a struggle for power.*  
 ii *Whatever republican model be proposed, it is unlikely to be approved at the referendum.*  
 iii *There isn't a single state-subsidised company, be it drama or opera or dance, that is not in a state of crisis.*

This construction belongs to relatively formal style and is virtually restricted to the verb *be*, but within those limitations it is by no means uncommon, especially in the ungoverned construction, as in these examples. As illustrated in [iii], an alternant of the *whether* construction with *be* has inversion instead of a subordinator.<sup>32</sup> The structural relation between *whether it be good or bad* and *be it good or bad* is comparable to that between *if it were possible* and *were it possible*.

The variable question construction very often contains the epistemic modal *may*:

- [83] *Whatever people may say, my mind is made up.*

The possibility meaning of *may* ties in with the fact that all possible answers to the question “What will/do people say?” are allowed for.

### ■ Remote exhaustive conditionals

All our examples so far have been of open conditionals; the remote construction is also possible, though quite rare:

- [84] [*Whatever / Irrespective of what we had decided,*] *someone would have objected.*

### ■ Analogous constructions

- [85] i *It doesn't matter what we say: he's going to give up the course anyway.*  
 ii *Believe it or not, Eric has been short-listed for a managerial position.*  
 iii *Say what you like: it's a big improvement on his last effort.*

Example [i] is equivalent to *No matter what we say / Whatever we say, he's going to give up the course (anyway)*, but *it doesn't matter what we say* is a main clause, not an adjunct embedded within a matrix clause. Similarly in [ii–iii], where the underlined element is an imperative; they can be glossed as “whether you believe it or not” and “whatever you say”.

## 15 Domain adjuncts

Adjuncts of this kind restrict the domain to which the rest of the clause applies:

- [1] i *Economically, the country is in sharp decline.*  
 ii *Officially, we shouldn't really be discussing the matter.*  
 iii *As far as the law is concerned, what he did is not a crime.*  
 iv *From a linguistic point of view, there are no primitive languages.*

<sup>32</sup> Compare also the idiomatic historical relic *come what may* (with a fused relative as subject of *come*), “whatever happens”.

Example [i] does not entail that the country is in sharp decline: it might be, for example, that the country's cultural life is flourishing. The property of being in sharp decline is thus ascribed to the country only with respect to the economic domain. The clause usually expresses a state, but occurrences are not excluded, as in *From an economic perspective, we acted foolishly*.

### ■ Realisation

Domain adjuncts generally have the form of AdvPs or PPs of the following kinds:

- [2] i AdvP *morally, weatherwise*  
 ii PP *from a moral point of view / perspective, as far as the weather (is concerned), as regards the weather, regarding the weather, with respect to the weather*

Adverbs are mostly derived from adjectives by suffixation of *-ly* (or *-ally*), but there are also (especially in AmE) those formed from nouns by suffixation of *-wise*. Domain adverbs are not gradable and cannot be lexically negated: *very morally* and *immorally*, for example, do not function as domain adjuncts. Clauses with a de-adjectival adverb as domain adjunct cannot be paraphrased by clauses with a predicative adjective applying to a clausal subject: compare [1i] with *\*It is economic that the country is in sharp decline*. Omission of *be concerned* from the PP frame *as far as . . . be concerned* is increasingly common in speech: *We're a lot better off than we were, as far as conditions of work*; *As far as dealing with teenagers, he doesn't have a clue*. This construction is still widely condemned by prescriptivists, and generally avoided in formal style.

In addition to AdvPs and PPs of the above kinds, we also find gerund-participials and past-participials with appropriate verbs: *economically speaking, speaking economically, considering the matter from an economic point of view, considered / looked at from an economic perspective*, and so on. There are also adjuncts belonging to other semantic categories which simultaneously serve to restrict the domain, notably adjuncts of spatial location and a narrow range of conditional constructions:

- [3] i *In this country giving bribes to secure foreign contracts is permitted.*  
 ii *If we consider the matter from an economic point of view, the country is in sharp decline.*

Omitting *in this country* from [i] would result in a statement understood to apply universally: it is for this reason that the adjunct can be regarded as defining the domain to which the residue applies rather than merely adding a specification of location.

### ■ Focus and questioning

Domain adjuncts can be the focus of a question, of negation, and in a cleft construction, and the PP type allows for occasional questioning:

- [4] i *Can the country stand on its own feet economically?*  
 ii *Linguistically but not ethnically the inhabitants have much in common with their northern neighbours.*  
 iii *It is only from an economic-rationalist viewpoint that the policy is defensible.*  
 iv *From what point of view, then, do you think the country is in decline?*

## 16 Modal adjuncts

### ■ Kinds of modality

Adverbs such as *necessarily*, *probably*, *possibly*, *surely* belong among the quite diverse set of forms expressing modal meaning (see Ch. 3, §9.1). Other items in the set include verbs, especially the modal auxiliaries, and adjectives, such as *necessary*, *probable*, etc. Verbs function as predicator, and in complement position adjectives too are predicative, so in these two cases the modality is expressed by means of predication, whereas the adverbs typically involve modification. Compare:

- |     |  |  |
|-----|--|--|
| [1] | MODAL PREDICATION  | MODAL MODIFICATION                                   |
|     | i a. <i>He <u>must</u> have made a mistake.</i>            | b. <i>He has <u>surely</u> made a mistake.</i>       |
|     | ii a. <i>They <u>should</u> be in Berlin by now.</i>       | b. <i>They are <u>probably</u> in Berlin by now.</i> |
|     | iii a. <i>It is <u>possible</u> that they are related.</i> | b. <i>They are <u>possibly</u> related.</i>          |

The adjunct may indeed combine with a verb in what we have called modal harmony, i.e. with dual or reinforced expression of a single modal meaning: *He must surely have made a mistake*; *They should probably be in Berlin by now*.

We saw in Ch. 3, §9, that modal auxiliaries can be used to express a range of different kinds of modality, epistemic, deontic, or dynamic. Modal adjuncts, however, are predominantly used for epistemic modality, where it is a matter of the speaker's assessment of the truth of the proposition expressed in the residue or the nature of the speaker's commitment to its truth. Modal adjuncts are not used to express deontic modality (obligation, permission, etc.). Compare, for example:

- |     |  |  |
|-----|--|--|
| [2] | i a. <i>You <u>must</u> return it to her tomorrow.</i> | b. <i>You <u>surely</u> return it to her tomorrow.</i> |
|     | ii a. <i>He <u>can/may</u> stay until six.</i>         | b. <i><u>Possibly</u> he stays until six.</i>          |

In the salient interpretation of [ia] I impose on you the obligation to return it to her tomorrow, but [ib] cannot have this deontic meaning: *surely* has an epistemic meaning and the present tense is interpreted as a futurate: "Surely the arrangement is that you return it to her tomorrow". The intended interpretation of [iia] is that he has permission to stay until six, but again [iib] can't have that deontic meaning: it has an epistemic reading combining with either a multiple situation ("Perhaps he habitually stays until six") or a futurate ("Perhaps the arrangement is that he stays until six").

Modal adjuncts are, indeed, often referred to as 'epistemic adjuncts'. We prefer the more general term because in spite of the above restrictions there are some uses that fall outside the epistemic category. Compare, for example, the two uses of *necessarily* in:

- |     |   |
|-----|---|
| [3] | i <i>You're his uncle, so <u>necessarily</u> he's your nephew.</i>  |
|     | ii <i>Twice as many people turned up as we had been told to expect, so <u>necessarily</u> things were a little chaotic for a while.</i> |

In [i] *necessarily* has an epistemic interpretation: given that the proposition "You're his uncle" is true, the proposition "He's your nephew" is necessarily true: its truth is absolutely guaranteed. In [ii], by contrast, it's not a matter of the truth of one proposition following from that of another, but of one situation being the result of another: the unexpectedly large number of people caused the chaos. *Unavoidably* could substitute for *necessarily* in [ii], but hardly in [i]. Examples like [ii] can be included in the category

we have called dynamic modality, here a matter of the interaction between one situation and another.

Note also that while modal adjuncts are not used deontically on their own, *possibly* can be used in modal harmony with deontic *can* in requests for permission or action:

- [4] i *Could I possibly borrow your bicycle for half an hour?*  
 ii *Could you possibly come a little earlier next week?*

Consider, finally, the adverb *hopefully*, as used in:

- [5] *The good weather will hopefully last for another week.*

Here we are concerned not with knowledge and probability but with desire. This is a type of modality not expressed by the modal auxiliaries, though it has some connection with deontic modality: if I say *You must come in now* this is likely to imply that I want you to come in now.<sup>33</sup>

### ■ Strength of modality

In discussing the meanings of the modal auxiliaries we distinguished three levels of strength, according to the speaker's commitment to the truth of the proposition, or to the actualisation of the situation, expressed by their complement. *Must*, *need*, *will*, and *shall* are strong, *should* and *ought* are medium, *can* and *may* are weak. *Necessarily*, *probably*, *possibly* are then examples of adverbs belonging respectively to the three categories.

Modal adverbs, however, are considerably more numerous than the auxiliaries, and are not so easily classified on this dimension. In the following list, we distinguish four levels, adding a 'quasi-strong' category between the strong of *necessarily* and the medium of *probably*:

- [6] i *assuredly*      *certainly*      *clearly*      *definitely*      *incontestably*  
           *indubitably*    *ineluctably*    *inescapably*    *manifestly*      *necessarily*  
           *obviously*      *patently*      *plainly*      *surely*      *truly*  
           *unarguably*    *unavoidably*    *undeniably*    *undoubtedly*    *unquestionably*  
 ii *apparently*    *doubtless*      *evidently*      *presumably*    *seemingly*  
 iii *arguably*      *likely*          *probably*  
 iv *conceivably*    *maybe*      *perhaps*      *possibly*

Some of these show the familiar contrast between manner and non-manner uses:

- [7]                    MANNER ADJUNCT                    MODAL ADJUNCT  
 i a. *I could see her clearly.*                    b. *He had clearly been irresponsible.*  
 ii a. *He was flirting too obviously.*                    b. *He was obviously flirting.*

But such items are in the minority: most of the adverbs in [6] do not occur with a matching manner use.

The strong items (of which [6i] gives only a sample) commit the speaker to the truth of the modalised proposition. An unmodalised assertion such as *Kim chaired the meeting* or *Pat is in love* also commits me to the truth of the propositions expressed: addition of a strong modal adjunct emphasises that commitment or makes it more explicit. *Kim*

<sup>33</sup>The modal use of *hopefully* (as distinct from the manner use of *He was looking hopefully around*) was quite rare until around the 1960s, when it acquired considerable popularity, but also aroused strong (in some cases quite intemperate) opposition from conservative speakers. It has become thoroughly established, and the opposition has abated somewhat in the last few years.

*definitely chaired the meeting* suggests a context in which the truth of the proposition had been questioned; *Pat is obviously in love* presents the truth as easily perceived. *Surely* is a borderline member of this category: it may suggest less than complete certainty, and is often used with an implicit request for confirmation by the addressee. *Unavoidably* and *ineluctably* are concerned with the actualisation of situations rather than the truth of propositions.

Turning now to the weak category, [6iv], the main members, *maybe*, *perhaps*, *possibly*, indicate that the proposition is not known to be false, with the chances of its being true falling in the range from slight to more or less fifty-fifty. They thus readily occur in combination with a proposition and its negation: *Maybe he told her, maybe he didn't*. The form of the informal idiom *as like as not* would lead one to expect that it too belonged in this category, but in fact the meaning is close to “probably”. *Conceivably* puts the chances at the low end of the scale.

*Probably* explicitly allows for the possibility that the proposition is not true, but rates the chances of its being true as greater than even. It can occur in contexts like:

- [8] i *He may be still in his office, but he's probably gone home by now.*  
 ii *He's probably gone home by now, though he could be still in his office.*

In abstraction from the modality, the propositions are inconsistent, but the weak modal in one and the medium modal in the other allow them to be combined without contradiction. *Likely* has the same meaning but differs syntactically in BrE in that it more or less requires a modifier, as in: *He has quite likely gone home by now*. *Arguably* indicates that an argument can be mounted for accepting the proposition as true, and implies that I find such an argument plausible or persuasive.

*Apparently*, *seemingly*, and *presumably* in [6ii] indicate that I don't know, cannot be certain, that the proposition is true: I'm merely judging by appearances or making a presumption. We put these at a higher level on the scale of strength than *probably*, because they do not so directly allow for the possibility that the proposition is false: they suggest a qualified acceptance of the proposition. Note the quite sharp contrast between the first two and the corresponding verbs. We can say, for example, *He appeared to like them but in fact couldn't stand the sight of them*, but not *\*He apparently liked them but in fact couldn't stand the sight of them*. *Evidently* can likewise be used to indicate lack of direct knowledge: *They said they would come, but have evidently changed their minds*. But it can also behave like a class [i] item, meaning much the same as *clearly*, and like it and a number of other class [i] items allows further strengthening by *quite*: *Quite evidently, the man's a fraud*. In spite of its form, *doubtless* belongs at level [ii], not [i]: it is noticeably weaker than *without doubt*.

One adverb not included in the above classification is *allegedly*, as in:

- [9] *Max had allegedly falsified the accounts.*

*Allegedly* absolves me from responsibility for the residual proposition: the latter has the status of an allegation, and I can't say whether it is true. As with *apparently* and *seemingly*, the fact that the qualification is expressed adverbially rather than by a predicative element serves to background it, and make it less accessible to denial. The verbal version *It was alleged that Max had falsified the accounts* readily allows the expression of a contrary view (*but I'm sure he hadn't*), but [9] does not accommodate that kind of continuation.

### Forms with negative affixes

A few modal adverbs contain one of the negative prefixes *in-* and *un-*, but the set of modal adverbs does not contain any pair of opposites. We have *possibly*, but not *impossibly*, *indubitably* and *unquestionably* but not *dubitably* or *questionably*. *Arguably* and *unarguably* are both found but are not opposites, for the former indicates that an argument can be given for the proposition being true, the latter that no argument can be given against it. All the ones with negative prefixes belong in the strong category. Note that *improbably* is not an exception: it does not function as a modal adjunct in examples like *Improbably, he had accepted our proposal without hesitation*. The meaning here is “Improbable as it may seem, he had accepted our proposal without hesitation”: *improbably* is an evaluative adjunct of the type discussed in §17 below.

### ■ Negation

In general, modal adjuncts have scope over a negative:

- [10] i a. She obviously didn't enjoy it.                      b. She didn't enjoy it, obviously.  
       ii a. He probably hasn't told her.                        b. He hasn't told her, probably.

The meaning in [i] (both versions) is “It is obvious that she didn't enjoy it” and in [ii] “It is probable that he hasn't told her”. To bring the modality within the scope of the negation we need to express it predicatively, e.g. *It isn't obvious that she enjoyed it; It isn't likely that he has told her*.

Most modal adjuncts behave in the same way, but there is not complete uniformity. Cases where a negative has scope over the adjunct are seen in:

- [11] i *Those who do best at school aren't necessarily the cleverest.*  
       ii *It wasn't definitely sabotage but that is the most likely explanation.*  
       iii *He couldn't possibly have done it by himself.*

Epistemic *necessarily* occurs much more often within the scope of a negative than otherwise: examples like [3i] above are quite rare in ordinary speech. *Not necessarily* is logically equivalent to *possibly not*, but much more frequent. *Not definitely* is possible, as in [11ii], but it would be more usual to use a predicative construction such as *It is not certain that . . .* The occurrence of *possibly* within the scope of negation is virtually limited to the case where it is in modal harmony with **can**, as in [11iii]; *perhaps* could not replace *possibly* here.

### ■ Questioning of modality

In general, modality is more readily questioned by a predication than a modification construction. Compare:

- [12] i a. Are they likely to be offended?                      b. \*Will they probably be offended?  
       ii a. Is it possible that he was poisoned?                b. Was he perhaps poisoned?

In [i] the [a] version is very strongly preferred over [b], which is very unnatural in most contexts. And in [ii], while [a] clearly questions the modality, the *perhaps* in [b] is likely to be construed as outside the scope of the question: I'm asking if he was poisoned, with *perhaps* indicating that I think that his having been poisoned is a possibility to be considered.

Nevertheless, there are certainly cases where a modal adjunct is in the scope of a question. *Will he probably die?* seems quite reasonable, and *Won't he probably die?* is fully acceptable; the negative question here is biased towards the positive answer *He will probably die*. Similarly, examples like [11], or their positive counterparts, can readily be questioned. Because epistemic *necessarily* predominantly occurs in the scope of a negative, a question like *Are those who do best at school necessarily the cleverest?* is typically biased towards a negative answer.

### ■ Double modality

It is perfectly possible to have more than one modal qualification, but no more than one can normally be expressed by means of an adverb. Compare, for example:

- [13] i *It is certainly possible that he told her. / Certainly he may have told her.*  
 ii *\*Certainly he possibly/perhaps told her.*

### ■ Other forms

A few PPs have meanings very similar to those of adverbs listed above: *without doubt/question, in all probability/likelihood*. There are others with no close adverbial equivalent, such as *in my opinion/judgement*, and the like. *According to Kim* belongs in a group with *allegedly* in absolving me from personal responsibility for the assertion, but specifies who is responsible for it. Parentheticals also very often serve to indicate epistemic status, and conditional adjuncts too can function in this way:

- [14] i a. *You didn't do it on purpose, I'm sure.*  
 b. *One of you, she suggests, should write a report for the local paper.*  
 ii a. *If I'm not mistaken, that's a kookaburra over there.*  
 b. *We're in for a wet week-end if the weather forecast is anything to go by.*

## 17 Evaluative adjuncts

- [1] i *Fortunately the commandos got away before their presence was discovered.*  
 ii *Ironically he did best in the subject he liked least.*  
 iii *Ominously, these two economic trends are connected.*

With adjuncts of this kind the residual proposition is presented as a fact, and the adjunct expresses the speaker's evaluation of it. They are therefore subjective, and in this respect (as in others too) resemble the subjective type of act-related adjunct discussed in §3. There are quite a large number of evaluative adverbs, a sample of which is given in:

- [2]    *absurdly            amazingly            annoyingly            appropriately            bewilderingly*  
       *curiously            disappointingly            fortunately            funnily            happily*  
       *importantly            improbably            inexplicably            ironically            luckily*  
       *mercifully            miraculously            oddly            ominously            paradoxically*  
       *predictably            regrettably            sadly            shamefully            strangely*  
       *surprisingly            thankfully            unaccountably            understandably            unfortunately*

There are also PPs of similar meaning: *to my amazement, by good fortune, contrary to what we'd been led to expect*, and so on.

For the adverbs in [2] (with the exception of *improbably*, *thankfully*, and *unaccountably*) there are two corresponding adjectival constructions:

- [3] i *Amazingly* he escaped with only a scratch. [evaluative adjunct]  
 ii He escaped with only a scratch, *which was amazing*. [supplementary relative]  
 iii *It was amazing* that he escaped with only a scratch. [superordinate adjective]

In [ii] the adjective is predicative in a supplementary relative clause whose subject has the residue as antecedent. In [iii] the residue is embedded as extraposed subject of a clause containing the adjective as predicative complement (there is also a less common variant without extraposition: *That he escaped with only a scratch was amazing*). Construction [ii] is much closer in meaning to [i] than is [iii]. In [iii] the “amazing” feature is foregrounded, with the residue backgrounded, presupposed, whereas in [i] it is the residue that constitutes the main new information. In [ii] the “amazing” feature is backgrounded relative to the residue, as it is in [i], though it still differs by virtue of being expressed predicatively rather than adverbially. Note, for example, that the relative clause can take an interrogative tag: *He escaped with only a scratch, which was amazing, wasn't it?* The adjunct construction doesn't readily take a tag at all because the truth of the residue is not in doubt, but when a tag is used it questions the residue, not the adjunct: *Fortunately, he'll be away for at least three weeks, won't he?*

### ■ Negation

Evaluative adjuncts always take scope over clausal negation, though a few adverbs can take a subclausal negative as part of the adjunct itself:

- [4] i *Surprisingly*, he hadn't been detected. [adjunct has scope over negative]  
 ii \*He hadn't been *surprisingly* detected. [negative has scope over adjunct]  
 iii *Not surprisingly*, he had been detected. [subclausal negation]

In [i] it is the fact that he hadn't been detected that is surprising. In [ii] the negation applies to “Surprisingly he had been detected”, but the result is ungrammatical; [ii] becomes grammatical if *surprisingly* is set apart prosodically from the residue, in which case the meaning is as in [i]. In [iii] *not* has scope only over *surprisingly*: the clause as a whole is positive.

### ■ Residue as asserted information

The residue in the adjunct construction is presented as new, factual information. Such adjuncts do not, therefore, occur in interrogatives, imperatives, or pragmatically presupposed subordinate clauses:

- [5] i \**Did the soldiers fortunately* get away?  
 ii \**Fortunately* catch the last bus.  
 iii \**Since Deidre fortunately* recovered from her illness, she has lived in California.

The *since* of [iii] is intended in its temporal sense. Causal *since* can introduce new information, and hence permits an evaluative adjunct in its complement: *Since she is unfortunately too ill to travel, she can't attend the wedding.*

### ■ Reported speech

[6] *Jill told me she had unfortunately been too ill to attend the wedding.*

Here *unfortunately* expresses Jill's evaluation of the situation, not mine. But it is relatively uncommon for evaluative adjuncts to be retained in reported speech in this way: they are not a central part of what was said and thus liable to be omitted when it is reported.

## 18 Speech act-related adjuncts

The adjuncts considered in this section are more peripheral than any treated so far, inasmuch as they relate not to the situation or proposition expressed in the clause but to the speech act performed in uttering the clause (or to the speech act that is expected as a response). For this reason, they do not have any bearing on the truth value of the statement expressed in the residue.

### ■ Manner adjuncts

Compare first the following examples of manner adjuncts:

- | [1] | SITUATIONAL ADJUNCT   | SPEECH ACT-RELATED ADJUNCT  |
|-----|---|---|
| i   | a. <i>Ed spoke <u>frankly</u> about his feelings.</i>                           | b. <i><u>Frankly</u>, it was a waste of time.</i>                       |
| ii  | a. <i>His daughter spoke <u>briefly</u> about her ordeal.</i>                   | b. <i><u>Briefly</u>, your expenditure must not exceed your income.</i> |
| iii | a. <i>Ruth told me <u>confidentially</u> that she is thinking of resigning.</i> | b. <i><u>Confidentially</u>, Ruth is thinking of resigning.</i>         |

In the [a] examples, the adverb relates to the situation described in the clause containing it: hence the label 'situational adjunct'. Thus *frankly* and *briefly* describe the way in which Ed and his daughter spoke, and *confidentially* specifies the way Ruth told me her news (or the terms under which she told me). In the [b] examples, by contrast, the adverb describes my speech act: [ib] can be glossed approximately as "I tell you frankly that it was a waste of time", and analogously for [iib/iiib]. But the adjunct in [b] is not part of the expression of a proposition and hence doesn't introduce a truth condition: if I'm not in fact speaking frankly, [ib] would be infelicitous, but not actually false.

In questions, the speech act-related adjunct may relate to the question itself or the response it aims to elicit:

- |     |     |   |                      |
|-----|-----|---|----------------------|
| [2] | i   | <i><u>Confidentially</u> / <u>Frankly</u>, what do you think of the plan?</i> | [addressee-oriented] |
|     | ii  | <i><u>Frankly</u>, who gives a damn anyway?</i>                               | [speaker-oriented]   |
|     | iii | <i><u>Briefly</u>, what are the chances of success?</i>                       | [ambiguous]          |

In [i] *confidentially* or *frankly* relates to your response: I'm inviting you to reply in confidence or with frankness. In [ii] *who gives a damn anyway?* is an indirect speech act, a rhetorical question that conveys an assertion ("Nobody gives a damn anyway"), and it's me who is speaking frankly. Non-rhetorical questions are usually addressee-oriented like [i], but as evident from [iii] they also allow a speaker-oriented adjunct: it can be a matter of your giving a brief answer or of my asking a brief or succinct question (here I might be following up on a relatively lengthy utterance of mine or yours).

### Form

Speech act-related manner adjuncts have the form of AdvPs, as in [1–2], or PPs, such as *in brief*, *in all honesty*, etc. We also find gerund-participials in which the verb *speak* is modified by an adverb: *Candidly speaking*, *they both drink far too much*. Here *candidly* is a situational manner adjunct within the subordinate clause, and the subordinate clause as a whole is a speech act-related adjunct within the matrix clause.

### ■ Purpose, reason, concession, and condition

There are various other kinds of adjunct that can relate to the speech act as well as functioning ordinarily to give information about the situation described in the clause.

- [3] i *To cut a long story short*, Ed accepted their offer and left the country.  
 ii *Well, since you ask*, I shan't be seeing her again.  
 iii *Dick's coming to the party, in case you're interested*.  
 iv *Jill's on the verge of a breakdown, though I don't suppose you could care less*.  
 v *If you must know*, I wasn't even short-listed.

In [i] the infinitival is a purpose adjunct – but it is my purpose, not Ed's. My purpose in saying what I do is to cut the story short. Such purpose clauses tend to suggest manner – compare *to put it bluntly*. The *since* phrase in [ii] is a reason adjunct, giving the reason not for my not seeing her again, but for telling you that I shan't be. Similarly in [iii] I'm telling you that Dick's coming to the party because of the possibility that you may be interested. In [iv] the *though* phrase is a concessive adjunct understood as relating not to Jill's being on the verge of a nervous break-down but again to my telling you that she is. Finally in [v] we have a conditional adjunct: "If you must know, I'll tell you that . . .". A rather curious conditional adjunct is *if you remember/recall*, as in *You promised to do the cooking today, if you remember*. This gives the utterance the force of a reminder, but is idiomatic in that there is no evident expanded version in which it serves as a situational conditional adjunct.

Such adjuncts can be found with questions:

- [4] i *Are you nearly ready, because the bus leaves in ten minutes?*  
 ii *What time will you be back, in case anyone calls?*  
 iii *Where are you going, if I may ask?*

*Why?* can also be used as a response to a question: you ask *Have you ever been to Pontefract?* and I respond *Why?*, asking why you asked or want to know.

### ■ Adjuncts relating to felicity conditions for the speech act

- [5] i *It's going to be a hard winter, because the storks are migrating early*.  
 ii *Is Irene still in Rome, because I've not heard from her since August?*  
 iii *Since you're so clever, what's the square root of 58,564?*

In [i] the adjunct indicates that one of the conditions for the felicitous performance of the illocutionary act of assertion is satisfied, namely that I have evidence for the truth of what I'm asserting. This case has much in common with the modal adjuncts discussed in §16 since it bears on the epistemic status of the superordinate proposition; we include it here as it clearly has the form of a reason adjunct, so that it can be construed as giving a reason for making the speech act, like the *since* phrase in [3ii] or

the *because* phrase in [4i]. Moreover, adjuncts relating to felicity conditions occur readily in questions, which modal adjuncts do not. For example, [5 ii–iii] would normally be used as inquiries, and the adjuncts indicate that two of the felicity conditions for an inquiry are satisfied – that I don't myself know the answer, and that you may well know it.

### ■ Metalinguistic adjuncts

One special case of the speech act-related adjunct is concerned with the selection of particular words used in the residue:

- [6] i *Metaphorically (speaking), French is descended from Latin.*  
 ii *They literally live in glass-houses.*  
 iii *To use a fashionable term, their decor looks postmodern.*  
 iv *The place stinks, if you will pardon the expression.*  
 v *You may take the 'elevator', as you are American.*

*Metaphorically* and *literally* (two of the adverbs most commonly used in this function) clarify how *descended* and *glass-houses* are to be understood; the other examples similarly relate to the selection of the words *postmodern*, *stinks*, *elevator*. Because they relate to the actual language used in the clause, we refer to these adjuncts as **metalinguistic**.

## 19 Connective adjuncts

The final category of adjunct we shall consider serves to relate the clause to the neighbouring text or, in the limiting case, to the context:

- [1] i *Jill was the only one with a Ph.D. Moreover, she had considerable teaching experience.*  
 ii *There's a good movie on at the Regal. Alternatively we could have a quiet evening at home.*  
 iii *Right, last week we were examining the Bloomfieldian concept of the morpheme.*

*Moreover* and *alternatively* here express the relation between the clause they introduce and what precedes. *Moreover* indicates a relation of addition; in this example the clause containing it presents a further positive property concerning Jill. *Alternatively* indicates a relation of choice; the issue in this example is to decide on what to do for the evening, with the first sentence presenting (somewhat indirectly) one possibility, and the second another. *Right* in [iii] (in the context we intend for it) is the first word of the discourse, but it can be subsumed under the category of connective if that term is understood in a suitably broad sense. It relates the residue to the context, seeking the attention of the audience for the commencement of some activity, in this example a lecture or seminar.

Connective elements often link units smaller than the clause. In *An unexpected and, moreover, very significant piece of information has just come to hand*, for example, *moreover* indicates the relation between the AdjP *very significant* and the preceding *unexpected*. We take up such cases in Ch. 15, §4.1, confining our attention here to connectives functioning as adjunct to a clause. The link may be with a preceding sentence, as in [1i–ii], or with a preceding stretch of text of indefinite length. It can equally be between a clause and a preceding clause in the same sentence, or between a clausal residue and a preceding

element in the same clause. The following examples show *nevertheless* relating its clause to a variety of preceding elements in the same sentence:

- [2] i *He has never had the disease himself but he can nevertheless identify it.*  
 ii *The shoes are expressly designed for those of us whose feet are no longer youthful, but who nevertheless like to be fashionably shod.*  
 iii *Although he affects a gruff exterior in many instances, nevertheless he is fundamentally a man of warm heart and gentle disposition.*  
 iv *Challenged by the passiveness of the music-hall and, later, by the twanging whines of American country and western music, it has nevertheless survived and is now undergoing a revival.*  
 v *This almost trivial example is nevertheless suggestive, for there are some elements in common between the antique fear that the days would get shorter and shorter and our present fear of war.*

Example [i] illustrates the common case where *nevertheless* relates a main clause to a preceding coordinate. Coordination is likewise involved in [ii], but this time the clauses are subordinate – integrated relative clauses. Another very common case is represented in [iii], where the connective adjunct has a **reduplicative** role: the relation between the main and subordinate clauses is already marked by *although*, so that *nevertheless* simply marks this relationship a second time. In [iv] *nevertheless* links its clause to the initial non-finite subordinate clause; precisely because this initial adjunct has the form of a non-finite clause, its relationship to the matrix is not explicitly marked within the adjunct itself. This time, therefore, *nevertheless* does not reduplicate what is already marked, but serves to indicate that the *challenge* clause is construed as “although it was challenged . . .”. Finally, in [v] *nevertheless* indicates a relationship between the clause and an element within the subject: the contrast is between the suggestiveness of the example and its near triviality.

Most connective adjuncts link their clause to preceding material, as is the case with the above *moreover*, *alternatively*, and *nevertheless*. There are, however, some correlative pairs (or larger sets) of connectives where the first member relates its clause to what follows and the second (or last) relates its to what precedes:

- [3] *On the one hand, normal daily life is largely concerned with the problems of the present or those of the quite near future; on the other hand, the universities live in a world with a quite different time-scale, and the problems which exercise the academic mind belong to that world.*

The clear and central cases of connective adjuncts have the following properties:

- [4] i They do not impose additional truth conditions on their clause.  
 ii They cannot fall within the scope of negation, be questioned, or be focused.

In [ii] (*Moreover, she had considerable teaching experience*), for example, the truth of the clause depends simply on whether she did in fact have considerable teaching experience. There is no way in which this condition could be satisfied and yet the whole clause be considered false on the grounds that the proposition expressed didn't stand in a “moreover” relation to what precedes. Consider, then:

- [5] i *Jill was the only one without a Ph.D. She did not, moreover, have any teaching experience.*  
 ii *\*Jill had just finished her Ph.D. She didn't have considerable teaching experience moreover but nevertheless.*

In [i] *moreover* follows *not* but nevertheless has scope over it: it relates a negative property to what precedes. Example [ii] attempts to say that the relation between the proposition “She had considerable teaching experience” and that expressed in the preceding sentence is not of the “moreover” kind but of the “nevertheless” kind. The very clear ungrammaticality of the example shows that it is quite impossible to express that meaning by contrasting *moreover* and *nevertheless* by means of such a construction as *not . . . but*.

It will be evident from earlier sections of this chapter that the properties in [4] are not unique to connective adjuncts (they apply equally, for example, to the speech act-related adjuncts discussed in §18): these properties have to be taken in conjunction with their crucial role of serving to relate the clause to surrounding text or context. It should also be borne in mind that there are many ways of relating one clause to another besides the use of a connective adjunct. Coordinators are one such device; syntactically, these have distinctive properties that lead us to analyse them differently from connective adjuncts. Nevertheless, the division between coordinators and connective adjuncts is not entirely clear-cut, and items such as *yet* and *so* have some uses where they are clearly connective adjuncts, others where they are very similar to coordinators (see Ch. 15, §2.10).

### ■ Pure and impure connectives

A distinction can be drawn, though again not sharply, between **pure** and **impure** connective adjuncts. Pure connectives like *moreover* and *also* have no other function than that of connecting their clause to the surrounding text (or context), while the impure ones combine that function with one of those discussed in earlier sections. This impure type may be illustrated by *therefore*. Compare such a set of examples as the following:

- [6] i *Because his son had been charged with importing illegal drugs*, Ed had decided to resign from the School Board.  
 ii *His son had been charged with importing illegal drugs*, and *for this reason* Ed had decided to resign from the School Board.  
 iii *His son had been charged with importing illegal drugs*, and Ed had decided to resign from the School Board.  
 iv *His son had been charged with importing illegal drugs*; Ed had *therefore* decided to resign from the School Board.

Sentence [i] has the form of a single clause (with subordinate clauses embedded within it); the underlined sequence is a PP functioning as adjunct of reason within this larger clause. In [ii] we have a coordination of clauses, with the information about the son’s being charged expressed in a main clause. *For this reason* is interpreted anaphorically, with the first main clause as its antecedent, so that it is understood like the *because* PP in [i], and like the latter it functions as reason adjunct within the clause containing it. In [iii] the reason adjunct is omitted; the clauses are linked only by the coordinator *and*, and the cause–effect relation between the clauses is merely implicit, one of the range of implicatures associated with *and*, inferrable from the specific content of the clauses (cf. Ch. 15, §2.2.3). In [iv] there is no coordinator (though *and* could of course be inserted), and *therefore* serves both to connect the second clause to the first and to indicate the reason for the decision. The meaning of [iv] is very similar to that of [ii], but the reason relation is expressed less directly, less explicitly. Note, for example, that *for this reason* can be the focus of a cleft clause or fall within the scope of negation, whereas *therefore* cannot:

- [7] i It was *for this reason* / \**therefore* that Ed had decided to resign.  
 ii However, Ed hadn't decided to resign *for this reason* / \**therefore* but because of his disagreement with the school's policy on corporal punishment.

It is also arguable that *therefore* does not contribute to the truth conditions of its clause in the way that *for this reason* does. Imagine a context where the son was charged and Ed decided to resign, but exclusively because of the disagreement described in [7ii]. In this scenario [6i–ii] will certainly be judged false, and [iii] true but misleading, while the status of [iv] is less clear, but seems to lie somewhere between the two.

### ■ Types of pure connectives

We suggest here a few broad subcategories of pure connectives, though we would not want to claim that they are either sharply distinct or exhaustive.

#### (a) Ordering

- [8] I have two objections to your proposal. *In the first place*, it hasn't been adequately costed. *Secondly*, it violates the spirit of our agreement with Father.

Connective adjuncts are often used to signal the structure of a piece of discourse by identifying separate points, as *in the first place* and *secondly* mark the two objections in [8]. Examples of adjuncts of this type are:

- [9] i *first, firstly, in the first place, first of all, for a start, for one thing, on the one hand*  
 ii *second, secondly, in the second place, second of all (AmE), on the other hand, third, . . . , for another (thing), next, then*  
 iii *finally, last, lastly, last of all, in conclusion*

Those in [i] mark the first point, and thus relate their clause to what follows rather than (or as well as) to what precedes. Some speakers have a preference for *first* over *firstly* that doesn't carry over to other forms of ordinal numerals. Those in [ii] mark a second or subsequent point, while those in [iii] mark the last in the series; *in sum* might be added here, though it indicates more than just the order of the point. Besides such forms as those in [9], we also find numerical figures and letters: [1], A, (a), etc.

#### (b) Addition and comparison (likeness and contrast)

- |      |                      |                        |                      |                  |                    |
|------|----------------------|------------------------|----------------------|------------------|--------------------|
| [10] | <i>alternatively</i> | <i>by contrast</i>     | <i>also</i>          | <i>besides</i>   | <i>conversely</i>  |
|      | <i>either</i>        | <i>equally</i>         | <i>further(more)</i> | <i>however</i>   | <i>in addition</i> |
|      | <i>in comparison</i> | <i>instead</i>         | <i>likewise</i>      | <i>moreover</i>  | <i>neither</i>     |
|      | <i>nor</i>           | <i>on the contrary</i> | <i>rather</i>        | <i>similarly</i> | <i>too</i>         |

This list includes a number of focusing adverbs, discussed further in Ch. 6, §7.3. *Neither* and *nor* belong to both the class of coordinators and that of connective adverbs (again, see Ch. 15, §2.4, for discussion). *Either* and *too* are polarity-sensitive, with *either* occurring in negative contexts, *too* preferring positives:

- [11] i *Kim didn't like it, and Pat wasn't greatly impressed either.*  
 ii *Kim thought it was wonderful, and Pat enjoyed it too.*

The felicitous use of these connectives requires that the similarity be between propositions that are informationally in the foreground, not presupposed. Compare, for example:

- [12] i *Kim has stopped smoking and Pat has given it up too.*  
 ii \**Kim has stopped smoking and Pat used to smoke too.*

In [i] the likeness is between “Pat has given up smoking” and “Kim has stopped smoking”, which are both asserted. In [ii], however, it is between “Pat used to smoke”, which is asserted, and “Kim used to smoke”, which is not asserted in the first clause but merely presupposed as a precondition for stopping.

To the list given in [10] we can add such expressions as *again* or *at the same time*:

- [13] i *If you have 12 hours to spare, put your feet up and over-indulge. ‘War and Peace’ it is not but then again, in these grim times, maybe that’s a blessing.*  
 ii *He did not want to appear to be running hat in hand to Premier Krushchev’s doorstep. At the same time he took pains not to rule out an eventual meeting with the Soviet leader.*

These have primary meanings in which they indicate serial order and temporal location respectively, but in examples like [13] these meanings have been bleached away, leaving only a comparative connective meaning. The same applies with *in the same way*. *By the same token* is an idiom specialised to the connective function. Comparative expressions like *better* or *what is more important* lie at the boundary between connective adjuncts and the evaluative type discussed in §17 above. There are also comparatives in the next category.

#### (c) Elaboration and exemplification

- [14] *for example for instance in other words more precisely that is (to say)*  
 [15] *The proposal has a lot to commend it. It would, for example, considerably reduce the amount of time spent travelling from one centre to another.*

#### (d) Markers of informational status

Such items as *by the way*, *incidentally*, *parenthetically* signal the informational status of their clause. They indicate a change of topic or digression, generally suggesting that the new information is less important. They have much in common with the speech act-related adjuncts of §18.

### ■ Impure connectives

Adjuncts combining the connective function with some other are illustrated in:

- [16] i CONCESSION *nevertheless, nonetheless, still, though, yet*  
 ii CONDITION *anyway, in that case, otherwise, then*  
 iii REASON/RESULT *accordingly, as a result, consequently, hence, in consequence, so, therefore, thus*

## 20 Linear position of adjuncts

### 20.1 Front, central, and end positions

We distinguish three main positions for adjuncts, illustrated in:

- [1] i *The next day she sold her car.* [front]  
 ii *They probably saw her.* [central]  
 iii *She spoke very confidently.* [end]

In clauses containing a subject and a lexical verb, front position is before the subject, central position is before the verb, and end position is after the verb.

The choice of position for an adjunct is strongly influenced by (a) its internal form; and (b) its semantic category. Central position disfavors long or heavy adjuncts. Thus (leaving aside the case of prosodically detached interpolations) adjuncts consisting of or containing subordinate clauses do not occur in central position, and PPs or NPs are for the most part less likely in this position than AdvPs. All three positions readily accept adverbial adjuncts, and in Ch. 6, §7.1, we examine the role of semantic category in determining or restricting the position of adjuncts.

### ■ Multiple occurrences

In all three positions, it is possible to have more than one adjunct (and in such cases it might be more appropriate to talk of ‘zones’ rather than ‘positions’):

- [2] i *For this reason, as soon as the meeting was over, he called his solicitor.*  
 ii *He probably deeply regretted having agreed to take part.*  
 iii *She left immediately in order to catch the early train.*

Such multiple occurrences, however, occur much more readily in end zone than in front or central zone.

### ■ Lexical verbs vs auxiliaries

One of the syntactic properties distinguishing auxiliary verbs from lexical verbs concerns the position of certain types of adjunct. Compare, then, the following, where the [a] examples have lexical *see* as verb, and the [b] ones the perfect auxiliary *have*:

- |     |  |                                       |
|-----|--|---------------------------------------|
| [3] | LEXICAL VERB                               | AUXILIARY VERB                        |
| i   | a. <i>They probably saw her.</i> (= [iii]) | b. <i>They probably had seen her.</i> |
| ii  | a. * <i>They saw probably her.</i>         | b. <i>They had probably seen her.</i> |

With the lexical verb the modal adjunct *probably* can precede but it cannot occur between the verb and its complement, as seen in [iia]. With auxiliary *have*, by contrast, the order shown in [iib] is not only possible but quite strongly preferred over that shown in [ib]. For this reason we will take the central position to cover not only the pre-verbal position illustrated in [ia–b], but also the post-auxiliary position of *probably* in [iib]. And the property distinguishing the two classes of verb is that with lexical verbs central adjuncts precede the verb while with auxiliaries they preferentially follow. In clauses with subject–auxiliary inversion, a post-auxiliary adjunct follows the subject as well as the auxiliary: *Have they really gone to Montreal?*

### ■ Central position in *to*-infinitivals

A centrally positioned adjunct may precede or follow the marker *to*:

- [4] i [*For him never to play again*] *would be a great pity.* [pre-marker]  
 ii [*For him to never play again*] *would be a great pity.* [post-marker]

The construction where the adjunct occurs between *to* and the following verb, as in [ii], is traditionally said to contain a ‘split infinitive’; it is discussed in Ch. 6, §7.1.

### ■ Clauses without a subject

If a clause has no subject the overt distinction between front and central (pre-verbal) position is lost. To a large extent, however, it remains possible to assign an initial adjunct to one or other of the two positions:

- [5] i *If it rains, bring the washing in.* [front]  
 ii *He complained about [never receiving any support from the boss].* [central]

The position of the conditional adjunct in [i] can be equated with the one it occupies in *If it rains, you bring the washing in* (rather than the somewhat unlikely *You, if it rains, bring the washing in*, where the adjunct has the status of an interpolation). In [ii], by contrast, we can confidently treat *never* as central within the *receive* clause because it cannot precede the subject in a gerund-participial: compare *He complained about [the staff never receiving any support from the boss]* and *\*He complained about [never the staff receiving any support from the boss]*.

### ■ Some constituent structure contrasts in complex clauses

Where one clause is embedded within another, we may need to consider whether an adjunct belongs in the subordinate clause or the matrix:

- [6] i *He says [he saw her yesterday].* [subordinate clause adjunct]  
 ii *He told me [you're getting married] yesterday.* [matrix clause adjunct]  
 iii *He told me you wanted it yesterday.* [ambiguous]

The subordinate clause is bracketed in [i–ii], with *yesterday* inside it in [i], giving the time of the seeing, but outside it, in the matrix clause, in [ii], giving the time of the telling. Example [iii] can be interpreted with *yesterday* either inside the subordinate clause, giving the time of your wanting, or else in the matrix clause, giving the time of his telling. In [ii] *yesterday* can precede the subordinate clause – and changing the order in [iii] in this way makes *yesterday* unambiguously a matrix clause adjunct (*He told me yesterday you wanted it*).

With a non-finite subordinate clause we have a comparable distinction in the case of an adjunct located between matrix and subordinate verbs:

- [7] i *I regret [impetuously volunteering to take part].* [subordinate clause adjunct]  
 ii *I regret deeply [volunteering to take part].* [matrix clause adjunct]

In [i] *impetuously* modifies *volunteering*, while in [ii] *deeply* modifies *regret*. In the former case the adjunct is in central (pre-verbal) position in the subordinate clause, while in [ii] it is in end zone in the matrix (following the verb, but preceding the non-finite complement). The difference is reflected in the different alternative positions available for the adjuncts. In [i] we can move *impetuously* from central position in the subordinate clause to end zone (with naturalness increased by adding a modifier such as *so*): *I regret [volunteering so impetuously to take part]*. In [ii], by contrast, *deeply* can be moved from end zone to central position in the matrix clause: *I deeply regret volunteering to take part*.

## 20.2 Central position in auxiliary constructions

### ■ Preference for post-auxiliary over pre-verbal position

We have said that where the verb is an auxiliary rather than a lexical verb, central adjuncts characteristically occur after the verb (post-auxiliary position) rather than before it (pre-verbal position). Consider first the case where the auxiliary is copular *be*:<sup>34</sup>

- |     |  |  |
|-----|--|--|
| [8] | POST-AUXILIARY (PREFERRED)                   | PRE-VERBAL (LESS FAVOURED)                   |
| i   | a. <i>It was <u>certainly</u> very good.</i> | b. <i>It <u>certainly</u> was very good.</i> |
| ii  | a. <i>They are <u>always</u> cheerful.</i>   | b. <i>They <u>always</u> are cheerful.</i>   |
| iii | a. <i>He is <u>already</u> in hospital.</i>  | b. <i>He <u>already</u> is in hospital.</i>  |

The degree of preference for the post-auxiliary position is variable. It is less, for example, with modal adjuncts (as in [i]) than with frequency ones ([ii]), while in [iii], with the aspectual adjunct *already*, the [b] version is less disfavoured in AmE than in BrE. In general, the pre-verbal version is considerably improved by placement of stress on the verb, and even more when such stress is accompanied by ellipsis of post-verbal elements:

- |     |    |  |                              |
|-----|----|--|------------------------------|
| [9] | i  | A: <i>They seem very cheerful today.</i> | B: <i>They always ARE__.</i> |
|     | ii | A: <i>He should be in hospital.</i>      | B: <i>He already IS__.</i>   |

### The special case of negation

When the auxiliary verb is negated, the choice between the two orders is determined by relative scope rather than by any general preference for post-auxiliary position:

- |      |   |  |
|------|---|--|
| [10] | POST-AUXILIARY: NARROW SCOPE                      | PRE-VERBAL: WIDE SCOPE                               |
| i    | a. <i>It wasn't <u>regularly</u> available.</i>   | b. <i>It <u>regularly</u> wasn't available.</i>      |
| ii   | a. <i>They aren't <u>always</u> co-operative.</i> | b. <i>They <u>sometimes</u> aren't co-operative.</i> |
| iii  | a. <i>It wasn't <u>necessarily</u> his fault.</i> | b. <i>It <u>probably</u> wasn't his fault.</i>       |

The post-auxiliary adjunct falls within the scope of the negative, while the pre-verbal one has scope over the negative. Thus in [i], version [a] can be glossed as “It isn’t the case that it was regularly available” and [b] as “It was regularly the case that it wasn’t available”. A good number of items have preferences (of varying strengths) for one or other scope relation: *always* and *necessarily*, for example, prefer narrow scope, while *sometimes* and *probably* prefer (quite strongly) wide scope.

### ■ Auxiliaries with non-finite complements

We turn now to the less straightforward case where the auxiliary verb has a non-finite complement. Here the issue arises as to whether an adjunct located between the auxiliary and the following verb is in post-auxiliary position in the matrix clause (the clause with the auxiliary as predicator) or pre-verbal position in the non-finite subordinate clause:

- |      |    |   |                              |
|------|----|---|------------------------------|
| [11] | i  | a. <i>He had [<u>deeply</u> offended her].</i>              | [subordinate clause adjunct] |
|      |    | b. <i>He had <u>probably</u> [offended her].</i>            | [matrix clause adjunct]      |
|      | ii | a. <i>He may [<u>regularly</u> write his own speeches].</i> | [subordinate clause adjunct] |
|      |    | b. <i>He may <u>obviously</u> [write his own speeches].</i> | [matrix clause adjunct]      |

<sup>34</sup>Recall that in this book auxiliary verbs are distinguished from lexical verbs by their behaviour in negative, interrogative, and similar constructions. Auxiliaries in construction with a secondary form of a verb, such as *will* in *They will buy it* or *have* in *I have seen it*, are analysed as catenative verbs taking non-finite complements: see Ch. 3, §2.2, and Ch. 14, §4.2.

The distinction thus matches that illustrated in [7] with the lexical catenative verb *regret*. The difference is reflected in the fact that the adjunct can be moved to the left of the auxiliary if it belongs in the matrix, but not if it belongs in the subordinate clause:

- [12] i a. \**He deeply had offended her.*                      b. \**He regularly may write his own speeches.*  
       ii a. *He probably had offended her.*                    b. *He obviously may write his own speeches.*

The asterisk in [12ib] applies to the reading where *may* has the epistemic meaning that it has in [11ii] (“It may be that he regularly writes his own speeches”): it is admissible with deontic *may* (“He is regularly allowed to write his own speeches”), but the adjunct then does belong in the matrix, and we no longer have an alternant of [11iia].

The syntactic constituent structure in these examples matches the semantic scope of the adjunct, just as it does in the *regret* examples in [7]. But the semantic content of the auxiliaries, especially *have*, *be*, and *will*, is such that we do not always have the sharp semantic contrasts that are seen in [7] and [11]. One consequence is that it is not always clear whether an adjunct located between an auxiliary and the following verb belongs in the matrix or in the subordinate clause. Consider such examples as:

- [13] a. *She is still working.*                                      b. *Do you often have lunch together?*

The place of *still* and *often* in the constituent structure is a good deal less obvious than that of the adjuncts in the earlier examples. The best test is to see whether the adjunct can be moved to the left of the auxiliary: if so, this is strong evidence that it belongs in the matrix. We have illustrated this test in [12]; applying it to [13] indicates that *still* and *often* are matrix adjuncts, for we can have *She still is working* or (with ellipsis) *She still is\_*, while a possible response to [13b] is *Yes, we often DO\_*.

### ■ Incongruent positioning

A more significant consequence of the relatively weak scope contrasts found with auxiliaries is that central adjuncts may be positioned ‘incongruently’, i.e. located syntactically in a way that does not match their semantic scope. Compare, for example:

- [14] i a. *He undoubtedly must have misinterpreted her letter.*                      [pre-verbal]  
       b. *He must undoubtedly have misinterpreted her letter.*                      [post-aux]  
       c. *He must have undoubtedly misinterpreted her letter.*                      [incongruent]  
       ii a. *The party will be long remembered.*    [pre-verbal]  
       b. *The party will long be remembered.*    [incongruent]

In [i] *undoubtedly* has wide scope semantically: “It is undoubtedly the case that he must have misinterpreted her letter”. The preferred position is after *must*, i.e. post-auxiliary position in the topmost clause. The position before *must* is also completely acceptable. In version [ic], however, *undoubtedly* cannot be in the topmost clause, the one to which it belongs semantically, and hence can be regarded as incongruently positioned. Such clauses are encountered, but they are considerably less likely than the ones where there is congruence between the syntactic position and the semantic scope. In [ii] *long* belongs semantically with *remember*; in version [iia] it belongs in the *remember* clause, while

in [iib] it is located syntactically in the *be* clause. Examples of this kind, where the adjunct occurs to the left of its expected position (rather than to the right, as in [ic]), are found with a very restricted range of adjuncts: compare, for example, *The supply will be drastically reduced* with *\*The supply will drastically be reduced*.

## 1 Introduction

A pair of clauses such as *It is raining* and *It isn't raining* are said to differ in **polarity**. The first is a **positive clause** or a clause with **positive polarity**, while the second is a **negative clause** or a clause with **negative polarity**. For the most part positive represents the default polarity, in the sense that positive constructions are structurally and semantically simpler than negative ones. To a very large extent, therefore, a description of polarity is a matter of describing the special properties of negatives – and it is for this reason that we have called this chapter ‘Negation’ rather than ‘Polarity’.

### 1.1 Tests for clause polarity

Negation is marked by words (*not, no, never*, etc.) or by affixes (e.g. *·n't, un·*), but very often the effect of adding a negative word or the suffix *·n't* is to make the whole clause negative. Hence the distinction drawn above between *It is raining* and *It isn't raining* as positive and negative clauses. We will therefore begin by surveying four useful diagnostic tests for determining the syntactic polarity of a clause. They are illustrated in [1]:

[1]            NEGATIVE CLAUSE	POSITIVE CLAUSE
i a. <i>He didn't read it, <u>not even</u> the abstract.</i>	b. * <i>He read it, <u>not even</u> the abstract.</i>
ii a. <i>He didn't read it; <u>neither/nor</u> did I.</i>	b. <i>Ed read it; <u>so</u> did I.</i>
iii a. <i>Ed didn't read it, <u>did he?</u></i>	b. <i>Ed read it, <u>didn't he?</u></i>
iv a. <i>Not once did Ed read it.</i>	b. <i>After lunch Ed read it.</i>

Single underlining marks the clauses whose polarity is indicated in the headings, while the double underlining in [i–iii] marks the crucial feature of the diagnostic.

#### ■ Clause continuations with *not even*

Negative clauses allow a continuation with *not even* + complement or adjunct, as in [1ia]. This is comparable to *Ed didn't even read the abstract*, but instead of *the abstract* being integrated into the structure of the clause, it is added on, as a prosodically detached supplement. When the clause is negative, the following *even* is commonly preceded by *not*, as here, but *not* is inadmissible after a positive clause. (For the meaning of *even*, see Ch. 6, §7.3.)

#### ■ Connective adjuncts

In [1iii] the underlined clause is followed by an anaphorically reduced clause introduced by a connective adjunct. Following a negative clause we find *neither* or *nor*, whereas a

positive clause is followed by *so*. Note that switching the connective adjuncts leads to ungrammaticality: compare \**Ed didn't read it; so did I* and \**Ed read it; neither/nor did I*. A contrast of the same kind applies when the connective adjunct is located at the end of the following clause:

- [2] a. *Ed didn't read it, and I didn't either.*      b. *Ed read it, and I did too.*

Again we may contrast \**Ed didn't read it and I didn't too* and \**Ed read it and I did either*. (The connective adjuncts *neither*, *nor*, *either* and *so*, *too* are not restricted to occurrence in reduced clauses, but the reduced construction provides the simplest test for our purposes.)

### ■ Reversed polarity tags

*Did he?* and *didn't he?* in [1iii] are reduced interrogative clauses, known as **tags**. They represent the most common type of interrogative tag, being used to seek confirmation of what has been said in the clause to which they are attached. This type of tag reverses the polarity of the preceding clause, so we have negative clause + positive tag in [iiia], positive clause + negative tag in [iiib].

These are not the only type of clause + tag construction: it is possible to have positive clause + positive tag, as in *Ed read it, did he?* and some speakers allow negative clause + negative tag, as in <sup>o</sup>*Ed didn't read it, didn't he?* But these are clearly different intonationally and in their pragmatic effect from those in [1iii], as described in Ch. 10, §5: our diagnostic is based on the most neutral type of confirmation tag.

### ■ Subject–auxiliary inversion with prenuclear constituents

The test illustrated in [1iv] involves the form of the clause itself rather than constraints on what may follow it. Negative clauses in which the negation is marked on a constituent in prenuclear position have obligatory subject–auxiliary inversion. Compare [iva], for example, with \**Not once Ed read it*. There is, by contrast, no inversion in the positive [ivb]. Nor do we have inversion in negative *After lunch Ed didn't feel well* since the negation is marked on the verb, not on the PP *after lunch*.

Obligatory subject–auxiliary inversion is not limited to negative clauses: inversion is obligatory following connective *so* in [1iib] and following a prenuclear phrase introduced by *only* (*Only occasionally did Ed read these reports*) – see Ch. 3, §2.1.2. This test thus needs to be used in combination with the others, but we will see that it nevertheless proves useful in drawing the distinction between a negative clause and a positive clause containing subclausal negation. This is one of the distinctions to which we now turn.

## 1.2 An overview of negation types

The framework in terms of which we shall describe negation involves four major contrasts: **verbal** vs **non-verbal**, **analytic** vs **synthetic**, **clausal** vs **subclausal**, and **ordinary** vs **metalinguistic**. We illustrate in examples [3–6], and then discuss each distinction in turn.

- |     |  |  |
|-----|--|--|
| [3] | VERBAL   | NON-VERBAL                             |
|     | i a. <i>He <u>doesn't</u> dine out.</i>            | b. <i>He <u>never</u> dines out.</i>   |
|     | ii a. <i>I did <u>not</u> see anything at all.</i> | b. <i>I saw <u>nothing</u> at all.</i> |

[4]	ANALYTIC	SYNTHETIC
i	a. <i>The report is <u>not</u> complete.</i>	b. <i>The report <u>isn't</u> complete.</i>
ii	a. <i><u>Not</u> many people liked it.</i>	b. <i><u>Nobody</u> liked it.</i>
[5]	CLAUSAL	SUBCLAUSAL
i	a. <i>She <u>didn't</u> have a large income.</i>	b. <i>She had a <u>not</u> inconsiderable income.</i>
ii	a. <i>We were friends at <u>no</u> time.</i>	b. <i>We were friends in <u>no</u> time.</i>
[6]	ORDINARY	METALINGUISTIC
i	a. <i>She <u>didn't</u> have lunch with my old man: he couldn't make it.</i>	b. <i>She <u>didn't</u> have lunch with your 'old man': she had lunch with your father.</i>
ii	a. <i>Max <u>hasn't</u> got four children: he's got three.</i>	b. <i>Max <u>hasn't</u> got four children: he's got five.</i>

The first two contrasts have to do with the expression of negation, i.e. with matters of form, while the second two have to do with meaning, i.e. with the interpretation of negation.

### (a) Verbal vs non-verbal negation

In verbal negation the marker of negation is grammatically associated with the verb, the head of the clause, whereas in non-verbal negation it is associated with a dependent of the verb: an adjunct in [3ib], object in [3iib]. This distinction is needed to account for the occurrence of the auxiliary *do*, which is required in the [a] examples of [3], but not the [b] ones. Within verbal negation we then distinguish three subcategories:

[7]	i	a. <i>You <u>didn't</u> hurt him.</i>	b. <i>You <u>aren't</u> tactless.</i>	[primary]
	ii	a. <i><u>Don't</u> hurt him.</i>	b. <i><u>Don't</u> be tactless.</i>	[imperative]
	iii	a. <i>It's important <u>not</u> to bend it.</i>	b. <i>It's important <u>not</u> to be seen.</i>	[secondary]

In **primary** verbal negation the negative marker is associated with a primary verb-form: here *do* is required if there is no other auxiliary verb. In **imperative** verbal negation *do* is required even if the corresponding positive does contain an auxiliary verb, as in [iib]. The third category comprises all constructions other than imperatives containing a secondary verb-form: infinitivals, subjunctives, gerund-participials, and so on. Auxiliary *do* does not occur in these constructions. We label this category **secondary** with the understanding that this is a shorthand for 'non-imperative secondary'.

### (b) Analytic vs synthetic negation

Analytic negation is marked by words whose sole syntactic function is to mark negation, i.e. *not* and also *no* in the use in which it contrasts with *yes*, as in answering a question, for example. Synthetic negation is marked by words which have some other function as well. Synthetic verbal negation is marked inflectionally, by negative verb-forms. Synthetic non-verbal negation is marked by elements of three kinds:

[8]	i	ABSOLUTE NEGATORS	<i>no</i> (including compounds <i>nobody</i> , <i>nothing</i> , etc., and the independent form <i>none</i> ), <i>neither</i> , <i>nor</i> , <i>never</i>
	ii	APPROXIMATE NEGATORS	<i>few</i> , <i>little</i> ; <i>barely</i> , <i>hardly</i> , <i>scarcely</i> ; <i>rarely</i> , <i>seldom</i>
	iii	AFFIXAL NEGATORS	<i>un-</i> , <i>in-</i> , <i>non-</i> , <i>-less</i> , etc.

Clausal negation is a matter of syntax, while affixal negation is purely morphological. For the rest we take clausal negation as the default case, and survey in §3.2.2 the main places where negative markers other than affixes yield subclausal negation.

#### (d) Ordinary vs metalinguistic negation.

Consider finally the contrast between the examples in [6]. In [ia] (*She didn't have lunch with my old man: he couldn't make it*) the negative indicates that it is not the case, not **true**, that she had lunch with my old man. But that is not how the negative is understood in (the intended interpretation of) [ib]: *She didn't have lunch with your 'old man': she had lunch with your father*. The latter would normally be used in a context where you had said *She had lunch with my old man*. In uttering [ib] I am not disputing the truth of what you said but rejecting the formulation you used: I'm objecting to your referring to your father as your 'old man'. Similarly, *She doesn't live in a /kæsl/, she lives in a /kasl/* might be used to reject your pronunciation of *castle*.

An important case of metalinguistic negation is illustrated in [6iib], *Max hasn't got four children, he's got five*: here it is used to deny an implicature. We argued in Ch. 5, §5.2, that *Max has four children* **entails** that he has no less than four and **implicates** that he has no more than four. *Max hasn't got four children: he's got three* ([6iia]) is thus ordinary negation. It denies the entailment of the positive, i.e. it indicates that *Max has got four children* is false. *Max hasn't got four children, he's got five* ([6iib]) denies the implicature. It is not saying that *Max has got four children* is false, and hence is not ordinary negation. Again I would typically use the metalinguistic negative in a context where you had just said that Max has four children: I am correcting what you said not because it is false but because it doesn't go far enough. It is metalinguistic in the sense that it is saying that *four* was the wrong word to use (among those yielding a true statement).

### 1.3 Scope and focus of negation

The notions **scope of negation** and **focus of negation** will be introduced together in this section because they are tightly interlinked. The **scope** of negation is the part of the meaning that is negated. The **focus** is that part of the scope that is most prominently or explicitly negated. We will explain these concepts by reference to the most elementary type of negation, verbal negation of declaratives.

#### 1.3.1 The concept 'having scope over'

The scope of a negative is most easily seen by considering the semantic effect of removing the negative element. We will illustrate by first exhibiting in [13] a case where the negative element *-n't* has scope over everything in a sentence, and then in [15] adding to it some material over which the negative element does not have scope, pointing out the semantic difference that results.

In the following pair, [a] is negative, and [b] is its positive counterpart:

- [13] a. *Liz didn't delete the backup file.*      b. *Liz deleted the backup file.*

Each of the clause constituents *Liz*, *deleted*, and *the backup file* in [b] makes a contribution to the meaning; we can therefore give the truth conditions of [b] as a list of

statements:

- [14] i “A deletion operation took place”  
 ii “The deletion operation was performed by Liz”  
 iii “The deletion operation was performed on the backup file”

Each of these has to be true in order for [13b] to be true. And the falsity of any one of them is sufficient to make [13a] true. That is, the negated sentence [13a] is true if either there was no act of deletion, or if any deletion operation that occurred was performed by someone other than Liz, or if any deletion operation that occurred was performed on something other than the backup file. The status of the propositions in [14] thus changes as we switch from [a] to [b]: the falsity of any one of them establishes the truth of [a], but also the falsity of [b]. All three components are therefore said to be **inside the scope** of the negation – or, to put it another way, the negative **has scope over** all three of them.

The negative can therefore be said to have scope over the whole clause, i.e. over everything in the clause (except itself): we can say that **the scope of the negation** here is “Liz deleted the backup file”.

Now compare the following examples, in which an extra clause has been added to each of the sentences:

- [15] a. *Liz didn’t delete the backup file and Sue wrote the report.*      b. *Liz deleted the backup file and Sue wrote the report.*

The truth conditions for [15b] consist of those given in [14] together with

- [16] “Sue wrote the report”

But this is also a truth condition for [15a]: if Sue didn’t write her report then both examples in [15] are false. The status of [16] is thus not affected by the negation: it is **outside the scope** of the negative. So the scope of the negative is the same in [15a] as in [13a], namely “Liz deleted the backup file”.

Notice that [15a] has the form of a coordination of clauses, and it is quite generally the case that a negative in one clause does not have scope over another clause that is coordinate with it. There is, though, an exception to this: a negative can have scope over a clause-coordination that involves gapping (Ch. 15, §4.2). Compare the following:

- [17] a. *Kim wasn’t at work on Monday or Pat on Tuesday.*      b. *Kim was at work on Monday or Pat on Tuesday.*

These involve the following components of meaning:

- [18] i “Kim was at work on Monday”  
 ii “Pat was at work on Tuesday”

Because of the meaning of *or* the truth of either one of these is sufficient to establish the truth of [17b]. But for [17a] to be true, both of [18i–ii] must be false. The negation thus affects the status of both: both fall within its scope. In this construction, therefore, the negative has scope over the whole coordination.

#### ■ Elements whose meaning is not truth-conditional

Not all elements in a sentence contribute to its truth conditions. Consider the connective adjunct *however* in:

- [19] a. *Ed noticed a problem; Liz, however, didn’t delete the backup file.*      b. *Ed noticed a problem; Liz, however, deleted the backup file.*

Here [b] can be analysed into three components of meaning:

- [20] i “Ed noticed a problem”  
 ii “Liz deleted the backup file”  
 iii “There is some relation of apparent contrast between [i] and [ii]”

The nature of the contrast is not made explicit; one plausible possibility is that the problem concerns the backup file and the speaker considers Ed’s noticing the problem as a reason for not deleting the backup file (so that the problem could be investigated). Now [20iii] does not constitute a truth condition for [19b]: you cannot argue that the latter was false simply because there is in fact no relation of contrast between the components. And because it does not affect the truth of the sentence it cannot fall within the scope of the negative in [19a]: the scope of the negative here is “Liz deleted the problem”, just as it is in [13a] and [15a].

### ■ Semantic and syntactic identification of scope

Scope is in the first instance a semantic concept, and we have been identifying the scope of negation in semantic terms – saying, for example, that the scope of the negative in [19a] is “Liz deleted the backup file”. Where a relevant component of meaning is expressed by a separate syntactic constituent, however, we can equally well refer to it in terms of its form. In a case like [19a], then, we can say that the clause *Ed noticed a problem* and the adjunct *however* are outside the scope of the negative.

#### 1.3.2 Relative scope: wide scope negation and narrow scope negation

Scope is the semantic analogue of syntactic constituent structure, and in many cases the syntactic structure reflects the scope of negation in an obvious and elementary way. Compare:

- [21] i a. *She didn't say that she knew him.*      b. *She said that she didn't know him.*  
 ii a. *She didn't promise to help him.*      b. *She promised not to help him.*

In [i] the scope of the negative in [a] is “she said that she knew him”, while in [b] it is “she knew him”. Thus the negative has scope over *say* in [ia] but not in [ib], and this correlates with the fact that in [ia] *say* is located within the subordinate clause functioning as complement of the negated verb *do*, whereas in [ib] the negative is located within the clause functioning as complement to *say*. Similarly, the negative has scope over *promise* in [iia], but not in [iib], and again the negative is in the matrix clause in [iia] but the subordinate clause in [iib].

The concept of scope applies to numerous other kinds of element besides negation markers, including verbs. Compare, for example:

- [22] a. *She tried to stop offending them.*      b. *She stopped trying to offend them.*

In [a] *stop* is syntactically within the complement of *try* and semantically within its scope, and conversely in [b]: here *try* is within the syntactic complement and semantic scope of *stop*. In [21iib], then, it is not simply that *promise* is outside the scope of the negative: the negative is inside the scope of *promise*. We are concerned here, then, with **relative scope**: we have two scope-bearing elements and the issue is which has scope over the other.

As far as negation is concerned, the clearest cases are those like [21] where relative scope is reflected in the contrast between matrix and subordinate clauses.<sup>1</sup> Less obvious

<sup>1</sup>Even here, however, matters are not entirely straightforward. With auxiliary verbs the issue arises as to whether a following *not* belongs in the matrix or the subordinate clause (see §2.3.2), and we will also find

are cases where relative scope is not marked by clause subordination in this way. We will consider two such cases here, involving the scope of negation relative to adjuncts in clause structure and relative to quantifiers; the issue also arises with respect to coordinators (see Ch. 15, §2.2.2) and modal auxiliaries (Ch. 3, §9.3.1).

### (a) Relative scope of negation and adjuncts in clause structure

Consider first the relative scope of negation and an adjunct such as *intentionally*.

- [23] i *Liz intentionally deleted the backup file.*  
 ii *Liz intentionally didn't delete the backup file.* [adjunct has scope over negative]  
 iii *Liz didn't intentionally delete the backup file.* [negative has scope over adjunct]

The truth conditions for positive [23i] can be given as follows:

- [24] i “Liz deleted the backup file”  
 ii “Liz did what she did intentionally”

Now [23ii] cannot be true by virtue of [24ii] being false: it can only be true if [24i] is false. Thus [24ii] is a condition for the truth of both [23i] and [ii] and hence outside the scope of negation in [23ii]. And since [24ii] is the meaning contributed by *intentionally*, we can say that *intentionally* in [23ii] is outside the scope of negation. In [23i] what was intentional was Liz's deleting the backup file, whereas in [23ii] what was intentional was Liz's not deleting the backup file, so the negative is inside the scope of *intentionally*: it contributes to specifying what it was that was done intentionally.

The interpretation of [23iii] is quite different. This can be true by virtue of it being false that Liz acted intentionally. So this time *intentionally* is inside the scope of negation, rather than the other way round. An equivalent way of expressing the difference is to say that in [23ii] the negative has **narrow** scope relative to the adjunct, whereas in [23iii] it has **wide** scope.

We noted that in the most elementary cases relative scope is reflected in a contrast between matrix and subordinate clauses, as in [21], and in cases like [23ii–iii] the difference in meaning can be brought out by means of glosses involving clause subordination:

- [25] i “Liz acted intentionally in not deleting the backup file” [meaning of [23ii]]  
 ii “Liz didn't act intentionally in deleting the backup file” [meaning of [23iii]]

When the negative has narrow scope, it appears in the subordinate clause of the gloss; when it has wide scope, it appears in the matrix clause of the gloss.

#### Contraries and contradictories

The contrast between [23ii] and [23iii] can also be brought out by noting that they stand in different semantic relations to the positive [23i]:

- [26] i *Liz intentionally didn't delete the backup file* and *Liz intentionally deleted the backup file* are **contraries**: they cannot be both true, but they can be both false.  
 ii *Liz didn't intentionally delete the backup file* and *Liz intentionally deleted the backup file* are **contradictories**: they cannot be both true, but they cannot be both false either.

that in certain circumstances non-verbal negation within a subordinate clause can have scope over the matrix (see §3.2.1).

Both [23i] and [23ii] are false if Liz deleted the backup file unintentionally, but there is no context in which both [23i] and [23iii] are false.

### Relative scope and the contrast between clausal and subclausal negation

The difference in scope of the negatives in [23ii–iii] is reflected in the fact that while the latter behaves straightforwardly as a negative clause, the former does not:

- |      |   |   |
|------|---|---|
| [27] | NARROW SCOPE: SUBCLAUSAL  | WIDE SCOPE: CLAUSAL   |
| i    | a. * <i>Liz intentionally didn't delete the backup file, and neither did Sue.</i> | b. <i>Liz didn't intentionally delete the backup file, and neither did Sue.</i> |
| ii   | a. * <i>Liz intentionally didn't delete the backup file, did she?</i>             | b. <i>Liz didn't intentionally delete the backup file, did she?</i>             |

The *neither* continuation is permitted in [b] but not [a] (*and so . . .* would be somewhat awkward in [a], but the inadmissibility of *neither* is sufficient to establish a clear difference). Similarly *did she?* as a reversed polarity tag seeking confirmation of what is said in the preceding clause can be added in [b] but not in [a]. Thus [23iii] is a negative clause, but [23ii] is not.

It should not be assumed, however, that in negative clauses the negative necessarily has scope over every element in the clause. One case where this is not so is [19a]. Here the negative does not have scope over *however*, but that does not prevent the clause being negative: compare *Liz, however, didn't delete the backup file and neither did Sue* (where the *neither* continuation shows that the clause is negative), or *Liz, however, didn't delete the backup file, did she?* (where the tag shows the clause is negative). We will see, moreover, that the exceptions are not confined to cases like this where the element outside the scope of negation is non-truth-conditional.

### Relative scope and linear order

An obvious syntactic difference between [23ii] and [23iii] is that *intentionally* precedes *didn't* in the former while *didn't* precedes *intentionally* in the latter. The semantic difference in scope is marked syntactically by a difference in linear order. In both examples, then, the element with wider scope precedes the one with narrower scope. This represents the default case:

- [28] Given a construction containing two scope-bearing elements, the one which comes first will generally have scope over the one which comes later.

As implied by the 'generally', relative scope does not always correlate directly with relative order in this way. One factor that may override it is intonation. Compare:

- [29] i *Liz didn't delete the backup file intentionally.* [negative has scope over adjunct]  
 ii *Liz didn't delete the backup file – intentionally.* [adjunct has scope over negative]

In the intended pronunciations of these, *intentionally* falls in the same intonational phrase as *didn't* in [i], whereas in [ii] it is prosodically detached. In [i], the default pattern is observed: the negative has scope over the following adjunct. But in [ii] the prosodic offsetting of the adjunct allows it to take scope over the whole of what precedes.

A similar illustration is provided by reason adjuncts:

- [30] i *Because it cost \$50 she didn't buy it.* [adjunct has scope over negative]  
 ii *She didn't buy it because it cost \$50.* [ambiguous]

In [i] we find the default pattern: the adjunct comes first and has scope over the negative. The narrow scope of the negative here can again be brought out by a roughly equivalent sentence in which it appears in a subordinate clause (underlined): *The \$50 price caused her not to buy it*. Here we understand that \$50 was too high a price. Example [ii], however, is ambiguous. It can have an interpretation following the default pattern, with the negative having scope over the adjunct; here the adjunct will be in the same intonational phrase as *didn't*. In this interpretation we understand that \$50 was a good price, but that this price did not lead her to buy it – and there is an implicature that she did buy it, for some other reason. But [ii] can also have the same interpretation as [i]. This departs from the default pattern given in [28], and the adjunct would form a separate intonational phrase (and in writing it might well be preceded by a comma to remove the ambiguity).

### (b) Relative scope of negation and quantifiers

The issue of relative scope also arises when negation combines with quantification:

- [31] i *He hasn't got many friends.* [negative has scope over quantifier]  
 ii *Many people didn't attend the meetings.* [quantifier has scope over negative]

Here [i] is the contradictory of *He has many friends*: one will be true, the other false. But [ii] is not even the contrary of *Many people attended the meetings*: both could easily be true. Given a large enough set of people, it is perfectly possible for the subset attending and the subset not attending to both qualify as 'many'. Again the narrow scope of the negative in [ii] is brought out by a gloss with a negative in a subordinate clause: "There were many people who didn't attend the meetings". Note, however, that [ii] behaves as a negative clause: cf. *Many people didn't attend the meetings, not even the first one* or *Many people didn't attend the meetings, did they?* This confirms the point made above that in negative clauses the negative does not necessarily have scope over all other elements in the clause.

#### Linear order

The examples in [31] follow the default pattern where relative scope matches relative linear order. Again, however, the default may be overridden under certain circumstances:

- [32] i *I didn't agree with many of the points he made.* [scope ambiguous]  
 ii *Everybody didn't support the proposal, but most did.* [wide scope negation]

Example [i] can be interpreted with either the negative or the quantifier having scope over the other. With wide scope negation it is like [31i], the contradictory of *I agreed with many of the points he made*. In this reading there weren't many points that I agreed with. The wide scope quantification reading can be expressed unambiguously by fronting the quantified NP: *Many of the points he made I didn't agree with*. In this second reading there were many points that I disagreed with; it is a less likely reading of [32i] than the one with wide scope negation, but certainly possible, especially with a clear change of intonation contour on *many*. Without the *but* clause, [32ii] would be ambiguous in the same way: *most did*, however, forces the interpretation where the negative has scope over the quantifier, as it unambiguously does in *Not everybody supported the proposal*. Again the intonation can assist in making the meaning clear: the reading with wide scope negation reading will typically be encouraged by high pitch on *Everybody*.

Because the preferred (most likely) interpretation matches scope with order of appearance in the sentence, if we change the order – for example, by switching from active to passive – we will change the preferred interpretation:

- [33] i *Many members didn't back the proposal.* [narrow scope negative]  
 ii *The proposal wasn't backed by many members.* [wide scope negative preferred]

A prosodic override is virtually impossible in [i]: *many* has scope over the negative. In [ii] the preferred reading has *many* within the scope of the negative (“there weren’t many who supported the proposal”), though it is just possible for this to be overridden, making it equivalent to [i].

#### Equivalence between wide scope universal and narrow scope existential quantification

- [34] i *All of them didn't have a clue what he meant.* [wide scope universal]  
 ii *None of them had a clue what he meant.* [narrow scope existential]

These are semantically equivalent (cf. Ch. 5, §5.1). In [i] the universal quantifier *all* has scope over the negative: all of them had a negative property. In [ii] *none* expresses the negation of existential quantification: “it is not the case that any of them had a clue what he meant”. (A more emphatic version is *Not one of them had a clue what he meant*, with negative and quantifier expressed separately, and the one with wider scope coming first.) Although [34i–ii] are equivalent, version [ii] is quite strongly preferred. This preference for a formulation with existential quantification within the scope of the negative over universal quantification with scope over the negative is reflected in the possibilities for overriding order in clauses combining negation with universal quantification:

- [35] i *All of the members didn't support the proposal.*  
 ii *The proposal wasn't supported by all of the members.*

Here [i] can be interpreted with wide scope negation (“Not all of the members supported the proposal”): it allows a prosodic override of the narrow scope negation reading much more readily than [33i] because *None of the members supported the proposal* would be preferred over the narrow scope negation reading of [35i]. Conversely, override is hardly possible in [ii]. The normal reading here has wide scope negation (“not all”): instead of overriding the order to put *all* outside the scope of negation one would normally use *any* instead of *all* (*The proposal wasn't supported by any of the members*), with the negative having scope over an existential quantifier.

### 1.3.3 Focus

In all but the most trivial negative clauses there are several different conditions whose failure to hold would cause the clause to be strictly true. Which condition is intended can be indicated by a speaker through the device of stressing the most closely associated word. A constituent marked by stress as being crucial to the way in which an instance of negation should be understood is called the **focus** of that negation.<sup>2</sup>

#### ■ Negation focus, falsity conditions, and prosody

Let us again compare a negative clause and its positive counterpart:

- [36] a. *Your children don't hate school.*      b. *Your children hate school.*

<sup>2</sup>Throughout this chapter ‘focus’ is to be understood in the sense of ‘informational focus’: see Ch. 6, §7.3, for the distinction between two concepts of focus.

One way of giving the truth conditions for the positive [b], one which highlights the contribution of the separate words, is as follows:

- |   |                              |
|---|------------------------------|
| [37] i a. “Somebody’s children hate school”                             | b. “You are that person”     |
| ii a. “Some relatives of yours hate school”                             | b. “They are your children”  |
| iii a. “There is some attitude your children<br>harbour towards school” | b. “That attitude is hatred” |
| iv a. “There is something your children hate”                           | b. “That thing is school”    |

In order for [36b] to be true, each of these conditions must be true; but for [36a] to be true it is sufficient that any one of the conditions be false. From this point of view, negative statements run the risk of being relatively uninformative. It could be that somebody’s children hate school, but not yours – or indeed that no one’s children hate school; it could be that some relatives of yours hate school, but not your children – or indeed that none of your relatives hate school. And so on.

English provides ways of making negatives more informative by giving some indication as to which condition fails to hold. The way we are concerned with here involves the use of stress and intonation to highlight the part of the clause that is associated with that condition. Consider, for example, the four ways of saying [36a] shown in [38], where the small capitals indicate heavy stress and raised or changing pitch:

- [38] i *YOUR children don’t hate school.*  
“If there are children who hate school, they are not yours”
- ii *Your CHILDREN don’t hate school.*  
“If any of your relatives hate school, it is not your children”
- iii *Your children don’t HATE school.*  
“If your children harbour an attitude towards school, it is not hatred”
- iv *Your children don’t hate SCHOOL.*  
“If your children do hate something, it’s not school”

The part of the clause that is prosodically highlighted is the focus. In [38i] the focus is *your*, and this indicates that what makes the positive *Your children hate school* false is the non-satisfaction of the condition associated with *your*. Hence the gloss we have provided for this reading, “If there are children who hate school, they are not yours”, which locates the failure to satisfy the set of conditions given in [37] specifically in [ib]. Similarly, the glosses given for [38ii–iv] reflect the choice of *children*, *hate*, and *school* respectively as focus.

### ■ Narrower and broader negation focus

In this very simple example we have taken the focus to be simply the stressed word itself. But it does not have to be just that word: it can be a constituent that includes the stressed word. The focus in *Your CHILDREN don’t hate school*, for example, could be the whole NP *your children*, and the interpretation in this case would be “If there are some people who hate school, they are not your children”. Here, then, the focus is broader than we took it to be in our interpretation of [38ii]. Similarly, the focus in *Your children don’t hate SCHOOL* need not be as narrow as *school*: it can also be the VP *hate school*, and here the interpretation would be along the lines of “If your children have some property, it’s not that of hating school”.

To illustrate this variation in how broad a focus is selected, consider the following more complex example:

- [39] i *At least Max didn't wear a green mohair SUIT to the wedding.*  
 ii a. "At least the green mohair garment Max wore to the wedding wasn't a suit"  
 b. "At least the green garment Max wore to the wedding wasn't a mohair suit"  
 c. "At least the garment Max wore to the wedding wasn't a green mohair suit"  
 d. "At least what Max did wasn't to wear a green mohair suit to the wedding"  
 e. "At least Max wearing a green mohair suit to the wedding didn't happen"

We confine our attention to the case where the stress is placed on *suit*. This allows five different choices of focus, each a constituent containing the word *suit*. The glosses given in [ii] correspond to progressively broader foci. In [iia] the focus is taken to be *suit*; [iib] makes *mohair suit* the focus; [iic] makes it *green mohair suit*; [iid] makes it *wear a green mohair suit to the wedding*; and [iie] makes it the whole clause. The later paraphrases are probably more plausible in normal contexts than the first two, but all are possible.

There are default assumptions for both main stress and focus of negation. The neutral place in a clause to put the heaviest stress is on the last stressed syllable of the lexical head of the last phrasal constituent of the VP. When this is the stress pattern, the focus is quite likely to be taken by the hearer to be the whole clause that corresponds semantically to the scope of the negation. Consider a normal pronunciation of the sentence *I don't know why they appointed him to the job*. The heaviest stress is likely to be on *job*, and given that stress the focus of the negation will probably be taken to be the entire scope of *not*, i.e., the whole clause meaning "I know why they appointed him to the job".

#### ■ Positive implicatures resulting from the choice of focus

The focus of negation serves to narrow down the condition whose non-satisfaction makes the negative true and the positive counterpart false. But in picking out one condition one often implicates that the other conditions for the truth of the positive are in fact satisfied. The glosses we gave in [38] did not incorporate these implicatures. We glossed *YOUR children don't hate school* as "If there are children who hate school, they are not yours". But very often it will be interpreted more strongly as "There are children who hate school, but they are not yours". Thus in addition to the negative component "they are not yours", we have the positive implicature "there are children who hate school". It is clear that this is an implicature, not an entailment: to select *your* as focus is not to actually **say** that somebody else's children hate school. It would be perfectly coherent, for example, to say *I don't know about other people, but I'll certainly concede that YOUR children don't hate school*.

Such positive implicatures tend to be stronger with narrow focus than with broad. Thus if *I haven't done my TAX return yet*, *say*, is interpreted with the whole clause as focus it will not convey any positive implicatures of this kind. Compare this with a narrow focus example discussed earlier, *She didn't buy it because it cost \$50* ([30ii]). The reading where the negative has scope over the reason adjunct will normally have the stress on *\$50*, and focus on *because it cost \$50*. It will then have a very strong positive implicature that she did buy it, giving the interpretation that she bought it for some reason other

than its price. (But again, this is not an entailment: it could be that I don't know whether she bought it or not but am merely quite confident that she would not have allowed the mere price to induce her to buy it.)

### ■ Focus of negation as a special case of informational focus

The concept of focus applies in all main clauses, not just negatives. Compare:

- [40] i *Liz INTENTIONALLY deleted the backup file.*  
 ii *Liz INTENTIONALLY didn't delete the backup file.*  
 iii *Liz didn't INTENTIONALLY delete the backup file.* [focus of negation]

In all three cases the focus is *intentionally*, and in all three cases the effect of selecting this as focus is to give prominence to the associated piece of information – that Liz did what she did intentionally. Example [i] is positive and in [ii] the scope of the negation, “deleted the backup file” does not include the focus. Only in [iii] does the focus fall within the scope of a negative, but when it does, it serves as the focus of the negation. The effect of selecting as focus a constituent within the scope of negation is still to give prominence to the associated piece of information, but by virtue of giving it prominence I indicate that this is where you are to find the condition whose non-satisfaction makes the negative true.

## 2 Verbal negation

Negation of a clause is commonly marked on or adjacent to the verb of that clause, and we call that **verbal** negation. There are three types of clause that exemplify it, and the syntax is different in each case. We will deal first with clauses that have verbs inflected in a primary inflectional form, then with imperative clauses, and then with non-imperative clauses whose verbs are inflected in secondary forms.

### 2.1 Primary verbal negation

Positive clauses containing a primary form of an auxiliary verb may be negated by adding *not* after the verb, giving **analytic primary negation**, or by inflecting the verb in the negative, giving **synthetic primary negation**:

- [1] i *Kim will be here later on.* [positive clause with auxiliary verb]  
 ii *Kim will not be here later on.* [analytic primary negation]  
 iii *Kim won't be here later on.* [synthetic primary negation]

In [i] we have the neutral present tense form *will* in a positive clause. In [ii] this neutral form *will* is modified by *not* in post-auxiliary position. In [iii] the negation is marked by the negative present tense form *won't*.

To negate a clause containing a primary form of a lexical verb it is necessary to add the semantically empty auxiliary that we have called supportive **do**:

- [2] i *Kim waved to us.* [positive clause with lexical verb]  
 ii *Kim did not wave to us.* [analytic primary negation]  
 iii *Kim didn't wave to us.* [synthetic primary negation]

*Do* takes on the inflectional properties (here preterite tense) that in the positive are carried by the lexical verb, and the latter now appears in the plain form. Again the negation may be marked analytically or synthetically by a negative form of *do*.<sup>3</sup>

### ■ The choice between analytic and synthetic primary negation

Analytic and synthetic primary negation forms are not fully interchangeable. The main difference is one of style level.

The synthetic forms are a mark of informal style. While they are the default form in ordinary conversation and informal writing,<sup>4</sup> they are not used in very formal and solemn contexts or in some kinds of written (especially published) language. They are by no means absent from academic prose, but the author or speaker who uses them makes a definite style decision: the effect of using synthetic negative auxiliaries is to increase the sense of familiarity, intimacy, and accessibility. Compare the following pairs, where the [a] members belong to formal style, the [b] members to informal style:

- [3] i a. *I do not accept, and will not condone or defend, this shameful policy.*  
 b. *I don't accept, and won't condone or defend, this shameful policy.*
- ii a. *This is not to say that one could not conceive of a world in which aesthetic properties did not supervene on the physical; but the necessity of positing them does not seem to me an attractive prospect.*  
 b. *This doesn't mean that you couldn't imagine a world where aesthetic properties didn't supervene on physical ones; but having to assume them doesn't seem like an attractive prospect to me.*

While [ia] sounds grave and parliamentary, [ib] does not, and might be judged to sound too petulant in the context of a political speech. Likewise, [iia] has the tone of a published paper in analytic philosophy, while [iib] (in which various other changes are made in addition to the choice of synthetic negatives) has the flavour of a more informal explanation of the same ideas; it might be judged too patronising for appearance in some philosophy journals, but just right for a lecture. Naturally, there is much variation in style, and some academic writers choose to use a much more informal style than others.

The fact that synthetic negative auxiliaries are informal does not mean that analytic forms are neutral or preferable. Analytic forms sound unnatural in many conversational contexts unless there is some clear reason for their use, e.g., emphasis on the word *not* (*I did NOT sneak out by the back door when she arrived!*). Thus in an ordinary conversation, *I don't think so* or *Don't worry, I won't be long* are perfectly natural even in slow and careful speech, while *I do not think so* or *Do not worry, I will not be long* would be not just unusual but highly unnatural.<sup>5</sup>

<sup>3</sup>In earlier forms of English, non-auxiliary verbs in primary forms were also postmodified by *not*. Instances are preserved in various biblical and proverbial phrases (*I care not whether she lives or dies; He who knows not, and knows that he knows not, can be taught*), but the construction is no longer part of the productive syntax of the language.

<sup>4</sup>This applies to the synthetic forms that are fully acceptable; for the case of <sup>0</sup>*mayn't* and of *aren't* with a 1st person singular subject, see Ch. 18, §5.5.

<sup>5</sup>Such unnatural avoidance of negative auxiliaries is used in films to underscore the alienness of such characters as visitors from outer space.

### Grammatical restriction on synthetic negatives: inadmissible in inverted conditionals

Although the difference is mainly stylistic, there is one construction that does not permit synthetic negatives, namely the inverted conditional (see Ch. 3, §2.1.2). Compare:

- [4] i *Had it not been for the weather, the plan would have succeeded.*  
 ii *\*Hadn't it been for the weather, the plan would have succeeded.*

### ■ Synthetic verbal negation is a matter of inflection

The suffix *·n't* is often mistaken for a reduced pronunciation of the word *not*. That is of course its etymology, but it is no longer an unstressed pronunciation of *not*; in the contemporary language it is a verbal suffix. There are syntactic, morphological, and phonological reasons for distinguishing between such pairs as *does not* and *doesn't*, as described in Ch. 3, §1.9.

### ■ Position of negator in clauses with subject–auxiliary inversion

Clauses with subject–auxiliary inversion normally have the subject immediately following the auxiliary verb. The negative marker will thus precede the subject in synthetic negation but follow the subject in analytic negation:

- [5] i a. *She doesn't agree with me.*                      b. *She does not agree with me.*  
 ii a. *Doesn't she agree with me?*                      b. *\*Does not she agree with me?*  
 iii a. *\*Does shen't agree with me?*                      b. *Does she not agree with me?*

Example [iiia] is ungrammatical for the reasons just given: *·n't* is an inflectional suffix of the verb and hence can never be separated from the verb. In general the word *not* cannot come between the auxiliary and the subject, as shown in [iib]. The construction with *not* preceding the subject is not completely excluded, however: it is occasionally found as an alternant of the normal pattern where *not* follows the subject. Compare:

- [6] i *Do most self-indulgent public officials not accept bribes?*  
 ii *Do not most self-indulgent public officials accept bribes?*

Construction [ii] is a survival of an older pattern where *not* was quite generally permitted in this position. In speech it would be highly unnatural except in extremely formal declamation. But in writing it will still be found in sources not permitting synthetically negated auxiliaries. It is normally restricted to cases where the subject is relatively long, where it serves to avoid the lengthy interruption between auxiliary verb and *not* which makes [i] too sound somewhat stilted.<sup>6</sup>

### ■ Subclausal primary negation

Primary negation is normally clausal. Subclausal cases are restricted to constructions where the negated verb falls within the scope of a preceding adjunct, as in *He often isn't there when you call him*. The reversed polarity tag would be *isn't he?*, and we could have continuations like *and so is his secretary*. What is negated here, then, is the predicate (that is, the VP), not the whole clause.

<sup>6</sup>We have noted, however, that synthetic negatives are not permitted in inverted conditionals, and this may facilitate the use of the construction with *not* preceding the subject: *She might have regretted her smallness had not all the parts been so well-proportioned.*

## 2.2 Imperative negation

Imperative clauses have a pattern of negation that cannot be reduced to the generalisations about the other types of negation, uniformly using the negative auxiliary *don't*. Positive and negative examples of the main types of imperative are shown in [7]:

[7]	POSITIVE IMPERATIVES	NEGATIVE IMPERATIVES
i	a. <i>Look at me.</i>	b. <i>Don't look at me.</i>
ii	a. <i>You look at me!</i>	b. <i>Don't you look at me!</i>
iii	a. <i>Everyone shout it out.</i>	b. <i>Don't everyone shout it out.</i>

### ■ Contrasts between imperatives and non-imperatives

Verbal negation in imperatives differs from that in other clauses in the following respects:

#### (a) Auxiliary *do* required even with auxiliaries

[8]	IMPERATIVE	DECLARATIVE
i	a. <i>Don't be afraid.</i>	b. <i>You aren't afraid.</i>
ii	a. <i>Don't have eaten all the pizza by the time I get back.</i>	b. <i>I hope [they haven't eaten all the pizza by the time I get back].</i>

Here auxiliary *do* appears in imperatives but not in comparable declaratives – because they contain auxiliary verbs, which permit primary verbal negation without the addition of supportive *do*. The most usual case of this kind involves the verb *be*, as in [i]. In [ii] we have the perfect auxiliary *have*; this is quite rare in imperatives, so [iia] may seem somewhat contrived. Nevertheless, its grammatical status is sharply different from that of the clearly ungrammatical *\*Haven't eaten all the pizza by the time I get back!* The distinction between auxiliary verbs and lexical verbs is thus irrelevant to the formation of negative imperatives: *do* is required in all cases.<sup>7</sup>

#### (b) Order of subject and verb

The subject, in imperatives that have one, as in [7ii–iii], precedes the verb in the positive, but usually follows *don't* in the negative (but see also Ch. 10, §9.7.3). No such order change accompanies negation in other clause types.

#### (c) Synthetic negation is found even though imperatives have plain form verbs

The verb in imperative clauses is in the plain form: it is not a tensed form, as evident from the form of *be* in *Be careful* and the absence of the *-s* suffix on *shout* in [7iii]. The negative imperative is the only construction containing an inflectional negative that is not a primary verb-form.

#### (d) Restrictions on analytic negation

In speech, verbal negation in imperatives is generally expressed synthetically, with *don't*. Analytic *do not* occurs mainly in writing and is a somewhat stronger marker of formal style than analytic negation is with primary verb-forms. It is particularly unlikely when the imperative has an overt subject, and in the case of *you* it can be regarded

<sup>7</sup>Verbally negated imperatives without *do* will occasionally be encountered, but they are conscious archaisms, surviving as relics, usually biblical, literary, or proverbial: *Fear not*; *Be not afraid*; *Waste not, want not*; *Judge not that ye be not judged*; etc. This construction is comparable to that illustrated in footnote 3.

as ungrammatical:

- [9] i a. *Don't any of you think you have heard the last of this matter.*      b. *Do not any of you think you have heard the last of this matter.*  
 ii a. *Don't you renege on our deal.*      b. *\*Do not you renege on our deal.*

Note that there is no alternative version of the analytic construction where *not* follows the subject. This order is found only in interrogatives: *Do you not habitually renege on your promises?*

## 2.3 Secondary verbal negation

The final category of verbal negation covers clauses other than imperatives that contain a secondary verb-form: a plain form, past participle, or gerund-participle. Since imperatives have plain form verbs, this category might be called non-imperative secondary negation, but we will simplify by dropping the 'non-imperative' and speak of secondary negation. The category covers subjunctive and non-finite clauses with verbal negation.

### 2.3.1 Formal marking of secondary negation

Secondary verbal negation differs from the others in two respects. First, it never introduces the auxiliary verb *do*. Second, it is always analytic: negative verb-forms are all primary except for the *don't* of imperatives. In all cases, then, secondary verbal negatives are formed by placing *not* as premodifier of the VP, as in the following subordinate clauses (enclosed in square brackets):

- | [10]      POSITIVE                            | NEGATIVE   |
|---|--|
| i a. <i>It is vital [that he be told].</i>    | b. <i>It is vital [that he <u>not</u> be told].</i>    |
| ii a. <i>[Locking the doors] is unwise.</i>   | b. <i>[<u>Not</u> locking the doors] is unwise.</i>    |
| iii a. <i>[His accepting it] was a shock.</i> | b. <i>[His <u>not</u> accepting it] was a shock.</i>   |
| iv a. <i>a plan [approved by the board]</i>   | b. <i>a plan [<u>not</u> approved by the board]</i>    |
| v a. <i>It looks bad [for them to smile].</i> | b. <i>It looks bad [for them <u>not</u> to smile].</i> |
| vi a. <i>They let me [wear high heels].</i>   | b. <i>They let me [<u>not</u> wear high heels].</i>    |

Here [i] is subjunctive, [ii–iii] gerund-participial, [iv] past-participial, [v–vi] infinitival. The infinitival with *to* has an alternant where *not* follows *to*: *It looks bad [for them to not smile]*. Since *to* carries no identifiable contribution to meaning, there is no real possibility of any scope contrast between the two constructions: they are semantically equivalent. The one with *not* between *to* and the verb is a special case of the 'split infinitive' construction discussed in Ch. 6, §7.1.

Most clauses with secondary negation are subordinate clauses, but the minor clause types that have secondary verb-forms in main clauses with exclamatory or optative senses also show this pattern:

- [11] i a. *A letter written on a computer!*      b. *A letter not written on a computer!*  
 ii a. *My only son getting into Harvard!*      b. *My only son not getting into Harvard!*  
 iii a. *Oh to have to visit England!*      b. *Oh to not have to visit England!*

### 2.3.2 Secondary negation with *not* following an auxiliary verb

When *not* comes between two verbs the issue arises as to which of them it negates. If the first verb is a lexical verb or a secondary form of an auxiliary, *not* belongs clearly with

the following verb:

- [12] i *She agreed [not to make a formal complaint].*  
 ii *Jill's instruction had been [not to take on any extra staff].*

These are straightforward cases of secondary negation, with *not* located syntactically in the infinitival clause. The matrix clauses with primary verb-forms are positive, as evident from the reversed polarity tags *didn't she?* and *hadn't it?*, and other tests. *Not* can modify a preceding verb only if it is a primary form of an auxiliary (or imperative *do*). This is the case we need to consider further.

#### (a) *Not* immediately following a primary form of an auxiliary

In this position *not* normally modifies the auxiliary verb and hence marks primary negation. This is so even when the auxiliary is not within the semantic scope of the negative:

- [13] a. *They must not read it.*                      b. *They need not read it.*

In [a] *must* has scope over *not* (“it is required that they not read it”), whereas in [b] *not* has scope over *need* (“it is not necessary for them to read it”) – cf. Ch. 3, §9.3.1. Nevertheless, *not* belongs syntactically in the matrix clause in both cases. Note, for example, that they take positive tags (*must they?*, *need they?*) – and that the analytic negation alternates with synthetic *mustn't* and *needn't*.

There are, however, three exceptions to the general rule, illustrated in:

- [14] i *Jill's instruction was [not to take on any extra staff – in any circumstances].*  
 ii *You can [not answer their letters]: you're not legally required to respond.*  
 iii *You can't [not go with them].*

#### *Not* after *be* in its specifying sense

Example [14i] can be interpreted like [12ii] without the perfect tense feature: “Jill’s instruction was that they not take on extra staff”. The reversed polarity tag in this case would be *wasn't it?*, for the main clause is positive. The construction illustrates the specifying use of *be* with a clause in the complement position that happens to be subjectless and negative. In [14i] it is impossible to replace *was not* by *wasn't* and preserve the sense.

However, it is perfectly possible for the *not* to follow *be* in sentences of superficially similar form and belong to the copular clause (if the copula is in a primary form): compare the attested sentence *The sole purpose of the criminal law is not to amuse Mr Mortimer*, which we understand as denying that the purpose of the criminal law is to amuse Mr Mortimer, not as affirming the bizarre claim that its purpose is to avoid amusing him. The construction is therefore potentially ambiguous. We included the prosodically detached *in any circumstances* in [14i] because it strongly favours the secondary negation reading that we wish to illustrate.

#### *Can not* and possibility of abstention

The meaning of the first clause in [14ii] is “You are permitted not to answer their letters”, with *can* thus having scope over *not*. In this use, the *not* will characteristically be stressed and prosodically associated with *answer* rather than *can* by means of a very slight break separating it from the unstressed *can*. The fact that the modal has scope over *not* makes this semantically comparable to [13a], but syntactically it differs in that it has secondary negation rather than the primary negation of [13a]. This is evident from the fact that

the reversed polarity tag for the *can* clause is *can't you?* The meaning is quite different from that of *You can't/cannot answer their letters*, which has primary negation in the *can* clause, and where the negative has scope over the modal (“It is not possible or permitted for you to answer their letters”).

In [14ii], therefore – unlike [13a] – the syntax matches the semantics, with the *not* located in the subordinate, non-finite, clause. But this construction is fairly rare, and sounds somewhat contrived. It would not normally occur with modals other than *can* and *may*.

#### *Can't not*: secondary negation combined with primary negation

In [14iii] (*You can't not go with them*) the *not* follows a negative auxiliary: a verb cannot be negated twice, so the *not* can only belong in the non-finite clause. Note that the matrix clause is straightforwardly negative by virtue of the synthetic negation: the reversed polarity tag is *can you?*, just as it is for *You can't go with them*. Syntactically, two negatives do not cancel each other out to make a positive: there are two negative elements in [14iii] but the main clause remains syntactically negative.

In principle, this construction is possible with any auxiliary verb: *I won't not speak this time, I promise you*. It can even be used, and has been attested, when the auxiliary is supportive *do*, to deny a negative assertion that has been made: *I DIDN'T not listen to you*. Compare also imperative *Don't not go just because of me*. These examples have one negative immediately within the scope of another, so that they cancel each other out semantically. *I won't not speak* is truth-conditionally (but not rhetorically) equivalent to *I will speak*; *I DIDN'T not listen* is similarly equivalent to *I DID listen*; *Don't not go* is equivalent to *Go*. In most circumstances the simpler positive would be preferred, but special circumstances can make the use of mutually cancelling negatives preferable.<sup>8</sup>

The *can* case in [14iii] differs from these in that the first negative has scope over *can*, so that *You can't not go with them* is not equivalent to *You can go with them*; it is equivalent to *You must go with them*, but there is sufficient pragmatic difference between *can't not* and *must* to motivate the use of both forms.

#### (b) *Not* syntactically separated from an auxiliary

*Not* can more readily mark secondary negation if it is adjacent to the secondary verb-form but not to the auxiliary. There are three distinct ways in which such a separation of the auxiliary from the negator can come about.

##### Infinitival *to* preceding *not*

The subordinator *to* can separate an auxiliary from *not*. One very clear case concerns infinitival *to* in the specifying *be* construction. Compare:

- [15] a. *Their aim is not to change things.*      b. *Their aim is to not change things.*

<sup>8</sup>Three attested examples of mutually cancelling adjacent negative elements of this kind are found in the following interesting piece of dialogue from a film script. The situation is between a man, A, who has run into a woman, B, whom he had been dating but has not seen for a while.

A: *Don't think that I have [not called you]. I haven't [not called you]. I mean . . . , I don't mean that I haven't [not called you] because that's a double negative so as to say that I have called you. . .*

B: *When did you call?*

A: *I didn't. But I didn't [not call you] in the way that you might think that I didn't call you.* [i.e. as indicating that I didn't want to see you again]

Each occurrence of *not* is prosodically associated with *call*, and marks secondary negation in the non-finite clause functioning as complement of the auxiliary.

In [a] we find the ambiguity between primary negation in the matrix clause and secondary negation in the infinitival clause that we mentioned in the discussion of [14i]; this ambiguity is resolved in favour of primary negation in the matrix if *is not* is replaced by synthetic *isn't*. In [b], by contrast, only the secondary negation reading is possible: the subordinator *to* marks the beginning of the infinitival VP of the subordinate clause, so *not* can only be in that subordinate clause.

#### Adjuncts between auxiliary and VP

A second case has an adjunct between the auxiliary and the *not*:

- [16] i *You can simply not answer their letters, can't you?*  
 ii *They have always not enforced that regulation, haven't they?*

The intervening adjunct serves to dissociate the *not* from the auxiliary. Compare [16i] with [14ii] above: adding the *simply* facilitates the association of *not* with the non-finite clause. In [16ii] the universally quantified adverb *always* has scope over *not*, forcing the association of *not* with *enforce*, to give the meaning “waive”.

#### Subject between auxiliary and *not*

A third possibility is for the subject to intervene between the auxiliary and its complement, when the matrix clause has subject–auxiliary inversion:

- [17] i *Would you not put your feet on the sofa.*  
 ii *Can you not ask them to help you?*  
 iii *Did you not agree with her?*

The natural interpretation of [i] is as a request not to put your feet on the sofa: *not* belongs in the *put* clause, and there is no alternant with synthetic negation in the matrix clause (i.e. we can't replace *would you not* by *wouldn't you*). But [ii] is ambiguous. It can be interpreted like [i], i.e. as a request not to ask them (in which case a full stop might be preferred to the question mark); this reading would be forced if *please* were inserted before *not*. Or it can be interpreted with *not* having scope over the modal, equivalent to synthetic *Can't you ask them to help you?*; in this reading we have primary negation in the matrix clause.

Strictly speaking, [17iii] is likewise ambiguous between primary negation of the matrix and secondary negation of the complement. The latter reading would be assisted if there were a slight prosodic separation of *you* from *not*, as in [14ii], but this reading is strongly disfavoured as the relevant meaning could be expressed much more clearly by *Did you disagree with her?* Again we could insert an *always* to force the secondary negation construal: *Did you always not agree with her?*

### 3 Non-verbal negation

We turn now to constructions where the negator is not associated with the verb. We look first in §3.1 at analytic negation marked by *not*. Then in §§3.2–3 we consider synthetic negation marked by absolute and approximate negators respectively. Finally, in §3.4 we discuss the semantic difference between affixal negation and verbal negation. Analytic negation marked by *no* (as in answers to questions) is discussed in §7.

### 3.1 *Not* as a marker of non-verbal negation

The clearest cases where *not* marks non-verbal negation are illustrated in:

- [1] i [Not all of them] regarded it as a success.  
 ii He seemed [not entirely honest].

These clauses contain primary forms of lexical verbs, which are not permitted with verbal negation: compare the verbal negation constructions *They did not all regard it as a success* and *He did not seem entirely honest* (which have synthetic alternants containing *didn't*).

When we turn to constructions with auxiliary verbs a contrast emerges because of the very strong tendency for *not* after an auxiliary to be interpreted as primary negation:

- [2] i [Not all of them] had regarded it as a success.  
 ii He was not entirely honest.

The negation in [i] remains clearly non-verbal: *not* is part of the subject NP, and not in a position where there could be any doubt about that. In [ii], however, *not* follows the auxiliary, and the sentence is most likely to be interpreted as a case of primary verbal negation. Note that the reversed polarity tag for [1ii] would be *didn't he?*, whereas that for [2ii] would be *was he?*

As in the case of [17] in the previous section, our syntactic description does in fact entail that [2ii] is structurally ambiguous, with *not* marking either verbal or non-verbal negation, because we have said nothing to exclude the bracketed AdjP constituent in [1ii] from occurring as the complement of the copula. And indeed, the non-verbal negation reading can be forced if the copula is separated from the *not*; thus we might find *He was both not entirely honest and somewhat aggressive*.<sup>9</sup> Nonetheless, the likelihood that an example like [2ii] will be seen as ambiguous is very low in most contexts.

We now proceed to review a dozen constructions where things are not as subtle as this, and *not* can be shown to be quite clearly a marker of non-verbal negation. (An additional one where *not* functions as an anaphoric complement, as in *I think not*, is covered in §7.2.)

#### (a) The *not all* type

- [3] i Not all people have had the opportunities you have had.  
 ii Not often do we see her lose her cool like that.  
 iii \*I agree with not all your arguments.  
 iv \*He not often visits his parents.

*Not* combines with a quantifier to form a negative phrase: *not all* is a negative DP, *not often* a negative AdvP. The *not* of course has scope over the quantifier. Such phrases can occur within the subject, as in [i], or before the subject, as in [ii]. The *not* here marks clausal negation, so *not often* in [ii] triggers subject–auxiliary inversion. These phrases are excluded from post-verbal position ([iii]) or central position ([iv]). Instead of [iii–iv] we need verbal negation: *I don't agree with all your arguments* and *He doesn't often visit his parents*.

<sup>9</sup>A further case is in predicative AdjPs modified by *so*, as in <sup>%</sup>*It was so not funny*. This is a relatively new construction, characteristic of the informal speech of younger speakers.

There are severe restrictions on what quantifiers take *not* as modifier in this construction (cf. Ch. 5, §11). Compare:

- [4] i *not all*      *not every*      *not many*      *not much*      *not often*  
 ii *\*not both*      *\*not each*      *\*not most*      *\*not some*      *?not any*

In clauses with verbal negation *each*, *most*, and *some* do not readily occur within the scope of negation. The salient interpretation of *I hadn't read most of it*, for example, is "Most of it I hadn't read". There is therefore little need for a phrase that explicitly brings them within the scope of a negative.

*Both* can occur readily enough inside the scope of verbal negation: *I couldn't afford both of them*. But there is still little need for a phrase combining *not* with *both*. Suppose two swimmers have attempted to swim the Bering Straits but have not both succeeded. If we want to express the quantification in the subject we would very likely be in a position to say *Neither of them succeeded* or *Only one of them succeeded*, which are more informative, and hence generally preferable to the inadmissible *\*Not both of them succeeded*.

*Not any* is of doubtful acceptability. Normally one would instead use *no* or *none*, as in *None of her friends had supported her*, but *not any* is marginally acceptable as an emphatic alternant: *?Not ANY of her friends had supported her*.

#### (b) *Not one*

- [5] i *Not one person supported the proposal.*  
 ii *They had found not one mistake.*

*Not one* has a somewhat wider distribution than the items in [4i], in that it can occur post-verbally, as in [5ii]. We can also have *not* in combination with *a* or *a single*: *They had found not a single mistake*.

#### (c) *Not two, etc.: "less than"*

- [6] i *Not two years ago this company was ranked in the top ten.*  
 ii *He was here not ten minutes ago.*

*Not* behaves differently in combination with numerals denoting numbers higher than one than in (b) above. In the first place, *not two, etc.*, are largely confined to measure phrases, of time, distance, and the like. They could not replace *one* in such examples as [5ii]: *\*They found not two mistakes*. Secondly, *not* in [6] marks subclausal negation: the clauses are positive, as evident from the lack of inversion in [i], and the reversed polarity tags, which would be *wasn't it?* and *wasn't he?* The clauses in [5], by contrast are negative (though *not one* or *not a single* . . . can also occur in measure phrases with subclausal negation). The interpretation of *not* in [6] is "less than", and this sense is found also in such expressions as *not an hour ago*, *not long before his death*, *not far from the post office*, etc., which likewise do not mark clausal negation.

#### (d) *Not a little, not a few*

- [7] *His speech had caused not a little confusion.*

*Not* can also combine with the determinatives *a little* and *a few*. These have paucal meaning, and the effect of the *not* is to negate the low upper bound on the quantification,

giving “a fairly large amount/number” (compare the use of *no* in *no small achievement* in [29]). The negative thus has very narrow scope and the clause itself is positive – witness the tag *hadn't it*?

(e) *Not even, not only*

- [8] i a. *Not even Ed approved of the plan.*      b. *Not only Ed approved of the plan.*  
 ii a. *Not even then did he lose patience.*      b. *\*Not only then did he lose patience.*

*Not* commonly combines with the focusing adverbs *even* and *only*. *Not even* generally marks clausal negation: the tag for [ia] would be *did he?* Clause [ib], by contrast, is positive. A tag would be rather unlikely here, but the construction readily allows a continuation with a positive connective adjunct: *Max approved of it too*. In [ii] we have inversion in [a], whereas the inversion in [iib] is ungrammatical.<sup>10</sup> The difference between *not even* and *not only* reflects the semantic difference: it follows from [ia] that Ed did not approve of the plan but from [ib] that he did approve of it. (In fact [ib] presupposes, takes for granted, that he approved of it: that is why it resists the addition of a confirmatory tag.)

*Not only* marks clause negation when it functions by itself as a clause adjunct: [*Not only was the acting appalling,*] *the movie was far too long.*

(f) *Not very, not quite, etc.*

- [9] i *We had a [not very amicable] discussion.*  
 ii *It somehow sounded [not quite right].*  
 iii *I found his story [not wholly convincing].*  
 iv *He spoke [not very confidently].*  
 v [*Not very many of them*] *had been damaged.*

*Not* combines with various degree expressions that can modify adjectives, adverbs, or certain determinatives. In [i] it combines with an attributive AdjP, in [ii–iii] predicative AdjPs, in [iv] an AdvP, in [v] a DP. While [i–iv] illustrate subclausal negation, [v] is different: *not very many* behaves like *not many* in marking clausal negation and being limited to pre-verbal position.

(g) *Not unattractive: not with affixally negated adjectives*

- [10] i *Morton was in his early fifties and not unattractive to women.*  
 ii *It was a not undistinguished private university with a large endowment.*  
 iii *They had fixed the walls, and purchased some not inelegant furniture.*

In general, attributive adjectives cannot be negated directly by *not*: cf. *\*a not large house* or *\*It looked not large*. The *not* + adjective construction illustrated in [10] is permitted only when the adjective consists of a base preceded by a productive and transparently negative prefix. Note then that we cannot have *\*a not anarchic society*, *\*several not intrepid explorers*: *anarchic* and *intrepid* are etymologically divisible into negative prefix + base,

<sup>10</sup>*Not only then* would not be fronted even without inversion: to give it prominence we would use the cleft construction with verbal negation: *It wasn't only then that he lost patience*. *Not even* can occur with subclausal negation, and thus without inversion, when the focus is a measure phrase: *Not even two years ago this company was ranked in the top ten, wasn't it?*

but this analysis is not synchronically transparent.<sup>11</sup> A further condition is that the adjective must be gradable. This excludes examples like *\*a not immoral purpose*, *\*this not uncrystalline substance*, or *\*a not illegal act*. In these uses the adjectives are classificatory rather than gradable: purposes are either moral or not, substances either form crystals or they do not, acts are either legal or not.

There has been occasional prescriptive condemnation of the ‘*not un-*’ construction, though most manuals are perfectly clear in their view that it is fully acceptable. It would certainly be mistaken to imagine that *attractive* should or could be substituted for *not unattractive* to express the same meaning. The two have different meanings. The adjective *attractive* denotes an appearance that ranks towards the positive end of a scale that has ugliness at the negative end, beauty at the positive end, and a range of indeterminate looks in the middle. The *un-* reverses the orientation of the scale to give an adjective denoting an appearance ranked towards the lower end of the scale. The *not* yields a negation of being towards the lower end of the scale, suggesting an appearance ranked towards the positive end, but only guardedly so, since the middle of the range is not excluded, and the phrase is too cautious to suggest that the user intended to indicate a high degree of beauty:

- [11] Impressionistic graph of the meanings of *attractive* and *not unattractive*
- |          |                               |        |
|----------|-------------------------------|--------|
|          | —— <i>attractive</i> ——       |        |
|          | —— <i>not unattractive</i> —— |        |
| UGLINESS | INTERMEDIATE LOOKS            | BEAUTY |

#### (h) *Not unnaturally*: negation of adverbs

- [12] i *Not unexpectedly*, Charles was late for the meeting.  
 ii *Not unreasonably*, he asked for payment in advance.  
 iii *Not surprisingly*, they didn't want any part of it.

Again, adverbs cannot in general be negated directly by *not*: cf. *\*Not stupidly*, he asked for payment in advance. The exceptions illustrated in [12] are similar to those with adjectives in [10] – except that *surprisingly* (which is roughly synonymous with *unexpectedly*) accepts *not* even though it has no negative prefix. The *not* in [12] has scope over just the adverb: the clauses in [i–ii] are positive, while that in [iii] is negative by virtue of the verbal negation.

#### (i) *Not with PPs*

- [13] i *Not at any stage of the proceedings* did she contemplate giving up.  
 ii *Not for the first time*, she felt utterly betrayed.

*Not* can modify a limited range of PPs, resulting either in clausal negation as in [i], or subclausal negation, as in [ii]. The difference here is again shown by the presence or absence of inversion. It correlates also with a difference in meaning: [i] entails that she did not contemplate giving up, while [ii] entails that she did feel utterly betrayed.

<sup>11</sup>A subtle point here derives from the fact there are adjectives treated as affixally negated by some speakers and not by others. For example, *impious* is pronounced /ɪm'piəs/ by some, making it clear that it is analysable into negative prefix + *pious*; but others pronounce it as /'ɪmpɪəs/, not related in pronunciation to *pious*. In general, %*a not impious man* is acceptable for the first group of speakers, but not for the second.

(j) *Not* in verbless clauses

- [14] i *Not an accomplished dancer*, he moved rather clumsily.  
 ii *Not under any illusions about the matter*, he continued to be cautious.  
 iii We need someone *not afraid of taking risks*.

These are equivalent to the verbal constructions *not being an accomplished dancer*, *not being under any illusions about the matter*, *who is not afraid of taking risks*. As in these latter examples, the negative does not have scope beyond the subordinate clause: the matrix clauses in [14] are all positive.

(k) *Not* + *that* clause

- [15] i *The film never quite generates his trademark level of icy paranoia. Not that it doesn't try*.  
 ii *I don't think they should be allowed to use our public health services – not that I have anything against immigrants, of course*.  
 iii *There are spare blankets in here, not that you'll have any need of them*.

This construction may be glossed as “This is not, however, to say/suggest that . . .”. In each case, the *not* calls up a proposition that might be naturally assumed or expected in the context, and denies that it is in fact true. In [i] what is denied is that the film doesn't try to generate the icy paranoia usually found in the director's works; in [ii] that the speaker has xenophobic views; and in [iii] that there is reason to think that it will be useful to know where the spare blankets are kept because you might be cold enough to need them. None of these are linguistically explicit.

The syntactic analysis is somewhat problematic. In terms of function the construction occupies a non-embedded position, like a main clause. In terms of its structure, we might take *not* as modifying the content clause (as in *not all* it modifies *all*, and so on). If so, the whole construction will have the form of a subordinate clause even though it is not functionally subordinate; as with other cases of this kind (such as *That it should have come to this!*) there is implicit rather than explicit functional subordination.

(l) *Not* in coordination

- [16] i *They are now leaving [not on Friday but on Saturday]*.  
 ii *They are now leaving [on Saturday, not on Friday]*.  
 iii *They've invited [you and your brother, but not me]*.

*Not* is found in a variety of coordinative constructions (discussed further in Ch. 15, §2.6). In [i] *not* appears in the first coordinate, and there is an equivalent construction with verbal negation: *They aren't now leaving on Friday but on Saturday*. (The non-verbal version is admissible only by virtue of the coordination: compare \**They are now leaving not on Friday*.) In [ii–iii] *not* belongs in the second coordinate – without a coordinator in [ii] (where the coordinates are conceived of as mutually exclusive), following coordinator *but* in [iii]. In all of these constructions the negation is subclausal, with *not* having scope over only one of the coordinates. Hence the tags or continuations seen in *They are now leaving not on Friday but on Saturday, aren't they?* and *They are now leaving on Saturday, not on Friday, and so are the Smiths*.<sup>12</sup>

<sup>12</sup>Where the *not* belongs in the second element, the negated phrase may be detached as a supplement, so that what precedes is a whole clause, which may take its own tag: *They are now leaving on Saturday, aren't they, not on Friday?*

The coordinates in construction [16ii] may be verbs, but the negation is still sub-clausal:

- [17] *The night turned viciously cold under a sky crowded with stars that [shone, not twinkled,] in the diamond-clear air.*

The scope of the *not* is just the second coordinate, so this is not a case of verbal negation of the clause – which is why we do not have supportive *do* (cf. \**shone, didn't twinkle*).

### ■ Unintegrated final *not*

- [18] i %*I'm so glad those old people came to the party . . . not!*  
 ii %*Obviously the government is going to tell us the whole truth . . . not!*

This construction is found mainly in younger-generation speech (popularised and perhaps originated by characters in an American television comedy sketch) but is occasionally echoed in recent journalistic writing. As a humorous way to signal irony or insincerity, a final emphatic *not* is added following a clause, retracting the assertion made. A comparable effect can be achieved by attaching *I DON'T think* instead of *not*.

## 3.2 The synthetic absolute negators

The absolute negators are:

- [19] i *no, none, nobody, no one, nothing, nowhere, no place* (informal AmE)  
 ii *neither, nor, never*

*No* and *none* are dependent and independent forms of the determinative **no**, while the other items in [i] are compounds containing *no*: in spite of the orthography we take *no one* (“nobody”) and *no place* (“nowhere”) to be grammatically single words. The three words in [ii] are transparently related to *either, or, and ever*.<sup>13</sup>

### 3.2.1 Clausal negation

In the default case the negators in [19] mark clausal negation: we look at this construction first and then turn in §3.2.2 to the subclausal case. The examples in [20] illustrate the clausal negation behaviour of clauses containing these items:

- [20] i [*Kim had done nothing about it,*] *and neither had Pat.* [connective *neither*]  
 ii [*They never replied to your letter,*] *did they?* [positive tag]  
 iii *In no city has she been entirely comfortable.* [subject–auxiliary inversion]

Note that in [iii] we have subject–auxiliary inversion triggered by the preposing of the PP *in no city*. The negative property of *no* percolates upwards in a way that is similar to that in which the interrogative property percolates upwards in *In which city has she been entirely comfortable?* The negative or interrogative property percolates upwards from the determiner to the NP, and thence to the PP (see Ch. 10, §7.9).

<sup>13</sup> There is also an archaic alternant of *nothing*, namely *naught*. But as such it is now restricted to a handful of collocations, as in *It availed him naught, It will come to naught*. In AmE *naught* can also be a variant spelling of *nought* (“zero”), which is not syntactically a negation marker; it is discussed in Ch. 5, §7.6.

### ■ Alternation with verbal negation constructions

Clausal negation marked by the absolute negators is generally in alternation with verbal negation in which *no* is replaced by *any* in the case of [19i] and by *either, or, and ever* in the case of [19ii]. Compare:

[21] NON-VERBAL NEGATION	VERBAL NEGATION
i a. <i>They showed <u>no</u> remorse.</i>	b. <i>They <u>didn't</u> show <u>any</u> remorse.</i>
ii a. <i>We liked <u>none</u> of them.</i>	b. <i>We <u>didn't</u> like <u>any</u> of them.</i>
iii a. <i>You did <u>nothing</u> about it.</i>	b. <i>You <u>didn't</u> do <u>anything</u> about it.</i>
iv a. <i>I knew <u>neither</u> of them.</i>	b. <i>I <u>didn't</u> know <u>either</u> of them.</i>
v a. <i>He <u>neither</u> knew <u>nor</u> cared where his children were.</i>	b. <i>He <u>didn't</u> <u>either</u> know <u>or</u> care where his children were.</i>
vi a. <i>She had <u>never</u> felt more alone.</i>	b. <i>She <u>hadn't</u> <u>ever</u> felt more alone.</i>

There are three restrictions that apply to the alternation between the non-verbal and verbal constructions.

#### (a) No verbal negation counterpart with negator in clause-initial constituent

Where the negator falls within the subject or an element preceding the subject, there is no direct verbal negation counterpart:

[22] i a. <i><u>Nobody</u> knew where Kim was.</i>	b. <i>*<u>Anybody</u> <u>didn't</u> know where Kim was.</i>
ii a. <i>At <u>no</u> stage did she complain.</i>	b. <i>*At <u>any</u> stage she <u>didn't</u> complain.</i>
iii a. <i>I <u>didn't</u> go and <u>neither</u> did he.</i>	b. <i>*I <u>didn't</u> go and <u>either</u> <u>didn't</u> he.</i>

In the case of [iib/iiib], the ungrammaticality of the verbal negation construction can be corrected by placing the element in post-verbal position: *She didn't complain at any stage* and *I didn't go and he didn't go either*.

#### (b) Verbal negation counterparts with *no* in predicative complements

Where *no* determines an NP in predicative complement function there may or may not be a verbal equivalent, depending on the interpretation of the negative NP. Compare:

[23] i a. <i>This is no place for a child.</i>	b. <i>This isn't any place for a child.</i>
ii a. <i>This is no time to give up.</i>	b. <i>This isn't any time to give up.</i>
iii a. <i>That is no way to behave.</i>	b. <i>That isn't any way to behave.</i>
iv a. <i>I'm no angel.</i>	b. <i>?I'm not any angel.</i>
v a. <i>You are no electrician.</i>	b. <i>?You're not any electrician.</i>
vi a. <i>He's no friend, is he?</i>	b. <i>?He isn't any friend, is he?</i>

The examples in [i–iii] show the regular relationship between the two constructions, but in [iv–vi] the [b] versions are of questionable acceptability and in any case do not have the same meaning as the [a] versions. It is [iv–vi] that illustrate the usual pattern for predicative NPs with *no*: pairs like those in [i–iii] are largely limited to NPs with simple and basic head nouns like *place, time, and way*, and subjects like *this* or *that*. As discussed in Ch. 5, §7.8, the interpretations of the [a] examples in [iv–vi] involve the stereotypical qualities associated with the set that the head noun denotes: angels, electricians, and friends in this case. Thus to make [iva] true it is neither necessary nor sufficient that I should not be a member of the set of angels; the sentence claims that I do not have the stereotypical qualities of angels (perfect goodness, kindness, patience, or whatever). Analogously for [va/via]. For this sort of interpretation, the [b] versions

are not appropriate paraphrases; they convey the literal meanings that the [a] meanings lack; for example, [ivb] means “I am not any specific member of the set of angels”.

(c) Limitation on distance between verb and negator

In principle, non-verbal negators marking clausal negation can appear in any position in the clause. However, as the position gets further from the beginning of the clause and/or more deeply embedded, the acceptability of the construction decreases, simply because more and more of the clause is available to be misinterpreted as a positive before the negator is finally encountered at a late stage in the processing of the sentence:

- [24] i a. *I am not satisfied with the proposal you have put to me in any way.*  
 b. *?I am satisfied with the proposal you have put to me in no way.*  
 ii a. *As far as I can recall, I have not purchased food at the drive-through window of a fast-food restaurant on any street in this city.*  
 b. *?As far as I can recall, I have purchased food at the drive-through window of a fast-food restaurant on no street in this city.*

When the negator is in a subordinate clause, particularly a finite one, and is significantly far away from the matrix clause verb, it will typically not be interpreted as negating the matrix clause, but rather will be heard as negating the subordinate clause in which it is located. Compare, for example:

- [25] i *I was not trying to imply that Bob had offered bribes to any official.*  
 ii *I was trying to imply that Bob had offered bribes to no official.* [≠ [i]]  
 iii *I was trying to imply that Bob had not offered bribes to any official.* [= [ii]]

Example [ii] is not synonymous with [i]: it is, rather, an alternant of [iii]. Compare also:

- [26] i *I cannot recall actually seeing a magpie attempting to steal anything.*  
 ii *?I can recall actually seeing a magpie attempting to steal nothing.* [≠ [i]]

In [26i] there is an occurrence of *anything* in a subordinate clause with primary verb negation in the matrix clause. If the primary verb negation is removed and the *anything* in the subordinate clause is replaced by *nothing*, we get [ii], but this is not equivalent to [i]. Example [ii] is understood with subordinate clause negation, either of the *steal* clause or the *attempt* clause; e.g., picking the *attempt* clause as the scope, the meaning is “I can recall actually seeing a magpie not attempting to steal anything”. But seeing a bird not attempting to steal is hardly worth mentioning, so [ii] sounds bizarre.

It is not entirely impossible for a negator in a subordinate clause to negate the matrix one, merely unusual. Where it happens, the subordinate clause will virtually always be non-finite, usually infinitival:

- [27] i *I don't know why they say they were forced to take their shoes off; [WE certainly forced them to do nothing of the kind].*  
 ii *[We are requiring people to pay nothing for the concert,] but nonetheless we are hoping for at least some donations at the door.*

Here the negator is located in the underlined infinitival clause but marks negation of the bracketed finite clause, as shown by the equivalence with the verbal negation versions *WE certainly didn't force them to do anything of the kind* and *We are not requiring people to pay anything for the concert*. In cases like this, then, the negative property percolates upwards from one clause into a higher one.

### 3.2.2 Subclausal negation

We review here three situations in which absolute negators mark subclausal negation.

#### (a) Negative NP as complement of preposition

- [28] i *I could do a lot for this place with no money at all.*  
 ii *Kim regretted having married someone with no ambition.*  
 iii *It was a matter of no consequence.*  
 iv *They were arguing about nothing.*  
 v *She finished it in no time.*

The PPs in [i–iii] are semantically equivalent to clauses or PPs with clausal complements: compare *even if I had no money at all, who had no ambition, which had no importance*. And just as the negative in these latter constructions would not percolate upwards beyond the subordinate clause, so the scope of the negative in the PP examples does not percolate upwards into the containing clause. Example [iv] is, strictly speaking, ambiguous. It has an interpretation as clausal negation, equivalent to the verbal negative *They weren't arguing about anything*; much more likely, however, is the meaning “They were arguing about something completely trivial”, and here the clause is positive (with *weren't they?* as tag). *In no time* in [v] is an idiom meaning “extremely quickly”; it is an instance of hyperbole: a desirably small amount of time implying a very high speed is overstated as being zero and thus implying infinite speed. Also idiomatic is the PP in *They were obviously up to no good*.<sup>14</sup>

#### (b) *No + mean, small, etc.*

- [29] *Getting that degree was no mean achievement, wasn't it?*

Here, in contrast to [28v], we have understatement: we understand “quite an achievement”, a positive meaning. Similarly: *His resignation was in no small measure involuntary, wasn't it?*

#### (c) Semantically clausal NP

- [30] i *They predicted no rain.*  
 ii *They promised no increase in income tax.* } [ambiguously clausal or subclausal]

Example [i] has an ordinary clausal negation interpretation, equivalent to *They didn't predict any rain*. But it can also be interpreted as subclausal negation, with the NP serving as a compressed expression of a clause, “They predicted that there would be no rain”. Similarly for [ii].<sup>15</sup>

## 3.3 The approximate negators

The class of approximate negators comprises the following seven words:

- [31] i DETERMINATIVES: *few, little*  
 ii ADVERBS: *rarely, seldom; barely, hardly, scarcely*

<sup>14</sup>A non-prepositional idiom is *no end*, meaning “very much”, as in *We enjoyed it no end and so did the others*, or *She had no end of a good time, didn't she?*

<sup>15</sup>This type is not mutually exclusive with (a) above, for such NPs can occur as complement to a preposition: *The weak US dollar is expected to weigh on equity and bond markets, despite no signs of inflation in Australia* (“despite there being no signs of inflation”).

*Few* and *little* are determinatives. They function in NP structure as determiner (*Few people liked it*) or fused determiner-head (*Few of them liked it*). *Few* selects count plural heads, *little* non-count singulars. *Little* also functions as degree adjunct modifying verbs (*He little understood the implications of what he had done*) or comparatives (*He felt little better*). *Few* and *little* are the plain forms of the lexemes ***few*** and ***little***, but the comparative and superlative forms (*fewer, fewest, less, least*) do not behave syntactically as negators.

The words in [31ii] are adverbs. *Rarely* and *seldom* are adverbs of frequency, while the other three are adverbs of degree, characteristically modifying verbs (*She hardly moved*), adjectives (*He was barely intelligible*), and a restricted range of determinatives (especially *any*: *There was scarcely any food left*).

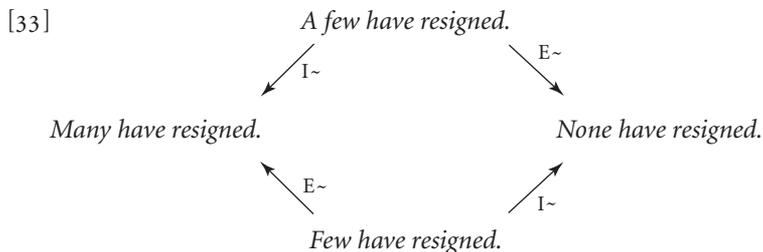

We refer to these items as approximate negators on the basis of such contrasts as the following with absolute negators or verbal negation:

- [32] i a. *Few* of them will survive.                      b. *None* of them will survive.  
       ii a. *Ed rarely* leaves the house.                    b. *Ed never* leaves the house.  
       iii a. *She had hardly* moved.                        b. *She hadn't* moved.

While the [b] examples indicate absolute zero, those in [a] express an imprecise quantification which is close to or approximates zero. However, the fact that the approximate negators do not indicate absolute zero gives them a somewhat equivocal status with respect to the positive vs negative contrast. Take [iia], for example. This entails that Ed doesn't often leave the house, that he leaves the house no more often than occasionally, and in this respect has a negative meaning. On the other hand, it implicates that he sometimes does leave the house: in this respect it differs from [iib] and has to some extent a positive character. We will attempt to shed some light on the status of these forms by considering three issues: the nature of the "not zero" implicature, their likeness to prototypical negators with respect to what we will call the 'direction of entailment', and their behaviour in the constructions we have used to distinguish between negative and positive clauses. *Few* and *little* contrast with *a few* and *a little*, which are unequivocally positive, and it will help clarify the status of *few* and *little* to show how they differ from *a few* and *a little* in these three areas.

#### (a) Nature of the "not zero" implicature

As imprecise quantifiers, the approximate negators cover a range of the relevant scale of quantification. In general, they **entail** that the upper bound of that range is not high but only **implicate** that the lower bound is not zero. We can show the relations between *a few* and *few* in relation to *many* and the absolute negator **no** in a diagram. The arrows stand for two different relations according to the labels: 'E~' means 'entails the falsity of' and 'I~' means 'implicates the falsity of'.

*A few have resigned* implicates that *Many have resigned* is false, and entails that *None have resigned* is false. The meaning of *a few* sets a lower bound of three, so if no one has resigned then *A few have resigned* is quite clearly false. If I know that many have resigned, then I would not normally use the sentence with *a few*, since to use *many* would be more informative. But the statement with *a few* would not be false in this context: if many have resigned, then it is necessarily true that a few have resigned. And it could be that I didn't yet know whether many had: I could still make the claim with *a few* without excluding the possibility that the stronger claim with *many* would also turn out to be true.

Now with *few* we have precisely the reverse situation: *Few have resigned* entails that *Many have resigned* is false, and implicates that *None have resigned* is false. The first of these is obvious, but it is not immediately obvious that the second is just an implicature, because it is a very strong implicature: I would be very unlikely to say *Few have resigned* unless I knew that at least some had resigned. But in other cases it can be less strong. Consider such an example as *Few of you will have experienced the kind of intimidation which our colleague Kim Jones has had to endure over the last several months*. Here it could well be that none of you have in fact experienced it: in this case I say *few* rather than *none* not because the latter would be false but because I do not have the knowledge to justify the stronger claim that it makes.

The difference between *a few* and *few* is reflected in constructions where the implicatures are cancelled (cf. Ch. 5, §5.2):

- [34] i *A few of them, indeed quite a lot, had found the proposal offensive.*  
 ii *Few of them, if any, will find the proposal offensive.*

In [i] *indeed quite a lot* cancels the “not multal” implicature of *a few*: we could not substitute *few* for *a few* because entailments cannot be cancelled in this way. In [ii] *if any* cancels the “not zero” implicature of *few*, and again we could not substitute *a few*, which has “not zero” as an entailment.

There may of course be other features of the clause that strengthen such “not zero” implicatures into entailments. One such case is the common construction where *barely*, *hardly*, or *scarcely* is followed by *when*:

- [35] *I had hardly arrived at the office when I was summoned to see the boss.*

The meaning is that I was summoned to see the boss virtually immediately after reaching the office. Here it is entailed, not merely implicated, that I did get to the office.

### (b) Direction of entailment

The concept **direction of entailment** may be illustrated by comparing the entailments in two sets of sentences, the first unproblematically negative, the second equally clearly positive. The negative set is given in [36]:

- [36] i *No one would deliberately injure an animal.*  
 ii *No one would deliberately injure a mammal.*  
 iii *No one would deliberately injure a horse.*  
 iv *No one would deliberately injure a racehorse.*
- ↓ direction of entailment

The VPs have meanings expressing successively harder conditions to satisfy: only certain animals are mammals; only some of those are horses; and only some horses are racehorses.

The direction of entailment test gives the same results for the other approximate negators. It is illustrated for *seldom* in:

- [39] i *I had seldom seen such birds.*  
 ii *I had seldom clearly seen such birds.*  
 iii *I had seldom clearly seen such birds through binoculars.*  
 iv *I had seldom clearly seen such birds through really powerful binoculars.*

The conditions imposed by the VPs of successive examples are, as before, increasingly hard to meet (more people will have seen such birds than will have clearly seen them; more will have clearly seen them than will have clearly seen them through binoculars; and so on). Again, then, we have downward entailment: if [i] is true then [ii] is true; if [i] and [ii] are true then [iii] is true; and so on downward into more and more specific claims. This downward entailment property is what the adverb *seldom* contributes, for notice that if *seldom* is removed the property disappears: it is not necessarily the case that if *I had seen such birds* is true then *I had clearly seen such birds* is true and that *I had clearly seen such birds through binoculars* is true, and so on.

Care should be taken when determining whether adverbs of this sort are downward entailing to make sure that the implicit context of comparison is not changed. For example, take the sentences in [40]:

- [40] i *David rarely watches films.*  
 ii *David rarely watches violent films.*

It is natural to interpret [i] against a background consisting of all the days of David's life, so that if he watches only one film a year, [i] is true. And it is natural to interpret [ii] against a background of all of David's visits to the cinema, so that if 90% of the films he watches are violent ones, [ii] is false. Now, it is perfectly possible to envisage David watching just ten films in ten years, but with nine of the ten being violent films. In that case a natural interpretation of [i] is true (he watches very few films per year) and a natural interpretation of [ii] is false (in fact most of the films he sees are violent). But that is not grounds for doubting that *rarely* is downward entailing.

Selection of the reference class for assessing rarity is crucial to the interpretation of the word *rare*. The proper comparison is between the truth conditions of the two sentences given a constant choice of reference class. For example, if we fix the reference class as the set of days in David's life, then watching films on average ten times in ten years certainly counts as rarely watching films, so [i] is true; but by the same standard, watching violent films on average only nine times in ten years certainly counts as rarely watching violent films, so [ii] is true (as it would be even if **all** David's film choices were violent).

This is not to say that it is illegitimate to select the set of David's film viewing experiences as the reference class for evaluating the truth of [40ii]; but if we are concerned with whether [i] entails [ii], we should not shift reference class between sentences so that [i] is evaluated by reference to one class and [ii] is evaluated by reference to another. The claim of downward entailing is that if we select a reasonable reference class that makes [i] true, when we fix that class and use it to evaluate [ii], [ii] will also be true.

## (c) The syntactic tests for negative polarity

Examples such as the following show that the approximate negators can mark clause negation:

- |  |   |              |
|--|---|--------------|
| [41] i a. <i>Little of the liquid spilled, <u>not even</u> when the flask fell over.</i> | } | [not even]   |
| b. <i>One <u>seldom</u> sees such birds, <u>not even</u> in Australia.</i>               |   |              |
| ii a. <i>She <u>hardly</u> goes out these days, and <u>neither</u> does her son.</i>     | } | [connective] |
| b. <i>Little of the gas spilled, and little of the gas escaped, <u>either</u>.</i>       |   |              |
| iii a. <i>Few good drivers ignore signs, <u>do they?</u></i>                             | } | [tag]        |
| b. <i>Hardly any of them complained, <u>did they?</u></i>                                |   |              |
| iv <i>Rarely <u>does the possum</u> emerge before dusk.</i>                              |   | [inversion]  |

Matters here, however, are somewhat more complex than with the absolute negators: examples like those in [41] are not fully representative of the patterns found. There are four points that need to be noted.

## Approximate negators mark clausal negation more readily when positioned early

The negators in [41] all precede the verb. In cases where they occur late in the clause the polarity tests often give much less clear-cut results. Compare, for example:

- [42] i *Few of the boys had shown any interest in the proposal.*  
 ii *He had so far shown the visitors few of the sights of London.*

While ‘*had they?*’ is perfectly acceptable as the tag for [i], ‘*had he?*’ for [ii] is for many speakers at best marginal. And [i] allows the continuation *and nor indeed had many of the girls*, while *and nor indeed had his colleagues* is questionable as a continuation of [ii].

## The strength of the “not zero” implicature may affect the syntactic polarity

- [43] i *He’s probably lying. It’s barely conceivable that he could have done it himself.*  
 ii *She’s barely alive.*

A positive tag is more acceptable for [i] than for [ii], and this would seem to correlate with the fact that [i] has a somewhat stronger negative flavour than [ii]: [i] suggests that I’m inclined to believe he couldn’t have done it himself, while [ii] seems to be saying that she is alive, though only just.

## The class of approximate negators is not entirely homogeneous

*Rarely* and *seldom* are somewhat weaker markers of clausal negation than the others. These two can be the focus for *only*, while the others cannot:

- [44] i *She visits her parents only rarely.*  
 ii *\*She had read only few of the letters.*  
 iii *\*She had done only hardly anything about it.*

Note that [ii] can be corrected by replacing *few* by *a few*. The *only* strongly favours an interpretation where there are at least some occasions on which she visits her parents, and a *does she?* tag for [i] or a continuation like *and neither does her brother* would be quite unacceptable. It is also possible, for many speakers at least, for *rarely* to occur in front position without triggering subject–auxiliary inversion: *Rarely, the possum emerges before dusk*. Here we understand “very occasionally, on rare – but at least some – occasions”, and the clause is syntactically positive.

at the left: the in-between area is therefore greater, and the difference in meaning more obvious.

#### 4 Polarity-sensitive items

A significant number of items – specific words, fixed or variable phrases, and idiomatic expressions – are **polarity-sensitive**, i.e. sensitive to the polarity of the environment in which they occur. Some items are admissible in negative environments but not normally in positive ones, while others occur in positive environments but generally not in negative ones:

- [1] i a. *She doesn't see him any longer.*      b. *She knows him already.*  
 ii a. *\*She sees him any longer.*      b. *\*She doesn't know him already.*

The aspectual adjunct *any longer*, for example, is acceptable in negative [ia] but not in positive [iia]. And conversely *already* is acceptable in positive [ib] but not in negative [iib] (ignoring the special case when it is used to contradict a previous utterance like [ib]). We need two pieces of new terminology for referring to these two kinds of item:

- [2] i Items which prefer negative contexts over positive ones (such as *any longer*) are **negatively-oriented polarity-sensitive items**, or **NPIs**.  
 ii Items which prefer positive contexts over negative ones (such as *already*) are **positively-oriented polarity-sensitive items**, or **PPIs**.

#### ■ Non-affirmative contexts

The reference to preferring negative contexts above is not incorrect, but it is only part of what needs to be said about the distribution of NPIs. The clauses in [1] are declarative main clauses. When we go beyond such data to consider interrogatives and certain types of subordinate clause we find that NPIs are not restricted to negatives:

- [3] i *Do you need me any longer?* [interrogative]  
 ii *If [you play any longer], you'll get too tired.* [conditional]

In [i] *any longer* occurs in an interrogative clause, while in [ii] it occurs in a subordinate clause functioning as protasis in a conditional construction. Although these clauses are positive, they have it in common with [iia] that they are not used to assert a positive proposition: the proposition is questioned or merely conditionally entertained. This larger class of contexts that admit NPIs we call **non-affirmative** contexts – and those that exclude them, by contrast, are **affirmative** contexts.

While NPIs are restricted to non-affirmative contexts, PPIs are not restricted to affirmative contexts. *Already*, for example, is just as acceptable as *any longer* in interrogative and conditional constructions:

- [4] i *Have they already left?* [interrogative]  
 ii *If [he has already finished his work], we can leave immediately.* [conditional]

Thus NPIs and PPIs do not occur in mutually exclusive sets of environments. They are mutually exclusive in declarative main clauses, but not always elsewhere.<sup>17</sup>

<sup>17</sup>NPIs are often referred to as 'negative polarity items'. We avoid that term because it is open to misinterpretation. NPIs are not themselves negative items: the NPI *any*, for example, is to be distinguished from the negative word *no*. Nor, as we have just emphasised, are NPIs restricted to negative contexts. Alternative terms found in the literature for our 'affirmative' and 'non-affirmative' are 'assertive' and 'non-assertive'.

### ■ Varying strength of the restrictions

The NPI and PPI classes are by no means completely homogeneous: we find significant differences with respect to the distributional restrictions that apply. *Much*, for example, qualifies as an NPI by virtue of the unacceptability of clauses like \**She loved him much*, but it is not wholly excluded from affirmative contexts, as is evident from examples like *She much regretted accepting their invitation*. By contrast, the NPI *at all* (*She did not love him at all*) is completely excluded from affirmative contexts. Similarly with PPIs. We have noted that *already* is quite acceptable in interrogatives, but *pretty* (“fairly”) is not: examples like *‘Is she pretty happy?’* are of doubtful acceptability.

It should also be borne in mind that in some cases the restrictions apply to one sense of an item but not to another. Thus *any* is non-affirmative in the sense it has in *She didn’t make any changes* or *Did she make any changes?*, but it also has a ‘free choice sense’ which is not polarity-sensitive, as in *Take any card*, or *Any changes must be approved by the board* (cf. Ch. 5, §7.5). Where it will help exposition we will use subscripts to distinguish between different senses, referring to the NPI *any* as ‘*any<sub>n</sub>*’.

We will review the NPI and PPI classes in turn, and then examine correspondences between certain sets such as *any* (NPI), *some* (PPI), and *no* (negator). In the final subsection we take up in more detail the question of what constitutes a non-affirmative context.

## 4.1 Negatively-oriented polarity-sensitive items (NPIs)

The class of NPIs is quite large: it is not possible to give an exhaustive and definitive list. The most important ones, and a sample of the less important ones, are given in [5].

- [5] i The *any* class of items: *any<sub>n</sub>*, *anybody<sub>n</sub>*, *any longer*, *any more* (AmE *anymore*), *anyone<sub>n</sub>*, *anything<sub>n</sub>*, *anywhere<sub>n</sub>*
- ii Miscellaneous grammatical items (mostly functioning as adjuncts): *at all*, *either<sub>n</sub>*, *ever<sub>n</sub>*, *long<sub>n</sub>*, *much*, *till/until*, *too<sub>n</sub>*, *what(so)ever<sub>n</sub>*, *yet<sub>n</sub>*
- iii The modal auxiliaries *dare* and *need*
- iv A few lexical verbs: *bother* (+ infinitival), *budge*, *faze*
- v A large and probably open array of idioms, including: *can abide/bear/stand*, *can be bothered*, *could care less*,<sup>18</sup> *cost a bean*, *do a (single) thing (about . . .)*, *drink/touch a drop*, *eat a bite/thing*, *give a damn/fig*, *have a clue*, *have a penny (to one’s name)* (BrE), *have a red cent* (AmE), *hearsay a word/sound*, *hold a candle to*, *in ages*, *in donkey’s years*, *lift a finger (to help)*, *mind a bit*, *move a muscle*, *say a word*, *see a thing*, *see a (living) soul*, *so much as* (+ verb), *take a (blind) bit of notice*, *would hurt a fly*

We prefer ‘affirmative’ as it suggests the two most important features: positive in contrast to negative (an affirmative answer is a positive one) and declarative in contrast to interrogative (to affirm is to state, not to ask). ‘Non-affirmative’ can also be applied to items, providing an alternative term for NPIs, one which we have used in other chapters: in the present context we prefer NPI because we are dealing with the contrast between the two types of polarity-sensitive item.

<sup>18</sup>For many American speakers the expression *I couldn’t care less* has lost its negation and the expression is now *I could care less*, still with the idiomatic meaning “I do not care at all”. For these speakers, *care less* is no longer an NPI; *could care less* has become an idiom with a negative meaning (approximately the opposite of its literal meaning). This is not an uncommon development; it is seen again in the development from *I don’t know beans about it* “I don’t know anything about it” to *I know beans about it* with the same meaning.

The following examples provide matching negative and positive examples in declarative main clauses for a sample of these.

- |  |   |
|--|---|
| [6] i a. <i>Lee didn't <u>budge</u> an inch.</i>         | b. * <i>Lee <u>budged</u> an inch.</i>              |
| ii a. <i>They <u>can't</u> <u>abide</u> aniseed.</i>     | b. * <i>They <u>can</u> <u>abide</u> aniseed.</i>   |
| iii a. <i>You <u>needn't</u> come with us.</i>           | b. * <i>You <u>need</u> come with us.</i>           |
| iv a. <i>He didn't wait <u>so much as</u> a week.</i>    | b. * <i>He waited <u>so much as</u> a week.</i>     |
| v a. <i>She hasn't woken up <u>yet</u>.</i>              | b. * <i>She has woken up <u>yet</u>.</i>            |
| vi a. <i>I didn't <u>see</u> a living soul.</i>          | b. # <i>I <u>saw</u> a living soul.</i>             |
| vii a. <i>Joe hasn't <u>lifted</u> a finger to help.</i> | b. # <i>Joe has <u>lifted</u> a finger to help.</i> |

The positive versions are either ungrammatical or have a quite different and often bizarre literal meaning. Thus while [via] means that I didn't see anyone, [vib] can only mean that in some way I actually saw a soul. Similarly, [viia] means that Joe did nothing to help, but [viib] can only mean that Joe's help consisted literally of raising a finger.

The subscripts attached to some of the items in [5] indicate that they have other senses in which they are not NPIs. Thus *any* and *either* have free choice senses (cf. Ch. 5, §§7.5, 7.7); *either* also has a non-NPI use as a marker of coordination (*She's arriving either on Monday or on Tuesday*); *ever* and *yet* are similarly not NPIs in *It will last for ever* and *He is yet to announce his decision*; nor is *long* an NPI as an adjective (*It lasted a long time*).

*Too<sub>n</sub>* means “very”, as opposed to the ordinary *too* meaning “excessively”: the difference is seen in the well-known ambiguity of the testimonial writer's *I can't recommend her too highly* (“it's impossible to overstate her good qualities” or, with *too<sub>n</sub>*, “I can give only a lukewarm recommendation”).

*What(so)ever* is an NPI, with the meaning “at all”, only when functioning as an emphatic postmodifier in NP structure following *any* or *no*: *There is no justification whatsoever for his behaviour*; *Have you any idea whatever of its value?*

The case with *till* and *until* is somewhat different. These are NPIs only when the clause has a punctual meaning (cf. Ch. 8, §7.3):

- |   |   |
|---|---|
| [7] i a. <i>We won't leave till six o'clock.</i>  | b. * <i>We will leave till six o'clock.</i>     |
| ii a. <i>We won't publish it until next year.</i> | b. * <i>We will publish it until next year.</i> |
| iii a. <i>We won't stay until the end.</i>        | b. <i>We will stay until the end.</i>           |

With verbs that are non-punctual and atelic, *till* and *until* are not polarity-sensitive, as shown in [iii]. But this is not a matter of a difference in the sense of *till/until*: it is simply that the polarity-sensitivity of these prepositions is limited to their occurrence with certain types of VP.

#### 4.1.1 NPIs vs negative idioms

It will be noted that we have not included the word *not* or the inflectional suffix *-n't* in any of the NPIs. Thus we have listed *long* and *could care less* rather than *not long* or *couldn't care less*. The negative element is part of the context which admits the NPI, not part of the NPI itself. There are in fact a number of idioms which do include negators as subparts, and they behave quite differently from NPIs. Idioms of the type in question include the underlined phrases in [8]: *not half bad* “quite good”, *like nothing better* “be pleased”, and *stop at nothing* “use any means necessary”.

- [8] i *I tasted the caviar, and it was not half bad.*  
 ii *I would like nothing better than to attend the dinner.*  
 iii *George will stop at nothing to get that job.*

Notice that the positive counterparts are not available, or not available with related meanings: *half bad*, *like something better*, and *stop at something* are not positive counterparts to the expressions given in [8].

These idioms contain a negator, but do not negate the clause they belong to. NPIs, by contrast, do not contain a negator, but require that one of a certain range of properties be present in the context in which they appear in order that it be non-affirmative: negation is just one of the properties of this kind. The difference between the behaviour of negative-containing idioms and that of NPIs is seen when we contrast, say, the distribution of *not for long* with that of *not half bad*. At first they might seem parallel:

- [9] i a. *They laughed, but not for long.*                      b. *It was salty, but not half bad.*  
 ii a. *It wasn't for long.*    b. *It wasn't half bad.*

But the parallel rapidly breaks down:

- [10] i a. *They didn't laugh loudly or for long.*                      b. <sup>#</sup>*It wasn't too salty or half bad.*  
 ii a. *No one laughs for long.*    b. <sup>#</sup>*Nothing was half bad.*  
 iii a. *Few people laughed for long.*                                      b. <sup>#</sup>*Few portions were half bad.*  
 iv a. *I doubt that he'll laugh for long.*                              b. <sup>#</sup>*I doubt that it was half bad.*  
 v a. *Did they laugh for long?*    b. <sup>#</sup>*Was it half bad?*  
 vi a. *I'll leave if they laugh for long.*                                  b. <sup>#</sup>*I'll leave if it's half bad.*

The ‘#’ in the [b] cases indicates that the expected idiomatic meaning is not present (though some other meaning might be possible, e.g. with *half bad* meaning ‘50% putrescent’). As we see, *for long* does not have to be preceded by *not* or a negative auxiliary; it merely has to be in some sort of non-affirmative context. The situation with *not half bad* is quite different. Immediately before *half bad* must be either *not* or a negative auxiliary; merely having *half bad* in some non-affirmative context is not sufficient for it to count as an instance of the idiom *not half bad*.

The idiom *like nothing better* is likewise restricted to combinations involving those three words: [8ii] can be paraphrased by *There's nothing I'd like better than to attend the dinner*, but not by *I wouldn't like anything better than to attend the dinner*. The latter has only the literal meaning that nothing (not even winning a national lottery) tops dinner attendance on my preference list, whereas [8ii] is just a polite form of words carrying no such literal entailment.

*Stop at nothing* also exists only in negative form. <sup>?</sup>*George will stop at something* would have to have a literal meaning and is hard to find any context for; [8iii] is not paraphrased by <sup>?</sup>*George will not stop at anything to get that job*. It has a tighter structural restriction than *like nothing better* in that the word sequence *stop at nothing* (usually *will stop at nothing*) must be intact, so we do not find <sup>?</sup>*There is nothing that George will stop at to get that job* with the NPI sense.

#### 4.1.2 Variation in the strength of the negative orientation

We noted at the beginning of the discussion of polarity-sensitive items that there is variability with respect to the strength of their positive or negative orientation. As far as NPIs are concerned, there are two issues to be considered: (a) how strictly the restrictions

apply in negative clauses, and (b) the occurrence of these items in other kinds of non-affirmative context, such as interrogatives.

### ■ The restriction to negative contexts in declarative main clauses

With some items things are fairly clear. Leaving aside certain special constructions dealt with in §4.4 below, the NPI *at all* is completely excluded from positive declaratives. *She didn't like it at all* is admissible, but *\*She liked it at all* is not, and so on. The same applies to the *any* series of words once we set aside the semantically distinct free choice uses. But for others we find that a word may be an NPI in some styles or registers and not in others. The item *much* is a particularly problematic case of this sort, and *long* and *many* have similar properties.

#### Contexts for *much*, *long*, and *many*

*Much* has a bewilderingly large set of distinct uses associated with different styles or registers. Compare:

- [11] i a. *The new, more elaborated abstracts were much favoured among modernists.*  
 b. *Location theorists have given these matters much consideration.*  
 c. *This means much to the American tradition.*  
 d. *The design of an interlocking frame is much like a mechanical puzzle.*  
 e. *The president spent much of the weekend at his summer home on Cape Cod.*
- ii a. *Thank you very much for the lovely flowers.*  
 b. *So much has happened that I'm not sure I can remember it all.*  
 c. *When I wear these I look too much like my dad.*  
 d. *This is much better than the other one.*  
 e. *I'll tell you this much: I didn't pay full price.*
- iii a. *The lecture was very long but it didn't really cover much.*  
 b. *I went sailing once but I didn't enjoy it much.*  
 c. *He isn't much of a dancer.*

In general terms the examples in [i] can be said to be more characteristic of written English, literary contexts, formal style, and the usage of older speakers. The uses illustrated in [ii–iii] are more likely to be found in spoken English, conversational contexts, informal style, or the usage of younger speakers. But this is only a rough guide. It is extraordinarily difficult to separate the constructions out in a rigorous way, because certain phrases from the literary language have become familiar sayings in everyday speech almost as quotations.

We can be more specific about the examples in [11i], which will give a sense of what we mean. In [ia], *much* is a premodifier of a past participle (in its passive use), and has an intensificatory meaning like “greatly” or “to a high degree”. This is quite literary, but even this turns up in casual conversation through a number of fixed or partially fixed phrases that are in a sense borrowings from an earlier stage of the language; for example, the phrase *Much appreciated* is often used with the sense “Thank you”. In [ib], *much* is determiner in NP structure, and means “a lot of”; again, this is literary, but while *We have much sugar* is extremely unlikely to occur in casual conversation, one might easily hear something like *The living room is a scene of much confusion, I'm afraid* in a semi-jocular echo of the formal construction. Something similar is true for [ic], where *much* is used as fused determiner-head. The phrase *much like* in [id] is distinctly literary

in that context, yet the phrase *one is much like the next* has been adopted as a common turn of phrase in conversation. And *much of the weekend* in [ie] is slightly literary (*a lot of the weekend* would be more conversational), but *much of the time* is familiar in conversation.

There is an important difference between the cases in [11i] and those in [ii]. No cautions about literariness or formality need apply to the latter: all of them are fully natural in casual conversation in the contemporary language. It should be noted that *much* with an adverbial modifier like *very*, *so*, or *too* as in [iia–c] has a far wider distribution than *much* on its own. *Much* as a modifier of comparatives, as in [d], is very common (*much longer* is analogous to *very long*); and so are the phrases *this much* and *that much*, as in [e]. None of these illustrate NPIs.

That leaves the kind of use seen in [11iii]. These are the constructions in which *much* is an NPI. This is particularly clear in contrasts like these:

- |        |   |                                     |
|--------|---|-------------------------------------|
| [12] i | a. <i>I don't enjoy sailing much.</i>     | b. <i>*I enjoy sailing much.</i>    |
|        | ii a. <i>We don't have much time.</i>     | b. <i>*We have much time.</i>       |
|        | iii a. <i>Kim isn't much of a dancer.</i> | b. <i>*Kim is much of a dancer.</i> |

*Much* is thus certainly an NPI (and it is therefore on the list in [5]), despite the fact that looking at a random selection of occurrences of *much* would make it easy to think that one had found counterevidence to that statement. Many occurrences of *much* are, indeed, in affirmative environments. But nonetheless, if we focus on (say) the use of *much* as a post-verbal adjunct when occurring without its own premodifying adverb, it is clearly an NPI, as the sharp contrast between [12ia] and [b] shows. Instead of [12ib] we would have, in informal style, *I enjoy sailing a lot / a great deal*. The informal way to express the positive counterpart of the claim in [12iia] would be not [12iib] but something like *We have plenty of time*. And to express the positive counterpart of [12iia] one would use something like *Kim is quite a dancer*.

The durational adverb *long* – which, like *much*, expresses multal quantification – exhibits similar behaviour. We have *She hasn't known him long* but not *\*She has known him long* (cf. *She has known him a long time*); but *long* can occur pre-verbally in (somewhat formal) positive clauses: *I have long thought that this should be changed*.

Multal *many* also shows some signs of negative orientation, though to a lesser extent. The sentences *Many were lost* and *We saw many flowers*, with no negation, are very slightly literary, whereas *Not many were lost* and *We didn't see many flowers*, with negation, are as common in casual conversation as in writing. But again, an example like *?I'm not hungry because I've eaten many biscuits* sounds completely unnatural, with *a lot of biscuits* very strongly preferred in informal style.

#### ■ Occurrence in contexts that are non-affirmative but positive

Negatives constitute the most central type of non-affirmative context, but we have noted that NPIs can occur in certain types of positive clause, such as interrogatives – this is precisely why we talk in terms of non-affirmative contexts rather than simply negative ones. These positive non-affirmative contexts all have various semantic or pragmatic links to negatives. There are, however, differences among the NPIs with respect to how

strong or close these links need to be. Such differences can be illustrated by considering the non-affirmative context provided by closed interrogatives.

### NPIs in closed interrogatives

Other things being equal, questions expressed by positive closed interrogatives are neutral as opposed to biased (cf. Ch. 10, §4.7). That is, they do not indicate any predisposition on the part of the questioner to think that one answer is more likely than the other. Now the inclusion of certain NPIs in the question has no effect on this neutrality, but with others bias towards a negative answer is introduced. Compare:

- [13] i a. *Did they have a dog?*                      b. *Did they have any money?*  
       ii a. *Has she been to Paris?*                 b. *Has she ever been to Paris?*  
       iii a. *Did they help him?*                    b. *Did they lift a finger to help him?*

The possible answers to [ia] may be expressed as *Yes they did have a dog* and *No they didn't have a dog*: as we have said, there is no indication that one or other of these is expected to be the right answer. The answers to [ib] (omitting henceforth the *yes* and *no*) are *They had some money* and *They didn't have any money*, and again the question is quite neutral. The inclusion of *any* in the question does not indicate that the answer containing *any* is expected. The absence of any indication that a positive answer is favoured is sufficient to license the NPI *any*: this is the default existential quantifier for polar questions. Similarly, both questions in [ii] are neutral as between the answers *She has been to Paris (at some time)* and *She hasn't (ever) been to Paris*. This is not so in [iii]. While [iiia] is of course neutral, [iiib] is not: it is oriented towards the negative answer *They didn't lift a finger to help him*. The form of the question is such that the positive answer would be <sup>#</sup>*They lifted a finger to help him*, but since this (in the sense “They helped him”) is anomalous, the question doesn't cater directly for a positive answer and hence indicates bias towards a negative one. The same applies to most of the other items in [5iv–v].

### Pragmatic nature of strength contrasts

It is important to emphasise that the difference between (say) *any* or *ever* on the one hand and *budge* or *lift a finger* or *in ages* on the other is not a syntactic one. We are not saying that the former can occur in positive interrogatives while the latter cannot. The difference, rather, is pragmatic, having to do with the conditions under which they can be used in the expression of questions and with the interpretation of the resulting questions.

Take, for example, the phrase *in ages*, as in *I haven't tasted truffles in ages*. This is not easily contextualised in an interrogative: <sup>?</sup>*Have you tasted truffles in ages?* would not be a highly appropriate way of simply asking someone whether it had been a very long time since they last tasted truffles. However, it might well be found in a context that was strongly biased in a direction suggesting a negative answer, as in [14i]. Similarly, the occurrence of the verb *budge* is almost entirely limited to negative clauses but one might encounter it in a biased context like [14ii].

- [14] i *I don't think you know anything about truffles or any other gourmet foods. Do you eat truffles regularly? Have you even so much as tasted truffles in ages?*  
       ii *Did you budge an inch to let anyone else sit down? Not you; you just sat there hogging the whole couch as usual.*

The connective adjuncts *so*, *too*, and *as well*, however, cannot even take scope over negation:

- [18] i \**Kim didn't see it, and so didn't Pat.*  
 ii \**Kim didn't see it, and Pat didn't see it too / as well.*

This of course is why we were able to include these items in our tests for clause polarity. There is, however, an appreciable difference in the strength of the restriction: [i] is completely ungrammatical, whereas [ii] might be regarded as marginally acceptable by some speakers provided the final adjunct is prosodically set off to some extent.

### ■ Metalinguistic and other overrides

A number of the PPIs can occur within the scope of negation when used in a metalinguistic or quasi-metalinguistic way:

- [19] i A: *It's a pretty big fish.*      B: *It isn't pretty big, it's absolutely gigantic.*  
 ii A: *He's pretty stupid.*      B: *He's not pretty stupid, he's actually quite bright.*

In [i] we have a case of metalinguistic negation. B is not saying that the proposition “It is pretty big” is false, but is rejecting it on the grounds that it doesn’t go far enough. In [ii], B is rejecting A’s statement as false, so this is not metalinguistic negation; nevertheless B is repeating A’s expression. We refer to this latter case as a **denial**, a contradiction of something that has been said and explicit assertion of an alternative to it. In talking about the unacceptability of PPIs in negative contexts we are setting aside such special uses; and the asterisk attached to the [b] examples in [16] is to be understood as applying to the ordinary use of the clauses in question.

PPIs may also be found in negative clauses that are embedded beneath a superordinate negative in such a way that the positive counterpart is implicated:

- [20] i *You can't tell me that it isn't far better for some couples to divorce than to stay together.*  
 ii *Never think that I wouldn't rather be with you than at the office.*

*You can't tell me that it isn't* in [i] strongly implicates “it is”, which sanctions the positively-oriented *far*; and in [ii], *never think that I wouldn't* strongly implicates *I would*, which sanctions the PPI *would rather*.

### ■ Interrogatives

Most PPIs can occur in interrogative clauses:

- | [21]      NEGATIVE INTERROGATIVE                  | POSITIVE INTERROGATIVE                      |
|---|---|
| i a. <i>Wouldn't you rather stay here?</i>        | b. <i>Would you rather stay here?</i>       |
| ii a. <i>Didn't Kim see it too / as well?</i>     | b. <i>Did Kim see it too / as well?</i>     |
| iii a. <i>Isn't he pretty stupid?</i>             | b. <i>Is he pretty stupid?</i>              |
| iv a. <i>Aren't they still/already in London?</i> | b. <i>Are they still/already in London?</i> |
| v a. <i>Isn't there something wrong with it?</i>  | b. <i>Is there something wrong with it?</i> |

Negative interrogatives are normally used to ask biased rather than neutral questions, and when there is bias towards a positive answer this is sufficient to admit the PPIs even though they are in the scope of the negative. Illocutionary *I guess* and connective *so*, however, are restricted to declaratives. For the rest, the degree adverbs *pretty*, *fairly*, *quite*<sub>p</sub> occur significantly less readily in positive interrogatives than the others.

### 4.3 Correspondences between PPIs, NPIs, and negators

There is an important relationship between *some*, *any*<sub>n</sub>, and **no** illustrated in such sets as:

- [22] i *Kim made some mistakes.* [positive]  
 ii *Kim didn't make any mistakes.* [negative with verbal negation]  
 iii *Kim made no mistakes.* [negative with non-verbal negation]

In [ii–iii] the existential quantification falls within the scope of the negation, and (with the provisos mentioned in §4.2 above) *some* cannot occur in this environment. Thus [ii–iii] are negations of [i], differing in that the negation is expressed separately from the quantification in [ii] but not in [iii].

Broadly similar relationships are found with a number of other items, so that we can set up the following correspondences:

[23]	PPIs	NPIs	ABSOLUTE NEGATORS
i a.	<i>some</i>	<i>any</i>	<i>no</i>
b.	<i>someone/somebody</i>	<i>anyone/anybody</i>	<i>no one / nobody</i>
c.	<i>something</i>	<i>anything</i>	<i>nothing</i>
d.	<i>somewhere/someplace</i>	<i>anywhere/anyplace</i>	<i>nowhere / no place</i>
e.	<i>sometimes</i>	<i>ever</i>	<i>never</i>
f.	<i>sometime, once</i>	<i>anytime, ever</i>	<i>never</i>
g.	<i>somewhat</i>	<i>at all</i>	
ii a.	<i>still</i>	<i>any more / any longer</i>	<i>no more / no longer</i>
b.	<i>already</i>	<i>yet</i>	
iii a.	<i>so</i>		<i>neither/nor</i>
b.	<i>too / as well</i>	<i>either</i>	
c.		<i>either</i>	<i>neither</i>
d.		<i>either . . . or</i>	<i>neither . . . nor</i>

These three displays need to be interpreted with some caution. In the first place, the relation between paired PPIs and NPIs is not identical in all cases. For example, the connection between *somewhat* and *at all* is considerably weaker and less systematic than that between *some* and *any*. Secondly it should be borne in mind that a number of the forms have a range of senses or uses, with the correspondences applying only to some of them. Take *some*, for example. Of the several senses distinguished in Ch. 5, §7.5, the connection with *any* and **no** is clearest in the basic existential quantificational sense illustrated in [22i]. But for certain uses, most clearly that seen in *That was SOME journey* (“a remarkable journey”) or *SOME friend he was!*, there are no close negative counterparts.

A good number of polarity-sensitive items involve quantification. Broadly speaking, we find that the following generalisations hold:

- [24] i Universal quantifiers are not polarity-sensitive.  
 ii Some multal quantifiers exhibit some degree of negative orientation.  
 iii Paucal quantifiers tend to have positive orientation (like *a few*) or to be approximate negators (*few*).  
 iv The most central existential quantifiers enter into the pattern of correspondences illustrated in [23i].

Note in this connection that those uses of *some* that go beyond simple existential quantification to indicate a fairly considerable quantity do not enter into such correspondences. *It took some time to rectify the problem*, for example, does not have a straightforward negative with *any* or *no*: <sup>#</sup>*It didn't take any time to rectify the problem*; a pragmatically closer negation here would be *It didn't take much time to rectify the problem*.

A further general point to be made is that certain of the NPIs have free choice senses in addition to their NPI senses. This applies to *any* and its compounds and to *either* when it functions as determiner or fused determiner-head in NP structure: *Take any of the computers*; *Ask anyone*; *You can have either of the printers*. *Ever* has a free choice sense when compounded with relative and interrogative words (*Take whatever you like* or *He'll grumble whatever you do*). Elsewhere *ever* can express universal quantification: *She had been ill ever since she returned from Paris* ("all the time"); *Ever the optimist, she was undeterred by these warnings*. Free choice and universal quantification are often related by implicature: *Anyone can do that* implicates "Everyone can do that" (see Ch. 5, §7.5).

We will now provide some further brief comments on the sets given in [23]:

(a) **The *some* ~ *any* series ([23i])**

In positive interrogatives the *some* and *any* words generally contrast:

- |      |    |    |   |    |                                     |       |
|------|----|----|---|----|-------------------------------------|-------|
| [25] | i  | a. | <i>Did Kim make <u>some</u> mistakes?</i> | b. | <i>Did you tell <u>someone</u>?</i> | [PPI] |
|      | ii | a. | <i>Did Kim make <u>any</u> mistakes?</i>  | b. | <i>Did you tell <u>anyone</u>?</i>  | [NPI] |

The positive orientation of *some* is reflected in the fact that while the versions in [ii] are quite neutral, those in [i] suggest a somewhat greater inclination on the part of the speaker to think that the answer may well be positive.

The variants in [23id] containing *place* rather than *where* belong to AmE (informal style).

*Ever* and *never* can function as adjuncts of frequency or temporal location. In the frequency sense they correspond straightforwardly to *sometimes*: *He sometimes loses his patience* ~ *He doesn't ever lose his patience* ~ *He never loses his patience*.<sup>19</sup> For the temporal location sense with past time the closest PPI is *once*: *She once liked them* ~ *She didn't ever like them* ~ *She never liked them*. For future time the PPI *sometime* can be used: *I hope they will change these rules sometime* ~ *... won't ever / will never change these rules*. AmE *anytime* most often has a free choice sense (*Feel free to call me anytime*), but it is found as an NPI in combination with *soon* and suchlike expressions as counterpart to *sometime*: *I expect it to end sometime soon* ~ <sup>%</sup>*I don't expect it to end anytime soon*.

Correspondence between *somewhat* and *at all* is seen in pairs like *I somewhat regret agreeing to take part* ~ *I don't at all regret agreeing to take part*. *Somewhat* is slightly formal in style, and *at all* occurs in a much wider range of syntactic constructions. For example, there is no positive counterpart with *somewhat* for *He hasn't worked at all this week*. *At all* commonly occurs as a reinforcing postmodifier in the structure of NPs containing *any* or *no*, as in *I hadn't had any food at all* or *I'd had no food at all*:

<sup>19</sup> *Never* is likely to be preferred over verbal negation when *ever* immediately follows *not* or the negative verb; a more natural use of frequency *ever* is seen in *I don't think he ever loses his patience*. *Ever* can be used in juxtaposition to *never* with emphatic effect; this device is associated primarily with informal conversation, but can be found in other styles too: *Any risk of a prime minister abusing this power is effectively eliminated because he can never, ever put a political crony into the job*.

#### 4.4 Non-affirmative contexts

We review in this section the constructions or lexical items that create contexts within which NPIs can occur. Negation is the most central of them, while the others have various kinds of semantic or pragmatic connection with negation. In the examples that follow we use single underlining to pick out the NPI and double underlining for the item which sanctions it.

##### ■ Negators

All negators, whether expressing clausal or subclausal negation, sanction NPIs:

- |        |   |                         |
|--------|---|-------------------------|
| [28] i | a. <u>Kim</u> <u>didn't</u> do <u>anything</u> wrong.                     | } [clausal negation]    |
|        | b. <u>No one</u> did <u>anything</u> wrong.                               |                         |
|        | c. <u>Hardly anyone</u> liked it <u>at all</u> .                          |                         |
| ii     | a. He seems <u>not</u> very interested in <u>any</u> of these activities. | } [subclausal negation] |
|        | b. It was a matter of <u>little</u> consequence for <u>any</u> of us.     |                         |
|        | c. It is <u>unlikely</u> <u>anyone</u> has noticed it <u>yet</u> .        |                         |

Recall, however, that the negative context begins at the point where the negator is located. An NPI is not sanctioned by a following negator: cf. \*Anyone did nothing wrong or \*We had given anyone nothing.

##### ■ Interrogative clauses

We have observed that NPIs are commonly found in closed interrogatives, and for these nothing need be added to what has been said above. Positive open interrogatives, however, require some further discussion.

##### Open interrogatives

The way NPIs interact with positive open interrogatives is slightly different from the way they work in the semantically simpler closed interrogatives. Compare the following:

- |        |   |   |
|--------|---|---|
| [29] i | a. <u>Who</u> helped her?                       | b. <u>Who</u> did <u>anything</u> to help her?                            |
| ii     | a. <u>Why</u> did you help someone like George? | b. <u>Why</u> would you <u>lift a finger</u> to help someone like George? |
| iii    | a. <u>How</u> come you like her?                | b. * <u>How</u> come you like her <u>much</u> ?                           |

In general, questions expressed by means of positive open interrogatives have positive presuppositions. When I ask [ia] I normally take it for granted that someone helped her and aim to find out who it was. Similarly [iia] presupposes that you helped George and [iiia] that you like her.

Introduction of an NPI, even one like *any* or *ever*, changes matters in various ways. It is not presupposed by [29ib] that someone did something to help her. It may suggest that no one did, though it doesn't need to – cf. *Who has any suggestions to make?*, which leaves it entirely open whether anyone does in fact have any.

In [29iib], with the more strongly negatively-oriented *lift a finger*, there is a negative implicature – that George doesn't deserve help, so that a proper stance would be for you not to lift a finger to help him. In effect, the question asks for a reason for departing from that presumption.

Example [29iiib] is ungrammatical, like the positive declarative *\*You like her much*. (Note the contrast with the fully acceptable *How come you like her so much?*) But again, there is no question of *much* being syntactically excluded from positive open interrogatives: we merely need to find contexts with an appropriate negative flavour, as in *Who cares much about it, anyway?*

#### Bare infinitival *why* interrogatives

[30] a. *Why tell them anything about it?* b. *\*Why not tell them anything about it?*

It might initially seem surprising that the NPI is permitted in the positive question [a] but excluded from the negative [b]. But again the explanation has to do with the conveyed meaning of the construction.

Although positive, [30a] conveys the negative suggestion that there is no reason to tell them anything about it. The negative meaning of the clause that would express this negative implicature allows naturally for NPIs. With *why not* interrogatives, on the other hand, there is a positive implicature. The conventional meaning of *Why not tell them about it?* is to suggest via a rhetorical question that you should tell them about it. The positive sense of the latter makes the NPI in [b] unacceptable.

### ■ Covertly negative lexical items with clausal or clause-like complements

Many verbs and adjectives that take clauses as complements are covertly negative in that they trigger entailments or implicatures involving the negation of the subordinate clause, and this is sufficient to sanction NPIs in those clauses. Certain of these items allow the complement to take the form of an NP or PP with an interpretation like that of a clause with NPIs still being sanctioned. In some cases the subordinate clause (or its equivalent) may be subject: this is one case where an NPI can precede the item that sanctions it, as in [34ii] and [36ii] below.

We group these covertly negative items into six classes: (a) failure, avoidance, and omission; (b) prevention and prohibition; (c) denial; (d) doubt; (e) counter-expectation; and (f) unfavourable evaluation.

#### (a) Expressions of failure, avoidance, and omission

NPIs are sanctioned in the complements (usually infinitival or gerund-participial complements) of lexical items (mostly verbs) expressing failure to do something or similar acts of avoidance or omission. Relevant verbs include *avoid*, *decline*, *fail*, *forget*, *neglect*, *refrain*, and a few others, e.g. *omit* in BrE.

- [31] i *The authorities failed to do a thing to ensure the child's safety.*  
 ii *Lee forgot to take a blind bit of notice when they were giving directions.*  
 iii *I want you to refrain from moving a muscle until you're completely recovered.*  
 iv *We managed to avoid any further delays.*

Example [i] entails that the authorities didn't do a thing to ensure the child's safety. In [iv] the verb *avoid* has an NP as complement, understood roughly as "having any further delays".

#### (b) Expressions of prevention and prohibition

Lexical items expressing prevention, prohibition, banning, excluding, or otherwise stopping actions generally take gerund-participle complements in PPs headed by *from*, and NPIs are sanctioned in those complements. The verbs include *ban*, *hinder*, *keep*, *prevent*, *prohibit*, *stop*.

- [32] i We kept him from telephoning anyone before the police arrived.  
 ii I am prohibited from so much as naming any of the principals in this case.

Again we have negative entailments: it follows from [i], for example, that he didn't telephone anyone before the police arrived.

### (c) Expressions of denial

The verb *deny* is the central item here, but a close paraphrase will work the same way regardless of lexical content or syntactic structure.

- [33] i My client denies that he ever said any such thing.  
 ii My client denies any involvement in the matter.  
 iii My client completely rejects the notion that he ever said any such thing.

Here we can paraphrase [i] as *My client says that he never said any such thing*. Example [ii] illustrates the case where the complement has the form of an NP: we understand "that he was in any way involved in the matter".

### (d) Expressions of doubt

The class of dubitative items includes verbs (*doubt* being the clearest case), adjectives (*doubtful*, *dubious*, *sceptical*), and nouns (*doubt*, *scepticism*):

- [34] i I doubt that Lee has been to the theatre in ages.  
 ii That they will ever have a better opportunity is very much to be doubted.  
 iii I'm doubtful about the value of pursuing the matter any further.  
 iv She expressed scepticism about there being any point in continuing.

There is a clear relation between doubt and negation: to doubt is to entertain the possibility that some proposition is false. The verb *doubt* with a declarative clause complement suggests an inclination to believe that the proposition is false (see Ch. 11, §5.3.3).

### (e) Expressions of counter-expectation

A statement like *I'm surprised the car started* asserts that I have experienced a reaction to the discovery that the car started because that is counter to expectation: it implicates that I had a prior expectation that could be expressed as *The car won't start*. Such implicatures are enough to sanction NPIs in complements of such verbs or verbal idioms as *amaze*, *astonish*, *astound*, *bowl over*, *flabbergast*, *shock*, *surprise*, *take aback*, and corresponding adjectives:

- [35] i It astounds me that they took any notice of him.  
 ii It's surprising he lifted a finger, considering that he's a total stranger.  
 iii We were all amazed that he had been able to write anything during that time.

### (f) Expressions of unfavourable evaluation

A large array of lexical items expressing unfavourable evaluations, e.g. *absurd*, *excessive*, *foolish*, *monstrous*, *ridiculous*, *silly*, *stupid*, *unacceptable*, *unwise*, and many others, are capable of providing contexts for NPIs:

- [36] i It would be foolish to take any unnecessary risks.  
 ii Any more pudding would be quite excessive.  
 iii It was stupid of Basil ever to have mentioned the war.

The implicature in [i] here is that we (or whoever) should not take any more risks than the absolute minimum, and [ii] implicates that we (or whoever) should not have any

more pudding. The situation concerned will generally be in the domain of the potential rather than the actual: we would not say *'It was foolish to take any unnecessary risks* in speaking of a single event in the past.

#### ■ Downward entailing quantified NPs

All quantified NPs that are downward entailing in the sense explained in §3.3 sanction following NPIs. Compare:

- [37] i a. Few of the bees stung anyone.                      b. \*A few of the bees stung anyone.  
 ii a. At most ten students did any work.                      b. \*At least ten students did any work.

Most downward entailing quantified NPs are negative and hence are already covered under (a) above, but we noted in footnote 15 that *at most* triggers downward entailment although it is not negative. As seen in [iia], it nevertheless sanctions following NPIs. *A few* and *at least* are upward entailing, and do not create non-affirmative contexts.

Although [37iia] is not itself negative, it has clear links with negation. *At most ten of the thirty students worked* entails that the other twenty (the majority) did not work: compare the negative paraphrase *No more than ten of the students worked, did they?*

*At least ten of the thirty students worked*, on the other hand, has no such negative entailment: in fact it suggests that some of the other twenty may have worked. *At least* can be paraphrased by *no less than*, but this yields a positive clause: *No less than ten of the students worked, didn't they?*

#### ■ The degree adverb *too*

- [38] i *By that time I was just too tired to budge.*  
 ii *It was too difficult for anyone else.*

*Too* in the sense “excessively” licenses an indirect complement with the form of an infinitival clause or a *for* PP. The *too* + positive infinitival construction can be paraphrased by *so* + negative finite clause: *I was so tired that I couldn't budge*. Similarly [ii] conveys “It was so difficult that no one else could do it / that it was not appropriate for anyone else”. Note that *He wasn't too tired to have a couple of games of tennis* implicates that he did play, and this positive implicature excludes an NPI (ignoring again the denial use): *\*I wasn't too tired to budge*.

#### ■ Prepositions (*against*, *before*, *without*)

Certain prepositions define contexts for NPIs, as illustrated in the [a] examples of [39]:

- [39] i a. *She did it without any difficulty.*                      b. \**She did it with any difficulty.*  
 ii a. *He left before anyone noticed it.*                      b. \**He left after anyone noticed it.*  
 iii a. *I argued against taking any more.*                      b. \**I argued in favour of taking any more.*

Again the NPIs are admissible because the clauses convey negative propositions: that she had no difficulty in doing it, that no one had noticed it, that I argued we (or whoever) should not take any more. No such negative propositions are conveyed by the [b] examples, which contain prepositions of opposite meaning: the NPIs are therefore inadmissible. *Without* and *before* sanction NPIs quite generally, but *against* does so only in the rather special sense it has here.

### ■ Only

- [40] i *Only then did she realise she had any chance of winning.*  
 ii *She remained the only one capable of making any sense of it.*

Again, there is a very clear connection between *only* and negation. Example [i] entails that until then she hadn't realised she had any chance of winning, while [ii] entails that no one else was capable of making any sense of it. For further discussion, see Ch. 6, §7.3.

### ■ Comparative and superlative constructions

NPIs are commonly found in the complement of comparative *than* or *as*, and in relative clauses and partitive PPs in construction with superlatives. As usual, this reflects the close association between these constructions and negatives:

- [41] i *She ran faster than she had ever run before.*  
 ii *The performance was as good as any you could hope to see.*  
 iii *It was the biggest fish I had ever seen.*

Example [i] entails that she had never previously run as fast; [ii] entails that no performance you could hope to see would be better than this one; and [iii] entails that I had never before seen a bigger fish.

### ■ Overt and covert conditionals

A clause embedded as complement of *if* generally allows NPIs, and so do clauses in various other constructions that have conditional interpretations. Consider:

- [42] i *If you want anything, just call.*  
 ii *If I'd ever seen anything like that, I'd have reported it.*  
 iii *I would read your review, if I gave a damn about your opinion.*  
 iv *Drink any more and you'll have to get a taxi home.*

Example [i] is an open conditional; it envisages that you may or may not want something, without bias in favour of one or other of those possibilities. The mere absence of positive affirmation is sufficient to allow an NPI such as *any*. The remote conditional construction illustrated in [ii–iii] is more closely related to negation: [ii] implicates that I hadn't ever seen anything like that, and [iii] that I don't give a damn about your opinion. *Give a damn* is one of the more strongly negatively-oriented items, and occurs much more naturally in a remote conditional like [iii] than an open one. In [iv] an NPI is sanctioned by the conditional meaning even when there is no syntactically conditional construction: we interpret the imperative as equivalent to *if you drink any more* (cf. Ch. 10, §9.5).

## 5 Increased specificity of negation (*I don't want to hear about it*)

In various ways, negative clauses are often interpreted with increased specificity: they are taken to be making a stronger claim than they actually entail. One common instance of this phenomenon was discussed in §1.3.3, where we were examining the effect of selecting as focus an element falling within the scope of the negation. Thus *YOUR children don't hate school* is interpreted as saying not just that the conditions for the truth of the proposition "Your children hate school" are not all satisfied, but as indicating, more specifically, that it is the condition associated with *your* that is not satisfied.

Another common case of this general phenomenon is illustrated in:

- |     |     |   |  |
|-----|-----|---|--|
| [1] | i   | a. <i>Mary doesn't like you.</i>        | b. <i>Mary dislikes you.</i>           |
|     | ii  | a. <i>He doesn't have many friends.</i> | b. <i>He has few friends.</i>          |
|     | iii | a. <i>The weather wasn't very good.</i> | b. <i>The weather was rather poor.</i> |

In each pair, [a] implicates [b], which has a more specific meaning.

Consider [1ia]. This would presumably be true if Mary had never even heard of you, and in this case [1b] would be false. But it would normally be quite pointless to say [1a] if this were the case, so this scenario can be ignored in interpreting it. It would also be true if Mary did know you but hadn't formed a judgement about you or had no feelings about you, positive or negative: in this case she neither likes you nor dislikes you, so [1a] is true and [1b] is false. However, if this were so, I would normally be expected to say so explicitly: *Mary doesn't like you, but she doesn't dislike you either*. Much the most likely scenario for [1a] is one where Mary dislikes you, and in the absence of indications to the contrary that is how it will generally be interpreted. The interpretation is more specific than the actual meaning of [1a] in that it ignores the various other conditions under which [1a] could be true.

*Many* in [1iia] is an imprecise multal quantifier: there's no clear lower bound such that twenty, say, would count as 'many' but nineteen would not. The scenario in which I can be confident in saying [1iia], therefore, is one in which the number of friends falls well below what would count as many – i.e. one in which he has few friends. So [1iia] will generally be taken as conveying that he has few friends. But again that is not what it means: it makes perfect sense to say *He doesn't have MANY friends, but he has a reasonable number*.<sup>21</sup> The implicature [1iib] is thus more specific than [1iia], excluding the middle ground on the numerical scale that lies between few and many.

*Very* in [1iiia] likewise has an imprecise multal meaning, and again the middle ground on the good–bad scale is discarded, so that [1iiia] implicates [1iiib]. It is easy to see that the meanings are different, for *very good* denotes a relatively small part of the scale at the top end, so that [1iiia] places the weather within the large area of the scale below that top segment, whereas [1iiib] places it towards the bottom end. The implicature can be cancelled, typically by using contrastive stress on *very*: *It wasn't VERY good, but it was quite reasonable*. This kind of implicature is found quite generally with multal quantification. A third example is provided by *She doesn't often lose her temper*, which implicates, but does not entail, *She rarely loses her temper*.

Our major concern in this section is with a further special case of this tendency to move to a more specific interpretation of a negative clause: the case where a clause containing a clausal complement has negation in the matrix clause interpreted as applying to the subordinate clause, as in the [a] examples of:

- |     |    |  |  |   |
|-----|----|--|--|---|
| [2] |    | MATRIX NEGATION                              |  | SUBORDINATE NEGATION                        |
|     | i  | a. <i>I don't want to hear about it.</i>     |  | b. <i>I want to not hear about it.</i>      |
|     | ii | a. <i>Mary didn't want you to tell them.</i> |  | b. <i>Mary wanted you not to tell them.</i> |

<sup>21</sup>Where *not* combines with *many* to form a DP *not many*, the paucal interpretation is an entailment, not an implicature: *not many* means 'few'. Note then that we can't say \**Not many people came to the meeting but a reasonable number did*.

In both pairs the negative marker is located in the topmost clause in [a], but in the complement of *want* in [b]. And in both cases [b] is an implicature of [a] with a somewhat more specific meaning.

This case is very similar to [1ia] above. Example [2ia] is true if **either** I have no feelings about the matter one way or the other, **or** I want to not hear about it (to be spared from hearing about it). In practice, the first of these possibilities is normally discounted, giving the more specific interpretation where it is the second condition that obtains – i.e. the interpretation expressed by [ib]. If I had no feelings about the matter, I would typically be expected to say so: e.g. by saying *I don't mind whether I hear about it or not*. But the fact that the truth of the latter would be sufficient to make [ia] true shows that [ia] does not have the same meaning as [ib]. This is why [ib] is an implicature of [ia], not an entailment. And again the implicature can be cancelled: *I don't want to hear about it and I don't want to not hear about it – I'm completely indifferent*.

### ■ Matrix verbs and adjectives allowing the subordinate negation implicature

The phenomenon illustrated in [2] is quite widespread: there are a good number of lexemes which behave like *want* in constructions containing a non-finite or finite subordinate clause. In [3] we list a sample of the verbs and adjectives concerned, classified into broad semantic groups:

- [3] i WANTING: *choose, intend, mean, plan, want*  
 ii ADVICE: *advisable, advise, had better, be meant, recommend, <sup>?</sup>suggest, be supposed*  
 iii PROBABILITY: *likely, <sup>?</sup>probable*  
 iv OPINION: *<sup>%</sup>anticipate, believe, expect, feel, <sup>%</sup>figure, guess, imagine, reckon, suppose, think*  
 v PERCEPTION: *appear, feel, look, sound, seem*

### ■ The common semantic factor: 'medium strength'

The items in [3] all have to do with various kinds of modality, and they have in common that their value on the dimension or scale we have called 'strength' is medium, as opposed to weak or strong: see Ch. 3, §9.2.1. Consider again *want*, which contrasts with weak *willing* and strong *insist*. Compare:

- [4] i a. *I'm not willing to be included.*      b. *I'm willing to not be included.* [weak]  
 ii a. *I don't want to be included.*      b. *I want to not be included.* [medium]  
 iii a. *I don't insist on being included.*      b. *I insist on not being included.* [strong]

It is clear that [b] is an implicature of [a] only in case [ii]. In [i], [a] actually entails [b], but [a] is much more informative than [b] and would not be used to convey the latter. In both [ii] and [iii], [b] entails [a], but the difference in meaning between [iiia] and [iiib] is very much greater than that between [iia] and [iib]. As we have seen, the only difference between [iia] and [iib] is that [iia] allows for the scenario in which I am indifferent as to whether I'm included or not. But [iiia] allows for a much greater range of possibilities than [iiib]: it could be, for example, that I want to be included, but am just not insisting on it. It is only in the medium strength case – where there is relatively little difference in meaning between matrix and subordinate negation – that the implicature applies.

The same holds for advice. Compare:

- |     |     |   |   |          |
|-----|-----|---|---|----------|
| [5] | i   | a. <i>He <u>didn't allow</u> me to go.</i>  | b. <i>He <u>allowed me not</u> to go.</i> | [weak]   |
|     | ii  | a. <i>He <u>didn't advise</u> me to go.</i> | b. <i>He <u>advised me not</u> to go.</i> | [medium] |
|     | iii | a. <i>He <u>didn't order</u> me to go.</i>  | b. <i>He <u>ordered me not</u> to go.</i> | [strong] |

*Advise* has medium strength in contrast to weak *allow* and strong *order*, and the implicature is found only in case [ii]. Again, [ia] is much more informative than [ib] (which it entails), and [iiib] is much more informative than [iiia] and could not be conveyed by it. But the difference between [iia] and [iib] is much less. They don't have the same meaning, of course, since [iia] is consistent with his not having offered any advice at all. If we assume that he did give some advice as to whether I should go, however, then [iib] can be inferred from [iia]. Note that the implicature is more likely to be present when *advise* is used performatively (Ch. 10, §3.1), as in *I don't advise you to go*.

*Likely* expresses medium strength epistemic modality. Compare this time:

- |     |     |   |   |          |
|-----|-----|---|---|----------|
| [6] | i   | a. <i>It <u>isn't possible</u> that he's alive.</i> | b. <i>It is <u>possible</u> that he <u>isn't</u> alive.</i> | [weak]   |
|     | ii  | a. <i>It <u>isn't likely</u> that he's alive.</i>   | b. <i>It is <u>likely</u> that he <u>isn't</u> alive.</i>   | [medium] |
|     | iii | a. <i>It <u>isn't certain</u> that he's alive.</i>  | b. <i>It's <u>certain</u> that he <u>isn't</u> alive.</i>   | [strong] |

As before, the implicature is found in the medium strength case [ii], but not in [i/iii]. In [i], [a] entails [b] and is much more informative. In [iii], [b] is much more informative than [a] and cannot be pragmatically inferred from it. But in [ii] there is relatively little difference between [a] and [b]. Like *many* in [11ia], *likely* is an imprecise term: the lower bound for what probability qualifies as 'likely' is fuzzy, just as it is for what number counts as 'many'. Suppose for the sake of argument we take the lower bound to be 60%: if there's a 60% chance he's alive then we'll accept *It's likely that he's alive* as true. In this case, [iia] puts the probability of his being alive at less than 60%, while [iib] puts it at 40% or less. The interpretation of [iib] is then more specific by cutting out the middle ground in the range 40% to 60%. Again this is comparable with the interpretation of negated multal quantification as paucal.<sup>22</sup>

Such verbs as *think* and *believe* are also often used to express medium strength epistemic modality, but differ in taking two arguments, with the subject associated with the role of experiencer (the one making the epistemic judgement). They contrast with strong *know*, but there is no syntactically comparable verb or adjective expressing weak modality. Compare, then:

- |     |    |  |  |          |
|-----|----|--|--|----------|
| [7] | i  | a. <i>She <u>doesn't think</u> he's alive.</i> | b. <i>She <u>thinks</u> he <u>isn't</u> alive.</i> | [medium] |
|     | ii | a. <i>She <u>doesn't know</u> he's alive.</i>  | b. <i>She <u>knows</u> he <u>isn't</u> alive.</i>  | [strong] |

As before, [b] is an implicature of [a] only in the medium strength case: the difference in meaning between [iia] and [iib] is too great to be pragmatically ignored. Note, moreover, that although we have not provided a contrast with weak modality here there is no doubt that *think* belongs in the medium strength category. The weak case can be expressed in other ways, such as *She is quite open-minded as to whether he is alive* or (more naturally, but with negation) *She has no idea whether or not he is alive*.

<sup>22</sup>There is one catenative that allows the implicature which is semantically closer to multal *often* than to the modal items in [3], namely *tend*: compare *They don't tend to read the fine print* and *They tend not to read the fine print*.

The items in the perception category [3v] are very similar, and although there are no simple contrasts with strong or weak modality, it is clear that they belong in the medium category. As before, [a] implicates [b] in the pair:

- [8] a. *He doesn't seem to understand.* b. *He seems not to understand.*

### ■ Conventionalisation of specificity increase

Not every item expressing medium strength modality permits the increased specificity implicature that we have been illustrating. Lexemes meeting the general semantic condition become associated with it on a piecemeal basis.

For example, while the implicature is found with *likely*, as illustrated in [6ii], it is very questionable with *probable*: *It's not probable that he's alive* is not a natural way of conveying "It is probable that he's not alive". Similarly, *I don't recommend that you tell them* conveys "I recommend that you not tell them" much more readily than *I don't suggest you tell them* conveys "I suggest you don't tell them".<sup>23</sup> There are, moreover, dialect differences with respect to some items, as indicated by the % annotation. Thus for some speakers, but not others, *I don't guess there's anybody home* can convey "I guess there isn't anybody home". At the same time, there are differences with respect to how readily the construction with subordinate negation is used. Thus *He seems not to have understood* is perfectly natural, whereas *I want to not go* is highly unusual, and normally sharply disfavoured relative to *I don't want to go*.

A clear indication of the importance of conventionalisation in this area is provided by cross-linguistic differences in the items which allow the implicature. In English the verb *hope* clearly belongs in the medium strength category, like *want*, but its negation is not pragmatically interpreted as applying to the subordinate clause. Thus *I don't hope you're late* does not implicate *I hope you're not late*. In German, however, the corresponding verb, *hoffen*, does permit the implicature, behaving like the English verbs in [3].

### ■ No subordinate negation implicature with modal auxiliaries

It will be noted that (leaving aside the *had* of the idiom *had better*) there are no modal auxiliaries among the verbs in [3]. At first glance the following might appear to behave in the same way:

- [9] i *You mustn't tell anyone.* [strong]  
 ii *You shouldn't take the job.* [medium]

In both of these the negation is located syntactically in the matrix clause but applies semantically to the subordinate clause: in this respect they are like the examples we have been considering. There is, however, an important difference. The semantic association of the negation with the subordinate clause is this time not a matter of implicature but of sentence meaning. We noted in Ch. 3, §9.10, that a syntactically negative modal may or

<sup>23</sup>Note also the difference between the epistemic and deontic senses of *expect*. In the epistemic sense (roughly "think likely") the implicature generally goes through, but in the deontic sense ("think *x* should") its application is more restricted. Consider, for example, *We don't expect them to pay more than \$100*. In the epistemic sense this implicates "We expect that they won't pay more than \$100". But in the deontic sense (roughly "We don't regard them as having an obligation to pay more than \$100") there is no subordinate negation implicature: it doesn't convey "We regard them as having an obligation not to pay more than \$100".

may not fall within the semantic scope of the negation. The examples in [9] have what we call ‘internal negation’: the negation applies semantically to the non-finite complement of the modal, not to the modal itself. Thus [i] imposes or reports an obligation not to tell anyone. To negate the modality we use *need*: *You needn’t tell anyone*. Note, moreover, that *must* expresses strong modality, whereas we have seen that the implicature only applies in the case of medium strength modality.

*Should*, on the other hand, does belong in the medium strength category, but the subordinate negation interpretation, approximately “The right thing for you to do is to not take the job”, is still the meaning proper, not an implicature. Example [9ii] differs from the examples with a subordinate negation implicature in that it does not allow the less specific interpretation in which the negation applies semantically to the matrix: it doesn’t mean “The right thing for you to do isn’t to take the job”. This is evident from the fact that one can’t say: \**You shouldn’t take the job and you shouldn’t not take it either: it doesn’t matter whether you take it or not*. The implicature arises only in cases where there is a syntactic contrast between matrix and subordinate negation like that found between [8a] and [8b], and the other pairs discussed.

#### ■ The *can’t seem to* construction

[10] a. *I can’t seem to get it right.*      b. *I seem not to be able to get it right.*

The meaning of [a] is the same as that of [b] – or of *It seems that I can’t get it right*. Syntactically, *seem* falls within the complement of the negated modal auxiliary, but semantically it is outside the scope of the negative. This example differs from those considered above, however, in that modal *can* also belongs semantically within the complement of *seem*, rather than the other way round, as one would expect from the syntax.

This is another case where the interpretation is a matter of meaning proper, not implicature: *can’t seem* (as used here) is simply an idiom meaning “seem unable”. The essential parts of the idiom are **can**, negation, and *seem*; note, for example, that *seem* is not here replaceable by *appear*. The mismatch between syntax and semantics here is probably related to the fact that **can** has no plain form, so we don’t have \**I seem not to can get it right*.

## 6 Multiple negation

When a clause contains two or more negative elements we need to distinguish cases where they express separate semantic negations from those where only one semantic negation is involved:

[1] i *I didn’t say I didn’t want it.*      [two semantic negations]  
 ii *He consulted neither his wife nor his parents.*      [one semantic negation]

In [i] we clearly have two semantic negations, one of *want* and one of *say*. In [ii], however, there is just one semantic negation: it has scope over the coordination and is syntactically expressed twice, once in each coordinate. The negation in [ii] is non-verbal, and the fact that there is only one semantic negation is evident from the version with verbal negation,

which is semantically equivalent: *He didn't consult either his wife or his parents. Neither and nor* in [ii] are markers of coordination, and exhibit what can be regarded as **negative concord**, or agreement.

Constructions with semantic negations in separate clauses, as in [1i] or *I didn't promise [not to tell them]* are unremarkable and do not need to be considered further (for the special case where the negation markers are adjacent, as in *You can't not go*, see §2.3.2 above). Nor do we need to say any more here about affixal negation. This is always subclausal, and it can combine unproblematically with clausal negation, as in *Their behaviour was certainly not immoral* or *None of the problems seemed unimportant*. In §6.1 we will look briefly at constructions with separate semantic negations in a single clause, each of which could by itself mark clausal negation. Then in §6.2 we turn to concordial and similar types of negation.

## 6.1 Multiple semantic negation within a single clause

### (a) Constructions where the first negation has scope over existential quantification

- [2] i *None of them had no redeeming features.*  
 ii *No one, surely, has never experienced such temptation.*  
 iii *Never before had no one nominated for the position.*  
 iv *Neither investigator had no financial interest in the company.*  
 v *No one didn't consider it a retrograde move.*

By virtue of the relation between existential and universal quantification (see Ch. 5, §5.1) these are all equivalent to positive clauses with universal quantification: *All of them had some redeeming features; Everyone, surely, has at some time experienced such temptation; Before, someone had always nominated for the position; Both investigators had some financial interest in the company; Everyone considered it a retrograde move.* Note that it is the first negative that is replaced by a universally quantified counterpart in the paraphrase. Thus in [ii] *no one* precedes *never*, so we have *everyone* and *at some time*, but in [iii] *never* precedes *no one*, so we have *always* and *someone* (even though in the positive they do not occur in that order).<sup>24</sup>

The positive versions are of course easier to process and represent the default way of expressing the meanings concerned. The more complex forms would thus typically need some special motivation, such as contrast. In [2iii], for example, we are concerned with an occasion on which no one had nominated for the position in question, and [iii] contrasts this occasion with all previous ones of the relevant kind. Such contexts of contrast will often lead to one or other of the negative markers being stressed.

As far as the syntax is concerned, only one of the negators can mark clausal negation. The clauses in [2] are all negative and behave with respect to the tests for polarity just like clauses with a single negative. Compare, for example, *None of them had any redeeming features, did they?* and *None of them had no redeeming features, did they?*

<sup>24</sup>The same kind of relationship holds between disjunctive and conjunctive coordination, so that *Neither Kim nor Pat had no financial interest in the company* is equivalent to *Both Kim and Pat had some financial interest in the company*.

## (b) Other types

- [3] i [*He didn't say nothing.*] *he said it didn't matter.*  
 ii *Not all of them made no mistakes.*  
 iii *Not many / Few people found nothing to criticise.*  
 iv [*We not only made no progress.*] *we actually moved backwards.*

In [i] *nothing* follows the verbal negation, and this time the meaning involves existential quantification: “He did say something”; examples of this kind are used to contradict a negative assertion, in this case *He said nothing*. Example [ii] has negation of the universal quantifier *all* and is accordingly equivalent to a positive with existential quantification: *Some of them made some mistakes*. Example [iii], with negation of the plural quantifier *many* or combination of negation with paucal quantification in *few*, has no positive semantic equivalent of a comparable kind. But given a reasonably large set of people under consideration it will tend to be pragmatically equivalent to *Most people found something to criticise*.

One of the commonest cases has *not only* with scope over a negative, as in [3iv]. This differs from the other types in that we can drop the *not only* without affecting the other negative, giving *We made no progress: we actually moved backwards*.

## 6.2 Negative concord and pleonastic negation

We turn now to constructions where a single semantic negative is expressed more than once.

## (a) The standard variety

There are a number of constructions in Standard English in which the negation of a clause is expressed at more than one point morphologically:

- [4] i *Their action was neither illegal nor immoral.* [disjunctive coordination concord]  
 ii *They aren't here, I don't think.* [parenthetical concord]  
 iii *Not in my car, you're not.* [negative retort]  
 iv *I wouldn't be surprised if it didn't rain.* [pleonastic subordinate negative]

## Disjunctive coordination concord

When a negative has scope over disjunctive coordination, it may be expressed verbally, as in *Their action wasn't (either) illegal or immoral*, or non-verbally, in the coordination itself, as in [4i]. In the latter case it is generally incorporated into all markers of coordination, and we can therefore talk of concord or agreement in polarity. Occasionally, however, we find *or* instead of *nor*: *Their action was neither illegal or immoral* (see Ch. 15, §2.4).

## Parenthetical concord

A further minor case is seen in [4ii], where semantically there is a single negation, just as there is in the non-parenthetical versions *I don't think they are here* or *I think they aren't here*. In the parenthetical version the negation is expressed both in the anchor *they aren't here* and in the parenthetical *I don't think*. The negation in the parenthetical, however, is optional, for we can also have *They aren't here, I think*. The matching negation in [4ii] is comparable to the matching interrogatives in *Are they here, do you know?* (cf. Ch. 10, §5.3).

### Negative retort

Example [4iii] might be said by B in response to A's saying *I'm just driving into town*. B's response is thus a reduced version of *You're not driving into town in my car*. The negated initial constituent represents new information, while the rest is discourse-old, recoverable from A's utterance. The effect is to emphatically reject a proposition or proposal that is more specific than the one just uttered.

### Pleonastic negation in subordinate clauses

Example [4iv] is ambiguous between a reading with two semantic negations ("It would not come as a surprise to me if I were to learn that it didn't rain") and the one we are concerned with here, where there is only one semantic negation ("I wouldn't be surprised if it rained"). In this second interpretation the negative in the subordinate clause is pleonastic, an extra mark of something that has already been marked – in this case, in the matrix clause. Other examples are:

- [5] i *No one can say what might not happen if there were another earthquake.*  
 ii *He is unable to predict how much of it may not turn out to be pure fabrication.*

The range of constructions where this pleonastic *not* is found is very restricted. In [4iv] the pleonastic *not* is in the protasis of a remote conditional where the apodosis has a negated expression of surprise (cf. also *I wouldn't wonder if...*). In [5i–ii] it is in an interrogative clause headed by modal *may*. In all three examples the subordinate clause containing pleonastic *not* is strongly non-factual.

## ■ Negative concord in non-standard dialects

The clearest case of negative concord in English is found in non-standard dialects. This book is of course a grammar of Standard English, but the negative concord phenomenon is so widespread and salient that it deserves some mention here.

In many dialects, ranging from Cockney (spoken in the East End of London, England) to African American Vernacular English (AAVE, formerly known as Black English Vernacular, spoken in segregated African American communities in the USA), the absolute negators *no*, *no one*, *nothing*, etc., are used in negative clauses where the standard dialect has the NPIs *any*, *anyone*, *anything*, etc.:

[6]	NON-STANDARD	STANDARD
i	a. <i>He <u>didn't</u> say <u>nothin'</u>.</i>	b. <i>He <u>didn't</u> say <u>anything</u>.</i>
ii	a. <i>You gonna spend your whole life [<u>not</u> trustin' <u>nobody</u>]?</i>	b. <i>Are you going to spend your whole life [<u>not</u> trusting <u>anybody</u>]?</i>
iii	a. <i><u>Nobody</u> here <u>didn't</u> point <u>no</u> gun at <u>nobody</u>.</i>	b. <i><u>Nobody</u> here pointed <u>any</u> gun at <u>anybody</u>.</i>

Each clause contains just one semantic negation and in the standard versions it is marked by a single negator. In the non-standard versions, however, it is marked by verbal negation and also on all the existentially quantified elements in the clause. We accordingly have negative concord between the verb and these elements.

Non-standard clauses with negative concord are characteristically homonymous with standard dialect clauses containing multiple semantic negation, such as [2v] and [3i] above. Standard *He didn't say nothing* means "He did say something (it's not true that he said nothing)". The bracketed clause of [6iia] could likewise be used in the standard dialect with the meaning "not being in a state of refusing to trust anyone". In principle [6iia] could be used in Standard English to express a meaning containing four semantic negations,

though in practice of course it would be far too complex to process. There are, however, some constructions – such as imperative *Don't nobody move!* – that cannot be used in the standard dialect to express multiple semantic negation.<sup>25</sup>

There is an extremely widespread tendency among Standard English speakers to regard dialects with negative concord as ‘illogical’ and ‘inferior’. It is argued that by a rule of logic two negatives cancel each other out to make a positive. Thus just as *It isn't the case that she didn't move* (or *She didn't not move*) is equivalent to *She moved*, it is argued that *He didn't say nothing* is a double negative that can only mean “He said something” and hence should not be used to express the opposite of that meaning. But such an argument is completely invalid. The rule of logic that two negatives are equivalent to a positive applies to logical forms, not to grammatical forms. It applies to semantic negation, not to the grammatical markers of negation. And as far as the [a] examples of [6] are concerned, there is only a single semantic negation, so the rule of logic doesn't apply: it is completely irrelevant.<sup>26</sup> The pattern in the non-standard dialect is similar to the one found in the standard dialect of Italian, French, Spanish, Polish, Russian, and many other languages. For example, Italian *non* means “not” and *nessuno* means “nobody”, but the meaning of *Non ti credo nessuno* is “Nobody believes you”, not “Nobody doesn't believe you”. Here again, then, we have two negative words marking a single semantic negation, just as we do in the non-standard English dialects. There is no more reason to condemn the latter as illogical than there is to condemn Italian, French, and so on. The difference between the [a] and [b] versions of [6] is a matter of grammar, not logic, and neither set can be regarded as intrinsically superior to the other.

Despite its non-standard character every experienced user of English needs to be passively acquainted with the negative concord construction in order to be able to understand English in such ordinary contexts as film soundtracks, TV dramas, popular songs, and many everyday conversations. Those who claim that negative concord is evidence of ignorance and illiteracy are wrong; it is a regular and widespread feature of non-standard dialects of English across the world. Someone who thinks the song title *I can't get no satisfaction* means “It is impossible for me to lack satisfaction” does not know English.<sup>27</sup>

## 7 Positive and negative polarity in responses and anaphora

### 7.1 Answers to polar questions and comparable responses

#### ■ Yes and no answers

*Yes* and *no* serve as markers of positive and negative polarity in answers to questions. They may stand alone, or combine with a clause that expresses the answer more

<sup>25</sup> The same applies to the construction *without + no* (corresponding to standard *without + any*), as in <sup>1</sup>*Give me a large cheeseburger without no onions*. And also to the construction with negative concord between the verb and an approximate negator of degree, as in <sup>1</sup>*I can't hardly see* (corresponding to standard *I can hardly see*).

<sup>26</sup> Given that the term ‘double negative’ is strongly associated with the semantic rule whereby two negatives do cancel each other out, it is an unsatisfactory term for the negative concord construction. It is in any case inappropriate because there is no limitation to two, as we have seen.

<sup>27</sup> Negative concord was common in Old English and became virtually obligatory in the Middle English period. Its decline in the standard written language in the early Modern period may have had much to do with a nascent prescriptive tradition and its conscious comparison of English with Latin. In the nineteenth century negative concord re-emerged as a literary mark of non-standard usage, the gap in the historical record almost certainly concealing a continuous but largely unrecorded tradition in many spoken dialects.

explicitly:

- [7] i a. A: *Is this car yours?* B: } *Yes (it is).*      *No (it isn't).*  
       b. A: *Isn't this car yours?* B: }  
    ii a. A: *He has gone, hasn't he?* B: } *Yes (he has).*      *No (he hasn't).*  
       b. A: *He hasn't gone, has he?* B: }

The choice between *yes* and *no* depends simply on the polarity of the answer – not, for example, on agreement vs disagreement with what may be suggested by the question. Polar questions, especially negative ones, may be biased, indicating the questioner's predisposition to think that one or other answer is the right one, but that has no bearing on the choice between *yes* and *no*. In [ib], for example, the appropriate response is *yes* if the car is B's and *no* if it isn't, irrespective of what A appears to expect is the case. Similarly with answers to tag questions, as in [ii].

\**Yes it isn't* and \**No it is* are thus ungrammatical as single clauses. In *Yes it is* and *No it isn't*, the *yes* and *no* can be regarded as a special type of adjunct, a polarity adjunct, which agrees in polarity with the clause – a further case of polarity concord in English. The adjunct can also be placed at the end of the clause, with prosodic detachment: *It is, yes* and *It isn't, no*. A response to [7i] with the form *No, it's Kim's* would not of course violate the polarity concord rule, because here we have not a single clause but a sequence of two, just as we do in *No it's not mine, it's Kim's*.

One respect in which the agreement vs disagreement factor is relevant concerns the choice between single-word and expanded responses. Suppose you ask *Didn't you post the letter after all, then?*, indicating that you think I didn't. If in fact I did post it, I would normally say *Yes I did*, not just *Yes*.

### ■ Responses to other kinds of speech act

*Yes* and *no* are used in response to statements in a similar but not identical way:

- [8] i A: *She did very well.* B: *Yes (she did).*      *No she didn't.*  
    ii A: *She didn't do very well.* B: *Yes she did.*      *No (she didn't).*

In [i] the disagreeing negative response would not normally be reduced to *No*, and in [ii] the disagreeing positive answer could not be reduced to *yes*. It is in fact here possible to say *yes* to express agreement with the negative statement: “Yes, you're right”.

Following directives, *yes* and *no* can be used to express intention to comply with a positive and negative directive. *No* is also used to indicate refusal to comply with a positive one, but *yes* is not an idiomatic way of refusing to comply with a negative directive:

- [9] i A: *Remember to lock up.* B: *Yes (I will).*  
    ii A: *Don't forget to lock up.* B: *No (I won't).*  
    iii A: *Tell me who did it.* B: *No (I won't).*  
    iv A: *Don't tell them I did it.* B: *?Yes I will.*

In [iv] B would more likely say just *I will (tell them)*, or words to that effect. With directives expressed by certain kinds of interrogative clause (a type of indirect speech act, in the sense of Ch. 10, §9.6.1), a response may reflect the literal question meaning or the indirect directive meaning. Thus in response to *Would you mind coming a little earlier next week*, I might respond *No of course not, I'll come around six* (“No of course I wouldn't mind”), or *Yes of course, I'll come around six* (“Yes of course I'll come a little earlier”).

### ■ Idiomatic negative answers with *not* and *no*

There are a number of idiomatic phrases that express an emphatic negative response to a question or other speech act. Some have *not*, others the determinative *no*:

- [10] i *Not for all the tea in China!*      *Not likely!*      *Not on a bet!* (AmE)  
           *Not in a million years!*      *Not on your life!*      *Not on your nelly!* (BrE)  
 ii *No fear!*      *No chance!*      *No way!*<sup>28</sup>

## 7.2 Anaphoric *so* and *not*

With predicates that take *so* as the anaphoric pro-form for a positive clausal complement, *not* is used as a pro-form for a negative (cf. Ch. 17, §7.7.2). We illustrate with answers to questions, but they occur more widely than this.

- |      |                           |                            |                             |
|------|---------------------------|----------------------------|-----------------------------|
| [11] | QUESTION                  | POSITIVE ANSWER            | NEGATIVE ANSWER             |
|      | <i>Are they reliable?</i> | <i>I believe/think so.</i> | <i>I believe/think not.</i> |
|      |                           | <i>I was told so.</i>      | <i>I was told not.</i>      |
|      |                           | <i>It seems so.</i>        | <i>It seems not.</i>        |

*Not* (like *so*) is here functioning as complement and marks non-verbal negation: it is not modifying the verb.

What accompanies the pro-form need not be a full matrix clause; a preposed AdvP functioning as clause adjunct will serve as well:

- |      |                               |                            |                             |
|------|-------------------------------|----------------------------|-----------------------------|
| [12] | <i>Is the city beautiful?</i> | <i>Apparently so.</i>      | <i>Apparently not.</i>      |
|      |                               | <i>Most definitely so.</i> | <i>Most definitely not.</i> |

Other adjuncts such as PPs are permitted with *not* but not *so*:

- |      |                           |                                |                                |
|------|---------------------------|--------------------------------|--------------------------------|
| [13] | <i>Does it rain much?</i> | <i>*On the whole so.</i>       | <i>On the whole not.</i>       |
|      |                           | <i>*So in the winter.</i>      | <i>Not in the winter.</i>      |
|      |                           | <i>*Usually so this early.</i> | <i>Usually not this early.</i> |

*Not* can also introduce anaphorically reduced clauses used in response to other types of speech act or following a negative clause:

- [14] i A: *I think you should leave now.*      B: *Not without my money.*  
 ii *I won't go, not even if they beg me.*  
 iii *There aren't many wild rhinoceroses left, not in Africa or in Asia.*

*Not* is here understood respectively as “I won't leave”, “I won't go”, and “there aren't many rhinoceroses left”.

<sup>28</sup> *No way* can also be integrated into clause structure as an emphatic negator, as in *No way is that a diamond!* The original manner meaning has here been bleached away, so that we understand “That is emphatically not a diamond”.

## 1 Type as a grammatical system of the clause

### ■ The five major categories

**Clause type** is the grammatical system whose five major terms are illustrated in:

- |     |     |                              |                        |
|-----|-----|------------------------------|------------------------|
| [1] | i   | <i>You are generous.</i>     | [declarative]          |
|     | ii  | <i>Are you generous?</i>     | [closed interrogative] |
|     | iii | <i>How generous are you?</i> | [open interrogative]   |
|     | iv  | <i>How generous you are!</i> | [exclamative]          |
|     | v   | <i>Be generous.</i>          | [imperative]           |

### ■ Characteristic use and general definitions

Each of the categories is associated with a characteristic use as follows:

[2]	CLAUSE TYPE	CHARACTERISTIC USE
	i declarative	statement
	ii closed interrogative	closed question
	iii open interrogative	open question
	iv exclamative	exclamatory statement
	v imperative	directive

A closed question is one with a closed set of answers: for example, the answers to [1ii] are just “Yes” and “No”. By contrast, [1iii] has any number of possible answers, and is therefore an open question; similarly with *Who attended the meeting?*, and so on. In [2iv] we have used ‘exclamatory statement’ rather than the more familiar ‘exclamation’, because an exclamatory meaning can be added to any of the use categories, but the special syntactic construction shown in [1iv] is associated just with a particular kind of statement. For example, the exclamatory command *Get the hell out of here* or the exclamatory question *What on earth are you doing?* belong syntactically with [1v] and [1iii] respectively, not with [1iv]. ‘Directive’ in [2v] is a cover term for requests, commands, instructions, and the like; traditional grammars tend to use the term ‘command’, but this is far too narrow and specific for our purposes if understood in its everyday sense.

The correlation shown in [2] provides the basis for general definitions of the clause type categories:

- [3] Imperative clause is a grammatically distinct class of clause whose members are characteristically used to issue directives.

And similarly for the others.

### ■ Complex relation between form and meaning

We have spoken of ‘characteristic’ use because, as is so often the case, the correlation between major categories of grammatical form and categories of meaning or use is by no means one-to-one. Compare, for example:

[4]		CLAUSE TYPE	USE
	i	<i>Passengers are requested to remain seated.</i>	declarative      directive
	ii	<i>Would you mind opening the door for me.</i>	closed interrogative      directive
	iii	<i>Sleep well.</i>	imperative      wish

Examples [i] and [ii] illustrate conventional ways of expressing a polite request, a kind of directive, but syntactically they belong to the same structural class as *You are generous* and *Are you generous?* respectively. And though [iii] belongs syntactically with *Be generous* it is not used to tell or ask somebody to do something, but to express a wish. Numerous further examples of this and other kinds will emerge during the course of the chapter. It is essential therefore to maintain a sharp conceptual distinction between the grammatical clause types and the categories of meaning or use – between declarative and statement, imperative and directive, and so on. The situation is closely parallel to that which obtains in the area of tense (form) and time (meaning), but whereas it is standard practice for grammars to distinguish terminologically between tense and time, many use ‘question’ both for form (our ‘interrogative’) and for meaning. Again we emphasise, therefore, that interrogatives aren’t always used as questions, and not all questions have the syntactic form of interrogatives.

### ■ Clause type in subordinate clauses

Four of the clause type categories apply to subordinate clauses as well as to main clauses:

[5]	MAIN	SUBORDINATE	
	i	<i>It's a bargain.</i>	<i>She says <u>that it's a bargain</u>.</i> [declarative]
	ii	<i>Is it a bargain?</i>	<i>I wonder <u>if it's a bargain</u>.</i> [closed interrogative]
	iii	<i>Which one is a bargain?</i>	<i>I know <u>which one is a bargain</u></i> [open interrogative]
	iv	<i>What a bargain it is!</i>	<i>I realise <u>what a bargain it is</u>.</i> [exclamative]

Imperatives, however, are normally restricted to main clauses.<sup>1</sup> Our main focus in this chapter will be on main clauses, with most of the material on subordinate clause types deferred till Ch. 11.

### ■ The type system applies to the clause, not the sentence

What we refer to here as ‘clause type’ is more often called ‘sentence type’, but given the way in which we have defined sentence and clause in this grammar (Ch. 2, §1), it is evident that it is to the clause, not the sentence, that the system applies. In the first place, the subordinate clauses of [5] are not sentences but are nevertheless classified for type. And secondly, in sentences with the form of a clause-coordination the coordinated

<sup>1</sup>For arguments against treating infinitivals like *I told them to be quiet* as subordinate imperatives, see §9.8. Examples like *It's time we were going home, because don't forget we have to be up early in the morning* are of somewhat marginal grammaticality, and the internal structure here remains like that of a main clause.

clauses do not have to be of the same type:

- [6] i *Come around six, or is that too early for you?* [imperative + closed interrog]  
 ii *You can come too, but please bring your lunch.* [declarative + imperative]  
 iii *What a fine player she is, and she's still only ten!* [exclamative + declarative]

In [i] the first clause is imperative and the second closed interrogative: the sentence as a whole cannot be assigned to any of the type categories. And similarly with [ii–iii].

### Clause fragments

We include within the category of clause various kinds of verbless construction, such as open interrogative *What about the others?* or exclamative *What a disaster!*

## ■ The clause types are mutually exclusive

Clause type is a grammatical system in the sense that no clause can belong to more than one of the categories: they are mutually exclusive. There can be ambiguity: *How many problems remain* (considered in abstraction from punctuation and prosody) can be an open interrogative (“What is the number of problems that remain?”) or an exclamative (“What a lot of problems remain!”), but any particular instance of it will be one or the other, not simultaneously both.

### Echo question not a clause type

Echo questions are illustrated in:

- |     |                                   |                             |
|-----|-----------------------------------|-----------------------------|
| [7] | STIMULUS                          | ECHO QUESTION               |
|     | i a. <i>Give it to Angela.</i>    | b. <i>Give it to who?</i>   |
|     | ii a. <i>Did you use a macro?</i> | b. <i>Did I use a what?</i> |

Suppose you say [ia] and I don't quite catch the name: I might respond with [ib] to ask you to repeat it, and similarly in [ii]. The [b] examples are known as **echo questions**: they echo **the stimulus**, what has just been said, with a view to questioning some aspect of it. We examine this construction in §4.8, but we mention it in the present context to develop what has just been said about the concept of system. It is evident from [7] that the echo construction is not mutually exclusive with the clause type categories. In [i] the echo feature is superimposed on an imperative and in [ii] on a closed interrogative: from a syntactic point of view, echo question is therefore a different kind of category from the clause types, not a sixth term on the same dimension. With respect to clause type, then, [ia] and [ib] are both imperatives, [iia] and [iib] both closed interrogatives; in each pair [b] differs from [a] by virtue of being an echo question. This reinforces the need to distinguish carefully between the clause types and the categories of meaning/use: [ib], for example, is a question, but it is not syntactically interrogative.

## 2 Distinctive grammatical properties of the major clause types

Declarative is the default clause type: a clause is declarative if it lacks the special properties that define the other types. In this section, therefore, we outline the distinctive properties of the other four major types with respect to main clauses.

### ■ Exclamatives

- [5] i Exclamatives contain an initial exclamative phrase, based on one or other of the two exclamative words *what* and *how*.  
 ii They may be reduced to just a predicative exclamative phrase; otherwise they are always tensed.  
 iii They usually have subject + predicator order, but subject postposing and subject–auxiliary inversion are also possible.
- [6] i *What a disaster it was!*  
 ii *How great would be their embarrassment if the error were detected!*  
 iii *How happy would he be if he could see her once more!*  
 iv *What a disaster!*

Examples [6i–iii] have fronting of a non-subject exclamative phrase; in [ii] this is accompanied by postposing of the subject *their embarrassment* and in [iii] by subject–auxiliary inversion. In [iv] the clause is reduced to the exclamative phrase, understood predicatively (“What a disaster it was!”).

### ■ Imperatives

- [7] i Imperatives are normally restricted to main clauses.  
 ii A 2nd person subject is omissible.  
 iii The verb is in the plain form.  
 iv In verbal negation, emphatic polarity, and code, supportive *do* is required even in combination with *be*.  
 v Verbal negatives with *you* as subject usually have the order *don’t + you*.

The examples in [8] show how these properties distinguish imperatives from declaratives:

[8]      DECLARATIVE	IMPERATIVE
i a. <i>You look after yourself.</i>	b. <i>(You) look after yourself.</i>
ii a. <i>You are very tactful.</i>	b. <i>Be very tactful.</i>
iii a. <i>Everybody stands up.</i>	b. <i>Everybody stand up.</i>
iv a. <i>You aren’t late.</i>	b. <i>Don’t be late.</i>
v a. <i>You don’t worry about it.</i>	b. <i>Don’t you worry about it.</i>

*You look after yourself* is ambiguous between declarative and imperative (it could be used as a statement about your behaviour or as a directive), but *Look after yourself* is unambiguously imperative (having only the directive interpretation). Examples [8ii–iii] have a difference in verb-form. Present tense *are* in [iia] contrasts with plain form *be*: **be** is the only verb lexeme that does not have syncretism between the plain form and one of the present tense forms. The difference in [iii] is of greater generality: here the plain form of the imperative contrasts with the 3rd person singular present tense form of the declarative, whatever the lexeme involved. In [8iv] *do* isn’t needed in the declarative because *be* is an auxiliary verb, but it is nevertheless required in the imperative (cf. *\*Be not late*). Finally, in [8v] we have a difference in the position of the subject. Example [va] has the default S–P order; it is a statement, one that might well be followed by the question tag *do you?* In imperative [vb], a directive, the subject follows *don’t*.

### ■ Closed and open interrogatives: subclasses of a larger class or distinct primary classes?

The terms ‘closed interrogative’ and ‘open interrogative’ suggest that they are subclasses of ‘interrogative’. Yet what they have in common is much more a matter of meaning than of syntax: they both characteristically express questions. From a syntactic point of view, they are in fact strikingly different. The most important property of open interrogatives is the presence of an interrogative phrase, based on the special set of interrogative words – they can in fact be reduced to just an interrogative phrase, as seen in [4v]. The distinctive property of closed interrogatives (in main clauses) is subject–auxiliary inversion. Inversion is found in the open interrogative as well as the closed, but only as a secondary feature, triggered by the fronting of a non-subject interrogative phrase. As a result, closed *Did she win the race?* and *Who won the race?* share no syntactic feature distinguishing them from declarative *She won the race.* Note, moreover, that inversion is also found as a secondary feature in a variety of other constructions too, such as negatives like *Not once did she smile.*

It is for these reasons that we have treated closed and open interrogatives as each on a par with declarative, exclamative, and imperative within the syntactic system of clause type. It would not be helpful, however, to coin new terms for them without a shared component – and we will make use of ‘interrogative’ as a cover term, generally when the focus is on the relation with question rather than on the syntactic structure.

## 3 Some semantic and pragmatic preliminaries

Before looking systematically at the relation between the clause types and their meaning or use, we need to clarify some of the concepts we will be using in talking of meaning in this area.

### 3.1 Illocutionary force

Statement and directive are in the first instance pragmatic categories: we are concerned with the way the speaker is using the clause when uttering it in a particular context. A more specific term for this aspect of pragmatic meaning is **illocutionary force**. If, for example, I utter the clause *Tom has arrived* with the intention of thereby committing myself to the truth of the proposition “Tom has arrived”, I have uttered it with the illocutionary force of a statement – or, to put it slightly differently, I have performed the **illocutionary act** of making a statement. If I say *Sit down* with the intention of telling you to sit down, my utterance has the illocutionary force of a directive – or, again, I have performed the illocutionary act of issuing a directive. And so on. Question is commonly used in the same kind of way: asking a question is a kind of illocutionary act contrasting with making a statement or issuing a directive.

### ■ More specific kinds of illocutionary force

Statement, directive, and question are very general categories of illocutionary force, but there are in addition innumerable more specific illocutionary categories. Some of these can be regarded as simply special cases of the more general categories. For example, *Bring*

*the water to the boil* might be said with the force of a command, a request, advice, an instruction (e.g. in a recipe), all of which can be subsumed under the broader category of directive, for they all count as attempts to get you to do something.

In other cases, the specific illocutionary force is different in kind from the three general ones:

[1] *I promise to return the key tomorrow.*

The natural use of this is to make a promise, and a promise is different in kind from a statement. In making a statement I commit myself to the truth of some proposition, whereas in making a promise I commit myself to doing something – in the case of [1], to returning the key tomorrow.

### ■ Primary and secondary force

Strictly speaking, a natural utterance of [1] would be both a statement and a promise, though the promise is of course more important, more salient than the statement. We will speak of the promise force as **primary** and the statement force as **secondary**. Making the statement can be regarded as simply the means of making the promise. I make a promise by stating that I do, and the statement is true simply by virtue of my uttering the clause with the intention of making a promise. The greater salience of the promise over the statement is reflected in the way the utterance of [1] would most naturally be reported, in comparison with the way in which an utterance with primary statement force would be:

[2]	i	a.	<i>I returned the key yesterday.</i>	[statement]
		b.	<i>You said you returned the key yesterday.</i>	[report of statement]
	ii	a.	<i>I promise to return the key tomorrow. (= [1])</i>	[promise]
		b.	<i>You promised to return the key tomorrow.</i>	[report of promise]

*You said you promised to return the key tomorrow*, although possible, is much less natural than [iib] precisely because it reports [iia] as a statement, whereas [iib] reports it as a promise.

Notice, then, that whereas the clause types are mutually exclusive, the illocutionary categories are not: it is possible for an utterance to belong simultaneously to more than one such category. This applies, indeed, also to the general categories: *I order you to leave* would naturally be both a directive (the primary force) and a statement (secondary).

### ■ The performative use of verbs

The two illocutionary forces of [1] are expressed by quite different linguistic devices. The statement force derives from the declarative clause type, whereas the promise force derives from the presence of the verb *promise* itself. *Promise* belongs to the class of **illocutionary verbs**, verbs that denote illocutionary acts, and in [1] it is used **performatively**, i.e. to effect the performance of the illocutionary act it denotes. The performative use of **promise** in [1] may be contrasted with its non-performative use in examples like [2iib]. The latter is not a promise but simply a report of a promise, hence just a statement. The first device, declarative clause type, is a matter of grammar, and there is accordingly only a very small number of possible contrasts; the second device, the performative use of *promise*, is primarily a lexical matter, which allows for a large number of contrasts. In [3] we give a

small sample of verbs that can be used performatively:

[3]	<i>admit</i>	<i>advise</i>	<i>apologise</i>	<i>ask</i>	<i>beg</i>
	<i>bet</i>	<i>claim</i>	<i>command</i>	<i>commend</i>	<i>concede</i>
	<i>congratulate</i>	<i>entreat</i>	<i>estimate</i>	<i>name</i>	<i>order</i>
	<i>postulate</i>	<i>promise</i>	<i>repudiate</i>	<i>resign</i>	<i>suggest</i>
	<i>swear</i>	<i>thank</i>	<i>urge</i>	<i>warn</i>	<i>welcome</i>

There are also expressions consisting of verb + dependent: *declare . . . open* (*I declare the meeting open*), *give one's word*, and so on. For convenience we will refer to such utterances as [1]/[2iia] as **performatives**.<sup>3</sup>

### ■ Perlocutionary effect

Illocutionary force contrasts with **perlocutionary effect**, the effect the utterance has on you, the addressee. If I say *Tom has arrived* with the illocutionary force of a statement, the default perlocutionary effect is that you will accept it as true. But of course statements do not invariably have this effect: you may know or believe me to be mistaken. Similarly, if I say *Sit down* with the illocutionary force of a directive, the default perlocutionary effect will be that you comply by sitting down; but again this is not the only possible result. Typically, then, an illocutionary force is associated with a particular perlocutionary effect which the speaker is aiming to achieve, but failure to achieve this effect does not normally deprive the utterance of its illocutionary force: a statement is still a statement even if it is not accepted as true, a directive is still a directive even if it is not complied with, and so on.

Verbs which denote illocutionary acts can normally be used performatively, like *promise* in [1]. Those – such as *persuade*, *convince*, *annoy*, *intimidate*, *impress* – which denote perlocutionary acts cannot similarly be used to perform those acts. I can warn you (an illocutionary act) that the car is unroadworthy by saying [4i], but I cannot persuade you (a perlocutionary act) that it is unroadworthy by saying [4ii]:

- [4] i *I warn you that the car is unroadworthy.* [performative]  
 ii *I persuade you that the car is unroadworthy.* [non-performative]

(The second is indeed pragmatically unlikely: it needs some such continuation as *and yet you buy it nevertheless!*) Similarly, there are differences in the way I might ask you to clarify your illocutionary and perlocutionary intentions. Compare

- [5] i a. *Is that a threat or a promise?* } [illocutionary]  
 b. *Are you asking me or telling me?* }  
 ii a. *Is that intended to intimidate me?* } [perlocutionary]  
 b. *Are you trying to annoy me or to amuse me?* }

When questioning the perlocutionary intention, one typically needs to include some such verb as *intend* or *try*, but this is generally not necessary when questioning the illocutionary intention. Saying *I'll be back at six* with the intention of making a promise is sufficient for the utterance to be a promise, but telling a joke with the intention of amusing the addressee is not sufficient to achieve that goal.

<sup>3</sup>Clauses like *I promise to return the key* and *I order you to leave* are ambiguous, having also less salient interpretations in which they are statements about my habitual behaviour ('I habitually promise to return the key / order you to leave'): in this interpretation they are not performatives since they do not themselves constitute a promise or order. The *tomorrow* in [2iia] makes the habitual reading even less salient, but it is still possible in principle.

### ■ Propositional and non-propositional components of meaning

The **propositional content** of a sentence is that part of its meaning that determines what propositions it can be used to express; clause type, however, contributes to **non-propositional meaning** (see Ch. 1, §5.2). Consider the relation between a declarative and its closed interrogative counterpart, as in:

[6]	DECLARATIVE	CLOSED INTERROGATIVE
	i a. <i>Kim is in Paris.</i>	b. <i>Is Kim in Paris?</i>
	ii a. <i>Pat saw them.</i>	b. <i>Did Pat see them?</i>

In each pair, [a] and [b] are partly alike and partly different in both form and meaning. In form, the closed interrogative contains the same elements as the declarative (sometimes with the addition of *do*, as in [ii]) but with a different order of subject and verb. As for meaning, what they have in common is that they have the same propositional content: both express the proposition “Kim is in Paris” or “Pat saw them”. They differ in the non-propositional component, more specifically, in their **illocutionary meaning**. In a normal use of [a] the proposition is asserted, whereas in [b] it is questioned. In both [i] and [ii] the illocutionary force is separate from the propositional content of the utterance: when I use [ia] to make a statement I do not express the proposition that I am making a statement – I simply make it by uttering a declarative with the appropriate intention. Similarly, when I ask a question by means of [ib] I do not **say that** I am asking a question. Note, then, that the term ‘express’ is neutral as to illocutionary force. And the terms ‘true’ and ‘false’ can be applied to propositions or to statements, but not of course to questions.

A unique feature of performatives like [1], *I promise to return the key tomorrow*, is that here the (primary) illocutionary force is identified in the propositional content of the utterance. Thus [1] itself, for example, expresses the proposition “I promise to return the key tomorrow”. As a result of this feature of performatives, the primary illocutionary force of the utterance is more explicit and precisely specified in such utterances than it normally is elsewhere.

#### Other non-propositional markers of illocutionary force

Clause type and the performative use of illocutionary verbs are not the only linguistic devices for indicating illocutionary force. Intonation plays an important role too, as we shall see, and there are also particular words, such as *please*, which serve this purpose. But these further devices are like clause type in that they do not contribute to the propositional content of the utterance. When I say, for example, *I'd like a cup of tea, please*, the *please* serves to indicate that I am making a request, that I am **asking** for a cup of tea, but I do not express the proposition that I am doing so. *Please* is quite irrelevant to the truth or falsity of the utterance, and hence does not express any part of its propositional content.

## 3.2 Indirect speech acts

Illocutionary force is very often conveyed indirectly rather than directly. Consider:

[7] *Do you know what time it is?*

A likely context for this (not the only possible one of course) is where I don't know the time, want to know the time, and believe you may well be able to tell me. In this

context it would indirectly convey “What time is it?” This is why it would be thoroughly unco-operative in such a context for you to respond merely with *Yes*. *Yes* would answer the question that is actually asked, but not the one that I in fact want to have answered. Another plausible context for [7] is where it is addressed to a child (by a parent, say) when it is known to be past the child’s bedtime: here my intention may well be to convey a directive to go to bed.

In either contextualisation, I perform two illocutionary acts simultaneously, one directly (a question as to whether you know what time it is), and one indirectly (a question as to what time it is, or a directive to go to bed). We will follow the established practice of referring to indirect illocutionary acts as **indirect speech acts** (with the understanding that the term covers writing as well as speech). Commonly, the direct act is obviously less important than the indirect one – as when the interest of the question whether you know the time is simply that if you do you will be able to answer the question that I really do want an answer to. There is an analogy here with performatives, and we will again, where appropriate, apply the terms ‘primary’ and ‘secondary’ to the different acts or forces. Thus just as in the performative *I promise to return the key tomorrow* the promise is primary and the statement secondary, so in the first contextualisation of [7] the question about the time is primary and that about your knowledge secondary. The difference is that in the performative case the primary act is direct, whereas in such cases as [7] it is not.

#### ■ Definition of indirect speech act

An indirect speech act is one where (a) the propositional content actually expressed differs from that which the speaker intends to convey with some illocutionary force, or (b) where the illocutionary force is different from that normally conveyed by the clause type concerned.

Most cases are covered by condition (a). The propositional content expressed in [7], for example, is “You know what time it is”, whereas the propositional content that I intend to convey is “What time is it?” (with question force) or “You go to bed” (with directive force). Case (b) is illustrated by [4iii] of §1, *Sleep well*. At the direct level it is a directive (the force characteristically associated with imperative clause type), but since sleeping well is not something that we normally regard as being under our control it will generally have the indirect force of a wish.<sup>4</sup>

#### ■ Degrees of indirectness

There are varying degrees of indirectness, depending on how different the two propositional contents are. The first suggested contextualisation of [7], for example, is less indirect than the second because the propositional content of the conveyed “What time

<sup>4</sup>The sense of ‘indirect’ introduced in this section is quite different from the one it has in traditional grammar in such expressions as ‘indirect question.’ A traditional indirect question, such as the underlined clause in *She asked who had done it*, is in our terminology a subordinate interrogative, whereas an indirect question in the speech-act sense might be *I’d be interested to hear your view*, when used to convey “What is your view?” As it happens, both senses are applicable in [7], but to different parts of it. The subordinate clause *what time it is* is an indirect question in the traditional sense (it is a subordinate interrogative clause), whereas the whole utterance is an indirect question in the speech act sense (in the use where it conveys “What time is it?”). We will use ‘indirect’ solely in the speech-act sense.

is it?” is included as part of that which is actually expressed, whereas “You go to bed” is not. Intuitively (for we are not suggesting that the degree of indirectness can be precisely calculated), the following are less indirect again, though they still qualify as indirect speech acts:

- [8] i *I should like to order two copies of the Penguin edition of Plato’s ‘Republic’.*  
 ii *May I remind you that you agreed to pay for the drinks?*

In the context of a letter to a bookshop, the writer of [i] will be taken to have performed the illocutionary act of ordering the goods, but the act is performed indirectly because the propositional content expressed is “I should like to order . . .”, not “I (hereby) order . . .”. The inference from “I should like to order” to “I order” is a very easy one to make in this context, for the wish to order can be fulfilled instantaneously simply by writing the letter (and perhaps enclosing payment). Nevertheless, “I should like to order” and “I order” are obviously not propositionally equivalent, and it is easy to imagine other contexts where the inference would not go through – e.g. in a conversation where the speaker adds: *but in my present financial plight I can’t afford to do so*. Example [ii] conveys “I remind you that you agreed to pay for the drinks”, but again that is not the same as the propositional content actually expressed. The question concerning permission is here vacuous since merely mentioning that you agreed to pay for the drinks itself reminds you of that fact, but this does not alter the fact that there is a difference between the propositional content expressed and that which I wish to convey.

### ■ The pervasive nature of indirect speech acts

Indirect speech acts are an immensely pervasive phenomenon. Some kinds of illocutionary act are more often performed indirectly than directly, either in general or in a certain range of contexts.

#### Requests

Take first the case of requests, not in general but in a context where speaker and addressee are social equals yet not closely intimate. Here a request is much less likely to be made directly than indirectly. Instead of the direct *Please open the window*, for example, I am likely to use one of the indirect directives in [9] or something along similar lines:

- [9] i *Can/Could you (please) open the window.*  
 ii *Will/Would you (please) open the window.*  
 iii *Would you be good enough to open the window (please).*  
 iv *Would you mind opening the window (please)?*  
 v *Would you like to open the window (please)?*  
 vi *I wonder if I might trouble you to open the window?*

(There is some variation in the punctuation of interrogatives such as [iv], with a full stop reflecting the primary directive force, a question mark the secondary question force.)

#### Job applications

As a second example, consider the more specialised illocutionary act of applying for a job, an act normally performed in writing. Some of the formulations used for this purpose

are illustrated in [10], where those in [i] are direct, the others indirect:

- [10] i a. *I hereby apply for the position of Lecturer in Philosophy advertised in 'The Australian' of 30 November.*  
 b. *I apply for the position . . .*  
 c. *This is an application for . . .*
- ii a. *I would/should like to apply . . .*  
 b. *I wish to apply / make application . . .*  
 c. *I am writing to apply . . .*  
 d. *I would/should like to be considered for . . .*  
 e. *I would/should be grateful if you would consider me for . . .*  
 f. *Please consider this letter as my formal application for . . .*  
 g. *I beg/wish to offer myself as a candidate for . . .*  
 h. *The purpose of this letter is to express my interest in securing . . .*  
 i. *I am very glad to have this opportunity to apply . . .*

Again, only a small minority of applications are performed directly, and there are innumerable variations on the indirect formulations exemplified in [ii].

#### ■ Non-propositional markers of indirect force

We have explained the concept of indirect speech act primarily by reference to propositional content; non-propositional components may, however, relate to the illocutionary act which is conveyed indirectly rather than the one which is directly expressed. This is illustrated by the *please* of [9], *Can you please open the window*, etc., or of the earlier, *I'd like a cup of tea, please*. The latter is an indirect speech act in that the propositional content expressed ("I'd like a cup of tea") differs from that conveyed with directive force ("you give me a cup of tea"), but the *please* serves to signal this indirect directive force (marking it, more specifically, as a request): it does not relate to the direct statement. Similarly in [9] *please* works at the indirect level of request, not the direct level of question. The distinction between direct and indirect is therefore not to be identified with that between explicit and implicit: the *please* explicitly marks the above examples as requests, but they are still indirect because of the discrepancy between the propositional content expressed and that implied.

Prosody and punctuation commonly serve as markers of indirect force:

- [11] i *Could you turn your radio down a little.*  
 ii *Isn't she fantastic!*

At the direct level these are questions, but I am unlikely to use them with question as the primary force: I would generally be indirectly conveying "Turn your radio down a little" (directive) and "How fantastic she is!" (exclamatory statement). In this use they would typically have falling intonation, rather than the rising intonation that is the most characteristic prosodic accompaniment of closed questions, and they are very often not punctuated with a question mark.

Such markers of the indirect force have the effect of increasing the difference in salience between the indirect speech act and the direct one, pushing the latter further into the background. In such an example as *Boy, am I ever hungry!* the combination of falling intonation with the non-propositional elements *boy* and *ever* causes the direct question force to be completely overshadowed by the indirect exclamatory statement force.

### ■ Idiomatic forms of indirect speech acts

As will be evident from the examples given, certain forms of expression are idiomatically or conventionally used in the performance of indirect speech acts. A clear distinction can be seen in such a pair as:

- [12] a. *Can you turn the light on.*      b. *Are you able to turn the light on?*

The construction with *can* is a much more frequent and natural way of making an indirect request than that with *be able*. It is certainly possible to make indirect requests with *be able*, but the degree of backgrounding of the direct inquiry force is significantly less than it is with *can*. With *can*, the inquiry force is commonly vacuous, in that the answer is self-evidently *Yes*, but this is not normal for *be able*. Thus in a context where it is obvious that you can turn the light on, [12a] is appropriate, or idiomatic, whereas [b] is not. Version [b] needs a context where there is genuine doubt as to your ability to turn the light on (e.g. one where you are carrying some shopping). This difference is reflected in the fact that the request marker *please*, which backgrounds the question force, would be very much more naturally inserted before *turn* in [a] than in [b]: *Can you please turn the light on*, but hardly *Are you able to please turn the light on*.

A similar, probably sharper, distinction is seen in

- [13] a. *Have a good match.*                      b. *Win the match.*

Like the earlier *Sleep well*, [a] is likely to be used as an indirect wish, whereas it is hardly possible to convey a wish by means of [b]. The range of imperatives conventionally used as wishes is very limited: *Sleep well*, *Get well soon*, *Have a good . . .*, *Enjoy . . .*, but not many more.

To say that [12a] is an idiomatic way of making a request is not to say that it, or just the initial part, *can you*, is an idiom. An idiom (such as *kick the bucket* with the sense “die”) is an expression whose meaning is not systematically derivable from its parts, but the request meaning conveyed by [12a] is derivable from the meanings of *can*, *you*, and the remainder of the clause together with the inference from an inquiry about your ability to do something to a request that you do it.

## 4 Kinds of question

### 4.1 Question as a semantic and as a pragmatic category

#### ■ Semantic questions and their answers

The term ‘question’ is commonly used at both the semantic and pragmatic levels. At the semantic level, a question is distinguished by the fact that it defines a set of logically possible answers:

- | [1]      QUESTION             | ANSWERS   |
|-------------------------------|---|
| i a. <i>Have you seen it?</i> | b. <i>I have seen it. I haven't seen it.</i>  |
| ii a. <i>Who broke it?</i>    | b. <i>I broke it. Kim broke it. The priest broke it. One of her children broke it . . .</i> |

Instead of saying *I have seen it* in answer to [ia], I might say *Yes* or *I have* or *Yes, I have* or *Yes, I've seen it*, and so on. Although these are different in form they are equivalent,

and we will regard them as (expressing) the same answer. Similarly for the negatives: *I have not seen it; I have not; I haven't; No; No, I haven't*. These all count as the same answer. It is in this sense of the term that we can say that [ia] defines a closed set of just two possible answers. Questions like [iia], on the other hand, define in principle an open set of answers: there are indefinitely many others besides those given in [iib]. It was this distinction that provided the basis for general definitions of closed and open interrogatives.

### ■ The distinction between answer and response

**Answer** is to be distinguished from **response**, which is a purely pragmatic concept. If you ask question [1ia], *Have you seen it?*, I could give any of the following as response, or of course indefinitely many others:

- [2] i *No. I have.*  
 ii *I'm not sure. I can't remember. Possibly. Does it matter?*  
 iii *I've already told you that I have. It's on your desk. I saw it yesterday.*

The responses in [i] are answers, but the others are not. In [ii] I avoid giving an answer – whether on the grounds of insufficient knowledge or for some other reason. The responses in [iii] implicate or entail the answer *Yes*, but they are not logically equivalent to *Yes*: they are not themselves answers. With *It's on your desk* I interpret your question as indirectly asking “Where is it?”, and answer that – *Have you seen my pen?*, for example, is a conventional way of indirectly conveying “Where's my pen?” The final response in [iii], *I saw it yesterday*, is not an answer because it contains extra information not called for in the question.

It is clear, then, that for a wide range of reasons one very often responds to a question in some other way than by giving an answer. And such a response will sometimes contain less information than an answer would, and sometimes more.

### ■ ‘The answer’ and ‘the right answer’

A semantic question defines a **set** of answers, but commonly one speaks of **the** answer to a question. Unless there are special features of the context indicating otherwise, the expression *the answer* is understood to mean “the right answer”. Usually the right answer is the one that is true, but we will see below (§4.6) that there is a kind of question where ‘right’ cannot have this interpretation.

### ■ Pragmatic questions

#### Inquiry

The pragmatic concept of question is an illocutionary category. Prototypically, a question in this sense is an **inquiry**. To make a (genuine) inquiry is to ask a question to which one does not know the answer with the aim of obtaining the answer from the addressee. An inquiry can be thought of as effectively a kind of a directive – a directive (usually a request) to the addressee to supply the answer. The directive force is indirect, however, since the propositional content of the implied directive (“Tell me the answer to the question . . .”) is not the same as that which is actually expressed. As with the indirect directives discussed in §3.2, the request force can be signalled explicitly in the non-propositional component by the marker *please*, as in *What time is it, please?*

### Not all questions are inquiries

The category of question is much broader than that of inquiry. Consider, for example:

- [3] i A: *Ed's coming round tonight.* B: *Is he? I didn't know he was still in London.*  
 ii *What will become of her, I wonder?*  
 iii *What were the names of Henry VIII's six wives?*  
 iv *How can this problem be overcome? I suggest that the first step is . . .*

Example [i] illustrates the case where a question is used to indicate surprised or interested acknowledgement of new information. B's *Is he?* is not an inquiry: it doesn't seek to find out the answer, for A has just provided it, and B is not challenging what A has said. In [ii] I am wondering, not inquiring – probably not asking for an answer (much less 'the' answer). Question [iii] might be used in a quiz or exam: in this case it's not an inquiry since presumably I already know the answer, my aim being to test whether you do. And [iv] is intended as an expository question. Instead of asking you for the answer, I am directing your attention to a question whose answer I'm about to give you. Other cases of questions that are not inquiries include indirect speech acts like *Could you turn your radio down a little* or *Isn't she fantastic!* ([11] of §3), where the question force is secondary and very much backgrounded.

In comparison with a statement, a question on its own is informationally incomplete: it needs the answer to complete it. In an utterance with question as its primary force, I draw attention to this need for a completing answer. What we are calling an inquiry is then the special, but most common, case where I ask you to provide this answer.

## 4.2 Summary classification of questions

Questions can be classified in numerous different ways. In the following sections we will examine distinctions on the four dimensions shown in [4] where the first distinguishes three kinds of question, the others two each:

[4] i	POLAR	ALTERNATIVE	VARIABLE
	<i>Is it breathing?</i>	<i>Is it alive or dead?</i>	<i>Why isn't it moving?</i>
ii	INFORMATION	DIRECTION	
	<i>What time is it?</i>	<i>Shall I put some music on?</i>	
iii	NEUTRAL	BIASED	
	<i>Have you read it?</i>	<i>Haven't you read it yet?</i>	
iv	ORDINARY (NON-ECHO)	ECHO	
	<i>What's he going to do?</i>	<i>He's going to what?</i>	

Dimension [i] is based on the way the question defines the set of answers. Polar and alternative make up the class we have called closed question, and both are characteristically expressed by closed interrogatives. Variable questions are open questions, and are expressed by open interrogatives. We examine polar, alternative, and variable questions in turn in the next three sections.

For the other three dimensions the category in the left column of [4] can be regarded as the default, and §§4.6–8 will therefore focus respectively on direction questions (where the answers have the force of directives, not statements), biased questions (where the speaker is biased in favour of one answer over another) and echo questions (which seek repetition or clarification of what has just been said).

In addition, we take the view that while intonation may mark a question it does not mark interrogative clause type, and hence with respect to the syntactic form of (non-echo) polar questions we distinguish:

[5]	INTERROGATIVE QUESTION	DECLARATIVE QUESTION
	<i>Are you ready?</i>	<i>You're ready?</i>

### 4.3 Polar questions

#### ■ Answers to polar questions

A polar question has as answers a pair of polar opposites, positive and negative. The answers to *Is it ready?* are *It is ready* and *It is not ready* (or equivalently *Yes* and *No*, or *Yes, it is* and *No, it's not*, and so on). The propositional content of one answer is expressed in the question itself, and that of the other is obtained by reversing the polarity.<sup>5</sup>

Usually it is the positive that is expressed in the question, but it can also be the negative, as in the biased question *Isn't it ready?*

#### Choice between *Yes* and *No* determined by answer

*Yes* and *no* are used in positive and negative answers respectively: the choice between them is determined by the polarity of the **answer**, with the polarity of the **question** being irrelevant. Thus *Yes, it is* and *No, it's not* are answers to both *Is it ready?* and *Isn't it ready?* *Yes* on its own, however, is relatively unlikely to be used as a response to a negative question.

#### ■ The form of polar questions

Polar questions prototypically have the form of a closed interrogative clause, as in *Is it breathing?* in [4i]. They do not always have this form, however; other possibilities are shown in:

- [6]
- i *Your aim that evening, then, was to go to the discotheque?*
  - ii *So you went to the party but your brother stayed at home?*
  - iii *Another cup of tea?*

Example [i] is what we are calling a declarative question: it has declarative not interrogative syntax, with the question meaning normally signalled by rising intonation or the punctuation; see §4.7.2 for further discussion. Example [ii] has the form of a coordination of declarative clauses: there are two clauses, but it is a single question. Finally, [iii] is a clause fragment.

### 4.4 Alternative questions

#### ■ Answers to alternative questions

Alternative questions have as answers a set of alternatives given in the question itself. For example, the answers to *Is it right or wrong?* are *It's right* and *It's wrong*, which are derivable directly from the question. This example contains two alternatives, but there may be more: e.g. three in *Would you like to meet in the morning, the afternoon, or the evening?*

<sup>5</sup>Other terms for polar question include 'yes/no question', 'general question', 'total question', 'nexus-question'.

The propositional content of an alternative question is, or is logically equivalent to, a disjunction of propositions, disjunction being the relation expressed by *or* (see Ch. 15, §2.2.1). Each of these propositions gives the content of one of the answers. The propositional content of *Is it alive or dead?*, for example, is “It is alive or dead”, which is logically equivalent to “It is alive or it is dead”.

### ■ The form of alternative questions

The essential feature of alternative questions is the coordinator *or* which relates the alternatives. The *or*-coordination is normally prosodically marked by a rise on the first coordinate and a fall on the final one, as indicated in [7], where we put ↗ after a word or phrase that is uttered with rising pitch and ↘ after a word or phrase that is uttered with falling pitch:

- [7] i *Is it a boy ↗ or a girl ↘?* [closed interrogative]  
 ii *Is it genuine ↗ or is it a hoax ↘?* [coordination of closed interrogatives]  
 iii *You're staying here ↗, or coming with us ↘?* [declarative]  
 iv *Tea ↗ or coffee ↘?* [clause fragment]

With multiple coordination the intermediate coordinates take rising intonation, like the first: *Would you like orange juice ↗, lemonade ↗, or coke ↘?*

Alternative questions usually have closed interrogative syntax. In [7i] the *or*-coordination is within the clause, whereas in [ii] it is between clauses. In the latter case, then, we have two interrogative clauses but a single question. It is also possible for an alternative question to have the form of a declarative, as in [iii], or of a clause fragment, as in [iv]. Prosodically marked declaratives, however, are much less readily used for alternative questions than for polar ones; this is no doubt because questions with declarative form are biased, and alternative questions tend to be neutral.<sup>6</sup>

### ■ Or in alternative and polar questions

The coordinator *or* is an essential component of an alternative question, but it may also occur incidentally in a polar question: *Will I be able to get some tea or coffee at the bus station?* Here the answers are *Yes, you will* and *No, you won't*: I'm not asking which drink is available but whether or not I'll be able to get one or other of the drinks.

In writing there will often be ambiguity between an alternative question and a polar question that happens to contain an *or*-coordination, but the two cases are distinguished in speech by the intonation. An alternative question, we have noted, has a rise on the first coordinate and a fall on the last: a polar question will not distinguish the coordinates in this way but will normally have a rising pitch on the last:

- [8] i *Are you free on Tuesday ↗ or Wednesday ↘?* [alternative]  
 ii *Are you free on Tuesday or Wednesday ↗?* [polar]

The answers to the alternative question [i] are *I am free on Tuesday* and *I am free on Wednesday*. The polar question [ii] is equivalent to *Are you free on Tuesday or Wednesday, or not?*, its answers being *Yes, I am free on Tuesday or Wednesday* and *No, I'm not free on Tuesday or Wednesday*. It should again be borne in mind, however, that while the **answers** to the alternative and polar questions are sharply distinct, the **responses** may

<sup>6</sup> A special case is where the alternatives are identical: *Is it hot, or is it hot?* This serves as an indirect emphatic statement, “It is remarkably hot”.

be less so. A co-operative addressee might respond to the polar question with *Yes, I'm free on Tuesday*, giving more specific information than is actually asked for.

The ambiguity which is found in the written form *Are you free on Tuesday or Wednesday?* is seen also when the coordination is between clauses:

[9] *Have you moved or are you about to move?*

The answers to the alternative question are *I have moved* and *I am about to move*, and those to the polar question are *Yes, I have moved or I am about to move* (unlikely as a response: you would generally give more specific information) and *No, I have not moved nor am I about to move*. The example is taken from a bank statement, where the continuation – *If so, please call us on the number below* – makes clear that the polar interpretation is intended, but it is equally easy to imagine contexts where the alternative one applies. Again, the ambiguity would be resolved in speech by the intonation.

One **grammatical** difference between the two kinds of question is that *or* cannot be paired with *either* when it is the marker of an alternative question. *Are you free on either Tuesday or Wednesday?*, for example, is unambiguously polar. This explains the anomaly of examples like *Would you prefer to watch with the light either on or off?* or (to an expectant mother) *Are you hoping for either a boy or a girl?* – the *either* forces a polar, yes/no, interpretation which conflicts with normal assumptions that there are no other possibilities than those expressed.

#### ■ No alternative interrogative clause type corresponding to alternative question

Although [8i] and [ii] are, semantically, different kinds of question, they do not belong, grammatically, to different clause types. This is one reason why we have adopted different terminologies for subclassification at the two levels. Semantically we distinguish three kinds of question on the basis of the way they define the set of answers: polar, alternative, and variable. But grammatically there are just two subtypes of interrogative: closed and open.

The reason we do not treat the *or* of alternative questions as a clause type marker is that the coordination in which it figures may be between clauses, as in [7ii]. This is a clause-coordination, not a clause, so the issue of what clause type it belongs to doesn't arise. And as for the component clauses, *is it genuine* and *is it a hoax*, they have the same syntactic form as clauses expressing polar questions. Note that with embedded questions the clause subordinator *whether* can appear in both coordinates: *I don't know whether it's genuine or whether it's a hoax*. From a grammatical point of view, therefore, alternative questions are distinguished from polar questions not by the system of clause type but by a special use of coordination.

#### ■ Polar-alternative questions

A special type of alternative question has the alternatives consisting of a positive and its negative counterpart. Questions of this kind are logically equivalent to polar questions, and we refer to them as **polar-alternative questions**:

- [10] i a. *Are you ready or are you not ready?*  
       b. *Are you ready or aren't you ready?*  
       c. *Are you ready or aren't you?*  
       d. *Are you ready or not?*  
       e. *Are you, or are you not, ready?* } [polar-alternative]
- ii *Are you ready?* } [polar]

As shown in [i], the second coordinate can be reduced by the omission of repeated material, and its position relative to the first can be varied, as in [ie]. With embedded polar-alternative questions there is also the possibility of having *or not* adjacent to the subordinator *whether*: *They want to know whether or not you're ready*.

The questions in [10] are logically equivalent in that they define the same set of answers. They do so, however, in different ways. Polar [ii] expresses a single proposition and the answers are provided by this and its polar opposite, whereas the polar-alternatives in [i] express two propositions, each of which provides an answer. The distinction between polar, alternative, and variable questions is based on the way they define the set of answers, and in accordance with the definitions given above, therefore, [i] and [ii] belong to different categories despite their logical equivalence. The term ‘polar-alternative’ is to be understood as denoting a subclass of alternative questions.

Apart from the issue of how the answers are derived, there are two other respects in which [10i] behave like alternative questions rather than polar ones. These involve the subordinate constructions illustrated in:

- |        |    |   |                     |
|--------|----|---|---------------------|
| [11] i | a. | <i>I wonder/doubt whether it is alive.</i>                | [polar]             |
|        | b. | <i>I wonder/*doubt whether it is alive or dead.</i>       | [alternative]       |
|        | c. | <i>I wonder/*doubt whether it is alive or not.</i>        | [polar-alternative] |
| ii     | a. | <i>*I'm marrying her whether you like her.</i>            | [polar]             |
|        | b. | <i>I'm marrying her whether you like her or hate her.</i> | [alternative]       |
|        | c. | <i>I'm marrying her whether you like her or not.</i>      | [polar-alternative] |

While verbs like *wonder* license interrogative complements expressing all three kinds of question, *doubt* accepts only the polar type: the polar-alternative is excluded just as other alternative questions are (see Ch. 11, §5.3.3). Conversely, the ungoverned exhaustive conditional construction [ii] excludes the polar type, while allowing polar-alternatives as well as other alternative questions (see Ch. 11, §5.3.6).

#### ■ Pragmatic differences between polar and polar-alternative questions

Although polar questions are logically equivalent to their polar-alternative counterparts, there are considerable pragmatic differences between them. The polar version is simpler and much more frequent: it can be regarded as the default version. We draw attention here to a selection of contexts favouring one rather than the other of the two.

##### (a) Polar-alternative emphasises choice

The explicit expression of the negative often has an emphatic effect. One reason for my emphasising the choice might be that you have failed to give a satisfactory response, i.e. an answer, to a previous polar question. In such a context, the polar-alternative question is likely to have an impatient, hectoring, or petulant tone, conveying “Make up your mind”, “Give me an answer”, or the like. The different versions of the polar-alternative, as illustrated in [10i], vary in the extent to which they convey such emotive meaning. In general, the less elliptical the form, the greater the emotive meaning is likely to be: compare *Are you going or not?* with the more insistent *Are you going or aren't you?* Typically, however, the version where the second coordinate is interpolated within the first, as in [10ie], is the most hectoring.

##### (b) Polar-alternative emphasises the exhaustiveness of the two alternatives

- |      |    |                     |    |                            |
|------|----|---------------------|----|----------------------------|
| [12] | a. | <i>Was it good?</i> | b. | <i>Was it good or not?</i> |
|------|----|---------------------|----|----------------------------|

The answers to both polar [a] and polar-alternative [b] are simply *It was good* and *It wasn't good*, but (no doubt because of the tendency for the negative *It wasn't good* to

be interpreted as “It was bad” – see Ch. 9, §5) [a] will often receive such non-answer responses as *It was okay*, *It wasn't too bad*, and the like. Such responses locate ‘it’ in the middle ground between good and bad. The polar-alternative can serve, then, to insist on a simple, unequivocal choice between ‘good’ and ‘not good’ – and again the emotive meaning of impatience or the like will be more evident in the less elliptical versions.

(c) Polar version preferred when answers are of unequal status for the speaker

- [13] i *Have you any idea how much these things cost?*  
 ii *Will they agree to the proposal, do you think, or not?*  
 iii *Is it the sixteenth today?*

I might use [i] rhetorically, to convey that I believe that you haven't any idea of the cost: in this use (which is not the only one, of course) it would be a biased question, one where I am predisposed to one answer over another. In this case it would be very unnatural to add *or not*, for this would take away the rhetorical effect. Negative polar questions – e.g. *Don't you like it?* – are always biased, and will never be pragmatically equivalent to polar-alternatives. The polar-alternative, by expressing both positive and negative propositions, tends to assign them equal status.

In a case like [13ii] the effect is to give you full freedom to choose between them: it avoids any appearance of according greater likelihood to one answer. Especially in combination with the parenthetical *do you think*, the effect of the polar-alternative may then be to suggest a certain diffidence or deference to the addressee.

Bias is not the only factor that can make the answers of unequal status. Consider [13iii], for example. I might say this when my concern is to find out what date it is, and in that case a “yes” answer gives me the desired information but a “no” does not (so that a co-operative response would go further: *No, it's the fifteenth*, say). For this reason, the answers are of unequal value, and in such a context the polar-alternative version would be very unlikely. There are numerous other ways in which the answers might be of unequal status. To give just one, note that we say *Are you awake?*, not (normally) *Are you awake or not?* The latter suggests that positive and negative answers are on a par, but they are not. If you are awake you can answer *Yes*, but if you're not you can't answer *No*, so only one of the answers is a possible (true) response.

## 4.5 Variable questions

### ■ Answers to variable questions

Variable questions have a propositional content consisting of an open proposition, i.e. a proposition containing a variable (Ch. 1, §5.1). The answers express closed propositions derived by substituting a particular value for the variable. If we use the symbol ‘*x*’ for the variable, we can represent the propositional content of *What did they give her?* as “They gave her *x*”, and the answers have different values for the variable *x*: *They gave her some books*; *They gave her the key*; *They gave her everything she asked for*; and so on.

Prototypically, there is no logical limit to the number of different possible values, so that the set of answers will be open-ended. It need not be so, however: a limit to the

possible values may be incorporated into the question, as in *Which of the two proposals suits you better?*<sup>7</sup>

### ■ The form of variable questions

These questions have the form of an open interrogative clause. They are marked by a phrase containing an interrogative word – whose role is to express the variable. Details of the interrogative words and their properties are given in §7. The question may consist solely of the interrogative element, forming a clausal fragment: *Who?*; *What about the others?*; and so on.

#### Fronting of the interrogative phrase

When the interrogative phrase has a function other than that of subject of the interrogative clause, it is normally fronted to prenuclear position, and in main clauses this triggers subject–auxiliary inversion. Fronting of a non-subject interrogative phrase is not obligatory in main clauses: it can remain in situ, i.e. in the default position of corresponding non-interrogative phrases, following the verb. Open interrogatives with a post-verbal interrogative phrase generally occur, however, only in contexts of sustained questioning, such as quizzes and interrogations by legal counsel, police, and so on. Compare, then:

[14]	FRONTED: INVERSION	IN SITU: NO INVERSION
i	a. <i>Where are those senses located?</i>	b. <i>And those senses are located where?</i>
ii	a. <i>What were the results of that examination?</i>	b. <i>And the results of that examination were what?</i>

The [b] versions are attested examples used in court during the cross-examination of a medical witness. As such, they are quite distinct from echo questions: the aim was to elicit new information, not a repetition or clarification of what had just been said.

### ■ Infinitivals

Open interrogatives may have infinitival form, with or without *to*; in either case, no subject is permitted.

#### The *to*-infinitival construction

Two non-embedded cases of this are to be found:

[15]	i	<i>What to do in the event of fire</i>	[titular]
	ii	<i>How to persuade her to forgive him?</i>	[main clause]

Type [i] is a non-sentential construction: infinitivals of this kind are used as titles of books, articles, etc., or headings for lists, notices, and the like. They have the same function as an NP: compare *How to get rich quick* and *Five easy ways to get rich quick*. In [ii] the interrogative is a main clause, forming a sentence – note the difference in punctuation between [ii] and [i]. By virtue of forming a sentence, it will normally have illocutionary force: it's a matter of asking, or at least wondering. This type is somewhat rare and literary; one case of it is in interior monologue, where one is pondering over a question. The meaning here is essentially “How could he persuade her . . . ?”

<sup>7</sup>Other terms to be found in the literature as equivalent to our ‘variable question’ include ‘x-question’, ‘wh-question’, ‘specific question’, ‘partial question’, and ‘information question’.

### The bare infinitival construction

This is found only in main clauses, almost invariably with *why*:

- [16] a. *Why be so soft with them?*      b. *Why not accept his offer?*

These convey that I don't think there is any valid reason, and this leads to an interpretation as an indirect directive: "I suggest that you not be so soft with them / that you accept his offer". With negatives, a finite construction can be used in the same way: *Why don't you accept his offer?* A negative finite, however, does not have to be interpreted in this way. Thus *Why don't you let him drive your car?* can be interpreted literally as asking for your reasons or indirectly as suggesting you should let him, whereas *Why not let him drive your car?* has only the second interpretation.<sup>8</sup>

### ■ Single-variable vs multi-variable questions

All the variable questions given so far have contained a single variable, but it is possible for there to be more than one. Compare:

- |                                   |                      |
|-----------------------------------|----------------------|
| [17] i <i>Who said that?</i>      | [single-variable Q]  |
| ii <i>Who said what?</i>          | } [multi-variable Q] |
| iii <i>Who said what to whom?</i> |                      |

We are representing the propositional content of [i] as "x said that", with 'x' as the variable; the content of [ii] can similarly be represented as "x said y", with two variables, and that of [iii] as "x said y to z", with three. We therefore distinguish [i] and [ii/iii] as respectively **single-variable** and **multi-variable** questions. As there is a straightforward match with the grammar, we can use the same terms to distinguish the corresponding grammatical categories: clause [i] is a single-variable open interrogative, while clauses [ii] and [iii] are multi-variable ones.

### ■ Coordination of interrogative phrases

It is possible for two or more interrogative phrases to be coordinated:

- [18] i *How many sheets and how many towels do we need to take?*  
 ii *When and where did you see her?*

These two examples differ in that in [i] the two coordinate phrases are functionally alike (with the coordination as a whole understood as object of *take*), whereas in [ii] they are functionally distinct (*when* being an adjunct of temporal location, *where* one of spatial location). In answers to [i], phrases expressing the values of the variables will be coordinated, as in *We need to take six sheets and a dozen towels*, but in answers to [ii] they generally will not, as in *I saw her last Saturday at the Planetarium*.

### ■ Restriction on fronting of interrogative phrase

In multi-variable questions where the variables are not coordinate, no more than one interrogative phrase can be fronted:

- [19] i *They did what to whom?*  
 ii *What did they do to whom?*  
 iii \**What to whom did they do?*

<sup>8</sup> Bare infinitivals with *how* are occasionally attested, but they are of questionable acceptability: *How leave the matter rest?* The interpretation is similar to those with *why*, suggesting that there is no way in which one could reasonably leave the matter rest.

### ■ Answers to multi-variable questions

Multi-variable questions may have either **singular answers** or **multiple answers**:

- [20] i *Who beat who?*  
 ii *Kim beat Max.* [singular answer]  
 iii *Kim beat Max and Pat beat Bob.* [multiple answer]

A singular answer simply provides a single value for each variable. A multiple answer provides sets of values – pairs if there are two variables, triples if there are three, and so on. Thus for “*x* beat *y*” in question [20i], the singular answer [ii] provides the value “Kim” for “*x*” and “Max” for “*y*”, whereas the multiple answer [iii] provides the pairs {“Kim”, “Max”} and {“Pat”, “Bob”} for the variable pair {“*x*”, “*y*”}. For example, [ii] might be the answer when the question is used to inquire about the final match in some sporting competition, [iii] when it is used to inquire about the semi-finals.

A two-variable question with multiple answers can be used as an inquiry in a range of contexts differing with respect to what information I already have, as opposed to that which I am seeking to obtain:

- [21] i I don’t know the values of either variable.  
 ii I know the values of one variable but not the other.  
 iii I know the values for both variables, but not how they are paired.

Answer [20iii] would be used under condition [21i] when I simply know that two matches took place but don’t know who the players were, or I know who played but not who won or lost. A context where [21ii] applies would be one where I know who has won through to the final but want to know who they beat in the semi-finals. Context [21iii] would obtain if I knew who was playing in the semi-finals and ask *Who beat who?* to find out the results. Or [21iii] might similarly apply to the answer to such a question as *Who’s going to teach which courses this semester?* A likely context for this is the planning of a teaching-programme when we know who the teaching staff are and what the courses are: it is then just a matter of matching teachers with courses.

### Multiple answer vs multiple response

Single-variable questions (and multi-variable ones where the variables are coordinate, as in [18]) have only singular answers. Again, however, we need to invoke the distinction between answer and response, for sometimes a single-variable question can receive a multiple response:

- [22] i *Where did she buy these books?* [single-variable Q]  
 ii *She bought them at Heffer’s.*  
 iii *She bought them at Heffer’s and Dillon’s.* } [singular answers]  
 iv *She bought this one at Heffer’s and that one at Dillon’s.* [multiple response]

With [ii] we have a straightforward singular answer: all the books were bought at one place. Answer [iii] is still singular, but as the books were bought at more than one place a coordinate phrase is used to give the value of the variable. This situation then implicitly raises the multi-variable question of which books were bought at which shop, and [iv] gives the answer to this question, not to [i]: it gives more information than is needed to answer the question to which it was a response. As we have noted, a co-operative participant commonly provides more information than is directly asked for. The difference in directness can be brought out by contrasting the anomaly of [23i] with the naturalness of [ii]:

- [23] i #I know that she bought these books at Heffer's and Dillon's, but I don't know where she bought these books.  
 ii I know that she bought these books at Heffer's and Dillon's, but I don't know where she bought which.

The single-variable *where she bought these books* in [i] is the embedded counterpart of [22i]. Example [23i] is anomalous because it is self-contradictory. Thus to know [22iii] is to know the answer to [22i], even in a context where [22iv] is true: information about the pairing of books with shops is not part of the answer. The multi-variable *where she bought which* in [23ii] is the embedded counterpart of *Where did she buy which?*, and the naturalness of the example shows that to know [22iii] is not sufficient to know the answer to this latter question: in the multi-variable case, information about the pairing is part of the answer.

#### ■ Juxtaposition of variable and polar or alternative questions

It is not uncommon for a variable question to be followed by a polar or alternative question which pragmatically supersedes it:

- [24] i *What's her name*? Is it Anne?  
 ii *What's her name*? Is it Anne or Anna?

In [i] the polar question suggests an answer to the variable one. If the answer is positive, then answering the second also provides the answer to the first – though the typical form, *Yes*, shows that it is given in response to the polar question. If the answer is negative, then another answer to the variable question is needed – *No, it's Anna* (as we saw above, this kind of response is often given when the variable question is merely implicit). In [ii] the alternative question reformulates the variable one, narrowing down the range of possible answers; this time, whatever the answer to the second question is, it will simultaneously be an answer to the first. (To respond with *Neither: it's Amy* is not to answer the alternative question but to reject its presupposition: see §6.1 below.)

In either the polar or the alternative case, the second question will often be elliptically reduced:

- [25] i *What's her name?* Anne?  
 ii *What's her name?* Anne or Anna?

Such reduction will be particularly likely when the full form would involve more lexical repetition than is the case with [24]: *Who do you think I am?* (*Do you think I am*) *Father Christmas?*; *What are you going to give him?* (*Are you going to give him*) *a book or just money?*

We have punctuated the questions in [24] and [25] as separate sentences, but they could also be integrated into a single written sentence: e.g., for [24], *What's her name – Anne?* With an alternative question, but not a polar, they can be separated simply by a comma: *What's her name, Anne or Anna?* Similarly, in speech there are different degrees of prosodic integration between the two questions. This is one of the places where it is difficult to draw a sharp distinction between a succession of two grammatical sentences on the one hand and a single sentence on the other.

## 4.6 Direction questions

### ■ Distinguished from information questions by the illocutionary force of the answers

The great majority of questions are **information questions**: when used as inquiries they seek to elicit information. The characteristic illocutionary force of their answers is that of a

statement. There is also, however, a kind of question whose answers characteristically have the force of directives. They seek not information but direction, and we accordingly call them **direction questions**.<sup>9</sup> The distinction applies to all three of the polar, alternative, and variable categories of question. Compare:

[26]	INFORMATION QUESTION	DIRECTION QUESTION	
i	a. <i>Did he open the window?</i>	b. <sup>%</sup> <i>Shall I open the window?</i>	[polar]
ii	a. <i>Did he do it then or later?</i>	b. <sup>%</sup> <i>Shall I do it now or later?</i>	[alternative]
iii	a. <i>When did he come back?</i>	b. <sup>%</sup> <i>When shall we come back?</i>	[variable]

The answers to the information questions are *He opened the window / He didn't open the window; He did it then / He did it later; He came back at six* (or whenever): these would all have the force of statements. The answers to the direction questions are *Open the window / Don't open the window; Do it now / Do it later; Come back at six* (etc.): and these would have the force of directives. With the polar questions, *Yes* and *No* could of course be used in either case, but they would still have the statement force in response to [a] and directive force in response to [b]. We annotate the [b] examples with ‘<sup>%</sup>’ because some varieties use *will* in place of *shall* here.

#### ■ Distinction between direction and information questions only weakly grammaticalised

As far as unembedded questions are concerned, direction questions are not sharply distinguished in grammatical form from information questions. Matters are complicated by the fact that a response giving an answer to a question may, like utterances generally, have more than one illocutionary force. Consider, for example:

[27]	i	a. <i>Do you promise not to tell him?</i>	b. <i>I promise not to tell him.</i>
	ii	a. <i>Would you advise me to accept?</i>	b. <i>I would advise you to accept.</i>
	iii	a. <i>Have I got to eat it all?</i>	b. <i>You have got to eat it all.</i>
	iv	a. <sup>%</sup> <i>Shall I tell the police?</i>	b. <i>You shall tell the police.</i>

For convenience, we give the answers in unreduced form, rather than as *Yes, I do*, etc. Answer [ib] has the illocutionary verb *promise* used performatively, so that it is a promise as well as a statement. Similarly [iib] both makes a statement and gives advice: it differs from [ib] in that the advice force is indirect rather than direct, because we have *I would advise*, not *I advise*. Answer [iiib] is literally a statement but, in the context of answering question [iiia], stating that you have to eat it all amounts to telling you to do so. Here then we have an answer which is both statement and directive. However, from the point of view of its form, and more specifically of the relation between its form and that of its answer, there is nothing special about [iiia]. What makes [iva] different from the other questions is that *shall* here has a sense that is specialised to direction questions: [ivb] is not a possible answer precisely because the meaning of *shall* is not the same.

The semantic development of *shall* has led to a situation where it has a use in 1st person interrogatives that specifically marks direction questions. It can also be used with a futurity sense, as in the information question *Shall I ever need it again?* As a result, there is potential for ambiguity:

[28]	<i>Shall I get my money back?</i>	[direction or information question]
------	-----------------------------------	-------------------------------------

<sup>9</sup>Direction questions are also known as ‘deliberative questions’.

As a direction question, this is concerned with the choice between future actions by the speaker: I'm asking you to tell me to retrieve it or not to do so. As an information question, it is concerned with predictions as to what will happen: will the money be returned or not?<sup>10</sup>

The case with *should* is less clear-cut. *Should I get my money back?* is ambiguous between a deontic reading ("Is getting my money back the right thing for me to do?") and an epistemic one ("Is it probable that I'll get it back?"). But the ambiguity is also found in *You should get your money back*. So the development of *should* has certainly not been entirely parallel to that of *shall*. Nevertheless, we do see something partly analogous. While *Yes, you should* is a perfectly natural (deontic) response to *Should I tell the police?*, it would be odd to respond in this way to *Should I open the window?*, said in a context where it is a matter of my possibly opening the window there and then. In this use *should* behaves like *shall* – and could not be replaced by *ought . . . to*, as it could in *Should I tell the police?*

### ■ Embedded direction questions have infinitival form

We have seen that with unembedded questions the distinction between direction and information questions is not matched by any sharp grammatical distinction; with embedded ones, however, the distinction is clearly marked. For here there is a construction, the infinitival interrogative, that is used exclusively for direction questions. Compare the following, as used, say, in the frame *I asked* \_\_\_:

[29]	INFORMATION QUESTION	DIRECTION QUESTION	
i	a. <i>whether she told him</i>	b. <i>whether to tell him</i>	[polar]
ii	a. <i>whether he left then or later</i>	b. <i>whether to leave then or later</i>	[alternative]
iii	a. <i>how she got home</i>	b. <i>how to get home</i>	[variable]

Because they are embedded, these are questions only in the semantic sense, not in the pragmatic sense, as they do not themselves have illocutionary force. But we can relate them to unembedded questions by considering them in the suggested frame. *I asked whether she told him* reports my asking the information question "Did she tell him?"; while *I asked whether to tell him* reports my asking the direction question "Shall I tell him?"<sup>11</sup> Note that subordinate interrogatives with *shall* do not express direction questions. *I must ask him whether I shall get my money back*, for example, lacks the ambiguity of [28], having only the information question interpretation.

### ■ Right answers to direction questions

It is because of the existence of direction questions that we cannot identify a 'right' answer with a true one (cf. §4.1). Right answers to information questions are true, but the categories true and false are not applicable to directives, and hence to the answers to direction questions.

<sup>10</sup>In neither interpretation is *You shall get your money back* an answer; with a 2nd or 3rd person subject *shall* indicates commitment on the part of the speaker, rather than obligation on the part of the subject-referent (cf. Ch. 3, §9.6.1). The positive answers to the two readings of [28] are therefore *Get your money back* and *You will get your money back*.

<sup>11</sup>We are concerned here with indirect reported speech, where one reports the content of what was said rather than the actual words, but for present purposes we can consider the idealised case where there is the closest possible match. The embedded infinitival construction does not always correspond to an unembedded *shall* question. *How shall I turn the machine on?* is hardly idiomatic whereas *I don't know how to turn the machine on* is; nevertheless, the answers to the infinitival question involve directions for turning the machine on.

If I use a direction question to ask you to tell me what to do, then the issue of whether the answer given is right or wrong is trivial. Consider, for example:

[30] A: *Shall I call a taxi for you?* B: *No, thanks. I'll enjoy the walk.*

A's question is an indirect offer, and it is up to B to accept or reject. The issue of whether the directive answer is right or wrong is comparable to that of whether a statement like *I promise to help you*, when used to make a promise, is true or false. This latter issue is trivial because the statement is made true simply by virtue of its being uttered with the relevant intention, and similarly B's directive answer to the direction question in [30] will be right simply by virtue of B's deciding to deliver that directive rather than another.

There are also cases, however, where the issue of what the right answer is to a direction question can arise in a non-trivial way. For example, such questions can be used to ask for advice:

[31] A: *Shall I take a taxi?* B: *No, you'd be better off walking.*

Here it is easy to imagine circumstances under which B could be said to have given bad advice, given the wrong answer – e.g., if the distance were too great for A to be able to walk it comfortably in the time available. Similarly when one puts a direction question to oneself, in wondering: what the right answer is in this case is of course a crucial issue. Determining what is the right answer to direction questions used to seek advice or in wondering involves a judgement as to what course of action is in the best interests of the one uttering the question (or, in *shall we* questions, of the group containing that person).

## 4.7 Biased questions

### ■ The distinction between neutral questions and biased questions

A biased question is one where the speaker is predisposed to accept one particular answer as the right one. A neutral question lacks such bias towards one answer rather than another: it is the default category on this dimension. The distinction between neutral and biased questions applies primarily to polar questions. Compare, for example:

[32] i *Did you get any annuity, superannuation, or other pension?* [neutral]  
 ii *Doesn't she like it?* [biased]

Example [i] is taken from an income tax form: it is addressed individually to all those filling in the form, and for any individual there is no expectation on the part of the 'speaker' (the Income Tax Commissioner) that the answer will be positive rather than negative, or vice versa. A plausible context for [ii], though not the only one, is that her behaviour or her remarks suggest that she doesn't like it: I ask the question to confirm whether this is so. In such a context the question is biased towards the negative answer *She doesn't like it*.<sup>12</sup>

<sup>12</sup> Alternative terms for 'neutral' and 'biased' are 'open' and 'conductive' respectively.

### 4.7.1 Kinds and degrees of bias

#### (a) Epistemic bias

There are different kinds of bias. It may be simply a matter of the speaker thinking, expecting, or knowing that one answer is the right one. We will refer to this kind of bias as **epistemic**, a term whose primary application is in the closely related field of modality. In the contextualisation of [32ii] suggested above, for example, the bias towards the negative answer will be an epistemic one.

#### (b) Deontic bias

Alternatively, it might be a matter of the speaker judging that one answer **ought** to be the right one. Again we will take over a term from the field of modality, and refer to this kind of bias as **deontic**. It is seen in the natural interpretations of:

- [33] i *You're surely not going to let them get away with outrageous behaviour like that, are you?*  
 ii *Aren't you ashamed of yourselves?*

In [i] there is a deontic bias towards a negative answer: I convey a judgement that you ought not to let them get away with their outrageous behaviour. Example [ii] shows a deontic bias towards a positive answer: you ought to be ashamed of yourselves. But at the same time, [ii] has an epistemic bias towards a negative answer: it appears from your behaviour that you are not ashamed of yourselves.

#### (c) Desiderative bias

A third kind of bias, not greatly different from the deontic, is that where the speaker wants one answer to be the right one – **desiderative** bias, as we shall call it. For example, when I indirectly request something by means of such a question as

- [34] *Can I have some more ice-cream?*

there will be a desiderative bias towards a positive answer: I want a *Yes* answer. The negative epistemic bias of [32ii] could also be accompanied by a positive desiderative bias. This could be the case in a context where *it* refers to something I am responsible for (a painting, say, that I have painted or chosen): I want her to like it but think she doesn't.

#### ■ Different degrees of bias

We also find considerable differences in the degree or strength of the bias. Take, for example, the case illustrated in [13iii], where I ask, wanting to know the date:

- [35] *Is it the sixteenth today?*

It is likely that there will be some positive bias here (primarily epistemic), for if I had no idea whether it was the sixteenth or not, it would generally be more natural to use the variable question *What date is it today?* But my confidence that I am right about the date can vary greatly. Similarly in [32ii] the negative bias could be a matter of a mere flimsy suspicion or a strongly supported conviction.

The limiting case is where the bias is complete: I am in no doubt at all as to what is the right answer.

- [36] i A: *May I speak to Ms Jones?* B: *I'm afraid she's no longer here. Didn't you know that she went overseas yesterday?*  
 ii A: *I wasn't able to get a ticket.* B: *Weren't you? I'm sorry to hear that.*

In [i], assuming that B does not consider the possibility that A intended to deceive, B will be in no doubt that A didn't know that Ms Jones went overseas yesterday, i.e. that the answer to the question is negative. Nor is there any doubt in [ii]: A has just given the answer, and B accepts it. Where the bias is complete, as here, the question cannot have the force of an inquiry: the intention is not to elicit information. In [i] the question serves to inform A that Ms Jones went overseas yesterday: it is an indirect statement. In [ii] the question serves to acknowledge the information A has just supplied (cf. [31] above).

Complete bias can also be found with variable questions, as in *Who's a clever girl?* In a context where the addressee or the speaker is a girl who has just done something clever, there will be no doubt as to what is the value for the variable in “*x* is a clever girl”, and the question will therefore indirectly convey “What a clever girl you are!” or “What a clever girl I am!”.

### ■ The encoding of bias

The inference that a question is biased towards a particular answer may be based simply on the context, together with assumptions about the speaker's intentions. This is likely to be the case in [35], for example. In other cases, bias may be reflected in the prosodic properties of the question. For example,

- [37] *Have you any idea how much these knives cost?*

could be used as an indirect way of inquiring about the cost of the knives or as a rebuke to someone considered to be misusing a certain knife. In the first case there is some positive desiderative bias (I am no doubt hoping for a positive answer to the direct question, for otherwise you will not be able to answer the indirect question about the cost, the one I am primarily interested in), but it could be epistemically quite neutral (I have no reason to think that one answer rather than the other is actually the right one). In the rebuke use, on the other hand, there will be a strong negative epistemic bias: the suggestion is that the maltreatment of the knife indicates lack of awareness of its value.

Our focus in what follows will be on the grammatical marking of bias, on cases where the bias is reflected in the grammatical structure of the question. Declarative questions and negative interrogative questions are always quite strongly biased; note that neither of these would occur in the kind of context attested for the neutral question [32i]. In addition, a weaker bias can be conveyed by the use of positively- and negatively-oriented polarity-sensitive items, such as *some* and *any*. We take these three cases in turn; see also §5.2 for bias in tag questions.

## 4.7.2 Declarative questions

Positive declarative questions have an epistemic bias towards a positive answer, negative ones towards a negative answer:

- [38] a. *They've finished?* b. *They haven't finished?*

The expected answer is here the statement with the same propositional content as the question – i.e. *They've finished* and *They haven't finished* respectively. In asking a

declarative question I am typically seeking confirmation of a proposition that I am inclined, with varying degrees of strength, to believe. There may be deontic or desiderative bias as well as epistemic, but this is not inherent to the construction as such.

### ■ Lexical reinforcement of bias

The bias may be reinforced by lexical markers indicating confidence in the truth of the proposition expressed:

- [39] i *They no doubt misunderstood her intentions?*  
 ii *You're surely not going to agree?*  
 iii *And the manager has been informed, of course?*  
 iv *There isn't any chance of her changing her mind, I take it?*

These confidence markers are outside the propositional content of the question, outside the scope of the question. The positive answer to [39i], for example, is not *They no doubt misunderstood her intentions*, but simply *They misunderstood her intentions*. Such markers would not naturally occur in interrogative questions, where comparable items are epistemically much weaker:

- [40] i *Did they perhaps misunderstand her intentions?*  
 ii *Isn't there any chance of her changing her mind, I wonder?*

### ■ Responses to declarative questions

The bias of declarative questions is reflected in the fact that they can naturally receive confirmatory responses like *That's right*, *Exactly*, *Quite so*, which would be out of place with a neutral question. *Yes* can even occur here with a following negative, which is not normally possible: *Yes, there's no chance at all* is a plausible response to [39iv], but not to interrogative *Is there any chance of her changing her mind?* or even *Isn't there any chance of her changing her mind?*

### ■ Declarative questions as indirect speech acts

The illocutionary force of declarative questions is not that characteristically associated with the clause type, and hence they are indirect speech acts in the sense of §3.2. At the direct level they are statements, but the intonation overrides this to yield an indirect question. The indirectness is reflected in the fact that pragmatic inferences may be involved in determining the scope of the question, which need not be the whole of the propositional content. Consider, for example:

- [41] i *I take it there isn't any chance of her changing her mind?*  
 ii *I hope you're not proposing to leave it like that?*  
 iii *I don't suppose I could borrow your car for a couple of hours?*

Example [41i] differs grammatically and semantically from [39iv], but pragmatically there is little difference. In [39iv] *I take it* is a parenthetical (§5.3), but in [41i] it occurs as part of a complex clause construction: *there isn't any chance of her changing her mind* is this time a subordinate clause, the grammatical complement of *take*, and its content is semantically integrated into that of the complex clause. Nevertheless, *I take it* is again outside the scope of the question: the expected answer is not *You take it there isn't any chance . . .*, but simply *There isn't any chance . . .* At the direct level, [41i] is a statement with the propositional content "I take it there isn't any chance of her changing her mind", but indirectly it is a question with the content "There isn't any chance of her changing her mind", or perhaps "It is true

that there isn't any chance of her changing her mind". Example [ii] is just like [i], but [iii] involves two additional factors. One is that the negative is associated with the complement of *suppose* (cf. the discussion of increased specificity of negation in Ch. 9, §5), giving "Couldn't I borrow your car for a couple of hours?"; and the other factor is that the latter question in turn indirectly conveys a request to borrow the car.

#### 4.7.3 Negative interrogative questions

Questions with negative interrogative form are always strongly biased. They typically allow a range of interpretations, and the epistemic bias can be towards either the negative or the positive answer. Consider:

[42] *Didn't I tell you Kim would be coming?*

One context for this is where it has become apparent that I have, or probably have, omitted to tell you that Kim would be coming. Here the bias is towards the negative answer (I didn't tell you). But I could equally use [42] in a context where I remember quite well having said that Kim would be coming: my prediction was not accepted at the time but has now been shown by Kim's presence to have been correct and I am asking you to admit that I was right. Here, then, the bias is towards the positive answer (that I did tell you).

Similarly with such examples as:

- [43] i *Wasn't I right?*  
 ii *Isn't it all as simple as she predicted?*  
 iii *Aren't they spending Christmas with their uncle?*  
 iv *Isn't it raining?*

For [i] possible interpretations are: "It appears that I wasn't right – is that so?" (negative epistemic bias) and "It is now evident I was right – admit it" (positive). For [ii]: "It is looking as though it is not as simple as she predicted, isn't it?" (negative) and "It has turned out just as simple as she said it would, hasn't it?" (positive). For [iii]: "It seems I was wrong in thinking they are spending Christmas with their uncle" (negative) and "Remember they are spending Christmas with their uncle" (positive). A context for this latter, positively biased, interpretation could be one where you have suggested inviting them over for Christmas and I point out that they won't be able to come because they will be away at their uncle's – another case where a question is used not to obtain information but to indirectly impart it. For [iv], a negatively biased interpretation is "I thought it was raining but there is now evidence suggesting it is not" (for example, you may be showing signs of going out without protection against rain), and a positively biased one is "Let me remind you that it's raining" (e.g. in response to *Why aren't you going out?* – "Surely the fact that it is raining is reason enough!").

Negative interrogative questions typically suggest some element of contrast. We will consider this feature first in cases where the bias is negative, and then in those where it is positive.

#### ■ Negative interrogative questions with negative bias

The negative epistemic bias commonly contrasts with a positive deontic bias. This was illustrated in [33ii] above, *Aren't you ashamed of yourselves?* The most salient interpretation here carries an implied contrast between the state of affairs which apparently obtains

(negative) and my judgement of what should be the case (positive). When such a contrast reflects adversely on you, the question will be an indirect reproach or rebuke, as in [33ii]. This is also the natural interpretation of [44i], and a quite likely one for [44ii–iii]:

- [44] i *Can't you think of a more positive response?*  
 ii *Didn't you turn the oven off?*  
 iii *Don't you know where it goes?*

In this interpretation [44i] conveys “It appears you can't think of a more positive response, but you ought to be able to”. Similarly for [ii] we may have “You apparently didn't turn the oven off, but you ought to have done”, and for [iii], “You have been told where it goes but have apparently forgotten”. On the other hand, I may myself accept responsibility for the contrast between what is and what should be, and then the question may be accompanied by an apology. An alternative, apologetic, implicature of [iii], therefore, is “I should have told you where it goes but apparently didn't do so”.

Such a contrast between what is and what should be (whether a matter for reproach or apology) is not, however, the only kind of contrast that may be suggested by the negative interrogative construction. The negative bias reading of [43iv], for example, is unlikely to suggest that it ought to be raining. There is still a contrast, however: between what now appears to be the case (negative: it's not raining) and what I previously thought to be the case (positive: it was raining).

#### ■ Negative interrogative questions with positive bias

Where the epistemic bias is positive, there is commonly an implicit contrast between my belief in some proposition and previous unwillingness on the part of you or others to accept it. This is the context suggested for the positive bias interpretations of [42] and [43].

One case where such a contrast is not in evidence, or at least not obviously in evidence, is that where the question is used as indirectly equivalent to an exclamatory statement:

- [45] *Aren't they lovely! Haven't they made a good job of it! Doesn't he talk fast!*  
*Haven't I been a fool! Didn't it rain!*

The interpretations can be given in the form of exclamatives: “How lovely they are!”; “What a good job they made of it!”; “How fast he talks!”; “What a fool I have been”; “How it rained!” The indirect statement force is reflected in the falling intonation that marks this use. Such exclamatory questions typically involve gradable expressions – very often adjectives (predicative *lovely* or attributive *good*) or adverbs (*fast*), but also certain nouns (*fool*) or verbs (*rain*).

#### 4.7.4 Positively- and negatively-oriented polarity-sensitive items (*some vs any*, etc.)

The distinction between contrasting pairs of items such as unstressed *some* vs *any*, or *already* vs *yet*, is discussed in detail in Ch. 9, §4.3; here we focus on the relation between this distinction and bias in questions.

#### ■ Positive interrogative questions

Here, the selection of a positively-oriented item rather than its negatively-oriented counterpart confers some degree of positive bias. Compare:

- | [46] | NEGATIVELY-ORIENTED ITEM                       | POSITIVELY-ORIENTED ITEM                        |
|------|--|---|
| i    | a. <i>Is <u>anything</u> wrong?</i>            | b. <i>Is <u>something</u> wrong?</i>            |
| ii   | a. <i>Has <u>anybody</u> told Ed about it?</i> | b. <i>Has <u>somebody</u> told Ed about it?</i> |
| iii  | a. <i>Have they gone <u>yet</u>?</i>           | b. <i>Have they gone <u>already</u>?</i>        |

In each pair [b] suggests that I am rather more inclined towards a positive answer than does [a]. The difference is particularly evident in [iii]: *already* is a stronger marker of positive bias than *some* and its compounds. The bias is potentially either epistemic or deontic/desiderative. The positively-oriented *somebody* in [iib], for example, could reflect some positive evidence that somebody has told him about it (e.g. he may have said something which suggests that he knows about it) or it could reflect the need for someone to tell him (e.g. it has been recognised that his behaviour is causing inconvenience and it is necessary that someone inform him of this).

Positively-oriented items with desiderative bias often appear in questions used as indirect speech acts of various kinds:

- [47] i *Could you please do something about that noise.*  
 ii *Would you like some coffee?*

Example [i] is an indirect request, with the direct question force very much backgrounded. In the natural interpretation, I assume you can do something about the noise (so that there is complete positive bias) and ask you to do so. Negatively-oriented *anything* would be out of place here. Example [ii] would typically be used as an offer, a more hospitable one than the form with *any*: the positive bias signalled by *some* suggests that I am favourably inclined towards an acceptance of the offer, whereas *any* suggests indifference. In a more effusive offer such as *Would you care for some of this delicious coffee?* substitution of *any* for *some* would be unlikely, because of the inconsistency between the indifference of *any* and the enthusiasm of the rest.

#### ■ Positive declarative questions

These always have a strong positive bias, as we observed in §4.7.2. For this reason they do not take negatively-oriented items:

- [48] *There's something/\*anything else you need? \*You have ever been to Paris?*

#### ■ Negative interrogatives

Negatively-oriented items give these a negative bias:

- [49] i *Haven't they seen anybody about it yet?*  
 ii *Wasn't I right about anything else?*

Question [i] expects the negative answer *They haven't seen anybody about it yet*, and analogously for [ii]. Example [ii] differs strikingly from [43i], *Wasn't I right?*: it allows only the negative bias interpretation, whereas [43i] allows both positive and negative.

Positively-oriented items occur in negative interrogatives with either bias, though the positive case will often be more salient:

- [50] i *Didn't you like some of it?*  
 ii *Haven't you forgotten something?*  
 iii *Shouldn't someone do something about it?*  
 iv *Weren't some of them marvellous!*

Question [i] can be interpreted with positive bias, conveying “It wasn’t all bad: there was some of it you liked, wasn’t there?”; or (less likely) with negative bias: “It apparently wasn’t a complete success: there was some of it you didn’t like, did you?” The others generally have positive bias. Example [ii] would typically convey “You have apparently forgotten something”, and would often be used as a reminder (e.g. to a child to say *please* when asking for something). Similarly, [iii] is likely to be seeking agreement to the proposition that something should be done about it. Finally, [iv] illustrates the use of positively-oriented items in indirect exclamatory statements.

#### 4.8 Echo questions

The prototypical use of the echo question is to question whether one has correctly heard what the previous speaker said – heard the **stimulus**, as we call it. My doubt as to whether I heard the stimulus correctly may arise because it was not perceptually clear (I may have had difficulty making it out above some background noise) or because its content is surprising or remarkable in such a way that I want to verify whether you did in fact say, or mean to say, what I apparently heard.

##### ■ Polar, alternative, and variable echo questions

Echo questions are predominantly of either the polar or the variable kind, but alternative echoes are also possible:

[51]	STIMULUS	ECHO QUESTION	
i	A: <i>She’s leaving on Saturday.</i>	B: <i>She’s leaving on Saturday?</i>	[polar]
ii	A: <i>He gave it to Anne.</i>	B: <i>He gave it to Anne or Anna?</i>	[alternative]
iii	A: <i>He’s proposing to resign.</i>	B: <i>He’s proposing to what?</i>	[variable]

The polar echo question prototypically repeats the stimulus but with a rising intonation imposed on it; like ordinary polar questions, it has *Yes* and *No* as answers. The alternative echo question substitutes an *or*-coordination for part of the stimulus, and each answer will include just one of the coordinates; it generally has the rise + fall intonation pattern of ordinary alternative questions. The variable question, which – like the polar – prototypically also has rising intonation, substitutes an echo question word expressing a variable for part of the stimulus, and the answers involve replacing the variable by its possible values.

##### ■ Modification of stimulus

The stimulus is often modified by reduction – by omitting parts or replacing them by shorter expressions such as pro-forms. An echo response to *Kim is going to try and persuade him to buy a microwave*, for example, could take one of many forms, including:

- [52] i *To try and persuade him to buy a microwave / one / a what?*  
 ii *To buy a microwave / one / a what?*  
 iii *Kim/Who is?*

And since the stimulus will normally be produced by a different speaker, there will be a change in deictic pronouns: *I like it* will be echoed as *You like it?*, and so on.

### 4.8.1 The contrast between echo and ordinary questions

#### ■ Echo questions as indirect speech acts

The propositional content of echo questions is not the same as that which is actually expressed in the utterance, and such questions therefore belong to the class of indirect speech acts. The propositional content of the echo question in [51i] is not “She’s leaving on Saturday”, the content actually expressed, but something like “You said she’s leaving on Saturday”. (We say ‘something like’ for it could be “You’re telling me . . .”, “You’re suggesting . . .”, and so on: precisely because it is implicit rather than directly expressed there is some imprecision as to what it is.) And, correspondingly, the answer *Yes* is equivalent not to *She’s leaving on Saturday*, but to *I said she’s leaving on Saturday*. The difference between these two interpretations may not seem very important, but is of much greater significance in a case like:

[53] A: *Is he going to resign?* B: *Is he going to resign?*

The propositional content of B’s echo question is clearly not “He’s going to resign”, but “You said he’s going to resign”, and a *Yes* answer in this context is equivalent to *I asked whether he is going to resign*, not to *He’s going to resign*. The latter would be an answer to A’s question, not B’s – to an ordinary question, not an echo question. The same applies to the other kinds of question. For example, the propositional content of B’s variable question in [51iii] is approximately “You said that he’s going to *x*”.

This indirectness is a crucial property distinguishing echo questions from ordinary questions. They are not distinguished simply by the fact that an echo question questions what has just been said, for it is perfectly possible to use an ordinary question to do that:

[54]	PREVIOUS UTTERANCE	ORDINARY QUESTION
i	A: <i>She’s leaving on Saturday.</i>	B: <i>Did you say she’s leaving on Saturday?</i>
ii	A: <i>He’s proposing to resign.</i>	B: <i>What did you say he’s proposing to do?</i>

Note that B’s utterances here may be said with the same prosodic signals of incredulity or the like that commonly accompany echo questions: these prosodic features are likewise not what is crucial for the echo question. There is nothing special about B’s questions in [54]: they are just ordinary questions whose subject matter happens to be the content of a previous utterance.

The following also belong to the category of ordinary questions, not echoes:

[55] i	A: <i>She’s leaving on Saturday.</i>	B: <i>Is she?</i> [sc. <i>leaving on Saturday</i> ]
ii	A: <i>He’s proposing to resign.</i>	B: <i>What’s he proposing to do?</i>

B’s questions here are not echoes in the technical sense we are giving to that term in that they do have their face value. That is, they are genuinely questions as to whether she is leaving on Saturday and as to what he is proposing to do: assuming that what A said was true, the answers are *She’s leaving on Saturday* and *He’s proposing to resign*. Since A has already given the answers, B may be construed as challenging what A said or asking for repetition, but this is not a reason for identifying them with the echoes in [51]. (As we have seen, the polar question here could also be used simply to acknowledge, with surprise, what A has said.) The difference between these examples and the echoes is reflected in the difference in form: in [55] B’s questions have the characteristic grammatical form of ordinary questions, but in [51] they do not.

#### 4.8.2 The grammatical form of variable echo questions

We turn now to the form of echo questions, beginning with the variable kind. The variable echo question is grammatically marked by an echo-question word – *what* in the above examples. As there is here a fairly straightforward relation between grammar and meaning we can use the term ‘variable echo’ at both levels, speaking of a variable echo construction at the level of grammar and of a variable echo question at the level of meaning. And just as there is a difference in meaning between a variable echo question and a variable ordinary question, so there are differences in form.

##### ■ Grammatical differences between variable echoes and open interrogatives

###### (a) Differences between *what/who* as echo-question words and as interrogative words

One difference between the two constructions is that these words, especially *what*, have a wider range of uses in variable echo clauses than in open interrogatives. For example, in [51iii], *He’s proposing to what?*, the echo word *what* is a verb and combines with *to* to form a verb phrase, but interrogative *what* is not a verb and hence we need *do* in [5]. Note also:

- [56] i A: *He was enthusing about the film.*      B: *He was whatting about the film?*  
 ii A: *They gave it to Angela Cooke.*      B: *They gave it to Angela who?*

Example [i] shows that echo *what*, unlike interrogative *what*, can inflect. And [ii] shows that echo *who* likewise differs from interrogative *who*: the latter must always be initial in the interrogative phrase.

###### (b) Position of echo-question and interrogative words, and subject–auxiliary inversion

In open interrogative clauses a non-subject interrogative element is normally fronted and triggers subject–auxiliary inversion; in variable echo clauses a non-subject question element always remains in situ and therefore never triggers inversion. Compare, for example, echo *He’s proposing to what?* ([51iii]) with *\*What is he proposing to?*, or *They gave it to Angela who?* ([56ii]) with *\*Angela who did they give it to?* The absence of fronting and inversion serves of course to make the echo maximally like the stimulus that it echoes.

However, there are places where we find overlap between echoes and ordinary questions:

- [57] i *Who made a mistake?* [subject]  
 ii *And the purpose of that was what?* [post-verbal non-subject]

Example [i] is the case where the interrogative or echo element is subject, and hence will be in pre-verbal position in either case. It could be either an ordinary question with answers like *The Secretary-General made a mistake* or an echo question with the latter as a possible stimulus and answers like *I said, ‘The Secretary-General made a mistake’*. Question [ii] has non-subject *what* after the verb: this is a possible if rare position in open interrogatives, as well as the only possible one in echoes, so [ii] could be an ordinary question with such answers as *The purpose of that was to test the PH level* or an echo of a stimulus like the latter. The two interpretations would normally be distinguished prosodically: the echo construction will generally have a fall + sharp rise on the question word.

###### (c) Relation with clause type

The open interrogative is a clause type, and as such it is mutually exclusive with the other clause types. The variable echo construction, by contrast, is not a clause type. It

is a construction on a quite independent dimension, and can combine with any of the clause types:

[58]	STIMULUS	VARIABLE ECHO QUESTION	
i	A: <i>She's a genius.</i>	B: <i>She's a what?</i>	[declarative]
ii	A: <i>Did Kim complain?</i>	B: <i>Did who complain?</i>	[closed interrogative]
iii	A: <i>What did he do last week?</i>	B: <i>What did he do when?</i>	[open interrogative]
iv	A: <i>What a fuss Ed made!</i>	B: <i>What a fuss who made?</i>	[exclamative]
v	A: <i>Give the key to Angela.</i>	B: <i>Give what to Angela?</i>	[imperative]

In each of these, B's echo question belongs to the same clause type as the corresponding stimulus, being derived from it by substituting a question element for some element of the stimulus.

The independence of the variable echo construction from clause type is explicable in terms of both form and meaning. As far as its form is concerned, it is marked simply by the presence of a question word, and there is no reason why this should not co-occur with any of the clause type markers. Notice in particular that the variable echo does not determine any features of order, which means that the order of elements in the clause is able to be determined by clause type (or other properties). As far as meaning is concerned, the variable echo question is indirect; at the direct level it is merely a partial repetition, citation, of the stimulus and hence there is no reason why the stimulus should not have an illocutionary force of the kind characteristically associated with any of the clause types.

#### ■ Multi-variable echo questions

Like an ordinary question, an echo question can contain more than one variable. All the examples so far have been single variable echoes, but multi-variable echoes can be formed simply by substituting a question word for two or more elements in the stimulus:

[59]	STIMULUS	SINGLE VARIABLE ECHO	MULTI-VARIABLE ECHO
i	A: <i>Kim's a genius.</i>	B: <i>Kim's a what?</i>	B: <i>Who's a what?</i>
ii	A: <i>Give the key to Pat.</i>	B: <i>Give what to Pat?</i>	B: <i>Give what to who?</i>

Each question word will normally bear the main stress in its own intonation group.

Because the differences between interrogative words and echo-question words are relatively slight, there is scope for a great deal of potential ambiguity as to whether a word that does not trigger subject–auxiliary inversion is an interrogative word or an echo-question word. *Who's a what?*, for example, is given in [59i] as a two-variable echo of a declarative, but it could also be a single-variable echo of an open interrogative, used in response, say, to the stimulus *Who's a genius?* In the two-variable interpretation, *who* and *what* are both echo-question words, but in the single-variable reading only *what* is, *who* being an interrogative word. Similarly, *Who saw what?* can be a non-echo multi-variable open interrogative, a single-variable echo of a single-variable open interrogative (with a stimulus such as *Who saw the weasel?*) or a multi-variable echo of a declarative (with a stimulus like *The butler saw the weasel*).

### 4.8.3 The form of polar echo questions

Unlike the variable echo question, the polar echo is not, for the most part, expressed by any special grammatical construction: rather, the echo is signalled prosodically, by the

rising intonation. A polar echo question can have the syntactic form belonging to any of the clause types. Polar counterparts of the variable echoes given in [58], for example, are as follows:

[60]	STIMULUS		POLAR ECHO QUESTION	
i	A: <i>She's a genius.</i>		B: <i>She's a genius?</i>	[declarative]
ii	A: <i>Did Kim complain?</i>		B: <i>Did Kim complain?</i>	[closed interrogative]
iii	A: <i>What did he tell her?</i>		B: <i>What did he tell her?</i>	[open interrogative]
iv	A: <i>What a fuss Ed made!</i>		B: <i>What a fuss Ed made?</i>	[exclamative]
v	A: <i>Give the key to Angela.</i>		B: <i>Give the key to Angela?</i>	[imperative]

The echo repeats the stimulus, with rising intonation signalling a request for repetition, or justification.

We have seen that rising intonation can also combine with declarative clause type to yield an ordinary polar (or alternative) question, and there is accordingly again potential ambiguity in examples like *She's a genius?* It can be an ordinary (direct) question whose answers are *She's a genius* and *She's not a genius*; or it can be, as in [60i], a polar echo (indirect) question whose answers are *I said she's a genius* and *I didn't say she's a genius*. In both cases the question is biased – towards an answer which expresses the same propositional content as is expressed in the direct question or implied in the indirect one. For example, in:

[61]	a. <i>She gave it to him?</i>	b. <i>She didn't give it to him?</i>
------	-------------------------------	--------------------------------------

the expected answers for the ordinary question interpretations are, for [a], *She gave it to him* and, for [b], *She didn't give it to him*, whereas those for the echo question interpretations are respectively *I said, 'She gave it to him'* and *I said, 'She didn't give it to him'*.

#### ■ The bare predication construction in polar echoes

[62]	STIMULUS		POLAR ECHO (BARE PREDICATION)
i	A: <i>Kim has resigned.</i>		B: <i>Kim resign?</i>
ii	A: <i>She's a genius.</i>		B: <i>Her a genius?</i>

One case where a polar echo does have a special syntactic form is the **bare predication** construction. The clause consists of a subject together with a non-finite VP (as in [i]), or simply a predicative complement (as in [ii]). The echo belongs to relatively informal style, and a personal pronoun subject will thus tend to take accusative case.

#### 4.8.4 Repetition vs clarification echoes

The echoes considered so far have all been what we will call **repetition echo questions**, as their answers include a repetition of the stimulus. They are distinguishable from a more peripheral kind of echo used to seek clarification of some element in the stimulus – the **clarification echo question**. The distinction may be illustrated by means of a potentially ambiguous example, such as:

[63]	i	A: <i>I've finally solved the problem of the missing cents.</i>	B: <i>You've finally solved what?</i>	[repetition]
	ii	A: <i>I've finally solved it.</i>	B: <i>You've finally solved what?</i>	[clarification]

In [i] the echo *what* substitutes for *the problem of the missing cents*, which B has not properly perceived or understood. The answer would be *I said, 'I've finally solved the problem of the missing cents'*: this is the repetition echo interpretation. In [ii], by contrast,

B has heard perfectly well what A has said but does not know what A intended to refer to by the pronoun *it*. B seeks therefore not a repetition of the stimulus, but a reformulation that expresses A's intended meaning more successfully. Similarly, B's echo in [56ii], *They gave it to Angela who?*, was given above as a repetition echo, aiming to obtain repetition of *Cooke*, but it could also be used as a clarification echo to A's stimulus *They gave it to Angela*: A mistakenly assumes that the name *Angela* on its own is sufficient to pick out the intended referent, and B asks for a fuller referring expression.

One obvious use of the clarification echo is when the stimulus is an incomplete utterance like A's *I need to buy a new er, er, . . .*; here B's echo response *You need to buy a new what?* aims to elicit the word or expression that A was trying to find.

Clarification echo questions can again be of the polar, alternative, or variable kind. In response to the stimulus *Give the key to Angela*, for example, we might have:

- [64] i *Give her the front-door key?* [polar echo]  
 ii *Give her the front-door key or the back-door one?* [alternative echo]  
 iii *Give her which key?* [variable echo]

There are intonational differences between clarification and repetition echoes, especially in the variable kind. For example, *You've finally solved what?* as a repetition echo (in [63i]) will have a fall followed by steep rise on *what*, but as a clarification echo (in [63ii]) it will have falling intonation.

The implicit propositional content for the repetition echo begins, roughly, "You said . . .", whereas that for the clarification echo might be given as "You meant . . .". And indeed the distinction between the two kinds of echo question can be made explicit by means of parentheticals using one or other of these verbs:

- [65] i *Give the key to Angela, did you say?* [repetition echo]  
 ii *Give her the front-door key, do you mean?* [clarification echo]

In spite of these differences, the clarification echo belongs grammatically with the repetition echo in that it too exhibits the grammatical properties that distinguish the variable echo construction from the open interrogative. This is evident from the above examples. In *You need to buy a new what?*, the echo-question word *what* is a common noun with a determiner and adjectival modifier as dependents: interrogative *what*, by contrast, is a pronoun, unable to take such dependents. And in [64iii] the echo question element *which key* occurs in an imperative clause, whereas interrogative *which key* is a clause type marker, and can occur only in open interrogatives.

## 5 Interrogative tags and parentheticals

In this section we look at the form and interpretation of questions like:

- [1] i *He's rather aggressive, isn't he?* [interrogative tag]  
 ii *He's rather aggressive, don't you think?* [interrogative parenthetical]

An interrogative clause is here added as a supplement to another clause, changing the illocutionary force of the utterance. The clause to which the interrogative is attached we refer to as the **anchor**, e.g. *he's rather aggressive* in [1]. In the default case the anchor is

declarative, but it can belong to any of the five major clause types: closed interrogative in *Is it genuine, do you think?*, imperative in *Be quiet, will you!*, and so on (those with imperative anchors are discussed in §9.7).

No great significance attaches to the terminological distinction between tag and parenthetical, but it is useful to have a separate (and well-established) term for the construction shown in [1], which we examine first.

## 5.1 The formation of interrogative tags

### ■ Reversed polarity and constant polarity tags

A tag is a short interrogative clause which may be negative or positive:

- [2] i *Your friends made a good job of it, didn't they?* [negative tag]  
 ii *They haven't finished it, have they?* [positive tag]

In [i] a negative tag attaches to a positive anchor and in [ii] a positive tag attaches to a negative anchor: we refer to these as **reversed polarity tags**. It is also possible to have **constant polarity tags**, where the tag has the same polarity as the anchor. Thus in [i] we could have *did they?* instead of *didn't they?*, and in [ii] *haven't they?* instead of *have they?* The four possibilities are shown in:

- |     |                                |  |                         |
|-----|--------------------------------|--|-------------------------|
| [3] | POSITIVE ANCHOR                | NEGATIVE ANCHOR                                |                         |
| i   | a. <i>He is ill, isn't he?</i> | b. <i>He isn't ill, is he?</i>                 | [reversed polarity tag] |
| ii  | a. <i>He is ill, is he?</i>    | b. <sup>0</sup> <i>He isn't ill, isn't he?</i> | [constant polarity tag] |

As far as the meaning is concerned, the important issue is not whether the tag is positive or negative, but whether it has reversed or constant polarity. Reversed polarity tags are much the more frequent, and constant polarity tags occur predominantly with positive anchors: many speakers reject examples like [iib]. A more formal variant of the inflectional negative *isn't he?* is the analytic negative *is he not?*

### ■ Formation of tags by reduction of full interrogatives

In the examples so far, the tag might be regarded as a reduced version of a full closed interrogative clause corresponding to the anchor. The tag in [2i], for example, might be derived from its anchor in three steps, as follows:

- [4] i *your friends made a good job of it* [anchor]  
 ii *your friends didn't make a good job of it* [step I: reverse polarity]  
 iii *didn't your friends make a good job of it?* [step II: form interrogative]  
 iv *didn't they?* [step III: reduce]

For constant polarity tags, step I would of course be skipped. Although this procedure works in the great majority of cases, it runs into difficulties with anchors like those in:

- [5] i *Few of them liked it, did they?*  
 ii *It's hardly fair, is it?*

The only way we could apply step I to the anchor *few of them liked it* would be to change this into *few of them didn't like it*, which would lead via steps II and III to the tag *didn't they?* But in fact the reversed polarity tag for this anchor is *did they?*, as in [5i]. The reason is that *few of them liked it* is in fact negative (see Ch. 9, §3.3), so the reversed polarity tag must be positive. It is a negative, however, with no positive counterpart, so step I can't be applied. The same applies with [ii].

### ■ Direct formation of the tag

It follows that we need rules to account for the tags directly, rather than by reduction of some full interrogative clause. The form of the tag is as in [6], and it can be derived by procedure [7]:

- [6] Auxiliary as predicator + personal pronoun as subject (+ *not*)
- [7] i Subject: if anchor subject is a personal pronoun, repeat it; otherwise take the anchor subject as antecedent and select the appropriate personal pronoun.  
 ii Auxiliary lexeme: if anchor predicator is an auxiliary, select the same lexeme, otherwise select *do*.  
 iii Auxiliary tense: same as anchor tense.  
 iv Auxiliary person–number properties (if any): determined by agreement with subject.  
 v Polarity: opposite to that of anchor for reversed polarity tags, the same for constant polarity tags.  
 vi Negation: if tag is negative, choose between the less formal synthetic negation (with negative form of auxiliary) and the more formal analytic negation (neutral auxiliary, with final *not*)

Step [i] will often require pragmatic information: the tag for the anchor *the boss has arrived* can be either *hasn't he?* or *hasn't she?*, depending on the sex of the boss. Step [ii] reflects the normal rules for closed interrogative formation: the closed interrogative is a *do*-support construction. Step [iv] selects person–number properties by reference to the tag subject rather than the anchor predicator to cater for cases like *Everybody has read it, haven't they?*, where the anaphoric personal pronoun for singular *everybody* is plural *they*. Steps [v] and [vi] handle the polarity of the tag and of the auxiliary in accordance with the account given above.

### ■ Tags based on subordinate clauses

Special provision must be made for the construction illustrated in:

- [8] a. *I think it's legal, isn't it?*    b. *I don't think it's legal, is it?*

In [a] the first constituent structure boundary is between *I think it's legal* and *isn't it?*: the tag is appended to the main clause *I think it's legal*, which is in this sense the anchor. But the form of the tag is based on the subordinate clause *it's legal*, so from this point of view it is the latter that is treated as anchor. This conflict reflects the mismatch between the grammatical structure of *I think it's legal* and its communicative meaning. Grammatically, *it's legal* is subordinate to the *think* clause, but communicatively it is the subordinate clause that is primary: *I think* simply expresses some modal qualification. The anchor is comparable to *It's probably legal*, where the modal qualification is expressed in a grammatically subordinate way, by an adverbial adjunct, or *It's legal, I think*, where the qualification is parenthetical: for both of these the procedure [7] would give *isn't it?* as tag quite straightforwardly.

Example [8b] is similar but has the added complication of negative polarity. *Is it?* is a reversed polarity tag, but the negative which it reverses is in the *think* clause. Again the form of the tag reflects the communicative meaning rather than the grammatical structure – by the process we call specificity increase (Ch. 9, §5) the negative is interpreted as applying to the complement of *think* (“I think it isn't legal”), so the tag is positive, just as it is in *It's probably not legal, is it?* or *It isn't legal, I think, is it?*

Other expressions allowing the tag to be based on a subordinate clause complement include: *I believe/suppose/guess/reckon; it seems/appears; it follows/this means*; and so on (cf. *It seems we made a mistake, didn't we?*; *It follows that we won't have to pay any more, will we?*).

### ■ Minor departures from the main pattern of tag formation

We find a number of departures from the forms predicted by [7] (but with a good deal of idiolectal and dialectal variation), all indicating that meaning rather than exact syntactic form is what is important in tag selection:

- [9] i The non-prototypical auxiliary *ought* is sometimes replaced by the synonymous *should*: *You ought to have told them the whole truth, shouldn't you?*
- ii The rules predict *mayn't it?* as the informal reversed polarity tag for *It may rain*, but most speakers do not have the form <sup>o</sup>*mayn't*; there is no clearly established way of filling the gap: possibilities include *mighn't it?*, *won't it?*, the more formal *may it not?*, or a structurally independent interrogative such as parenthetical *don't you think?*, *isn't that so?*, etc.
- iii *Do* may be found as a variant of *have* in the tag to an anchor with *have got*: *He's got problems, doesn't he?* (which may be regarded as a blend of *He's got problems, hasn't he?* and *He has problems, doesn't he?*).
- iv *Be* + 3rd person pronoun can occur as tag to a verbless anchor: *Lovely day, isn't it?*; *Beautiful ship, isn't she?*

## 5.2 The use and interpretation of tags

### ■ Reversed polarity tags

The illocutionary force of an utterance with the form anchor + tag depends on the prosody. The two principal patterns both have falling tone on the anchor; the tag itself is either rising or, more frequently, falling:

- |      |                                     |                                     |               |
|------|-------------------------------------|-------------------------------------|---------------|
| [10] | POSITIVE ANCHOR                     | NEGATIVE ANCHOR                     |               |
| i    | a. <i>He was here, wasn't he</i> ↗? | b. <i>He wasn't here, was he</i> ↗? | [rising tag]  |
| ii   | a. <i>He was here, wasn't he</i> ↘? | b. <i>He wasn't here, was he</i> ↘? | [falling tag] |

#### (a) The rising tag

This expresses doubt or asks for verification: the question is biased towards an answer that confirms the anchor. A special case, involving a negative anchor, is prosodically distinguished by a somewhat wider pitch movement and the lack of any rhythmic break between anchor and tag. Here there is no such bias towards an answer with the same polarity as the anchor:

- [11] *It isn't raining again, is it? It isn't my turn already, is it?*

If anything, there is a bias towards a positive answer, but in addition the construction has an emotive component of meaning – a suggestion of being afraid that the positive answer is the true one.

#### (b) The falling tag

The version with falling intonation on the tag does not express doubt: the question merely seeks acknowledgement that the anchor is true. Thus it can be used in a context where the anchor is obviously true: *Good gracious, you're up early this morning, aren't you?*

uttered at 4 a.m., say. There may be, as perhaps in this example, an implicit invitation to provide an explanation (*Yes, I've got a train to catch*). Or I may want you to admit something you didn't previously accept (*I was right all along, wasn't I?*). Or again I might be asking for your agreement to some minor uncontroversial proposition (*It's a lovely day again, isn't it?*). Thus an exclamative anchor will normally take a falling tag because I can hardly ask you to confirm my exclamation: *What a mess I've made of things, haven't I?* With an exclamative the truth of the proposition is not at issue (see §8.2), so that such an anchor is inconsistent with the expression of doubt. The falling tag may therefore have the character of a rhetorical question, where an answer-response is unnecessary.

### ■ Constant polarity tags

The characteristic intonation for constant polarity tags is slightly but not steeply rising. They do not, however, express doubt: the content of the anchor is typically something I am repeating or inferring from what you have just said or from what was said earlier. For many speakers they occur only in the positive. One use, commonly accompanied by *so* or a comparable item such as *oh, I see*, etc., carries an emotive meaning of disapproval, reproach, belligerence, or the like:

- [12] i *So you have forgotten your homework again, have you?*  
 ii <sup>%</sup>*So you haven't done your homework, haven't you?*

These suggest a context where you have just revealed that you have forgotten your homework or failed to do it. Because the anchor proposition is implicitly attributed to you, this use lends itself to sarcasm, as when I say to someone who has performed badly: *So you're the one who was going to come back laden with prizes, are you?*

Such belligerence is not, however, a necessary feature of the constant polarity tag construction. A second use is where I accept what you say, indicating some surprise or at least acknowledging that the information is news to me:

- [13] A: *Jones is coming over next semester.*  
 B: *Jones is coming, is he? In that case we can ask him to give some seminars.*

In both uses, the anchor proposition derives from the addressee, rather than representing a prior belief of the speaker. Exclamatives, which do not readily occur in such contexts, normally allow only reversed polarity tags.

## 5.3 Parentheticals

By **parentheticals** we mean expressions which can be appended parenthetically to an anchor clause but which also have a non-parenthetical use in which they take a declarative content clause as complement – expressions like *I think, don't you think?*, and so on. Compare:

- |      |   |   |
|------|---|---|
| [14] | NON-PARENTHETICAL USE                               | PARENTHETICAL USE                                   |
|      | i a. <i><u>I think</u> it is quite safe.</i>        | b. <i>It is quite safe, <u>I think</u>.</i>         |
|      | ii a. <i><u>Don't you think</u> it is safe?</i>     | b. <i>It is safe, <u>don't you think?</u></i>       |
|      | iii a. <i><u>Would you say</u> it is safe?</i>      | b. <i>Is it safe, <u>would you say?</u></i>         |
|      | iv a. <i>When <u>did she say</u> it'll be safe?</i> | b. <i>When will it be safe, <u>did she say?</u></i> |

In the parenthetical use they can, in general, interrupt the anchor instead of following it, as in, for example, *It is, I think, quite safe* or *Has there, would you say, been any serious attempt at compromise?*

In the parenthetical construction the anchor is syntactically a main clause, whereas the corresponding clause in the non-parenthetical construction is subordinate. And while the verbs *think* and *say* have complements in [a], in [b] they do not: in this construction verbs which (with the meanings they have here) normally require a complement occur without one. The syntactic structure signals that the anchor is the communicatively most important part of the message, with the parenthetical supplement correspondingly backgrounded.

#### ■ Declarative anchor + declarative parenthetical: *It is quite safe, I think*

Many of the parentheticals here serve, like *I think*, to weaken the speaker's commitment to the truth of the anchor proposition: *I believe, I reckon, I guess, I suppose, I suggest, it seems, it appears*, etc. Others are somewhat stronger: *I'm sure, I have no doubt*. And some have concessive force: *it is true, I admit*.

In the non-parenthetical construction the matrix verb and its subject may also be backgrounded, but this is not signalled syntactically, being rather a matter of pragmatics, dependent on context and the content of the subordinate clause. *I believe that there is a God*, for example, will be taken as a statement about my beliefs, with the informational status of *believe* matching its syntactic status as verb of the main clause. This is not the natural way of taking *I believe that nominations close on Tuesday*, however. Here, the subordinate clause will generally be pragmatically foregrounded and the matrix *I believe* reduced in status to a modal qualifier, making it like the parenthetical in *Nominations close on Tuesday, I believe*. Note that while *Do you?* is a pragmatically perfectly natural response to the God example, it would be rather odd as a response to the nominations one, indicating that *I believe* had been taken as foreground material. With the parenthetical construction this response would be anomalous.

#### ■ Declarative anchor + interrogative parenthetical: *It is quite safe, don't you think?*

The effect of the parenthetical is much like that of a tag (*isn't it?*): I seek your confirmation that the anchor proposition is true. Other such parentheticals include *wouldn't you say?*, *don't you reckon?*, and so on. One might also say *am I right?*, *don't you think so?*, and the like, but these would have the status of independent questions rather than parentheticals.

#### ■ Interrogative anchor + interrogative parenthetical: *Is it safe, would you say?*

From a grammatical point of view we have here a sequence of two interrogative clauses, but in normal use I would be asking one question, not two. The parenthetical does not serve to ask a second question but to clarify the way the question expressed in the anchor clause is to be interpreted and answered: it is not part of the propositional content that is questioned. The parenthetical makes clear that I am asking for an expression of your opinion – and, indeed, a more formal variant might be *In your opinion, is it safe?*, where the adjunct *in your opinion* likewise does not contribute to the propositional content of the question.

The non-parenthetical *Would you say it is safe?* might well be interpreted in the same way, but again this is a pragmatic matter, not signalled in the syntactic structure. Note,

for example, that *Did you say it's safe?* can be used as an indirect speech act to ask whether it is safe, i.e. essentially equivalent to *Is it safe, did you say?*, but it can also be used at face value as a question about what you said.

Other interrogative parentheticals that are appended to interrogative anchors include *would/do you reckon/guess/believe/argue?* We also find similar expressions with 3rd person subjects: *does she think?*, *did she say?*, etc. In general, the same items are used with closed and open interrogatives. An exception is *do you know?*, which appears as a parenthetical only with the closed type: *Are they valuable, do you know?*

### ■ Interrogative parentheticals with echo-question anchors

Parentheticals can also be appended to echo questions:

- [15] i *He's going to what, did you say?*  
 ii *Did I help him, do you mean?*

Again the parenthetical does not express a second question, but clarifies the force of the whole – [i] is a repetition echo, [ii] a clarification echo.

Note that with these there is no comparable non-parenthetical construction. *Did you say that he's going to what?*, for example, is an (unlikely) echo of a question (with a stimulus like *Did I say that he's going to emigrate?*), whereas [15i] is an echo of a statement (with a stimulus like *He's going to emigrate*).

## 6 The presuppositions of information questions

### ■ Pragmatic Q–A presuppositions

In general, when I ask a question I presuppose that it has a right answer. We are concerned here with **pragmatic presupposition**: to presuppose something in this sense is to take it for granted, as not at issue, to present it as uncontroversial background. In the case of information questions, to presuppose that a question has a right answer is to presuppose that one of the possible answers is true.

There are several different kinds of pragmatic presupposition, and we will accordingly refer more specifically to the kind we are concerned with here as a **question–answer presupposition** ('Q–A presupposition'). The most straightforward case is perhaps that of the alternative question: we will look at this first, and then examine how the concept of Q–A presupposition applies to polar and variable questions.

### 6.1 Q–A presuppositions of alternative questions

The possible answers to [i] are given in [ii], and its Q–A presupposition in [iii]:

- [1] i *Is he leaving on Monday or Tuesday?* [alternative Q]  
 ii "He is leaving on Monday"; "He is leaving on Tuesday" [answers]  
 iii "He is leaving on Monday or Tuesday" [presupposition]

To presuppose that [i] has a right answer is to presuppose the **disjunction** (*or*-coordination) of the possible answers, i.e. "Either he is leaving on Monday or he is leaving on Tuesday", which is logically equivalent to [iii]. The presupposition of an alternative question can thus be derived simply by taking the corresponding statement.

The *or* in alternative questions and their presuppositions is interpreted exclusively – i.e. the question presents a set of alternatives with the presupposition that one, but only one, is true. Just as [1i] does not countenance the possibility that he will not leave on Monday or Tuesday, so it does not countenance the possibility that he will leave on both days. This relation of mutual exclusiveness between the alternatives is perfectly consistent with the use of such expressions as *or both*:

- [2] i *Would you like cheese, fruit, or both?* [alternative question]  
 ii “You would like cheese”; “You would like fruit”; } [answers]  
     “You would like both fruit and cheese” }  
 iii “You would like cheese or fruit or both” [presupposition]

The *or both* simply adds a third alternative, mutually exclusive with the first two, for “cheese” and “fruit” in the first two answers are interpreted as “just cheese” and “just fruit”.

## 6.2 Q–A presuppositions of polar questions

The presuppositions of polar questions are arrived at in a similar way:

- [3] i *Has the clock stopped?* [polar question]  
 ii “The clock has stopped”; “The clock hasn’t stopped” [answers]  
 iii “(Either) the clock has stopped or it hasn’t” [presupposition]

To presuppose that [i] has a true answer is again to presuppose the disjunction of the answers listed in [ii], i.e. to presuppose [iii]. The Q–A presupposition of a polar question is therefore the disjunction of the corresponding statement and its polar opposite.

This applies equally when the question is negative:

- [4] i *Didn’t she see them?* [polar question]  
 ii “She didn’t see them”; “She did see them” [answers]  
 iii “(Either) she didn’t see them or she did” [presupposition]

We have seen that negative questions are biased, but bias is perfectly consistent with presupposition. The presupposition is that one of the answers is true; the bias goes beyond this and favours one rather than the other as the true one.

The presuppositions in [3] and [4] are necessarily true: they are logical truths, tautologies. This will always be the case with polar questions: the disjunction of any proposition and its polar opposite is necessarily true. Polar questions clearly differ in this respect from alternative ones: [1], for example, is obviously not a logical truth. It should not be thought, however, that this property of polar presuppositions makes them vacuous: from a pragmatic point of view they can be of considerable significance. This may be illustrated by such an example as:

- [5] i *Are you telling the truth?* [polar question]  
 ii “(Either) you are telling the truth or you are not” [presupposition]

The presupposition is what I take for granted, and the significance here is that the presupposition is so weak – it doesn’t go beyond a mere tautology. In asking [5i] I take for granted the truth of [ii], but in so doing conspicuously fail to take for granted the truth of the proposition “You are telling the truth”. The question entertains the possibility that you are not telling the truth, thereby casting doubt on your veracity. At the direct level [i] is clearly a question, not an accusation, but is not uncommon for such questions to be interpreted as indirect accusations.

### 6.3 Q–A presuppositions of variable questions

The presuppositions of variable questions cannot be derived in quite so simple a way as with alternative and polar questions. This is because the set of answers is prototypically open-ended: we shall not therefore derive the presupposition by taking the disjunction of the possible answers. Instead we derive it by substituting an appropriate indefinite phrase for the variable in the open proposition expressed in the question:

- |     |     |                                       |                     |
|-----|-----|---------------------------------------|---------------------|
| [6] | i   | <i>Who wrote the editorial?</i>       | [variable question] |
|     | ii  | “Person <i>x</i> wrote the editorial” | [open proposition]  |
|     | iii | “Someone wrote the editorial”         | [presupposition]    |

We have seen that the answers to a variable question assign values to the variable(s) in the open proposition. To presuppose that [6i] has a right answer, therefore, is to presuppose that there is a true proposition in which a value is assigned to the variable in [ii] – and to presuppose this is to presuppose [iii]. Note that the latter does not constitute an **answer** to the question, and to give it as a response would be clearly unco-operative. This is precisely because it does not provide any information beyond that which the speaker presents as already established. Thus [iii] no more constitutes an answer to [i] in set [6] than it does in sets [2–4]. With alternative and polar questions an answer must be more specific than the presupposition by selecting one of the coordinates; with variable questions it must be more specific by genuinely providing a value for the variable.

It will be noted that in [6ii] the variable *x* is attached to ‘person’ instead of standing on its own, as in the formulations which, for simplicity of presentation, we have been using hitherto. ‘Person’ is needed to show that the variable ranges only over the set of persons: *#The lawnmower wrote the editorial*, for example, is not a possible answer to [6i]. ‘Person’, of course, is part of the meaning of *who*, and is encapsulated also in that of *someone*, which appears in the presupposition. For *when*, a comparable schema is given in:

- |     |     |   |                     |
|-----|-----|---|---------------------|
| [7] | i   | <i>When did they move to Edinburgh?</i>     | [variable question] |
|     | ii  | “They moved to Edinburgh at time <i>x</i> ” | [open proposition]  |
|     | iii | “They moved to Edinburgh at some time”      | [presupposition]    |

A detailed account of the presuppositions of variable questions must therefore draw on a description of the individual interrogative words: we take this up in §7 below.

#### ■ Q–A presuppositions in relation to the set consisting of all the answers

Another, but equivalent, approach to an explanation of the Q–A presupposition of a variable question is to see it as following from every one of the answers. Thus instead of [6], for example, we might have:

- |     |     |  |                     |
|-----|-----|--|---------------------|
| [8] | i   | <i>Who wrote the editorial?</i>  | [variable question] |
|     | ii  | “Ian wrote the editorial”; “I wrote the editorial”;<br>“One of the directors wrote the editorial”; . . . } | [answers]           |
|     | iii | “Someone wrote the editorial”  | [presupposition]    |

If Ian wrote the editorial, it follows that someone wrote it, and similarly for all other answers.

It is important to note, however, that the presupposition may follow not from the answer alone, but from the answer together with the premise that it **is** an answer. Consider [9i] and the sample of responses given in [ii]:

- [9] i a. *What Soviet president won the Nobel Peace Prize?* [question]  
 b. “Some Soviet president won the Nobel Peace Prize” [presupposition]  
 ii a. *Mikhail Gorbachov won the Nobel Peace Prize.*  
 b. *Leonid Brezhnev won the Nobel Peace Prize.*  
 c. *Willy Brandt won the Nobel Peace Prize.*

The right answer is [iia], but this does not by itself entail [ib]: we need the additional premise “Mikhail Gorbachov is/was a Soviet president”. Though false, [iib] is still an answer. By contrast, [iic] is true, but not a true answer, because the additional premise – “Willy Brandt is/was a Soviet president” – is false. Presuppositions thus play a significant role in the interpretation of responses to variable questions. If you interpret a response as an answer you add to its content whatever additional premise is needed for the presupposition to be entailed.

No such additional premises are needed with alternative and polar questions. Here the presupposition is a disjunction of the answers, and since any proposition “p” entails “p or q”, any one answer will always entail the disjunction of the set of answers. In [1], for example, if “He is leaving on Monday” is true, then obviously “He is leaving on Monday or Tuesday” is also true.

#### 6.4 Rejection of Q–A presuppositions

The Q–A presuppositions of alternative and variable questions are generally not logical truths, and they will not always be accepted by the addressee:

- [10] i A: *Will Kim or Pat chair the meeting?* B: *Neither. I’m chairing it this time.*  
 ii A: *Who helped her?* B: *Nobody – she did it herself.*

B’s responses here are not answers. They contradict the presuppositions of the questions: B rejects these presuppositions and hence cannot answer. Notice that although *nobody* has the grammatical form of an NP, it does not have reference and hence does not supply a value for the variable in the question. It indicates, rather, that there is no value of *x* such that “Person *x* helped her” is true.

#### 6.5 Cancellation of Q–A presuppositions

We have said that Q–A presuppositions are pragmatic in nature: they are not invariant, immutable, as they would have to be to qualify as a semantic phenomenon. In particular, there are cases where I can use a variable question without taking it for granted that a value can be supplied for the variable. We will refer to this as **presupposition cancellation**: the question is used without the presupposition that characteristically accompanies a question.

Some examples are given in:

- [11] i *Who cares?*  
 ii *What do I care? / What does it matter?*  
 iii *How do you know Jill didn’t do it herself?*  
 iv *How should I know?*  
 v *Why should he do a thing like that?*

Question [i] is a conventional way of indirectly asserting “Nobody cares”. Similarly [ii] typically conveys “I don’t care at all / It doesn’t matter at all”. A difference between them

is that in [i] there is nothing in the grammatical form of the sentence to indicate that the expected presupposition is cancelled, whereas in [ii] there is. It would be possible in principle to use [i] in a presupposition-preserving way, and this is reflected in the fact that it can be used as complement to *know*: *She knows who cares and who doesn't care*. This is not so with [ii] – cf. *\*She knows what I care / what it matters*. They involve semi-fixed expressions, with *what* here meaning “how much”. Questions like [iii], beginning with *how do you know*, are often used to challenge what the addressee has just said. I am suggesting that you have not considered the possibility that Jill did it: I am therefore not taking it for granted that you know she didn't.

Question [11iv] is a conventional way of conveying “There's no reason why I should (be expected to) know”. Modal *should* quite often occurs with presupposition cancellation, but is not an unequivocal marker of it. Question [11v], for example, could be used either with or without the Q–A presupposition. Suppose you say *I've just discovered that Max has been tampering with the computer*; I might then respond with [11v] in two different ways:

- [12] i *Yes, I can't understand it. Why should he do a thing like that?*  
 ii *Oh, surely not! Why should he do a thing like that?*

The question in [i] presupposes that Max ‘did a thing like that’ (i.e. tampered with the computer), whereas in [ii] the presupposition is cancelled: it conveys that Max probably didn't do it. (Note that even in [i] *should* serves an emotive role, indicating puzzlement or surprise, rather than being part of the propositional content: the presupposition is “He did a thing like that for some reason”, not “He should do a thing like that for some reason”.) *Would* is possible instead of *should* in all these examples.

Negatively-oriented polarity-sensitive items generally serve to cancel the presuppositions of variable questions:

- [13] i *When will you ever learn not to trust them?*  
 ii *Where could you find anything better?*

There is no presupposition here that you will at some time learn not to trust them or that you could find something better somewhere. On the contrary, these questions tend to convey the speaker's belief that you won't, that you couldn't.

The presupposition is also cancelled in the bare infinitival construction illustrated in [16] of §4. *Why invite them both?* suggests that there is in fact no reason to do so. Likewise in the negative finite *Why don't you invite them both?*, when it's a matter of some future situation – the presupposition is preserved in examples like *Why don't you like it?*

## 6.6 Secondary presuppositions

In addition to the Q–A presupposition that a question normally has simply by virtue of being a question, there may be further presuppositions that follow from it – we will refer to these as **secondary presuppositions**:

- [14] i *Has he stopped smoking?* [polar question]  
 ii “(Either) he has stopped smoking or he hasn't” [Q–A presupposition]  
 iii “He formerly smoked” [secondary presupposition]

Here [ii] presupposes [iii]. If he has stopped smoking, then necessarily he formerly smoked and precisely because you can't stop doing something that you have never

done I also wouldn't normally say *He hasn't stopped smoking* unless he had previously done so (cf. Ch. 1, §5.4). If [i] presupposes [ii] and [ii] presupposes [iii], it follows that [i] presupposes [iii]. When I ask [i], the issue is normally just whether he smokes now: I take it for granted that he formerly did. We call this a secondary presupposition because it doesn't derive directly from the question form itself, but depends crucially on the properties of the verb *stop*.

A second example is seen in:

- |        |   |                            |
|--------|---|----------------------------|
| [15] i | <i>Did he break it intentionally?</i>             | [polar question]           |
| ii     | “(Either) he broke it intentionally or he didn’t” | [Q–A presupposition]       |
| iii    | “He broke it”                                     | [secondary presupposition] |

If he didn't break it, the issue of whether he broke it intentionally doesn't arise, so in asking [i] I normally take [iii] for granted. But again [iii] is only a secondary presupposition of the question because it derives from properties of the verb + manner adverb construction.

## 7 Interrogative words and phrases

This section is concerned with the grammatical and semantic properties of the following interrogative words, and phrases based on them:

- |     |            |             |              |              |              |
|-----|------------|-------------|--------------|--------------|--------------|
| [1] | <i>how</i> | <i>what</i> | <i>when</i>  | <i>where</i> | <i>which</i> |
|     | <i>who</i> | <i>whom</i> | <i>whose</i> | <i>why</i>   |              |

The interrogative subordinators *whether* and *if* are discussed in Ch. 11, §5.2: we confine our attention here, therefore, to the open interrogative words, which are used in both main and subordinate clauses. *Who* and *whom* are inflectional forms of the lexeme **who**, and will here be treated together, the difference being a matter of case (Ch. 5, §16.2.3). The issue of the grammatical number of interrogative phrases, as reflected in subject–verb agreement, is discussed in Ch. 5, §18.

### ■ The dual role of interrogative words

Open interrogatives are marked as such by the presence of an open interrogative word, but these words all have some other role in the syntactic structure. Compare:

- |     |    |  |                                     |
|-----|----|--|-------------------------------------|
| [2] | i  | a. <u>Who</u> has taken my umbrella?     | b. <u>What</u> mistakes did I make? |
|     | ii | a. <u>Someone</u> has taken my umbrella. | b. I made <u>some</u> mistakes.     |

As well as marking the clause type, *who* in [ia] is head of the subject NP, like *someone* in [iia], and *what* in [ib] is determiner in the object NP, like *some* in [iib]. We refer to these two roles respectively as their **interrogative role** and their **core role**. In their interrogative role they serve as a variable that is replaced by a value in the set of answers; the core role differs from one to another, and hence has to be described individually.

#### 7.1 Which

*Which* differs from all the other interrogative words in having a property we shall call ‘selective’. It implies that the value which an answer substitutes for the question variable is to be selected from some definite set:

### ■ Which + partitive phrase

The set may be specified by a partitive phrase within the interrogative phrase itself:

- [3] i *Which (one) of the chapters did you write?*  
 ii *Which of quiche, pizza, and lasagna would you prefer?*

A possible answer to [i] is *I wrote Ch. 3*, where *Ch. 3* refers to a member of the set referred to by *the chapters* in the question. The partitive phrase usually consists of *of* + definite NP, as in this example. An alternative to a definite NP is a coordination defining the set by listing its members, as in [ii]. Note, however, that we can't have an indefinite NP: *which of us / them / the boys / these books / your shares*, but not *\*which of boys / some books / any shares*. Instead of *of* we sometimes find *out of*: *Which out of the three cheapest ones do you think we should take?* A cardinal numeral commonly precedes the partitive: *which one/two of the chapters*.

### ■ Which without an overt partitive phrase

The set from which selection is made need not be specified in a partitive phrase, but may be given elsewhere or just be contextually implicit:

- [4] i *Which would you prefer, quiche or pizza?*  
 ii *It comes in three colours, red, blue, and green. Which would you prefer?*  
 iii *Which chapter(s) did you write?*

In [i] the set is defined by the coordination which is added at the end, effectively converting the variable question into an alternative one. In [ii] the set is given in the preceding text, while in [iii] it is contextually given: we are talking about some book, and the chapters in that book constitute an identifiable set.

### ■ Which vs what

*What* cannot occur just before a partitive: *\*What of the chapters did you write?* It is also normally excluded before a cardinal numeral + partitive: *Which/\*What one of them is defective?* Elsewhere, *what* is not grammatically excluded, though there will be a strong pragmatic preference for *which* in cases like [4ii], where the interrogative word constitutes the whole interrogative phrase and the set is given in the preceding text – *what* could substitute much more readily for *which* in [i], where the set is defined later.

When the interrogative word is determiner to a noun head, both *which* and *what* are possible:

- [5] i *Which/What approach to the problem would you recommend?*  
 ii *Which/What king of England had six wives?*

In [i] the contrast is quite sharp. The set of approaches to a problem is not inherently clearly defined. Normally, therefore, one would present it as an identifiable set by using *which* only in a context where a number of possible approaches have been mentioned: the question implies a choice from such a contextually defined set. *What* does not have the selective feature and is the form one would use when there is no identified set to choose from. *What* is not inconsistent with there being a contextually defined set, as evident from the fact that it can be used in [ii], since the kings of England do form an identifiable set. In such cases the distinction between *which* and *what* is effectively neutralised: *which* encodes the fact that the choice is from an identifiable set while *what* doesn't, but as that is part of background knowledge it doesn't matter from a pragmatic

point of view whether it is encoded or not. Compare, similarly, *Which/What gear are we in?*, as said of a car with five gears.

## 7.2 Whose

Interrogative *whose* is genitive and (unlike relative *whose*) personal, so that presuppositions to *whose* questions contain *someone*:

[6] QUESTION	PRESUPPOSITION
i a. <i>Whose bicycle did she take?</i>	b. "She took someone's bicycle"
ii a. <i>Whose is that?</i>	b. "That is someone's / belongs to someone"
iii a. <i>Whose do you prefer?</i>	b. "You prefer someone's"

In [i] *whose* is determiner to a noun head, while [ii] is the predicative use, with answers like *It's mine*. In [iii] *whose* is a fused determiner-head, with the interpretation recoverable from the context – e.g. *Kim and Pat don't need their bicycles today: whose would you prefer to borrow?* This is a relatively infrequent construction: one would be more likely to use *which*. *Whose* can be used when the variable ranges over a contextually identifiable set, but it is hardly possible with a partitive *of* phrase: \**Whose of the two of them would you prefer?*

## 7.3 Who and whom

Nominative *who* and accusative *whom* occur only in head function, contrasting with *whose* as non-genitive vs genitive, and with *what* as personal vs non-personal:

[7] i a. <i>Who is that?</i>	[non-genitive]
b. <i>Whose is that?</i> (= [6ii])	[genitive]
ii a. <i>Who have you got as tutor this year?</i>	[personal]
b. <i>What have you got as set text this year?</i>	[non-personal]

### ■ Who vs what in predicative complement function

[8] i A: <i>Who is Lesley?</i>	B: <i>She's their solicitor.</i>	[specifying <i>be</i> ]
ii A: <i>What is Lesley?</i>	B: <i>She's a solicitor.</i>	[ascriptive <i>be</i> ]

In [i] we have the specifying *be* construction: the question asks about Lesley's identity, and the answer identifies her as their solicitor. Here *their solicitor* is used referentially. In [ii] *be* is ascriptive, and the NP *a solicitor* in the answer is non-referential (cf. Ch. 5, §8.3). The contextually most neutral interpretation of such *what* questions about people is that the variable ranges over occupations, as in this example. The context, however, may specify other kinds of property: the question *What are you?*, for example, could be a question about your political affiliation, your religion, or your martial art grade, when following such statements as *I'm Labour*, *I'm Catholic*, *I'm a Blue Belt* – and so on.

### ■ Who vs which

[9] i <i>There are two contestants left, Kim and Pat. Which/Who do you think will win?</i>
ii <i>Who/Which is Lesley?</i>

The contrast between **who** and *which* is similar to that between *what* and *which*. Unlike *which*, **who** does not encode that selection is to be made from an identifiable set, but

it can substitute for *which* in cases where the set is defined in context, as in [i]. Again, we could add *of them* with *which* but not **who**. (A partitive phrase with *of* or *out of* is not in general excluded with **who**, however: *Who (out) of all the conductors you have worked with was the most inspiring?*) Both *who* and *which* are found in the specifying **be** construction, [ii]. With *who* the more likely interpretation is that *who* has the identifier role, *Lesley* the identified, as in [8i]: I don't know who Lesley is and am wanting to find out. With *which*, by contrast, the salient interpretation has *which* as identified and *Lesley* as identifier: I do know who Lesley is and am wanting to find out which of a certain set of persons (e.g. on a group photograph, or on a stage) is identifiable as her.

## 7.4 *When*

*When* is used to question time, and is used with a range of functions:

- |        |   |                                       |
|--------|---|---------------------------------------|
| [10] i | <i>When is she leaving?</i>                         | [adjunct (temporal location)]         |
| ii     | <i>When is the concert?</i>                         | [complement]                          |
| iii    | <i>When would be a good time to meet?</i>           | [subject of specifying <i>be</i> ]    |
| iv     | <i>When would the best time be for her lecture?</i> | [complement of specifying <i>be</i> ] |
| v      | <i>Since when have you been in charge?</i>          | [complement of preposition]           |

Question [i] presupposes “She is leaving at some time”, but it is more general than *What time / At what time is she leaving?*, which normally refers to clock time, so that while *in August* is not an answer to the latter it is an answer to [i]. Similarly for [ii]. In the specifying *be* construction *when* could be replaced by *what* (or *what time*), and the answer would generally be given without *at*: *five o'clock* rather than *at five o'clock* (though *the afternoon* and *in the afternoon* are equally possible). One case of specifying *be* where *what* could not replace *when* is the *it*-cleft construction: *When/\*What was it you saw her?*

*Since when*, as in [10v], is often used sarcastically, with cancellation of the presupposition. So as well as asking how long you have been in charge, it might be used to suggest that you are behaving as though you were in charge when in fact you are not.

## 7.5 *Where*

*Where* questions spatial location or goal and occurs in the same range of functions as *when*:

- |        |   |                                       |
|--------|---|---------------------------------------|
| [11] i | <i>Where are we going to have lunch?</i>              | [adjunct (spatial location)]          |
| ii     | <i>Where are you? Where are you going?</i>            | [complement]                          |
| iii    | <i>Where would be a good place to meet?</i>           | [subject of specifying <i>be</i> ]    |
| iv     | <i>Where would the best place be for her lecture?</i> | [complement of specifying <i>be</i> ] |
| v      | <i>Where have you come from?</i>                      | [complement of preposition]           |

Example [i] presupposes “We are going to have lunch (at) some place”. As complement, *where* can question location (*Where are you?*: “at what place?”) or goal (*Where are you going?*: “to what place?”). In the latter case, *to* can be used, giving a structure like [v]: *Where are you going to?* In [iii–iv] we could again substitute *what*. In the prepositional construction [v] the preposition is normally *to* or *from* (though *at* is found in idiomatic

*Where are we at?*). The preposition is usually stranded, as in [v]: fronting of the preposition (*From where have you come?*) is confined to markedly formal style.<sup>13</sup>

## 7.6 Why

This has a narrower range of use than *when* and *where*, being restricted to adjunct function or the complement of the *it*-cleft construction; note, for example, that other specifying *be* constructions allow only *what*:

- |        |   |                         |
|--------|---|-------------------------|
| [12] i | <i>Why is she going home?</i>                             | [adjunct (cause)]       |
| ii     | <i>Why is it that we keep getting the wrong results?</i>  | [ <i>it</i> -cleft]     |
| iii    | <i>What/*Why was the reason for her sudden departure?</i> | [specifying <i>be</i> ] |

*Why* questions cause (reason or purpose): answers to [i] include *Because she's hungry, To get some food*, and so on. In adjunct function (but not in [ii]) *why* is replaceable by the idiomatic, and relatively informal, *what . . . for*: *Why did you do that?* or *What did you do that for?*

### ■ Presupposition cancellation

Question [12i] presupposes “She is going home for some reason”, but *why* is often found with cancellation of the presupposition. Compare:

- |        |   |                                     |
|--------|---|-------------------------------------|
| [13] i | a. <i>Why is Max so naughty?</i>              | b. <i>Why am I naughty?</i>         |
|        | ii a. <i>Why don't you go to the beach?</i>   | b. <i>Why not go to the beach?</i>  |
|        | iii a. <i>Why don't you be more tolerant?</i> | b. <i>Why not be more tolerant?</i> |

In its salient interpretation [ia] presupposes that Max is naughty and asks for the cause, or explanation. Question [ib] can be used in a similar way, but I'm more likely to use it to ask for evidence or justification for the claim that I'm naughty: the presupposition is cancelled in this use, whether I'm naughty being the main issue, not something that is taken for granted. (A similar interpretation is possible for [ia], but the *so* makes it less likely.) *Why* questions with presupposition cancellation often contain modal *should*, as noted in §6.6. Example [iia] allows a face value interpretation where the presupposition is retained: “Why is it that you don't go to the beach?”, but it can also be used when I don't think there is any valid reason and the cancellation of the presupposition results in an indirect directive: “You should go to the beach”. The other three examples have only this directive interpretation: see §4.5.

### ■ Direction questions and *to*-infinitivals

Unlike the other interrogative words, *why* is not normally possible in direction questions. Thus <sup>o</sup>*Why shall I get my money back?* can only be an information question, with answers like *You will get your money back because the manufacturer has accepted responsibility for the defect*. In *to*-infinitivals, *why* is just possible in the titular use: *Why to vote yes in the referendum*.

<sup>13</sup> *Whereabouts* can be used instead of *where* to indicate that only an approximate answer is envisaged. However, the noun *whereabouts* (derived from the preposition by shift of stress from the last syllable to the first) is not an interrogative word: *His whereabouts aren't known* is declarative and has no embedded interrogative clause within it. Interrogative *whence* (“from where”) and *whither* (“to where”) are archaic. So too is *wherein*, which is the only one of the compounds of interrogative *where* + preposition that one is likely to encounter; its archaic status is seen in the fact that it does not require *do*-support but allows inversion of subject + lexical verb, as in *Wherein lies its appeal?*

### ■ Why in response to directives and questions

*Why* also differs from the other interrogative words in examples like:

- [14] i A: *Get your money back.*                      B: *When?/Why?*  
 ii A: *Did you see her?*                              B: *When?/Why?*

B's *When?* in [i] asks for a more specific directive, whereas *Why?* asks for a reason for complying with the directive. Features such as time and place count as features of the action itself (getting your money back tomorrow is a different action from getting it back next week), but reason does not (getting your money back counts as the same action, whether you do it for this reason or for that). Similarly in [ii] *When?* asks for further specification of the propositional content of A's question: it is a clarificatory echo question, elliptical for *Did I see her when?* (cf. §4.8.4). *Why?*, by contrast, asks for A's reason for asking the question – and could accompany an answer to the question, as in *Yes, why?*

## 7.7 How

Interrogative *how* has a considerable range of uses which we will consider in turn.

### (a) Adjectival predicative complement

- [15] i a. *How are you (feeling)?*                      b. *How was the concert?*                      [PC<sup>s</sup>]  
 ii a. *How did you find the seminar?*              b. *How do you like your coffee?*              [PC<sup>o</sup>]

Adjectival *how* is used predicatively only, not attributively (we can't say *\*How films do you like?*, but need a periphrastic expression such as *what kind of*). In [i] the PC is subjective, and in [ii] objective. It is difficult to state the presuppositions precisely, because there is no word standing in the same relation to *how* as *someone* does to *who* or *somewhere* to *where*, for *somehow* can only be an adverb, not an adjective. Nor is there any comparable NP or PP standing in the same relation to *how* as *some time* does to *when* or *for some reason* to *why*.

The salient interpretation of [15ia] is as a question about your present state of health, with such answers as *I am well/ill/better, I have a headache*, and so on: the presupposition is thus roughly "You are in some state of health". Question [ib] would typically be used to ask for your subjective evaluation of the concert, with such answers as *It was good / fair / disappointing / a disaster*. An example like *How does the house look now?*, which has a more specific verb than *be*, seems to allow a wider range of values for the variable, though evaluative ones will still be the most likely; the presupposition is that the house has some property relating to its appearance.

Example [15iia] again asks for evaluation (*I found it enlightening / a waste of time*). The complex-transitive construction with *like* takes a very limited range of PC<sup>o</sup>s – *black, white, sweet, hot, with cream*, etc., and the presupposition of [15iib] will be that you like your coffee with some property from this range.

Questioning of a predicative (like that of a predicator: see §7.10) is much more restricted than questioning an argument or circumstance. *How* occurs with relatively few copulative and complex-transitive verbs, so that [15] may be contrasted with examples like *\*How did she become?*, *\*How did you think the concert?*, etc. With *strike* it is only in the interrogative that the PC can have the form of an adjective rather than a PP: compare *How does it strike you?* and *It strikes me as quite interesting*.

## (b) Adverbial degree modifier

- [16] i [How old] is your father? [modifier of adjective]  
 ii [How many] children have they got? [modifier of degree determinative]  
 iii [How seriously] are they taking his threat? [modifier of adverb]  
 iv How did you like the concert? [modifier of verb]

*How* modifies adjectives, degree determinatives, adverbs, and verbs to question degree, extent, quantity. Only a very small number of verbs (*like, enjoy, please*, etc.) take *how* in its degree sense: with other verbs, degree is normally questioned with *how much*, as in *How much do you care about him?*

Whatever its category, the word modified by *how* is always gradable. The presupposition of the question then depends on the nature of the scale involved. Consider:

- [17] a. *How deep is the water?* b. *How shallow is the water?*

While [b] presupposes that the water is shallow, [a] does not presuppose that it is deep – only that it has a value on the scale of depth, a value which may or may not fall within the range denoted by the unmodified adjective *deep*.

## (c) Adjunct in clause structure, questioning means

- [18] i A: *How did you get in?* B: *By climbing through the kitchen window.*  
 ii A: *How is she going to pay for it?* B: *By cheque.*  
 iii A: *How can I remove it?* B: *With a razor-blade.*

The presupposition is “You got in by some means / in some way”, and so on. This represents the most usual sense of adverbial *how* when it modifies the verb.

## (d) Adjunct in clause structure, questioning manner

- [19] i A: *How did she speak?* B: *With a strong French accent.*  
 ii A: *How does he drive?* B: *Rather recklessly.*

The presupposition this time is “She spoke in some manner/way”, etc. Very often such questions ask for evaluative judgements, as in [ii]. *How* can also occur as complement with those verbs requiring manner specification: *How do they treat you?* This again invites an evaluative answer, such as *Well* or *Badly*.

## (e) Adjunct in clause structure, asking for evidence:

- [20] i *How does he know she is going to resign?*  
 ii *How can you be so sure that it was an accident?*

This use is found with *know* and a few similar expressions, and serves to challenge what has been said or implied. There is no presupposition “He knows (in some way) that she is going to resign”: I am calling into question the contention that she is going to resign.

(f) Questioning reason in the *it*-cleft construction, and in the idiom *how come*

- [21] i *How is it you didn't tell me before?*  
 ii *How come the fridge is switched off?*

The use of *how* shown in [i] is restricted to the *it*-cleft construction: the closest non-cleft counterpart has *why* rather than *how*: *Why didn't you tell me before?* Like the latter, [i] presupposes “You didn't tell me before (for some reason)”.

The idiom *how come*, a common alternant to *why* in informal speech, derives from a construction where *come* is a verb taking a clausal subject (cf. *How does it come to be that the fridge is switched off*). But it is best regarded as a compound interrogative word functioning as adjunct in a simple clause. Note, for example, that it is impossible to insert *that* after *come*, a strong indication that the following NP (*the fridge*) has been reanalysed as subject of a main clause. Moreover, the lack of any inflection on *come* works against its construal as a verb with a 3rd person singular subject. *How come* is nevertheless very exceptional as an interrogative expression in that it doesn't trigger subject–auxiliary inversion. It normally occurs in main clauses, but is not entirely excluded from subordinate interrogatives: *That's how come they stay No. 1*.

### (g) In the idiom *how about*

- [22] i *How about another drink?*  
 ii *How about helping me with the washing-up?*  
 iii *How about we leave the others until next week?*  
 iv *I think it's excellent; how about you?*

*How about* belongs to informal style – with *how's about* more informal still. The primary use is to put forward a suggestion. This may have the indirect force of an offer (as in a possible contextualisation of [i]), a directive (as in a likely interpretation of [ii]), and so on. The complement of *about* can be an NP, a gerund-participial clause, or a tensed declarative clause, as in [i–iii]. Besides its use in suggestions, the idiom can be used to introduce a change to a related topic – e.g. from the speaker's opinion to the addressee's in [iv]. *What about* is a possible variant except in [iii], where the complement is a tensed clause.

### (h) In certain non-question idioms

- [23] i *How do you do.*  
 ii *How dare you speak to me like that!*

The boundary between direct and indirect speech acts is by no means sharply drawn, but it is arguable that these are not questions indirectly conveying a greeting and a rebuke respectively, but simply a greeting and a rebuke at the direct level. *How do you do* may be contrasted with *How are you?*, which is used as a greeting, but is clearly also a question. *I'm very well* is an answer to the latter, but *I do very well* is archaic (in the sense “I am in good health”), so that [i] can no longer be regarded as defining a set of possible answers. Similarly it is difficult to accept that any declarative clause could properly be regarded as expressing an answer to [ii] or other rebukes beginning with *how dare*.

## 7.8 What

*What* occurs as determinative or pronoun, with respectively *some* or *something* as the non-interrogative counterpart, and, in general, presuppositions of *what* questions can be derived by substituting these:

- [24] i a. *What class is she in?*                      b. “She is in some class”  
 ii a. *What did the doctor say?*                    b. “The doctor said something”

Determinative *what* contrasts with *which* and *whose*, while pronoun *what* contrasts with these two and also with *whol/whom*, *when*, and *where*: the meaning of *what* has been discussed above in relation to these contrasts.

#### ■ *What* in verbless constructions

- [25] i A: *Tom.* B: *What?* A: *Can you come here a moment?*  
 ii A: *I've just discovered something.* B: *What?*  
 iii A: *Kim's just got a new job.* B: *So what?*

In [i] *what?* serves to acknowledge a call; *yes?* would be a rather more polite alternative. In [ii] it is elliptical: we understand “What have you just discovered?”; this elliptical use is found with all the interrogative words. (*What?* can also be a repetition echo question, and [25ii] is thus ambiguous between the ordinary question interpretation just given and the echo question interpretation “What did you say?”) The idiom *so what?* is a conventional way of expressing, none too politely, a lack of interest in what has just been said: the meaning is “What is the relevance/significance of that?”.

#### ■ *What about?* and *what if?*

- [26] i A: *The car's in fine shape now.* B: *What about the tyres?*  
 ii A: *I've invited Peter.* B: *And what about Paul?*  
 iii A: *You know that knife I found?* B: *Yes, what about it?*  
 iv *What about a game of squash?*  
 v *What if we can't get back in time?*

*What about* is often used to introduce a new but related topic, as in [i–ii]; in [i] it serves to challenge what has been said, the implicature being that the judgement fails, or may have failed, to take account of the tyres. In [iii] the topic marked by *about* is not new, but old information: I'm asking you to say something about the topic that you introduced. *What about* can also be used to make suggestions, as in [iv]; *how about* could be substituted for it here, and also in [i–ii]. The interpretation of [v] is along the lines of “What will happen / will you do / shall I do if . . . ?”

### 7.9 Upward percolation of the interrogative feature: interrogative phrases

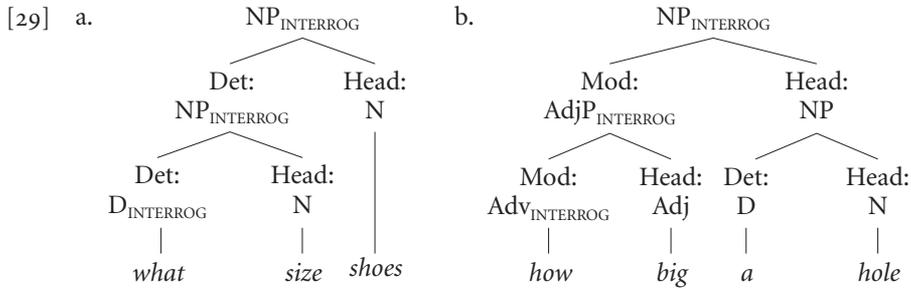

The markers of the open interrogative clause type are in the first instance words. We must also recognise a category of interrogative phrase, however, for it is whole phrases, not single words, that are affected by the fronting rule:

- [27] a. *She took which car?* b. *Which car did she take?*

In [a] *which car* remains in situ, while in [b] it is fronted, but we can't have fronting of *which* alone: \**Which did she take car?* We will say, therefore, that *which* is an interrogative word and *which car* an interrogative phrase. And since *which car* is an interrogative phrase by virtue of containing the interrogative word *which*, we can speak metaphorically of the interrogative feature as percolating upwards from the word *which* to the phrase *which car*.

This is a useful way of speaking because such upward percolation may involve more than one step, as we see from such examples as:

- [28] a. *What size shoes do you take?* b. *How big a hole did it make?*

Both involve two steps. In [a] the interrogative feature first percolates up from the word *what* to the NP *what size*, and then from this to the higher NP *what size shoes*. Similarly in [b]: from *how* to the AdjP *how big*, and thence to the NP *how big a hole*. There may, therefore, be one interrogative phrase within another, and when fronting applies it is the topmost one that is fronted: compare \**What size do you take shoes?*; \**How big did it make a hole?*

The question then arises: what determines how far upwards the interrogative feature percolates? How far up the tree do we have to go before we come to the **maximal** interrogative phrase, i.e. the one that is fronted? The examples in [28] share two properties:

- [30] i The maximal interrogative phrase is the highest phrase beginning with the interrogative word.  
 ii The maximal interrogative phrase is an element of clause structure.

In [28a], for example, *what size shoes* is higher in the tree than the other phrase beginning with *what*, namely *what size*; and *what size shoes* is a clause element, namely object, whereas *what size* is not (it is determiner in NP structure).

Usually, both these properties obtain – but not always:

- [31] i *In which drawer do you keep the bank statements?* [fronted preposition]  
 ii *Which drawer do you keep the bank statements in?* [stranded preposition]

In [i] the fronted interrogative phrase is *in which drawer*; again the upward percolation involves two steps, from *which* to the NP *which drawer*, and then from this to the PP *in which drawer*. But although property [30ii] applies (*in which drawer* is a locative complement), property [30i] does not, for the maximal interrogative phrase begins with the preposition. In [31ii], by contrast, the upward percolation stops at the NP *which drawer*, which begins with the interrogative word but is not an element of clause structure, being complement of the preposition *in*. Here, then, the preposition is stranded in situ while its complement is fronted. In general, informal style conforms to [30i], formal style to [ii].

We should also note that a PP containing an interrogative phrase as complement will not always be an element of clause structure – it may be the complement in NP or AdjP structure, as in:

- [32] i a. *Which country was she the president of?* [informal]  
 b. *Of which country was she the president?* [formal]  
 c. \**The president of which country was she?*  
 ii a. *What subjects are you interested in?* [informal]  
 b. *In what subjects are you interested?* [formal]  
 c. \**Interested in what subjects are you?*

Informal style continues to follow principle [30i], but the formal style conforms to neither [30i] nor [30ii]: it represents a compromise between the two principles. If the highest phrase beginning with the interrogative word is complement of a preposition, upwards percolation proceeds towards an element of clause structure as far as is consistent with the fronted interrogative phrase being a PP. This rather complex formulation is needed to exclude examples like [32ic/iic], where the inadmissibly fronted interrogative phrase is not a PP, while nevertheless allowing such structures as:

[33] *To the daughter of which famous statesman was he engaged?*

Here the fronted interrogative phrase is not the PP containing *which famous statesman* as complement, but the next higher PP. Upward percolation of the interrogative feature here involves four steps: from *which* to the NP *which famous statesman*, then to the *of* PP, then to the NP *the daughter of which famous statesman*, and finally to the fronted PP itself. The contrast between the fronted and stranded preposition constructions applies much more widely than in interrogatives, and is discussed in more detail in Ch. 7, §4.1.

### 7.10 Upward percolation of the question variable: the questioned element

The upward percolation of the grammatical feature interrogative has an analogue at the semantic/pragmatic level, as illustrated in:

[34] A: *Which team do you support?* B: *United.*

From a grammatical point of view, as we have seen, the fronting rule applies to the whole NP *which team*, not just to the interrogative word *which*. Similarly, from the point of view of the meaning, the answer substitutes *United* for the whole NP *which team*. We will therefore use the same metaphor, and speak of the question variable as percolating upwards from the interrogative word to the phrase containing it, and we will refer to *which team* as the **questioned element**, the one for which the answer provides a replacement, giving a value for the variable.

Although there is this similarity between form and meaning, quite extensive differences are to be found in the way the upward percolation works at the two levels. One small difference applies, in fact, to example [34], for a very limited subset of answers to A's question involve replacement of the interrogative determinative alone: *this team*, *your team*, etc. We will consider the major differences between syntactic and semantic upward percolation under three headings: determinative *whose*, PPs, and predications.

#### (a) Determiner *whose*

[35] A: *Whose father is on duty today?* B: *Kim's.*

The answer, without ellipsis, is *Kim's father is on duty today*, where it is just *whose* that is replaced. The syntactic interrogative phrase is *whose father*, but the semantic questioned element is just *whose*. Note that *Mr Roberts* is not a possible answer, even in a context where it is known that Mr Roberts is Kim's father. With determiner *whose*, upward percolation is obligatory at the syntactic level, but barred at the semantic level.

#### (b) PPs

[36] A: *To whom are you referring? / Who are you referring to?*  
B: *(I'm referring to) your mother.*

The answer retains the preposition, making a substitution just for its NP complement. This is the usual case: in general there is no semantic percolation into a PP – and hence it is in the informal preposition stranding construction that we find the closer match between form and meaning.

There are nevertheless some exceptions, cases where the answer involves replacement of the whole PP:

- [37] i a. A: *What are you closing the window for?*  
 B: (*I'm closing the window*) *because I'm cold / to cut out the noise.*  
 b. A: *What's the new boss like?*  
 B: (*The new boss is*) *quite pleasant.*  
 ii a. A: *Under what conditions would you take on the job?*  
 B: (*I'd take on the job*) *if they gave me adequate support staff.*  
 b. A: *In what way can I help you?*  
 B: (*You can help me*) *by minding the children for a couple of hours.*

In [i] we have the idioms *what...for* and *what...like*: the answers must provide a replacement for the whole PP. The same applies with certain very general PPs, such as *under what circumstances/conditions* and *in what way* in [ii], but this time the syntax matches, having obligatory percolation into the PP.

### (c) Predication

- [38] i A: *What did you do?* B: *I called the police.*  
 ii A: *What happened?* B: *The car rolled into the ditch.*

The syntactic interrogative phrase is *what*, but the semantic questioned element is in [i] the VP, the predicate, and in [ii] the whole clause. There is no verb among the interrogative words, and hence to question the predication it is necessary to use a very general verb together with the pronoun *what*; syntactically there is no percolation beyond the *what*, but semantically there is. *Do* is used to question the predicate, *happen* the whole clause. Just as the answer in [34] implicates “United is a team”, so the answer in [38i] implicates “For me to call the police is for me to do something”. This is why *I was older than my sister*, *I was seen by one of the guards*, etc., are not possible answers: the implicit propositions “For me to be older than my sister / seen by one of the guards is for me to do something” are not true. An answer to such a *do* question must denote a situation which is dynamic rather than static, and one in which the subject-referent has an agentive role (cf. Ch. 17, §7.6).<sup>14</sup> Similarly, the answer in [38ii] implicates “For the car to roll into the ditch is for something to happen”. *Happen* also denotes a dynamic situation, but it need not be agentive; *I was older than my sister* is thus again not a possible answer to [38ii], but *I was seen by one of the guards* is.

Such predication questions may include specification of various circumstances of the situation denoted by the answer: *What did you do in the morning?*; *What happened to make you change your mind?* They may also include specification of an argument:

- [39] i A: *What did you do to/with my hat?* B: *I dropped it in the mud / put it away.*  
 ii A: *What happened to your father?* B: *He was taken away for questioning.*

<sup>14</sup>An exception is the idiom ‘*What be X doing Y?*’ (where Y is a locative or a gerund-participial): *What are your gloves doing on my desk?*; *What are you doing sleeping in my bed?* These convey “Why are your gloves on my desk?” and “How come you are sleeping in my bed?” – with the suggestion that the gloves shouldn’t be there, that you shouldn’t be sleeping in my bed.

With *do*, the preposition *to* indicates that the complement NP is associated with an affected, patient role, as in B's *I dropped it in the mud*. Another answer here might be *I sat on it*, where 'it' does not inherently have an affected, patient role, but is interpreted as having such a role because for *I sat on it* to be an answer to *What did you do to my hat?* implicates "To sit on your hat is to affect it". *With* involves disposing of something, putting it somewhere: *I put it away / gave it to Kim*. With *happen*, *to* indicates a less specific participant role: it will often be an affected patient, as in B's answer in [ii], but it can also be an agent (*He escaped through the bathroom window*). *Become* can be used with an *of* phrase in a related way (A: *What became of his sister?* B: *She went to China*).

### 7.11 Open interrogatives as an unbounded dependency construction

The open interrogative is what is known as an **unbounded dependency construction**, as illustrated in the following examples:

- [40] i *What<sub>i</sub> did he [buy \_\_\_<sub>i</sub>]?  
 ii *What<sub>i</sub> did she [say [he bought \_\_\_<sub>i</sub>]]?  
 iii *What<sub>i</sub> do you [think [she said [he bought \_\_\_<sub>i</sub>]]]?  
 iv *What<sub>i</sub> do you [think [she said [he wanted [to buy \_\_\_<sub>i</sub>]]]]?]****

In all of these *what* occupies initial (prenuclear) position in the open interrogative clause but its core role is that of object of the verb *buy*. The *buy* clause is embedded within the interrogative clause and it will be evident from these examples that there is no limit as to how deeply embedded it may be. The paired brackets indicate clause boundaries, and by adding verbs that take clausal complements we can increase the number of clause boundaries between *what* and *buy*. The dependency relation between *what* and *buy* is thus unbounded: there is no grammatical limit on how many clause boundaries may separate them.

There are a number of constructions of this kind, including exclamatives and relatives. We discuss the general properties of this kind of construction in Ch. 12, §7, and here we will merely note that we show the relationship between *what* and *buy* by co-indexing *what* with a **gap** (\_\_\_) located in the position of direct object to *buy* (cf. Ch. 2, §2). This gap pre-empts the filling of the direct object function by any other NP: *\*What did he buy some meat?*, etc.

### 7.12 Ambiguities concerning the role of an interrogative phrase in complex clauses

Two kinds of ambiguity can arise when an open interrogative clause has another clause embedded as complement within it. One concerns the core role of a fronted interrogative phrase, the other the interrogative role of an interrogative phrase that remains in situ.

#### ■ Core role ambiguities resulting from fronting

Examples such as the following are ambiguous in that the interrogative phrase may have its core role in either of two clauses:

- [41] i a. *When did they decide to leave?*  
 b. *When<sub>i</sub> did they [decide [to leave] \_\_<sub>i</sub>]?* [gap in *decide* clause]  
 c. *When<sub>i</sub> did they [decide [to leave \_\_<sub>i</sub>]]?* [gap in *leave* clause]  
 ii a. *Why do you think he lied?*  
 b. *Why<sub>i</sub> do you [think [he lied] \_\_<sub>i</sub>]?* [gap in *think* clause]  
 c. *Why<sub>i</sub> do you [think [he lied \_\_<sub>i</sub>]]?* [gap in *lie* clause]

In [ia] *when* may question the time of deciding (“When did they make the decision to leave?”) or the time of leaving (“What was the time of leaving they decided on?”). Similarly in [iia] *why* can be reason adjunct in the *think* clause (“What makes you think he lied?”) or in the *lie* clause (“In your opinion, why did he lie?”).

Such ambiguities most often involve adjunct interrogative phrases, as in these examples. Under quite restricted conditions, however, ambiguity may arise involving a more central core function:

- [42] i *Who do you expect to play?*  
 ii *Who<sub>i</sub> do you [expect \_\_<sub>i</sub> [to play]]?* [gap as object of *expect*]  
 iii *Who<sub>i</sub> do you [expect [to play \_\_<sub>i</sub>]]?* [gap as object of *play*]

The question here is ambiguous according as it concerns your expectation as to who will play or who you will play: answers for the two interpretations might be respectively *I expect Jones to play* and *I expect to play Jones*. For reasons given in Ch. 14, §2, we analyse *I expect Jones to play* as having *Jones* as object of *expect*, whereas *I expect to play Jones* has *Jones* as object of *play*: on this account, therefore, the ambiguity in [i] results from the fact that *who* can be syntactically object of *expect* or of *play*.

The ambiguity in [42] is clearly dependent on the interrogative phrase being fronted, since the core positions are different. This is typically not so with the adjunct examples. The ambiguity of [4iia], for example, is found also in *They decided to leave when?*, just as it is in declarative *They decided to leave yesterday*.

### Interrogative role ambiguities in multi-variable constructions

The ambiguities illustrated above have to do with the core role of an interrogative phrase but it is also possible for there to be ambiguity concerning its interrogative role. Such ambiguity can arise when one open interrogative clause is embedded within another and at least one of them is multi-variable:

- [43] i *Who knows which universities offer the best courses in which subjects?*  
 ii *Kim knows which universities offer the best courses in medicine and Pat knows which universities offer the best courses in law.*  
 iii *Kim knows which universities offer the best courses in which subjects.*

The core functions of the three interrogative phrases in [i] are clear: *who* belongs in the *know* clause as subject, while *which universities* and *which subjects* belong in the *offer* clause as subject of the clause and complement of *in* respectively. The issue is: which of the two clauses is the multi-variable one?

*Who* clearly expresses a variable with respect to the *know* clause: we will say that *who* (or, more precisely, the interrogative component of *who*) has the *know* clause as its scope. Similarly for *which universities* in the *offer* clause: it has the *offer* clause as its scope. The issue can thus be put more specifically as: what is the scope of the interrogative component of *which subjects*? Is the variable it expresses associated with the *know* clause (making the

main clause the multi-variable one) or with the *offer* clause (making the subordinate clause the multi-variable one)? The ambiguity can be brought out by using variables just for the propositional content of the *know* clause:

- [44] i “x knows which universities offer the best courses in y”  
 ii “x knows which universities offer the best courses in which subjects”

Thus [i] corresponds to the reading where the *know* clause is multi-variable: this is the one for which [43ii] is an answer, since it supplies paired values {“Kim”, “medicine”} and {“Pat”, “law”} for the pair of variables {“x”, “y”}. Different people are assumed to be informed about different fields, and the answer supplies a pairing of people with fields. By contrast, [44ii] matches the reading where the *know* question is a single-variable one: this is the one for which [43iii] is an answer, since it supplies a value for the variable “x”. Here the presupposition is that someone is informed about the whole range of fields, and the answer identifies such a person.

From a formal point of view, the ambiguity is attributable to the fact that only one interrogative phrase can undergo fronting. In single-variable constructions the fronting of the interrogative phrase shows clearly which clause its interrogative role is associated with:

- [45] i *She will say what<sub>i</sub>; she saw \_\_<sub>i</sub>.* [see clause interrogative]  
 ii *What<sub>i</sub>; will she say she saw \_\_<sub>i</sub>?* [will clause interrogative]

In both [i] and [ii] *what* is at the front of the clause over which it has scope. In multi-variable constructions only one phrase can have its scope marked in this way: the scope of the other(s) is not overtly signalled. Hence the scope ambiguity of [43i].

### 7.13 Modification of interrogative words

Interrogative phrases may contain a limited range of modifiers, as illustrated in:

- [46] i a. [*What ever*] *did you do that for?* b. [*Why ever*] *would he do that?*  
 ii a. [*What the hell*] *is she trying to do?* b. [*Who on earth*] *can that be?*  
 iii a. [*Who else*] *will be there?* b. [*What exactly*] *do you mean?*

The items in [i–ii] express surprise or bafflement, and hence suggest that the speaker does not know the answer to the question. They tend to emphasise the open-endedness of the set of possible values for the questioned variable; as a result they are hardly compatible with *which*, for this involves selection from an identifiable set. They do not contribute to the propositional meaning, and we will refer to them as **emotive modifiers**. Variants of *hell* in [iia] are *heck*, *blazes*, *deuce*, *dickens*, *fuck*, etc.

These modifiers are constrained to occur immediately after an interrogative word in head, not dependent, function: \*[*What on earth reason*] *could they have for rejecting it?*; \*[*How ever much*] *did that cost?* The interrogative phrase must be in initial position: contrast \**And after that you went [where the hell]*? Except in combination with *why*, *ever* is found written as part of the interrogative word: *Whatever did you do that for?*<sup>15</sup>

Interrogatives are among those words that accept *else* as postmodifier, as in [46iiia]. *Else* is semantically like *other* (“who other than those mentioned”); it licenses a *than* complement (*What else than this?*). The adverbs *exactly* and *precisely* may follow the head, as in [46iiib], or precede: *Just exactly who do you think you are?*

<sup>15</sup>The more conservative usage manuals say that *ever* should always be written separately in this interrogative construction, but that is in conflict with actual usage. This *ever* is semantically distinct from the *ever* that occurs – always as part of a compound – in fused relatives ([*Whoever* said that] *was mistaken*) and the exhaustive conditional construction (*I won’t sell [however much you offer]*).

## 8 Exclamatives and exclamations

### 8.1 The syntax of exclamatives

Exclamatives, we have said, are marked by one or other of the exclamative words *how* and *what*. These enter into the structure of an exclamative phrase, which is fronted when it is not subject:

- |     |   |                                   |
|-----|---|-----------------------------------|
| [1] | EXCLAMATIVE SUBJECT                                   | EXCLAMATIVE NON-SUBJECT           |
|     | i a. <i>How much remains to be done!</i>              | b. <i>How she hated it!</i>       |
|     | ii a. <i>What strange people inhabit these parts!</i> | b. <i>What a disaster it was!</i> |

Where the exclamative phrase is subject, the order is the same as in matching declaratives: compare *Much remains to be done* and *Strange people inhabit these parts*. Where the exclamative phrase is non-subject, the fronting is obligatory: there is no exclamative analogue of open interrogatives like *And the results of the examination were what?*

Like the open interrogative (cf. §7.11), the exclamative is an unbounded dependency construction, so that the initial exclamative phrase can be linked with a gap in a subordinate clause embedded within the exclamative clause, as in:

- |     |    |   |
|-----|----|---|
| [2] | i  | <i>How <u>impossibly polite</u>; she expected them [to be ___i]!</i>    |
|     | ii | <i>What a waste of time; they thought [it was likely [to be ___i]]!</i> |

As evident from the above examples, the exclamative feature percolates upwards in the same way as the interrogative feature; in [1iia], for example, it goes from *what* to the NP *what strange people*, while in [2i] it goes from *how* to the AdvP *how impossibly*, and thence to the AdjP *how impossibly polite*. It may percolate up into a PP or stop at the NP complement, leaving the preposition stranded:

- |     |    |  |                            |
|-----|----|--|----------------------------|
| [3] | i  | <i>With what unedifying haste he accepted the offer!</i> | [fronting of preposition]  |
|     | ii | <i>What unsavoury people he associates with!</i>         | [stranding of preposition] |

#### ■ Ambiguity between exclamative and open interrogative

*How* and *what* can be either exclamative or interrogative, and in abstraction from the prosody/punctuation such examples as [1ia/iia] are ambiguous between an exclamative reading (“A remarkably large amount remains to be done”; “Remarkably strange people inhabit these parts”) and an open interrogative reading (“What is the amount that remains to be done?”; “Who are the strange people that inhabit these parts?”). Where the clause is not ambiguous, as in the other examples given above, this is due to the distributional differences between exclamative and interrogative *how* and *what* or to differences in the order of elements in the clause. We will consider the exclamative words in the next two subsections, and then take up the issue of order.

Whereas there are a fair number of interrogative words, the exclamative class has only two members, *how* and *what*: clauses like *Who remains to be seen?* or *Which strange people inhabit these parts?* are unambiguously interrogative. Like interrogative words, exclamative *how* and *what* have a dual role: on one dimension they are markers of exclamative clause type, but they also have what we are calling a core role. And in their core role they show some differences from their interrogative counterparts in both grammar and meaning.

### 8.1.1 Exclamative *how*

We will consider two uses of *how*, both adverbial; the first is closely parallel to interrogative *how*, the second quite different.

#### (a) Modifying an adjective, degree determinative, or adverb

*How* commonly functions as a degree modifier. Compare the following exclamative and interrogative examples:

- | [4] | EXCLAMATIVE                               | OPEN INTERROGATIVE                           |
|-----|---|--|
| i   | a. <u><i>How tall</i></u> they are!       | b. <u><i>How tall</i></u> are they?          |
| ii  | a. <u><i>How much time</i></u> we wasted! | b. <u><i>How much time</i></u> did we waste? |
| iii | a. <u><i>How quickly</i></u> it grows!    | b. <u><i>How quickly</i></u> does it grow?   |
| iv  | a. <u><i>How very tactful</i></u> he is!  | b. * <u><i>How very tactful</i></u> is he?   |

In both constructions we are concerned with degree: with exclamative *how* the degree is remarkably great, with interrogative *how* it is to be indicated in the answer. Two differences are to be noted. In the first place, as illustrated in [iv], exclamative *how* can modify another degree modifier such as *very*, *absolutely*, *remarkably*, etc., whereas this is not possible with interrogative *how*. Secondly, while [ia] says that they are tall (remarkably tall), [ib] does not presuppose that they are tall, only that they have some degree, small or large, on the scale of tallness.

#### (b) Modifying a verb

- |     |   |  |
|-----|---|--|
| [5] | i a. <u><i>How</i></u> they deceived her! | b. <u><i>How</i></u> did they deceive her? |
|     | ii a. <u><i>How</i></u> I hated it!       | b. # <u><i>How</i></u> did I hate it?      |

Here we find a sharp difference: exclamative *how* is again concerned with degree, whereas interrogative is rarely used in that way (cf. §7.7 above). Exclamative [ia] means “They deceived her greatly / to a remarkable degree or extent”, while interrogative [ib] means “By what means / In what way did they deceive her?”

### 8.1.2 Exclamative *what*

*What* occurs in NPs with a following noun head: there is no exclamative counterpart to the interrogative *what* of *What did they bring with them?* In NPs with a noun head, we find the following patterns:

- | [6] | EXCLAMATIVE                            | OPEN INTERROGATIVE                                   |
|-----|--|--|
| i   | a. <u><i>What a game</i></u> it was!   | b. <u><i>What game</i></u> was it? [count singular]  |
| ii  | a. <u><i>What games</i></u> he played! | b. <u><i>What games</i></u> did he play? [plural]    |
| iii | a. <u><i>What music</i></u> he played! | b. <u><i>What music</i></u> did he play? [non-count] |

With count singulars, the NPs are overtly distinct, as shown in [i]: the exclamative has *what a*, the interrogative just *what*. In other cases, i.e. with plurals and non-count singulars, as in [ii–iii], there is no overt distinction in the form of the NP itself. We take interrogative *what* to be a determinative functioning as determiner; exclamative *what*, by contrast, is an adjective functioning as external or internal modifier (see Ch. 5, §§7.1.3, 12).

Interrogative *what* is concerned with identity: answers to questions [6iia/iiia] will identify the games/music (e.g. *He played cricket and tennis / Schubert's octet*). Exclamative *what*, by contrast, is concerned with quality and degree: [iia/iiia] indicate that the games/music he played were remarkable for their quality (though whether the speaker approves or disapproves is not indicated: the quality may be remarkably good or remarkably bad). However, if the head noun is gradable, the difference is like that described above for *how* in [4i–iii]: compare *What a size it was!* (its size was remarkable) and *What size was it?*

### ■ Differences between exclamative *what* and *how*

#### Style

*How* is associated with a somewhat formal style, especially in main clauses: *How well she plays!*, for example, is appreciably more formal than *What a fine player she is!*

#### Distribution

*What* occurs only as modifier in NP structure. *How* modifies adjectives, degree determinatives, adverbs, and verbs; it does not function immediately in NP structure, but phrases containing it can occur as external modifier in count singular NPs. (The distributional difference is similar to that between *such* and *so*: see §8.3.) Compare, then, the following exclamative phrases, which might occur in such a frame as ‘*\_\_\_ we have on our hands!*’

- |     |     |   |   |                  |
|-----|-----|---|---|------------------|
| [7] | i   | a. <i><u>what a difficult</u> problem</i> | b. <i><u>how difficult</u> a problem</i>  | [count singular] |
|     | ii  | a. <i><u>what difficult</u> problems</i>  | b. * <i><u>how difficult</u> problems</i> | [plural]         |
|     | iii | a. <i><u>what difficult</u> work</i>      | b. * <i><u>how difficult</u> work</i>     | [non-count]      |

Although *what* is not directly in construction with the adjective *difficult*, it nevertheless indicates a remarkable degree of the property expressed by it, so that with count singulars the meaning of [a] is effectively the same as that of [b]. For plurals and non-count singulars, only the *what* construction is available.

### 8.1.3 Position of the subject

The normal position for the subject in exclamatives is before the predicator. A major grammatical difference between main clause exclamatives and open interrogatives is thus that whereas fronting of an interrogative phrase is obligatorily accompanied by subject–auxiliary inversion, fronting of an exclamative phrase is not:

- |     |                                     |                                       |
|-----|-------------------------------------|---------------------------------------|
| [8] | EXCLAMATIVE                         | OPEN INTERROGATIVE                    |
|     | a. <i>What a mistake they made!</i> | b. <i>What mistake did they make?</i> |

### ■ Subject–auxiliary inversion in exclamatives

However, subject–auxiliary inversion is available as an option in exclamatives, though it is relatively infrequent and characteristic of fairly literary style:

- [9] i *How much clearer does it seem now that you have explained it yourself!*  
 ii *How rarely does one see such chivalry nowadays!*  
 iii *What a row would there have been if they had known you were here!*

The effect of course is to make the structure more like an interrogative, so that from a grammatical point of view there will often be ambiguity as to clause type. In abstraction from the prosody/punctuation, for example, [9i] can be either exclamative (“How much clearer it now seems”) or interrogative (“To what extent does it now seem clearer?”).

Example [iii] is unambiguously exclamative because *what* is here in a count singular NP, where the constructions are distinct. Inversion is not possible with *how* when it is modifying the verb, as in [5ia] (*How they deceived her!*): the inverted *How did they deceive her?* is unambiguously interrogative.

When the clause is grammatically ambiguous, it is not always as clear as one might expect which is the contextually appropriate reading. Consider, for example:

[10] *How often have I told you not to put your feet on the sofa!*

The most salient interpretation of this is as a rebuke and directive (“Don’t put your feet on the sofa”), but in spite of the exclamatory prosody/punctuation this corresponds to the interrogative reading. In this interpretation the force at the direct level is that of question, but it is a rhetorical question which indirectly conveys “I have told you very many times not to put your feet on the sofa”; this is close to the meaning of an exclamative, but not quite the same. An unco-operative addressee could respond with, say, *forty-five times*, thereby answering the question at the direct level. Note, moreover, the clear style difference between [10] and [9ii]: the latter suggests the rather formal style that is characteristic of exclamative *how*, whereas [10] does not.

### ■ Subject postposing

It is also possible for the subject to be postposed when the exclamative phrase is an adjectival predicative:

[11] *How great would have been her disappointment if she had known what they had actually thought!*

## 8.1.4 Verbless exclamatives

An exclamative clause often consists of just the exclamative phrase (or of this plus a coordinator or the like), normally an NP or an AdjP:

[12] *What nonsense! What an insensitive way to behave! What a strange thing for him to say! How fantastic! How incredibly unlucky!*

The infinitival clauses here are relatives. The exclamative phrase is interpreted as a predicative complement, with *be* and the subject understood: “What nonsense that is!”. It is also possible to omit just *be*, with an overt subject in final position: *What a terrible thing, that ‘wailing wall’ in Berlin!*

Another frequent verbless construction consists of an exclamative phrase followed by a declarative content clause, infinitival, or (less frequently) a gerund-participial:

[13] *How strange that nobody noticed the error! What a coincidence that they were on the same bus! How kind of you to let me know! What a nuisance having to do them all again!*

These can be regarded as involving the omission of *it + be*: compare *How strange it is/was that nobody noticed the error!* The subordinate clause thus functions as extraposed subject – and the infrequency of the gerund-participial reflects the fact that such clauses do not readily undergo extraposition.<sup>16</sup>

<sup>16</sup>An idiomatic verbless exclamative is *and how!*, added (in informal style) to what has just been said (by the same or another speaker) as an exclamatory intensifier: *She can certainly play the piano! – And how!*

## 8.2 Meaning and use of exclamative main clauses

Exclamative utterances normally have the force of exclamatory statements. Consider again our initial example:

[14] *How much remains to be done!* (= [1ia])

At the most general level of classification we include this in the statement family because of its resemblance to the straightforward statement *Much remains to be done*. The meaning of the latter is contained within that of the exclamative.

Nevertheless, exclamative utterances are by no means prototypical statements. The exclamatory component gives them a strongly subjective quality, so that they are not presented as statements of fact. Rather, they express the speaker's strong emotional reaction or attitude to some situation. The exclamative indicates that the situation obtains (e.g. [14] indicates that much remains to be done), and this is the statement component of the meaning – but this component is backgrounded relative to the emotive exclamatory component. Several more specific properties follow from this general account.

In the first place, because the statement component is backgrounded it is presented as uncontroversial, not at issue. Thus one normally doesn't envisage disagreement, dispute. This is reflected in the use of interrogative tags:

[15] i *What a disaster it was, wasn't it!* [reversed polarity tag]  
 ii *What a disaster it was, was it!* [constant polarity tag]

Example [i] (with falling intonation on the tag) is possible because such a tag can be used to seek agreement – but note that it is agreement with the subjective attitude (that the situation is remarkable), not just the statement component. However, [ii] would not normally be used because the constant polarity tag in this case would be seeking acknowledgement of the statement component, which is inconsistent with its background status.

Secondly, exclamatives do not give answers to (non-echo) questions: *How I enjoyed it!* is not an answer, and a very unlikely response, to *Did you enjoy it?* In part, this relates to what we have said about the backgrounded status of the statement component: information giving the answer to an explicit question will normally be foregrounded. But a more important reason is the semantic one that exclamative *how* and *what* express variables rather than constants. The construction indicates that the value of the variable is remarkable, but does not explicitly specify what it is. This is why exclamative utterances are not naturally assessed as true or false. Thus one would hardly express agreement by saying *Yes, that's true*: more normal would be something like *Yes, indeed*, or – where the exclamative phrase is non-subject – a reduced interrogative, such as *Yes, didn't she!* in response to *How she hated it!*

### ■ The resemblance between exclamatives and open interrogatives

The property of expressing a variable is of course common to both exclamative and interrogative uses of *how* and *what*, and it is a very widespread phenomenon in the world's languages that exclamative clauses bear strong formal resemblances to open interrogatives. (Because subject–auxiliary inversion generally does not apply in English exclamatives, their resemblance is greater to subordinate interrogatives, and this too is illustrative of the most common pattern.) We have seen that closed interrogatives

altogether excluded, however: they can occur in interrogatives used with the indirect force of an exclamatory statement, as in *Haven't they such charming manners!*

### (c) Extraposable NPs

NPs with the form *the* + . . . N + integrated relative clause / *of* phrase can stand on their own as exclamations:

- [18] i *The money he spends on clothes!*  
 ii *The cost of these clothes!*  
 iii *The way he treats his wife!*

We call these 'extraposable NPs' because they can appear in extraposed subject position with predicates such as *amazing*: *It's amazing the money he spends on clothes / the cost of these clothes; It's a scandal the way he treats his wife*. The verbless examples in [18] are understood in much the same way as these with some generalised exclamatory predicate understood; the attitude implied is usually one of disapproval. An alternative to *the* + N + relative is the fused relative construction: *What some people will do to save a few dollars!* (compare: *The things some people will do . . . !*).

### (d) Imprecative retorts

- [19] A: *I'll invite them round for dinner.* B: *Like hell you will!*

The structure consists of an expletive + personal pronoun subject + auxiliary with anaphoric ellipsis of the complement.

## 9 Imperatives and directives

### 9.1 Subtypes of imperative clauses

The grammatical properties which together define the class of imperative clauses in English were summarised in §2. The most important points are:

- [1] i The subject is an optional rather than obligatory element.  
 ii The verb is in the plain form.  
 iii Supportive *do* is used in relevant constructions with *be*, not just lexical verbs.

#### ■ Ordinary imperatives vs *let*-imperatives

The main syntactic division within the class is between **ordinary imperatives** (the default subclass) and ***let*-imperatives**:

- |     |   |                                   |
|-----|---|-----------------------------------|
| [2] | ORDINARY IMPERATIVE                         | LET-IMPERATIVE                    |
|     | i a. <i>Open the window.</i>                | b. <i>Let's open the window.</i>  |
|     | ii a. <i>Please let us borrow your car.</i> | b. <i>Let's borrow Kim's car.</i> |

*Let*-imperatives are marked by a special use of *let* distinct from the normal use with the sense "allow". *Let* in the "allow" sense is found in all clause types (cf. declarative *He let us borrow his car*), including ordinary imperatives like [iia]. The *let* of [ib] and [iib] has been bleached of this meaning and serves as a marker of this special type of imperative construction.

be some kind of directive for you to give the first lecture, and as a declarative it would be a statement about what you do (e.g. as part of some scheduled lecture programme). With a 3rd person subject, imperative and declarative will in the singular always have overtly distinct verb-forms, but in the plural again only with *be*. Thus [5ii] contrasts with declarative *Somebody gives me the screwdriver*, whereas [iii] is ambiguous between imperative (with directive force) and declarative (with statement force).<sup>17</sup>

### 3rd person subjects

The range of possible subjects is more limited in imperatives than in declaratives, though it is questionable how far this is a matter of grammatical rule. The subject must normally have personal denotation, and dummy or clausal subjects are thus categorically ruled out: \**There be no more talking*; \**That he's over 60 don't be forgotten*. The most likely 3rd person subjects are the compound determinatives (*someone, nobody, everybody*, etc., alone or with dependents – *Everybody over here stay still*; *Anybody with a faulty disk please let me know*), other fused determiner-head constructions with *of you* as complement (*Some/One of you give me a hand with this trunk*; *Those of you who've finished please put up your hands*), and bare plurals (*Passengers on flight QF2 please proceed to Gate 6*; *Gentlemen lift the seat*). Definite NPs with *the* are less likely, but possible (*The boy by the door please turn on the light*), and the same applies to proper names (*Kim move upstage a little*). These 3rd person definites occur somewhat more readily in coordinative constructions (*You and Kim play on the other court*; *You give the first four lectures and the others do the rest*). Personal pronouns other than *you* are very unlikely though they probably cannot be categorically ruled out, especially in the coordinative constructions just illustrated.

### 2nd person subjects

Given that *you* can be omitted, why is it sometimes retained? One factor is the need to mark contrast. In [5i], for example, *you* contrasts with *I*; compare, similarly, *You do the washing-up tonight please: Kim did it last night*. Where there is no such contrast, the addition of *you* has an emotive effect:

- [6] i (Just) *you watch where you put your feet*.  
 ii *You mind your own business*.  
 iii *You sit down and have a nice cup of tea; everything is going to be all right*.  
 iv *You go back and tell him you need more time*.

Very often it contributes to a somewhat impatient, irritated, aggressive, or hectoring effect, as in a natural use of [i–ii]. But [iii–iv] show that it can also have very much the opposite effect of soothing reassurance, encouragement, support. Whether the effect is of the first or the second kind will of course depend on the tone of voice, the content, and the context. What the two cases have in common is perhaps that expression of *you* emphasises the speaker's authority. In the aggressive case, the *you* emphasises that I am telling you, not asking you, to do something. In the reassuring case, I assume the position of one who is assured, one who knows best what to do.

<sup>17</sup>It should be borne in mind that declaratives can be used as indirect directives: directive force is thus no guarantee that an ambiguous clause is construed as imperative. A common way of giving street directions, for example, is illustrated in *You take the first road on the right after the church*, which is normally intended (and pronounced) as a declarative, even though it is (indirectly) a directive. Note that the contextual conditions for an imperative with overt subject would not normally apply to such cases – see the final paragraph of this section.

### 9.2.2 Subject vs vocative in imperatives

In declarative clauses we find a very sharp grammatical distinction between the subject and a vocative (i.e. the underlined element in *We need to talk this over, my boy or Kim, I'm just slipping out to the shops*). One obvious factor is that the subject is obligatory whereas the vocative is optional. It follows that if only one of them is present it can only be the subject. In *Someone in the back row is not in tune*, for example, *someone in the back row* must be subject: there is no possibility of it being vocative.

In imperatives the two functions are less sharply distinct because they are both optional, so that it is possible to have either element without the other:

- [7] i *Nobody move.* [subject]  
 ii *Kim, dear, just come and see what I've found.* [vocative]  
 iii *Someone in the back row(,) please turn on the fan.* [subject or vocative]

*Nobody* in [i] is unambiguously subject because a vocative can't be negative, and in [ii] *dear* marks the NP as unambiguously vocative, but in abstraction from punctuation and prosody *someone in the back row* in [iii] could be either.

Apart from the grammatical factor, there is a pragmatic reason why the distinction is less sharply drawn in imperatives than in declaratives. In declaratives subject and vocative are referentially quite independent. There is no intrinsic connection between the subject-referent and the addressee(s): the subject may of course refer to the addressee(s), but it then does so only coincidentally. But in imperatives the subject is always referentially tied to the addressee(s). This is perfectly consistent with the NP being grammatically 3rd person: *somebody* and *all those in the front row* in [5] are also interpreted as “somebody among you”, “all those of you in the front row”. It follows that with a few exceptions like those in [7i–ii], expressions which have the potential to function as imperative subject can also appear in vocative function, and vice versa.

#### ■ Single NP in imperatives: subject or vocative?

##### NP in initial position

Where the NP is initial, vocative and subject will be distinguished prosodically: the vocative is set apart intonationally, whereas the subject is intonationally linked with the predicator; in writing, the vocative, but not the subject, is set off by a comma. The two functions can of course combine, with vocative + subject effectively the only possible order:

- [8] i *You at the back(,) please make less noise.* [vocative or subject]  
 ii *Kim, you be umpire please.* [vocative + subject]

One grammatical difference is that a subject, but not a vocative, can serve as antecedent for a pronoun. Compare:

- [9] i *Somebody at the front(,) write your name on the board.* [vocative or subject]  
 ii *Somebody at the front write their name on the board.* [subject only]

In [i] *your* is deictic, not anaphoric, and hence has no bearing on the status of the initial NP. In [ii], however, *their* is anaphoric to the initial NP, which requires that it be read as subject.

##### NP in final position

Here the distinction between subject and vocative is somewhat less determinate:

- [10] i *Turn the fan on please, somebody.*  
 ii *Stand up all those who wish to leave.*

### ■ *Don't and do not*

Analytic *do not* occurs as a somewhat more formal variant of inflectional *don't*, except that it is of somewhat doubtful acceptability in constructions like [13i] which have *you* as overt subject. The imperative differs from the interrogative in that the subject cannot come between *do* and *not*. Compare:

- [15] i *Don't you tell her!/?* [imperative or interrogative]  
 ii *Do you not tell her?* [interrogative only]

### ■ *Emphatic imperatives*

Supportive *do* is also used in imperatives to emphasise the positive polarity and again it occurs unconditionally, not just in the absence of an auxiliary, as in non-imperatives:

- [16] a. *Do hurry up.* b. *Do be careful.*

Here too it can either follow or precede an overt subject (though this is unlikely to be just *you*):

- [17] i *Those with a bus to catch do please feel free to leave.*  
 ii *Do at least some of you make a commitment to contribute.*

## 9.2.4 Imperatives as directives

Whereas declarative clauses are prototypically concerned with the truth of propositions, imperatives are prototypically concerned with carrying out some future action. Imperatives are characteristically used as directives, and directives do not have truth values. The issue that arises with a directive is not whether it is true or false, but whether it is (subsequently) complied with. A directive expresses a proposition representing a potential situation: realising or actualising that situation constitutes compliance with the directive.

The terms 'directive' and 'compliance' are to be understood in a broader sense than they have as non-technical terms. There is no everyday word whose normal sense is general enough to embrace the quite wide range of (direct) uses of imperatives: we therefore extend the sense of 'directive' so that it covers not just orders, requests, instructions, and the like but also advice or merely giving permission. Similarly, 'compliance' covers obeying orders, acceding to requests, following advice, or simply doing what one is given permission to do. What is common to the various more specific kinds of directive is that they all 'promote' compliance – with varying degrees of strength, of course. At the stronger end of the spectrum, compliance is required, whereas at the weaker end it is merely accepted: the range of the imperative is therefore comparable to that of the deontic modals *must*, *should*, *may/can* together.

We list and illustrate below a sample of directive categories – with the proviso that since illocutionary force depends on the interplay of a whole variety of factors many of the examples could also be used in other ways than those suggested.

### (a) *Orders, commands, demands*

- [18] i a. *By the left, quick march!* b. *Get out of my way!*  
 ii a. *Release all detainees!* b. *Do as you're told!*  
 iii a. *Keep off the grass.* b. *Don't move!*

With orders, commands, and demands, compliance is required: failure to comply is not countenanced – or is liable to provoke sanctions. For a command, I generally need institutionalised authority to tell you to do something. A demand doesn't have this kind of backing, but I nevertheless forcefully insist on compliance. 'Order' is the most general term for a strong directive; it can cover commands, some demands, and directives issued by some legal authority to the public at large (. . . *By order of the Council*). A prohibition is an order not to do something.

### (b) Requests, pleas, entreaties

- [19] i a. *Please help me tidy up.*                      b. *Kindly lower your voices.*  
 ii a. *Open the door, will you?*                      b. *Give me one more chance, I beg you.*

Here I give you the option of not complying: I am asking, not telling – though very often it will be assumed that you will do as you are asked. It is of course possible for me to ask even when I have the authority to tell: I simply do not present myself as invoking the authority to require compliance. The examples in [19] illustrate various ways in which the 'asking' force is commonly signalled: by means of *please* or (less frequently) *kindly*, by an interrogative tag like *will you?*, or by a performative parenthetical like *I beg you*. There are other devices too, such as *just* in *Just hold the hammer for me a moment*.

The distinction between telling and asking is scalar rather than categorical, and many directives could be reported with either verb. For example, if I say to my spouse *Don't forget to buy some milk on the way home* this could lie somewhere in the middle ground, construable as indeterminate between telling and asking. Categories (a) and (b) together have been called 'wilful' directives: it is, with varying strength, my will that you comply.

### (c) Advice, recommendations, warnings

- [20] i a. *Keep your options open.*                      b. *Don't put all your eggs in one basket.*  
 ii a. *Wait until the price is right.*                      b. *Don't let yourself become too complacent.*  
 iii a. *Mind the step.*                                      b. *Try your uncle, perhaps.*

These are a kind of non-wilful directive: compliance is not something I will, not for my benefit, but rather something I present as being in your interest. It is then up to you whether you comply or not. Suggestions belong in the same family, though here I am merely putting forward a possible course of action for you to consider: there is not the same accountability as there is with advice, in that I am not expected to be able to justify the action as being the best thing for you to do. Some kinds of warning (e.g. *Look out!*) may be very peripheral to this category in that immediate compliance can be more or less a reflex action.

### (d) Instructions and expository directives

- [21] i *Insert a cassette as illustrated with its labelled side facing you.*  
 ii *Dilute 1ml to 20ml with water, and gargle for 30 seconds.*  
 iii *Blend lemon juice, orange rind, and cornflour and add to the cottage cheese.*  
 iv *Take the first road on the right after the post office.*  
 v *Compare these figures with those shown in Table 1 above.*  
 vi *Take, for example, the case of my uncle.*

These too are non-wilful: compliance is primarily in your interest rather than mine, but is presented as necessary for the achievement of the relevant goal – using some appliance, cooking some dish, finding your way somewhere, etc.

Examples [21v–vi] are what we will call **expository directives**. Directives of this kind are used in various kinds of expository discourse, especially written, to engage the active participation of the addressee (there are many examples in the text of this book). They have it in common with instructions like [i–iv] that compliance will serve the purpose in hand: in this case, following the speaker’s exposition.

#### (e) Invitations

- [22] i a. *Come over and see my etchings.*      b. *Bring your family too if you like.*  
 ii a. *Have some more soup.*                      b. *Feel free to call in at any time.*

These have some similarity with advice in that you can choose whether or not to comply (accept) and doing so is intended to be primarily for your benefit – but it is a matter of what you’d like rather than what is calculated to be in your best interest. Invitations may lie at the boundary between the wilful and non-wilful categories, since compliance may be something I’d like too. Where this is not so, they tend to merge with offers, where the speaker has an initiating and enabling role.

#### (f) Permission

- [23] i a. *Yes, go ahead.*                                      b. *Take as many as you’d like.*  
 ii a. [Knock at the door] *Come in.*                      b. *Yes, borrow it by all means.*

The action is something you want to do, but I have the authority to permit or prohibit it. Giving permission promotes compliance in the rather weak sense of not exercising power to stop it or, to put it more positively, removing a potential obstacle.

#### (g) Acceptance

- [24] i *Well, tell her if you want to – it’s all the same to me.*  
 ii *OK, buy it if you insist – it’s your money, after all.*  
 iii *Take it or leave it – it’s my final offer.*

This is the weakest kind of directive. Compliance is not something I positively want, but I haven’t the authority or power to prevent it; I thus merely express acceptance, perhaps with defiance, perhaps with indifference. As [iii] shows, the acceptance use is not sharply distinct from that where the imperative is more or less equivalent to an exhaustive conditional. Compare, similarly:

- [25] i *Say what you like, it won’t make any difference.*  
 ii *Double your offer: I still won’t sell.*

It is arguable that the imperatives here have lost all directive force, and that such examples are instances of indirect speech acts, with direct directive + statement indirectly conveying a concessive statement (“Whatever you say, it won’t make any difference”; “Even if you double your offer, I still won’t sell”). For other indirect uses of imperatives, see [29] and [39–41] below.

### 9.2.5 Agentivity in imperatives

Prototypically, compliance with a directive with the form of an ordinary imperative is a matter of future action by the addressee(s).

### ■ Preference for dynamic VPs

Compliance is a matter of **doing** something. This is why an imperative is likely to have a dynamic rather than a stative VP: *Apply for Australian citizenship* is more natural than *Be Australian* and *Help yourself to some more coffee* more so than *Want some more coffee*. Progressive *be* (like *be* generally) and perfect *have* are stative, and hence relatively infrequent in imperatives. This is especially so with the perfect, where essentially equivalent non-stative constructions of less or at least no greater structural complexity are available – compare:

- |        |  |                                   |
|--------|--|-----------------------------------|
| [26] i | <i>Have finished it before I return.</i> | [perfect: stative <i>have</i> ]   |
| ii     | <i>Have it finished before I return.</i> | [causative: dynamic <i>have</i> ] |
| iii    | <i>Finish it before I return.</i>        | [dynamic <i>finish</i> ]          |

Example [ii] uses the dynamic causative *have* rather than the perfect and is much more natural than [i]. This alternative will of course be available only in a limited set of cases (for example, the non-finite complement of *have* must be transitive), but simply dropping the perfect component, as in [iii], is a quite generally available option. The loss of perfect meaning will not normally be significant, because if you comply with [iii] you will necessarily comply with [i] as well.

### ■ Agentivity conferred by imperative construction itself

It must be emphasised, however, that there is no grammatical rule excluding inherently stative VPs from imperatives. The imperative construction can itself affect the interpretation of the VP, assigning an agentive role to the subject when it would not have (or not necessarily have) such a role in a corresponding declarative. Compare:

- |        |                                     |                                |
|--------|-------------------------------------|--------------------------------|
| [27] i | a. <i>Kim is patient.</i>           | b. <i>Be patient.</i>          |
| ii     | a. <i>Kim saw what time it was.</i> | b. <i>See what time it is.</i> |

Declarative [ia] describes a state, and Kim has a non-agentive role, whereas in [ib] the imperative leads us to assign an agentive role to the understood subject-referent: we interpret it as a directive to exercise self-control, to refrain from acting impatiently. Similarly in [ii]: in declarative [a] the salient interpretation describes a happening, with Kim in the non-agentive role of perceiver, while [b] assigns an agentive role: “Find out / Go and look what time it is”. Where the normal sense of a predicate is stative, acceptability of the imperative will thus depend on how readily it lends itself to such an agentive reinterpretation. For the earlier *Want some more coffee*, for example, we need the interpretation “Get yourself into the state where you want some more coffee”, and this is a pragmatically rather unlikely directive.

### ■ Passive imperatives

Because the agentive role is associated with subject function, passive imperatives are relatively infrequent. This reflects the fact that in declaratives whose predicate assigns an agentive role to one of the arguments the argument concerned is aligned with the subject of the active, not the passive. Compare active *Kim attacked him* and passive *He was attacked by Kim*, where only the former has an agentive subject. Thus *Attack him* makes a perfectly natural imperative, but *Be attacked by Kim* does not. Passive imperatives

are not ungrammatical, however, for the imperative construction can itself, as we have just seen, confer agentivity on a subject that is not assigned an agentive role by the predicate:

- [28] i *Be warned!* (“Heed this warning”)  
 ii *Don’t be intimidated.* (“Don’t allow yourself to be intimidated”)  
 iii *Get checked out by your own doctor.* (“Get your own doctor to check you out”)

Positive passives with *be* are not often found with directive force: [i] has something of the character of a fixed phrase. But negatives lend themselves more readily to such an agentive interpretation, as in [ii] or, say, *Don’t be seen* (“Avoid being seen”). *Get* also facilitates an agentive interpretation, as in [iii], where *be* would be unidiomatic. It is more usual, however, to have a reflexive object here (*Get yourself checked out by your own doctor*), but this involves a different construction, one where it is not the imperative matrix clause itself that is passive.

### ■ Non-agentive imperatives and indirect speech acts

In certain cases the unnaturalness of an agentive interpretation is associated with the use of the imperative as an indirect speech act:

- [29] i *Win \$60,000 for an extra \$1.10.*  
 ii *Sleep well. Get well soon. Have a good week-end. Enjoy your holiday.*

Example [i] illustrates a form commonly used in advertising. While it suggests that winning is subject to your control, that is not in fact so (we may assume): what is subject to your control is just paying the extra \$1.10, but whether doing so results in your winning \$60,000 is a matter of chance. Your role relative to the predicate actually expressed in the verb *win* is therefore non-agentive, and the imperative indirectly conveys another directive where the role is agentive – something like “Spend an extra \$1.10 (on your Gold Lotto ticket or whatever) in order to give yourself a chance of winning \$60,000”.

Imperatives like [29ii] are normally interpreted as wishes. Sleeping well, recovering from an illness, and so on, are situations we do not normally think of as being under our control, and this inhibits a direct interpretation as directives. This use of imperatives as indirect wishes is highly conventionalised, but it is limited to a very narrow range of situations, hardly going beyond the types exemplified here. Note that these illustrate the way indirect speech acts may involve the backgrounding of the direct force without it being totally lost. Although enjoying oneself is generally not thought of as something you can choose to do, your role is not wholly passive, and *enjoy* can certainly be used in imperatives with full directive force (as in *Come on, join in and enjoy yourself*): there seems to be a residue of this directive force in the wishes.

Other non-agentive imperatives are found in constructions with a conditional interpretation: see §9.5.<sup>18</sup>

<sup>18</sup>Controlled compliance is incompatible with past time reference, and imperatives like *Please don’t have eaten it* are highly exceptional and again not interpreted as genuine directives. This example might be used in addressing someone not actually present, expressing the hope that they have not eaten something (e.g. because I know it to have been contaminated and am concerned for their safety).

### 9.3 1st person inclusive *let*-imperatives

#### 9.3.1 Grammatical properties

##### ■ Dialect differences

This construction involves a specialised use of *let*, but there are dialect differences in the extent to which it has diverged from the ordinary verb *let* meaning “allow”. We will therefore distinguish two varieties, Dialects A and B, on the basis of their rejection or acceptance of examples like [30ii]:

[30]		Dialect A	Dialect B
	i <i>Let's go for a walk.</i>	✓	✓
	ii <sup>o</sup> <i>Let's you and I/me make it ourselves.</i>	*	✓

##### ■ Dialect A

This is the more conservative dialect, and here 1st person inclusive *let*-imperatives are analysable as containing the catenative verb *let* together with an NP object and (except in ellipsis) a bare infinitival clause as second complement. The object is *us*, actually or potentially contracted to 's, with an interpretation that includes the addressee(s) in the reference along with the speaker: *Let's go for a walk* proposes that you and I go for a walk, not that I go with some third person.<sup>19</sup>

The differences between this construction and an ordinary imperative may be illustrated with reference to the following pair:

[31]	1ST INCLUSIVE <i>LET</i> -IMPERATIVE	ORDINARY IMPERATIVE
	a. <i>Let us / Let's go with her.</i>	b. <i>Let her go with you.</i>

##### (a) Contraction of *us*

In 1st person inclusions *us* can be contracted to 's, whereas in ordinary imperatives, as indeed in all non-imperatives, it can't: *Don't make us/\*'s look ridiculous*; *He won't let us/\*'s join in*. As it stands, *Let us go with her* is ambiguous between a 1st person inclusive (“I propose that we go with her”) and an ordinary imperative (“Allow us to go with her”), but if we reduce the *us* to 's, only the first possibility remains. Contraction reduces the pronoun to the status of a clitic (i.e. *let's* is phonologically like a single word); this is the usual form, with uncontracted *us* found only in relatively formal style (cf. *Let us pray*, as said in a church service).

##### (b) No subject allowed for *let*

The 1st person inclusive doesn't allow *let* to have a subject, whereas the ordinary imperative normally does. Compare *\*You let's go with her* with the ordinary imperative *You let her go with you*.

##### (c) Interrogative tags

Ordinary imperatives normally allow the addition of an interrogative tag with *you* as subject; comparable tags with 1st person inclusions have *we*. Compare:

[32]	a. <i>Let's go with her, shall we?</i>	b. <i>Let her go with you, will you?</i>
------	--	--

<sup>19</sup>As with the 1st person plural pronoun generally (see Ch. 17, §2.2.2), there are also peripheral uses where *us* refers just to the addressee(s), as when a parent says to a young child, *Now, let's just eat up these carrots*, or just to the speaker, as in the very informal *Let's have a look*.

## (d) Scope of negation

Ordinary imperatives with catenative *let* as verb allow negation of either the imperative clause itself or of the infinitival complement, with a corresponding difference in the semantic scope of the negative. Both constructions are possible with 1st person inclusives, but without the semantic scope difference:

- [33] i a. *Don't let's go with her.*                      b. *Don't let her go with you.*  
       ii a. *Let's not go with her.*                        b. *Let her not go with you.*

There is a very clear difference in meaning between [ib] and [iib]. In [ib] *let* is inside the scope of negation, so it is a matter of your not allowing something (her going with you); in [iib] the *let* is outside the scope of negation, so it is a matter of your allowing something (her not going with you). There is no comparable semantic difference between [ia] and [iia]. Both would normally be used to propose/suggest that we not go with her: the difference is simply stylistic, with [ia] a little more informal than [iia].

(e) *Let not* omissible in ellipsis

The verb *let* cannot be omitted in ellipsis in 1st person inclusives:

- [34] i A: *Let her go with you.*                      B: *Yes, do. / No, don't.*                      [ordinary]  
       ii A: *Let's go with her.*                        B: *\*Yes, do. / \*No, don't.*                      [1st inclusive]

In [i] A addresses the ordinary imperative to some person C and another person B gives an elliptical response understood as “Yes, do let her go with you” or “No, don’t let her go with you”. But these are not coherent responses to a 1st person inclusive imperative; what we would get in [ii] (from the person to whom the directive was addressed) might be, for the positive, *Yes, let's*, with ellipsis only of *go with her*.

These properties of the 1st person inclusive indicate that *let* has here lost its propositional meaning. It does not contribute to the propositional content, does not help specify what action would constitute compliance with the directive. It serves, rather, as a marker of illocutionary meaning. In Dialect A, however, there is no compelling reason to suggest that there has been a reanalysis of the syntactic structure. The data are compatible with an analysis where *let* is still a catenative verb: it is semantically bleached and partly fossilised in its syntax.

## ■ Dialect B

This is the dialect that allows, in informal style, examples like [3oii], *Let's you and I/me make it ourselves*. This would appear to be widely enough used to qualify as acceptable informal style in Standard English.

Syntactically, this construction indicates that the specialisation of *let* has been taken a significant step further. The *'s* is not here replaceable by *us*; for this reason (and also because of the prosody) it is not plausible to treat the NP *you and I/me* as being in apposition to *'s*. It seems clear, rather, that *let* and *'s* have fused syntactically as well as phonologically, and are no longer analysable as verb + object: they form a single word which functions as marker of the 1st person inclusive imperative construction. The NP *you and I/me* will be interpreted not as object of *let* but as subject of the following verb.<sup>20</sup>

<sup>20</sup>Some speakers of Dialect B have a negative construction that provides even stronger evidence of reanalysis: <sup>20</sup>*Let's don't bother*. This is much less common than the construction with an NP after *let's*, and cannot be regarded as acceptable in Standard English. Its syntactic interest is that it shows conclusively that *let* is no longer construed as a verb: a subjectless *don't* could not appear in the complement of a catenative verb.

### 9.3.2 Use of 1st person inclusive imperatives

Like ordinary imperatives, 1st person inclusions are normally used as directives – but with a narrower range of subcategories than was illustrated for ordinary imperatives in §9.2.4. Compliance normally involves joint action by speaker and addressee(s), alone or with one or more others. I commit myself to the action and seek your agreement.<sup>21</sup> For this reason, a verbal response is normally expected, indicating agreement or refusal:

[35] A: *Let's go for a walk.*

B: *Okay, just let me put some shoes on. / Not just now: I must finish this letter.*

The force is thus of a proposal for joint action, which the addressee can accept or reject. The speaker's attitude towards compliance can range from strongly wanting it (*Come on, let's get going: the bus leaves in five minutes*) to merely accepting it (*Okay, let's invite Kim as well, if that's what you want*). With expository directives, the 1st person inclusive tends to suggest less inequality between speaker and addressee than the ordinary imperative, and where *us* is contracted it is less formal:

[36] i *Consider now the effect of increasing the velocity.* [ordinary imperative]

ii *Let's consider now the effect of increasing the velocity.* [1st incl *let*-imperative]

This is one use where no verbal response is expected: agreement is taken for granted.

### 9.4 Open *let*-imperatives

This construction – if it is indeed a syntactically distinct construction – is illustrated in:

[37] i *If he has any evidence to support his allegation, let him produce it.*

ii *Let anyone who thinks they can do better stand for office at the next election.*

iii *If this is what the premier really intends, let him not / don't let him pretend otherwise.*

These differ (in their salient interpretation) from prototypical ordinary imperatives with *let* in that they are not understood as directives to the addressee(s) to allow or permit something. They are roughly paraphrasable with deontic *should*: “he should produce it”; “anyone who thinks they can do better should stand for office”; “he shouldn't pretend otherwise”. They can be used where the speaker has no specific addressee(s) in mind, e.g. in newspaper editorials, and the one(s) on whom the obligation is laid need not be among the audience. They are therefore somewhat peripheral members of the speech act category of directives. Nevertheless, they have it in common with more central directives that they define some future action and call for it to be carried out. As in 1st person inclusions, the *let* does not contribute to defining that future action, but serves as an illocutionary marker.

For this reason, it is again not possible to insert *you* as subject, or to have an interrogative tag such as *will you?* – indeed, no comparable tag at all is possible with these. And as with 1st person inclusions there is no semantic scope contrast with negatives. *Let . . . not* is a great deal more likely than *don't let*, no doubt because such imperatives are characteristically used in relatively formal style, but *don't let* is not excluded, as in [37iii].

<sup>21</sup>A special case is where the action is in fact to be carried out by just one (typically the speaker). For example, I might say *Let's open the window* with the aim of securing your agreement to my opening it. But note that in this scenario I could still report the action subsequently by saying *We opened the window*.

There is, however, no positive grammatical property that sets such clauses apart as a distinct construction (as contraction of *us* does the 1st person inclusives). An alternative analysis, therefore, would be to group them grammatically with ordinary imperatives, treating the difference as a matter of meaning and use rather than form.

One advantage of this is that it avoids the problems raised by the very fuzzy boundary that would separate them. Consider the range illustrated in:

- [38] i *Let the prisoners be brought in.*  
 ii *This proposal was first made, let it be noted, by the Liberal Party.*  
 iii *Let ‘u’, ‘v’, ‘w’ be the velocity components along the ‘x’, ‘y’, ‘z’ axes of a molecule moving with velocity ‘q’.*  
 iv *Now, let me see, what’s the best way of tackling the problem?*

Example [i] differs from *Bring the prisoners in* in that it is not so specifically addressed to those who are to bring the prisoners in. Nevertheless the audience is more directly involved than in cases like [37] – and of course a reformulation with *should* would here be much too weak to capture the meaning. *Let* clearly doesn’t mean “allow”, but it might be argued that it has a causative sense, and hence does contribute to the propositional content, with compliance being a matter of causing the prisoners to be brought in – compare the ordinary imperative *Have the prisoners brought in.*<sup>22</sup>

*Let it be noted* in [38ii] can be roughly glossed as “it should be noted”, but it can be regarded as an expository directive to the addressee(s); it is comparable to an ordinary imperative with *note*: *Note that this proposal was first made...* Example [38iii] illustrates an expository device in scientific discourse, where the speaker assigns values to arbitrary symbols, by fiat, as it were, and invites the addressee to accept these decisions. Because the structure is conventionalised, it would not be possible to insert *you* as subject or add a *will you?* tag, but otherwise the meaning is consistent with *let* having its basic “allow” sense. Note, moreover, that such *let*-imperatives can be coordinated with ordinary ones in the expository use: *To keep things simple, let I be an open interval and assume that all functions mentioned have domain I.*

In [38iv] *let me see* is a conventional way of giving oneself time to think. As such, it doesn’t permit manipulation of the usual kind (adding *you*, a tag, etc.), but this is no reason for denying that *let* here has the “allow” sense and contributes to the propositional content rather than being an illocutionary marker.

## 9.5 Imperatives interpreted as conditionals

When an imperative is the first element in a clause-coordination, it is commonly interpreted as a conditional:

- [39] i *Ask him about his business deals and he quickly changes the subject.*  
 ii *Do that again and you’ll regret it.*  
 iii *Persuade her to agree and I’ll be forever in your debt.*  
 iv *Don’t make him the centre of attention and he gets in a huff.*

Thus we understand “If you ask him about his business deals he quickly changes the subject”, and so on. The examples illustrate the prototypical case, where the second clause is declarative and overtly linked to the imperative by *and*. The conditional interpretation

<sup>22</sup> *Let* has a causative sense not restricted to imperatives in the idiom *let ... know*: *I’ll let you know* means “I’ll tell you”, i.e. “I’ll cause you to know”.

derives from the implicature of consequence that is commonly conveyed by *and* – compare *I'll offer him a 10% discount and he's bound to take it*. The first clause is usually positive, but it is just possible for it to be negative, as in [iv]; the form of the negative shows clearly that it is indeed the imperative construction that we are dealing with here.

Condition is not part of the meaning of the imperative, and the present examples can be regarded as involving indirect speech acts. The direct force of the imperative, that of directive, is lost or backgrounded in varying degrees.<sup>23</sup> In the salient interpretation of [39i] I am not directing you (even in the broad sense we have given to that term) to ask him about his business deals. No illocutionary force attaches to the imperative clause itself: the coordination has a force as a whole – that of a conditional statement. Example [ii] is similar except that a further step follows: the whole indirectly conveys “If you do that again you’ll regret it”, and this in turn conveys “Don’t do that again”, the opposite of what would be directly conveyed by the imperative clause standing on its own. The indirect negative directive results from the undesirability of the consequence expressed in *you’ll regret it*. In [iii] the consequence is desirable, so that the conditional “If you persuade her to agree I’ll be forever in your debt” conveys “Persuade her to agree”, the meaning of the imperative itself. In such cases the distinction between direct and indirect is blurred: it is hardly possible to distinguish [iii] from, say, *Come over around seven and then we’ll be able to avoid the rush hour traffic*, which surely directly conveys a directive to come around seven.

#### ■ Relaxation of constraints applying to imperatives in their directive use

The use of imperatives to convey conditions is a highly conventionalised one, with the result that certain constraints on form and propositional meaning that normally apply to imperatives in their directive use are here relaxed:

- |        |   |                                    |
|--------|---|------------------------------------|
| [40] i | <i>Do that ever again and I'll brain you.</i>                         | [negatively-oriented <i>ever</i> ] |
| ii     | <i>Feel slightly off-colour and he thinks you're dying.</i>           | [absence of agentivity]            |
| iii    | <i>Buy myself the slightest luxury and I'm branded a spendthrift.</i> | [1st sg]                           |
| iv     | <i>Express any misgivings and he accused you of disloyalty.</i>       | [past time reference]              |

Negatively-oriented items like *ever* are normally excluded from positive imperatives, but they occur readily in conditionals (cf. *if you ever do that again*), and the conditional meaning in [i] thus sanctions the *ever*. Imperatives used with directive force (other than those with open *let*) associate an agentive role with the subject, but conditionals of course do not, so that there is no suggestion in [ii] that feeling off-colour is under your control. The reflexive *myself* in [iii] shows that the understood subject is 1st person singular, a normal possibility for conditionals, but not imperatives with directive force. And in [iv] the tense of *accused* shows that we are concerned with past time (“if you expressed any misgivings”), whereas imperatives normally involve future situations. Note that *any* in [iv] is a further case of a negatively-oriented item like *ever* in [i]. Examples like [iii] and [iv] are comparatively rare, but they are possible; they provide further illustration of the way an indirect use can have repercussions on the formal and semantic properties of constructions.

<sup>23</sup>This distinguishes the *and* construction from the one with *or*: *Hurry up or we'll be late*. This conveys “If you don’t hurry up we’ll be late”, but the full directive force of the imperative is retained. For further discussion of the *and* and *or* constructions, see Ch. 15, §2.2.3–4.

### ■ Clause type of second coordinate

The second clause can belong to other clause types than declarative; what is important is not the form but what the clause conveys:

- [41] i *Invite one without the other and what a row there'll be.* [exclamative]  
 ii *Tell the truth and who'll believe you / what'll they do?* [open interrogative]  
 iii *Act in haste and repent at leisure.* [imperative]

Exclamatives, we have seen, have essentially the same force as declaratives and hence [i] needs no explanation. The interrogatives in [ii] would not be used as inquiries. The most likely interpretation of *who'll believe you?* is as a rhetorical question conveying “No one will believe you”; with *what'll they do?* the answer might again be contextually obvious or else be given immediately by the one who put the question (e.g. *They'll say you're being disloyal to your friends*). In [iii] the second imperative indirectly conveys approximately “You'll regret it (for a long time)”.

### ■ *Let*-imperatives

Our conditional examples have all been of ordinary imperatives. Open *let*-imperatives are also possible: *Let anyone question what he says and he flies into a rage*. But 1st person inclusives are not used in this way: in normal use they always retain their directive force. For example, *Let's put up the price and they'll cancel the order* cannot be used like [39ii] to convey the opposite of what is expressed in the imperative (“If we put up the price they'll cancel the order, so let's not put up the price”).

## 9.6 Non-imperative directives

### 9.6.1 Interrogatives as directives

Directives are very often conveyed indirectly by means of interrogatives. This is especially so with requests – particularly when speaker and addressee are not intimates. The imperative structure, we have noted, can be used for a wide range of directives, including orders: to make a request by means of an imperative may therefore run the risk of appearing too brusque or peremptory, even if illocutionary modifiers like *please* and *kindly* are added. In many circumstances indirect directives with interrogative form are considered more polite. This is not to suggest that there is any simple correlation between interrogative form and politeness with directives. In the first place, prosody plays an important and in part independent role: *Can you move your car?* will typically be more polite than *Move your car*, but this can be overridden by an impatient, emphatic tone of voice. Secondly it depends on the content of the interrogative: *Can you move your car* lends itself much more readily to use as a polite request than, say, *Must you park your car across my driveway?*

We find a great variety of interrogative directives, but four of the most important semantic categories concern: (a) your ability to do something; (b) your desire or willingness to do something; (c) the deontic necessity for you to do something; (d) the reason for you to do something:

- [42] i *Can you open the door.* (“Open the door”) [ability]  
 ii *Would you like to / Will you sign here?* (“Sign here”) [desire/willingness]  
 iii *Must you talk so loud?* (“Don't talk so loud”) [deontic necessity]  
 iv *Why don't you bring your radio?* (“Bring your radio”) [reason]

(As noted in §3.2, there is some variation with respect to punctuation, with a full stop often preferred to a question mark in the ability or desire/willingness cases.)

### (a) Ability questions

These lend themselves to indirect directive use since a likely reason for me to be interested in your ability to do something is that I want you to do it. Typical openers are:

- [43] *can you, could you, is it possible (for you), will/would it be possible (for you), are you able, will/would you be able*

The versions with *can* are most frequent, and are especially likely in contexts where the answer is obviously “yes”, so that the direct inquiry force is effectively lost; this will usually apply with such everyday examples as *Can you pass the salt*, etc. The forms with preterites (*could/would*, with the preterite indicating tentativeness) are regarded as more polite.

All the above could be negated: *can't you, couldn't you*, etc. Negative questions are always biased, and in the present case the negation adds some emotive component of meaning, perhaps impatience (*Can't you talk a little louder?*, suggesting you ought to be able to) or persuasiveness (*Couldn't you stay a little bit longer?*). Inflectional negatives always have the ability predicate within their scope; analytic ones with *can* are potentially ambiguous as to scope. *Can you not stand by the door*, for example, can have the *not* in the *can* clause or in the *stand* clause. In the first case it is a negative question conveying the positive directive “Stand by the door”, and in the second it is a positive question conveying the negative directive “Don't stand by the door”.

### (b) Desire/willingness questions

These likewise have a natural connection with directives: if you want or are willing to do something you are likely to comply with a request to do it. Typical formulae are:

- [44] i *will/would you, would you like to / care to / be so kind as to* [+ infinitival]  
 ii *do/would you mind* [+ gerund-participial]

Again the tentative preterite *would* adds to the effect of politeness. (Note that *want* occurs in this use with *do* but not *would*, and is appreciably less polite: *Do you want to clear the table so that we can have lunch?*) Inflectional negatives are possible for those taking infinitival complements, especially the first three (*won't/wouldn't you, wouldn't you like to*); they do not occur with *mind*, for the salient bias of the question would be positive, suggesting that you do/would mind. The analytic negatives *will/would you not* have the scope ambiguity illustrated above for *can*. Compare:

- [45] i *Will you not [take a seat]?* [not in will clause]  
 ii *Will you [not put your feet on the sofa].* [not in put clause]

The pragmatically salient interpretations have primary verb negation in [i], “Take a seat”, and secondary negation in [ii], “Don't put your feet on the sofa”.

Closely related to desire/willingness is prospective intentional future, as in *Are/Aren't you going to tidy your room?* These express doubt as to whether you intend to do what you should do, and for this reason are quite well down the politeness scale.

### (c) Deontic necessity questions

Deontic necessity is usually questioned by *must*, as in [42iii] or *have* (*Do you have to talk so loud?*), though *need, necessary*, etc., are also possible (cf. *Need you / Is it necessary to talk so loud?*). The situation denoted in the complement clause (your talking so loud) is one

that I regard as undesirable, and the question has, in context, a clear negative bias: I don't think there is any necessity for you to talk so loud. Hence the implied directive – whose content is this time the opposite of that expressed in the complement clause. Suggesting that you are unnecessarily doing what I don't want does not of course make for a polite directive.

#### (d) Reason questions

These are usually expressed by means of *why* and have been discussed in §4.5. Here again the content of the implicit directive is the opposite of that expressed in the question, whether the latter is negative, as in [42iv], or positive, as in *Why accept less?* (“Don't accept less”).

#### ■ 3rd person

The above examples all have *you* as subject, but just as imperatives can have 3rd person subjects, so can interrogatives with directive force: *Will everyone remember to sign the register.* It is also possible to have 3rd person subjects in examples like those given in [42]: *Can he come a little earlier tonight?*; *Would he like to return my wrench?*; *Must they talk so loud?*; *Why doesn't she bring her radio?* These aren't equivalent to imperatives because they are not addressed to the person(s) concerned, but can still have indirect directive force, suggesting that you should convey the directive to whoever is to comply.

#### ■ 1st person inclusive

Interrogatives used with essentially the same force as 1st person inclusive imperatives generally begin with *shall we* or *why*:

- [46] i *Shall we go for a swim?*  
 ii *Why don't we eat out tonight? Why waste our time on it?*

At the direct level, [i] is a direction question whose answers are expressed by 1st person inclusive imperatives: in context the question is biased towards the positive answer, “Let's go for a swim”, which it therefore indirectly conveys.

### 9.6.2 Declaratives as directives

Declaratives can be used with either direct or indirect directive force. The direct cases involve the performative construction (§3.1):

- [47] i *I order/beg you to return her letters.*  
 ii *The riding of bicycles on the walkway is strictly prohibited.*

Among the many indirect cases, mention may be made of those involving (a) the speaker's wants or needs; (b) the addressee's future actions; (c) deontic necessity:

- [48] i *I want / need / would like someone to hold the ladder.* [speaker's wants/needs]  
 ii *You are going to / will apologise.* [addressee's future actions]  
 iii *You must / have to come in now.* [deontic necessity]

The indirectness in these cases does not contribute to politeness. Case [48ii] in particular is strongly wilful and coercive: in telling you what you are going to do I conspicuously leave you no choice. Politeness can be achieved, however, by combining declarative and interrogative in a doubly indirect directive:

- [49] *I wonder whether you would mind moving your car a little.*

The statement actually expressed conveys an indirect question (“Would you mind moving your car a little?”), and this in turn is interpreted as an indirect directive. This device generally involves the more polite of the interrogative constructions (note, for example, that *would* is not omissible from the *whether* clause), and the extra indirectness increases the impression of politeness.

### 9.6.3 Non-finite and verbless directives

Directives of this form are commonly used in written notices, where there is a need for brevity:

- [50] i *Smoking prohibited. No visitors allowed beyond this point.* [non-finite]  
 ii *No smoking. No entry. Slow.* [verbless]

Non-finites are typically abbreviated passive performatives (cf. *Smoking is prohibited*). The verbless construction is commonly used in speech to indicate what one is ordering or asking for: *Two black coffees; The hammer, please; Two adults, please* (“I request admission for two adults”); *Single to Manchester* (as in booking transport); and so on.

### 9.7 Imperatives with interrogative tags

Ordinary and 1st person inclusive *let*-imperatives may be anchor to an interrogative tag:

- [51] i *Help yourself, will you / won't you?* [positive ordinary imperative]  
 ii *Don't tell anyone, will you?* [negative ordinary imperative]  
 iii *Let's (not) go with them, shall we?* [1st person inclusive *let*-imperative]

The tags attached to imperatives cannot be derived by grammatical rules of the kind we suggested for tags attached to declaratives (§5.1). They can be regarded as elliptical versions of the full interrogatives *Will you help yourself?*, *Won't you help yourself?*, *Will you not tell anyone?*, *Shall we (not) go with them?*, but the reason truncated versions of these can be attached to the imperative anchors is that they are interrogatives of the types that are commonly used as indirect directives, as described in §9.6.1. The indirect force of the interrogative thus matches the direct force of the imperative anchor.

This is why we can have either a positive or a negative tag with the positive imperative in [51i], but only a positive tag with the negative imperative in [ii]. *Will you help yourself?* and *Won't you help yourself?* can both be used to convey “Help yourself”, and hence both *will you?* and *won't you?* can be attached to *Help yourself*. “Don't tell anyone”, however, can be indirectly conveyed by *Will you not tell anyone*, but not normally by *Won't you not tell anyone*, and hence only *will you?* is an appropriate tag for *Don't tell anyone*.

Nevertheless, the construction is conventionalised in that the tags correspond to only a subset of the interrogatives that can be used with indirect directive force. For example, *Can/Could/Will/Would you not touch it* could all convey “Don't touch it”, but the tag for a negative ordinary imperative is virtually restricted to *will you?* With positives the range is considerably greater: the most frequent are the above *will you?*, *won't you?*, but *would you?*, *can you?*, *can't you?*, *could you?* and, especially in AmE, *why don't you?* are also common (and *wouldn't you?*, *couldn't you?* are possible):

- [52] i *Just give me a hand with these boxes, would you?*  
 ii *Let me have your reply by the end of the week, can you / could you?*  
 iii *Watch where you're putting your feet, can't you?*

*Can* and *could* tend to retain some of their direct inquiry force. *Can't you?* typically conveys some impatience. *Won't you?* and *would you?* are generally the most polite. One context favouring *won't you?* is where the directive is a reminder or otherwise not unexpected: *Be there at six, as we agreed, won't you?* The normal tag for 1st person inclusives is *shall we?*, but *why don't we?* is also a possibility.

## 9.8 No subordinate imperative construction

Imperatives normally occur as main clauses: there is no grammatically distinct construction that can properly be regarded as the subordinate counterpart of a main clause imperative, as *whether she liked it* and *why she liked it* are the subordinate counterparts of the closed and open interrogative main clauses *Did she like it?* and *Why did she like it?* respectively.

### ■ Reporting of directives

Imperatives are generally used as directives, and directive speech acts can of course be reported. But they are reported by means of constructions where the subordinate clauses are syntactically and semantically very different from imperative clauses. Compare, for example:

- [53] i *Leave her alone.* [imperative]  
 ii *Max ordered/told/asked/advised me to leave her alone.* [infinitival]  
 iii *Max asked that I leave her alone.* [mandative subjunctive]

All three constructions contain the plain form of the verb, but the imperative differs from the other two in taking auxiliary *do* for verbal negation and emphatic polarity:

- [54] i *Don't be late.* [imperative]  
 ii *\*He told me to do not be late.* [infinitival]  
 iii *\*He asked that I do not be late.* [mandative subjunctive]

In other clause types subordination does not exclude *do* in this way (compare main *Why didn't they like it?* and subordinate *He asked why they didn't like it*), so the data in [54] suggests we are dealing with different constructions, not main and subordinate versions of a single construction. Compelling evidence for this view comes from the fact that both infinitivals and mandatives allow a much wider range of subject–predicate combinations than we find with imperatives. There are, for example, no main clause imperatives matching the subordinate clauses in:

- [55] i a. *The house was shown to be in need of repair.*  
 b. *She was the first one to realise its significance.*  
 c. *It's unusual for it to rain so much in August.*  
 d. *We can't afford for there to be more disruption.*  
 ii a. *He suggested that the meeting be postponed.*  
 b. *It is essential that there be no more disruption.*  
 c. *It's important that she get all necessary assistance.*

\**Be in need of repair* and \**Realise its significance* are pragmatically anomalous, while \**It rain so much in August*, \**There be more disruption*, and so on are ungrammatical.

The infinitival construction has a vastly greater range of use than the imperative, and examples like those in [55i] bear no significant relation to imperatives at all. The meaning is compatible with its use to report directives, but the interpretation of [53ii] as reports of directives depends crucially on the lexical verb in the matrix clause – *order*, *tell*, etc. The range of the mandative construction is more limited, but still considerably broader than that of the imperative, as evident from the lack of imperative counterparts to the subordinate clauses in [55ii]. The differences in form and meaning between either infinitivals or mandatives on the one hand and imperatives on the other cannot be explained in terms of subordination: we must recognise three syntactically quite distinct constructions.

## 10 Minor clause types

In this final section of the chapter we review summarily a number of main clause constructions that do not belong to any of the major clause types discussed so far. See also the elliptical constructions discussed in Ch. 17, §7.8.

### ■ Optatives

- [1] i *Long live the Emperor. God save the Queen! God help you if you're not ready on time! Far be it from me to complain. So be it.*  
 ii *May all your troubles be quickly resolved! Long may she reign over us!*  
 iii *Would that he were still alive! Would to God I'd never set eyes on him!*

These three constructions express wishes. The examples in [i] are subjunctives. Though the subjunctive construction is fully productive in subordinate clauses, in main clauses it is found only in a narrow range of fixed expressions or formulaic frames. In some the subject occupies its basic position, while in others it is postposed to the end of the clause or to the right of *be*. Construction [ii], which belongs to somewhat formal style, has *may* in pre-subject position, meaning approximately “I hope/pray”. There is some semantic resemblance between this specialised use of *may* and that of *let* in open *let*-imperatives, but syntactically the NP following *may* is clearly subject (witness the nominative form *she*). The construction has the same internal form as a closed interrogative, but has no uninverted counterpart. Construction [iii] is archaic; syntactically it consists of *would* as predicator with a finite clause complement (and optionally the PP *to God* as another complement), but is of course exceptional in that the understood subject (*I*) is not expressed. The subordinate clause is a modal preterite, with the same interpretation as in the regular construction with *I wish* (Ch. 11, §7.2).

### ■ Clauses with the subordinate form

- [2] i *That it should have come to this!*  
 ii *To think that he was once the most powerful man in the land!*

The meaning is close to that of the exclamatives *How amazing it is that it should have come to this / to think that he was once the most powerful man in the land*, with subordinate clauses in extraposed subject function. The subordinate form of the clauses in [2] suggests that, when they stand on their own, as here, they are fragments, containing a subordinate clause but with the matrix frame omitted. Other infinitival constructions that are not overtly embedded include the *Oh to be in England* pattern (which also belongs in the

optative category: “I wish I were in England”) and the negative *Not to worry* (“Don’t / Let’s not worry”), which is rarely found with verbs other than *worry*.

### ■ Conditional fragments

- [3] i *If only you’d told me earlier!*  
 ii *Well, if it isn’t my old friend Malcolm Duce!*  
 iii *If you’d like to move your head a little.*  
 iv *Supposing something happens to part us, June?*

Various kinds of conditional adjunct can be used on their own, with the apodosis left unexpressed. Construction [i], with *if only* + modal preterite indicating counterfactuality, is used to express regret: “How unfortunate you didn’t tell me earlier (because if you had done, things would have been better)” – see Ch. 8, §14.2.1. Construction [ii] involves a fixed frame of the form *if it/that isn’t X*; it is used to express surprise at seeing *X* (so [ii] itself conveys “It is my old friend Malcolm Duce”). Construction [iii] is a further type of indirect directive: “Please move your head a little” (as said by doctor to patient, for example); the missing apodosis is understood along the lines of “that would be helpful”. Example [iv] is understood as a question: “What if . . .?”; the same construction can be used with directive force, as a suggestion or invitation: *Supposing we meet at six*. This fragment construction represents the most common use of conditional *supposing*; *suppose* can be used with the same meaning, but syntactically that gives an imperative clause rather than a fragment.

### ■ Verbless directives

- [4] *Out of my way! On your feet! This way! Everybody outside! All aboard!*  
*Head up! Shoulders back! Careful! Off with his shoes! On with the show!*

Fragmentary structures like these are commonly used for a peremptory type of directive, where immediate compliance is required. In many a verb could be supplied (*Get out of my way!*; *Come this way!*; *Everybody move outside!*; *Put your shoulders back!*; *Be careful!*), but the *off/on* + *with* construction can’t be expanded in this way. Military commands often take this form: *Eyes right!*; *At ease!*; etc. Other types of verbless directive have the form of NPs: *No talking!* or *Two coffees, please*, as used in restaurants, shops, etc.

### ■ Parallel structures

- [5] *The sooner, the better. More haste, less speed. Out of sight, out of mind.*  
*No work, no pay. Once bitten, twice shy. Like father, like son.*

There are numerous lexicalised expressions of this kind, fixed phrases, proverbs, and the like. They consist of a juxtaposition of two expressions of like form. The first two can be seen as elliptical versions of the correlative comparative construction (Ch. 13, §4.6) – cf. *The sooner you decide, the better it will be*. Some have a conditional interpretation (e.g. “If you do no work, you get no pay”). Some, such as the last, bear no clear resemblance to any productive syntactic construction. Similar parallelism is seen in pairs of imperative clauses like *Spare the rod, and spoil the child*, which also have conditional interpretations like those of the non-lexicalised examples discussed in §9.5.

This chapter is concerned with one of the three major classes of finite subordinate clause; the other two classes, relative and comparative clauses, are covered in the next two chapters, while non-finite subordinate clauses are the topic of Ch. 14.

## 1 Subordinate clauses

A subordinate clause characteristically functions as dependent within some larger construction:

- [1] i [The book *she recommended*] *is out of print.*  
 ii *He* [knows *that she is right*].  
 iii [Although *the paper is poorly written*,] *it contains some excellent ideas.*

The underlined clause is modifier of the noun *book* in [i], complement of *knows* in [ii], and complement of *although* in [iii]. Note that in [iii] *it contains some excellent ideas* is a clause contained within a larger construction (the clause that forms the whole sentence), but it has the function of head, and hence is a main clause, not a subordinate one.

### ■ Marking of subordination

Subordination is very often marked by some feature in the internal structure of the clause:

- [2] i *It is clear* [that he made a mistake].  
 ii *They interviewed all those* [she mentioned \_\_\_ in her affidavit].  
 iii *She's asking* [how many copies we will want].

One very simple case is illustrated in [i], where *that* serves directly to mark the clause as subordinate. In [ii] it is the absence of the understood object that distinguishes the subordinate clause from a main clause. And in [iii] what marks the clause as subordinate is the combination of a prenuclear interrogative phrase and the subject + predicator order, for the corresponding main clause has subject–auxiliary inversion (*How many copies will we want?*).

### Not all subordinate clauses are structurally marked as such

English does not require that subordination be marked in the structure of the subordinate clause itself. In *He knows she is right*, for example, the underlined clause is subordinate by virtue of functioning as complement to *know* but it is structurally identical to the main clause *She is right*. We examine the conditions under which the marking is omissible in §3.1.

### Marking may be sufficient to establish that a clause is subordinate

There are certain places where a clause can be marked as subordinate even though it is not functioning as dependent within some larger construction:

- [3] i A: *What are they demanding?* B: [That *the sacked workers be reinstated.*]  
 ii That *it should have come to this!*  
 iii *He took advice from his daughter, who was manager of the local bank.*

The bracketed clause in [i] is the familiar case of an elliptical answer to a question, while [ii] illustrates a special, and rare, exclamatory construction consisting of a content clause without any governing predicate (cf. Ch. 10, §10). The underlined relative clause in [iii] functions as supplement rather than dependent, but it has subordinate clause form by virtue of containing the relative pronoun *who*.

This is why we began by saying that a subordinate clause **characteristically** functions as a dependent. It is also why we use the terms subordinate vs main rather than dependent vs independent. Notice, moreover, that a clause functioning as a dependent may have main clause rather than subordinate clause form, as in *The question they need to answer is why did no one check her references?* (see [21] of §5.3.1).

### ■ Finite and non-finite

A major division within subordinate clauses is between finite and non-finite clauses:

- [4] i *He thinks that she is here.* } [finite]  
 ii *He insists that she be here.* }  
 iii *She wants to be here.* [non-finite]

Most finite clauses have primary forms of the verb – preterite or present tense forms or irrealis *were*. For reasons explained in Ch. 3, §1.8, we also include the subjunctive construction, as in [ii], in the finite class. Non-finite clauses have the verb in the gerund-participle or past participle form, or involve the infinitival use of the plain form, as in [iii]. They differ structurally from main clauses in much more radical ways than do finite subordinate clauses, and are dealt with separately in Ch. 14.

### ■ Relative, comparative, and content clauses

We distinguish three main classes of finite subordinate clause:

- [5] i *I couldn't find the book that I wanted.* [relative]  
 ii *He gave me more copies than I wanted.* [comparative]  
 iii *You know that I wanted it.* [content]

Content clauses can be regarded as the default category on this dimension: they lack the special properties of relative and comparative clauses, and their structure is less different from that of main clauses. Notice, for example, that in [i] and [ii] *wanted* is understood as having an object that is not expressed, whereas in [iii] the object must be expressed, just as it must in main clauses. And those subordinate clauses that show no structural difference at all from main clauses belong in the content clause class, as in the above *I know she is right.*

The term **content clause** reflects this default status: it suggests that the clause is simply selected for its semantic content.

## 2 Clause type

The system of clause type applies to content clauses as well as to main clauses, except that we don't have imperative content clauses as argued in Ch. 10, §9.8. Compare, then, for the other types:

[1]	MAIN	SUBORDINATE (CONTENT)	
	i a. <i>They are in Paris.</i>	b. <i>He says [(that) they are in Paris].</i>	[declarative]
	ii a. <i>Is she ill?</i>	b. <i>He asked [whether/if she is ill].</i>	[closed interrogative]
	iii a. <i>What does he do?</i>	b. <i>I wonder [what he does].</i>	[open interrogative]
	iv a. <i>What a liar he is!</i>	b. <i>You know [what a liar he is].</i>	[exclamative]

We again take declarative to be the default category, and we defer discussion of the special properties of interrogative and exclamative content clauses until §§5–6.<sup>1</sup>

## 3 Subordinators in content clauses

### ■ Expanded (or *that*-) declaratives vs bare declaratives

Declarative content clauses are prototypically introduced by the subordinator *that*, but they are also found without any such marker of subordination:

[1]	i	<i>He knows <u>that you are here</u>.</i>	[expanded declarative / <i>that</i> -declarative]
	ii	<i>He knows <u>you are here</u>.</i>	[bare declarative]

Content clauses introduced by the subordinator *that* we call **expanded declaratives**, or simply *that*-declaratives; those without an introductory subordinator are **bare declaratives**.

### ■ Non-expandable vs expandable declaratives

Certain prepositions take declarative complements that are invariably bare. We call these **non-expandable**. The default class of **expandable declaratives** then comprises all others: they allow, in principle, for the subject–predicate construction to be expanded by a subordinator. This second classification is based, then, not on whether a subordinator is actually present or absent, but on whether or not the content clause is complement to an item which invariably excludes a subordinator, such as *if* and *before* in[2]:

[2]	NON-EXPANDABLE DECLARATIVE	EXPANDABLE DECLARATIVE
	i a. <i>I'll do it <u>if</u> [you pay me].</i>	b. <i>I'll do it <u>provided</u> [(that) you pay me].</i>
	ii a. <i>He left home <u>before</u> [she died].</i>	b. <i>You <u>know</u> [(that) he is guilty].</i>

<sup>1</sup>Blends between declarative and interrogative are occasionally attested: *There are, he thought, so few true means of forgetfulness in this life that why should he shun the medicine even when the medicine seemed, as it did, a little crude?* The *why should he . . .* interrogative (which has main clause syntactic form, evident in the subject–auxiliary inversion) is so strongly biased towards a negative answer that it indirectly conveys “he should not shun the medicine”, and it is this interpretation that allows it to be subordinated by means of the declarative subordinator *that*.

### 3.1 Conditions under which *that* must or may appear

In expandable declaratives structural properties of the matrix may make the subordinator obligatory or, exceptionally, they may require that it be absent. We examine these cases first and then consider those where *that* is omissible.

#### ■ Conditions under which *that* is obligatory

(a) When the content clause is subject or otherwise precedes the matrix predicator

- [3] i [*That they were lying*] is now quite obvious.  
 ii But [*that he really intended to cheat us*] I still can't believe.

Compare these with *It is now quite obvious* [(*that*) *they were lying*], where the content clause is in extraposed subject position, and *But I still can't believe* [(*that*) *he really intended to cheat us*], where it is in post-verbal complement position. What distinguishes [3] from these is that in [3] *that* is needed to signal the start of a subordinate clause: if [i] began with *They were lying* this would be perceived initially as a main clause, whereas in the extraposed subject construction the matrix *It is now quite obvious* prepares the ground for a subordinate clause, and the marker of subordination does not therefore have the essential role that it does in [i]. The same applies in [ii], where we have a further contrast between [ii] itself and *He really intended to cheat us, I believe*. The absence of *that* in the latter indicates that *he really intended to cheat us* is indeed a main clause, and *I believe* is a parenthetical: we have here two main clauses in a supplementation relation, not one clause subordinated within another, as in [3].<sup>2</sup>

(b) The content clause is adjunct

- [4] *He appealed to us to bring his case to the attention of the authorities that justice might be done.*

Content clauses usually function as complement, being licensed by some verb, noun, preposition, etc., in the matrix clause, but they are also occasionally found as adjuncts, as in [4]. Here *that* is needed to show the relation of *justice might be done* to the matrix structure.

(c) When the content clause is complement to comparative *than/as*

In comparative constructions *that* may distinguish a content clause from a comparative clause, as in:

- [5] i *He hired a taxi more often [than he drove my car].* [comparative clause]  
 ii *I'd rather (that) he hired a taxi [than that he drove my car].* [content clause]

Example [i] illustrates the most usual case where *than* has a clause as complement: *he drove my car* is a comparative clause of the type described in Ch. 13, and it would be impossible to add *that*. In [ii], however, *than* has a content clause as complement: it contrasts with (*that*) *he hired a taxi*, which is licensed by the idiom *would rather*. Here the first *that* is optional, but the one in the complement of *than* is obligatory, serving to mark the clause as a content clause as opposed to a comparative.

<sup>2</sup>The difference between the subordination and supplementation constructions is perhaps even clearer in the case of interrogatives: compare *Whether it was deliberate I won't ask* (subordination) and *Was it deliberate, I ask myself?* (supplementation).

### ■ When *that* must be omitted

*That* is not permitted when the content clause is embedded within an unbounded dependency construction in such a way that its subject is realised by a gap:

- |     |     |  |                         |
|-----|-----|--|-------------------------|
| [6] | i   | <i>She thinks [(that) Max is the ringleader].</i>        | [ <i>that</i> optional] |
|     | ii  | <i>Who does she think [__ is the ringleader]?</i>        | [ <i>that</i> excluded] |
|     | iii | <i>Max is the one she thinks [__ is the ringleader].</i> |                         |

*That* is allowed in [i] but not in [ii–iii] (these being unbounded dependency constructions in the sense of Ch. 12, §7): compare \**Who does she think that is the ringleader?* and \**Max is the one she thinks that is the ringleader.* In [ii] the subject of *is the ringleader* is realised by a gap linked to *who* in the superordinate interrogative clause. The content clause subject is likewise realised by a gap in [iii], where the content clause is embedded within a relative clause.<sup>3</sup>

The obligatory absence of *that* in such clauses is quite consistent with our saying that *think* selects an expandable declarative as complement. The inadmissibility of *that* in [6ii–iii] is not attributable to *think* but to non-lexical aspects of the structure: it is different in kind from the inadmissibility of *that* in the complement of prepositions like *if* and *before* in [2ia/ia].

### ■ Optional omission of *that*

The default case is the one where *that* is present as a marker of the subordinate status of the clause. Departures from this default case, declaratives without *that*, are more likely in informal than in formal style. For the rest, the relative likelihood of dropping the *that* depends largely on the structure of the matrix clause but also on that of the content clause itself. Factors which favour respectively the omission and the retention of *that* are illustrated in [7i–ii]:

- |     |    |   |
|-----|----|---|
| [7] | i  | a. <i>I think [it's a good idea].</i>   |
|     |    | b. <i>She said [they'd had a wonderful holiday].</i>  |
|     |    | c. <i>It's a good job [we left early].</i>  |
|     | ii | a. <i>One of them mentioned to me [<u>that</u> your secretary might be leaving].</i>                |
|     |    | b. <i>It distresses me [<u>that</u> he is trying to lay the blame for the accident on us].</i>      |
|     |    | c. <i>I didn't like his insinuation [<u>that</u> we had initiated the complaint].</i>               |
|     |    | d. <i>She said [<u>that</u> because of the new regulations they had to lay off ten more staff].</i> |
|     |    | e. <i>It was possible [<u>that</u> she was ill and <u>that</u> her mother had gone to see her].</i> |
|     |    | f. <i>This motion, [<u>that</u> the subscription be increased by 50%,] was quickly defeated.</i>    |

In [ia–b] the content clause is complement to a common and quite general verb of cognition or communication, and in [ic] it is extraposed subject in a matrix clause containing *be* + a short predicative complement. In [ia], moreover, *I think* is likely to be backgrounded to the status of a modal qualification, informationally comparable to a parenthetical (cf. *It's a good idea, I think*); similarly with *it seems* in *It seems we made a mistake*.

Turning now to the examples with *that*, note that the verb in [7iia] is longer and less common than *say*, and also that the content clause is separated from the verb by another

<sup>3</sup> Acceptability is improved by adding between *that* and the gap an adjunct of the kind that could occur between *that* and an overt subject. Compare *She said that in her opinion Max was the ringleader* and <sup>3</sup>*[the one] who she said that in her opinion was the ringleader*. We doubt whether such structures can be considered grammatical, however, and have not catered for them in formulating the constraint.

phrase. In [iib] the content clause is extraposed subject in a transitive matrix clause. In [iic] it is complement to a noun; omission is not impossible in this construction, but it is unlikely with a morphologically complex noun like *insinuation* (compare *The fact [it was illegal] didn't seem to worry him*, with the simple noun *fact* as head). In [iid] *that* is followed by a non-subject element (the PP *because of the new regulations*), and *that* signals that the phrase belongs in the subordinate clause, not the matrix. Omission of *that* is very unlikely in such cases, though probably not impossible in rather casual speech (*I think [often they don't realise how much it means to her]*). In [iie] the repetition of *that* makes clear that the coordination is between subordinate clauses: without the second *that* the second coordinate (*her mother had gone to see her*) could be construed as a main clause, and hence as being presented as a fact rather than a possibility. (In many cases, of course, it will be clear from the sense that the coordination is at the level of subordinate clauses, and the second *that* will then be readily omissible: *It is possible [that you are right and I am wrong]*.) Finally, in [iif] the content clause is a supplement to the NP *this motion* rather than being integrated into the structure of the NP as a complement of the head noun *motion*; the pressure to retain *that* is so great here that this construction might be included among those where the subordinator is strictly obligatory.<sup>4</sup>

### ■ How as subordinator

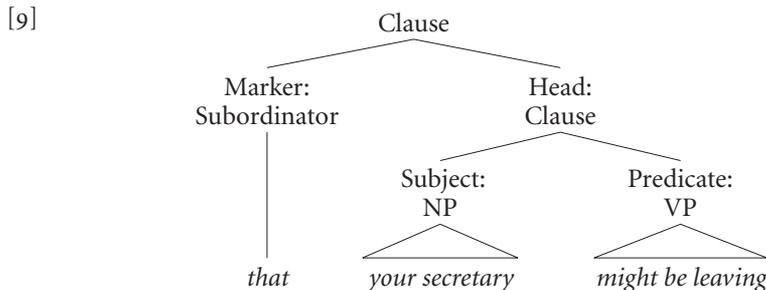

In very informal style *how* can be used without any trace of its usual manner (or degree) meaning, and in such cases it is arguable that it is no longer an interrogative word but has been reanalysed as a declarative subordinator, a variant of *that*:

- [8] *He thought of the time he had ridden to Gavin and told him how his cattle were being rustled at the far end of the valley.*

In the salient interpretation *how* here is simply equivalent to *that*. The interrogative origin, however, is reflected in the fact that it is found only in the complement of items that allow interrogative as well as declarative complements: compare *\*I believed how his cattle were being rustled*.

## 3.2 The syntactic category of subordinator

The structure we propose for a *that* clause such as *that your secretary might be leaving* in [7iia] is as follows:

<sup>4</sup>A rather different kind of factor is involved in such an example as *I would ask that you keep me fully informed*, where *that* is hardly omissible. It serves here to distinguish the finite construction from the infinitival one of *I would ask you to keep me informed* (where *you* is object of *ask*).

There are two features of this analysis that require explanation: the initial constituent structure division into *that* + *your secretary might be leaving*, and the treatment of the second constituent (*your secretary might be leaving*) as the head. Note that it is because this element is head that we can apply the term ‘clause’ both to it and to the larger construction; more specifically, it is a bare clause while the larger one is an expanded clause.

### ■ The binary division into *that* + the rest

The main argument here comes from coordination: *that* may combine with a coordination of subject–predicate constructions.

- [10] i *I told him [that the kitchen tap was dripping and the doorbell wasn't working].*  
 ii *I concluded [that I hadn't installed the program properly or else it was defective].*

Note that it would not be possible to argue that the coordination is simply between a *that* clause and a bare one (e.g. that the coordinates in [i] are *that the kitchen-tap was dripping* and *the doorbell wasn't working*). That would not account for the semantic difference between [ii] and the pragmatically less likely *I concluded that I hadn't installed the program properly or else that it was defective*. Example [ii] says that the conclusion I came to contained a disjunction, an *or*-coordination: I concluded that one or other of two possibilities obtained. The version with repeated *that*, by contrast, says that I came to one or other of two conclusions. The distinction is perhaps easier to see if we insert correlative *either*:

- [11] i *I concluded [that either I hadn't installed the program properly or else it was defective].*  
 ii *I concluded [either that I hadn't installed the program properly or else that it was defective].*

Version [ii] is pragmatically rather unlikely because it suggests I can't now remember which of these conclusions I came to. What this contrast shows is that *that* in [10] serves to mark as subordinate the whole of the coordination that follows it. We need to say, therefore, that *that* enters into construction with either a clause or a coordination of clauses.

### ■ Why *that* is not the head

#### Omissibility

One obvious reason for treating *that* as a dependent element in the construction, rather than the head, is that it is frequently omissible: we have either *I know that it's wrong* or *I know it's wrong*. What we're suggesting is that *that* is simply a syntactic marker of subordination, and in contexts where the subordinate status of the clause is predictable from features of the matrix structure the marker may be omissible.

#### Licensing

A second argument is based on the contrast between such examples as:

- [12] i *We insist [that the work be finished this week].*  
 ii *\*We hope [that the work be finished this week].*

Here we have subjunctive content clauses (as evident from the plain form *be*), and the contrast shows that such a clause can be licensed by *insist* but not by *hope*. If *that* were head with the bare clause as its complement we would have an exceptional situation where a verb determines the form not directly of its own complement but of the complement within the latter.

### Position of preposed adjuncts

It is possible for a preposed adjunct that is part of the content clause to precede *that*:

- [13] *The boat was such an attraction that I was afraid, [if he came near it again, that I should never see the last of him].*

The *if* phrase here is an adjunct not in the *be afraid* clause, but in the content clause that functions as complement of *afraid*. The most usual position for it would be after the *that*, but the fact that it can precede indicates that the *that* is construed as part of the subordinate clause itself, not as a head element taking the subordinate clause as its complement. The adjunct occupies initial position within the content clause, just as it does in the main clause counterpart *If he came near it again, I should never see the last of him*.

### ■ Whether

We treat *whether* in the same way: it (together with its variant *if*) is a marker of subordination in interrogatives, as *that* is in declaratives. *Whether* is not omissible in the same way as *that*: it is only the default clause type declarative that can dispense with a marker, *whether* being required to distinguish interrogative from declarative. However, it is restricted to closed interrogatives, with the open type being marked as interrogative by the initial interrogative phrase. Compare, then:

- [14] i *They didn't say [(that) they needed some help].* [declarative]  
 ii *They didn't say [whether they needed some help].* [closed interrogative]  
 iii *They didn't say [what help they needed].* [open interrogative]

In all of these the bracketed expression is a clause; [i] has an omissible subordinator, [ii] a non-omissible one, while [iii] does not allow a subordinator at all, the initial prenuclear position being filled instead by the interrogative phrase *what help*. This phrase has the function of object within the content clause: it is not a head, with *they needed* as dependent. *Whether* differs from *what help* in that it has no role as complement or adjunct within the content clause, but the two expressions are alike in that they both mark the clause as interrogative. The similarity between *whether* and an interrogative phrase is reflected in the fact that certain limited patterns of coordination are permitted: *She didn't know whether or to what extent he was involved in the conspiracy*.

The similarity between *whether* and *that* is also seen in the following example, which is parallel to [13] above:

- [15] *He wondered, [if the ceiling did drop, whether he and the other flights would be able to find their way back in this unfamiliar territory].*

The *if* phrase again belongs in the content clause: it relates not to his wondering but to their being able to find their way back. Nevertheless, it precedes *whether*. Note also that *whether* could here too be replaced by an interrogative phrase such as *how*.

## 4 Functions of declarative content clauses

In this section we review in turn the various functions in the structure of clauses and phrases that can be filled by declarative content clauses.

## 4.1 Subject

The prototypical subject is an NP; all verbs (and VPs) allow an NP as subject, but some license a content clause as well:

- [1] i *Their failure to reply doesn't worry her.* [NP as subject]  
 ii *That they haven't replied doesn't worry her.* [content clause as subject]

Content clauses do not have the full set of subject properties listed in Ch. 4, §3.1. In particular, they cannot undergo subject–auxiliary inversion: \**Doesn't that they haven't replied worry her?* Nevertheless, clauses have enough of the distinctive subject properties to make their analysis as subject unproblematic. They occupy the distinctive subject position before the verb, as seen in [1]. Note also such examples as:

- [2] i *That the project has not been properly costed is a serious objection, isn't it?*  
 ii *That the project has not been properly costed and that the manager is quite inexperienced are just two of my objections to your proposal.*

Example [i] is the interrogative tag construction: the pronoun subject of the tag has as its antecedent the subject of the declarative clause, in this case *that the project has not been properly costed*. And the contrast between [i] and [ii] shows that subject–verb agreement holds between the verb and the initial element, a single clause in [i], a coordination of clauses in [ii].

Constructions containing a *that* clause as subject are illustrated in:

- [3] i *That he tried to retract his statement is hardly surprising.* [complex-intransitive]  
 ii *That the work might be a forgery simply hadn't occurred to us.* [other active]  
 iii *That she did everything in her power to help cannot be doubted.* [passive]

We will give in turn a sample of governing expressions that license constructions [i] and [ii]; some of the verbs found in the passive [iii] are noted in §4.2 below, when we examine the corresponding active construction.

### ■ Subject of a complex-intransitive clause

The clausal subject of [3i] is licensed by *surprising*, the head of the predicative complement. Examples of predicatives allowing a declarative content clause as predicand are given in [4i] (adjectival) and [4ii] (with nouns as head):

- [4] i *apparent clear critical disconcerting disgusting*  
*distressing due [to] evident important indisputable*  
*inevitable obvious remarkable significant striking*  
*suggestive true undeniable vital worrying*  
 ii *an accident an asset a consequence a factor an irony*  
*a measure [of] a miracle a reflection [of] a source [of] a tribute [to]*  
*no consolation no reason [for] testimony [to] the fault [of] the result [of]*

### ■ Subject of other active clause constructions

Declarative content clauses are also found as subject of such transitive and intransitive verbs as the following:

- [5] *amuse bother deter disgust enrich help*  
*illustrate indicate influence infuriate matter mean*  
*offend reflect reveal show suggest surprise*

It should be borne in mind, however, that what licenses a subject of this kind is often not the verb alone, but the verb in combination with one or more complements – for example, such expressions as *bring home to NP that . . .*, *cloud the fact (that) . . .*, *leave NP AdjP* (e.g. *leave us confused*), *make sense*, *offer testimony to . . .*, *underline the point (that) . . .*

### ■ Postposing of subject

It is possible for a content clause to occupy matrix final position as a postposed subject:

[6] *Even more disturbing is that the neighbours hadn't noticed his absence.*

This, however, is quite rare. It would be more usual to use one of the following constructions:

- [7] i *Even more disturbing is the fact that the neighbours hadn't noticed his absence.*  
 ii *What is even more disturbing is that the neighbours hadn't noticed his absence.*  
 iii *It is even more disturbing that the neighbours hadn't noticed his absence.*

In [i] the content clause is complement to a noun (*fact*), in [ii] it is complement to *be* in a pseudo-cleft clause, and in [iii] it is extraposed subject.

## 4.2 Internal complement in clause structure

This section surveys constructions containing a declarative content clause within the matrix VP, as in:

- [8] i *Everyone expected that he would resign.*  
 ii *They told us that the battery was flat.*

For reasons we will take up in §8.3, we do not analyse the content clauses in such constructions as objects: we take them simply as internal complements of the verb. We exclude from consideration at this stage those content clauses that are in construction with dummy *it* (as in *It seems that he was wrong*, for example): these are dealt with separately in §4.3.

In the default case, there is a related passive, with the content clause as subject ('Type I') or extraposed subject ('Type II'):

- [9] i *They cannot dispute that they misled us.* [active]  
 ii *That they misled us cannot be disputed.* [passive, Type I]  
 iii *It cannot be disputed that they misled us.* [passive, Type II]

Type I passives are rare, and acceptable with only a fairly small number of verbs. Verbs in the following sample lists are marked '-P' only if they are excluded from Type II as well as Type I; 'P' indicates that the passive is questionable.

### ■ Content clause as the only internal complement: *She decided that it was a hoax*

- |      |                |                  |                    |                |                   |                 |
|------|----------------|------------------|--------------------|----------------|-------------------|-----------------|
| [10] | <i>accept</i>  | <i>add</i>       | <i>allege</i>      | <i>care -P</i> | <i>claim</i>      | <i>consider</i> |
|      | <i>contend</i> | <i>decide</i>    | <i>dispute</i>     | <i>fear</i>    | <i>feel</i>       | <i>find</i>     |
|      | <i>forget</i>  | <i>gather -P</i> | <i>guess</i>       | <i>hope</i>    | <i>imagine</i>    | <i>maintain</i> |
|      | <i>presume</i> | <i>realise</i>   | <i>reason</i>      | <i>reflect</i> | <i>rejoice -P</i> | <i>suppose</i>  |
|      | <i>suspect</i> | <i>think</i>     | <i>threaten ?P</i> | <i>vote</i>    | <i>wonder -P</i>  | <i>worry -P</i> |

Impossible and questionable passives may be illustrated by the contrast between *We gather that it was an accident*, *He threatened that the meeting would be disrupted*, and:<sup>5</sup>

- [11] i \**It is gathered that it was an accident.*  
 ii ?*It was threatened that the meeting would be disrupted.*

#### ■ With optional PP as first internal complement:

*She suggested (to me) that he was ill*

[12] i	<i>admit</i>	<i>announce</i>	<i>assert</i>	<i>boast</i>	<i>brag</i> <sup>?P</sup>
	<i>complain</i>	<i>confess</i>	<i>declare</i>	<i>disclose</i>	<i>explain</i>
	<i>hint</i>	<i>insist</i>	<i>let on</i> <sup>?P</sup>	<i>mention</i>	<i>object</i>
	<i>point out</i>	<i>pray</i> <sup>?P</sup>	<i>propose</i>	<i>protest</i>	<i>prove</i>
	<i>remark</i>	<i>reply</i>	<i>report</i>	<i>reveal</i>	<i>say</i>
	<i>signal</i>	<i>state</i>	<i>suggest</i>	<i>swear</i> <sup>?P</sup>	<i>testify</i>
ii	<i>conclude</i>	<i>discover</i>	<i>elicit</i>	<i>gather</i> –P	<i>hear</i>
	<i>infer</i>	<i>learn</i>	<i>notice</i>	<i>observe</i>	<i>see</i>
iii	<i>agree</i>	<i>arrange</i>	<i>confirm</i>	<i>organise</i>	<i>pled</i>

With the verbs in [i] the optional PP is a *to* phrase whose NP indicates the recipient of some act of communication. In [ii] the preposition is *from*, indicating the source – either a speaker (*I gather from Kim that you are going to Paris*) or evidence (*I conclude from your silence that you have no objections*). In [iii] the preposition is *with*: *I had organised with the secretary that the meeting should be postponed*.

#### ■ With NP as first internal complement: *You told me that you would help*

[13] i	<i>assure</i>	<i>convince</i>	<i>inform</i>	<i>notify</i>	<i>persuade</i>
	<i>reassure</i>	<i>remind</i>	<i>satisfy</i>	<i>tell</i>	<i>thank</i>
ii	<i>advise</i>	<sup>?ask</sup>	<sup>?beg</sup>	<i>caution</i>	<sup>?command</sup>
	<i>forewarn</i>	<sup>?instruct</sup>	<sup>?order</sup>	<i>promise</i>	<i>show</i>
	<i>teach</i>	<i>warn</i>			

With the verbs in [i] the NP is normally obligatory.<sup>6</sup> With the verbs in [ii] it is optional and those marked ‘?’ (all of them mandative) occur much more readily without the NP object. It is the NP that corresponds to the subject of related passives, so that passives with the content clause as extraposed subject are restricted to constructions where the NP is omitted:

- [14] i *We have been shown that the program is defective.*  
 ii *It has been shown that the program is defective.*  
 iii \**It has been shown us that the program is defective.*

#### ■ As complement to the verb *be*

- [15] i *The reason he resigned was that he didn't get on with the boss.*  
 ii *What she said was that she'd be contacting us later in the day.*  
 iii *The fact/problem/rumour is he can't afford the rent.*

<sup>5</sup> *Wonder* allows passives in such modal contexts as *Can it be wondered that he feels insecure?*, but not normally in non-modal contexts like \**It is wondered that he feels insecure*. For *worry* we have *I worry that he may have left it too late*, but not \**It is worried that he may have left it too late*; *I'm worried that he may have left it too late* is perfectly acceptable, but this is not a passive clause since *worried* is here an adjective.

<sup>6</sup> The NP object is omissible when informal *how* is the subordinator: *He told how he'd had to sleep in the carport*. *Thank* appears in this construction with a limited range of objects, as in *I thank my good fortune I wasn't at home at the time* – with others the second complement is a *for* phrase (*I thank you for being so patient*).

Examples [i–ii] are straightforward instances of the specifying use of *be* described in Ch. 4, §5.5; the content clause identifies the value of the variable expressed in the subject.<sup>7</sup> Example [iii] can be spoken with two intonation groups, the first ending with stressed *is*, in which case it is hardly possible to have *that* in the content clause. Although the subject NP contains the definite article, there is no reference to any previously mentioned or independently definable fact, problem, or rumour. The effect here is to present the content clause as new information, rather than to specify the value of a variable – and in this interpretation it is certainly not possible to reverse the order of the elements related by *be*.

### 4.3 Content clauses in construction with *it*

#### 4.3.1 *It* as subject

##### ■ Extraposed subject

The clausal subject construction illustrated in [3] (*That he tried to retract his statement is hardly surprising*, etc.) is by no means rare, but it is nevertheless much more usual for the content clause to occur in extraposed subject function, at the end of the matrix clause:

- [16] i *It is hardly surprising that he tried to retract his statement.*  
 ii *It simply hadn't occurred to us that the work might be a forgery.*  
 iii *It cannot be doubted that she did everything in her power to help.*

The relationship between the two constructions with and without extraposition is discussed in Ch. 16, §7.

##### ■ The impersonal construction with *it* as subject

- [17] i *It appeared/seemed that he was trying to hide his true identity.*  
 ii *It chanced / (so) happened / turned out that she had just been to the bank.*

In this construction the subject is semantically empty (as indicated by the term **impersonal**), so that the content clause represents the sole argument of the matrix clause. For [i] this can be brought out by a paraphrase containing an adverb instead of the matrix verb: *Apparently/Seemingly he was trying to hide his true identity*. Similarly the version of [ii] with *chance* as verb is approximately equivalent to *By chance, she had just been to the bank*. Some of the verbs concerned allow a further complement containing an NP with the semantic role of experiencer: *It seems to me she's probably right* or *It strikes me that we are losing control*. For other verbs in this impersonal construction, see [10i] of Ch. 16, §7.1.

We take the content clause in [17] to be an internal complement of the verb. The construction bears some resemblance to the one shown above in [16], where the content clause occurs in extraposed subject position, but differs from it in that the subordinate clause cannot occupy the actual subject position. Compare:

- |      |                                       |  |
|------|---------------------------------------|--|
| [18] | INTERNAL COMPLEMENT ONLY              | EXTRAPOSED OR SUBJECT                      |
| i    | a. <i>It seems that he was wrong.</i> | b. <i>It is obvious that he was wrong.</i> |
| ii   | a. <i>*That he was wrong seems.</i>   | b. <i>That he was wrong is obvious.</i>    |

<sup>7</sup>We noted that *remain* is occasionally used with its complements interpreted as variable and value, and it too allows a content clause as value: *My main objection to your article remains that it is too speculative*.

In spite of this difference many grammars do in fact treat the content clauses in [17] as extraposed subjects: the ungrammaticality of [18iia] is accounted for by saying that with these verbs extraposition is obligatory. There are, however, a number of objections to this analysis.

#### No structural reason for extraposition to be obligatory

The contrast between [ia] and [iia] in [18] is quite different from that seen in:

- [19] i *Isn't it obvious that he is wrong?* } [extraposition obligatory]  
 ii *\*Isn't that he is wrong obvious?* }

Here it is reasonable to say that extraposition is obligatory, because [ii] is excluded by a general structural constraint preventing a finite clause occurring in the post-auxiliary position. But there's no such rule blocking [18iia]: finite clauses can occupy subject position if licensed by the verb or VP. Indeed, the inadmissibility of [18iia] is not attributable to the fact that the subject is a clause: no other kind of expression (besides impersonal *it*) would be acceptable here. Ordinary subjects are possible if we add an internal complement, but that changes the construction and makes it possible to have a content clause as well as an ordinary NP in subject position:

- |      |  |   |
|------|--|---|
| [20] | IMPERSONAL CONSTRUCTION                | ORDINARY COMPLEX-INTRANSITIVE                       |
| i    | a. <i>It seems that he was guilty.</i> | b. <i>It seems <u>clear</u> that he was guilty.</i> |
| ii   | a. <i>*That he was guilty seems.</i>   | b. <i>That he was guilty seems <u>clear</u>.</i>    |
| iii  | a. <i>*His guilt seems.</i>            | b. <i>His guilt seems <u>clear</u>.</i>             |

In the [b] examples *seem* takes *clear* as predicative complement, and this licenses as subject either an NP (*his guilt* in [iiib]) or a content clause (*that he was guilty* in [iib]). Example [ib] is an alternant of [iib] and a straightforward case of the construction with extraposed subject. Similarly in the construction with an infinitival complement (the catenative construction):

- [21] i *It seems to have surprised her that he was guilty.*  
 ii *That he was guilty seems to have surprised her.*  
 iii *His guilt seems to have surprised her.*

But examples [iia] and [iiia] in [20] show that *seem* can't occur in monovalent constructions. The deviance of [iia] has nothing to do with extraposition: it simply doesn't satisfy the complementation requirements of *seem*. The same applies with the other verbs illustrated in [17]: cf. *\*A meeting chanced*; *\*Their friendship happened* (not possible with the relevant sense of *happen* – compare *It so happened that they were friends*); *\*A disaster turned out*.

#### Coordination

Compare next:

- [22] i *It seemed that he was trying to hide his true identity.*  
 ii *It was later confirmed that he was trying to hide his true identity.*  
 iii *\*It seemed and was later confirmed that he was trying to hide his true identity.*

Example [ii] is a clear case of the extraposition construction: if [i] also belonged to this construction it should be possible to coordinate the contrasting parts *seemed* and *was later confirmed*. However, [iii] shows that this can't be done, suggesting that the content clause does not have the same function in the two cases.

### Complementation with *as if*

With *seem* and *appear* the content clause in what we are analysing as the impersonal construction can be replaced without any perceptible change of meaning by a phrase introduced by *as if* (or *as though* or *like*), a type of phrase also found with such verbs as *feel*, *look*, *smell*, *sound*, *taste* – and *be*:

- [23] i *It seemed that / as if he was trying to hide his true identity.*  
 ii *It looked/was as if he was trying to hide his true identity.*

*As if* phrases cannot function as subject, so there is no question of an extraposed subject analysis for this construction: we must recognise an impersonal construction containing an internal complement with the form of an *as if* phrase. To cater for *It seems that...* we need only add that with *seem* and *appear* this internal complement can also have the form of a content clause.<sup>8</sup> The similarity between the content clause and the *as if* phrase is seen in examples like:

- [24] *It seems to me as if / that they have a reasonable chance of winning; is that how it seems to you?*

The internal complement of *it seems* is here questioned by *how*, with either an *as if* phrase or a content clause providing an appropriate answer. Not only does this show the similarity between the content clause and an *as if* phrase: it also shows the difference between both and an extraposed subject. Extraposed subjects can't be questioned: since the interrogative element would not itself be a clause, there would be no extraposition. With *It invariably annoys him that I work on Sundays*, for example, we can question the subject (*What invariably annoys him?*), but not the extraposed subject (*\*What does it invariably annoy him?*).

### ■ With *be*

There are several more or less idiomatic uses of *be* with *it* as subject and content clause as internal complement:

- [25] i *It's not that I don't understand what you're trying to say.*  
 ii *It's just that there hasn't been time to consider the matter carefully.*  
 iii *It may be that we should have given him a second chance.*

In the salient interpretations (we ignore the unproblematic ones where *it* is simply anaphoric to some preceding NP such as *my objection* or *the best suggestion*) the *it* here has no clear reference and hence can hardly be regarded as defining a variable whose value is specified by the content clause. Example [i], with *not* and obligatory *that*, is an idiomatic way of denying the proposition expressed in the content clause. Positive [ii], again with *that* obligatory, is a way of presenting an explanation – I might have been showing reluctance to accept some proposal and say [ii] to explain why. Example [iii], with *may*, stressed *be*, and optional *that*, is equivalent to *Maybe/Perhaps we should have given him a second chance*. We noted above that *it + be* is like *it + seem* in allowing an *as if* phrase as complement (cf. [23]), and the examples in [25] should perhaps be analysed as belonging to the impersonal construction we have proposed for *seem*.

<sup>8</sup> *Feel*, *look*, and *sound* are very occasionally found with a content clause too: *It looks to me that a vendetta has struck up*. Content clauses differ from *as if* phrases in that they are restricted to the impersonal construction: compare *Ed seemed as if/\*that he was trying to hide his true identity*.

### 4.3.2 The complex-transitive construction

- [26] i *I find it hardly surprising that he tried to retract his statement.*  
 ii *They regard it as a discourtesy that you didn't notify them earlier.*

Example [i] may be compared with *I find his behaviour hardly surprising*, where the predicand of the predicative complement *hardly surprising* is an NP in object function. If the predicand is a content clause we normally need *it* as a dummy object, with the content clause in **extraposed object** position, as here. The content clause cannot itself occupy the position between verb and predicative complement, for a clausal complement cannot in general be followed within the VP by another complement; however, a version without the extrapositional *it* is possible if the content clause is preposed to prenuclear position:

- [27] i *\*I find that he tried to retract his statement hardly surprising.*  
 ii *That he tried to retract his statement I find hardly surprising.*

A sample of complex-transitive verbs appearing in this construction is given in [28]; the notation '[as]' indicates that the predicative has the form of an *as* phrase, as in [26ii]:

[28]	<i>accept</i> [as]	<i>believe</i>	<i>call</i>	<i>confirm</i> [as]	<i>consider</i>
	<i>declare</i>	<i>deem</i>	<i>establish</i> [as]	<i>find</i>	<i>hold</i>
	<i>judge</i>	<i>make</i>	<i>present</i> [as]	<i>recognise</i> [as]	<i>see</i> [as]

### 4.3.3 Other constructions

- [29] i *I take it you'll be accepting their offer.*  
 ii *He didn't like it that she had brought the children.*  
 iii *She resents it that they appointed someone less qualified than her.*  
 iv *You can depend on it that she'll find a solution.*  
 v *We owe it to you that we got off so lightly.*  
 vi *I put it to you that the man's a charlatan.*  
 vii *This brought it home to us that we were in great danger*

These are all different in various ways, but each type is restricted to a small number of governing expressions. *Take it* in [i] is a verbal idiom, which as a whole licenses the content clause; *have it* is another idiom of the same kind (cf. *Rumour has it that they're getting divorced*). *Like* has the same meaning in [ii] as elsewhere, but it doesn't license a content clause on its own (*\*He didn't like that she had brought the children*); *dislike* and *hate* probably behave in the same way. Example [iii] differs from [i–ii] in that the *it* here can be omitted without any apparent change in meaning; *resent* and *regret* are the main verbs that display this behaviour. In [iv] *it* is object of a preposition rather than of the verb; the preposition *on* cannot take declarative content clauses as complement, so again the *it* is obligatory. Verb + preposition combinations found in this construction, beside *depend on*, include *bank/rely on*, *get over*, *see to*, and there are also verbal idioms like *get wind of*, *take my word for*. Examples [v–vii] have one or more complements between *it* and the content clause. In [v], the content clause can be preposed, with omission of *it* (*That we got off so lightly we owe to you*); in [vii] the *it* can be dropped without change in the position of the content clause; and [vi] has neither type of alternant. The idiom *take for granted* belongs with [vii]: *He had taken (it) for granted that he would be given a second chance.*

#### 4.4 Complement of an adjective

Adjectives in predicative function may take complements with the form of content clauses:

- [30] i *He's* [*very conscious* that they might not give him a second chance].  
 ii *This made me* [*glad* I'd stayed at home].  
 iii *I'm* [*determined* that he won't get the better of me].

Adjectives that license declarative content clauses as complement include the following:

- [31] i *afraid*      *angry*      *aware*      *certain*      *confident*      *conscious*  
           *eager*      *fearful*      *glad*      *grateful*      *happy*      *hopeful*  
           *positive*      *proud*      *sad*      *sorry*      *sure*      *thankful*  
 ii *amazed*      *amused*      *annoyed*      *determined*      *disgusted*      *distressed*  
           *disturbed*      *irritated*      *pleased*      *surprised*      *upset*      *worried*

Those in [ii] are participial adjectives, and many others of this kind could be added. All the adjectives in [31] also take complements with the form preposition + NP, as in *He's afraid of snakes*. There is, however, a sense of *afraid* that is found only with a clausal complement – approximately “regret”, as in *I'm afraid I can't help you*.

The present construction is to be distinguished from that dealt with in §4.3.1 above, where an adjective is followed by an extraposed subject. Compare:

- [32] i *Max is certain* that he is being victimised.      [complement in AdjP structure]  
 ii *It is certain* that he is being victimised.      [extraposed subject in clause structure]

In [i] *certain* has two arguments, expressing Max's state of mind relative to the proposition that he is being victimised. In [ii] *it* is a dummy element, so that *certain* here has only one argument, just as in the non-extraposed counterpart *That he is being victimised is certain*. For the most part the adjectives licensing the two constructions are distinct, as is evident from a comparison of [31] with [4] above; note in particular that the participial adjectives taking a complement are based on past participles, while those taking a clause as (extraposed) subject are based on gerund-participles. *Certain* is the only item that occurs commonly in both constructions; in addition, *sure* occurs predominantly in construction [32i] but occasionally in [ii] (*It now seems sure there'll be an election before the end of the year*), and conversely *clear* usually appears in [ii] but is occasionally found in [i] (*I'm quite clear that he's not telling the truth*).

#### 4.5 Complement of a noun or supplement

Content clauses commonly function as complement in NP structure:

- [33] i [*The thought* that we might need him] *had simply never occurred to him*.  
 ii *He expressed* [*the opinion* that we should advertise the position overseas].  
 iii *We're looking for* [*evidence* that the fire was deliberately lit].

For the distinction between this construction and one with a relative clause modifier (e.g. *evidence that will convince them*), see Ch. 12, §3.1; and for argument that this construction involves complementation rather than apposition, see §8.2 below. A sample of

nouns licensing declarative content clause complements is given in:

[34] i	<i>admission</i>	<i>agreement</i>	<i>argument</i>	<i>assertion</i>	<i>assumption</i>
	<i>belief</i>	<i>boast</i>	<i>claim</i>	<i>complaint</i>	<i>conclusion</i>
	<i>discovery</i>	<i>expectation</i>	<i>feeling</i>	<i>guess</i>	<i>hope</i>
	<i>implication</i>	<i>inference</i>	<i>knowledge</i>	<i>objection</i>	<i>promise</i>
	<i>proof</i>	<i>proposal</i>	<i>revelation</i>	<i>rumour</i>	<i>saying</i>
	<i>statement</i>	<i>suggestion</i>	<i>thought</i>	<i>warning</i>	<i>worry</i>
ii	<i>awareness</i>	<i>certainty</i>	<i>confidence</i>	<i>eagerness</i>	<i>inevitability</i>
	<i>likelihood</i>	<i>possibility</i>	<i>probability</i>	<i>sorrow</i>	<i>willingness</i>
iii	<i>chance</i>	<i>danger</i>	<i>evidence</i>	<i>fact</i>	<i>faith</i>
	<i>idea</i>	<i>impression</i>	<i>message</i>	<i>news</i>	<i>odds</i>
	<i>opinion</i>	<i>principle</i>	<i>proposition</i>	<i>prospect</i>	<i>sign</i>
	<i>story</i>	<i>tradition</i>	<i>view</i>		

Those in [i] and [ii] are derived from verbs and adjectives respectively; some of those in [iii] are also morphologically derivative but differ in meaning from the source.

With the deverbal nouns the element corresponding to the subject of the verb commonly appears as genitive subject-determiner; with agentive verbs it may also appear as complement in a *by* phrase and with non-agentives occasionally within an *of* phrase:

- [35] i *our assumption that he was telling the truth*  
 ii *a proposal by one candidate that there should be a television debate*  
 iii *the earnest hope of all of us that she would quickly recover from her operation*

The adjectives from which the nouns in [34ii] are derived include some that take content clauses as complement (*aware*, *confident*, etc.) and others that license them as subject (*likely*, *probable*, etc.). Genitive determiners are then found in nouns deriving from the former, but not the latter:

- [36] i *his confidence that he would get the job*  
 ii *the\*his probability that he would get the job*

#### ■ *the fact (that)*

Among the nouns in [34iii] *fact* merits special mention as much the most frequent noun taking a content clause complement. It serves as a device for nominalising clauses by incorporating them into an NP that can occupy any ordinary NP position. Consider, for example:

- [37] i *This theory is borne out by [the fact that children in co-educational schools often mature earlier than those who are segregated].*  
 ii *Are they indifferent to [the fact that the dog can easily pick up germs from the preceding patient]?*  
 iii *No amount of statistical explanation can disguise [the fact that, as a nation, we are still spending more than we are earning].*

Many prepositions like *by* in [i] allow NP complements but not declarative content clauses: use of *the fact* here is therefore necessary to accommodate the content clause within the *by* phrase. Similarly *indifferent* in [ii] and *disguise* in [iii] don't license content clauses: the former requires a *to* phrase, the latter an NP object. *The fact* is not limited, however, to cases where the content clause could not stand on its own. It commonly

occurs, for example, in subject position, where it is in competition with two other constructions:

- [38] i *The fact that it was illegal* didn't worry him. [NP as subject]  
 ii *That it was illegal* didn't worry him. [clause as subject]  
 iii *It* didn't worry him *that it was illegal*. [it + extraposed subject]

Construction [ii], with the content clause itself as subject, is much the least frequent of the three; use of *the fact* facilitates the incorporation of the content clause into the subject when there is a preference for positioning it early in the matrix clause, rather than later, as in the extraposition construction.

Like other cases of full nominalisation, *the fact* permits the introduction of adjuncts such as AdjPs that cannot modify clauses:

- [39] *We should encourage the leaders of these societies to accept the unpleasant fact that they are responsible for their fates.*

NPs with *fact* as head and clause as complement are always definite: the clause identifies the fact. A coordination of clauses usually counts as a single fact, but can also be taken as a set of facts:

- [40] i *It hides [the fact that the peace movement is still advancing and that clarification of the issues can bring a majority to secure the Scarborough decisions].*  
 ii *They are invited to consider [the facts that when a prisoner's letter home contained the word 'commies' it was suggested that 'People's Volunteers' should be substituted, and that the only address to which any prisoner's relatives could send letters was 'c/o the People's Committee for World Peace'].*

### ■ Postposed complements and supplements

In all the examples given so far the content clause has been integrated into the structure of the NP headed by the licensing noun. It is also possible for it to be postposed or detached as a supplement, as in [41i–ii] respectively:

- [41] i a. *The possibility can't be ruled out that she will call an early election.*  
 b. *He presented evidence to the commission that the fire was deliberately lit.*  
 ii a. *I'm inclined to favour your first suggestion, that we shelve the proposal until after the election.*  
 b. *Avoiding one counsel of the Fabian tract, that a few of the larger school boards might well be saved for limited purposes because of their superior efficiency, the government came out for their abolition.*

The supplements have the whole of the preceding NP as anchor; they must be semantically compatible with it (identifying its content), but are not syntactically licensed by the head noun: *counsel*, for example, does not license content clause complements (cf. Ch. 15, §5.1).

### ■ Multi-word licensing

There are some instances of the sequence noun + content clause where the clause is not licensed by the noun alone. The clearest cases involve prepositional constructions like *to the effect*, *on the basis*, etc., discussed in Ch. 7, §3.2, but it is arguable that certain clausal

constructions involving *have/give* or existential *there + be* are also of this kind:

- [42] i *We had no idea it would be so difficult.*  
 ii *The present system has the disadvantage that it is inordinately complicated.*  
 iii *There's also the problem that two signatures are needed.*

*Idea* can certainly take a clausal complement (*The idea that he might be wrong had simply never occurred to him*), but hardly with *no*, and (as observed in Ch. 4, §6) the *have no/any idea* combination can license an interrogative complement, which is certainly not possible with *idea* on its own (*He had no idea what to do*, but not \**A good idea what to do was suggested by Terry*). *Have no idea* is semantically like *not know*, and it appears to behave as an idiom with the same complementation as *know*. *Disadvantage* and *problem* are hardly able to take clausal complements on their own: ?*The disadvantage that it is inordinately complicated had been overlooked*; ?*The problem that two signatures are needed is quite serious*. Again, therefore, it is arguable that the content clause is a complement in the structure of the VP or clause rather than of the NPs headed by these nouns.

#### 4.6 Content clauses licensed by *so, such*, and (in AmE) *enough, sufficient(ly)*

##### ■ Delayed complements with *so* and *such*

In all varieties of English the adverb *so* and the adjective *such* license declarative content clauses occurring at the end of the matrix clause:

- [43] i a. *The case was so heavy that I couldn't lift it.*  
 b. *So many people enrolled for the course that we had to move to a larger room.*  
 c. *It happened so quickly that we were taken completely offguard.*  
 d. *It was so at variance with his usual behaviour that we thought he was ill.*  
 e. *He'd so arranged the programme that we had lots of time to discuss the papers.*  
 ii a. *It was such a miserable day that we decided to stay at home.*  
 b. *He placed the boulder in such a way that the door couldn't swing shut.*  
 c. *Such strain is being placed on the marriage that it is likely to collapse.*

The content clause here is not adjacent to the *so* or *such* that licenses it, but is 'delayed' to the end of the matrix clause. This position is obligatory. In [ia], for example, we cannot have \**It was so that I couldn't lift it heavy*; nor can [ib] have the content clause at the end of the subject phrase: \**So many people that we had to move to a larger room enrolled for the course*. Note also that there may be multiple occurrences of *so* or *such* followed by a single content clause:

- [44] i *So many defects had been found in so many of the components that the model had to be withdrawn from the market.*  
 ii *Some places are so lovely, so mystical, that they must be left intact for the sake of the human spirit.*

For these reasons we analyse the content clause as a complement in clause structure rather than as a complement of *so* and *such* themselves. This is a further case, therefore, of an indirect complement, one licensed not by the word which is the ultimate head of the construction containing it, but by an item embedded within some other dependent. In [43ib], for example, the immediate constituents are *so many people enrolled for*

*the course* and *that we had to move to a larger room*. The ultimate head is *enrolled*, but it is the *so* within the subject that licenses the content clause.

*So* and *such* indicate degree/extent or manner and the content clause has a resultative meaning that can be brought out by such glosses as “The result of the case being as heavy as it was was that I couldn’t lift it”, “The result of his arranging the programme in the way he did was that we had plenty of time to discuss the papers”, and so on. *So* occurs as modifier to a wide range of heads: adjective in [43ia], degree determinative in [ib], adverb in [ic], PP in [id], verb in [ie]; *such* in [ii] is a predeterminer modifier in NP structure, but it can also occur predicatively, as illustrated below.

The subordinator *that* is omissible, under the conditions that apply to content clauses generally (§3.1): *The case was so heavy I couldn’t lift it*. One quite exceptional feature of this construction, however, is that *that* cannot be repeated in coordination:

- [45] \**The goods were so defective that they had to be recalled and that the manager was forced to resign.*

### ■ *such that*

When the adjective *such* is used predicatively the content clause generally follows immediately, but it does not have to:

- [46] i *His circumstances were such that he could rarely afford a restaurant meal.*  
 ii *Such is the mystique of planning that people expect that fulfilment of the plan will follow automatically upon its announcement.*  
 iii *The angle of attack was such on take-off that several passengers reported hearing the fuselage scrape the runway.*

In [ii] the *such* is preposed and in [iii] it is followed by an adjunct. In all cases, however, the content clause is again located at the end of the matrix clause, just as in [43ii] above, and we will analyse it in the same way, as complement in the matrix clause. The only difference, a minor one, is that in this predicative construction the subordinator *that* is not omissible.

*Such* is also used postpositively, in which case the content clause is obligatory:

- [47] *The approach aims to achieve a body of laws of empirical generalisations about human conduct such that one can both explain human behaviour and social change and gain the power to change society.*

### ■ *so that*

*So* occurs immediately before the content clause it licenses in three constructions, involving manner, result, and purpose adjuncts.

#### (a) Manner

- [48] i *He’d arranged the programme so that we had lots of time to discuss the papers.*  
 ii *I apply the hay so that only the tops of the plants show above it.*

The *so* here can be glossed as “in such a way”: it is a manner adjunct and licenses a resultative in the same way as the *so* of [43i] – note that [48i] is identical to [43ie] except for the position of the *so*. The construction with post-verbal manner *so* is, however, comparatively rare: *so* in this position is usually interpreted as in (b) or (c) below (and

indeed the *so* phrase in [48i] is ambiguous between the manner reading considered here, and a “with the result that” reading like that of [49] below).

#### (b) Result

[49] *Most primary teachers are women so that suitable ‘role models’, to use the trendy phrase, are more abundant for girls than for boys.*

Here *so* is syntactically inseparable from the content clause which, moreover, cannot be omitted. In this construction, therefore, the content clause is best analysed as a complement of *so*, with the combination of *so* + content clause functioning as adjunct of result. Note then that here the resultative meaning is attributable not to the content clause itself, but to the phrase consisting of *so* as head and clause as complement; this phrase we take to be a PP, with *so* a preposition by virtue of taking a content clause as complement (see Ch. 15, §2.11).

#### (c) Purpose

[50] i *I disconnected the phone so that we could talk undisturbed.*  
 ii *So that his customers should not soil their hands, Brecht issued white gloves.*

Again the content clause is inseparable from *so*, and this time *so* + content clause can be preposed, as in [ii]: it is clear therefore that the content clause is a complement of *so* itself. The PP consisting of *so* + content clause functions as adjunct of purpose, with *so* equivalent to *in order*.

### ■ *enough, sufficient, sufficiently*

In AmE these degree modifiers license a complement with the form of a content clause or *so* + content clause:

[51] i <sup>%</sup>*The orchestra is far enough away from you that you miss the bow scrapes, valve clicks, and other noises incidental to playing.*  
 ii <sup>%</sup>*The calculation can usually be made with sufficient accuracy that it won’t affect the final computation.*  
 iii <sup>%</sup>*The party is usually in a room small enough so that all guests are within sight and hearing of one another.*

(BrE would have to have an infinitival complement here: *far enough away from you for you to (be able to) miss the bow scrapes . . .*) The complement has to be final in the matrix clause like those in [43] and is again best analysed as belonging in the matrix clause.

## 4.7 Adjunct in clause structure

There are a handful of constructions where a declarative content clause functions as adjunct rather than complement.

### (a) With subject + predicator order

[52] i *What has happened, that you are looking so worried?*  
 ii *‘This is my party card’, he said, holding it high, that all might see it.*  
 iii *The more we talked, the more I liked her.*

The type of content clause we have in [i] functions as adjunct to interrogative clauses. Semantically the adjunct can be regarded as resultative: the presupposition of the question can be glossed as “Something has happened with the result that you are looking worried”. The content clause in [ii] is a purpose adjunct; the construction is rare and somewhat archaic, with Present-day English usually having *so that* rather than *that* alone. In [iii] *the more we talked* is the subordinate clause in the correlative comparative construction discussed in Ch. 13, §4.6; note that although it occurs in a comparative construction it does not have the distinctive properties of comparative clauses with respect to its internal form and hence belongs in the default category of content clauses. The initial element is always a comparative phrase modified by *the*.

### (b) With subject–auxiliary inversion

[53] *Had they committed a similar crime here, they would have got a jail sentence.*

Here the content clause functions as a conditional adjunct, equivalent to the PP *if they had committed a similar crime here*. Only a subset of auxiliaries can occur in this construction: the great majority of cases involve *had*, *were*, or *should*.

By virtue of the subject–auxiliary inversion, the subordinate clause has the appearance of a main clause closed interrogative. This formal resemblance is one reflection of the significant semantic resemblances between conditions and questions. Compare:

- [54] i *If you're free this afternoon, we can go and look at some houses.*  
 ii *Are you free this afternoon? If so, we can go and look at some houses.*

The conditional adjunct in [i] entertains two possibilities, one where you're free this afternoon and one where you're not, and these correspond to the two answers to the polar question in [ii]. The second sentence of [ii] begins with an *if* phrase where *so* is interpreted in terms of the positive answer to the preceding question; for the negative answer we have *not* (*If not, I'll look at the houses on my own*). Consider next the following set:

- [55] i *Are you sitting comfortably? Then I'll begin.*  
 ii *He does little himself. He only plans. But his agents are numerous and splendidly organised. Is there a crime to be done, a paper to be abstracted, we will say, a house to be rifled, a man to be removed – the word is passed to the Professor, the matter is organised and carried out.*  
 iii *Dare a woman have a child, she's putting her job at risk.*  
 iv *Could he have cast himself in the part of Mr Cophorne, the villain and apostate, he would not have attempted to run away from his captors.*  
 v *Suddenly it seemed to him insane that they might hope to locate Gyp Carmer so casually, even were he to prove the thief.*

Here [i] (the first words of a radio programme for young children) is like [54ii] except that we have *then* instead of the *if* phrase in the second sentence: this time a positive answer is assumed. In [55ii] (from Conan Doyle's *The Adventures of Sherlock Holmes*, 1901–3) there is no question mark and no following adjunct; the underlined sequence is interpreted like a conditional adjunct (“If there is a crime to be done, . . .”), but its syntactic status is somewhat obscure: it lies somewhere between [i], which is clearly an interrogative expressing a question, and [iii–v], which are conditional adjuncts. Example [iii] is unusual in that we have here an open conditional: these inverted conditional adjuncts normally occur in remote conditionals (except when introduced by modal *should*: see §7.1.2). For this reason, [iii] is not

sharply different from [ii], though the latter does not represent an established construction in Present-day English, for *is* cannot introduce inverted conditionals. In [iv–v] we have remote conditionals, with [iv] a rare example of inversion with modal *could*. In [v] the irrealis form *were* and even more strikingly the focusing adverb *even* make the underlined clause clearly distinct from an interrogative. There is no doubt, then, that inversion can serve as a marker of a conditional, and that [iii–v] are not interrogative clauses but belong to the default declarative type of content clause.

#### 4.8 Complement of a preposition or adverb

With prepositional governors we need to distinguish between non-expandable content clauses, which exclude *that*, and expandable ones, which allow it (§3):

- [56] i a. *They left [before the meeting ended].*  
       b. *We'll invite them both [though I don't think he'll come].* } [non-expandable]  
 ii a. *I'll come along, [provided (*that*) I can leave early].*  
       b. *I was lucky [in that the other candidates withdrew].* } [expandable]

##### ■ The non-expandable construction

The main items governing non-expandable content clauses are as follows:

- [57] *after*        *although*        *as*        *as if*        *as long as*        *as soon as*  
       *because*        *before*        *for*        *for all*        *if*        *in case*  
       *lest*        *like*        *once*        *since*        *though*        *till/until*  
       *unless*        *when*        *where*        *whereas*        *directly*        *immediately*

The last two are adverbs, the others prepositions or prepositional idioms.

##### ■ The expandable construction

Prepositions governing content clauses of this kind include those given in [58]; see also the discussion in Ch. 7, §3.2, of prepositional idioms that license content clauses: expressions such as *in order*, *on condition*, *for fear*, etc.

- [58] *but*        *considering*        *except*        *given*        *granted*  
       *in*        *notwithstanding*        *now*        *provided*        *providing*  
       *save*        *seeing*        *so*        *supposing*

The subordinator *that* is obligatory with *in*, and effectively with *so* too, for *so* without *that* is construed as a connective adverb (cf. Ch. 15, §2.11). *But* occurs with a content clause complement in such constructions as:

- [59] i *I don't doubt but that she meant it.*  
       ii *I wouldn't have taken any notice but that I feared they might upset Angela.*  
       iii *There wasn't a boy among them but would have gladly taken my place.*

Example [i] (conveying that I believe she meant it) illustrates the use with expressions of doubt in non-affirmative contexts; *but* is omissible, with the content clause then a complement of *doubt* (cf. §5.3.3 below). *That* is more or less obligatory in [ii], for without it *but* will generally be taken as a coordinator (but cf. the proverb *It never rains but it pours*, where *but* clearly has its prepositional meaning, “except”). In [iii] the subordinate

clause has a gap in subject position (anaphorically linked to *a boy among them*), with *that* obligatorily omitted. This is a somewhat archaic construction, restricted to non-affirmative contexts; the “except” meaning of *but* gives an interpretation like that of a negative relative clause: “There wasn’t a boy among them who would not gladly have taken my place”.

## 5 Interrogative content clauses

Subordinate interrogatives, like main clause interrogatives, normally express questions, but because they are embedded there is no illocutionary force associated with them. A main clause interrogative such as *Where was she born?* is characteristically used to **ask** a question, i.e. as an inquiry, but the subordinate counterpart *where she was born* is not. It nevertheless **expresses** the same question as the main clause, with the same set of possible answers. As will be evident from this formulation, we continue to maintain a distinction between categories of grammatical form and categories of meaning: interrogative applies to the formal category, question to the semantic one.

Subordinate interrogatives are used in reporting inquiries, as in *They asked where she was born*, but have numerous other uses too, as in *They know where she was born* or *It depends where she was born*. We refer to the questions they express as **embedded questions**, avoiding the traditional term ‘indirect question’ for reasons given in Ch. 10, §3.2. In the default case, sentences whose meaning contains an embedded question can be glossed with the formula ‘the answer to the question’ – thus for the examples just given, “They know / It depends on the answer to the question ‘Where was she born?’”.

### 5.1 Form

#### ■ Absence of subject–auxiliary inversion

The main structural difference between subordinate and main clause interrogatives is that subject–auxiliary inversion does not generally apply in the subordinate construction:

[1]	MAIN	SUBORDINATE
i	a. <u>Has</u> he read it?	b. I wonder [ <i>whether/if he <u>has</u> read it</i> ]. [closed]
ii	a. What <u>did</u> he do?	b. I know [ <i>what he <u>did</u></i> ]. [open]

Closed interrogative content clauses are generally marked by one or other of the subordinators *whether* and *if*, while open interrogatives are distinguished from declaratives by the presence of an interrogative phrase in initial position:

[2]	DECLARATIVE	INTERROGATIVE
i	a. I can’t say [( <i>that</i> ) it’s his].	b. I can’t say [ <i>whether/if it’s his</i> ]. [closed]
ii	a. I know [( <i>that</i> ) he told Ed].	b. I know [ <i>who he told</i> ]. [open]

Since main clause open interrogatives with the interrogative phrase as subject have no inversion, there is here no internal difference between the main and subordinate constructions:

[3]	MAIN	SUBORDINATE
	a. What happened to Kim?	b. It’s unclear [ <i>what happened to Kim</i> ].

The absence of inversion results in a very considerable overlap between subordinate open interrogatives and relative constructions:

- |     |   |  |
|-----|---|--|
| [4] | OPEN INTERROGATIVE                              | RELATIVE   |
|     | i a. <i>You know <u>which</u> I prefer.</i>     | b. <i>This is the version <u>which</u> I prefer.</i> |
|     | ii a. <i>I don't know <u>what</u> you want.</i> | b. <i>I haven't got <u>what</u> you want.</i>        |

The distinction between these constructions is discussed in Ch. 12, §§3.1, 6.2.

Subject–auxiliary inversion is not wholly excluded from subordinate interrogatives, but it is largely restricted (in Standard English) to constructions where questions are cited, as in *Easily the most popular question put to the PM was: Why are we buying New Zealand carpets for the new Parliament House?*

We have noted that in main clause open interrogatives it is possible for the interrogative phrase to remain 'in situ' (*And after that you went where?*). In the subordinate construction, however, fronting is obligatory: *He wants to know [where you went after that]*, not *\*He wants to know [after that you went where]*. But, as in main clauses, there can be more than one interrogative phrase, with just one of them occurring in initial position:

- |     |  |
|-----|--|
| [5] | i <i>They haven't told us [<u>who</u> is responsible for <u>what</u>].</i>                   |
|     | ii <i>I haven't found out yet [<u>which</u> projects they are assigning to <u>whom</u>].</i> |

#### ■ Infinitival interrogatives

A second difference between subordinate and main clause interrogatives is that with subordinates the distinction between information questions and direction questions is clearly marked grammatically, with direction questions having infinitival form (cf. Ch. 10, §4.6):

- |     |                                |   |               |
|-----|--------------------------------|---|---------------|
| [6] | MAIN                           | SUBORDINATE                               |               |
|     | i a. <i>Where am I going?</i>  | b. <i>I don't know [where I'm going].</i> | [information] |
|     | ii a. <i>Where shall I go?</i> | b. <i>I don't know [where to go].</i>     | [direction]   |

## 5.2 *Whether vs if*

Closed interrogative subordinate clauses are marked as such by one or other of the interrogative subordinators *whether* and *if*. Typically these are interchangeable, as in [1ib] and [2ib] above, but this is not always so. We examine here constructions where *if* is excluded, and then consider factors favouring one or the other in constructions that permit both.

#### ■ Constructions where only *whether* is permitted

##### (a) In the exhaustive conditional construction

- |     |   |
|-----|---|
| [7] | <i>I'm going to see her [<u>whether</u>/*<u>if</u> you like it or not].</i> |
|-----|---|

##### (b) When the interrogative clause is infinitival

- |     |  |
|-----|--|
| [8] | <i>She can't make up her mind [<u>whether</u>/*<u>if</u> to accept].</i> |
|-----|--|

##### (c) When the interrogative clause precedes the superordinate predicator

- |     |   |                       |
|-----|---|-----------------------|
| [9] | i [ <u>Whether</u> /* <u>if</u> this was the right decision remains unclear]. | [subject]             |
|     | ii [ <u>Whether</u> /* <u>if</u> it will work ] we shall soon find out.       | [preposed complement] |

(d) When *or not* immediately follows the subordinator

[10] *I don't know [whether/\*if or not she'll accept].*

When *or not* follows the first coordinate, either subordinator is permitted: *I don't know whether/if she'll accept or not.*

(e) As complement to *be* or as a supplement to an NP

- [11] i *The question you have to decide is [whether/\*if guilt has been established beyond reasonable doubt].*  
 ii *This question, [whether/\*if the commissioner exceeded the terms of reference,] will need to be carefully investigated.*

Example [i] represents the specifying use of *be*: the interrogative specifies the value of the variable expressed in the subject, i.e. it identifies which question you have to decide. In [ii] the bracketed supplement specifies the content of 'this question' (cf. Ch. 15, §5.2).

(f) When the interrogative clause is complement of a preposition<sup>9</sup>

[12] *It depends on [whether/\*if we have enough time left].*

## ■ Factors favouring one or other subordinator

In constructions where both *whether* and *if* are grammatically allowed, a preference for one over the other may arise from a variety of factors, including the following:

(a) Reports of questions used as indirect speech acts favour *if*

- [13] i *I asked them if they'd like to stay to dinner.*  
 ii *He wants to know if you'd mind moving your car.*  
 iii *I suggested getting you to do it and he asked me if I'd taken leave of my senses.*

These examples would typically be used to report utterances of the unembedded questions *Would you like to stay to dinner?*; *Would you mind moving your car?*; *Have you taken leave of your senses?*; and the characteristic use of these would be as indirect speech acts (Ch. 10, §3.2) – the first as an offer/invitation, the second as a request, and the third as a statement (“You must have taken leave of your senses to make such a suggestion”). *If* tends to be preferred in cases of this kind. *Whether* would give more prominence to the question itself than to the indirect speech act: it focuses on the choice between possible answers. This preference for *if* generalises to cases like *I wonder if you could help me move these plants*: this is not a report of a question, but a statement used as an indirect question (“Could you help me move these plants?”), which in turn indirectly conveys a request.

(b) Style: *if* slightly more informal than *whether*

There is a small difference in style level: other things being equal, formal style will favour *whether*, informal style *if*.

<sup>9</sup>Occasional examples with *if* in this construction are attested, but they are at best of very marginal acceptability: *I was excited for this new opportunity, and yet worried about if I would be able to find work.*

(c) Some matrix verbs favour *whether*

Such verbs include *explain, investigate, judge, ponder, study*, etc.:

- [14] i *You should explain whether they are required to write detailed answers or only short ones.*  
 ii *They are investigating whether there is any way of closing the loophole.*

The verbs concerned tend to be ones which do not frequently take closed interrogative complements. There is some correlation here with factor (b), but it is clearly not simply a matter of style, for such verbs as *ascertain, inquire, recall*, etc., take *if* more readily than the above but do not differ from them in style level: *I'll inquire if we are required to write detailed answers or only short ones.*

■ Interrogative and conditional *if*

*If* is used as a marker of conditionality as well as of closed interrogative clause type – and there may be ambiguity between the two constructions:

- [15] i *I won't tell her if you bring it back today.* } [conditional or interrogative]  
 ii *Let me know if you need any help.* }

With conditional *if* the meaning of [i] is “If you bring it back today then I won't tell her (something contextually retrievable, e.g. that you borrowed her ring)”. With interrogative *if* the meaning is “I won't tell her whether you bring it back today”. *Whether* is interrogative, not conditional, and hence will disambiguate when substituted for *if*. In [ii] there is little pragmatic difference between the two interpretations. In the conditional interpretation I am asking you to tell me that you need help if you do, and in the interrogative interpretation to tell me whether or not you need help – but telling me you need help would be an appropriate response in either case, and failure to say anything could indicate non-fulfilment of the condition or a negative answer to the question.

The overlap between the conditional and closed interrogative markers is not surprising (and quite common cross-linguistically), for there is an evident semantic connection between conditions and questions, as discussed in §4.7 above.

## 5.3 Survey of constructions containing subordinate interrogatives

## ■ Classification of embedded questions

In Ch. 10 we distinguished numerous different kinds of question, but for present purposes it is sufficient to consider two dimensions of contrast. One is that between information questions and direction questions mentioned above, and the other is between polar, alternative, and variable questions. These dimensions cut across each other, yielding the following six categories:

[16]	INFORMATION	DIRECTION
POLAR	<i>I don't know <u>if it is possible.</u></i>	<i>I don't know <u>whether to tell them.</u></i>
ALTERNATIVE	<i>I don't know <u>if it's true or not.</u></i>	<i>I don't know <u>whether to go or not.</u></i>
VARIABLE	<i>I don't know <u>what he wants.</u></i>	<i>I don't know <u>what to do.</u></i>

Variable questions are expressed by open interrogatives, polar and alternative questions by closed interrogatives, with alternative questions further marked by an *or*-coordination. As noted above, information questions are expressed by finite clauses, direction questions by infinitivals.

In the great majority of cases where subordinate interrogatives are found, all six categories are permitted. Cases where this is not so are discussed in §§5.3.2–4.

### ■ Licensing of subordinate interrogatives

Subordinate interrogatives mainly occur in complement function, where they have to be licensed by an appropriate head – for example, we can have *I forget whether Kim was present* but not *\*I regret whether Kim was present*. We will give sample lists of licensing heads as we look in turn at the various constructions involved, but it will be helpful to give at the outset a rough semantic classification of a sample of licensing expressions:

- |        |               |  |                    |
|--------|---------------|--|--------------------|
| [17] i | ASKING:       | <i>ask, inquire, wonder, investigate</i>                               |                    |
| ii     | KNOWING:      | <i>know, find out, remember, certain</i>                               |                    |
| iii    | GUESSING:     | <i>guess, estimate, predict, judge</i>                                 |                    |
| iv     | TELLING:      | <i>tell, inform, point out, show</i>                                   |                    |
| v      | DECIDING:     | <i>decide, determine, make up one's mind, agree</i>                    |                    |
| vi     | DEPENDENCE:   | <i>depend, have a bearing, influence, affect</i>                       |                    |
| vii    | SIGNIFICANCE: | <i>significant, important, matter, care</i>                            |                    |
| viii   | CONCERNING:   | <i>concern, about, as to, regarding</i>                                |                    |
| ix     | SURPRISE:     | <i>amaze, amazed, amazing, surprise</i>                                | [open type only]   |
| x      | DISBELIEF:    | <i>doubt<sub>v</sub>, doubtful, question<sub>v</sub>, questionable</i> | [closed type only] |

Knowing covers coming to know, as with *find out, learn, discover*. The categories are to be interpreted as subsuming corresponding negatives, whether expressed analytically (*not know*), by a negative affix (*uncertain*), or lexically (*forget* in contrast to *remember*). We have given priority to verbs in selecting items to illustrate the classification but corresponding nouns generally belong in the same categories; for reasons explained in §5.3.3, however, it is only as verbs that *doubt* and *question* belong in category [x] (hence the subscripts): the homonymous nouns belong in [ii] and [i] respectively.

### ■ Concealed questions: embedded questions with the form of NPs

While embedded questions are generally expressed by means of interrogative clauses, they can also take the form of a definite NP, and are then known as **concealed questions**:

- [18] i *I can't remember the kind of pizza she likes.*  
 ii *Can you tell me the time?*

The underlined NPs are equivalent to subordinate interrogatives: compare *I can't remember what kind of pizza she likes* and *Can you tell me what time it is?* NPs with this kind of interpretation are found only with items that license interrogative clauses. Thus we do not have a concealed question in *I don't like the kind of pizza she likes*, for *like* does not license interrogative complements (cf. *\*I don't like what kind of pizza she likes*). Not all items that do license interrogatives allow concealed question complements, however. We can have, for example, *I wonder what time it is*, but not *\*I wonder the time*: *wonder* does not license NP complements.<sup>10</sup>

<sup>10</sup>Except for certain types of anaphoric NP, as in *Surely John must have an inkling who's responsible? Gill Templar was wondering the same thing*.

### 5.3.1 As complement or supplement

We review here the various types of complement that can be realised by an interrogative clause; for each category we begin with examples and a sample of the governors that license the interrogative. We then turn briefly to interrogative clause supplements.

#### (a) Subject and extraposed subject

- [19] i *Whether we do it now or later is immaterial.* [subject]  
 ii *It is immaterial whether we do it now or later.* [extraposed subject]
- [20] i *bother concern<sub>n</sub> interest matter worry*  
 ii *arguable certain clear crucial debatable immaterial*  
*important interesting obvious predictable relevant significant*  
 iii *concern issue matter problem question secret*  
 iv *affect bear (on) depend (on) determine influence*

Those in [20i–iii] are respectively verbs, adjectives, and nouns. The items in [20iv] are verbs too; they are listed separately as they allow interrogatives both as subject and as internal complement: *Whether we win depends on how much effort we put in*. *Concern*, means roughly “be of relevance to or cause anxiety for”, as in *Whether we accept or reject the offer doesn’t concern you*. The noun *concern* in [iii] is related to this sense: *What I do is not your concern*. The noun *matter* requires some elaboration by means of a dependent, one with more content than just an article – *Whether these differences count or not is another matter / a matter of social convention / \*a matter*.

In many cases the interrogative is not licensed directly by the verb or the head adjective/noun in the predicative complement, but indirectly via their dependents. In *How this problem can be resolved needs further study* and *Whether this is the best solution is open to debate*, for example, the crucial items are *study* and *debate*, which are not immediately in construction with the interrogative clause.

#### (b) Specifying predicative complement

Embedded interrogatives commonly occur with the role of value in the specifying construction discussed in Ch. 4, §§5.1–2. In this function, however, there is a choice between subordinate and main clause form:

- [21] i *The main question is whether we have sufficient evidence to secure a conviction.*  
 ii *The main question is: Do we have sufficient evidence to secure a conviction?*

The interrogatives here serve to identify the main question, to specify the value of the variable expressed in the subject (“the *x* such that *x* is the main question”). The underlined content clause in [i] has the normal form for embedded interrogatives, while the complement in [ii] is realised by a main clause. What makes the main clause form possible here is that the question is identified by citing it – and it is cited in the form it has when it stands alone as a sentence. The subject NP generally has *question* as its head, or some semantically similar noun such as *problem*, *issue*, etc., or it can be a fused relative construction, such as *what we must ascertain*. Like most cases of the specifying construction, the examples in [21] are reversible: *Whether we have enough evidence to secure a conviction is the main question*, and similarly for [ii].

## (c) The complex-transitive construction

- [22] i *I consider how he cheated us less important than why he did.* [object]  
 ii *I consider it immaterial whether we do it now or later.* [extraposed object]

Interrogatives differ from declaratives in that they can intervene between the matrix verb and the predicative complement, as in [i] – but they also occur with extraposition, as in [ii]. We have not listed governors here since it is the PC of the matrix, rather than its verb, that licenses the interrogative in these constructions, and the items concerned (here *important* and *immaterial*) are among those that license interrogative subjects or extraposed subjects.

## (d) Internal complement licensed by the matrix verb

- [23] i *We'll [establish what caused the malfunction].*  
 ii *We [investigated whether the contract is valid].*
- [24] i *ascertain      care      check      consider      decide      determine*  
*disclose      discover      establish      estimate      forget      guess*  
*indicate      inform      judge      know      learn      mind*  
*notice      observe      predict      prove      realise      recall*  
*remember      say      see      show      tell      think*
- ii *ask      concern<sub>2</sub>      inquire      investigate      ponder      wonder*

*Concern<sub>2</sub>* means “be about”: *The debate concerned how best to contain inflation.* The verbs in [i] license declaratives as well as interrogatives, while those in [ii] do not: compare *We'll establish that the contract is valid* and *\*We investigated that the contract is valid.* The verbs that exclude declaratives include the verbs of asking (interpreted broadly enough to include *wonder*), but they are not limited to these.<sup>11</sup>

There are also various verbal idioms that belong with the verbs of [i]:

- [25] *find out, work out, have any/no idea/clue/notion, give a damn, make certain/sure, make up one's mind*

## (e) Complement of a preposition

- [26] i *They were divided in their beliefs [as to whether the diet was effective].*  
 ii *The result will be the same regardless [of whether you involve yourself or not].*  
 iii *He is preoccupied [with whether people find his behaviour socially acceptable].*  
 iv *[As for/to what should be done next] I think your own proposal is best.*
- [27] *about      as for      as to      concerning      into      of      on      over      with*

There are two complicating factors to note regarding this construction:

## Relevance of higher construction

To a significant extent it is not the preposition itself that licenses the interrogative but the preposition in combination with the head item that governs the preposition. In [iii], for example, the interrogative is licensed by *preoccupied + with* – in contrast, say, to *equipped + with*. Similarly we find interrogatives after *depend on* but not *rely on*, after *the issue of* but not *the photograph of*, and so on. This applies equally when the

<sup>11</sup> *Ask* and *wonder* license declaratives when used with a different sense: *I must ask that you take more care* (“request”), *I wonder (that) he wasn't sacked* (“am surprised”).

## (g) Complement of a noun

Again we have a distinction between core and oblique complements:

- [33] i *The minister has been reluctant to ‘come clean’ on [the question whether or not he intends to build any new towns].*  
 ii *This brings us to [the question of how much the proposals would cost].*

The core complement construction is mainly found with the noun *question*, but occasional examples with other nouns are found:

- [34] i [A decision whether to hold a public inquiry] *in London will be taken after they report.*  
 ii [The test whether damped fires are really alight] *is to see whether they can burn up when poked.*  
 iii *They could be sent to US ports for [rulings whether cargo should be confiscated].*

A sample of nouns found with interrogatives as oblique complement is given in [35]; other prepositions from the “concerning” set [27] could also be used, and clearly the preposition plays a major part in the licensing of the interrogative.

- [35] *apprehension as to      argument over      belief as to      controversy over*  
*debate as to              discussion of      dispute about      indication as to*  
*judgement on            knowledge of      opinion on          wrangle over*

## Postposing

Interrogative content clauses, like declaratives and other post-head dependents, may be postposed:

- [36] *The question may be raised whether or not we are dealing with a common factor in anxiety and compulsivity.*

## (h) Supplements

Interrogatives quite often function as supplements, with an NP as anchor. As they involve citation of the question, they can appear either as content clauses (subordinate) or as main clauses:

- [37] i *Ch. 19 discusses the converse question, whether aboriginal customary laws should themselves be imported into the general legal system in some way.*  
 ii *We now turn to our final question: What place should brief, crisis-oriented preventive case-work occupy in our total spectrum of services?*

When the supplement is not adjacent to the NP anchor, main clause form is preferred:

- [38] i *The question might be asked: Isn't the management aware of these facts?*  
 ii *Once again the question arises: When should the change be made?*

As noted in §4.5, supplements are required to be semantically compatible with their anchor NP, but are not syntactically licensed by the head of that NP:

- [39] i *I had earnestly sought for some definition of the ultimate object of the whole great enterprise: whether, for example, Germany was to be destroyed, dismembered, or reorganised.*  
 ii *Their quarrels were always about the same thing – whether she should give up her job and get married.*

- iii *Newton maintained that his conclusion could be reached without reference to any hypothetical commitments as to the nature of light – for example, whether it was corpuscular or wave-like in nature.*

The nouns *definition*, *thing*, and *nature* do not license interrogatives as integrated complements, and the occurrence of the interrogatives in these examples depends crucially on the interpretation of the underlined NPs. In [i] a definition of the object of the enterprise must provide the answer to various questions about it. In [ii] the context of quarrelling allows *the same thing* to be interpreted more specifically as “the same question/issue”. And in [iii] the *as to* triggers the interpretation of *the nature of light* as a concealed question, i.e. as meaning “what is the nature of light?”.

### 5.3.2 Question-orientation vs answer-orientation

Depending on the context in which they are embedded, subordinate interrogatives can be classified as having an orientation towards the question or towards the answer:

- |      |   |  |
|------|---|--|
| [40] | QUESTION-ORIENTATION  | ANSWER-ORIENTATION                           |
| i    | a. <i>She asked <u>where he lived</u>.</i>                        | b. <i>She told me <u>where he lived</u>.</i> |
| ii   | a. <i>She wanted to know / didn't know <u>where he lived</u>.</i> | b. <i>She knew <u>where he lived</u>.</i>    |

Example [ia] reports an illocutionary act of asking a question, whereas [ib] reports an act of stating, giving the answer to a question that may or may not have been asked. These, being reports of illocutionary acts, represent the distinction at its clearest, but we can generalise to cases where no actual illocutionary act is necessarily being reported, as in [ii]. In [iia] she may or may not have asked the question, but her mental state was conducive to doing so, and in [iib] it is conducive to answering the question.

This distinction correlates with restrictions relating to the use of emotive modifiers, closed interrogatives, and subject–auxiliary inversion. For the last two of these we will need to work with a finer classification, distinguishing between strong and weak orientation to question or answer.

#### ■ Emotive modifiers restricted to contexts with question-orientation

- |      |  |   |
|------|--|---|
| [41] | QUESTION-ORIENTATION                                 | ANSWER-ORIENTATION                                      |
| i    | a. <i>Tell me <u>how on earth you saved her</u>.</i> | b. * <i>I recall <u>how on earth you saved her</u>.</i> |
| ii   | a. <i>I wonder <u>who ever would do that</u>.</i>    | b. * <i>I see <u>who ever would do that</u>.</i>        |

The emotive modifiers *on earth*, *the hell*, *ever*, etc., are used in main clause interrogatives like *How on earth did you save her?* or *Who ever would do that?* to indicate surprise that you did in fact save her, that someone would do that. They are admissible in corresponding subordinates only in contexts of question-orientation.

#### ■ Restrictions on closed interrogatives

In the default case, contexts which accept open interrogatives also accept the closed type too, and vice versa. There are, however, contexts where the open type is admissible but where closed interrogatives are either: (a) of questionable acceptability; or (b)

completely excluded. We will refer to these as involving respectively weak and strong answer-orientation.

(a) Marginal status of closed interrogatives in contexts of weak answer-orientation

[42]	QUESTION-ORIENTATION	WEAK ANSWER-ORIENTATION
i	a. <i>Did she say <u>if the door was locked?</u></i> <i>She didn't say <u>if the door was locked.</u></i>	b. <i>?She said <u>if the door was locked.</u></i>
ii	a. <i>Does he know <u>whether it is ready?</u></i> <i>He doesn't know <u>whether it is ready.</u></i>	b. <i>?He knows <u>whether it is ready.</u></i>

The [b] examples here are significantly less natural and acceptable than the [a] ones. If I know that [ib] is true, then I will typically also know either that she said the door was locked or that she said it wasn't locked – and in that case the expectation would be that I would use a declarative complement. *She said that the door was locked* and *She said that the door was not locked* are clearly more informative than [ib], and hence if I'm in a position to say one or other of these I would normally do so. Analogously for [iib]. The [a] examples involve non-affirmative contexts (interrogatives, negatives, etc.), and a number of the verbs governing interrogative complements occur most readily in such contexts. But it must be emphasised that this is a matter of pragmatically motivated preference, not of a syntactic rule. Compare, for example, [42iib] with *He must know whether it is ready*: this is still an affirmative context, but it is more acceptable than [42iib] because the *must* makes it more likely that the speaker doesn't know whether it is ready and hence is not in a position to use a declarative instead of the interrogative. Compare, similarly, *He knows whether it is ready but he won't tell me*.

The distinction between non-affirmative and affirmative contexts is of much less significance for open interrogatives. Affirmatives like *She said what she plans to do* or *He knows why she resigned*, for example, do not have the questionable status of the closed interrogatives in [42].

(b) Exclusion of closed interrogatives in contexts of strong answer-orientation

Some governing expressions license open but not closed interrogatives:

[43]	CLOSED INTERROGATIVE	OPEN INTERROGATIVE
i	a. <i>*It's amazing <u>whether he wrote it.</u></i>	b. <i>It's amazing <u>what he wrote.</u></i>
ii	a. <i>*He realised <u>if she meant you.</u></i>	b. <i>He realised <u>who she meant.</u></i>

The [a] examples here are not improved by making the matrix clause non-affirmative: *\*Is it amazing whether he wrote it?*; *\*He didn't realise if she meant you*. The governors generally take declarative complements with a factive interpretation: *It's amazing that he wrote it* and *He realised she meant you* presuppose respectively that he wrote it and that she meant you (cf. §7.4).<sup>13</sup> Note also that [ib] conveys that I know what he wrote – similarly with *It's surprising, I'm amazed*, etc. Another item which belongs here is the preposition *considering*: while the verb *consider* licenses a closed interrogative (*We were considering whether we should accept the proposal*), the converted preposition allows

<sup>13</sup> An exception is the complex governing expression *you wouldn't believe*, as in *You wouldn't believe who she's going to marry. You wouldn't believe that she is going to marry Fred* does not involve the same exclamatory use of *you wouldn't believe* and is not factive.

only a declarative or an open interrogative (*Considering what the conditions were like, it was a creditable performance*, but not *\*Considering whether it was her first attempt, . . .*). Similarly with *given*, except that here the verb from which it is converted does not take content clause complements at all.

Non-factive *careful, take care* behave in the same way: *Be careful what you say* but not *\*Be careful whether they see you*. Instead of the latter we need a declarative: *Be careful they see / don't see you*.

### ■ Subject–auxiliary inversion

Some varieties of English (quite widespread in the USA) allow subordinate interrogatives with subject–auxiliary inversion in contexts of strong question-orientation:

[44]	INVERTED ORDER	UNINVERTED ORDER
i	a. % <i>She asked <u>what had she done wrong</u>.</i>	b. <i>She asked <u>what she had done wrong</u>.</i>
ii	a. % <i>He wanted to know <u>was she ill</u>.</i>	b. <i>He wanted to know <u>if she was ill</u>.</i>
iii	a. * <i>He didn't know <u>was she ill</u>.</i>	b. <i>He didn't know <u>if she was ill</u>.</i>

In [i] we have the open interrogative construction, with the two versions differing just in respect of subject–auxiliary inversion; [ii] has closed interrogatives, marked by inversion alone in [a], but by *whether* or *if* in the uninverted version. The inverted construction is limited to a subset of the question-oriented contexts – to contexts of what we are calling strong question-orientation. This is seen in the contrast between [iia] and [iiaa]: both *want to know* and *not know* allow emotive modifiers like *on earth* (*He wanted to know / didn't know why on earth she put up with it*), but only the former allows inversion. The inverted construction is more characteristic of non-standard speech, but examples are certainly found in Standard English.

The inverted construction represents a blurring of the distinction between subordinate and main clauses. It is not to be equated with the main clause construction illustrated in [21ii], for this time the question is not cited: [44ia], for example, involves indirect reported speech, not direct (such as we have in *She asked, 'What have I done wrong?'*). We treat it therefore as a subordinate clause, recognising that in this variety inversion does not always distinguish main from subordinate clause interrogatives.

## 5.3.3 Dubitatives

A handful of items – the verbs *doubt* and *question* and the derived adjectives *doubtful* and *questionable* – allow closed interrogatives but not the open type:<sup>14</sup>

[45]	CLOSED INTERROGATIVE	OPEN INTERROGATIVE
	a. <i>I doubt <u>whether he wrote it</u>.</i>	b. * <i>I doubt <u>who wrote it</u>.</i>

Moreover, the closed interrogative cannot contain an *or*-coordination marking an alternative question: *\*I doubt whether he wrote it or not*; *\*I doubt whether they'll appoint a man or a woman* (in the sense “uncertain which it will be”). From a semantic point of view, indeed, it is arguable that the interrogative clause in [45a] does not express a question at all but simply a proposition: it is equivalent to a declarative.

<sup>14</sup>The verb *question* takes open interrogatives as oblique complements (e.g. *He questioned them about where they had been*): we are concerned with core complements, as in *He questioned whether such drastic measures were really necessary*. An exceptional use of an open interrogative here is seen in *It might be questioned what he does learn at school*, but this is interpreted as “whether he does learn anything”, with the suggestion that the answer is negative.

Compare in this connection the following pairs:

- | [46] | DECLARATIVE  | CLOSED INTERROGATIVE                                    |
|------|--|---|
| i    | a. <i>She didn't say <u>that he wrote it</u>.</i>    | b. <i>She didn't say <u>whether he wrote it</u>.</i>    |
| ii   | a. <i>She's not certain <u>that he wrote it</u>.</i> | b. <i>She's not certain <u>whether he wrote it</u>.</i> |
| iii  | a. <i>I doubt <u>that he wrote it</u>.</i>           | b. <i>I doubt <u>whether he wrote it</u>.</i>           |

In [i] we have the typical case where there is a very obvious difference in meaning between declarative and interrogative. Example [ia] is quite consistent with her having said that he didn't write it, whereas [ib] is not. Strictly speaking the same applies in [ii]: it would be possible to say *She's not certain that he wrote it – on the contrary, she's certain that he didn't write it*. But when, as here in [ii], the matrix clause expresses uncertainty, the semantic distinction tends to be blurred pragmatically. The most likely context for [iia] is one where she isn't certain either way, hence one where [ib] would also be true. With the verb *doubt*, however, it seems that the semantic distinction is not just blurred but lost altogether, that [iiib] is equivalent to [iiia]. This would explain why we can add *or not* in [iib] but not [iiib]. *Doubt* expresses not uncertainty but an inclination to believe that the embedded proposition is not true.<sup>15</sup> This is why we can say [47i] but not [47ii]:

- [47] i *I'm not certain that he wrote it but I'm not certain that he didn't write it either.*  
 ii *\*I doubt that he wrote it but I doubt that he didn't write it too.*

On this account [46iiib] involves a mismatch between syntax and semantics: syntactically the complement is interrogative, whereas semantically it does not express a question.

A further point about *doubt* + *whether* is that it is normally restricted to affirmative contexts. This applies with both verb and noun *doubt*:

- [48] i a. *I don't doubt that he wrote it.* b. *?I don't doubt whether he wrote it.*  
 ii a. *There's no doubt he wrote it.* b. *?There's no doubt whether he wrote it.*

The [b] examples would be possible only in some special context such as one of denial, as when you say *They think you doubt whether he wrote it* and I reply *I don't doubt whether he wrote it – only whether he intended it for publication*.

### 5.3.4 On the construction *He made I don't know how many mistakes*

A distinction needs to be drawn between the following constructions:

- [49] i *He made some mistakes, though I don't know how many.*  
 ii *He made I don't know how many mistakes.*

In [i] *how many* is a reduced interrogative clause functioning as complement to *know*. This differs from the constructions we have been discussing only in the reduction of the interrogative clause; it is interpreted anaphorically as “how many mistakes he made”. In [ii], however, there is no ellipsis, and *how many mistakes* is not an interrogative clause. It means very much the same as *I don't know how many mistakes he made*, and its form seems in some way derivative from the latter. But clearly *made* is the verb of the matrix clause and the proposition that he made some mistakes is the main assertion, not backgrounded information; and there is an implicature that he made a large number

<sup>15</sup>This is very evident in the attested example *He watched her go, a little pensive because he doubted whether he would ever have an excuse to meet her, perhaps not even to see her again. Not even normally requires a preceding negative* (cf. Ch. 9, §1.1) and its use here indicates that the *whether* clause is interpreted like a negative declarative.

of mistakes. Syntactically, *I don't know how many mistakes* must be an object NP with *mistakes* as head; *I don't know* functions as an irregular type of modifier to *how*.

A variant of *I don't know* is *God knows*. These modifiers occur with most of the interrogative words (though not *why*) – compare *They're inviting God knows who to the reception*.

### 5.3.5 Infinitival interrogatives

Subordinate interrogatives commonly have infinitival form, expressing what we have called direction questions:

- [50] i *I was considering whether to get my jacket from the car*. [closed]  
 ii *Frequently readers request advice on how to establish a good lawn*. [open]

The answers have the force of directives and would characteristically be expressed as imperatives (*Get / Don't get your jacket from the car*, etc.).

We cover these in the present chapter because most expressions that govern interrogatives allow both finite and infinitival constructions. In terms of the classification suggested in [17] above, infinitivals are most often found with governors in the fields of knowing, asking, telling, deciding, and concerning. There are some cases where only the finite construction is permitted:

- |      |   |   |
|------|---|---|
| [51] | FINITE  | INFINITIVAL   |
| i    | a. <i>I <u>doubt</u> whether I should accept.</i>   | b. * <i>I <u>doubt</u> whether to accept.</i>         |
| ii   | a. <i>It was <u>amazing</u> what they offered.</i>  | b. * <i>It was <u>amazing</u> what to offer.</i>      |
| iii  | a. <i>It <u>depends</u> on how much I must pay.</i> | b. * <i>It <u>depends</u> on how much to pay.</i>     |
| iv   | a. <i>I <u>don't care</u> whether I go or not.</i>  | b. * <i>I <u>don't care</u> whether to go or not.</i> |

Infinitivals do not occur with expressions of disbelief, surprise, dependence, or (for the most part) significance.

### 5.3.6 Interrogatives as adjunct: the ungoverned exhaustive conditional construction

There is just one construction where subordinate interrogatives function as adjunct: the ungoverned version of the exhaustive conditional construction. The meaning of the adjunct is the same as in the corresponding governed construction – compare:

- [52] i *You got paid [whether business was good or bad]*. [ungoverned]  
 ii *You got paid [regardless of whether business was good or bad]*. [governed]

The underlining indicates the interrogative clause, the brackets the adjunct. In [ii] the adjunct has the form of a PP in which the interrogative clause is embedded, whereas in [i] it simply has the form of the interrogative clause itself. In [ii] the subordinate clause is governed by *of*, and is hence a complement; in [i] the subordinate clause is ungoverned, and hence an adjunct. In the governed version of the construction the adjunct is headed by *irrespective*, *regardless*, *independently* (which all take *of* + interrogative) or by *no matter* (which takes the interrogative as immediate complement: *You got paid [no matter whether business was good or bad]*).

The interrogative clause (like its non-embedded counterpart *Was business good or bad?*) expresses a question with two possible answers: “Business was good” and “Business was bad”. Each answer defines a condition or ‘case’. The meaning of [52] is that you got

paid in either of these cases; they are equivalent to an *and*-coordination of *if* phrases (or of conditional clauses):

- [53] i *Business was sometimes good, sometimes bad; you got paid in either case.*  
 ii *You got paid if business was good and (you got paid) if business was bad.*

The case where business was good and that where business was bad are assumed to constitute an exhaustive set of possibilities, so it follows from [52] that you got paid. Hence our term **exhaustive conditional** (see Ch. 8, §14.6).

The adjuncts in [52] differ from the prototypical adjunct of condition, as expressed in an *if* phrase, in that they are non-restrictive. *If* phrases are characteristically interpreted pragmatically as restrictive, i.e. as implicating “only if”. But they do not have to be: restrictiveness is not an essential feature of conditionals. Consider the following range of *if* constructions:

- [54] i *I'll do it if I have time.*  
 ii *You will fail your exam if you watch TV every evening.*  
 iii *We got paid even if business was bad.*

The restrictive use is illustrated in [i]: I'll do it only if I have time, for if I haven't time then I can't, hence won't, do it. Similarly, *You got paid if business was good* will normally be interpreted as giving a necessary condition for getting paid. *If* itself, however, does not mean the same as *only if*: without the *only* the restrictive meaning is implicated, not explicitly expressed. This is evident from [ii], which certainly does not say that the only condition under which you will fail your exam is if you watch TV every evening – I'm not guaranteeing that you will pass your exam if you don't watch TV every evening. And in [iii] the *even* explicitly rules out a restrictive interpretation: you got paid if business was bad but (it is implicated) you also got paid if business was good. Conditionals can therefore be non-restrictive, and the exhaustive conditional is a special case of a non-restrictive conditional.

Construction [52] is indeed quite similar in meaning to the *even if* example [54iii]. Both constructions convey that you got paid if business was good and also if it wasn't. The *even if* construction differs from the exhaustive conditional in that it mentions only one case: there is no explicit mention of the case where business was good, but there is an implicature that in this case too you got paid.

The use of interrogatives expressing embedded questions in conditionals is related to their use as complements to items whose meaning involves dependence and significance (cf. [17vi–vii]) – compare *Your getting paid didn't depend on whether business was good or bad* or *As far as getting paid was concerned, it didn't matter / wasn't relevant whether business was good or bad*. What distinguishes [52i] from these and from [52ii] is that in [52i] there is nothing external to the interrogative construction itself expressing the idea that the answer to the embedded question has no bearing on the issue.

Like interrogative clauses in general, those in exhaustive conditional function fall into two subclasses, open and closed:

- [55] i *I'm going with them, whatever the consequences may be.* [open]  
 ii *I'm going with them, whether you like it or not.* [closed]

We consider them in turn before returning to certain special properties that they have in common. Both differ in various respects from interrogative clauses in complement function; indeed their analysis as interrogative clauses is by no means uncontroversial.

### ■ The open interrogative construction

Open interrogatives in the ungoverned construction differ from those in the governed one in that they require interrogative words in *·ever*. Compare:

- |      |  |   |
|------|--|---|
| [56] | UNGOVERNED   | GOVERNED  |
| i    | a. * <u>Who we recommend</u> , they<br>will appoint Jones.   | b. [Regardless of <u>who we recommend</u> ,] they<br>will appoint Jones.      |
| ii   | a. <u>Whoever we recommend</u> , they<br>will appoint Jones. | b. *[Regardless of <u>whoever we recommend</u> ,]<br>they will appoint Jones. |

Open interrogatives express variable questions whose answers supply values for the variable. In the present example, the question contains the open proposition “we will recommend *x*”, and the answers consist of “We will recommend Smith”, “We will recommend Baker”, and so on. The meaning of [56] is that they will appoint Jones given any value of *x* – i.e. in any of the cases defined by possible answers to the question. In the governed construction [ib], the meaning that the actual value of *x* doesn’t matter is expressed outside the interrogative, by *regardless*; in the ungoverned [iia], it is expressed inside the clause by *·ever*. This has the free choice meaning found in one sense of *any*: “Take the case defined by any value of the variable – they will still recommend Jones in that case”. This free choice sense of *·ever* is likewise found in fused relatives: *They can appoint whoever they like*, “They can appoint anyone they want to appoint”. The requirement that the [a] construction contain *·ever* can be seen as motivated by the need to express the free choice meaning within the interrogative clause itself, given that there is no governing item such as *regardless* to express it outside the clause.

### ■ Open interrogatives compared with fused relatives

We have just noted that *·ever* forms are elsewhere found in fused relative constructions, which means that as far as their internal form is concerned, open interrogatives in the ungoverned construction bear a close resemblance to fused relatives. Compare:

- |      |  |                      |
|------|--|----------------------|
| [57] | i <i>They will appoint Jones, <u>whoever we recommend</u>.</i> | [open interrogative] |
|      | ii <i>They will appoint <u>whoever we recommend</u>.</i>       | [fused relative]     |

The underlined sequence is in [i] an interrogative clause in adjunct function and in [ii] a fused relative construction functioning as object of *appoint*.<sup>16</sup> The free choice *·ever* compounds do not occur elsewhere in interrogative clauses – the *ever* in examples like *What ever could have come over her?* has a different sense, and is usually written as a separate word (see Ch. 10, §7.13).

A further similarity between the ungoverned exhaustive conditional and the fused relative is that neither construction permits *\*whyever*: compare *\*[Whyever she was late,] they won’t forgive her* (interrogative) and *\*He complained [whyever she did]* (“for whatever reason she complained”). Fused relatives do not in fact allow *why* either (*\*[Why he did it] was invalid*, “the reason why...”), whereas they are allowed in interrogatives, including the governed exhaustive conditional: *No matter [why she was late,] they won’t forgive her*.

<sup>16</sup> *Whomever* is possible as a formal alternant of *whoever*, especially in [57ii].

Note also that, as in relatives, there can be no more than one *-ever* compound:

- [58] i *\*Whoever said whatever to whomever, we've got to put the incident behind us and work together as a team.* [interrogative]  
 ii *\*Whoever said whatever to whoever will be severely dealt with.* [relative]

Again the governed construction allows multiple interrogative words: [*No matter who said what to whom,*] *we've got to put the incident behind us and work together as a team.*

There are nevertheless compelling reasons for distinguishing between the constructions in [57] as respectively interrogative and relative.

#### (a) Meaning

The first point to note is that in [57ii] *whoever we recommend* denotes a person – they will appoint some person, and this construction indicates who it will be (namely the person we recommend). But the same expression in [57i] clearly does not denote a person: expressions denoting persons or concrete objects cannot function as adjunct in clause structure.

#### (b) Clausal status

*Whoever we recommend* is a clause in [57i] but not in [57ii]: in the latter it is an NP. This correlates with the point just made about meaning: it is NPs, not clauses, that denote persons. Syntactic evidence for distinguishing the constructions as clausal vs non-clausal is provided by facts concerning the placement of prepositions:

- [59] i *He always antagonised whoever he worked with.*  
 ii *\*He always antagonised with whomever he worked.*  
 iii *Now, in whatever way government may be theoretically conceived, it is in practice a matter of the adjustment of a multiplicity of private interests.*

In [i] we have a fused relative with a stranded preposition; as shown in [ii] the preposition cannot be placed in front of *whoever*. In ordinary interrogatives, both orders are possible: *I can't recollect who he worked with / with whom he worked*. But [ii] is ungrammatical because the preposition has been placed at the beginning of an NP rather than a clause. The difference between [i] and [ii] is thus comparable to that seen between *He always antagonised those who he worked with* and *\*He always antagonised with those whom he worked*. The ungoverned exhaustive conditional, however, is a clause and thus allows a preposition to be placed in front position along with its complement, as illustrated in the attested example [iii]. This may be compared with the governed counterpart *no matter in what way government may be theoretically conceived*.

#### (c) Place in the system of exhaustive conditionals

Exhaustive conditionals are classified, as we have noted, on two cross-cutting dimensions, governed vs ungoverned and closed vs open:

- |        |  |  |
|--------|--|--|
| [60]   | GOVERNED   | UNGOVERNED   |
| CLOSED | a. <i>They will appoint Jones [regardless of <u>whether he's the best candidate or not</u>].</i> | b. <i>They will appoint Jones <u>whether he's the best candidate or not</u>.</i> |
| OPEN   | c. <i>They will appoint Jones [regardless of <u>who we recommend</u>].</i>                       | d. <i>They will appoint Jones <u>whoever we recommend</u>.</i>                   |

On one dimension, the relation of [a] to [b] is the same as that of [c] to [d]; and on another the relation of [a] to [c] is the same as that of [b] to [d]. These relationships are most simply described if in other respects the constructions are all alike – i.e. all involve interrogative clauses.

(d) *Whatever the hell . . .*

Ordinary interrogatives allow emotive modifiers like *the hell* or *on earth* to follow the interrogative word: *What the hell do you want?* or *Who on earth said that?* This pattern is found also in the exhaustive conditional, as in the following attested example:

- [61] We [sc. women] *must be attractive* – *whatever the hell that means* – *because, without that, we will find no place in this society.*

Fused relatives do not admit these expressions: \**Whoever the hell said that was wrong.*

(e) *The exclusion of multiple ·ever words*

We noted above that it is not possible to have more than one word with free choice *·ever*: see [58]. This appears to make the ungoverned exhaustive conditional more like a relative than like a governed interrogative since the latter allows more than one interrogative word. But the constraint is best seen as excluding multiple *·ever* words, not multiple interrogative words as such. Note that if we replace the second and third *·ever* words in [58i] by ordinary interrogative counterparts, the stark ungrammaticality is lost:

- [62] <sup>?</sup>*Whoever said what to whom, we've got to put this incident behind us and work together as a team.*

This seems to be more or less acceptable: certainly, it is strikingly better than the corresponding fused relative \**Whoever said what to whom is going to be severely dealt with.*<sup>17</sup>

The conclusion must be that the ungoverned conditional is semantically and syntactically distinct from the fused relative. To some extent it is a blend between the relative and interrogative constructions, inasmuch as the *·ever* forms can be regarded as primarily relative: only those forms which are used in fused relatives are established in the conditional, even though the counterparts without *·ever* are regularly found in the governed construction and other interrogatives. But the interrogative features significantly outweigh the relative ones, and the construction is best analysed as a non-prototypical type of interrogative clause.

### ■ The closed interrogative construction

There are also differences between closed interrogatives in the ungoverned conditional construction and those which occur elsewhere, though this time it is a matter of an important restriction that applies. Closed interrogatives in general express either polar questions (*Is he the best candidate?*) or alternative questions (*Is the meeting in Paris or in Bonn?* or *Is he the best candidate or not?*) – see Ch. 10, §§4.3–4. Those expressing alternative questions contain an *or*-coordination, with each coordinate corresponding to one of the answers (“The meeting is in Paris” and “The meeting is in Bonn” or “He is the best candidate” and “He is not the best candidate”). In the ungoverned exhaustive

<sup>17</sup> A further point concerns the idiomatic interrogative construction with *what + be doing*: *What were they doing reading her mail?*, “Why were they reading her mail?” This is admissible in the exhaustive conditional (*I'm still going to complain about invasion of privacy, whatever they were doing reading my mail*), but is completely excluded from the fused relative (\**She didn't complain about whatever they were doing reading her mail*).

conditional only the alternative kind of question is permitted, i.e. an *or*-coordination is obligatory:

- [63] i *They will attend the meeting [whether it is in Paris or in Bonn.]* } [alternative]  
 ii *They will appoint Jones [whether he is the best candidate or not.]* }  
 iii *\*They will appoint Jones [whether he is the best candidate].* [polar]

The interrogative clause in [iii] is perfectly admissible in the governed construction: *They will appoint Jones regardless of whether he is the best candidate.*

As with the case of the *-ever* forms in the open construction, this special property of closed interrogatives in adjunct function can be related to the fact that there is nothing outside the clause itself to indicate that the choice between the various cases defined by answers to the question doesn't matter. In polar questions, one of the answers is left implicit: the obligatory presence of *or not* in [63ii] ensures that both answers are explicitly represented.

### The status of *whether*

In traditional grammar the subordinate clauses in [63] are analysed as adverbial clauses, not subordinate interrogatives ('indirect questions'). Adapting to our descriptive framework, this would be to say that *whether* here is a preposition, not an interrogative subordinator. *Whether* would then be like *if*, belonging to both preposition and subordinator categories. While this distinction is certainly necessary in the case of *if*, however, we do not believe that it is in the case of *whether*. There is a clear semantic difference between the *if* of *I'll do it if I've time* and that of *I don't know if I've time*, but there is no such difference in the case of *whether* between, say, [60b] and [60a]: as we have said, the systematic relations between the four constructions in [60] are most simply described if all the subordinate clauses are analysed as interrogative. Note, moreover, that the two constructions are syntactically alike in that the ungoverned conditional, like all subordinate closed interrogatives, allows *or not* to follow *whether*:

- [64] i *You'll have to stop now (regardless of) whether you have finished or not.*  
 ii *You'll have to stop now (regardless of) whether or not you have finished.*

On both semantic and syntactic grounds, therefore, we recognise just one item *whether*, an interrogative subordinator.

### ■ Reduction to participial or verbless construction

Conditional interrogatives commonly appear in reduced form:

- [65] i *Whether hunting or being hunted, the fox is renowned for its cunning.*  
 ii *Whether taken neat or with water, the mixture can be quite lethal.*  
 iii *Whether historically a fact or not, the legend has a certain symbolic value.*  
 iv *The United Nations may not interfere in the political affairs of any nation, whether to unify it, federalise it, or balkanise it.*  
 v *Whatever their faults, they are not hypocrites.*  
 vi *However well-meaning, the very act of helping old people may reduce their ability to look after themselves.*

With closed interrogatives introduced by *whether* we have omission of subject + verb. In [i] the result is a gerund-participial, in [ii] a past-participial construction, and in [iii] a verbless construction with *a fact* as predicative complement. The interrogative clause

“She forgot that they were remarkably old” (the exclamative reading), and similarly for [iiib] we have “I know what the games are that they play” and “I know that they play remarkable games (remarkable for either good or bad qualities)”.

Where both interrogative and exclamative readings are possible, the exclamative will often be considerably more salient where *how* is used in its degree sense:

- [3] i *This just shows how immature he was. I remembered how frail he was.*  
 ii *It's amazing/extraordinary/remarkable how old they were.*

We will normally interpret [i] as conveying that he was immature or frail to a remarkable degree, hence as exclamative. The exclamative reading is effectively more specific, more informative than the interrogative one, rather than being in conflict with it. If I remembered that he was remarkably frail, then I remembered the answer to the question “How frail was he?” – it’s just that the answer involves a high degree of frailty. In [ii] the expression governing the content clause incorporates within its meaning something very akin to the “remarkable” feature that is associated with the exclamative construction, and this favours the exclamative interpretation so strongly that one would generally not use this form to express the interrogative meaning (where what is amazing is simply the answer, whatever it might be, to the question “How old were they?”). The context in [ii] is one of strong answer-orientation: I know how old they were. I will then normally be understood as conveying how old they were (namely, remarkably old) rather than as leaving the question unresolved. It must be emphasised, however, that the governing expressions in [ii] do take interrogative complements as well as exclamative ones (they belong to the class given in [17ix] of §5 under the label ‘surprise’). This is evident from the fact that the complement is not limited to *how* and *what* but allows the full range of open interrogative words: *It's amazing who they appointed / which ones they preferred / where they took him*. There is an exclamatory component of meaning in such examples, but it derives from the matrix adjective *amazing*, not from the content clause.

## 6.2 Distribution of exclamative content clauses

Subordinate exclamatives occur in a subset of the environments where interrogatives are found; they always function as complement of some governing expression, and there are no expressions that license exclamatives but not interrogatives.

The functions that may be realised by exclamative clauses are illustrated in:

- [4] i *What a blunder it was didn't emerge till later.* [subject]  
 ii *It's incredible what a difference a little paint can make.* [extraposed subject]  
 iii *I found it quite amazing what a fuss he was making.* [extraposed object]  
 iv *She kept thinking what a fool she'd been to trust them.* [internal comp of verb]  
 v *He expressed his dismay at what a raw deal she'd had.* [comp of preposition]  
 vi *They were surprised what a good price we were offering.* [comp of adjective]

Exclamatives in subject function are rare: they generally do not satisfy the pragmatic constraints described in Ch. 16, §7.1. Compare [ii] with #*What a difference a little paint can make is incredible!* Exclamatives are as impossible as declaratives as (non-preposed)

object in the complex-transitive construction: \**I found what a fuss he was making quite amazing*. And while a number of nouns allow interrogatives as core complements, none allow exclamation: they occur in NP structure only as obliques. *At*, for example, is not omissible in [v], or in *I remember her amazement at how immaturally her husband had behaved*, and so on.

The governing expressions belong mainly in the semantic classes shown in [5], where the roman numerals match those in [17] of §5:

[5] ii	KNOWING	<i>We <u>know</u> what a disappointment it is for you.</i>
iii	GUESSING	<i>I couldn't have <u>predicted</u> what a disaster it would be.</i>
iv	TELLING	<i>She <u>told</u> them what bores they were.</i>
viii	CONCERNING	<i>He was holding forth <u>about</u> what a hard life he'd had.</i>
ix	SURPRISE	<i>It is <u>surprising</u> how little variation there was in these results.</i>

In general such governors license not only interrogatives and exclamation but also declaratives: compare *We know that it is a great disappointment for you*. The only exception is that declaratives do not occur as complement of such prepositions as *at* and *about*, so that we cannot replace the exclamation by a declarative in examples like [4v] and [5viii].

## 7 Mood, tense, and activity

In this section we outline certain uses of mood (including the modal auxiliaries) and tense that are not in general found in main clauses but are characteristic of content clauses.

### 7.1 The subjunctive construction and specialised uses of modal auxiliaries

The term 'subjunctive' is generally applied to an inflectional category of the verb but, as explained in Ch. 3, §1.8.2, we are here reinterpreting it as the name of a syntactic construction – a clause that is finite but tenseless, containing the plain form of the verb. Leaving aside various fixed phrases like *So be it*, *Long live . . . !*, etc., the subjunctive is restricted to various kinds of content clause.

#### ■ Three uses of the subjunctive in content clauses

The three main subordinate constructions where the subjunctive is found are illustrated in:

- [1] i *We insist that she be kept informed.*  
 ii *Nothing in English has been ridiculed as much as the ambiguous use of words, unless it be the ambiguous use of sentences.*  
 iii *Our thanks are due to all our staff, whether they be in the offices, the warehouses, or the branches, for their help during this difficult time.*

The content clause in [i] belongs to the subjunctive **mandative** construction; in [ii] it is complement to one of a small set of prepositions (*if*, *unless*, *lest*, etc.) that can take subjunctive complements; and [iii] is an exhaustive conditional interrogative.

### ■ Alternatives to the subjunctive construction

In none of the above three cases is the subjunctive construction obligatory. Two other possibilities have to be considered, as in the [b/c] examples in:

- [2] i a. *It is essential [that everyone attend the meeting].*  
 b. *It is essential [that everyone attends the meeting].*  
 c. *It is essential [that everyone should attend the meeting].*  
 ii a. *They must co-operate in order [that the system operate effectively.]*  
 b. *They must co-operate in order [that the system operates effectively.]*  
 c. *They must co-operate in order [that the system may operate effectively.]*

The [b] examples are ordinary declaratives, while [ic/iic] belong to what we call **the specialised-modal construction**. This involves a use of a modal auxiliary that cannot be identified with one of the uses characteristic of main clauses. The *should* of [ic], for example, is not the same as that seen in the main clause *Everyone should attend the meeting*: the latter does not accurately express the content of our demand since the *should* here is weaker than in [ic], allowing that not everyone will necessarily attend. Similarly the *may* of [iic] is not interpreted like that of the main clause *The system may operate effectively*, where it conveys epistemic possibility. The ordinary declarative contains a present tense or preterite non-modal verb or else a modal auxiliary with a sense that it can also have in a main clause: compare, for example, subjunctive *It is essential that everyone be able to see the screen* with ordinary declarative *It is essential that everyone is able to / can see the screen*.

### ■ Distinguishing the subjunctive from an ordinary declarative

The subjunctive construction contains the plain form of the verb, which is overtly distinct from a present tense only with the verb *be* or a 3rd person singular subject:

- |       |                   |   |  |                   |
|-------|-------------------|---|--|-------------------|
| [3] i | <i>be</i> as verb | { | <i>It's vital that they <u>be</u> kept informed.</i>         | [subjunctive]     |
|       |                   | { | <i>It's vital that they <u>are</u> kept informed.</i>        | [non-subjunctive] |
| ii    | 3rd sg subject    | { | <i>It's vital that <u>he</u> <u>keep</u> them informed.</i>  | [subjunctive]     |
|       |                   | { | <i>It's vital that <u>he</u> <u>keeps</u> them informed.</i> | [non-subjunctive] |
| iii   | other             |   | <i>It's vital that <u>we</u> <u>keep</u> them informed.</i>  | [indeterminate]   |

In [i] *be* and *are* contrast overtly as plain form vs present tense and hence mark the clauses as respectively subjunctive and non-subjunctive (ordinary declarative). In [ii] the absence of agreement in *he keep* shows the *keep* to be a plain form and hence the clause to be subjunctive, while *keeps* can only be a 3rd person singular present tense form, so that the clause is distinctively non-subjunctive. But in [iii] *keep* could be either the plain form or the plain present tense form, and the clause could therefore be either subjunctive or non-subjunctive. This is not a matter of ambiguity, however, since there is no semantic difference between the subjunctive and non-subjunctive examples in [i–ii].

Two places where the morphological indeterminacy can be resolved in favour of the subjunctive are illustrated in:

- [4] i *The nuns insisted [that their young ladies wear stockings].*  
 ii *It is vital [that they not accept the offer without first taking legal advice].*

*Wear* in [i] must be the plain form because if the subordinate verb were tensed backshifting would be required: *The nuns insisted that they wore stockings*, so the *wear* must be the plain form.<sup>19</sup> The mandative clause in [ii] is negative, and the tensed version would therefore require *do*: *that they do not accept the offer*. Negative subjunctives with verbs other than *be* are, however, quite rare and formal.

### 7.1.1 The mandative construction

Mandative clauses characteristically occur in construction with various verbs, nouns, and adjectives, such as *demand* and *mandatory* (to cite the two that contain the element *mand* on which the term ‘mandative’ is based).

- [5] i *They demanded [that access to the park remain free].*  
 ii *It is mandatory [that all pools be properly fenced].*

We will apply the term mandative not only to the subordinate clauses but also to the verb, noun, or adjective which licenses or governs them – for example, we will say that as used in [5] *demand* is a mandative verb and *mandatory* a mandative adjective.

#### ■ Three types of mandative clause

On the basis of their internal structure we distinguish three types of mandative clause:

- [6] i *They demand (ed) [that the park remain open].* [subjunctive mandative]  
 ii *They demand (ed) [that the park should remain open].* [should-mandative]  
 iii *They demand [that the park remains open].* } [covert mandative]  
 iv *They demanded [that the park remained open].* }

Those with the form of a subjunctive construction we refer to as **subjunctive mandatives**, those containing the specialised use of *should* as **should-mandatives**, and those with the form of an ordinary declarative content clause as **covert mandatives**. There is nothing in the internal structure of the bracketed clauses in [iii–iv] to distinguish them from the non-mandative content clauses in *I know [that the park remains open]* or *He said [that the park remained open]* – the mandative meaning derives entirely from the governing verb *demand*. Covert mandatives contain a present tense verb, or else a backshifted preterite, as in [iv]: we can't have an ordinary, past-time preterite (*\*They demand that the park remained open*).

Clear cases of the covert construction are fairly rare, and indeed in AmE are of somewhat marginal acceptability. In AmE the subjunctive is strongly favoured over the *should* construction, while BrE shows the opposite preference.

#### ■ Semantic contrast between mandative and non-mandative clauses

A content clause in construction with *demand* or *mandatory* – or *require*, *stipulate*, *essential*, *necessary*, etc. – is always mandative, but others items such as *insist*, *suggest*,

<sup>19</sup>Strictly speaking, [i] is ambiguous. We are concerned with the mandative interpretation, where the nuns imposed a rule about wearing stockings, but there is also a non-mandative interpretation with *wear* a present tense verb: “The nuns emphatically asserted it to be the case that their young ladies wear stockings” (compare the contrast between [7ia/iia] below).

*important* can select either a mandative or a non-mandative clause as complement:

- |     |    |   |   |                 |
|-----|----|---|---|-----------------|
| [7] | i  | a. <i>She <u>insisted</u> [that he tell her the whole story].</i>             | } | [mandative]     |
|     |    | b. <i>I <u>suggest</u> [you go and see a doctor].</i>                         |   |                 |
|     |    | c. <i>It's <u>important</u> [that he should take us into his confidence].</i> |   |                 |
|     | ii | a. <i>She <u>insisted</u> [that he had been lying].</i>                       | } | [non-mandative] |
|     |    | b. <i>I <u>suggest</u> [she doesn't like us very much].</i>                   |   |                 |
|     |    | c. <i>It's not <u>important</u> [that the gift won't be a surprise].</i>      |   |                 |

The difference in meaning is comparable to that between imperative and declarative clauses.<sup>20</sup> With mandatives it is a matter of bringing about the situation expressed in the content clause. As with imperatives, we can invoke the concept of 'compliance': in [ia] she insisted on compliance, in [ib] I'm advocating compliance in a relatively tentative way, and in [ic] compliance is said to be important. With the non-mandatives, by contrast, it is a matter of the truth of the proposition expressed in the content clause. In [iia] she insisted on the truth of the proposition, in [iib] I put the proposition forward as something that may well be true, and in [iic] the truth of the proposition is taken for granted, presupposed: it is treated as a fact, a fact that is said to be not important.

### ■ Ambiguity between mandative and non-mandative clauses

With the items that allow both mandative and non-mandative complements there may be ambiguity between them. Compare:

- |     |     |  |                 |
|-----|-----|--|-----------------|
| [8] | i   | <i>She <u>insists</u> [that <u>he take</u> the eight o'clock train].</i>                     | [mandative]     |
|     | ii  | <i>She <u>insists</u> [that <u>he took</u> the eight o'clock train].</i>                     | [non-mandative] |
|     | iii | <i>She <u>insists</u> [that <u>he takes</u> / <u>they take</u> the eight o'clock train].</i> | [ambiguous]     |

Example [i] is distinctively subjunctive. By contrast, [ii] is non-subjunctive and cannot be taken as a covert mandative because *took* is an ordinary past-time preterite, not a backshifted one: the time of his taking the train is earlier than that of her insisting. Both versions of [iii] are ambiguous. With *he takes* it can be a covert mandative equivalent to subjunctive [i]: the meaning is that she insists on his taking this train, either on some particular future occasion or habitually. But the more likely interpretation is non-mandative, that she emphatically asserts it to be the case that he takes this train – most probably a matter of his habitually doing so, but it could be a single future occurrence with a futurate interpretation ("She emphatically maintains that he is scheduled to take the eight o'clock train"). The version with *they take* has the same ambiguity, but on the mandative reading it is also syntactically indeterminate between the subjunctive and covert constructions.

### ■ Mandatives and modality

The mandative construction falls within the broad area of meaning that is known as modality. In our discussion of modality as expressed by the modal auxiliaries (Ch. 3, §9), we distinguished various dimensions of modal meaning, including 'kind' and 'strength'. Two of the main kinds of modality are deontic and epistemic: deontic modality is concerned with obligation and permission (as in *You must leave at once* or *You may leave as soon as you've finished*), while epistemic modality is primarily concerned with one's level of assurance about the truth of the proposition expressed (as in *He must/may have missed the train*).

<sup>20</sup>It has indeed been suggested that mandatives should be analysed syntactically as subordinate imperatives; we have argued against that view in Ch. 10, §9.8.

On the dimension of strength, *must* is strong and *may* weak, while *ought* is somewhere in between, of medium strength. Within this framework, mandates clearly involve deontic modality: *It is necessary that you leave at once* is comparable to the above *You must leave at once*, with the deontic use of *must*.<sup>21</sup> As for the dimension of strength, mandates show variation here, with *demand*, *insist*, *necessary*, for example, stronger than *advise*, *recommend*, *desirable*. In general, however, they occupy an area on the scale of deontic strength higher than that represented by permission: mandates are rare with *allow* (*He won't allow that she attend the meeting*), questionable with *permit*, and quite impossible with *let* – verbs of permission generally take infinitival complements (*He won't allow/permit her to attend the meeting*).

#### Blurring of semantic contrast between mandative and non-mandative

Verbs expressing deontic modality (whether auxiliaries or lexical verbs) may of course appear in content clauses, and this may lead to a loss of the sharp distinction between mandative and non-mandative illustrated in [7i] vs [7ii]. Consider:

- [9] i *She insisted [that he must / had to wear a hat when he went out].*  
 ii *I suggested [that we might invite the Smiths at the same time].*

There are grounds for saying that the bracketed clauses here are non-mandative. The modals *must* and *might* do not have plain forms and hence cannot occur in subjunctive or *should* mandates; *have* is not morphologically restricted in this way, but *had* could not here be replaced by *have* (or *should have*), so we cannot plausibly argue that these clauses are covert mandates. Note, moreover, that we could replace *insisted* and *suggested* by, for example, *said* and *added*, verbs that do not take mandative complements. Nevertheless, the meanings are very similar to the mandative *She insisted that he wear a hat when he went out* and *I suggested that we invite the Smiths at the same time*. This phenomenon is similar to that found with main clauses. *You must / have to wear a hat when you go out* and *We might invite the Smiths at the same time* are declarative clauses, not imperatives, and yet they are most likely to be interpreted in context as directives, as having much the same force as the imperatives *Wear a hat when you go out* and *Let's invite the Smiths at the same time* (cf. the discussion of declarative directives in Ch. 10, §9.6.2). This strengthens the analogy we have drawn between mandates and imperatives on the one hand, non-mandatives and declaratives on the other. Mandatives and imperatives are inherently deontic; non-mandatives and declaratives are not, but when they incidentally contain deontic modal expressions their interpretation may come to merge with that of mandates and imperatives respectively.

#### Modal harmony between mandative governor and its complement

One consequence of the resemblance between a modalised non-mandative and a mandative is that such items as *stipulate*, *essential*, *requirement*, which (unlike *insist* and *suggest*) normally allow only mandative complements, may nevertheless appear with a non-mandative that contains an appropriate deontic modal:

- [10] i *The agreement stipulates [that an election must be held next year].*  
 ii *These criteria must be satisfied within the overriding requirement [that work assessed must show literary merit].*  
 iii *It is essential [that the radiochemical procedure for the assay of lead-210 shall provide for a high degree of decontamination from major fission products].*

<sup>21</sup>Note that the adjective *necessary*, unlike the verb *must* or the adverb *necessarily*, is restricted to the deontic kind of modality, so that it takes mandative but not non-mandative clauses: we can say *He wasn't necessarily referring to you*, but not, equivalently, *\*It isn't necessary that he was referring to you*.

We will say that a non-mandative is allowed with such items if it is modally harmonic with them: the strong deontic modals *must* and *shall* here match the modality expressed by *stipulate*, *requirement*, and *essential*. (For further discussion of modal harmony, see Ch. 3, §9.2.3.)

### ■ *Should*-mandatives

In main clauses *should* expresses medium strength modality (like *ought*): *You should inform the police* countenances that you may not do so – I could add *but I don't suppose you will*, which would not be possible with strong *must*. Consider now its use in:

- [11] i *They demanded [that he should be freed]*. [should-mandative]  
 ii *She insists [that I should have told her]*. [non-mandative]  
 iii *They insisted [that all murderers should be hanged]*. [ambiguous]  
 iv *They suggested/recommended [that we should engage a consultant]*.

Example [i] is clearly not a case of modal harmony, for *demand* is stronger than *should* is in its main clause uses: cf. the discussion of [2ic] above. It is for this reason that we recognise a specialised use of *should* as a grammatical marker of a distinct *should*-mandative construction, equivalent in meaning to the subjunctive. *Insist* in [11ii] is also strong, but here *should* is the ordinary medium-strength one that we have in the main clause *I should have told her*. Moreover, *insist* cannot here be being used mandatively, for the past time expressed by *have* rules out a mandative interpretation. The example is like [7iia], meaning approximately “She maintains that I should have told her”. Example [11iii] can be interpreted in either way. As a *should*-mandative it is equivalent to subjunctive *They insisted that all murderers be hanged*, “They insisted on having all murderers hanged” (which implicates that they were in a position of power); in the non-mandative reading they forcefully expressed their view as to the right punishment for murderers (and hence may have been ordinary citizens).

More problematic is [11iv]: *suggest* and *recommend* are of medium strength and hence potentially harmonic with the ordinary *should*. This time, therefore, *We should engage a consultant* does accurately express the content of their suggestion/recommendation. We probably need to accept that the distinction between a *should*-mandative and a modally harmonic non-mandative is here neutralised; such examples are much more frequent than the clear cases of modal harmony like [10], but they are also considerably more frequent, especially in AmE and AusE, than strong *should*-mandatives like [11i].

### ■ Distribution of mandative clauses

In the most straightforward cases the mandative clause functions as (internal) complement to the governing mandative word or else, with nouns and certain adjectives, as subject or (much more likely) extraposed subject in the clause in which the governing item heads the predicative complement:

- [12] i *the requirement that it be signed by a director* [complement]  
 ii *That it be signed by a director is no longer a requirement.* [subject]  
 iii *It is no longer a requirement that it be signed by a director.* [extraposed subject]

The syntactic relation between the mandative clause and the governing word may, however, be less direct:

- [13] i *The main recommendation was that an outside consultant be engaged.*  
 ii *It seemed the most important thing in my life at this moment that she should know the real truth about me.*  
 iii *One of the qualities demanded of a politician by other politicians is that he or she always keep a confidence.*

In [i] *recommendation* is head of the subject while the mandative clause is complement of *be*: this is the specifying use of *be*, where properties of the variable (here the subject) carry over to the value (here the predicative complement). In [ii] the mandative property of *important* percolates up, as it were, so that it applies to the NP in which *important* is modifier. And [iii] combines these two extensions of the relationship: the main clause contains specifying *be* and the subject is mandative by virtue of *demand*, which heads the non-finite clause modifying *qualities*.

#### A sample of mandative verbs, adjectives, and nouns

We give here examples of items from these three categories that license mandative clauses. The annotation ‘†’ signifies that the item readily takes ordinary, non-mandative, content clauses too (as illustrated for *insist*, *suggest*, and *important* in [7i–ii]).

- [14] *advise/advice* †      *agree/·ment* †      *allow* †      *arrange/·ment*  
*ask*                      *beg*                      *command* /–      *decide/decision* †  
*decree/–*                *demand/–*                *desire/–*                *determinel·ation* †  
*enjoin*                      *entreat* /·y                *insist/·ence* †      *instruct/·ion*  
*intend/intention*      *move/motion*                *ordain*                *order/–*  
*pledge/–*                *prefer/·ence*                *propose/·al* †      *recommend/·ation*  
*request/–*                *require/·ment*                *resolve/–* †      *rule/·ing* †  
*stipulate/·ation*      *suggest/·ion* †                *urge/·ing* †                *votel/–*
- [15] i *advisable*      *appropriate* †      *compulsory*      *crucial* †      *desirable*  
*essential*      *fitting* †      *imperative*      *important* †      *necessary*  
*obligatory*      *preferable*      *proper*      *urgent*      *vital*  
 ii *anxious*      *eager*      *insistent* †      *keen*      *willing*

List [14] gives verbs together, where applicable, with the corresponding nouns; the notation ‘–’ indicates that the noun has the same lexical base as the verb.<sup>22</sup> The items in [15] are adjectives: with those in [15i] the mandative characteristically appears as subject or extraposed subject (*It’s vital that she be kept informed*), while with those in [ii] it is normally complement within the AdjP (*I’m anxious that it should be settled quickly*). A few of these provide the base for de-adjectival nouns: *importance*, *necessity*, *eagerness*, etc. It should be emphasised, however, that there can be no question of giving a definitive list of mandative items: in spite of suggestions that have been frequently made that the subjunctive is dying out in English, this construction is very much alive, with attested

<sup>22</sup>The final *e* of the verb base is deleted before a suffix beginning with a vowel, as in *determination*, etc. (see Ch. 19 §5.15). With *wish*, mandatives are commonly found with the noun (*It is her wish that the matter be resolved quickly*), but are hardly possible with the verb, which takes, rather, a modal preterite (*He wishes he had told them*). Similarly mandatives are licensed by the noun *regulation* but not normally by the verb *regulate*. Besides *ruling*, there is a noun *rule* which takes only a mandative complement: *the rule that ties be worn*.

examples like *I would stress that people just be aware of the danger* suggesting that its distribution is increasing.

### 7.1.2 Content clauses governed by prepositions

Prepositions and prepositional idioms governing subjunctive or specialised-modal content clauses include the following (where ‘-T’ indicates that the content clause cannot be expanded by the subordinator *that*):

[16] i	ADVERSATIVE	<i>for fear</i>	<i>lest</i> -T		
ii	CONDITIONAL	<i>if</i> -T	<i>in case</i> -T	<i>on condition</i>	<i>provided</i>
		<i>providing</i>	<i>though</i> -T	<i>unless</i> -T	
iii	PURPOSIVE	<i>in order</i>	<i>so</i>		

#### ■ Adversatives

- [17] i *He was bathed in perspiration, trembling [lest his authorship become known].*  
 ii *Both were tense with worry [lest things should somehow go wrong].*

*Lest*, which belongs to formal style, is the only preposition where the subjunctive is the preferred construction, though specialised *should*, as in [ii], is also readily used. Ordinary declaratives are possible, but comparatively rare.

#### ■ Conditionals

- [18] i *He struggles in vain against the proposition that [if the mind be immaterial,] its functions ought to be unaffected by the condition of the body.*  
 ii *He handed over the pretty sloop to Abel for keeps, [on condition that he never fail to let his brother accompany him whenever the younger boy wished].*  
 iii *[If you should need any help,] don't hesitate to call me.*  
 iv *They want flexibility [in case the market should fail].*  
 v *[If some thief should open her case,] he wouldn't easily find her jewellery.*

The subjunctive is fairly rare here, especially with verb-forms other than *be*; it belongs to formal style and verges on the archaic. Specialised *should* is regularly found, but much the most usual construction is with an ordinary declarative. *Should* can appear in either open or remote conditionals, as in [iii/iv] and [v] respectively. In the open construction *should* has a narrower range of use than an ordinary declarative: only the latter is found in cases where the condition is accepted as satisfied, where there is no element of doubt, as in *If it's as good as she says, let's go and see it*.

The noun *condition* takes mandative complements (*They wanted to impose a condition that full payment be made in advance*), so that there is an evident connection between the conditional and mandative constructions.

#### ■ Purposives

- [19] i *Extraordinary precautions were taken [so that no stranger be allowed in the city].*  
 ii *He issued white gloves [so that his customers should not soil their hands].*  
 iii *A true friend would change subjects [so that they could do projects together].*  
 iv *They say I am urging him to abdicate [in order that I may step into his shoes].*

Subjunctives and specialised *should* are found with both *so* and *in order*, but they are not common. *So* usually takes an ordinary declarative, very often containing the *can* of ability, as in [iii]. The combination of purpose and ability *can* might perhaps be regarded

as a case of modal harmony: there is a close connection between purpose and enabling. *In order* is more formal than *so*, and this is reflected in the fact that the most frequent pattern with *in order* has *may* (or *might*), as in [iv]. This use of *may* is somewhat different from its use in main clauses, and hence counts as a specialised-modal construction. The main clause *I may step into his shoes* would most likely be interpreted epistemically (“I will perhaps ...”), and a deontic reading is also available (“I’m allowed to . . .”), but a dynamic, ability, reading is hardly possible.<sup>23</sup>

### 7.1.3 Content clauses functioning as exhaustive conditional adjunct

The subjunctive is found in the exhaustive conditional construction discussed in §5.3.6:

- [20] i *It meets with continuing hostility from those who see themselves as fostering and guarding serious art, [whether it be in the theatre, in fiction, or on television].*  
 ii *Achieving the optimum blast design for a particular rock mass type, [be it in mining or quarrying,] can be an expensive and time-consuming procedure.*  
 iii *They realise that East–West friction, [wherever it take place around the globe], is in essence the general conflict between two entirely different societies.*

In [i] we have a closed interrogative expressing an alternative question: the meaning is approximately “irrespective of the answer to the question ‘Is it in the theatre, in fiction, or on television?’”. The subjunctive here is relatively formal and more or less confined to the verb *be*, so that we find *whether he likes it or not* but hardly *whether he like it or not*. Example [ii] is an alternant of the construction with *whether*, again belonging to formal style. Here the restriction to the verb *be* is absolute, and the following subject is usually a personal pronoun. The structural relation between *whether it be* and *be it* bears some resemblance to that between *whether it is* and *is it* (as found in main clause interrogatives), but the subjunctive *be* + subject order is not a case of normal subject–auxiliary inversion, which applies only with primary verb-forms. Example [iii] is an open interrogative, with the subjunctive much less common than a tensed construction (*wherever it takes place . . .*).<sup>24</sup>

Specialised *should* is hardly possible as an alternant of the subjunctive in such conditionals, but one commonly finds *may* in the open interrogative type, in what can be regarded as a case of modal harmony:

- [21] [*Whatever one may choose to call it,] natural law is a functioning generality with a certain objective existence.*

This is equivalent to *whatever one chooses to call it*: *may* doesn’t add a new modal meaning, but reinforces that inherent in the *whatever*.

### 7.1.4 Other specialised-modal constructions

#### ■ Attitudinal *should*

*Should* is found, as an alternant of an ordinary declarative, in clauses governed by (or otherwise related to) items expressing various kinds of subjective attitude or

<sup>23</sup>This is not to say that *may* cannot have the ability sense in main clauses, but the main clause use is considerably more restricted than that found in purposive constructions. A second example, involving backshifted *might*, is seen in *A press conference was held in order that the consulting specialists might clarify the president’s condition for the nation*.

<sup>24</sup>Two fixed phrases with postposed subjects, *come what may* (“irrespective of what may come/happen”) and *be that as it may* (“however that may be”), also belong here. So too does the rare subjectless construction with verb + fused relative as complement: *She wandered up and down, trying turn after turn, but always came back to the house, do what she would* (“whatever she did”).

evaluation:

- [22] i We felt *incensed* [that he *should* have been treated so leniently].  
 ii It is *wrong* [that a judge *should* sit while his conduct is under investigation].  
 iii What held his *interest* was the fact [that these two *should* have been there at all].

In [i] the content clause is complement to the adjective *incensed*, in [ii] it is extraposed subject in a matrix with *wrong* as predicative, and in [iii] it is in a much less direct relation to *interest* (compare *It was interesting that . . .*). A sample of licensing expressions is given in:

- |      |                      |                   |                    |                      |                     |
|------|----------------------|-------------------|--------------------|----------------------|---------------------|
| [23] | <i>a good idea</i>   | <i>a pity</i>     | <i>appropriate</i> | <i>astonishing</i>   | <i>can't bear</i>   |
|      | <i>can't imagine</i> | <i>distressed</i> | <i>expedient</i>   | <i>extraordinary</i> | <i>fortunate</i>    |
|      | <i>honoured</i>      | <i>impossible</i> | <i>improper</i>    | <i>inevitable</i>    | <i>intelligible</i> |
|      | <i>ironic</i>        | <i>lamentable</i> | <i>natural</i>     | <i>perturbed</i>     | <i>puzzling</i>     |
|      | <i>remarkable</i>    | <i>right</i>      | <i>sad</i>         | <i>suitable</i>      | <i>surprising</i>   |

This construction differs from the mandative in that the *should* clause is not replaceable by a subjunctive (cf. \**We felt incensed that he have been treated so leniently*) – though there may be variation with certain items (such as *appropriate* and *proper*) as to whether they belong here or with the mandatives.

The attitudinal use of *should* is virtually but not quite restricted to content clauses: it is also found in main clause interrogatives like *Who should I see but Bill?*

### ■ May

*May* and *might* occur in the complements of governors such as *hope*, *pray*, *fear*, *dread*, and the like:

- [24] i We *hope* that he *may* make a complete recovery.  
 ii She had *dreaded* still more that he *might* return to England.

These are equivalent to ordinary declaratives with *will*: *that he will make a complete recovery*; *that he would return to England*. The hope, that is, is not so much for the possibility of a recovery as for its actualisation, and analogously for the dread. With some items, such as *lest* and *for fear*, there is a choice between *may*, specialised *should*, and the subjunctive, but these last two constructions are not possible with *hope* or *fear* as a verb. Again there is variation over particular items: some speakers will have *pray* as a mandative and for others *dread* allows attitudinal *should*.

## 7.2 Modal preterites and irrealis mood

We use the term **modal preterite** for a preterite that expresses modal rather than temporal meaning, i.e. modal remoteness rather than past time (or backshift). By extension, the term applies to a clause with a preterite verb-form of this kind:

- [25] i *Suppose [they were in London last week].* [ordinary preterite]  
 ii *Suppose [they were in London now / next week].* [modal preterite]

In [i] we see the primary use of the preterite to locate the situation in past time; in [ii], by contrast, the time is present or future and the preterite serves to imply that their being in London at the time in question is a relatively remote possibility. Example [ii] contrasts with *Suppose they are in London next week*, where the same situation is presented as an open possibility. The modal auxiliaries *could*, *might*, *should*, and *would* are found

as modal preterites in main as well as subordinate clauses (*It could be over before next Tuesday; You might have been killed*), but with other verbs modal preterites are restricted to content clauses.

A clause with **irrealis mood** has *were* as verb in construction with a 1st or 3rd person singular subject. In general, modal preterite *was* has irrealis *were* as a somewhat more formal alternant:

- [26] i *Suppose [she was in London now/next week].* [modal preterite]  
 ii *Suppose [she were in London now/next week].* [irrealis mood]

Modal preterite and irrealis content clauses are found in the following constructions (see also Ch. 3, §1.7, for uses of irrealis *were* by some speakers in contexts where it is not an alternant of a modal preterite).

### (a) Remote conditionals

- [27] i *If [he was/were still in Paris] she would call on him this evening.* [present time]  
 ii *If [he had been in Paris last week] she would have called on him.* [past time]

These constructions are described in detail in Ch. 8, §14.

### (b) Complement to *wish*

- [28] i *I wish [she was/were here].* [present time]  
 ii *I wish [he hadn't told them].* [past time]

These have counterfactual interpretations: [i] indicates that she isn't here and [ii] that he did tell them. They contrast therefore with *I hope she is here* and *I hope he didn't tell them*, which leave open the issue of whether she is here and whether he told them. There is, however, no such straightforward contrast between *wish* and *hope* with future situations. For *wish* we find the following distribution:

- [29] i *I wish [she had come tomorrow].* [doubly remote]  
 ii *I wish [semester ended next week].* [futurate]  
 iii *I wish [you would come with us tomorrow].* [volition]  
 iv <sup>#</sup>*I wish [you passed your driving-test tomorrow].*

Example [i] indicates that something has already happened to exclude her coming tomorrow (perhaps she has come today): it has two markers of modal remoteness, preterite and perfect (Ch. 3, §6.1). Example [ii] is a futurate, concerned with the present schedule: it indicates that semester doesn't end next week. In [iii] *would* is interpreted as indicating present-time volition: we understand that you won't come with us tomorrow, i.e. that you are not (now) willing to. But *wish* cannot be used with a 'pure' future, one where there is no present time involved: cases like this are still within the realm of hoping, so that instead of [iv] we would say *I hope you pass your driving-test tomorrow*.<sup>25</sup>

### (c) *Would rather / sooner / as soon*

- [30] i *I'd rather [I didn't have to go].* [present time]  
 ii *I'd rather [you hadn't told her].* [past time]  
 iii *I'd rather [she came tomorrow].* [future time]

<sup>25</sup> A modal preterite is at best very marginal with *wish* as a noun: <sup>?</sup>*He told nobody of his wish that he had married Angela*. A clausal complement to the noun *wish* is normally mandative (*He expressed a wish that the director drop dead*).

Again, [i] and [ii] are counterfactual: I do have to go and you did tell her. But the most usual case is with a future time situation, as in [iii], and this is certainly not counterfactual: it doesn't say that she won't come tomorrow. It is a tentative way of expressing a preference, allowing that she may not do so. *Prefer* is marginally possible with a modal preterite when in construction with *would/should* or some similar context (*I'd prefer she came tomorrow*), but it is much more usual to have *it* + remote conditional: *I'd prefer it if she came tomorrow*.

#### (d) *It be time*

- [31] i *It is time* [*you were in bed*]. [present state]  
 ii *It is time* [*we repainted the house*]. [immediate future occurrence]

Here, [i] is straightforwardly counterfactual: "You aren't in bed but you should be". Example [ii] entails that the situation is not yet in progress: "We aren't repainting the house, but should do so". A perfect, as in *It is time you had finished it*, is interpreted as a modally remote version of the present perfect: "You haven't finished but should have done". This construction differs from the others in that it hardly allows an irrealis: *It is time he was/were in bed*.<sup>26</sup>

### 7.3 Present tense with future time interpretation

In main clauses a simple present tense can be used with a future time interpretation only in what we are calling the futurate, e.g. with a future event that has already been scheduled, as in *She leaves for London next week*. This restriction does not apply in various types of subordinate clause, including relatives, comparatives, and content clauses (Ch. 3, §4.2.5). Content clauses allowing such pragmatically unrestricted futures are illustrated in:

- [32] i *Let's go home before* [*it starts raining*]. [comp of temporal preposition]  
 ii *We'll visit Jill if* [*there is time*]. [comp of conditional preposition]  
 iii *We insist* [*that he answers all the questions*]. [covert mandative]  
 iv *It doesn't matter* [*whether you do it this week or next*]. [interrogative]  
 v *I hope* [*the weather clears up soon*]. [comp of hope-type governors]

These constructions are discussed in Ch. 3, §4.2.5; [v] differs from the others in that *will* can be added without changing the meaning: *I hope the weather will clear up soon*.

### 7.4 Activity

The lexical properties of the governing item determine whether or not a declarative content clause is entailed, and whether or not, in the default case, it is presupposed. Entailment is a semantic relation, while presupposition is a pragmatic one: this is why we need the default case proviso for presuppositions but not entailments.

<sup>26</sup>A rare attested example (from a British newspaper) is *It's high time the true cost of the monarchy were pointed out*. Examples are also occasionally found of mandative *should* or a present tense instead of the modal preterite: <sup>90</sup>*Perhaps it is time that the very principle of a public subsidy should be given a thorough examination*; <sup>90</sup>*It is about time we acknowledge the unconscionable fact that international trade benefits no one except the multi-nationals and international financiers*.

### ■ Definitions of entailment and presupposition

These concepts were introduced in Ch. 1, §5, and defined as follows:

- [33] i  $X$  entails  $Y \equiv$  If  $X$  is true, then it follows necessarily that  $Y$  is true too.  
 ii  $X$  normally presupposes  $Y \equiv$  in saying  $X$  the speaker, in the absence of indications to the contrary, takes the truth of  $Y$  for granted, i.e. presents it as something that is not at issue.

We are concerned in this section with the special case where  $Y$  is a declarative content clause. Entailment may then be illustrated with the following examples:

- [34] i *It happened [that Kim had left the country].* [entails [iii]]  
 ii *It seemed [that Kim had left the country].* [does not entail [iii]]  
 iii *Kim had left the country.*

If [i] is true, then [iii] must also be true, whereas in asserting [ii] I do not commit myself to the truth of [iii]: [ii] leaves open the possibility that Kim had not left the country. The difference is of course due to the properties of the governing verbs: with *happen* the complement clause is entailed, with *seem* it is not.

Presupposition is illustrated in the following:

- [35] i *The insurance company knows [that Jill had lent Ed her key].* [presupposes [iii]]  
 ii *It is true that Jill had lent Ed her key.* [does not presuppose [iii]]  
 iii *Jill had lent Ed her key.*

Example [i] conveys two pieces of information: (a) that Jill had lent Ed her key (i.e. [iii]); (b) that the insurance company has knowledge of [iii]. In normal circumstances these two pieces of information will differ in their pragmatic status, with (a) backgrounded, taken for granted, while (b) is foregrounded, presented as the proposition whose truth is at issue. We say then that (a) is presupposed, while (b) is asserted. If you respond with *No, that's not so*, you will normally be taken to be challenging (b), not (a). With [ii], by contrast, that Jill had lent Ed her key is part of the assertion, and there is clearly no way of challenging [ii] as a whole which doesn't simultaneously challenge [iii]. Again the difference is attributable to properties of the governing items in the matrix clause: *know* triggers the presupposition that the complement clause is true, while *true* does not.

### ■ Differences between presupposition and entailment

It will be evident from the above account that presupposition and entailment are very different kinds of concept. One especially important difference emerges when we change the matrix clause by making it negative, interrogative, or complement of conditional *if*:

- [36] i a. *The insurance company knows [that Jill had lent Ed her key].* (= [35 i])  
 b. *The insurance company doesn't know [that Jill had lent Ed her key].*  
 c. *Does the insurance company know [that Jill had lent Ed her key]?*  
 d. *If the insurance company knows [that Jill had lent Ed her key], they may refuse to pay her.*  
 ii a. *It is true [that Jill had lent Ed her key].* (= [35 ii])  
 b. *It isn't true [that Jill had lent Ed her key].*  
 c. *Is it true [that Jill had lent Ed her key]?*  
 d. *If it is true [that Jill had lent Ed her key], her claim will be refused.*

In [i] the presupposition that Jill had lent Ed her key holds for all of [a–d] in the absence of indications to the contrary. In the salient use of [ib], I know that Jill had lent Ed her key and assert that the insurance company doesn't know this. Similarly in [ic] I take it for granted that Jill had lent Ed her key and ask whether the insurance company knows this. And in the most likely context for [id] I know she had done so and entertain the possibility that the insurance company knows it too. In [ii], however, the entailment that Jill had lent Ed her key holds only in [a]. In [iib] of course we have the opposite entailment – that she had not lent Ed her key. Example [iic] is a question, and therefore does not have a truth value: questions themselves are neither true nor false. For this reason the issue of entailments does not arise: if the *X* in definition [33] has no truth value, the condition for *Y* being an entailment cannot be satisfied. And in [36iid] the whole sentence is not inconsistent with Jill's not having lent Ed her key: it excludes only the situation in which Jill had lent Ed the key but her claim will not be refused.

The conditional construction involves embedding the presupposing or entailing clause in a larger construction; other cases where the presupposing or entailing clause is embedded are illustrated in:

- [37] i a. I *hope* [*the insurance company knows that Jill had lent Ed her key*].  
       b. He *realised* [*that the insurance company knows that Jill had lent Ed her key*].  
 ii a. I *hope* [*it is true that Jill had lent Ed her key*].  
       b. He *realised* [*that it is true that Jill had lent Ed her key*].

Both [ia] and [ib] convey that Jill had lent Ed her key: the presupposition of [36ia] is retained under embedding. In [37ii], however, only example [b] conveys that Jill had lent Ed her key: the entailment of [36iia] is lost when the entailing clause is embedded as complement to *hope*, but retained when it is embedded as complement to *realise*. The difference is due to the fact that [37iib], but not [37iia], entails [36iia]. Entailment is what is known as a logically transitive relation: if *W* entails *X* and *X* entails *Y*, then *W* entails *Y*.<sup>27</sup>

The difference with respect to preservation of presuppositions and entailments can therefore be stated as follows:

- [38] i In the default case, presuppositions are preserved when the presupposing clause is negated, interrogated, or embedded.  
 ii Entailments are lost when the entailing clause is negated or interrogated, and also when it is embedded, unless it is itself entailed by the clause in which it is embedded.

### ■ Presuppositions that are also entailments of the positive declarative matrix clause

In the case of [36i] the positive declarative [a] (*The insurance company knows that Jill had lent Ed her key*) both entails and presupposes that Jill had lent Ed her key. The presuppositional status of the content clause *Jill had lent Ed her key* is retained under the operations of negation, interrogation, and embedding illustrated in [b–d], but its entailment status is lost, just as it is in [iib–d]. In [ib–id], the proposition that Jill had lent Ed her key is an implicature, not an entailment, and as such it can be cancelled. This

<sup>27</sup>The sense of 'transitive' in logic is quite different from the sense it has in syntax ('having an object'). Etymologically, the term has to do with the concept of 'going across'. How this applies in logic is transparent from the definition just given; in syntax it is based on the idea that the most prototypical transitive clause describes an action that 'goes across' from an agent to a patient.

could happen, for example, in a context where the insurance company is suggesting or claiming that Jill had lent Ed her key but where I, the speaker, question whether they have sufficient evidence to establish that. In this case *know* would bear contrastive stress to focus on the issue of whether it is indeed a matter of knowledge (as opposed, for example, to surmise). In [ib] I'm saying they don't have such knowledge, in [ic] I'm asking whether they do, and in [id] I'm presenting it as only a possibility that they do.<sup>28</sup>

It is also important to note that while the complement clause always has the status of an entailment in [36ia], its status as a presupposition can be cancelled. This could happen in a context similar to the one just discussed. It may be, for example, that you have doubts as to whether Jill had lent Ed her key and have questioned whether the insurance company have evidence to establish that she did: I can then say [36ia] with stress on *know* to indicate that they are indeed in the position of knowing it to be true. In this case I still convey that Jill had lent Ed her key, because this is an entailment, but the presuppositional status of the content clause is lost, just as in the contextualisations of [36ib–d] discussed in the last paragraph. That is, the information expressed in the content clause is not here taken for granted: the issue of whether Jill had lent Ed her key is foregrounded, not backgrounded.

#### ■ Presuppositions that are not entailments of the positive declarative

Most cases where a content clause is presupposed are like the *know* example in having the content clause as an entailment of the unembedded positive declarative. But there are some places where no such entailment obtains:

- [39] i *Ed went out before [his parents came home].*  
 ii *Ed regretted [that he had offended his parents].*  
 iii *Ed confessed [that he murdered her husband].*

Example [i] presupposes that his parents came home, but does not entail it. It is a truth condition for [i] that when Ed went out his parents had not come home, but not that they did in fact come home later. It may be, for example, that they were involved in a fatal traffic accident and never came home. That this is consistent with the meaning of *before* is evident from such examples as *Ed died before [he finished his thesis]*, which obviously does not entail that he finished his thesis after he died. The presupposition triggered by *before* – that the event expressed in its complement subsequently took place – thus has only the status of an implicature even in the positive declarative, and as such it can be cancelled.

The same applies with [39ii]: this presupposes, but does not entail, that he had offended his parents. Ed must have believed that he had offended his parents, but it is possible for him to have been mistaken. The implicature can therefore be cancelled, as in:

- [40] *Ed believed that he had offended his parents and very much regretted that he had done so, but it turned out that he had been mistaken: they hadn't been in the least offended.*

Similarly with [39iii]. The default assumption is that confessions are true, so that what is foregrounded is the act of confession, not the issue of whether the content is

<sup>28</sup>One very common case where the presuppositional implicature associated with *know* is cancelled is in the present tense with a 1st person singular subject: *I don't know that she approves of our plan*. Again *know* may have contrastive stress, indicating that this issue is whether it's a matter of knowledge or mere belief, but it can also appear without such stress, in which case I'm casting doubt on the truth of the content clause.

true. But it is perfectly possible to make a false confession, so it cannot be an entailment of [39iii] that he murdered her husband.

### ■ Varying degrees of backgrounding

We have said that a presupposed proposition is backgrounded, so that its truth is not at issue. The examples examined show, however, that there can be varying degrees of backgrounding. It is appreciably greater with *regret*, for example, than it is with *know* (even though the complement of *know* is entailed in the positive declarative, while that of *regret* is not). This can perhaps be most easily seen by comparing interrogative forms like:

- [41] i *Does he know that his plan has been modified?*  
 ii *Does he regret that his plan has been modified?*

In both cases, I am likely to be taking it for granted that his plan has been modified and asking whether he knows or regrets this. In [i], however, it is not difficult, as we saw for the earlier *know* example, to imagine a context where I don't know whether his plan has been modified: one aim of my question could be to determine whether it is a fact or merely supposition that his plan has been modified. But one would have to be very devious to ask [ii] with similar intent. Just as one cannot regret some proposition *P* unless one believes that *P* is true, so one would not normally ask whether someone else regrets that *P* unless one believes that *P* is true.

### ■ Factive and entailing governors

Verbs, adjectives, etc., whose content clause complement is normally presupposed are called **factive**. *Know*, *regret*, *confess*, for example, are factive verbs, while *before* is a factive preposition, and so on. There is no well-established name for items whose complement is entailed in the positive declarative: we will call them simply **entailing** verbs, adjectives, etc. A sample of governing items classified in terms of entailment and presupposition is given in [42]; in each case the items are given in the order verbs (or verbal idioms), adjectives, nouns, prepositions:

- [42] i    ENTAILING AND FACTIVE
- |    |                 |                  |               |                  |                   |                 |
|----|-----------------|------------------|---------------|------------------|-------------------|-----------------|
| a. | <i>find out</i> | <i>forget</i>    | <i>know</i>   | <i>point out</i> | <i>realise</i>    | <i>remember</i> |
|    | <i>aware</i>    | <i>fact</i>      | <i>after</i>  | <i>although</i>  | <i>because</i>    | <i>since</i>    |
| b. | <i>amuse</i>    | <i>bother</i>    | <i>matter</i> | <i>offend</i>    | <i>suffice</i>    | <i>worry</i>    |
|    | <i>exciting</i> | <i>important</i> | <i>odd</i>    | <i>relevant</i>  | <i>surprising</i> | <i>tragic</i>   |
- ii    ENTAILING AND NON-FACTIVE
- |    |                |                   |                |                 |  |  |
|----|----------------|-------------------|----------------|-----------------|--|--|
| a. | <i>happen</i>  | <i>prove</i>      | <i>show</i>    | <i>turn out</i> |  |  |
| b. | <i>evident</i> | <i>inevitable</i> | <i>obvious</i> | <i>true</i>     |  |  |
- iii    NON-ENTAILING AND FACTIVE
- |    |              |                |               |               |              |            |
|----|--------------|----------------|---------------|---------------|--------------|------------|
| a. | <i>admit</i> | <i>confess</i> | <i>regret</i> | <i>resent</i> | <i>angry</i> | <i>sad</i> |
|    | <i>sorry</i> | <i>before</i>  |               |               |              |            |
- iv    NON-ENTAILING AND NON-FACTIVE
- |    |                 |                   |                 |                |                 |                   |
|----|-----------------|-------------------|-----------------|----------------|-----------------|-------------------|
| a. | <i>announce</i> | <i>appear</i>     | <i>assume</i>   | <i>believe</i> | <i>conclude</i> | <i>conjecture</i> |
|    | <i>hope</i>     | <i>inform</i>     | <i>insist</i>   | <i>say</i>     | <i>seem</i>     | <i>tell</i>       |
|    | <i>certain</i>  | <i>confident</i>  | <i>hopeful</i>  | <i>sure</i>    | <i>danger</i>   | <i>evidence</i>   |
|    | <i>idea</i>     | <i>impression</i> | <i>if</i>       | <i>lest</i>    | <i>provided</i> |                   |
| b. | <i>likely</i>   | <i>possible</i>   | <i>probable</i> |                |                 |                   |

Items in the sets labelled [a] take the content clause as post-head complement, as in *He found out [that she had left]* or *It happened [that there were a few seats still available]*. Those in [b] take it as subject, [*That I was taken in by their story*] amused them, or extraposed subject, *It amused [them that I was taken in by their story]*.

### ■ Negative entailments and presuppositions

A small number of items entail or presuppose the negative of their content clause complement:

- [43] i [*That we intended to defraud you*] is simply false.  
 ii Ed wished [that her parents were still alive].  
 iii Jill pretended [that she was seriously ill].

Example [i] entails that we didn't intend to defraud you. *False*, however, unlike *true*, is very rarely used with a content clause as subject (or extraposed subject): examples like this are unlikely to be encountered outside philosophical discourse. It would be much more natural to have either an NP (e.g. *the claim that we intended to defraud you*) or an infinitival clause (*It's simply false to say that we intended to defraud you*) – or else to have *not true*. Examples [ii–iii] convey that her parents weren't still alive and that she wasn't seriously ill. It is arguable, however, that these are presuppositions but not entailments – only strong implicatures. Thus [ii] entails that Ed believed her parents were not still alive, but it does not entail that this belief was correct. It could be that he had been misinformed, that unknown to him they were in fact still alive: this would not itself make [ii] false. Similarly for [iii]: this can be true if Jill believed she wasn't seriously ill, even if she was in fact seriously ill without being aware that she was.

*Wish* differs from *pretend* in two respects. Firstly, the negative presupposition is marked syntactically by the modal preterite form. And secondly, the degree of backgrounding is significantly greater. With *pretend* it is not unusual for the presupposition to be cancelled in the negative: *Jill wasn't PRETENDING that she was ill – she really was very sick indeed*. Cancellation is not impossible with *wish*, but much less likely.

### ■ Correlation with other properties

The distinctions between entailed and non-entailed, factive and non-factive, are not marked as such in the form of the content clause itself, but there are a number of places where we find some correlation between these and other categories.

#### (a) Subjunctive and mandative clauses are non-entailed and non-factive

- [44] i *It is important [that the matter be /is /should be resolved without delay]*.  
 ii *They avoided the subject, lest [it be too painful for her to talk about]*.

Subjunctive clauses (whether mandative or not) and mandative clauses (whether subjunctive or not) are invariably non-entailed and non-factive, as in these examples. Note that some of the items that license the mandative construction are, elsewhere, entailing and factive. Compare [i], for example, with [*That no records were kept of these transactions*] is very *important*.

#### (b) Modal preterite and irrealis clauses are non-entailed and non-factive

- [45] *If [she was/were still alive] she would be horrified*.

A modal preterite / irrealis clause is never entailed or presupposed; on the contrary, there is often an implicature of counterfactuality.

(c) Simple present tense with future time interpretation normally non-entailed, non-factive

- [46] i *I'll certainly go if [they invite me].*  
 ii *I hope [you manage to get home in time].*

This does not apply to the futurate construction: *I realise [the match starts tomorrow]* entails and presupposes that the match starts tomorrow. But we have argued (Ch. 3, §4.2.4) that there is in fact a present time component involved here (a present arrangement), so this is not a pure future. One case where we do have entailment and/or presupposition is in the complement of temporal prepositions: *I'm leaving after/before [the meeting ends].*

(d) Attitudinal *should* occurs only with factive governors

- [47] *It is extraordinary [that she should have taken it all so calmly].*

This may be contrasted with *\*It is possible [that she should have taken it all so calmly].* Note, however, that this use of *should* is not licensed by all factive governors: most obviously, it does not occur with verbs of knowledge or coming to know such as *know* or *find out*.

(e) The *fact* normally insertable only with factive verbs/adjectives

- [48] i a. [*That she had to walk*] *didn't bother him at all.*      b. *The fact [that she had to walk] didn't bother him at all.*  
 ii a. [*That we've made a mistake*] *is quite likely.*      b. *\*The fact [that we've made a mistake] is quite likely.*

Factive verbs and adjectives often allow both constructions shown here: in [ia] *bother* has the content clause itself as complement, whereas in [ib] the complement of *bother* is an NP with *fact* as head and the content clause as complement of *fact*. This is not normally possible with non-factive governors, as illustrated in [ii]. Items like *regret*, *resent*, *angry*, *sorry*, which we have classified as factive but non-entailing allow insertion of *the fact* in this way: *He resented (the fact) that they had given him false information.* But the version including *the fact* does entail that the content clause is true – by virtue of the properties of *fact* itself. Notice, however, that not all factive verbs allow *the fact* as complement. We cannot, for example, insert it with *know*: *I know I made a mistake*, but not *\*I know the fact that I made a mistake.*

(f) Prohibition of gaps generally found only with factive verbs and adjectives

- [49] i a. *the errors which I think [I saw \_\_\_]*      b. *\*the errors which I regret [I saw \_\_\_]*  
 ii a. *Who is it likely [she'll invite \_\_\_]?*      b. *\*Who is it strange [that she'll invite \_\_\_]?*

In [i] the object of *saw* is realised by a gap linked to the relative pronoun *which*; the result is grammatical in [ia], where the content clause is complement of non-factive *think*, but not in [ib], where it is complement of factive *regret*. Similarly in [ii]: the gap linked to interrogative *who* is permitted in [iia], where the content clause is an extraposed subject licensed by non-factive *likely*, but not in [iib], where *strange* is factive. Such gaps are prohibited by the subset of factives that allow insertion of *the fact*, as discussed in (e) above.

### Content clauses containing a bound variable

We should note, finally, that the content clause complement of a normally entailing or factive governor cannot properly be said to be entailed or presupposed in examples like:

- [50] i *Every boy knew/resented that he was being watched.*  
 ii *Every boy was aware of the fact that he was being watched.*

We are concerned with the interpretation where the pronoun *he* has *every boy* as its antecedent. In this case *he* is not referring to any particular person, but is acting as a variable bound by the quantified NP *every boy*. The meaning of [i] can be represented along the lines of “For every boy *x*, *x* knew/resented that *x* was being watched”. In this case the content clause expresses an open proposition and does not have a truth value – it doesn’t make sense to ask whether “*x* was being watched” is true. For the same reason the content clause in [ii] does not express a fact, even though it functions syntactically as complement to the noun *fact*. For these reasons the content clauses here cannot satisfy the definitions of entailment and presupposition given in [33].

Examples of this kind serve as a useful reminder that content clauses are syntactically subordinate, differing in various features of form and meaning from main clauses. In particular, the subject pronoun of a main clause cannot express a bound variable like the *he* in [50]. In *Every boy was being watched and he very much resented it*, for example, *he* cannot have *every boy* as its antecedent: it must refer to some specific male person.

## 8 Some issues of syntactic analysis

The analysis of content clauses presented in this chapter differs in significant ways from that found in traditional grammar: in this section, therefore, we explain some of the changes we have felt it necessary to make.

### 8.1 Subordinators and the traditional category of ‘subordinating conjunctions’

The three subordinators that we have recognised in content clauses, declarative *that* and closed interrogative *whether* and *if*, are traditionally regarded as belonging to a class of a dozen or so ‘subordinating conjunctions’: they are assigned to the same class as *although*, *unless*, *while*, *after*, *before*, *since*, etc. In terms of the present framework, this is to say that all these items are markers of clause subordination, that none of them are heads: traditional grammar does indeed say that expressions like *although the paper is poorly written* are subordinate clauses, just like *that the paper is poorly written*. The view we have taken in the present grammar, by contrast, is that these other words are grammatically very different from *that* and *whether* and should be analysed as heads of the construction they introduce, more specifically as prepositions heading PPs with a content clause as complement.

For purposes of exposition, we will divide the traditional ‘subordinating conjunctions’ into two classes, S (corresponding to our subordinators) and P (a subset of our prepositions):

- [1] i S-class ‘subordinating conjunctions’: *that*, *whether*, *if*<sub>1</sub> (“whether”)  
 ii P-class ‘subordinating conjunctions’: *after*, *if*<sub>2</sub> (conditional), *since*, *though*, etc.

Some of the P-class ‘subordinating conjunctions’ are homonymous with prepositions: *after*, for example, is traditionally analysed as a subordinating conjunction in *She left [after she had signed the documents]* and as a preposition in *She left [after the ceremony]*.

### ■ Why P-class ‘subordinating conjunctions’ are heads

Unlike the S-class items, those in the P-class are not mere markers of subordination: they have evident semantic content, and this content is clearly the major factor in determining the function and distribution of the construction they introduce. Compare, for example:

- [2] i *Please bring the washing in [before/if it rains].*  
 ii *His behaviour [after you left] was atrocious.*

*Before it rains* and *if it rains* in [i] are adjuncts of time and condition respectively, and are obviously construed in this way by virtue of the meanings of *before* and *if*. In [ii] the meaning of *after* makes the bracketed sequence a time expression, and this in turn allows it to function as modifier of *behaviour* (but not, say, of *boy*).

### ■ Why P-class ‘subordinating conjunctions’ belong in the preposition class

The traditional distinction between ‘subordinating conjunctions’ and prepositions is that the former introduce clauses while the latter introduce phrases – in our terms traditional prepositions normally enter into construction with noun phrases. Words like *unless* are just ‘subordinating conjunctions’, those like *on* just prepositions, and those like *until* belong to both categories, being analysed as subordinating conjunctions when they introduce clauses and as prepositions when they introduce phrases:

- |     |   |  |
|-----|---|--|
| [3] | INTRODUCING CLAUSE                                      | INTRODUCING PHRASE                                       |
|     | i a. <i>I won’t do it [<u>unless</u> you pay me].</i>   | b. <i>*I won’t go [<u>unless</u> payment].</i>           |
|     | ii a. <i>*I’m banking [<u>on</u> you pay me more].</i>  | b. <i>I’m banking [<u>on</u> an increase in pay].</i>    |
|     | iii a. <i>I left [<u>before</u> the meeting ended].</i> | b. <i>I left [<u>before</u> the end of the meeting].</i> |

We reject this analysis for the following reasons.

#### (a) Difference in complementation doesn’t justify a primary part-of-speech distinction

We have argued that the P-class ‘subordinating conjunctions’ are heads, and the same point applies to traditional prepositions. The differences illustrated in [3] are thus differences in the complementation of the underlined words. This difference in complementation, however, does not provide adequate justification for saying that *unless* and *on* belong to different parts of speech. It is normal to find differences in complementation between members of the same primary category, and the above difference between *unless* and *on* is matched within the class of verbs by that between, for example, *complain* and *prevent*:

- |     |   |  |
|-----|---|--|
| [4] | CLAUSE AS COMPLEMENT  | NP AS COMPLEMENT   |
|     | i a. <i>We [<u>complained</u> that they didn’t consult with the staff].</i> | b. <i>*We [<u>complained</u> the lack of consultation with the staff].</i> |
|     | ii a. <i>*He [<u>prevented</u> that they consulted with the staff].</i>     | b. <i>He [<u>prevented</u> any consultation with the staff].</i>           |

The point is, then, that the difference in complementation provides no more reason for a part-of-speech distinction between *unless* and *on* than it does between *complain* and *prevent*. And just as we have seen that some items, such as *before* in [3], take either clauses or NPs, so there are verbs like *announce* whose complements can be of either kind (*He [announced that he was resigning]* vs *He [announced his resignation]*).

It should be noted, moreover, that the difference is not in fact between clause and NP as complement. Traditional grammar accepts that prepositions can take finite interrogative

clauses (*It depends [on whether there is adequate consultation with the staff]*) or gerund-participials (*We’re banking [on there being adequate consultation with the staff]*),<sup>29</sup> so the crucial property of subordinating conjunctions is not that they introduce clauses as opposed to NPs, but that they introduce a particular kind of clause, finite declaratives. This makes the contrast between the [a] and [b] structures in [3] even less appropriate as a basis for a distinction between primary part-of-speech categories.

### (b) Pre-head dependents

A further argument against making a part-of-speech distinction on the basis of the complements, the post-head dependents, is that items like *before* which occur with both kinds of complement take the same range of pre-head modifiers in the two cases:

- [5] i a. *an hour before the meeting ended*      b. *an hour before the end of the meeting*  
 ii a. *just/shortly before it ended*              b. *just/shortly before the end*

What we find, therefore, is that *before* is head of a phrase that can have an NP or a content clause as complement, and in either case it takes modifiers like *an hour, just, shortly*. To say that the phrase belonged to different classes in the two cases would lead to a quite pointless complication of the grammar. Overall, then, there is overwhelming evidence that the *before* that combines with a declarative content clause is, from both a syntactic and semantic point of view, very much more like the *before* that combines with an NP than it is like the subordinator *that*. And of course the same applies to the other words that fall into both preposition and ‘subordinating conjunction’ classes: *after, since, until*, etc.

### ■ Analysis of the sequences *provided that, in order that, etc.*

One point that is sometimes made in support of grouping the P-class ‘subordinating conjunctions’ with *that* is that they are mutually exclusive with it: we can have *before the meeting ended* and *that the meeting ended*, but not *\*before that the meeting ended*. This argument is undermined, however, by the fact that some of the items we have to consider do combine with *that*, i.e. take expandable rather than non-expandable clauses as complement. A few of these are illustrated in:

- [6] i *I’ll do it [provided that you pay me].*  
 ii *They went hungry [in order that their baby would have food].*  
 iii *It looks like any other typewriter [except that it has phonetic symbols].*  
 iv *He intends to exercise his constitutional right to sit on the court, [notwithstanding that the commission of inquiry has not yet made its report].*

The traditional account of such constructions is that the *that* belongs with the preceding item – so that *provided that, in order that, except that, notwithstanding that*, and so on, are complex ‘subordinating conjunctions’. This preserves a relation of mutual exclusiveness between what we are calling S-class and P-class ‘subordinating conjunctions’. But there is compelling evidence that the *that* in fact belongs in the content clause, i.e. that the immediate constituents are as shown in [7b], not [7a]:

- [7] a. \*COMPLEX HEAD ANALYSIS                      b. SIMPLE HEAD ANALYSIS  
       *provided that + you pay me*                      *provided + that you pay me*

The most important point is that *that* can be repeated in coordination: *provided [that you pay me and that I’m allowed to do it my way]*. The first *that* must belong in the coordination,

<sup>29</sup>Traditional grammar also allows for gerund-participials to occur after certain ‘subordinating conjunctions’. This creates further problems for the distinction between ‘subordinating conjunctions’ and ‘prepositions’, with *although living in London* having an initial ‘subordinating conjunction’, *despite living in London* an initial ‘preposition’.

not with *provided*: the coordination here is between two expanded declaratives, two clauses introduced by *that*.

A second point is that the *that* is usually omissible: we can equally have *I'll do it provided you pay me*. Under analysis [7b] this is covered by the general rules for the omission of the subordinator *that* as described in §3.1; under analysis [7a] it has to be treated as a separate phenomenon.

Thirdly, *in order* allows an infinitival complement, with or without a subject:

- [8] i [in order] [*that their baby have food*]  
 ii [in order] [*for their baby to have food*]  
 iii [in order] [*to save food for their baby*]

Traditional grammars commonly recognise two complex units here, *in order that* and *in order to*. But this doesn't cater for [ii]. The relation between [ii] and [iii] is just like that between *It is essential [for their baby to have food]* and *It is essential [to save food for their baby]*. If an infinitival clause contains a subject it takes *for* as subordinator, and *for* is permitted only when there is a subject. It is clear, then, that the structural division in [ii–iii] is between *in order* and the infinitival clause, as shown by the bracketing. And similarly in [i] the structural division comes before *that*, not after it; *that* as a marker of a finite declarative contrasts with *for* as the marker of an infinitival one with subject–predicate form. Similarly, items such as *notwithstanding*, *except*, *granted* take either a content clause or an NP as complement:

- [9] i *notwithstanding* [*that the commission has not yet made its report*]  
 ii *notwithstanding* [*the delay in the publication of the commission's report*]

We don't want to say there are two items *notwithstanding that* and *notwithstanding*: there is just one item, the preposition *notwithstanding*, and *that* appears when the complement is a declarative clause but not, of course, when it is an NP.

Once it is established that the *that* belongs in the content clause, it is quite clear that *provided*, *in order*, *notwithstanding*, and the like are syntactically quite different from *that*. They are not markers of clause subordination contrasting with *that*, but prepositions functioning as heads of phrases that may contain declarative content clauses as complement.

## 8.2 Content clauses in relation to the traditional classification of subordinate clauses

In §1 we introduced a classification of finite subordinate clauses into three major categories: relative clauses, comparative clauses, and content clauses. Traditional grammar recognises the categories of relative clause and comparative clause,<sup>30</sup> but the major classification of subordinate clauses is into nominal, adjectival, and adverbial clauses (or noun, adjective, and adverb clauses):

- [10] i *That he must be guilty is obvious to everyone.* [‘nominal’]  
 ii *They have all the equipment they need.* [‘adjectival’]  
 iii *The weather was so bad that they cancelled the expedition.* [‘adverbial’]

<sup>30</sup>In the case of comparative clauses, however, *than* and *as* are treated as subordinating conjunctions within the subordinate clause rather than prepositions governing the comparative clause, as in our analysis; this relates to the issue we have been discussing in §8.1.

This classification is based on functional analogies between the subordinate clauses and the three word categories. The above may be compared with, for example:

- [11] i *His guilt is obvious to everyone.* [noun phrase]  
 ii *They have all the necessary equipment.* [adjective (phrase)]  
 iii *The weather was unprecedentedly bad.* [adverb (phrase)]

We have not retained this traditional classification in the present grammar, but will work with the one distinguishing relative, comparative, and content clauses on the basis of overt or covert differences in the structure of the clause. We find the classification as nominal, adjectival, or adverbial unsatisfactory for the following reasons.

(a) **The traditional classification does not take proper account of the form of clauses**

The classification is based on the function of the subordinate clause rather than its structure. The functions have to be stated in any case, however, and there is no point in attempting to repeat the functional analysis in the classification. In [10], for example, we have to say that *that he must be guilty* is subject in [i] and that *that they cancelled the expedition* is complement in AdjP structure in [iii], and nothing is gained by using that functional distinction to assign the clauses to different classes. There is no relevant syntactic difference in the form of the two clauses, so that each could occur in the function of the other:

- [12] i *That they cancelled the expedition is highly regrettable.*  
 ii *His defence was so implausible that he must be guilty.*

Both are content clauses, and content clauses can fill either of these two functions. The case is comparable to that of a phrase like *last week*. Consider, for example, its use in:

- [13] i *Last week was the wettest for several years.* [subject]  
 ii *I saw them last week.* [adjunct]

The **function** of *last week* is subject in [i], adjunct in [ii], but in both cases it belongs to the **category** NP – because it has a noun as head. There is no more justification for assigning *that he is guilty* to different classes of subordinate clause in [10i] and [12ii] than there is for assigning *last week* to different classes of phrase in [13i–ii].

Consider also the following set of examples:

- [14] i *Things aren't always [as they seem to be].*  
 ii *Max was late for his appointment, [as he so often is].*  
 iii *Max was late for his appointment, [as he had been unable to start his car].*

The traditional analysis takes *as* as part of the subordinate clause, and in this framework the functional criterion will group [ii] and [iii] together as adverbial (the subordinate clauses here function as adjuncts) in contrast to [i] (where it is functioning as predicative complement, a position characteristically filled by adjectives or nouns, not adverbs). But this classification obscures the fact that in terms of their internal form [i] and [ii] belong together in contrast to [iii]. *They seem to be* and *he so often is* are alike in that there is a missing predicative complement (they could occur as main clauses only as elliptical constructions with a predicative retrievable from the context); *he had been unable to start his car*, by contrast, is structurally complete. On our analysis *he had been unable to start his car* is a content clause, while *they seem to be* and *he so often is* are comparative clauses – cf. the more transparently comparative constructions *They aren't as bad as they seem to be* and *Kim wasn't as late as Max so often is*.

## (b) Problems with the traditional class of subordinating conjunctions

A high proportion of so-called ‘adverbial clauses’ are introduced by traditional grammar’s ‘subordinating conjunctions’ (more particularly by what we referred to as P-class ones):

- [15] i *They cancelled the match [because the ground was too wet].*  
 ii *I’ll take on the job [if I can get secretarial assistance].*  
 iii *She left [before the meeting ended].*

We have argued in §8.1, however, that these items should be analysed as prepositions – prepositions that take clauses as complement. On this account the bracketed constituents in [15] are not clauses at all, but PPs. The subordinate clauses are *the ground was too wet*, *I can get secretarial assistance*, *the meeting ended*, and these are certainly not like adverbs: they are content clauses. The revised treatment of ‘subordinating conjunctions’, therefore, has the effect that a large proportion of traditional grammar’s ‘adverbial clauses’ have to be discarded from the class. Since *before* can take an NP complement the subordinate clause in [iii] could be assigned to the noun clause category, but those in [i–ii] hardly bear a close functional resemblance to nouns.

## (c) Functional differences between content clauses and nouns (or NPs)

There are many places where content clauses are not in contrast with NPs and where it is therefore misleading to call them noun clauses. This is so even if we confine our attention to those that traditional grammar does in fact analyse as noun clauses, i.e. if we leave aside those like *that they cancelled the expedition* in [10iii], traditionally analysed as an adverbial clause, or *the ground was too wet* in [15i], which on the traditional analysis is merely part of an adverbial clause introduced by *because*. Compare, for example:

- [16] i *He [feared that he might lose his job].* [complement of verb]  
 ii *He told me of his [fear that he might lose his job].* [complement of noun]  
 iii *He was [afraid that he might lose his job].* [complement of adjective]

The subordinate clause is complement of the verb *fear*, the noun *fear*, and the adjective *afraid* respectively, and on our analysis it is a content clause in all three cases. In [i] it could be replaced by an NP (*He feared the prospect of unemployment*), but in [ii–iii] it could not: a major difference between verbs on the one hand, nouns and adjectives on the other, is that the former can take NP complements, while the latter (with minor exceptions) cannot. The analysis of the underlined clause as a noun clause in all three is thus not in fact consistent with the principle of classifying subordinate clauses on the basis of functional similarity to various categories of word.

## The traditional treatment of content clause complements of nouns as appositives

In cases like [16ii] traditional grammar justifies the classification of the subordinate clause as a noun clause by saying that it is in apposition to the noun *fear*: on this account it is noun-like since the function of appositive to a noun is characteristically filled by a noun (NP in our scheme), as in *Kim Jones, the bank manager*. This, however, does not provide a satisfactory account of why the subordinate clauses in [16] are assigned to the same class. In the first place, it loses the parallelism between them: in particular, the subordinate clause is treated as an appositive in [ii] and as an object in [i], two quite different functions. In fact, however, the function of the subordinate clause is the same in all three cases in [16]: it is a complement, licensed by the head of the VP, NP, or AdjP in which it occurs. Note, then, that replacing these head words by others may result in the subordinate clause becoming inadmissible: *\*He*

*used that he might lose his job*; \**He told me of his injury that he might lose his job*; \**He was fond that he might lose his job*. The verb *use*, the noun *injury*, the adjective *fond*, unlike those in [16], do not license content clause complements.

A second objection to traditional grammar’s analysis of [16ii] is that the relation between the clause and the preceding noun is very different from standard cases of apposition. It is true that in [16ii] noun and clause could be identified one with the other in a specifying *be* construction (*His fear was that he might lose his job*), but there are numerous cases where this is not possible:

- [17] i a. *Their insistence that the meetings should be held at lunch-time angered the staff.*  
 b. \**Their insistence was that the meetings should be held at lunch-time.*  
 ii a. *His ruthless determination that his rival’s reputation should be destroyed was distressing to witness.*  
 b. \**His ruthless determination was that his rival’s reputation should be destroyed.*

But even where the specifying *be* construction is acceptable it is very often not possible to omit the noun (together with the pre-head dependents) as it should be if this were a genuine case of apposition. Compare:

- [18] i a. *Kim Jones, the bank manager, is to be congratulated on this initiative.*  
 b. *The bank manager is be congratulated on this initiative.*  
 ii a. *His fear that he might lose his job was increasing.*  
 b. \**That he might lose his job was increasing.*  
 iii a. *They ridiculed his suggestion that he was being stalked.*  
 b. \**They ridiculed that he was being stalked.*

We believe, then, that the classification of subordinate clauses as nominal, adjectival, or adverbial is a feature of traditional grammar that should be discarded. What we need is a classification based on the form of subordinate clauses themselves, not on supposed analogies with the parts of speech. As far as finite clauses are concerned, we claim that the first division is between relative clauses, comparative clauses, and the default category of content clauses.<sup>31</sup>

### 8.3 Content clauses and the function ‘object’

Our argument in §8.2 that content clauses are distributionally very different from NPs and hence cannot be satisfactorily analysed as ‘noun clauses’ focused on content clauses functioning as complement to nouns, adjectives, and prepositions or as adjunct in clause structure. In the present subsection we turn our attention to content clauses functioning as internal complement to a verb, as in *He feared that he might lose his job* ([16i]). Traditional grammar not only analyses the subordinate clause here as a noun clause, but

<sup>31</sup>The term ‘content clause’ is due to Jespersen. In formal grammar the most usual term is ‘complement clause’, but this too we regard as unsatisfactory. In the first place, content clauses are not restricted to complement function: they also occur (though much less frequently) as adjunct, as in [52] of §4.7 (*What has happened, that you are looking so worried?*, etc.), and in the interrogative examples of §5.3.5 (*You got paid whether business was good or bad*, etc.). Secondly, it is not only content clauses that function as complement: comparative clauses do too – of the prepositions *than*, *as*, or *like*. Note, in particular, that *than* and *as* can take both comparative clauses and content clauses as complement: *More people came [than we’d expected]*; *It’s not as good [as it was last year]* (comparative); *I’d rather you went overseas [than that you should risk being arrested]*; *He fell [as he was getting in the bath]* (content). Similarly with *like* in informal style: *It was just me and Eileen getting drunk together [like we used to in the old days]* (comparative); *It seems [like we’re going to get into a speck of trouble]* (content).

assigns it the same function as that of the NP in *He feared the prospect of unemployment*, namely that of object of the verb. Again, however, we believe that the subordinate clause is not sufficiently like an NP to justify that analysis. With external complements there are good grounds for recognising a single function, subject, applicable to content clauses as well as NPs: the subject is distinguished from other functions in clause structure by a whole cluster of syntactic properties, and a significant number of these apply to content clauses as well as to subjects, as we noted in §4.1. The case with internal complements, however, is very different. Not all internal complements are objects, and the object has far fewer distinctive properties than the subject. The grammatical differences between content clauses and NPs make it inappropriate in general to include both within the functional category of object.

### ■ Differences between content clause complements and NP objects

#### (a) Linear position

One distinctive property of NP objects is that they generally come immediately after the verb. Certain kinds of complement can intervene between the verb and its object (namely indirect objects, as in *She gave Kim the key*, and particles, as in *He brought in the clothes*), objects can be preposed (*Most of them we rejected*) and heavy objects can be postposed (*I reject emphatically the suggestion that I was in any way responsible for the delay*). Apart from these special cases, however, the object occurs just after the verb. Content clauses, on the other hand, are not constrained to follow the verb in this way. Compare, then:

- [19] i a. \**He opened slowly the door*.      b. *He denied categorically that he had spoken to her*.  
 ii a. \**He returned to me the key*.      b. *He mentioned to me that he was leaving*.

As far as position is concerned, therefore, we cannot say that content clauses behave like objects. Note again the contrast between this case and that of the subject: the default position for NP subjects is before the verb, and the fact that content clauses can occur here does provide evidence for saying that they can function as subject.

#### (b) Differences in the governing verbs

One important difference between an external complement (subject) and an internal complement is that all verbs which license a clause as subject also allow an NP, whereas this is not so with internal complements. There are verbs which take a content clause but not an NP:

- [20] i *I often [marvel that intelligent people can at times be so petty]*.  
 ii *She will [vouch that I didn't leave the house until six o'clock]*.

The content clauses here are internal complements of the verbs, but beyond that they have no significant property in common with NP objects. Nothing is gained by diluting the concept of object in such a way that it applies to constructions of this kind.

Note that one can't avoid this problem by using the passivisation test. We saw in Ch. 4 that passivisation provides neither a necessary nor a sufficient test for objecthood: *She has lots of friends* can't be passivised even though *lots of friends* is object, while *Someone has drunk out of this glass* can be passivised even though *this glass* is not object. And as far as content clauses are concerned, passivisation is not restricted to verbs where the clause could be replaced by an NP object:

- [21] i *Can it be wondered that they feel aggrieved?*  
 ii *It has been charged that Labour's failure to press for nationalisation of insurance was due to its financial links with the co-operatives.*

## (c) Contrast between NP objects and NP obliques doesn't apply to content clauses

The main reason for the existence of verbs which take content clause complements that are not replaceable by NP objects has to do with the difference between NPs and content clauses with respect to prepositions. Unlike NPs, declarative content clauses cannot occur (in relevant constructions) as obliques, i.e. as the complement of the preposition governed by a prepositional verb:

- [22] i *He rejoiced* [at her decisive victory]. [prep + NP]  
 ii \**He rejoiced* [at that she had won so decisively]. [prep + content clause]

Instead of [ii] we find the content clause related directly to the verb: *He rejoiced that she had won so decisively*. It follows that the distinction that applies with NPs between an object of the verb and an oblique does not apply with declarative content clauses. Compare, for example:

- |      |  |   |
|------|--|---|
| [23] | NP AS COMPLEMENT                                 | CONTENT CLAUSE AS COMPLEMENT                        |
| i    | a. <i>He said</i> <u>some cruel things</u> .     | b. <i>He said</i> <u>that Kim is an alcoholic</u> . |
| ii   | a. <i>He insisted on</i> <u>an adjournment</u> . | b. <i>He insisted</i> <u>that we adjourn</u> .      |

In [ia] *some cruel things* is object of *say*, whereas in [iia] *an adjournment* is an oblique, a complement of the preposition *on* rather than of the verb *insist*. The absence of a preposition before the NP is a distinctive property of objects. But with content clauses the contrast between structures with and without a preposition is lost: there is no preposition in either of the [b] examples. The absence of a preposition in [ib], therefore, does not provide any evidence for saying that the content clause is an object. Content clauses behave differently from NPs with respect to prepositions, and the loss of the distinction between constructions with and without a preposition provides a strong argument for assigning the content clauses to the more general functional category of complement rather than to the more specific one of object.

## ■ An oblique/object distinction cannot be justified by invoking latent prepositions

It is sometimes argued that the distinction between an object and an oblique can be carried over to content clauses if we postulate a latent ('covert' or 'underlying') preposition in examples like [23iib]. On this account, the verb *insist* would take as complement a PP with *on* as head: if the complement of *on* is an NP the preposition is retained, but if it is a declarative content clause the preposition is omitted or deleted. With *say*, however, there is no preposition involved. The content clause complement of *say* can therefore qualify as an object, while that of *insist* is (covertly) an oblique. Similarly, the complements of *marvel* and *vouch* in [20] and of *wonder* and *charge* in [21] will be obliques, governed respectively by *at*, *for*, *at*, *with*. As a result, we would no longer have verbs taking objects with the form of content clauses that do not also take NP objects.

The main argument used to support this account involves constructions where prepositions are stranded, as in:

- [24] i a. *Complete restitution* was insisted on by the principal.  
 b. *The drug's safety* we can vouch for on the basis of long experience.  
 ii a. *That they should all wear hats and blazers* was insisted on by the principal.  
 b. *That the drug is harmless* we can vouch for on the basis of long experience.

The structurally more basic alternants are as follows:

- [25] i a. *The principal insisted* on complete restitution.  
 b. *We can vouch* for the drug's safety on the basis of long experience.  
 ii a. *The principal insisted* that they should all wear hats and blazers.  
 b. *We can vouch* that the drug is harmless on the basis of long experience.

In [25i] the prepositions appear in their default position before their NP complement. The suggestion is that the relation between [24ii] and [25ii] is the same as that between [24i] and [25i], and that this provides evidence for a latent preposition before the content clause complements in [25ii]: its actual absence is attributed to a rule that deletes prepositions when they immediately precede a declarative content clause complement.

There are, however, serious problems with this analysis, and we do not believe that it provides a satisfactory basis for generalising the distinction between objects and obliques from NPs to content clauses.

#### Marginal status of the examples and irrelevance of pseudo-clefts

The first point is that examples like [24ii] are of very questionable acceptability. They are made-up examples: genuine examples of this construction are very hard to come by. More acceptable are ones involving pseudo-cleft clauses:

[26] *What you must insist on is that they all wear their hats.*

Examples like this tend to be included with those in [24ii] as data supporting a latent preposition analysis of *insist* + content clause, and its greater acceptability appears to strengthen the argument. Syntactically, however, the content clause in [26] is complement of *be* (in its specifying sense): it is *what*, not the content clause, that is in construction with *on*. Pseudo-cleft clauses cannot be systematically derived from simpler non-clefts, as argued in Ch. 16, §9.3. Consider first the following examples without stranded prepositions:

[27] i *What I like about your watch is that it's so compact.*

ii *What they want apparently is that we should meet only twice a year.*

Here the non-cleft counterparts are ungrammatical: \**I like about it that it's so compact*; \**They want that we should meet only twice a year*. The admissibility of the content clause *that it's so compact* in [i] is due to the semantic fact that it describes a property of your watch and hence denotes something that one can like: there is no syntactic requirement that it satisfy the complementation requirement of the verb *like* in the fused relative. Similarly in [ii] *that we should meet only twice a year* denotes a state of affairs that one can want, but doesn't need to be admissible as a complement of *want*. Compare, then, the following examples with stranded prepositions:

[28] i *What I'm getting at is that he may have been trying to mislead you.*

ii *What we're counting on is that they won't all turn up.*

The non-cleft counterparts are ungrammatical, whether we retain the preposition or omit it: \**I'm getting (at) that he may have been trying to mislead you*; \**We're counting (on) that they won't all turn up*. Again, the admissibility of [28i–ii] reflects the fact that the content clauses satisfy the semantic requirement that they denote possible values for the variables defined in the fused relative: they do not have to be syntactically admissible complements of *get* + *at* and *count* + *on*. The pseudo-cleft [26] cannot, therefore, be used as evidence for a latent preposition in the non-cleft *You must insist that they all wear hats*. But fully acceptable examples like [26] may make those in [24ii] seem more acceptable than they otherwise would be. Those in [24ii] are like [26] in that the content clause is not directly in construction with the preposition, but differ in that there is an indirect relation with the preposition, mediated by passivisation or complement preposing.

#### The stranded preposition construction is quite impossible with many prepositional verbs

A second point is that [24ii] is not illustrative of a regular pattern: there are numerous prepositional verbs where examples of these kinds are completely unacceptable. Compare,

It is equally important to note that similar differences in meaning are to be found with non-prepositional verbs, verbs that take either a content clause or an NP as complement:

- [32] i a. *She explained that the planets are in motion.*      b. *She explained the motion of the planets.*  
 ii a. *I understand he was furious.*      b. *I understand his fury.*

The difference in [32i] is similar to that in [31i]: in [a] she said that the planets are in motion in order to explain something else, whereas in [b] it is the motion itself that was explained. And in [32iia] *understand* means approximately “believe”, not “comprehend”, as in [iib].

#### ■ Conclusion: content clause complements must be analysed independently of NPs

The traditional view of content clauses as ‘noun clauses’ suggests that they are equivalent to, or substitutes for, NPs, but it is not in fact satisfactory to handle them derivatively in this way. There are a considerable number of verbs taking content clause complements that cannot be replaced by either NPs or PPs without a change in the meaning of the verb – verbs such as *understand*, *explain*, *object*, mentioned above, or *conclude*, *contend*, *observe*, *reason*, *reflect*, *reply*, and so on. The dictionary entries for verbs must specify directly whether (and with what senses) they take content clauses as complement: it is not satisfactory just to say whether they take an NP or preposition + NP, allowing that in general abstract NPs may be replaced by content clauses, with consequent loss of any governing preposition.

#### ■ The complex-transitive construction

One exceptional case where we do recognise a content clause in object function involves preposing in a complex-transitive clause. Consider the complex-intransitive and complex-transitive constructions together, as illustrated in:

- | [33] | COMPLEX-INTRANSITIVE                          | COMPLEX-TRANSITIVE                               |
|------|---|--|
| i    | a. <i>His behaviour is odd.</i>               | b. <i>I find his behaviour odd.</i>              |
| ii   | a. <i>That he lost his temper is odd.</i>     | b. <i>*I find that he lost his temper odd.</i>   |
| iii  | a. <i>It is odd that he lost his temper.</i>  | b. <i>I find it odd that he lost his temper.</i> |
| iv   | a. <i>*Isn't that he lost his temper odd?</i> | b. <i>That he lost his temper I find odd.</i>    |

The ungrammaticality of [iib] is due to the fact that the content clause is non-initial. The ungrammaticality can be removed by preposing the content clause, as in [ivb], and conversely [iia] becomes ungrammatical if the subject is placed in non-initial position, as in the interrogative [iva]. Compare also *That he still has no job is a source of great worry to them* (content clause subject in initial position) and *\*I can understand why that he still has no job should be a source of great worry to them* (non-initial). There is therefore good reason to analyse the constructions in comparable ways: in the [a] construction the predicand is subject or extraposed subject, while in [b] it is object or extraposed object.

One reason why we have not analysed the content clause as an object in examples like *I noticed that she lost her temper* is that there are numerous verbs occurring in this construction which do not take NP objects. But this argument doesn't apply in the present case: all verbs which license complex-transitive complementation with a content clause as the predicand (as in [33iib/ivb]) also license it with an NP as predicand ([33ib]).

## 9 Reported speech

What, following the grammatical tradition, we call **reported speech** covers the reporting of spoken and written text but also that of unspoken thoughts.

### ■ Direct vs indirect reported speech

There are two main types of reported speech, illustrated in:

- [1] i *The premier replied: ‘I have no intention of resigning.’* [direct]  
 ii *The premier replied that he had no intention of resigning.* [indirect]

**Direct reported speech** purports to give the actual wording of the original, whereas **indirect reported speech** gives only its content.<sup>32</sup> The conditions under which one is in a position to use direct reported speech are of course considerably more restricted than for the indirect variety – perhaps one has access to a written or recorded version of the original, perhaps the original was short enough for one to have been able to memorise it, or perhaps one is composing fiction, where the author can decide what the characters say.

We will use the term **original speaker** for the person who said (or thought) the text being reported (i.e. the premier in [1]) and **reporter** for the one reporting (i.e. in [1] the person who utters the whole sentence). And we will refer to *the premier replied* as the **reporting frame**, while the term ‘reported speech’ itself applies to the rest, the underlined sequence.

### Major difference between direct and indirect speech: deixis

The main reflection of the distinction between reporting wording (or form) and reporting content (or meaning) is to be found in the use of **deictic** expressions such as personal pronouns, demonstratives, and tense. Deictic expressions are interpreted in relation to certain features of the utterance-act – the place, time, and participants (see Ch. 17, §1.1). In direct speech these expressions are interpreted in relation to the original utterance, whereas in indirect speech they are interpreted wholly or predominantly in relation to the act of reporting. In [1], for example, the original speaker is referred to in the direct version by means of the 1st person singular pronoun *I*, but in the indirect version by means of the 3rd person pronoun *he*, interpreted through its anaphoric relation to its antecedent, *the premier*. The indirect report *The premier replied that I had no intention of resigning* would thus mean something quite different from [1], with *I* now referring to the reporter. Note also the difference in tense, with present tense *have* in [1i] and the backshifted preterite in [1ii].

<sup>32</sup> If the text to be reported is in a foreign language a direct report may retain that language or provide a translation of the text. Some writers omit the ‘reported’ and talk simply of ‘direct speech’ and ‘indirect speech’, while others restrict the term ‘reported speech’ to the indirect type; we believe, however, that it is useful to have a term covering both. Further alternative terms for direct and indirect reported speech are ‘oratio recta’ and ‘oratio obliqua’ respectively.

## 9.1 Indirect reported speech

### ■ Embedded vs non-embedded reported speech

The two main syntactic constructions used for indirect reported speech are illustrated in:

- |     |   |  |
|-----|---|--|
| [2] | EMBEDDED  | NON-EMBEDDED                                     |
|     | i a. <i>She said <u>that she lived alone</u>.</i>   | b. <i><u>She lived alone</u>, she said.</i>      |
|     | ii a. <i>Did she say <u>if I'll be invited</u>?</i> | b. <i><u>Will I be invited</u>, did she say?</i> |

In [ia/iia] the reported speech is syntactically subordinate. It has the form of a content clause functioning as complement of the reporting verb *say*: the reported speech is thus embedded within a matrix clause. This is a straightforward case of complementation: the content clause is obligatory in that *she said* cannot stand alone as a sentence (except in certain cases of ellipsis), and the content clause, declarative in [ia], closed interrogative in [iia], is licensed by *say*. The reporting frame does not form a syntactic constituent. In [ia], for example, *she* is subject while *said* is head of the VP *said that she lived alone*.

In [2ib/iib], by contrast, the reported speech has the form of a main clause. It does not function syntactically as complement of *say*, and is not embedded. The reporting frame (*she said* and *did she say*) does not belong in a matrix clause, but has the status of a **parenthetical**, a kind of supplement. Note that it would not be valid to analyse the reported speech as a preposed complement. In the first place, there is a difference in the internal form of the reported clause: in [ia/iia] it has subordinate form, while in [ib/iib] it has main clause form, as just observed. And secondly, in cases like [ii], where the reporting frame is interrogative, the two versions have different meanings. Version [iia], with embedding, asks whether she gave the answer to the question of whether I'll be invited, but does not itself explicitly ask this latter question; version [iib], however, does ask this question, with the issue of whether she provided the answer being backgrounded. A response of *No* means “No, she didn't say” in the case of [iia] and “No, you won't be invited” in the case of [iib]. (For further discussion of the illocutionary force of the parenthetical construction, see Ch. 10, §5.3.)

The parentheticals in [ib/iib] follow the reported speech, but it is also possible for them to be inserted medially within it; in addition, the subject of a declarative parenthetical may be postponed to follow the verb if it is not a personal pronoun. Compare:

- [3] i *When we got home, I told her, we would have to have the locks changed.*  
 ii *Is it likely, did she say, that the proposal will be accepted?*  
 iii *The person most likely to benefit, thought Jill, was herself.*

These structures, however, are less common than with direct reported speech, and we will look at them further in §9.2.

### ■ The syntactic constructions are not specific to indirect reported speech

The constructions illustrated in [2] are not syntactically distinct from ones used for other purposes than to report speech and thought:

- [4] i *This proves that he was lying.*  
 ii *These tests will determine whether he needs to be hospitalised.*  
 iii *The minister, it seems clear, has already made up her mind.*

The verbs that take content clauses as internal complement are by no means limited to those that serve to report speech and thought, as evident from [4i–ii], where *prove* selects a declarative and *determine* a closed interrogative (see the sample lists in §§4.2, 5.3.1). Similarly, the parenthetical in [4iii] is not a reporting frame, but expresses the same kind of meaning as a modal adjunct such as *seemingly* or *apparently*. Moreover, the original speech is often reported not by a content clause but by an infinitival – as when *Get a doctor, say*, is reported as *She told me to get a doctor*. But again the infinitival catenative construction is obviously not restricted to the function of reporting speech – cf. *This entitles you to seek admission to the advanced course*.

## ■ Deixis

The major difference between direct and indirect reported speech, we have said, is that in the direct type deictic expressions are interpreted relative to the original text, whereas in the indirect type they are, at least for the most part, interpreted relative to the report. The contrast was illustrated in [1]; here we will consider a little further the indirect case.

### Person

The most straightforward case involves the deictic category of person, which is invariably interpreted relative to the report. Compare:

- [5] i ORIGINAL: I love you.  
 ii REPORT: *I said I loved you. You said you loved me. She / Sue / The doctor said she loved me. I told him / Max / Jill's brother that I loved him.*

Suppose that [i] was said to Max (Jill's brother) by Sue (Max's doctor): it might be reported indirectly by means of any of the versions in [ii], and many others too, depending on who is reporting it to whom. The first version is appropriate if Sue is reporting it to Max, the second if Max is reporting it to Sue, the third if Max is reporting it to someone else, and so on. The essential point is that in an indirect report we refer to the persons and other entities concerned in just the same way as we do in utterances that do not contain reported speech. Compare, for example, *It is obvious that Sue loves you*, *It is fortunate that she loves Max*, and so on.<sup>33</sup>

### Tense

Indirect reports commonly have a preterite tense where the original has a present: compare the *loved* of [5ii] with the *love* of [5i]. This case is somewhat different from that of the personal pronouns. We have seen that there is nothing special about the use or meaning of the pronouns in [5ii]: it is the same as in non-reporting utterances. The *loved* of [5ii], however, does represent a special use of the preterite, what we call a backshifted preterite. An ordinary preterite, as in *She loved him for several years*, normally locates the situation of her loving him at a time prior to the time of speaking, but that is not what a backshifted preterite does. This is evident from examples like *I wish he realised she loved him*, where in the intended interpretation the situation of her loving him still obtains at the time of utterance. The phenomenon of tense backshift is discussed in detail in Ch. 3, §6.2.

<sup>33</sup>One qualification is that in a non-embedded report the parenthetical will not normally contain a pronoun with an antecedent located within the report. *The doctor, she said, loved Max even though he didn't love her*, for example, does not allow an interpretation where *she* has *the doctor* as its antecedent.

### Other deictic forms

In general other deictic forms, such as demonstratives and various temporal and spatial expressions, follow the pattern described for person. Consider, for example:

- [6] i ORIGINAL: *The lease expired yesterday.*  
 ii REPORT: *She said the lease had expired yesterday / the day before / last Friday / two weeks ago / on 17 June.*

Suppose the original was said on 18 June, so that *yesterday* refers to 17 June. Then, depending on when the report is uttered, any of the temporal expressions in [ii] could be used to refer to the day in question. Note in particular that the first version, with *yesterday*, will only be appropriate if the report is said on the same day as the original: i.e. *yesterday* is interpreted as the day before the day of the report, not the day before the day of the original. It is possible in certain circumstances, however, for this to be overridden, for *yesterday* (and other such deictic expressions) to be interpreted relative to the time of the original: *She realised the lease must have expired yesterday.* This could be used in a narrative context with *yesterday* referring to the day before that of the realisation rather than of the present time of the narration. This kind of deictic shift generally occurs, however, in free indirect speech rather than with an explicit verb of reporting, such as *realised* in this example: we postpone further comment, therefore, until §9.3.

## 9.2 Direct reported speech

### ■ Embedded vs non-embedded reported speech

This distinction applies to the direct mode as well as to the indirect, though this time it is not so clearly marked syntactically:

- |     |   |  |
|-----|---|--|
| [7] | EMBEDDED                                    | NON-EMBEDDED                             |
|     | i a. <i>She replied, 'I live alone.'</i>    | b. <i>'I live alone,' she replied.</i>   |
|     | ii a. <i>He asked, 'Where do you live?'</i> | b. <i>'Where do you live?' he asked.</i> |

Direct speech purports to be identical to the original, and hence the embedded and non-embedded constructions do not differ with respect to the form of the reported speech itself.<sup>34</sup> There is thus nothing comparable to the distinction in [2], where the reported speech has the form of a subordinate content clause in the embedded version and of a main clause in the non-embedded one. Nevertheless, the contrast between the two constructions can be maintained on the basis of the reporting frames: in the [b] examples the reporting frame has the status of a parenthetical, while in the [a] examples the reporting verb is syntactically superordinate to the reported speech. This is reflected in the fact that the [a] construction as a whole can itself be subordinated, whereas the [b] type cannot:

- [8] a. *I was taken aback when she replied, 'I live alone.'*  
 b. *\*I was taken aback when 'I live alone,' she replied.*

Similarly, we can have *He hadn't expected her to reply, 'I live alone'*, but there is no corresponding construction with a parenthetical.

In the embedded construction we therefore take the reported speech to function as complement of the reporting verb. However, this complement – *I live alone* in [7ia] and

<sup>34</sup>We ignore here the punctuational difference between [a] and [b] in [7i]: the punctuation of direct reported speech is described in Ch. 20, §6.

[8a] – is not a content clause. It is not a subordinate clause of any kind. What is embedded in these examples happens to have the form of a clause, but it can be longer than that:

[9] *She replied, 'I live alone. My son lives alone too. We both prefer it that way.'*

The construction thus involves the embedding of a **text**, not of clauses as such.

### ■ Form of the parenthetical

The subject of a parenthetical reporting frame is often postposed. Compare:

[10] a. *'Your father's arrived,' Sue said.*      b. *'Your father's arrived,' said Sue.*

Subject postposing is not permitted if the verb has an object (*Sue told them*, but not \**told Sue them* or \**told them Sue*); postposing of personal pronoun subjects (*said he*) is archaic.<sup>35</sup> As observed earlier, postposing is more usual with direct than with indirect reported speech, but in the direct case the parenthetical is predominantly declarative. There is no analogue here, for example, of the construction illustrated in [2iib]. Compare indirect *Will I be invited, did she say?* (as spoken, let us say, by Kim) with direct #*'Will Kim be invited?' did she say?*

### ■ Position of the parenthetical

The parentheticals in [7] and [10] occur after the reported speech; they are also often found medially within it:

[11] i *'Jennifer,' he called, 'have you seen my glasses?'*  
 ii *'In those days,' Sue admitted, 'we were heavily in debt.'*  
 iii *'One of the delegates,' Max added, 'had volunteered to move a vote of thanks.'*  
 iv *'I now realise,' Kim replied quietly, 'that I was probably in the wrong.'*  
 v *'The train leaves in two hours,' he screamed, 'and we haven't started to pack.'*

In [i–iii] the parenthetical follows the first element of the reported speech – a vocative, an adjunct, and the subject respectively. In [iv] it occurs between the verb and its clausal complement; it can also occur before an object provided it is relatively heavy: *'I have bought,' he insisted, 'only the things that were absolutely essential.'* In [v] it follows the first coordinate in a clause-coordination. It will be noted that these are all positions where we could insert an adjunct.

### ■ Reporting verbs

A sample of the large number of verbs that can be used to report direct speech is given in:

[12]	<i>add</i>	<i>admit</i>	<i>advise</i>	<i>agree</i> P	<i>answer</i>	<i>argue</i> P
	<i>ask</i>	<i>beg</i>	<i>begin</i> P – C	<i>boast</i> P	<i>call</i>	<i>comment</i>
	<i>declare</i>	<i>demand</i> P	<i>explain</i>	% <i>go</i> – C	<i>grin</i> P – C	<i>inquire</i>
	<i>maintain</i> P	<i>mumble</i>	<i>observe</i>	<i>order</i>	<i>promise</i> P	<i>reason</i> P
	<i>remark</i>	<i>reply</i>	<i>say</i>	<i>smile</i> P – C	<i>state</i>	<i>suggest</i>
	<i>tell</i> P	<i>think</i>	<i>warn</i>	<i>wonder</i> P	<i>write</i>	<i>yell</i>

The embedding construction tends to prefer the more general verbs such as *say*, *ask*, *reply*, etc.; those in the list marked 'P' occur predominantly in the parenthetical

<sup>35</sup> It is also found in the non-standard or jocular <sup>1</sup>*says I*. Subject postposing is occasionally found in the embedded construction too, but it is largely restricted to journalistic writing: *Said manager Fred Kessels: 'This has been a very successful year, with profits up by 45% on 1998.'*

construction. Compare, then: *'It was a good try,' she smiled* and *\*She smiled, 'It was a good try.'*

Most verbs that report direct speech can take content clauses; those with the annotation '–c' are exceptions, and hence do not occur with indirect reported speech in the embedded construction. Compare: *He goes, 'I don't know what you mean'* and *\*He went that he didn't know what I meant.*<sup>36</sup> Note also that with some of the verbs that take either direct speech or a content clause as complement there are significant differences in use:

- [13] i a. *She said, 'What did they want?'*                      b. *She said what they wanted.*  
 ii a. *'Why did you leave?' she demanded.*                      b. *\*She demanded why we left.*

In [ia] *say* reports the asking of a question, but in [ib] it reports the answering of one – an indirect report of the asking would need a reporting verb (such as *ask* itself). In [ib] but not [ia] we could substitute *tell* + object: *She told me what they wanted*, but not *\*She told me, 'What did they want?'* Content clauses, as we have seen earlier in this chapter, are subclassified according to clause type, i.e. as declarative, closed or open interrogative, and so on. The governing verbs are specified as to which type of content clause they can take as complement. Example [iib] is thus excluded because *demand* does not select an interrogative clause – it takes a declarative mandative, as in *She demanded that I tell her why we left* (it can also take an infinitival complement: *She demanded to know why we left*). There is no comparable grammatical restriction on the verbs taking direct speech, where it is semantic compatibility that determines acceptability. For *ask* with the approximate sense “inquire”, for example, the syntactic restriction on a content clause complement is that it be interrogative, while the semantic restriction on its use with direct speech is that the latter have the force of a question. And the question need not have the form of an interrogative: *'You're leaving already?' she asked* (cf. Ch. 10, §4.7.2).

#### ■ Other syntactic contexts for direct speech and citation

The cases of embedded direct speech considered so far have all been complements of reporting verbs. Other contexts where it is found are illustrated in:

- [14] i *What he said was 'I'll see what I can do.'*  
 ii *Her response was 'That's all I have done.'*  
 iii *Kim's first question, 'Who called the police?', was never answered.*

In [i–ii] the direct speech is complement of **be** in its specifying sense, while in [iii] it is a supplement sanctioned by the anchor *Kim's first question*. Very similar to direct speech is citation, as in:

- [15] i *The school motto is 'Dare to be wise!'*  
 ii *Next week's seminar will be on the topic 'Does God exist?'*

These are not reporting a particular speech act, but the form of the citation is of the kind that might serve as such a report.

<sup>36</sup>We mark *go* with the % symbol as it is mainly restricted to younger speakers in casual style; it is found predominantly in the historic present use of the present tense, as in this example. Another form found in casual speech for reporting direct speech consists of *be* + *like*: %*And he's like, 'I don't know what you mean.'*

### ■ Blurring of the distinction between direct and indirect reports

- [16] i *The Chief Minister said that the territory's justice system was so biased towards offenders that it was 'totally corrupt'.*  
 ii *Mr Crabb stated that, 'during this first half, there was an appreciable strengthening in most non-ferrous metal prices, . . .'*

The distinction between direct and indirect reporting is not always sharply maintained. Direct quotation may be inserted into what is primarily an indirect report, as in [i]. The subordinator *that* and the backshifted tense in the two instances of *was* mark this as an indirect report, but the quotation marks around *totally corrupt* indicate that this phrase was used by the original speaker.<sup>37</sup> Example [ii] (from a company circular) represents a much less usual type of blend between the constructions: the reporting verb is followed by *that*, normally a marker of indirect reporting, but what follows *that* itself is wholly quoted. It would seem to be motivated by the fact that *state* does not readily take direct reported speech as complement, though it is commonly found in parentheticals.

## 9.3 Free indirect and direct speech

We have been concerned so far with **reported** speech, constructions where there is a reporting frame superordinate to the reported speech or parenthetical to it. It is possible, however, for the reporting frame to be left implicit, and in this case we have **free** indirect or direct speech. This phenomenon is normally restricted to certain types of written or indeed oral narrative.

Free indirect speech is illustrated in the underlined sequence in:

- [17] *Max was feeling remorseful. He shouldn't have spoken to them so harshly. He would have to apologise to them next time he saw them.*

In the intended interpretation the last two sentences represent the thoughts of Max, not judgements by the narrator. We understand something along the lines of "He felt/told himself that he shouldn't have spoken to them so harshly", but the reporting frame is left implicit, recoverable from the first sentence. The form of the free indirect speech is the same as that of explicitly reported indirect speech. For further discussion and examples, see Ch. 17, §§3.1.4, 10.2.

Examples of free direct speech are seen in:

- [18] i *The reason I'm interested in language is because I'm interested in mind. That is an unfashionable position. Most psychologists these days will tell you that minds can't be studied scientifically. You can't measure them; all you can see is behaviour. So why not forget about minds and just study behaviour instead?*  
 ii *She ate with her friends like an actor on stage, miming enjoyment of cotton-wool cakes and a glass of cold tea; leaned back and laughed as they sharpened their tastes on their host's choice of food, furniture, bathroom fittings, and friends. See I eat, I laugh, I listen. I belong.*

<sup>37</sup>In speech this might be marked prosodically, by setting *totally corrupt* off from the rest. Alternatively it might be marked by a parenthetical (. . . was – and I quote – *totally corrupt*). There is also a convention of using the expression *quote*, alone or followed by *unquote*: *the system of justice was, quote, totally corrupt (unquote)*.

In [i] the underlined sequence represents the views of psychologists, not of the writer (the referent of *I* in the first sentence). We thus understand this sequence as though it were explicitly reported direct speech: “You can’t measure them”, they say, “all you can see is behaviour . . .” Similarly in [ii], where *I* in the underlined sequence is co-referential with *she* in the first sentence.

## 1 Terminological preliminaries

This chapter deals with what are traditionally called **relative clauses**. We use the more general term **relative constructions** because although it is reasonable enough to call the underlined construction in [1i] a relative clause, the term is misleading for the type of construction seen in [1ii]:

- [1] i *I agree with most of the things that your father was saying.* [clause]  
 ii *I agree with most of what your father was saying.* [NP]

These two sentences are equivalent. But the phrase *what your father was saying* in [ii] is an NP: it corresponds not to the relative clause *that your father was saying* in [i], but to the larger NP containing it, *the things that your father was saying*. And we will see that there are syntactic as well as semantic reasons for treating *what your father was saying* in [ii] as an NP.

We therefore use the term ‘relative constructions’ to cover both the underlined sequences in [1], with ‘relative clause’ available as a more specific term applying to cases like [i]. Often, however, we will talk simply of ‘relatives’, leaving ‘construction’ or ‘clause’ understood.

## 2 Types of relative construction

This section presents an overview of the different types of relative construction that will be discussed in detail in subsequent sections. The two major dimensions of contrast yield what we will call **formal types** and **relational types**.

The formal types are distinguished according to whether they contain one of the special relative words *who*, *which*, etc., or the subordinator *that*, or simply a ‘gap’, a missing constituent.

The relational types are distinguished on the basis of their external syntax, their relation to the larger construction containing them. The traditional distinction between restrictive and non-restrictive relative clauses fits in here, but we shall use different terms and contrast them with two further categories, cleft and fused relatives.

In addition to these major contrasts, we need to invoke the more general distinction of finiteness: while most relative constructions are finite, infinitivals (and certain minor types) are also possible under certain conditions.

## 2.1 Formal types: *wh*, *that*, and bare relatives

Relative clauses are so called because they are related by their form to an antecedent. They contain within their structure an anaphoric element whose interpretation is determined by the antecedent. This anaphoric element may be overt or covert. In the overt case the relative clause is marked by the presence of one of the relative words *who*, *whom*, *whose*, *which*, etc., as or within the initial constituent: clauses of this type we call **wh relatives**. In **non-wh relatives** the anaphoric element is covert, a gap; this class is then subdivided into **that relatives** and **bare relatives** depending on the presence or absence of *that*:<sup>1</sup>

- |     |     |   |                                       |
|-----|-----|---|---------------------------------------|
| [1] | i   | $\left\{ \begin{array}{ll} \underline{\textit{which you don't want.}} & [\textit{wh} \textit{relative}] \\ \underline{\textit{that you don't want.}} & [\textit{non-wh: that relative}] \\ \underline{\textit{you don't want.}} & [\textit{non-wh: bare relative}] \end{array} \right.$ |                                       |
|     | ii  |   | <i>He'll be glad to take the toys</i> |
|     | iii |   |                                       |

In [i] *toys* is antecedent for the pronoun *which*, whereas in [ii–iii] there is no such pronoun, merely the absence of the understood object of *want*. We take *that* in [ii] to be a clause subordinator, not a relative pronoun as in traditional grammar. It is the same marker of clause subordination as we find in content clauses, and the distinction between *that* and bare relatives is analogous to that between expanded and bare declarative content clauses, as in *You said that you don't want the toys* and *You said you don't want the toys*. We present arguments in support of this treatment of *that* in §3.5.6.

## 2.2 The relational types: integrated, supplementary, cleft, and fused

Four types are distinguished according to the relation of the relative construction to the larger structure containing it:

- |     |     |   |                          |
|-----|-----|---|--------------------------|
| [2] | i   | <i>The boys <u>who defaced the statue</u> were expelled.</i>          | [integrated relative]    |
|     | ii  | <i>My father, <u>who retired last year</u>, now lives in Florida.</i> | [supplementary relative] |
|     | iii | <i>It was Kim <u>who wanted Pat as treasurer</u>.</i>                 | [cleft relative]         |
|     | iv  | <i><u>What you say</u> is quite right.</i>                            | [fused relative]         |

The underlined sequence in [i–iii] is a clause, while that in [iv] is an NP; we will see, however, that fused relatives can also be PPs.

### ■ The integrated relative clause

The most central and most frequent type of relative construction is the **integrated** relative. It usually functions as a modifier within a nominal constituent: in [2i], for example, *who defaced the statue* modifies *boys*, which is the antecedent for the pronoun *who*. Integrated relative clauses are occasionally found as modifier to other kinds of head: a superlative adjective, as in *He's now the fattest he's ever been*, or an interrogative preposition, as in *Where can we eat that isn't too expensive?* (In this last example the relative clause is postposed instead of being in the default position immediately following the antecedent.)

Integrated relatives are so called because they are integrated into the construction containing them, both prosodically and in terms of their informational content. The prototypical integrated relative serves to restrict the denotation of the head nominal it

<sup>1</sup>Bare relatives are sometimes called 'contact clauses'.

modifies, and is often referred to by the term ‘restrictive relative’. The set of boys who defaced the statue, for example, is smaller than the set of boys; here the information expressed in the relative clause is an integral part of that expressed by the matrix clause in that it delimits the set of boys under discussion.

### ■ The supplementary relative clause

A **supplementary** relative clause adds extra information about the antecedent, information not fully integrated into the structure of the containing clause and not needed to delimit the set denoted by the antecedent. In [2ii] the antecedent of *who* is not the nominal *father*, but the NP *my father*, which refers to a unique person: the clause *who retired last year* thus plays no role in identifying the referent, but adds some extra information about him. The information expressed in this type of relative is presented as supplementary, separate from that expressed in the rest of the sentence, and this is reflected in the fact that the relative clause is characteristically marked off prosodically or by punctuation from the rest.

The supplementary relative is also distinguished from the integrated relative in that it permits a much wider range of antecedents, as is evident from such examples as:

- [3] i *Pat is afraid of snakes, which I’m sure Kim is too.* [AdjP]  
 ii *Pat is afraid of snakes, which doesn’t surprise me at all* [clause]

The antecedents for *which* here are an AdjP in [i] and a whole clause in [ii], the relative clauses being interpreted as “I’m sure Kim is afraid of snakes too” and “That Pat is afraid of snakes doesn’t surprise me at all”. The antecedent can indeed be a piece of text syntactically unconnected to the relative, as when a lecturer finishes one topic and then moves on to the next with the supplementary relative *Which brings me to my next point*.

### ■ The cleft relative clause

The clause that occurs after the foregrounded element in an *it*-cleft construction is called a **cleft** relative clause. Consider the following set of examples:

- [4] i *Kim wanted Pat as treasurer.* [non-cleft]  
 ii *It was Kim who wanted Pat as treasurer.* (= [2iii]) }  
 iii *It was Pat that Kim wanted as treasurer.* } [cleft]

Example [i] is an ordinary, non-cleft, clause, while [ii] and [iii] are cleft counterparts of it, and the underlined clauses are the cleft relatives, differing in function and, in certain respects, their internal structure from integrated relatives. The cleft construction is so called because it divides the more elementary construction into two parts, one of which is foregrounded and the other backgrounded. In [ii] *Kim* is foregrounded and *wanted Pat as treasurer* backgrounded, whereas in [iii] the foregrounded element is *Pat*, with *Kim wanted as treasurer* backgrounded. The cleft construction is dealt with in Ch. 16, §9, and in the present chapter will be mentioned only incidentally.

### ■ The fused relative construction

Finally we consider the **fused** relatives, which are always of the *wh* type:

- [5] i *What he did was quite outrageous.*  
 ii *Whoever devised this plan must be very naive.*  
 iii *You can buy whichever car appeals to you most.*

From a syntactic point of view this is the most complex of the four relative constructions. With the others we can separate a relative clause from its antecedent, but this is not possible with the fused construction. Compare, for example:

- [6] i *It would mean abandoning that which we hold most dear.* [antecedent + clause]  
 ii *It would mean abandoning what we hold most dear.* [fused relative]

These are semantically equivalent (though [i] belongs to very formal style). Syntactically, *that* in [i] is antecedent, with *which we hold most dear* an integrated relative clause modifying it, but in [ii] *what* corresponds to *that* and *which* combined, so that it is not possible to separately identify antecedent and relative clause – hence the term ‘fused’.

While the fused relatives in [5] are NPs, those based on *where* and *when* are PPs:

- [7] i *Put it back where you found it.*  
 ii *He still calls his parents whenever he is in trouble.*<sup>2</sup>

Because the fused relative construction is so different from the integrated, supplementary, and cleft relative clause constructions, we will treat it separately, deferring further consideration of it until §6.

### 2.3 Finiteness

The great majority of relative constructions are finite, but with integrated relatives we find infinitivals of the *wh* type and corresponding ones without a relative word. The underlined parts of [8] are infinitival relative clauses:

- [8] i *She found a good place from which to watch the procession.*  
 ii *She found a good place to watch the procession from.*

There are various other non-finite constructions which bear some resemblance to relatives, such as gerund-participials and past-participials that modify nouns (*anyone knowing his whereabouts, those killed in the accident*): these constructions are discussed in Ch. 14, §9.

## 3 The form of relative clauses

A relative clause, we have said, contains within its structure an overt or covert element that relates it anaphorically to an antecedent. Other kinds of clause may also contain anaphoric elements, of course. In *I lent Jill my bicycle last week [and she hasn't returned it yet]*, for example, *she* and *it* in the second clause are anaphorically related to *Jill* and *my bicycle* in the first. Here, however, the anaphoric relation is incidental: there is no anaphora in *I lent Jill my bicycle last week [and now there's a bus strike]*, but we still have the same syntactic construction, a coordination of main clauses. In relative clauses, by contrast, the anaphoric relation is an essential feature of the construction. What distinguishes relatives from other clauses is the specific nature of the anaphoric relation

<sup>2</sup>Other terms found in the literature corresponding to our ‘fused relative (construction)’ are ‘free relative’, ‘headless relative clause’, and ‘nominal relative clause’. Terms incorporating ‘clause’ are unsatisfactory for the reasons we have given. In addition, ‘nominal’ is insufficiently general in that it doesn’t cater for prepositional examples like those with *where* or *when*. And ‘headless’ is misleading in our view since the head of the containing phrase is not missing but fused with part of the modifying clause.

involved. In the central case of the integrated relative, the antecedent is the head that the clause modifies, and in all cases the anaphoric element itself has distinct properties. In *wh* relatives the overt forms *who*, *which*, etc., are distinct from the anaphoric forms that are used in main clauses; they are homonymous with interrogative words, but the latter are not anaphoric. In non-*wh* relatives the anaphoric element is a gap, but this too is distinct from other kinds of anaphoric gap with respect to the positions in which it can occur and the way it is interpreted.

### 3.1 Relativisation

The essential anaphoric element in a relative clause we call the **relativised element**. It is primarily in respect of this element that the relative differs in form from a comparable main clause. Consider first the case where the relativised element is subject:

- [1] i *A letter drew our attention to the problem.* [main clause]  
 ii *This is the letter<sub>i</sub>; [which<sub>i</sub> drew our attention to the problem].* [*wh* relative]  
 iii *This is the letter<sub>i</sub>; [*that* \_\_<sub>i</sub> drew our attention to the problem].* [*that* relative]

The main clause in [i] has the ordinary NP *a letter* as subject. In the *wh* relative the subject is *which*, a relative pronoun anaphorically linked to the antecedent *letter*, as indicated in [ii] by the identical subscripted indices. In [iii], where *that* marks the clause as subordinate, the subject position is empty, but there is still an anaphoric link to the antecedent *letter*, which we indicate by attaching the same index to the symbol marking the gap. The meaning in both [i] and [ii], ignoring the definite article, can be given roughly as “This is letter *x*; *x* drew our attention to the problem”. This kind of meaning, with two occurrences of a single variable, is an essential and distinctive feature of all relative constructions.

We take the antecedent of *which* and the gap to be *letter*, not *the letter*, since *the* enters into construction with the whole nominal *letter which/that drew our attention to the problem*: it is this, not *letter* by itself, that is presented as an identifying description that sanctions the definite article (see Ch. 5, §6.1).

In [1iii], as in almost all cases of subject relativisation in non-*wh* relatives, *that* is non-omissible: there is no bare relative counterpart \**This is the letter drew our attention to the problem*. But where it is the object that is relativised *that* is optional, so we have all three types:

- [2] i *My neighbour gave me some advice.* [main clause]  
 ii *I accepted the advice<sub>i</sub>; [which<sub>i</sub> my neighbour gave me].* [*wh* relative]  
 iii *I accepted the advice<sub>i</sub>; [*that* my neighbour gave me \_\_<sub>i</sub>].* [*that* relative]  
 iv *I accepted the advice<sub>i</sub>; [my neighbour gave me \_\_<sub>i</sub>].* [bare relative]

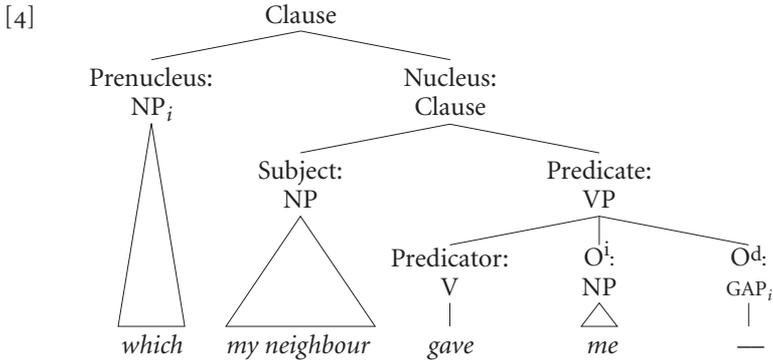

As in [1], the main clause in [2i] has an ordinary NP as direct object, whereas the relative clauses do not. The *wh* relative [ii] again has *which* as relative pronoun, while the non-*wh* versions simply have a gap in object position. And as before the meaning involves two occurrences of a variable: “I accepted advice *x*; my neighbour gave me *x*”.

#### ■ Fronting to prenuclear position

In [2ii] *which* occurs in what we call **prenuclear** position, before the subject + predicate construction that constitutes the nucleus of the clause (cf. Ch. 2, §2). Formally, there is a gap after *gave me* in this construction as well as in the non-*wh* relatives. The difference

is that while in [2iii–iv] the gap is related directly to the antecedent *advice*, in [2ii] it is related indirectly, via *which*. Example [2ii] can thus be represented as in [3], with the relative clause having the structure shown in [4]:

[3] *I accepted the advice<sub>i</sub> [which<sub>i</sub> my neighbour gave me —<sub>i</sub>].*

In the first instance it is the gap that is in object function, as indicated in the diagram. However, prenuclear elements that are linked to a gap are interpreted as having the function of that gap, and we can thus say in a secondary, derivative, sense that they have that function. On this account, therefore, *which* is object of the relative clause, just as it is in traditional grammar.

#### ■ Relative clauses vs content clauses

Examples [1–2] show how the relativisation feature distinguishes relative clauses from main clauses. The obligatory presence of an (overt or covert) relativised element likewise distinguishes relative clauses from content clauses, the default kind of subordinate clause:

- [5] i a. *They ignored the suggestion<sub>i</sub> [that Kim made —<sub>i</sub>].* [relative clause]  
 b. *They ignored the suggestion [that Kim cheated].* [content clause]  
 ii a. *Focus on the question<sub>i</sub> [which<sub>i</sub> your brother raised —<sub>i</sub>].* [relative clause]  
 b. *Focus on the question [which of them stood to gain by it].* [content clause]

The non-*wh* relative in [ia] has a gap in object position anaphorically linked to the antecedent *suggestion*: we understand that Kim made some suggestion. Thus, again ignoring the determiner, the meaning can be given as “They ignored suggestion *x*; Kim made *x*”, with two occurrences of the same variable. But there is no gap in the content clause in [ib], where we understand the subordinate clause as simply expressing the proposition “Kim cheated”. Similarly in [ii], except that this time the relative is of the *wh* type and the content clause is an open interrogative rather than a declarative.<sup>3</sup> We understand from [iia] that your brother raised some question: “Focus on question *x*; your brother raised *x*”. But the content clause in [iib] is understood simply as “Which of them stood to gain by it?” In [iia] *which* is anaphoric, relative, while in [iib] it is non-anaphoric, interrogative.

If the verb in the subordinate clause is one that can be used both transitively and intransitively there may be ambiguity between the two constructions:

<sup>3</sup>In the interrogative case a preposition (*of* or *as to*) would often appear after the head noun.

[6] *They rejected the idea [that we had advanced].* [relative or content clause]

In the relative interpretation there is a relativised object, a gap, with *idea* as antecedent. We had advanced some idea: “They rejected idea *x*; we had advanced *x*”. In the content clause interpretation, on the other hand, *that* introduces an ordinary clause (a complement to the noun *idea*): the meaning is that they rejected the proposition “We had advanced”.

There are other factors that distinguish relative clauses from content clauses. In NP structure relatives function as modifiers, whereas content clauses are complements, compatible only with a fairly small subclass of noun. Our examples contain *suggestion*, *question*, *idea*: others are *fact*, *news*, *belief*, *concern*, *proposal*, etc., but innumerable nouns like *cat*, *boy*, *health*, *energy* allow relatives but not content clauses. Secondly, content clauses do not allow the alternation between the *wh* and *that* constructions found with relatives: for example, if we replace *that* by *which* in [6] it becomes unambiguously relative. In content clauses, *that* marks declarative clause type, while *which*, *who*, etc., occur only in open interrogatives, licensed by such nouns as *question*.

### 3.2 Relative words, relative phrases, and upward percolation

We refer to the initial phrase in *wh* relatives as the **relative phrase**; it occupies either subject or prenuclear position. A **simple** relative phrase consists of a relative word on its own: *who*, *whom*, *which*, *where*, etc. A **complex** relative phrase consists of a relative word together with other material. Compare:

[7] i *I can't find the book [which he recommended \_\_].* [simple]  
 ii *We've never met the people [whose house we are renting \_\_].* } [complex]  
 iii *We admired the skill [with which she handled the situation \_\_].* }

In [ii–iii], as in almost all the complex cases, the relative phrase contains more than just the relativised element. In [ii], for example, the relative phrase in prenuclear position is the NP *whose house*, but it is just the genitive determiner within this NP, i.e. *whose*, that constitutes the relativised element: it is *whose* that derives its interpretation from the antecedent *people*. The gap in object position in the nucleus is thus not co-indexed with the antecedent, as it is in [i]. Rather, we have two co-indexed pairs of different extents, with *whose* linked to *people*, and the gap linked to *whose house*, for it is *whose house* that is understood as object of *renting*. Similarly in [iii], except that the gap is anaphorically linked to a PP rather than an NP. The anaphoric links can thus be shown as in [8], where the outer brackets in [ii–iii] enclose the relative clause, and the inner ones the complex relative phrase:

[8] i *I can't find the book<sub>i</sub>; [which<sub>i</sub> he recommended \_\_<sub>i</sub>].*  
 ii *We've never met the people<sub>i</sub>; [[whose<sub>i</sub> house]<sub>j</sub> we are renting \_\_<sub>j</sub>].*  
 iii *We admired the skill<sub>i</sub>; [[with which<sub>i</sub>]<sub>j</sub> she handled the situation \_\_<sub>j</sub>].*

Non-*wh* relatives do not contain a relative phrase, and consequently there can be no non-*wh* relatives matching *wh* relatives like [7ii–iii]:

[9] i *I can't find the book [that he recommended].*  
 ii \**We've never met the people [that's house we are renting].*  
 iii \**We admired the skill [with that she handled the situation].*

In describing the range of permitted complex relative phrases we will invoke the metaphor of ‘upward percolation’. In [7ii], for example, the relative feature percolates upwards from the genitive determiner *whose* to the matrix NP *whose house* and in [7iii] it percolates upwards from the NP *which* to the PP *with which*. We invoked the same metaphor in Ch. 10, §7.9, in describing the structure of complex interrogative phrases, but the phenomenon is considerably more extensive in the case of relatives. Seven types of upward percolation may be distinguished in relative clauses, five involving percolation from the element on the right, two from the one on the left:

[10]	TYPE	PERCOLATION FROM	TO	EXAMPLE
	I	comp of preposition	PP	<i>behind <u>which</u></i>
	II	PP	NP	<i>the result of <u>which</u></i>
	III	PP	AdjP	<i>prominent <u>among which</u></i>
	IV	NP	infinitival	<i>to refute <u>which</u></i>
	V	NP	gerund-participial	<i>passing <u>which</u></i>
	VI	genitive <i>whose</i>	NP	<i><u>whose</u> essay</i>
	VII	determinative <i>which</i>	NP	<i><u>which</u> suggestion</i>

We will examine each of these in turn. Where appropriate, we will contrast the examples with main clause constructions to show the basic, non-relative, form of the phrase.

### 3.2.1 Type I: from complement of preposition to PP (*behind which*)

In general, this type of upward percolation is optional:

[11]	i	<i>Kim was hiding <u>behind the curtain</u>.</i>	[main clause]
	ii	<i>the curtain</i> {	[Type I applied]
	iii		[Type I not applied]

In [ii] the relative phrase is the PP *behind which*, with percolation of the relative feature from the NP *which* to the PP in which it is complement; the result is that the preposition is fronted along with its complement. In [iii] the relative phrase is just *which*, and fronting this time affects only the complement of the preposition, the latter being left **stranded**. The factors favouring, or in some cases requiring, one or other of these structures are discussed in detail in Ch. 7, §4.1.

### 3.2.2 Type II: from PP complement of noun to NP (*the result of which*)

Type II always combines with Type I in the PP, so that we have percolation from a relative NP to a PP and thence to a larger NP:

[12]	i	<i>She’s just sat her final exam, [<u>the result of which</u> we expect next week].</i>
	ii	<i>She investigated all the complaints, [<u>most of which</u> were well founded].</i>
	iii	<i>They are members of an association [<u>the first and most precious principle of which</u> is mutual trust].</i>
	iv	<i>Police are looking for a Ford Escort [<u>the licence number of which</u> ends in 7].</i>

Much the most frequent preposition is *of*, and the construction is found more often in supplementary relatives ([i–ii]) than in integrated ones ([iii–iv]). Example [ii] illustrates the quite common case where *of which* is a partitive complement.

Like Type I, Type II upward percolation is in general optional. There is potentially alternation, therefore, between three different versions of the relative clause:

- |        |   |                      |
|--------|---|----------------------|
| [13] i | <i>He already knows <u>the answers to the problems</u>.</i>               | [main clause]        |
| ii     | { [ <i>the answers to <u>which</u> he already knows</i> ]                 | [Types I and II]     |
| iii    | { [ <i>problems <u>to which</u> he already knows <u>the answers</u></i> ] | [Type I only]        |
| iv     | { [ <i><u>which</u> he already knows <u>the answers to</u></i> ]          | [Type I not applied] |

In [ii] we have percolation from *which* into the PP *to which* (Type I), and from there into the NP *the answers to which* (Type II). In version [iii] only Type I applies so that we have fronting of just the PP complement of the NP object. Version [iv] has a simple relative phrase: there is no upward percolation at all.

### ■ Some factors relevant to choice between alternants

Examples like [13ii], with two steps of upward percolation, are characteristic of relatively formal style. Other factors include the following.

#### Preposition stranding not normally permitted at the end of the subject

- |           |   |
|-----------|---|
| [14] i a. | { [ <i>the <u>purpose of which</u> escapes me</i> ].  |
| b.        | { [ <i>He came up with a strange plan, <u>of which</u> the <u>purpose</u> escapes me</i> ].         |
| c.        | { * [ <i><u>which</u> the <u>purpose of</u> escapes me</i> ].                                       |
| ii a.     | { [ <i>the <u>purpose of which</u> I don't understand</i> ].  |
| b.        | { [ <i>He came up with a strange plan, <u>of which</u> I don't understand <u>the purpose</u></i> ]. |
| c.        | { ? [ <i><u>which</u> I don't understand <u>the purpose of</u></i> ].                               |

In the last example in each set, fronting applies to *which* from the larger NP, leaving *of* stranded; in [ic], where the NP is subject, the result is quite ungrammatical, while [iic], where the NP is object, is much more acceptable – stylistically inelegant rather than ungrammatical.

#### Partitive *of* resists stranding

Constructions with a partitive *of* phrase normally have at least one step of upward percolation:

- |        |   |
|--------|---|
| [15] i | { [ <i><u>only five of which</u> he'd answered</i> ].   |
| ii     | { [ <i>She hadn't kept copies of her letters, <u>of which</u> he'd answered <u>only five</u></i> ]. |
| iii    | { * [ <i><u>which</u> he'd answered <u>only five of</u></i> ].                                      |

#### Informational status

The main factor concerns what we are calling information packaging, the informational status of various parts of the message. Compare, for example:

- |        |  |
|--------|--|
| [16] i | <i>I sympathise with such complaints, [<u>of which</u> we receive <u>many</u>].</i>    |
| ii     | <i>I sympathise with such complaints, [<u>many of which</u> I investigate myself].</i> |

In the most likely interpretation of [i], the main information being conveyed is that the complaints are numerous: *many* occupies the basic object position and will carry the main stress, marking it as the focus of new information. *Many of which we receive* would suggest (if the focal stress is on *receive*) that some of the complaints are not received, i.e. are lost, or (if the stress is on *we*) that some of them are received by others. In [ii], where *many* is fronted along with its complement, the main information is that I investigate them myself.

In general, then, material will not be fronted if fronting it would leave the nucleus following the relative phrase with too little significant content:

- [17] i a. *They are striving to explain phenomena [of which we have little or no direct knowledge].*  
 b. \**They are striving to explain phenomena [little or no direct knowledge of which we have].*  
 ii a. *Her first loyalty is to the programme [of which she is director].*  
 b. \**Her first loyalty is to the programme [director of which she is].*

The [b] examples are unacceptable because of the radical imbalance between the content of the relative phrase in prenuclear position and that of the following nucleus. In [iib] *director* is head of the predicative complement, and it is doubtful if upward percolation of Type II could ever apply into an NP in predicative complement function, certainly where the verb is *be*: we have accordingly marked it as ungrammatical, not merely infelicitous.

### ■ Recursive application of percolation Types I and II

Since an NP containing a PP as complement can itself be the complement of a preposition, there can be a further application of Type I after Type II, and then a further application of Type II: the construction is recursive. Compare:

- [18] i *He was wearing a tall black sheepskin hat [from the top of which dangled a little red bag ornamented by a chain of worsted lace and tassels].* [I + II + I]  
 ii *They will be involved in several other projects, [one of the most important of which will be to find ways to use the new superconductor in chips that can provide the brains of a new generation of supercomputers].* [I + II + I + II]

In [i] the upward percolation goes from *which* to the PP *of which*, then to the NP *the top of which* and finally to the underlined PP. In [ii] there are four steps: from NP to PP, PP to NP, NP to PP, and PP to NP.

### 3.2.3 Type III: from PP to AdjP (*prominent among which*)

- [19] i *The many varieties of mammalian skin secretions perform a wide range of functions, [prominent among which is sexual attraction].*  
 ii *Several MPs were interviewed, [chief among whom was the Chancellor of the Exchequer, Douglas Durack].*

This type is rare and highly restricted: in general, the head of an AdjP containing a relative PP is not fronted with it but remains in the basic predicative complement position, as in *He had received a savage sentence for a crime of which he might quite possibly have been innocent* or *It concerns a part of the business for which I am no longer responsible*. This relates to the point about information packaging made in §3.2.2: fronting the adjective here would result in an imbalance between the informational content of the relative phrase and that of the following head clause. It is significant that the examples in [19] (which are semantically very similar) both have postposing of the subject, which is the locus of the main information in the relative clause.

Type III percolation is confined to supplementary relatives; it is obligatory in [19ii], while [19i] has the less favoured alternant *among which sexual attraction is prominent*.

### 3.2.4 Types IV and V: from NP to non-finite (*to refute which, passing which*)

#### ■ Type IV: infinitivals – supplementary relatives only

- [20] i *I felt the need of a better knowledge of Hebrew and archaeology to refute a higher criticism of the Bible.* [main clause]  
 ii *I became disturbed by a ‘higher criticism’ of the Bible, [to refute which I felt the need of a better knowledge of Hebrew and archaeology].* [Type IV]

This type is rare and very largely confined to purpose adjuncts and catenative complements that are semantically somewhat similar – e.g. *to please whom he had striven so hard*, but not *\*to please whom he had wanted so desperately* (only *whom/who he had so desperately wanted to please*).

Type IV combines (obligatorily) with Type I when the infinitival is complement of the preposition *in order*:

- [21] *Here is Dr Van Buren, [in order to interview whom Phelps says he was prepared to fly to Copenhagen].*

#### ■ Type V: gerund-participials – supplementary relatives only

- [22] *They take a rigorous examination, [passing which confers on the student a virtual guarantee of a place at the university].*

This is again very rare and also highly formal in style – except in the expressions *speaking/talking of which/whom*, used to indicate the topic of what follows.

### 3.2.5 Type VI: from genitive *whose* to NP (*whose essay*)

Relative *whose* functions as subject-determiner in NP structure and obligatorily triggers upward percolation:

- [23] i *He plagiarised the student’s essay.* [main clause]  
 ii *the student* { [whose essay he plagiarised] [Type VI]  
 iii *\*[whose he plagiarised essay]* [Type VI not applied]

Type VI percolation can combine with I, and hence also with II:

- [24] i *I hadn’t yet met the people [in whose house I would be staying].*  
 ii *She was lecturing on Tom Roberts, [an exhibition of whose work can currently be seen at the National Art Gallery].*  
 iii *You sometimes find yourself unable to describe the physical appearance of someone [with the very texture of whose thought you are familiar].*

The steps involved here are, respectively: VI + I; VI + I + II; VI + I + II + I.

### 3.2.6 Type VII: from determinative *which* to NP (*which suggestion*)

When *which* is a determinative rather than a pronoun, upward percolation to the containing NP is obligatory:

- [25] i *They all enthusiastically endorsed this suggestion.* [main clause]  
 ii *I said that it might be more efficient to hold the meeting on Saturday morning, [which suggestion they all enthusiastically endorsed].* [Type VII]  
 iii *\*... [which they all enthusiastically endorsed suggestion].* [Type VII not applied]

Determinative *which* is not itself a phrase, and cannot be separated from the head on which it is dependent, as evident from [iii]. We take the relativised element in [ii] to be the whole object NP, *which suggestion*: this is the phrase whose interpretation is given by the antecedent (*it might be more efficient to hold the meeting on Saturday morning*), though the presentation of it as a suggestion is of course contributed by the relative clause rather than being inherent in the antecedent itself. The double-variable gloss will thus be: “I said  $x$  (=it might be more efficient to hold the meeting on Saturday morning); they all enthusiastically endorsed suggestion  $x$ ”. This is the only type of upward percolation which does not yield a relative phrase that is larger than the relativised element.

Type VII percolation is found only in supplementary relatives. Further examples are seen in:

- [26] i *They refuse to support the UN's expenses of maintaining the UN Emergency Force in the Middle East as a buffer between Egypt and Israel, and the UN troops in the Congo, [which expenses are not covered by the regular budget].*  
 ii *I may be late, [in which case I suggest you start without me].*  
 iii *I will return at 3 pm, [by which time I expect this room to be tidy].*  
 iv *Both horses, broken and trained by different trainers, were blundering jumpers until they were seven, [at which age they began to outgrow their carelessness].*  
 v *She has to comment on him standing there, and later, when the soldiers march away, has to tell him not to move yet – [neither of which remarks should be so obtrusive that the soldiers might notice them, but both of which should be clearly heard by the audience].*

Examples like [i], where the NP concerned is itself an element of clause structure, are quite rare and formal, verging on the archaic. It is much more usual for the NP to be complement of a preposition which is also fronted, and the head noun is then predominantly one of very general meaning such as *case* or *time*, as in [ii–iii]. In the last example the upward percolation involves three steps: VII (*which remarks*), I (partitive *of which remarks*), and II (the whole NP).

### 3.3 What can be relativised

In this section we survey briefly the various elements in the relative clause that can be relativised, without at this stage distinguishing between *wh*, *that*, and bare relatives.

#### (a) Subject

- [27] i *A man came to dinner.*  
 ii *The man<sub>i</sub> [who<sub>i</sub> came to dinner] turned out to be from my home town.*

#### (b) Object

- [28] i a. *She received a letter from the Governor.* [direct object]  
 b. *This is the letter<sub>i</sub> [that she received \_\_<sub>i</sub> from the Governor].*  
 ii a. *He showed a student the exam paper.* [indirect object]  
 b. *\*The student<sub>i</sub> [whom<sub>i</sub> he showed \_\_<sub>i</sub> the exam paper] informed the police.*

Relativisation applies to direct objects but not normally to indirect ones.

## (c) Predicative complement

- [29] i a. *She is a scholar.*  
 b. *Her book displays the fine sceptical intelligence of the scholar; [she is \_\_\_<sub>i</sub>].*  
 ii a. *They consider it a good investment.*  
 b. *?I don't think it is the good investment; [they consider it \_\_\_<sub>i</sub>].*

Relativisation of predicatives is comparatively rare, and almost entirely limited to the subjective type, i.e. those with the subject as predicand, as in [ib]. Example [iib], with the object as predicand, is of doubtful acceptability – it would be much more usual to have *they consider it to be* \_\_\_.

With integrated relatives it is also very rare for the antecedent to be in other than a definite NP: we find the NP *the scholar she is* in [29], but it is hard to contextualise *#a scholar she is* as an NP. But in the right context indefinites are possible; for example, there is no syntactic ill-formedness to *Harry is basically a fat man searching for a thin man that he once used to be*.

## (d) Complement of preposition

- [30] i *He was trying to cut it with a penknife.*  
 ii *The penknife; [that he was trying to cut it with \_\_\_<sub>i</sub>] was blunt.*

In *wh* relatives the preposition may be fronted along with its complement: *the penknife with which he was trying to cut it*. This involves upward percolation, as described in §3.2 above, with the relativised element (still complement of a preposition) contained within the complex relative phrase.

## (e) Adjuncts and associated complements

- [31] i *We met Kim at the races one day.*  
 ii *Do you remember the day; [we met Kim at the races \_\_\_<sub>i</sub>]?*

The gap in [ii] is functioning as adjunct in its clause, like *one day* in [i]. A selection of the major types of adjunct or complement we are concerned with here is supplied in [32]:

- [32] i *It was a time in my life; [when; everything seemed to be going right \_\_\_<sub>i</sub>].* [time]  
 ii *I've finally found somewhere; [where; I can work undisturbed \_\_\_<sub>i</sub>].* [location]  
 iii *They want to go to the place; [where; they went last year \_\_\_<sub>i</sub>].* [goal]  
 iv *I shall go back the way; [I came \_\_\_<sub>i</sub>].* [path]  
 v *Look at the way; [he tackled the job \_\_\_<sub>i</sub>].* [manner]  
 vi *That's not really the reason; [she left him \_\_\_<sub>i</sub>].* [reason]

This sort of case is to be distinguished from (d) above: here it is the whole adjunct or complement that is relativised, whereas in (d) what is relativised is just the NP functioning as complement within a PP. In [30ii], for example, what is relativised is not the instrumental adjunct itself, but just the complement of *with*. Case (d) is in fact broader than (e) since it can apply with virtually the full range of prepositions. For most of the categories in [32] there is an alternant of type (d): for example, [v] alternates with *the way in which he tackled the job*. We look further at such alternations in §3.5.4.

Two extensions of this kind of construction should be noted.

### Extension I: special *wh* words

A number of additional adjunct categories can be relativised by means of the somewhat formal or archaic relative words *whence*, *whither*, *whereby*, *wherein*, etc.

- [33] i *They returned to the place; [whence; they had come \_\_<sub>i</sub>].* [source]  
 ii *It is a scheme; [whereby; payment can be deferred for six weeks \_\_<sub>i</sub>].* [means]

### Extension II: cleft relatives

Cleft relatives differ from ordinary ones in various ways, and one of them is that they allow for the relativisation of a very much wider range of complements and adjuncts, e.g. the beneficiary and purpose adjuncts in [34]:

- [34] i *It wasn't for me; [that he made the sacrifice \_\_<sub>i</sub>].* [beneficiary]  
 ii *It's to avoid such a conflict of interest; [that I'm resigning \_\_<sub>i</sub>].* [purpose]

### (f) Genitive subject-determiner

- [35] i *Some client's measurements remain unknown.*  
 ii *One cannot tailor a suit for a client [whose measurements remain unknown].*

### (g) Complement of auxiliary verb, and related constructions – supplementary relatives only

- [36] i a. *I simply can't design it myself.*  
 b. *He told me to design it myself, [which; I simply can't \_\_<sub>i</sub>].*  
 ii a. *I called the police immediately.*  
 b. *They advised me to call the police, [which; I did \_\_<sub>i</sub> immediately].*  
 iii a. *I'd very much like to go with him.*  
 b. *He's asked me to go with him, [which; I'd very much like to \_\_<sub>i</sub>].*

In [ib] the relativised element is complement of the auxiliary *can*. Auxiliary *have* and *be*, and of course the other modals, behave in the same way: *She said he had cheated; [which; indeed he had \_\_<sub>i</sub>]*, etc. Where the main clause counterpart does not contain an auxiliary, the relative construction requires *do*, as in [iib]. In this case, what is relativised is in effect the predicate, for it is *do* + *which* that derives its interpretation from the antecedent. In [iiib] it is the head of a *to*-infinitival VP that is relativised. This is possible only when the infinitival is complement of a catenative verb – compare, for example:

- [37] i *It is certainly important to consult your lawyer.*  
 ii *\*He says you should consult your lawyer, [which; it is certainly important to \_\_<sub>i</sub>].*

Here the infinitival is in extraposed subject function. For further discussion of the constructions illustrated in [36], see Ch. 17, §§7.1–3.

## 3.4 Relativisation of an element within an embedded clause

The gap that is linked to the antecedent in non-*wh* relatives and to the fronted relative phrase in the *wh* type need not be located directly in the relative clause itself: it can be within a smaller clause embedded within the relative. Compare:

- [38] i a. *She recommended a book.*  
 b. *This is the book; [that she recommended \_\_<sub>i</sub>].*

- ii a. *I think she recommended a book.*  
 b. *This is the book; [that I think [she recommended \_\_\_i]].*

In [ib] the gap is object of the relative clause itself, whereas in [iib] it is object of the content clause functioning as complement of *think* – the outer pair of brackets enclose the relative clause, while the inner pair enclose the content clause embedded within it. It is by virtue of this possibility that relative clauses belong to the class of unbounded dependency constructions which we shall be examining in §7.

### ■ Relativisation is characteristically unaffected by embedding

Leaving aside various general constraints on unbounded dependency constructions, it for the most part makes no difference, as far as relativisation is concerned, whether the gap is directly in the relative clause itself or in a smaller clause embedded within it. In [38], for example, we have relativisation of a direct object, and in both [ib] and [iib] *that* can either be replaced by *which*, giving a *wh* relative, or else be omitted, giving a bare relative. Compare, similarly, the following cases of indirect object relativisation:

- [39] i a. *I lent a boy my key.*  
 b. *\*They found the boy; [that I lent \_\_\_i my key].*  
 ii a. *He said I lent a boy my key.*  
 b. *\*They found the boy; [that he said [I lent \_\_\_i my key]].*

This time both relative clauses are ungrammatical: the indirect object can't be relativised. But again it makes no difference whether it is the indirect object of the relative clause itself, as in [ib], or of a clause embedded within the relative clause, as in [iib].

### ■ Subject vs embedded subject

There is just one exception to this pattern, one place where embedding does make a difference: when we have relativisation of the subject. Compare:

- [40] i a. *This car is safe.*  
 b. *I want a car; [that \_\_\_i is safe].*  
 ii a. *I know [this car is safe].*  
 b. *I want a car; [that I know [\_\_\_i is safe]].*

The difference is that *that* is obligatory in [ib] but omissible in [iib]. We can thus have a bare relative in case [ii], but not in case [i]:

- [41] i *\*I want a car; [\_\_\_i is safe].* [gap as subject of relative clause]  
 ii *I want a car; [I know [\_\_\_i is safe]].* [gap as subject of embedded clause]

We need therefore to distinguish between relativisation of the relative clause subject and relativisation of an embedded clause subject. The distinction is also relevant in *wh* relatives, where it has a bearing on the case of the pronoun *who*, with some speakers allowing an accusative for an embedded subject (<sup>0</sup>*the man whom they say was responsible*) but not a relative clause subject (*\*the man whom was responsible*): see Ch. 5, §16.2.3.

## 3.5 The formal types: *wh*, *that*, and bare relatives

In this section we examine the various *wh* relative words, the omissibility and syntactic status of *that*, and factors relevant to the choice between *wh* and non-*wh* relatives.

3.5.1 *Who and which*

*Which* belongs to both pronoun and determinative categories. As a determinative, it occurs only in supplementary relatives, as illustrated in [25–26] above; as a pronoun it contrasts in gender with *who*, as **non-personal** vs **personal**. The choice depends on the nature of the antecedent:

- |      |   |   |
|------|---|---|
| [42] | PERSONAL ANTECEDENT                                   | NON-PERSONAL ANTECEDENT                               |
| i    | a. <i>the <u>people</u> <u>who</u> were outside</i>   | b. <i>the <u>things</u> <u>which</u> matter most</i>  |
| ii   | a. <i>a <u>dog</u> <u>who</u> was licking my face</i> | b. <i>a <u>dog</u> <u>which</u> is always barking</i> |

The distinction between *who* and *which* is very similar, but not identical, to the one between *he/she* on the one hand and *it* on the other. The two contrasts are compared in our discussion of gender (Ch. 5, §17.3),<sup>4</sup> and here we will merely add a few points of detail.

#### ■ *Who* with antecedents denoting animals

*Who* occurs predominantly with human antecedents, but with antecedents denoting animals, both pronouns are possible, as shown in [42ii]: *which* is the default choice, but *who* is by no means uncommon. *Who* conveys a greater degree of empathy or personal interest and involvement. The most obvious cases where *who* is used are in references to pets, but it is also found with other creatures (or even collections of creatures), as in these attested examples:

- [43] i *For eighty years, grizzly bears have been feeding at the rubbish dumps, often in great roaming bands who came down from the remote pine forests.*  
 ii *The more vigorous dance for a dilute source of nectar in turn recruits other bees, who then visit that dilute source instead of concentrated ones.*

#### ■ Two special cases of *which* used with human antecedents

##### Ascriptive predicative complement of *be*

*Which* occurs with antecedents denoting human beings when the relativised element is complement of auxiliary *be* in a supplementary relative. Compare:

- [44] i *They accused him of being a traitor; [which; he undoubtedly was \_\_i].*  
 ii *It turned out that he wasn't the person; [who; I'd thought he was \_\_i].*

Example [i] belongs to the construction illustrated in [361b], with relativisation of the complement of an auxiliary verb. The complement in this case is a predicative, but we cannot relativise the predicative complement of a lexical verb such as *seem* in this way: \**She thinks he's a fool, which indeed he seems*. The relativised predicative in the *which* construction will generally be of the ascriptive type, as in this example: the clause is concerned with the person's properties, what kind of a person he was, not his identity. *Who* would be impossible here, but is used in the integrated relative clause of [ii], with *be* used in its specifying sense: the issue is the identity of the person (I thought he was person *x*, but he turned out not to be). Note that in both [i] and [ii] the antecedent is in predicative complement function as well as the pronoun.

<sup>4</sup>Ch. 5 (§16.2.3) also deals with the choice between nominative *who* and accusative *whom*.

### Complement of *have (got)*

- [45] i *They've got a chief executive who can provide strong leadership, which we certainly haven't got at the moment.*  
 ii *Remember that they have a house-keeper, which we don't have.*

Again there is no issue of identity involved here: it is not that we have not got the same chief executive or house-keeper, but the same kind of chief executive, or just the same kind of thing (a house-keeper). This construction is found only with supplementary relatives, but it differs from [44i] in that *which* is not complement of an auxiliary verb.

### ■ Coordination of personal and non-personal antecedent nouns

- [46] i *She spoke of the people and books which had brought her the greatest pleasure.*  
 ii *She spoke of the books and people who had brought her the greatest pleasure.*

Here the antecedent is a coordination of nouns differing with respect to the personal vs non-personal contrast. The conflict is typically resolved by means of the principle of proximity, with the gender of the pronoun determined by the last noun in the coordination. The conflict can of course be avoided by using a non-*wh* relative, in this example a *that* relative.

## 3.5.2 Whose

### ■ Used with both personal and non-personal antecedents

The contrast between personal **who** and non-personal *which* is neutralised in the genitive, where *whose* is the only form. It occurs with both personal and non-personal antecedents:

- [47] i *She started a home for women [whose husbands were in prison].* [personal]  
 ii *The report contains statements [whose factual truth is doubtful].* [non-personal]

### ■ Alternation with *of* construction

We have seen (Ch. 5, §16.5.2) that with non-relatives, a genitive determiner characteristically alternates with a construction containing *the* + post-head *of* phrase:

- [48] i a. *The child's parents were constantly quarrelling.*  
 b. *The parents of the child were constantly quarrelling.*  
 ii a. *The house's roof had been damaged in the storm.*  
 b. *The roof of the house had been damaged in the storm.*

The same alternation is found with *whose*, except that here we have two versions of the *of* construction, one with the *of* PP in post-head position, one where it is separated from the head:

- [49] i a. *a child [whose parents were constantly quarrelling]* [genitive]  
 b. *a child [the parents of whom were constantly quarrelling]* [post-head *of* PP]  
 c. *a child [of whom the parents were constantly quarrelling]* [separated *of* PP]  
 ii a. *a house [whose roof had been damaged in the storm]* [genitive]  
 b. *a house [the roof of which had been damaged in the storm]* [post-head *of* PP]  
 c. *a house [of which the roof had been damaged in the storm]* [separated *of* PP]

In the post-head *of* PP construction the relative phrase is the whole NP, so that there is upward percolation of Type II, from PP to NP. In the separated *of* PP version the relative phrase is just that *of* PP, with Type II percolation not applying.

With non-relatives the genitive alternant is more likely with personal nouns than with non-personals, and this general tendency applies with relatives too, where it may well be strengthened by the morphological resemblance between *whose* and *who*: the great majority of instances of *whose* have personal antecedents. In [49i], therefore, the genitive alternant [a] is much the most likely of the three. With non-personal antecedents one or other of the *of* constructions will often be preferred, but it must be emphasised that genitives like [49iia] are completely grammatical and by no means exceptional.<sup>5</sup> One genre where they occur very readily is scientific writing: examples like *a triangle whose sides are of equal length* are commonplace.

### ■ Distributional restrictions on relative *whose*

Relative *whose* does not occur in the full range of genitive constructions (see Ch. 5, §16.3). It is permitted in the oblique genitive (*a friend of whose*), but otherwise occurs only as determiner in NP structure. Compare, for example:

- |      |  |  |
|------|--|--|
| [50] | SUBJECT-DETERMINER GENITIVE              | PREDICATIVE GENITIVE                       |
| i    | a. It was <u>the doctor's</u> car.       | b. The car was <u>the doctor's</u> .       |
| ii   | a. the doctor [ <u>whose car</u> it was] | b. *the doctor [ <u>whose</u> the car was] |

Note that there is no *of* alternant available in [ib/iib] (*\*The car was of the doctor, \*the doctor of whom the car was*), so the meaning has to be expressed by quite different means (e.g. *the doctor who owned the car / to whom the car belonged*).

### 3.5.3 Other relative words

Other words belonging to the relative class are *where*, *when*, *while*, *why*, *whence*, and various compounds consisting of *where* + preposition.<sup>6</sup>

#### ■ *Where*

- [51] i *She wanted to see the house; [where; she had grown up].*  
 ii *They met in the journalists' club; [where; he went every Sunday afternoon].*  
 iii *She often climbed the knoll behind the mission; [from where; she could look down on roofs and people].*

*Where* takes locative expressions as antecedent; within the relative clause it functions as adjunct of spatial location, goal complement, or complement of a locative preposition. A 'double-variable' representation of [i] is "She wanted to see house *x*; she had grown up in *x*": the "in" component is contributed by *where* together with its spatial location function, with the antecedent determining the value of the variable *x*. In [ii] we understand "to *x*", with the "to" component derivable from the goal function. And in [iii] we have "from *x*", with the "from" component overtly expressed. Analogously for the examples below.

<sup>5</sup> It is interesting to note that a number of usage manuals feel it necessary to point out that relative *whose* can have a non-personal antecedent: there are apparently some speakers who are inclined to think that it is restricted to personal antecedents.

<sup>6</sup> In traditional grammar, all these are classified as adverbs; in the present grammar, we take *why* as an adverb and the others as prepositions: see Ch. 7, §2.4.

### ■ When

- [52] i *It happened at a time; [when; I was living alone].*  
 ii *In those days; [when; he was still a student,] he used to babysit for us.*  
 iii *He left college in 1982; [since when; I've only seen him twice].*

*When* takes a temporal expression as antecedent; it generally functions as an adjunct of temporal location within the relative clause, but it can also appear as complement to a temporal preposition such as *since*.

### ■ While

- [53] i *From 1981 to 1987; [while; his uncle lived with them,] she had a full-time job.*  
 ii *%He wrote most of his poetry during the years; [while; he was in Paris].*

Relative *while* is mostly found in the fused construction, but it can occur in supplementary relative clauses and, for some speakers, in integrated ones. The antecedent denotes a period of time, and *while* can be replaced by *when* or *during/in which (time)*.

### ■ Why

Relative *why* is used in a very narrow range of constructions – integrated relatives with *reason* as antecedent:

- [54] i *That's the main reason; [why; they won't help us].*  
 ii *There was no reason; [why; he should stay at the dance any longer].*  
 iii *I can't see any reason; [why; you shouldn't have a little fun].*

The majority of examples are of the types shown in [i–ii]: either the specifying *be* construction, where it is a matter of identifying reasons, or the existential construction, where we're concerned with the existence of reasons. *Why* alternates with *for which*, as in the attested example *The Physical Training and Recreation Act of 1937 deals with the acquisition of playing fields, which may not be absolutely the reason for which an authority would wish to acquire property*. *For which*, however, is comparatively rare and formal: it could not idiomatically replace *why* in ordinary examples like [54].

### ■ Whence

- [55] i *He sent his son with the papers to another congressman's house; [whence; they were spirited to a governor].*  
 ii *But this means that the Taniyama-Shimura conjecture is true; [whence; it follows that Fermat's Last Theorem is true].*

*Whence* belongs to formal style, serving in its primary sense to express spatial source, as in [i]. The “from” meaning can be incorporated in *whence* or expressed separately by the preposition *from*, which is obligatorily fronted. This use is in general somewhat archaic, though it is still found in journalistic writing. *Whence* is also used for logical source, normally in supplementary relatives, as in [ii]; this is the relative counterpart of the most common use of *hence*.

### ■ Compounds of *where* + preposition

There are a number of prepositions formed from *where* and a preposition: *whereat*, *whereby*, *wherefrom*, *wherein*, *whereof*, *whereon*, *whereto*, *whereupon*, and others. They have non-relative counterparts based on *here* and *there* (*thereat*, *hereby*, etc.). Most are

archaic and rare, though *whereby* and to a lesser extent *wherein* and *whereupon* are still regularly used:

- [56] i *His Lordship might make an order; [whereby; each side would bear its own costs].*  
 ii *Size segregation occurs when a powder is poured into a heap; [whereby; the larger particles run more easily down the slope of the heap].*  
 iii *Try to imagine a market; [wherein; the majority consistently wins what the minority loses].*  
 iv *She told him his essay was incoherent; [whereupon; he tore it up and stormed out of the room].*

In integrated relatives *whereby* is equivalent to *by which*, with *by* having approximately the “means” sense: typical antecedent nouns are *agreement*, *arrangement*, *mechanism*, *method*, *plan*, *proposal*, *scheme*, *service*, *suggestion*, etc. In supplementary relatives it can also occur with a clause as antecedent, as in [ii]. *Wherein* is equivalent to *in which*. *Whereupon* means approximately “immediately after which”; it is found only in supplementary relatives whose antecedent is a clause (or larger).

### 3.5.4 The choice between the *wh* and non-*wh* constructions

In this section we examine the choice between the *wh* and non-*wh* types in non-fused relatives – fused relatives invariably contain a *wh* phrase.

#### (a) *Wh* type required or strongly favoured in supplementary relatives

Supplementary relatives whose antecedent is an AdjP, VP, or clause, not an NP, always have a relative phrase:

- [57] i *She said he was arrogant, [which I don't think he is].* [AdjP]  
 ii *He set out to redeem himself, [which he eventually did].* [VP]  
 iii *He wouldn't let us defend ourselves, [which was completely unfair].* [clause]

Where the antecedent is an NP the *wh* construction is also normally used, but some speakers do allow supplementary *that* relatives, as in the following attested examples:

- [58] i *The patas monkey, [that spends almost all of its time in open grassland,] adopts just such tactics.*  
 ii *His heart, [that had lifted at the sight of Joanna,] had become suddenly heavy at the sight of Ramdez thumping after her.*  
 iii *February, [that in other years held intimations of spring,] this year prolonged the bitter weather.*  
 iv *She had long been accustomed to the solitary nature of her son's instincts, [that I had tried – and failed – to stifle].*

The remainder of this section will be concerned with integrated relatives.

#### (b) Upward percolation applies only in *wh* type

We have noted (§3.2) that upward percolation requires the presence of a relative word, and hence applies only in the *wh* type. With the few exceptions dealt with in (c) below, there are therefore no non-*wh* counterparts to clauses with complex relative phrases, such as:

- [59] i *They won't register companies [whose directors are undischarged bankrupts].*  
 ii *It's a burden [of which they will never be free].*

Where upward percolation is optional, as in [ii], there will be an alternant with a simple relative phrase (*It's a burden [which they will never be free of]*) and if relevant conditions are satisfied this will have a non-*wh* counterpart (*It's a burden [they will never be free of]*).

### (c) Time, reason, place, path, and means

Relatives introduced by *when* or *why* have non-*wh* counterparts, with or without *that*:

- [60] i *I haven't seen them since the day [when/(that) Kim was born].*  
 ii *That's the reason [why/(that) she resigned].*

The notation '*when/(that)*' indicates a choice between *when* and optional *that*, so we have *the day when Kim was born*, *the day that Kim was born*, or *the day Kim was born*. Relatives introduced by *where*, by contrast, do not in general alternate with the non-*wh* type except where the antecedent is a very general noun such as *place*:

- [61] i *This is much better than the hotel [where we stayed last year].*  
 ii *This is much better than the place [where/(<sup>e</sup>that) we stayed last year].*

The <sup>e</sup> annotation in [ii] applies to the version with *that* (<sup>e</sup>*the place that we stayed last year*); the bare relative (*the place we stayed last year*) is more acceptable.<sup>7</sup>

When the antecedent is *way*, in either the path or the means sense, we have non-*wh* relatives or *wh* relatives introduced by preposition + *which*:

- [62] i *Go back the way [(that)/by which you came].*  
 ii *I admired the way [(that)/in which she handled the situation].*

*How* does not belong to the class of relative words (except very marginally in the fused construction, §6.4), so we cannot have *\*the way how she handled the situation*.<sup>8</sup> Note that if *way* is replaced by *manner* the non-*wh* construction is no longer possible: *\*the manner (that) she handled the situation*.

### (d) *That which* and *all who*: obligatory *wh*

- [63] i *That [which we so carefully created] he has wantonly destroyed.*  
 ii *All [who heard her speak] were deeply impressed by her sincerity.*

The very formal *that which* ("what") cannot be replaced by either *that that* or *that*, and when pronominal *all* applies to people *who* is required (cf. *\*all that heard her speak*).

### (e) *Anything, all, etc.*: non-*wh* preferred

- [64] i *Anything [(that) you say] may be used in evidence against you.*  
 ii *All [(that) I ask for] is a little peace and quiet.*

<sup>7</sup>The restriction to *wh* relatives does not apply when *where* is complement to stranded *at*: *the hotel where/(that) we stayed at last year*. *Where . . . at* seems to be a blend between *where* and *which . . . at*; note that with *in* we can have *which* but not *where*: *the hotel which/\*where we stayed in last year*.

<sup>8</sup>Some non-standard dialects differ; hence the line *It ain't what you do, it's the way how you do it* in a rock 'n' roll song.

This case covers the compound determinatives (*anything, everything, nothing, something*) and non-personal fused determiner-heads *all, much, most, few, little, some, any*, etc. There is a preference for the non-*wh* type here, but of varying strength, with *everything which*, for example, significantly better than *'all which*.

(f) **Nominals with superlative modifiers: non-*wh* preferred**

- [65] i *She gave me the best meal [(that) I'd had for many years].*  
 ii *You should take the first appointment [that is available].*  
 iii *That fish is the biggest [(that) I've ever seen].*

There's a very strong preference for the non-*wh* type here, especially in fused-head NPs like [iii]. The non-*wh* type is also preferred, though not so strongly, after *only, next*, and *last*.

(g) **Relativised element is ascriptive predicative complement: normally non-*wh***

- [66] i *He's no longer the trustworthy friend [(that) he was in those days].*  
 ii *The interview turned out not to be the ordeal [(that) I had thought it would be].*

*Which* is virtually impossible here; we saw, however, in [44ii] (*It turned out that he wasn't the person who I'd thought he was*) that the *wh* type is permitted when the complement is specifying rather than ascriptive.

(h) **Personal antecedent**

With personal antecedents, there is a preference for *who* when the relativised element is subject, as in *the boy who threw the dart*, and for the non-*wh* type elsewhere, e.g. *the boy (that) they had found hiding in the cupboard*. The non-*wh* here avoids the choice between formal *whom* and informal *who*. It must be emphasised, however, that we are concerned here only with preferences: a phrase like *the boy that threw the dart* is certainly fully grammatical.

(i) **Complexity**

Increasing the distance between the relative clause and the head noun, notably by adding other post-head modifiers, favours the *wh* type (just as, within the non-*wh* type, it favours *that* over a bare relative). Thus *a material of great tensile strength and very remarkable electroconductive properties which has been widely used in the aviation industry* is preferred over the version with *that* in place of *which*.

### 3.5.5 Non-*wh* relatives: presence or absence of *that*

*That* relatives and bare relatives differ with respect to the presence or absence of the subordinator *that*. In its relative use, as with its use to mark declarative content clauses, *that* can very often be omitted, and in these cases we have alternation between the two types of non-*wh* relative.

■ **Restrictions on omission of *that***

With the rather marginal exception of examples like [61ii] above, there are no constructions where *that* has to be absent: it is normally possible to add *that* to any bare relative to

obtain a grammatical *that* relative. However, the converse does not hold: under certain very limited conditions, the subordinator cannot be omitted from a *that* relative without loss of grammaticality.

### The relativised element is subject

*That* cannot normally be omitted if the relativised element is subject of the relative clause:

- |      |  |  |
|------|--|--|
| [67] | NON-SUBJECT                                  | SUBJECT                                      |
| i    | a. <i>The car [that I took __] was Ed's.</i> | b. <i>The car [that __ hit us] was Ed's.</i> |
| ii   | a. <i>The car [I took __] was Ed's.</i>      | b. <i>*The car [__ hit us] was Ed's.</i>     |

The [a] cases represent the default: *that* can be omitted from [ia] to produce the grammatical [iia]. In this example the relativised element is object, but any other non-subject would similarly allow omission of *that*: *He's not the man (that) he was a few years ago* (predicative complement); *I can't find the book (that) you asked for* (complement of preposition); *He's the one (that) they think was responsible for the first attack* (embedded subject), and so on. In all these cases *that* precedes the subject, but when the subject itself is the relativised element, and hence missing, *that* must be retained, as in [b].

The prohibition on dropping the *that* with relativised subjects is associated with the need to distinguish the subordinate relative clause from the matrix predicate. Since *hit us* in [ib] immediately follows *the car*, there is nothing to stop the listener construing *hit us* as the main clause predicate, with *the car* as its subject: *that* prevents such a misconstrual by explicitly signalling the start of a subordinate clause. This is not to suggest that there would always be a danger of misconstrual if *that* were omitted from clauses with a relativised subject. In *\*We didn't take the number of the car \_\_ hit us*, for example, *the car* is complement of *of* and hence not a possible subject for a predicate *hit us*. The grammatical restriction preventing subject relativisation with bare relatives covers a wider range of cases, but the point is that it includes those where *that* serves a role in aiding perception of the structure.

Some varieties of English do allow *that* to be omitted from clauses with relativised subjects under certain conditions:

- |      |     |   |                     |
|------|-----|---|---------------------|
| [68] | i   | <i>It was my father [__ did most of the talking].</i>         | [ <i>it</i> -cleft] |
|      | ii  | <i>There's someone at the door [__ wants to talk to you].</i> | [existential]       |
|      | iii | <i>Anyone wants this can have it.</i>                         |                     |

Most such cases are clearly non-standard, like [iii]. The status of [i–ii], where the relative clause functions within an *it*-cleft and existential construction respectively, is less certain: they fall at the boundary between very informal and non-standard. Note that the position of the relative clause in [i–ii] is such that it could not be misconstrued as predicate of the matrix clause.

### *That* not omissible when not adjacent to the subject

A second, less important, exception to the optionality of *that* is seen in examples like:

- [69] *I found I needed a file [that only the day before I had sent to be shredded].*

*That* is needed here to mark the beginning of the subordinate clause: without it there would be the potential for the following adjunct to be misconstrued as belonging in the matrix clause. Bare relatives always have the subject in initial position.

### That not omissible in supplementary relatives

We have noted that although supplementary relatives are normally of the *wh* type, examples with *that* are also found, as in [58] above. But it is quite impossible to omit the *that* in such cases (cf. \**She had long been accustomed to the solitary nature of her son's instincts, I had tried – and failed – to stifle*).

#### ■ Factors favouring or disfavouring the omission of *that*

In contexts other than the above, *that* is grammatically optional. It is somewhat more likely to be omitted in informal than formal style, and when the antecedent and the relative clause, or at least its subject, are both short.

In the following, where the antecedent is indicated by underlining, [i–ii] involve a slightly special case where a bare relative is preferred, while the others illustrate the kind of structure where dropping *that* is very strongly disfavoured:

- [70] i *I'll go back the way [I came].*  
 ii *I haven't seen her since the day [Kim was born].*  
 iii *It was with considerable misgivings [that her parents agreed to this proposal].*  
 iv *It was in order to avoid this kind of misunderstanding [that I circulated a draft version of the report].*  
 v *Something has cropped up [that I hadn't expected].*

In [i–ii] the relativised element is respectively a path and time adjunct, and the antecedent is both short and prototypical for that kind of adjunct. Examples [iii–iv] belong to the cleft construction: the relativised element is an adjunct of a type that cannot be relativised in integrated or supplementary relatives and the antecedent, especially in [iv], is a relatively complex expression. In [v] the relative clause is postposed, so that it is not adjacent to its antecedent: *that* is here very strongly favoured, though a bare relative cannot be completely excluded.

### 3.5.6 *That* as a subordinator (not a relative pronoun)

Traditional grammar analyses the *that* which introduces relative clauses as a relative pronoun, comparable to *which* and *who*, but we believe that there is a good case for identifying it with the subordinator *that* which introduces declarative content clauses.

#### (a) Wide range of antecedent types and relativised elements

If *that* were a pronoun, or pro-form, its use would be much wider than that of the uncontroversial relative pronouns, or indeed of any pro-form at all in the language. Compare:

- [71] i *They gave the prize to the girl [that spoke first].* [who]  
 ii *Have you seen the book [that she was reading]?* [which]  
 iii *He was due to leave the day [that she arrived].* [when]  
 iv *He followed her to every town [that she went].* [where]  
 v *That's not the reason [that she resigned].* [why]  
 vi *I was impressed by the way [that she controlled the crowd].* [\*how]  
 vii *It wasn't to you [that I was referring].* [no *wh* form]  
 viii *She seems to be the happiest [that she has ever been].* [no *wh* form]

It would not only cover the ground of all the simple ‘*wh*’ words put together, as shown in [i–v]: it would also appear in a variety of constructions where no ‘*wh*’ word could replace it, as in [vi–viii]. Particularly important here is the cleft construction shown in [vii], and in [70iii–iv] above. Note that, leaving aside the disputed case of the relative construction, there is no pro-form in English that takes as antecedent such complements and adjuncts as *to you* (in the sense it has in [71vii]), *with considerable misgivings*, *in order to avoid this kind of misunderstanding*, and the like. Instead of postulating a pro-form with such an exceptional range of use, we are saying that *that* relatives do not contain any overt pro-form linked to the antecedent: they simply have an anaphoric gap, like bare relatives.

#### (b) Lack of upward percolation

There are no *that* relatives matching *wh* relatives with a complex relative phrase:

- [72] i a. *the woman* [whose turn it was]      b. \**the woman* [that’s turn it was]  
 ii a. *the knife* [with which he cut it]      b. \**the knife* [with that he cut it]

If *that* were a pronoun we would have to stipulate that it has no genitive form, and that it never occurs as complement of a preposition – or rather that when it is complement of a preposition the latter must be stranded, for *the knife that he cut it with* is quite grammatical. The severe restrictions here stand in sharp contrast to the remarkable versatility of the putative pronoun *that* illustrated in (a). In the analysis where *that* is a subordinator the ungrammaticality of [72ib/iib] is predictable. Subordinators do not inflect and must occupy initial position; there is no relative word and hence no possibility of the relative feature percolating upwards into a larger constituent.<sup>9</sup>

#### (c) Finiteness

*That* relatives are always finite, as are the declarative content clauses introduced by *that*. Note, then, that we cannot insert *that* into non-*wh* relative infinitivals like *a knife to cut it with* – cf. \**a knife that to cut it with*. If *that* were a pronoun this would be a special fact needing explanation, but under the subordinator analysis it is exactly what we would expect, given that *that* is a finite clause subordinator.<sup>10</sup>

#### (d) Omissibility

As we have noted, *that* can be regarded as very largely omissible in relative clauses in the same way as in declarative content clauses. The conditions under which omission is prohibited are not the same in the two cases (those for content clauses are given in Ch. 11, §3.1), but in both they have it in common that they are related to the need to mark explicitly the beginning of a subordinate clause under certain structural conditions. And in both cases, moreover, *that* is more readily omitted in simple structures than in complex ones. There is no pro-form in English that is systematically omissible under remotely similar conditions.

<sup>9</sup>There are non-standard regional dialects of English in which *that’s* does occur, as in *the man that’s leg was broken*. We do not believe that such examples necessitate a pronoun analysis for the dialects concerned, and certainly they do not establish this analysis as valid for all dialects.

<sup>10</sup>The force of this argument is diminished by the fact that *which* can’t occur here either: we have *a knife with which to cut it*, not \**a knife which to cut it with*. The absence of \**a knife with that to cut it* is then already covered under point (b). Nevertheless, the analysis of *that* as a finite clause subordinator does provide a very general account of why the only type of bare relative that can’t be expanded by means of *that* should be the infinitival one.

## 4 The distinction between integrated and supplementary relative clauses

These two types of relative clause are illustrated in:

- [1] i a. *They interviewed every student who had lent money to the victim.* [integrated]  
 b. *They interviewed Jill, who had lent money to the victim.* [supplementary]  
 ii a. *The necklace which her mother gave to her is in the safe.* [integrated]  
 b. *The necklace, which her mother gave to her, is in the safe.* [supplementary]

The terms **integrated** and **supplementary** indicate the key difference between them: an integrated relative is tightly integrated into the matrix construction in terms of prosody, syntax, and meaning, whereas a supplementary relative clause is related only loosely to the surrounding structure.

### (a) Prosody and punctuation

A supplementary relative is marked off prosodically from the rest of the sentence by having a separate intonation contour; there is typically a slight pause separating it from what precedes and, if it is non-final in the sentence, from what follows. The pitch contour tends to match that of the one preceding it and containing the antecedent. An integrated relative, on the other hand, is prosodically bound to its antecedent, falling within the same intonation contour.

This prosodic difference is largely reflected in writing by a difference in punctuation. A supplementary relative is characteristically preceded and (if non-final) followed by a comma, or, less often, by a dash, or the clause may be enclosed within parentheses. Conversely, an integrated relative is not separated from its antecedent by a comma or other punctuation mark. In this chapter we consistently mark the distinction in this way, but it must be emphasised that punctuation is elsewhere not a wholly reliable guide: it is by no means uncommon to find clauses that are not marked off punctuationally even though the syntax and/or meaning requires that they be interpreted as supplementary.

### (b) Syntax

An integrated relative clause usually functions as modifier within the structure of an NP. Those in [1ia/ii], for example, are constituents of the NPs *every student who had lent money to the victim* and *the necklace which her mother gave to her*. Note that *every student* and *the necklace* do not themselves constitute NPs in these examples.

The syntactic structure of sentences containing supplementary relatives is less clear: the relative clauses are only loosely incorporated into the sentence. In [1ib/ii] *Jill* and *the necklace* constitute NPs by themselves, but the supplementary relatives do not combine with them to form larger NPs. We suggest in Ch. 15, §5.1, that the antecedent + relative clause here is a special case of a **supplementation** construction, which is distinct from a head + dependent construction. The supplement is in construction with an **anchor** (in this case the antecedent), but does not combine with it to form a syntactic constituent.

### (c) Meaning

The content of an integrated relative is presented as an integral part of the meaning of the clause containing it, whereas the content of a supplementary relative is presented as a

separate unit of information, parenthetical or additional. We will see that there can be a range of reasons why the content of a relative should be presented as integral to the larger message, but our initial examples illustrate two very obvious cases. In [1ia] dropping the relative would drastically change the meaning: I would be saying that they wanted to interview every student, not just those who had lent money to the victim. And [1iia] implicates that there was more than one necklace, so if the relative were dropped it would be unclear which one I was referring to. The supplementary relatives here, by contrast, can be omitted without affecting the meaning of the remainder. Example [1ib] says that they interviewed Jill, and it would still say that if we dropped the relative. Example [1iib] says that the necklace was still in the safe, where I assume the necklace I'm referring to is identifiable in the context, and again the same would hold if the relative were dropped.

#### 4.1 Major syntactic differences

##### (a) Differences with respect to the formal types

[2]	INTEGRATED	SUPPLEMENTARY
i <i>Wh</i> relatives	Yes	Yes
ii <i>That</i> relatives	Yes	Marginal
iii Bare relatives	Yes	No

All three types occur as integrated relatives, whereas only the *wh* type occurs freely in the supplementary construction. Supplementary relatives with *that* are found, as illustrated in [58] of §3, but they are comparatively rare and of questionable acceptability for many speakers.

##### (b) Differences with respect to relative words and phrases

[3]	INTEGRATED	SUPPLEMENTARY
i <i>Which</i> as determiner	No	Yes
ii Upward percolation, Types III–V	No	Yes
iii <i>Whereupon</i>	No	Yes
iv <i>Why</i>	Yes	No

Supplementary relatives allow a wider range of complex relative phrases than integrated ones. Complex relative phrases are those containing more than just the relative word itself: we have described these in terms of the concept of upward percolation (§3.2). Most importantly, phrases containing *which* + head noun (upward percolation Type VII) are found only in supplementary relatives:

- [4] *He spent all breaks either riding racehorses – he won three steeplechases – or skiing, [in which sport he won a European under-18 downhill race].*

Rarer constructions involving upward percolation into an AdjP (*prominent among which*), an infinitival VP (*to refute which*), or a gerund-participial (*passing which*) are likewise limited to supplementary relatives. The same applies to such partitive expressions as *none/most/all/both of which*, etc.: *The new bedrooms, each of which will have its own private bath or shower, are all on the first floor.* Among the simple relative phrases, *whereupon* occurs only in supplementary relatives, *why* only in integrated ones, with *reason* as antecedent (cf. [56iv] and [54] of §3).

## (c) Differences with respect to antecedents

The above differences concern the internal structure of the relative clause; in addition there are differences in their distribution, in the range of antecedents they can have. The most important of these are as follows:

## Clauses

Only supplementary relatives can have a clause as antecedent:

- [5] *He said he'd drafted the report, which I knew to be untrue.* [supplementary]

The antecedent of *which* is the clause *he'd drafted the report*; the relative clause in such cases can only be of the supplementary type, with a separate intonation contour.

## Proper names

These occur readily as antecedent of a supplementary relative; they cannot normally take an integrated relative unless preceded by a determiner:

- [6] i *You should speak to Sue Jones, who was here the whole time.* [supplementary]  
 ii *She is obviously not the Sue Jones they are looking for.* [integrated]

*Sue Jones* forms a full NP in [i], but not in [ii], where it is only a nominal. Example [i] represents the primary use of a proper name – to refer to the bearer of the name; [ii] involves a secondary use, which may be glossed in this example as “person called Sue Jones”.

Quantification with *no*, *any*, *every*

Expressions consisting of *no*, *any*, or *every* morphologically compounded with *-one*, *-body*, or *-thing*, or syntactically combined with a head noun, have non-referential interpretations and cannot serve as antecedent of a supplementary relative, but they can be followed by integrated relatives:

- [7] i *\*No candidate, who scored 40% or more, was ever failed.* [supplementary]  
 ii *No candidate who scored 40% or more was ever failed.* [integrated]

## Superlatives and interrogative prepositions

Integrated relative clauses almost always have nominals as antecedent, but there are other possibilities:

- [8] i *He's now the fattest that he's ever been.*  
 ii *She ran the fastest that she's ever run.*  
 iii *When that wouldn't be too inconvenient for you could we hold the meeting?*  
 iv *Where can we go for lunch that isn't too expensive?*

*That* relatives of a very restricted type are also found in superlative AdjPs or AdvPs, as in [i–ii]. And the interrogative prepositions *when* and *where* – like nominal *time* and *place* – can serve as antecedents for integrated *that* relatives, which occur most readily in postposed position, as in [iv].

## (d) Stacking possible only with integrated relatives

- [9] i *I like those ties you wear that your sister knits for you.*  
 ii *\*They've given the job to Max, who has no qualifications, who starts next month.*

The integrated relative construction is recursive: an integrated relative can combine with its antecedent to form a larger unit which is antecedent for a second integrated relative. In [i], for example, *you wear* combines with its antecedent *ties* to give *ties you wear* and this is then the antecedent for the second relative, *that your sister knits for you*. This kind of recursion is known as **stacking**. It is limited to the integrated construction: antecedent + supplementary relative cannot serve as antecedent for a second supplementary relative, as illustrated in [ii].

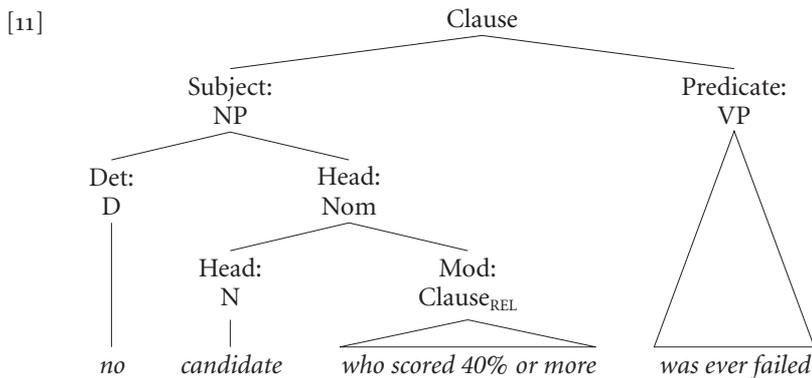

(e) Non-declaratives and question tags found only with supplementary relatives

- [10] i *He said he'd show a few slides towards the end of his talk, at which point please remember to dim the lights.*  
 ii *It may clear up, in which case would you mind hanging the washing out?*  
 iii *She may have her parents with her, in which case where am I going to sleep?*  
 iv *I didn't get much response from Ed, who seemed rather out of sorts, didn't he?*

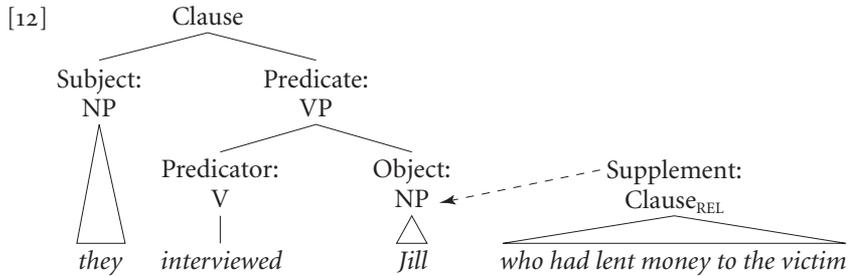

Relative clauses mostly belong to the default declarative clause type, but with supplementary relatives other clause types are possible. Those in [i–iii], for example, are respectively imperative, closed interrogative, and open interrogative. And declaratives can have question tags attached, as in [iv]. These constructions are quite impossible with integrated relatives.

■ Analysis

The antecedents of integrated relatives are sub-phrasal, parts of a phrase. In the great majority of cases, the antecedent of an integrated relative is a nominal, and the relative clause combines with it to form a larger nominal, as in the following structure that we propose for [7ii]:

With supplementary relatives, on the other hand, the antecedents are full phrases, such as NPs, or larger constituents, such as clauses, and the relative clause does not function as a dependent of the antecedent. The structure we propose for [11b] is as follows (and for [11ib] see Ch. 15: [52ii] of §5):

Consider these structures in the light of some of the syntactic differences noted above.

### Non-declaratives

The non-declarative clauses in [10] provide evidence for the view that supplementary relatives are not dependents of a head. Except for the relativisation, the structures are like those found in main clauses, not clauses in dependent function – compare *At that point please remember to dim the lights*; *In that case would you mind hanging the washing out?*; and so on.

### Stacking

The structure proposed for integrated relatives predicts the possibility of stacking. In [9i] *ties* is a nominal which combines with *you wear* to form a larger nominal *ties you wear*, and this in turn combines with *that your sister knits for you* to form the further nominal *ties you wear that your sister knits for you*, which enters into construction with the determiner *those*. In [9ii], however, the supplementary relative *who has no qualifications* does not form a unit with its antecedent, so *Max, who has no qualifications* is not a possible antecedent for the second *who*.

### Quantification with *no*, *any*, *every*

The structure for [7ii] is given as [11]; the antecedent for the integrated relative is *candidate*, not *no candidate* – this is why the relative clause is not interpreted as “No candidate scored 40% or more”.<sup>11</sup> In [7i], with a supplementary relative, the antecedent is *no candidate*, yet this NP has no reference – so there is no referent for the relative pronoun *who*. NPs of this kind can no more serve as antecedent for a relative pronoun than they can for a personal pronoun – compare the incoherence of *#I have no money; it’s on the desk*, if *no money* is taken as antecedent of *it*.

### Proper names

In [6i] the *who* of the supplementary relative has as antecedent the NP *Sue Jones*. This refers to the person of that name, and *who* refers to her too: it is coreferential with its antecedent. In [ii] *Sue Jones* is a nominal, not an NP, and as such does not refer; the integrated relative combines with it to form a larger nominal which is not a proper name and hence (given that it is count singular) it requires a determiner.

### Definite descriptions

Consider, finally, the *necklace* examples in [1ii]. In the supplementary case [iib] (*The necklace, which her mother gave to her, is in the safe*) the antecedent is *the necklace*: this is marked as definite, indicating that the description *necklace* is assumed to be sufficient in the context to identify the referent. In the integrated case [iia], the antecedent is *necklace*; the relative clause combines with this to form the nominal *necklace which her mother gave to her*, and

<sup>11</sup> A more complex case is seen in *Nobody who scored 40% or more was ever failed*. Here there is grammatical fusion of the determiner and the head (see Ch. 5, §9.6), but semantically the negative is again not part of the antecedent.

*the* indicates that this nominal provides an identifying description of the referent. The relative clause thus forms part of the identifying description in the integrated case but not in the supplementary: hence the implicature in the former but not the latter that there is some other necklace from which the one being referred to needs to be distinguished.

## 4.2 Meaning and use

### ■ Supplementary relatives express true or false propositions, integrated ones do not

In describing the semantics of relative clauses, it is useful to consider again our initial examples:

- [13] i *They interviewed every student who had lent money to the victim.* (= [1ia])  
 ii *They interviewed Jill, who had lent money to the victim.* (= [1ib])

In an ordinary use of [13ii] the supplementary relative expresses the proposition that Jill had lent money to the victim, and depending on the circumstances this will be true or false. But the integrated relative clause in [i] does not express a proposition that can be evaluated as true or false – in particular it does not express the proposition that every student had lent money to the victim. We represent the propositional content as “*x* had lent money to the victim”, where ‘*x*’ is a variable, and precisely because it is a variable “*x* had lent money to the victim” is an open proposition, one that is not itself either true or false. An integrated relative is comparable to an ascriptive modifier. Compare, for example, *every generous student* and *every student who had lent money to the victim*: it makes no more sense to ask whether the relative clause is true or false than it does to ask whether *generous* is true or false. This difference between the two types of relative clause correlates with the difference in syntactic structure we have proposed. The antecedent for *who* in [ii] is the full NP *Jill*, a referring expression, whereas the antecedent for *who* in [i] is a nominal, and nominals themselves do not refer.

### ■ Supplementary relatives normally have illocutionary force

We have noted that supplementary relatives select for clause type: they then characteristically have the same illocutionary force as other non-dependent clauses of the same type (cf. Ch. 10). The relative in [13ii], for example, would be used to make a statement, while those in [10i–iii] would be used as directive, indirect directive, and question respectively.

### ■ Supplementary relatives replaceable by clauses with non-relative anaphoric expressions

Supplementary relatives can be replaced by other kinds of supplements containing non-relative anaphoric expression, notably personal pronouns or demonstratives. Compare the following with the supplementary relatives given above:

- [14] i *They interviewed Jill – she had lent money to the victim.* (cf. [1ib])  
 ii *The necklace – her mother gave it to her – is in the safe.* (cf. [1iib])  
 iii *He spent all breaks either riding racehorses – he won three steeplechases – or skiing (in this sport he won a European under-18 downhill race).* (cf. [4])  
 iv *He said he'd drafted the report; I knew this to be untrue.* (cf. [5])

Note similarly that the deviance of [7i] is matched by that of \**No candidate – he or she scored 40% or more – was ever failed.*

### ■ The continuative use of supplementary relatives

- [15] i *I gave it to John, who passed it on to Mary, and she gave it back to me.*  
 ii *They come to a cliff, where the deer suddenly stops and throws off the little boy, and boy and dog then fall into a pond.*

These examples illustrate a use of juxtaposed supplementary relatives in narrative contexts that is traditionally referred to as **continuative**: they serve to continue, to develop, the narrative. The effect is like that of *and* + non-relative anaphoric expression: *I gave it to John and he passed it on to Mary, . . .* Whereas elsewhere the information conveyed in a supplementary relative is somewhat backgrounded relative to that conveyed in the clause containing the anchor, the continuative relative has equality of informational status, presenting a further event in a narrative chain.

### ■ Content of integrated relative an essential component of matrix message

Integrated relatives have it in common that their content is presented as an integral part of the meaning of the clauses containing them. The prototypical integrated relative expresses a distinguishing property, as in:

- [16] i *They only take in overseas students who they think have lots of money.*  
 ii *She was offended by the letter that accused her of racism.*

In [i] the relative clause distinguishes a subset of overseas students: the people referred to by *they* do not take in all overseas students, but only those from the subset they believe to have lots of money. In [ii] the relative distinguishes the letter she was offended by from other letters: it serves to identify which letter she was offended by. In cases like these, we find a very sharp contrast between the integrated and supplementary constructions. The supplementary counterparts of the above are:

- [17] i *They only take in overseas students, who they think have lots of money.*  
 ii *She was offended by the letter, which accused her of racism.*

This time the relative clause in [i] does not pick out a subset of overseas students, but makes an assertion about overseas students in general. Similarly the supplementary relative in [ii] does not serve to distinguish the letter from other letters, but provides additional information about a letter assumed to be identifiable simply by the description *letter*.

Contrasts like these provide the basis for the traditional classification of relative clauses as ‘restrictive’ ([16]) and ‘non-restrictive’ ([17]). We prefer to distinguish the two classes as integrated vs supplementary because there are many places where the contrast is not a matter of whether or not the relative clause expresses a distinguishing property.<sup>12</sup>

Consider first the following attested example (from a novel) involving a definite NP:

- [18] *The father who had planned my life to the point of my unsought arrival in Brighton took it for granted that in the last three weeks of his legal guardianship I would still act as he directed.*

<sup>12</sup>A term quite widely used instead of ‘non-restrictive’ is ‘appositive’. We find the latter term unsatisfactory because the integrated vs supplementary contrast applies to apposition as well as to relative clauses. Compare, for example, *my brother the heart surgeon* (integrated) and *my brother, the heart surgeon* (supplementary).

The narrator is three weeks short of eighteen and is saying that his father took it for granted that during those three weeks he would continue to do as his father directed. The relative clause here belongs to our integrated class: it cannot be omitted or spoken on a separate intonation contour and allows *that* as an alternant of *who* (albeit somewhat less favoured). Yet it does not serve to distinguish this father from other fathers of the narrator: he has only one father. The reason for presenting the content of the relative clause as an integral part of the message is not, therefore, that it expresses a distinguishing property but that it explains why the father took it for granted that the son would do as he was told.

Compare similarly:

- [19] i *He sounded like the clergyman he was.*  
 ii *She had two sons she could rely on for help, and hence was not unduly worried.*

Both underlined clauses are bare relatives and hence necessarily integrated. But we do not understand *he was* in [i] as distinguishing one clergyman from another: it conveys that he was a clergyman, and an obvious reason for presenting this as an integral part of the message is that sounding like a clergyman when you are one is significantly different from sounding like a clergyman when you are not. In [ii] it could be that she had more than two sons (in which case the relative would be serving a distinguishing role), but an at least equally likely context is one where she had only two sons. In this context the property expressed in the relative clause does not distinguish these sons from other sons she has, but is an essential part of the reason for her not being unduly worried.

The relative clause in [19ii] is embedded within an indefinite NP, and here it is very often the case that the crucial factor differentiating the integrated and supplementary constructions has to do with what we are calling information packaging rather than with whether the relative restricts the denotation of the antecedent. Consider:

- [20] i *She had two sons(,) who were studying law at university(,) and a daughter(,) who was still at high school.*  
 ii *A: Have you been to Paris? B: Yes, often: I have a brother who lives there.*  
 iii *I've been talking to one of the porters, who says the train may be an hour late.*

Example [i] could be spoken/punctuated equally readily with integrated or supplementary relatives in a context where she has just two sons and one daughter. On the supplementary reading the primary information being imparted is that she had two sons and a daughter: the information given in the relative clauses is supplementary, secondary. On the integrated reading, by contrast, the content of the relatives is part of the main information. In [ii] a supplementary reading would be incoherent even if B has only one brother. It would involve presenting “I have a brother” as the primary message, whereas it has in fact no relevance by itself in the context of A’s question: the crucial point is that the brother lives in Paris, since this explains B’s having frequently been there. Example [iii] has a supplementary relative, dividing the message into two separate pieces of information. But if we replace *one of the porters* by, say, *a guy* it would be much more natural to have the relative integrated. This is because “I’ve been talking to a guy” is less likely to be considered worth presenting as a self-contained piece of information: the crucial information will be that concerning the train’s delay.

### 4.3 Linear position

The normal position for a relative clause is immediately after the antecedent. Since integrated relatives have sub-phrasal antecedents whereas supplementary ones have phrasal antecedents, we find the sequence integrated + supplementary, but not the reverse:

- [21] i *The contestant who won first prize, who is the judge's brother, sang dreadfully.*  
 ii *\*The contestant, who is the judge's brother, who won first prize sang dreadfully.*

The antecedent for the *who* of the integrated *who won first prize* is a nominal (*contestant*), while that for the *who* of the supplementary *who is the judge's brother* is an NP (*the contestant who won first prize*).

#### ■ Postposing of relative clause

It is also possible, however, for the relative clause to occur in postposed position, at the end of the clause containing its antecedent.

- [22] i *A stranger came into the room who looked just like Uncle Oswald.*  
 ii *Kim lent a book to Ed which contained all the information he needed.*  
 iii *I met a man the other day who says he knows you.*  
 iv *There was a fight reported in Monday's paper that put three people in hospital.*

This construction is most likely when the informational content of the relative clause is greater than that of the material that would follow it in the matrix clause if it occupied the default position following the antecedent.<sup>13</sup> It will generally be avoided if it would result in possible confusion as to what was the intended antecedent. Compare [i], for example, with *A man was talking to one of the check-out operators who looked just like Uncle Oswald*, where *one of the check-out operators* provides a more salient antecedent than *man*. And *She put a hat on her head that had corks hanging from it* too strongly evokes the picture of the head having corks hanging from it to be used with *hat* as intended antecedent.

Postposed relative clauses are predominantly of the integrated type. For example, [22i] becomes quite unacceptable if we replace *a stranger* by a proper name, which would require the relative to be supplementary: *\*John came into the room, who looked just like Uncle Oswald*. Nevertheless, postposed supplementary relatives do sometimes occur:

- [23] i *Only the flower is used, which is not poisonous and is attached to the plant with a very fine stem.*  
 ii *She could hear her father in the next room, who was angrily complaining about the horrific telephone bill.*

#### ■ Preposing

A supplementary relative with a coordinated clause as antecedent can precede it, following the coordinator:

- [24] *The Net will open up opportunities to exploit tax differences and – which makes it even more of a headache than globalisation – it will make it possible to dodge taxes altogether.*

<sup>13</sup>There is one case where only the postposed position is possible – the case where we have 'split antecedents' (Ch. 17, §1.3): *There's a boy in Group B and a girl in Group E who have asked to be on the same team.*

## 5 Infinitival relative clauses

Integrated relatives may have infinitival form, with or without a relative phrase.

### ■ Wh type infinitivals

The most obvious kind of infinitival relative clause is illustrated in:

- [1] i *I'm looking for an essay question with which to challenge the brighter students.*  
 ii *She is the ideal person in whom to confide.*  
 iii *The best place from which to set out on the journey is Aberdeen.*

This construction is limited to somewhat formal style. It is found only with integrated relatives, and is subject to the following severe structural restrictions:

- [2] i The relative phrase must consist of preposition + NP.  
 ii There can be no expressed subject.

The first restriction excludes examples like *\*She's the ideal person whom to invite* and *\*I'm looking for an essay question which to challenge the brighter students with* (where the preposition is stranded rather than being part of the relative phrase). Condition [ii] rules out *\*She's the ideal person in whom for you to confide*, and the like. There is no evident explanation for the first restriction, but the second is predictable from the properties of *wh* relative clauses and infinitivals taken together: infinitivals allow subjects only when introduced by the subordinator *for*, but this cannot occur in *wh* relatives since both it and the relative phrase require to be in initial position.

### ■ Non-wh infinitivals

Infinitival relatives without a relative phrase allow a considerably wider range of structures:

- [3] i *She's the ideal person [(for you)to confide in \_\_\_\_].*  
 ii *I've found something interesting [(for us)to read \_\_\_\_].*  
 iii *A systems analyst wouldn't be such a bad thing [(for her)to be \_\_\_\_].*  
 iv *That is not a very good way [(for him) to begin \_\_\_\_].*  
 v *You're not the first person [\_\_\_\_ to notice the mistake].*

The relativised elements here are respectively complement of a stranded preposition, direct object, predicative complement, manner adjunct, and subject. Except in the latter case a subject can be optionally included, preceded by the subordinator *for*.

Where the relative clause is within an NP functioning as object or complement of a preposition, there is overlap with an infinitival adjunct of purpose. Compare:

- [4] i *He found a video [for the kids to watch].* [relative]  
 ii *He got it [for the kids to watch].* [purpose adjunct]  
 iii *He got a video [for the kids to watch].* [ambiguous]

In [i] the infinitival is a relative with a meaning close to that of the finite relative *that the kids could watch*. A relative interpretation of this kind is excluded in [ii] because it does not permit modification by a relative clause (cf. *\*He got it that the kids could watch*); [ii] has, rather, a purposive interpretation: "He got it in order that the kids could watch it". This interpretation is not possible in [i] because finding is non-agentive and therefore does not allow purpose adjuncts. In [iii] the conditions for both constructions are met;

it can be construed in either way, though there is little effective difference in meaning between them.

### ■ Modal meaning

Infinitival relatives characteristically have a modal meaning comparable to that expressed in finites by *can* or *should*. *Here's something interesting for you to read*, for example, is comparable to *Here's something interesting that you can/should read*. This modal meaning is indeed what makes relatives like those in [4] semantically so close to purpose infinitivals. Where the matrix NP is definite there is very often some explicit or implicit evaluative modification, such as *ideal* in [1ii] or *best* in [1iii].

Infinitivals where the relativised element is subject have a somewhat wider range of interpretations than others, allowing non-modal as well as modal meanings:

- [5] i *She's obviously the person to finish the job.* [modal]  
 ii *She was the first person to finish the job.* [non-modal]

Example [i] is like the non-subject examples considered above: we understand “best, most appropriate” and “should” (“the person who should finish the job”). But [ii] has no such modal meaning, being equivalent simply to *the first person who finished the job*. Nominals containing relatives with this kind of interpretation usually contain a modifier such as *only*, *next*, *last*, or one of the ordinals *first*, *second*, etc.

## 6 The fused relative construction

### ■ Classification

An initial illustration of the range of constructions belonging to the fused relative category is given in [1]:

- |     |  |   |        |
|-----|--|---|--------|
| [1] | SIMPLE SERIES                                    | ·EVER SERIES                                      |        |
|     | i a. <i>I spent <u>what he gave me</u>.</i>      | b. <i>I spent <u>whatever he gave me</u>.</i>     | } [NP] |
|     | ii a. <i>I gave him <u>what money I had</u>.</i> | b. <i>I gave him <u>whatever money I had</u>.</i> |        |
|     | iii a. <i>I'll go <u>where you go</u>.</i>       | b. <i>I'll go <u>wherever you go</u>.</i>         | } [PP] |

On one dimension we have a contrast between the simple series and the *·ever* series, the latter being marked by a relative word ending in *·ever*. Cutting across this is the major category contrast: the fused relatives are NPs in [i–ii], PPs in [iii]. And within the NP category we have a further distinction according as the relative word is a pronoun, as in [i], or a determinative, as in [ii].

### 6.1 Fused relatives as phrases, not clauses

Traditionally, fused relatives are analysed as clauses, but the view taken here is that they are NPs or PPs. Let us focus on the NP case, examining the evidence for treating examples like the fused relatives in [1i–ii] as NPs. The starting-point is the equivalence between pairs like the one given as [6] of §2:

- [2] i *It would mean abandoning that which we hold most dear.* [antecedent + clause]  
 ii *It would mean abandoning what we hold most dear.* [fused relative]

The fused relative is equivalent not to the relative clause *which we hold most dear* but to the NP containing it, *that which we hold most dear*. Compare similarly:

- [3] i *The dog quickly ate the scraps that I'd left on my plate.*  
 ii *The dog quickly ate what I had left on my plate.*

These are not of course fully equivalent since [i] contains the lexical item *scraps*, but in [ii], no less than in [i], the object of *ate* denotes something concrete, a physical entity. Clauses, by contrast, denote abstract entities: propositions, events, and so on. These points demonstrate the semantic likeness between the fused relatives and NPs, but there is also strong syntactic evidence for analysing these constructions as NPs.

#### (a) Subject–verb agreement

- [4] a. *What money she has is in the bank.* b. *What books she has are in the attic.*

The verbs here agree with the fused relatives in subject position. The crucial point is that the *are* in [b] shows that *what books she has* is plural, like the uncontroversial NP *all the books she has*. Clauses functioning as subject, by contrast, always belong to the default 3rd person singular category: *That she has so few books is rather surprising*.

#### (b) Subject–auxiliary inversion

- [5] a. *What she suggests is unreasonable.* b. *Is what she suggests unreasonable?*

Fused relatives can occur in interrogative and other constructions with subject–auxiliary inversion. Again this differentiates them from clauses: compare *That she proposes to go alone is unreasonable* and *\*Is that she proposes to go alone unreasonable?*

#### (c) No extraposition

- [6] a. *What she suggests is unreasonable.* b. *\*It is unreasonable what she suggests.*

Like ordinary NPs, fused relatives do not occur in the extraposition construction. Here too they differ from clauses: compare *That we should have to do it ourselves is unreasonable* and *It is unreasonable that we should have to do it ourselves.*

#### (d) No fronting of preposition

- |     |  |   |
|-----|--|---|
| [7] | FUSED RELATIVE                                   | INTEGRATED RELATIVE                                       |
| i   | a. <i><u>What she referred to</u> was Riga.</i>  | b. <i>The city <u>which she referred to</u> was Riga.</i> |
| ii  | a. <i>*<u>To what she referred</u> was Riga.</i> | b. <i>The city <u>to which she referred</u> was Riga.</i> |

When the relativised element is complement of a preposition the fused construction requires that the preposition be stranded, as in [ia]: it cannot be fronted along with its complement, as it can in the integrated relative construction [iib]. The difference in grammaticality here reflects the fact that *which she referred to* is a clause while *what she referred to* is an NP. Fronting the preposition in the integrated construction places it at the beginning of the clause, while fronting it in the fused construction places it before the NP. The deviance of [iia] is thus comparable to that of *\*To the city which she referred was Riga*. In the integrated case the antecedent *city* and the relative pronoun *which* are distinct and the preposition can come between them, but in the fused case the antecedent and relative pronoun are not distinct and hence there is no place for a fronted preposition to occupy.

## (e) Functional range of NPs

Fused relatives occur with the functions that ordinary NPs take:

- [8] i *What he said* was outrageous. [subject]  
 ii They criticise *whatever I do*. [direct object]  
 iii We'll give *whoever needs it* a second chance. [indirect object]  
 iv Things aren't always *what they seem to be*. [subjective predicative comp]  
 v She made him *what he is*. [objective predicative comp]  
 vi I was ashamed of *what I had done*. [comp of prep]

And, most distinctively, they cannot occur as complement of a noun or adjective (except with exceptional adjectives such as *worth* that take NP complements: see Ch. 7, §2.2). Compare, for example:

- [9] i I'm sorry *that you were inconvenienced*. [clause]  
 ii \*I'm sorry *the inconvenience / what I did*. [NP]

*Sorry* can take a clause as complement, but not an NP: an NP can occur only as an oblique complement, related by a preposition, as in *I'm sorry for the inconvenience / for what I did*.

## (f) Occurrence with integrated relative

- [10] i *Whatever they gave him* that he didn't need he passed on to me. [integrated]  
 ii He told me he had done it himself, *which was quite untrue*. [supplementary]

*That he didn't need* is an integrated relative with the nominal *whatever they gave him* as antecedent: it is part of the NP functioning as object of *passed*. As we have already noted, clauses can only be antecedent for supplementary relatives. This is seen in [ii], where the antecedent for *which* is *he had done it himself*, and where the relative clause has to be supplementary. The crucial point, then, is that a fused relative, like ordinary nominal expressions but unlike a clause, can take an integrated relative as modifier.

## 6.2 Fused relatives contrasted with open interrogatives

There is a considerable degree of overlap between fused relatives and subordinate open interrogative clauses. Compare, for example:

- [11] i I really liked *what she wrote*. [fused relative]  
 ii I can't help wondering *what she wrote*. [open interrogative]  
 iii *What she wrote* is completely unclear. [ambiguous]

In [i] the complement of *liked* is an NP approximately equivalent to one with an antecedent nominal + integrated relative clause, such as *the material which she wrote*. In [ii] *what she wrote* expresses an embedded question: it is the subordinate counterpart of *What did she write?* An approximate paraphrase is "I can't help asking myself the question 'What did she write?'". But [iii] can be interpreted in either way. With a fused relative as subject, the meaning is "The material she wrote is completely unclear" (she failed to write clearly); with a subordinate interrogative as subject, [iii] means "The answer to the question 'What did she write?' is completely unclear" (e.g. it is unclear which parts of some book, article, or whatever were written by her). There is no ambiguity in [i] because *like* cannot take an interrogative clause as complement, while [ii] is unambiguous because *wonder* cannot (with irrelevant exceptions) take an NP as complement.

Open interrogatives, whether main clauses (e.g. *What did she write?*) or subordinate (*what she wrote*) normally express what we have called variable questions (Ch. 10, §4.5). The propositional content of such questions contains a variable (“She wrote  $x$ ”), and the answers specify values of the variable (*She wrote the preface; She wrote a textbook on phonetics*, etc.). We have also analysed integrated relatives as containing variables, but here the variable is anaphorically bound to an antecedent. In the earlier *no candidate who scored 40% or more*, for example, we have an analysis along the lines of “no candidate  $x$  [ $x$  scored 40% or more]”, i.e. “no candidate  $x$  such that  $x$  scored 40% or more”. In the case of fused relatives the antecedent and pronoun are not syntactically discrete, but we still have linked occurrences of the variable in the interpretation, e.g. for [11i] “I liked the  $x$  such that she wrote  $x$ ”. Both relative and interrogative thus contain the “she wrote  $x$ ” component: in the relative case, the variable is bound to an antecedent, whereas in the interrogative case the value of the variable is to be given in the answer to the question.

Consider the following further examples in the light of this account:

- [12] i *The dogs wouldn't eat what she gave them.* [fused relative]  
 ii *I told him what she gave them.* [open interrogative]  
 iii *I told him what she suggested I tell him.* [ambiguous]

Again, the fused relative is roughly equivalent to an NP containing antecedent + integrated relative, e.g. *the food which she gave them*, so we might analyse [i] as “The dogs wouldn't eat the  $x$  such that she gave them  $x$ ”. There is again no ambiguity here because *eat* cannot take clausal complements. Example [ii] can be glossed as “I told him the answer to the question ‘What did she give them?’” – i.e. “I told him the value of the variable in ‘She gave them  $x$ ’”.

*Tell* can take NP complements, as in *I told him the news*, but the things you can tell are distinct from the things you can give, so there is no fused relative interpretation “#I told him the  $x$  such that she gave them  $x$ ”. However, if we change the example to remove this incompatibility, we can get an ambiguity with *tell*, as in [12iii]. The interrogative interpretation matches that for [ii]: “I told him the answer to the question ‘What did she suggest I tell him?’” – i.e. “I told him the value of the variable in ‘She suggested I tell him  $x$ ’”. And the fused relative interpretation is “I told him the  $x$  such that she suggested I tell him  $x$ ”.

The difference can be brought out by imagining the case where she suggested I tell him that his offer would have to be raised. In this scenario the interrogative interpretation of [12iii] is equivalent to *I told him that she suggested I tell him that his offer would have to be raised* (and I thereby implicitly distance myself from this evaluation of his offer), while the fused relative interpretation is equivalent to *I told him that his offer would have to be raised* (i.e. the value of  $x$  in “I told him the  $x$  such that she suggested I tell him  $x$ ” is “his offer would have to be raised”).

We have focused above on the semantic difference between the constructions. We now turn to the syntactic differences.

#### (a) NP vs clause

We have shown that fused relatives (other than the prepositional ones introduced by *where*, *when*, etc.) are NPs; interrogatives, however, are not: they are clauses. The points made in §6.1 above concerning agreement, subject–auxiliary inversion and extraposition, preposition fronting, and adjective complementation can therefore be applied to the

distinction between fused relatives and interrogatives:

- |           |  |                  |
|-----------|--|------------------|
| [13] i a. | <i>What ideas he has to offer are likely to be half-baked.</i>             | [fused relative] |
|           | b. <i>What ideas he has to offer remains to be seen.</i>                   | [interrogative]  |
| ii a.     | <i>Is what she wrote unclear?</i>  | [fused relative] |
|           | b. <i>It is unclear what she wrote.</i>                                    | [interrogative]  |
| iii a.    | <i>What he's referring to / *To what he's referring is Riga.</i>           | [fused relative] |
|           | b. <i>I can't imagine what he's referring to / to what he's referring.</i> | [interrogative]  |
| iv        | <i>He's not sure what he should say.</i>                                   | [interrogative]  |

The subject of [ia] is plural and must therefore be an NP: the corresponding clause in [ib] belongs to the default 3rd person singular category. In [ii] we have subject–auxiliary inversion in [a], so *what she wrote* must be an NP, and in [b] we have extraposition, so here *what she wrote* must be a clause. Note that both examples lack the ambiguity of *What she wrote is completely unclear* ([11iii]). In [13iii] the possibility of fronting the preposition in [b] shows that the complement of *imagine* is a clause, not an NP.<sup>14</sup> And the complement of the adjective *sure* in [13iv] can only be interrogative, matching the interpretation “He is not sure about the answer to the question ‘What should he say?’”.

### (b) Differences in unbounded dependency words

*Who, whom, whose, which, why, and how* are found in fused relatives only under very restrictive conditions (described below), but they occur freely in interrogatives. The contrast between fused relatives and interrogatives is quite clear:

- |           |                                     |   |                   |
|-----------|-------------------------------------|---|-------------------|
| [14] i a. | <i>I agree with what she wrote.</i> | b. <i>*I agree with who spoke last.</i> | } [relative]      |
| ii a.     | <i>I accepted what he offered.</i>  | b. <i>*I accepted which he offered.</i> |                   |
| iii a.    | <i>I wonder what she wrote.</i>     | b. <i>I wonder who spoke last.</i>      | } [interrogative] |
| iv a.     | <i>I know what he offered.</i>      | b. <i>I know which he offered.</i>      |                   |

Conversely the *-ever* series of forms occur freely in fused relatives, but they are generally not permitted in interrogatives:<sup>15</sup>

- |           |   |                   |
|-----------|---|-------------------|
| [15] i a. | <i>He accepted what/whatever she offered.</i>                     | } [relative]      |
|           | b. <i>He planted roses where/wherever there was enough space.</i> |                   |
| ii a.     | <i>He didn't tell me what/*whatever she offered.</i>              | } [interrogative] |
|           | b. <i>He went to see where/*wherever there was enough space.</i>  |                   |

### (c) Elliptical reduction

Open interrogatives (whether main or subordinate) can be reduced to an interrogative phrase if the rest of the clause is recoverable anaphorically, but such reduction is quite impossible with fused relatives, just as it is with non-fused ones. Compare:

<sup>14</sup>This last point is of only limited value as a distinguishing test because the stranded preposition construction is often strongly preferred or else the only option even in the subordinate interrogative construction (cf. Ch. 7, §4.1), as in *I can't imagine what he's getting at / \*at what he's getting*.

<sup>15</sup>We ignore here cases where *ever* (often written as a separate word) has a quite different sense, like that of *on earth*: *I can't imagine what ever he was thinking about*. There is, however, one type of interrogative where the *-ever* forms are found, namely interrogatives functioning as exhaustive conditional adjuncts, as in *He won't be satisfied, whatever you give him*. This construction is discussed (and contrasted with the fused relative) in Ch. 11, §5.3.6.

- [16] i a. A: *Jill gave him something last night.* B: *What?* } [interrogative]  
 b. *Jill gave him something last night, but I don't know what.* }  
 ii a. *\*Jill gave him something last night, but he lost what.* [fused relative]  
 b. *\*Jill gave him a book last night, but he lost the book which.* [integrated relative]

In [ia] *what* is equivalent to interrogative *What did she give him?*, while [iia] shows that relative *what she gave him* cannot similarly be reduced to *what*. Analogously in [ib/iib].

#### (d) Infinitivals restricted to the interrogative construction

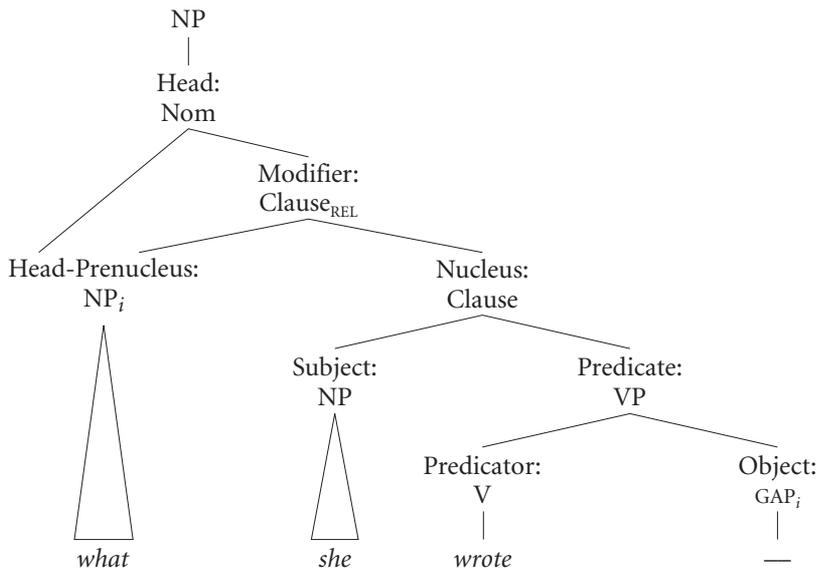

A further difference between open interrogatives and fused relatives is that only the former can be infinitival in form: *I wonder what to buy*, but not, say, *\*I can't afford what to buy* ("I can't afford that which I should buy").

## 6.3 Syntactic analysis

The analysis of NP structure given in Ch. 5 allows for the head to fuse with an adjacent dependent, i.e. for the two functions to be realised jointly. In *Many would agree with you*, for example, the determinative *many* jointly realises the determiner and head functions. As implied by the term, we invoke the same concept of functional fusion in our analysis of fused relatives. This time the head of an NP fuses with the relativised element in a relative clause.

As an example, take *what she wrote* as in [11i] above, *I really liked what she wrote*. We have demonstrated that the fused relative is an NP, and we take *what* to realise simultaneously the head of that NP and the prenuclear element in the relative clause:

[17]

#### ■ Case

The pronoun *what* in [17] is simultaneously head of the whole NP and object (in prenuclear position) in the relative clause. In constructions with personal *who* and *whoever*, the pronoun has to satisfy the case requirements of both the relative clause and

the matrix clause in which the whole NP is functioning. Compare:

- [18] i [*Whoever is responsible for the damage*] *must pay for it.*  
 ii *He will criticise* [*whomever she brings home*].  
 iii <sup>?</sup>*[Whomever he marries] will have to be very tolerant.*  
 iv <sup>?</sup>*She lunches with* [*whomever is going her way after morning classes*].

In [i] both the whole NP (bracketed) and the relativised element (underlined) are subject of their respective clauses: the nominative form matches both requirements. In [ii] both the whole NP and the relativised element are objects, and accusative is fully acceptable though somewhat formal in style. In [iii–iv], however, there is a clash between the function of the whole NP and that of the relativised element – respectively subject and object in [iii], object of a preposition and subject in [iv] – and the result is at best very questionable. *Whoever* would be preferable in both, but many would regard it as less than fully acceptable in formal style.

## 6.4 Relative words in the fused construction

The relative words used in the fused construction are as follows:<sup>16</sup>

- [19] i SIMPLE **who** *what* *which* *where* *when* *how* *while*  
 ii COMPLEX **whoever** *whatever* *whichever* *wherever* *whenever* *however*

**Who** and **whoever** have distinct nominative and accusative forms, illustrated for **whoever** in [18i–ii]; for the genitive of **whoever** see footnote 17.

The properties that distinguish **who**, *what*, and *which* in fused relatives are the same as in interrogatives, so that the system is significantly different from that found in non-fused relatives:

[20]	FUSED RELATIVES OF OPEN INTERROGATIVES	NON-FUSED RELATIVES
i PRONOUNS		
<b>who</b>	personal	personal
<i>what</i>	non-personal	—
<i>which</i>	—	non-personal
ii DETERMINATIVES		
<i>what</i>	non-selective	—
<i>which</i>	selective	(non-selective)

The gender contrast of personal vs non-personal is thus realised by **who** vs *what*, not **who** vs *which*, as in non-fused relatives. And *which* in fused relatives, as in interrogatives, is a determinative, contrasting with *what* as selective vs non-selective. In non-fused relatives determinative *which* is non-contrastively non-selective (and found only in the supplementary type). The same properties apply to the *-ever* forms, as illustrated in:

- [21] i [*Whoever finishes first*] *will win a prize.* [personal]  
 ii [*Whatever you can let us have*] *will be very much appreciated.* [non-personal]  
 iii *I'll use* [*whichever edition I can get hold of*]. [selective]  
 iv *He appears to have lost* [*whatever interest he ever had in it*]. [non-selective]

<sup>16</sup>There are also archaic variants of the *-ever* series with *-so*: *whosoever*, *whatsoever*, etc.

In [iii] it is a matter of selecting one edition from an identifiable set of editions, whereas there is no such feature in [iv]. Fused *which(ever)*, although a determinative, not a pronoun, can function as fused determiner-head, as in:

- [22] *[Whichever of these two finished ahead of the other] would be the undisputed financial leader of the tour.*

Three of the simple items, *who*, *which*, *how*, are virtually restricted to the particular use of the fused relative that we call the **free choice** construction; we will look at this first, and then turn to other uses, taking the *-ever* and simple forms separately.

#### ■ The free choice construction (*You can do whatever/what you want*)

- [23] i *Invite [whoever/whomever/who/whom you like].*  
 ii *Liz can go [wherever/where she wants].*

In fused relatives like these the referent of the (overt or understood) subject of the matrix clause is given the freedom to choose: in [i] it is for you to decide who you invite, and in [ii] it is for Liz to choose where she goes. We have used ‘free choice’ to label one sense of *any*, and constructions with *any* + integrated relative are very close in meaning to the above: compare *Invite anyone you like* and *Liz can go anywhere she wants* (but see Ch. 5, §7.14, n. 32, for a slight difference).

There is no detectable difference in meaning between the *-ever* and simple forms in this construction, and since *who*, *which*, and *how* can hardly occur in other kinds of fused relative, it is plausible to see the *-ever* as here omissible by virtue of being redundant: the “any whatever” meaning is entailed by the free choice and does not have to be explicitly expressed in the relative word. The verb in this construction belongs to a small class consisting primarily of *choose*, *like*, *please*, *want*, *wish*, and is interpreted as if it had a clausal complement – e.g. for [ii] “She can go wherever she wants to go”. Note, then, that *Sack who you like* does not mean “Sack the persons that you like”, but “Sack whoever you care to sack”. However, the distinctive syntactic property of the construction – that of allowing certain simple forms which do not normally occur in fused relatives – is generally restricted to the case where the clausal complement is merely implicit, so that we have *Invite who you want*, but hardly *Invite who you want to invite*. Moreover, *please* does not in fact license clausal complements: *Go where you please*, but not, in Present-day English, *\*He pleased to go to Paris*. And with *like* the meaning differs aspectually from that of a construction with an infinitival complement. *I like to take the biggest portion*, for example, implies repeated taking (cf. Ch. 14, §5.6.1), whereas *Take which you like* does not. There are also constraints on the matrix clause. For example, the fused relative must follow the matrix verb: *I’ll invite who you like* but not *\*Who you like I’ll invite*.<sup>17</sup>

<sup>17</sup>The genitive forms *whosever* and (informal) *whoever’s* are possible but rare in the free choice construction. Thus *Take whosever/whoever’s you like* could serve as a response to the question *Whose bicycle shall I take?* The genitives are not admissible outside the free choice construction – cf. *\*They want to question whosever/whoever’s dog was barking throughout the night* or *\*Whosever/Whoever’s car is blocking my driveway must move it immediately*. The close grammatical association between the genitive determiner and the following head noun seems to suggest the anomalous meanings where it is the dog they want to question and the car that must move itself.

### ■ Further uses of the *-ever* forms

- [24] i [*Whoever* told you that] can't have read the report carefully.  
 ii I'll accept [*whatever* price you suggest].  
 iii I'll go [*wherever* they tell me to go].  
 iv [*Whenever* I see her,] she's reading.

The *-ever* marks a phrase as non-referential: there is no reference to any particular person, price, place, or time in these examples. Such forms are found in several of the different kinds of non-referential phrases discussed in Ch. 5, §8.3. The bracketed phrase in [i] is a descriptive NP: we understand “the person *x* satisfying the description ‘*x* told you that’”, with the implicature that I don't know who it was. The interpretations in [ii–iii] are non-specific: we are concerned with future acts of suggesting a price and telling me where to go. And in [iv] we have a multiple-situation-bound interpretation: it is a matter of a series of situations such that I see her at time *x* and she is reading at time *x*. The free choice construction shown in [23] is a special case of non-specificity, and the close paraphrase with *any* extends to the non-specifics in [24ii–iii]: cf. *any price you suggest; anywhere they tell me to go*. Often (as also with *any*) there is an implicature of “every, all”: *I'll do whatever I can to help you*. This “every” interpretation is more clearly associated with the multiple-situation-bound case: [24iv] can be glossed as “Every time I see her, she's reading”.

### Use in coordination and supplementation

The *-ever* series of fused relatives appear in the expected range of functions of NPs and temporal or locative PPs: subject in [24i], object in [24ii], and so on. Two common uses worth drawing attention to are as the final element in a coordination, or in a supplement:

- [25] i *The central computer will simulate rape scenes or high-speed motor chases or [whatever stimulates their proletarian fancies].*  
 ii *There's always something different to do or eat or [whatever it happens to be].*  
 iii *They put on old coats or ducking jackets, [whichever they carried behind their saddle cantles].*

### Reduction

The construction may be reduced to the relative phrase + an adjectival predicative complement (e.g. *possible, necessary, feasible*) or past participle:<sup>18</sup>

- [26] i *They want to assist the impending assault in [whatever way possible].*  
 ii *She came to Atlanta, in the fall of 1888, to help [wherever needed].*

### ■ Further uses of the simple forms

As noted above, *who*, *which*, and *how* hardly occur in fused relatives other than as alternants of the *-ever* forms in the free choice construction. *Who* is found in archaisms preserved by quotation in the contemporary language, like *Who steals my purse steals trash* (from Shakespeare's *Othello*), but we cannot say, for example, \**Who wrote this letter must have been mad*, or (with *which* as the relative word) \**He always ordered which (one) was cheaper*. Examples with *how* are found but they are rare and quite marginal:

<sup>18</sup>In the coordination case we often find the *-ever* word on its own: *Disturbed by this telephone call or whatever, she walked out into the night*. We take this to be a simple NP, though it might alternatively be regarded as a fused relative with something like “it was” understood.

<sup>0</sup>We will not change how we use future contracts during the term of this Prospectus; <sup>0</sup>I don't like how it looks.

### What

The most frequent type of fused relative NP has *what* as fused head. It is found in non-referential NPs, like *whatever*, but it also readily occurs in referential NPs:

- [27] i I'll do [what I can] to help you. [non-referential (non-specific)]  
 ii They seem pleased with [what I gave them]. [referential]

Determinative *what* (leaving aside the free choice construction) is restricted to non-count or plural NPs and has a paucal meaning that can be reinforced by *little* or *few* and is inconsistent with *much* or *many*:

- [28] i This will further erode [what (little) economic credibility the government has left].  
 ii [What (few) mistakes she had made] were all of a minor nature.

### The specifying *be* construction

Simple forms of the unbounded dependency words are commonly found within a matrix clause containing *be* in its specifying sense, and here it is by no means a straightforward matter to distinguish between the fused relative and subordinate interrogative constructions. Compare, for example:

- [29] i What caused the trouble was a faulty switch. } [fused relative]  
 ii A faulty switch was what caused the trouble. }  
 iii That's who I meant. That's not how to do it. } [interrogative]  
 iv He's not who she thinks he is. }

Example [i] belongs to the pseudo-cleft construction (Ch. 16, §9.3), which is normally reversible, yielding in this case [ii]. There is no doubt that these involve fused relatives. Note, for example, that we can have subject–auxiliary inversion (*Was what caused the trouble a faulty switch?*) and that preposition fronting is completely impossible (*What I'm referring to is his intransigence*, but not *\*To what I'm referring is his intransigence*).

The examples in [iii–iv] are not reversible (cf. *\*How to do it is not that*, etc.), and there are grounds for saying that the underlined expressions are interrogative clauses even though they can be paraphrased by such NPs as *the person I meant*, *the way to do it*, *the person that she thinks he is*. Note first that *who* is found here, but not elsewhere in fused relatives, other than in the free choice construction. In particular, it cannot occur in the pseudo-cleft: *\*Who caused the trouble was your brother*.<sup>19</sup> Similarly, the infinitival of *how to do it* is not possible in fused relatives. Conversely, the one item that appears in relatives but not interrogatives, *while*, is not found here. *That was while we were in Paris*, for example, is quite different from [29iii]: it does not serve to identify the period during which we were in Paris but locates 'that' within this period.

A further difference between [29iii–iv] and the pseudo-cleft is that only the latter can incorporate an integrated relative (cf. the discussion of [10i]). Compare *What she left me that I treasure most is this little music-box* with *\*That's who she recommended who has the best qualifications* ("the person she recommended who has the best qualifications").

<sup>19</sup> *Why* (which has no counterpart in *-ever*) appears freely in the interrogative construction, as in *This is why I'm leaving*, but is marginally possible in the pseudo-cleft: *Why I'm leaving is that/because there's no opportunity to use any initiative*. It does not occur elsewhere in fused relatives.

Finally, and most decisively, the specifying *be* construction of [29iii] allows preposition fronting: *That is precisely for what it was designed; That is exactly against what we should be fighting now*. This distinguishes them clearly from the pseudo-cleft construction and indicates that they must be interrogatives.

The likeness in meaning between the relative and interrogative constructions of [29] is consistent with the different syntactic analyses we have proposed. For [i] we have “The *x* such that *x* caused the trouble was a faulty switch”: *a faulty switch* gives the value of the variable defined in the fused relative. And in *That’s who I meant* the subject *that* gives the value of the variable in “He meant person *x*”, the propositional content of the embedded question – i.e. it gives the answer to the question “Who did he mean?”<sup>20</sup>

### The prepositions *when, where, while*

- [30] i [When it rains] they play in the garage.  
 ii We must put it [where no one will be able to see it].  
 iii They insisted on talking [while I was trying to get on with my work].

These have paraphrases containing noun + integrated relative: *On occasions when it rains, they play in the garage; We must put it in a place where no one will be able to see it; <sup>96</sup>They insisted on talking during the time while I was trying to get on with my work.*

*While* differs from the other fused relative words in having no *-ever* counterpart and in having no interrogative use.

### Fused relatives or preposition + content clause?

An alternative analysis of examples like those in [30] is to treat *when, where, and while* as prepositions that take content clauses as complements – like *before, whereas, although*, etc. There are certainly some cases where the latter is the preferable analysis:

- [31] i [When they weren’t home at six o’clock] I began to get worried.  
 ii Let me know [if and when you need any help].  
 iii [Where the British Empire was established with musket and gunboat,] America’s empire has been achieved with the friendly persuasion of comedian and crooner.  
 iv [While I don’t agree with what she says,] I accept her right to say it.

In [i] we cannot gloss *when* as “at the time at which” since the temporal adjunct function within the subordinate clause is pre-empted by *at six o’clock*. In [ii] *when* is co-ordinated with *if*, which quite clearly takes a content clause as complement. Example [iii] illustrates a use of *where* that has been bleached of the basic locative meaning: it indicates contrast, like *whereas*. Moreover, it would conflict with the meaning to posit a location adjunct within the subordinate clause: the sentence does not say that America’s empire was established in the same place as the British Empire. Example [iv] is similar: *while* here is used for contrast and its meaning does not involve temporal duration.

On the other hand, we find places where a fused relative analysis is required. The clearest cases are with *where* and *while* in such examples as:

- [32] i I put the key [where I always put it], in the top drawer.  
 ii It was fun [while it lasted].

<sup>20</sup> Another case where an interrogative has an interpretation similar to that of a relative construction is illustrated in *There’s an article in the weekend magazine on how to grow orchids*. We might instead say on *the way to grow orchids*, with an NP containing a relative clause. But *how to grow orchids* must be an interrogative, by virtue of the *how* and the infinitival. And again the meaning in fact fits the interrogative analysis: the magazine article is concerned with answering the question “How to grow orchids?”

Here the subordinate clauses must contain complements of goal and duration respectively because of the complementation requirements of the verbs *put* and *last*. Thus *I always put it* and *it lasted* are not themselves structurally complete, and could not occur as complement of a preposition. They must have a gap in final position that is linked to *where* and *while*: *where<sub>i</sub> I always put it \_\_<sub>i</sub>* and *while<sub>i</sub> it lasted \_\_<sub>i</sub>*. In the light of examples [31–32], we conclude that both the fused relative and the preposition + content clause analyses are needed; some examples require just one, whereas others are consistent with either.

## 7 Unbounded dependency constructions

Relative clauses belong to a larger class of constructions known as **unbounded dependency constructions**. In this final section of the chapter we examine the properties of this more general category of constructions.

### 7.1 Definition and taxonomy

What is meant by an unbounded dependency construction can be seen by considering a set of examples such as those in [1]:

- [1] i *This is the book<sub>i</sub> [which<sub>i</sub> [she recommended \_\_<sub>i</sub>]].*  
 ii *This is the book<sub>i</sub> [which<sub>i</sub> [I think she recommended \_\_<sub>i</sub>]].*  
 iii *This is the book<sub>i</sub> [which<sub>i</sub> [I think you said she recommended \_\_<sub>i</sub>]].*

The outer brackets enclose the relative clause, while the inner ones enclose the nucleus. The nucleus contains a gap in the position of object of the verb *recommended*, and this gap is linked to the relative phrase *which* in prenuclear position. The relation between the gap and *which* is comparable to that between an anaphoric pronoun and its antecedent – between, for example, *which* and its antecedent *book*. *Which* derives its interpretation from *book*, and the gap derives its interpretation from *which*: a component of the meaning of all three examples is “she recommended *x*”, where *x* is some book. We will say, therefore, that the gap is anaphorically linked to *which*, i.e. that *which* is antecedent for the gap.

This relation between the gap and *which* is a **dependency** relation. Semantically, the gap derives its interpretation from *which*, as we have just seen. And syntactically *which* requires an associated gap: the object of *recommended* cannot be realised by an ordinary NP – compare *\*This is the book which she recommended ‘War and Peace’*.<sup>21</sup> The dependency relation between the gap and its antecedent is **unbounded** in the sense that there is no upper bound, or limit, on how deeply embedded within the relative clause the gap may be. In [1i] the gap is object of the topmost verb in the relative clause. In [1ii] it is object of the verb that heads a clause embedded as complement to the topmost verb (*think*). In [1iii] there are two layers of clause embedding: the *recommend* clause is complement in the *say* clause, and the latter is complement in the *think* clause. And there is no grammatical limit on how many such layers of embedding there can be. Adding a third might give, for example, *the book which I think you said Kim persuaded her to*

<sup>21</sup>The dependency relation between a gap and its antecedent is not to be equated with that of a dependent to a head. Dependent and head are functions within a syntactic construction, and the gap is not a dependent of *which* in this sense. The gap and *which* are related anaphorically, not as functions within a construction.

*recommend*. And further layers still can be added without loss of grammaticality even though they may result in stylistically undesirable complexity.

A second unbounded dependency construction is the open interrogative, illustrated in:

- [2] i *What<sub>i</sub> [does he want \_\_<sub>i</sub>]?*  
 ii *What<sub>i</sub> [do you think he wants \_\_<sub>i</sub>]?*  
 iii *What<sub>i</sub> [do you think she said he wants \_\_<sub>i</sub>]?*

The gap represents the object of *want* and is anaphorically linked to the interrogative phrase *what* in preuclear position. This relationship indicates that the question concerns the object of *want*: the meaning contains the component “he wants *x*”, and answers to the question supply a value for the variable *x*. Again, the dependency relation between the gap and the interrogative phrase is unbounded: the examples show the *want* clause progressively more deeply embedded, and again there is no grammatical limit as to how many layers of embedding are permitted.

In the light of these examples we may define an unbounded dependency construction as follows:

- [3] An unbounded dependency construction is one which sanctions within it an anaphoric gap, with no upper bound on how deeply embedded the gap may be.

#### ■ Constructions with and without unbounded dependency words

The two constructions considered so far, *wh* relatives and open interrogatives, have in common that they are marked by the presence of a distinctive type of word functioning as or within the preuclear element. *Which* in [1] is a relative word and *what* in [2] is an interrogative word. As we have seen, there is a large degree of overlap between relative and interrogative words, and we refer to them jointly as **unbounded dependency words**, i.e. words that are markers of an unbounded dependency construction.<sup>22</sup> Exclamative *what* and *how* also belong in this category, for exclamatives are also an unbounded dependency construction, as is evident from such examples as:

- [4] i *What a disaster<sub>i</sub> [it was \_\_<sub>i</sub>]!*  
 ii *What a disaster<sub>i</sub> [it turned out to be \_\_<sub>i</sub>]!*  
 iii *What a disaster<sub>i</sub> [it seems to have turned out to be \_\_<sub>i</sub>]!*

Not all unbounded dependency constructions are of this kind, however. In preposing, the preuclear position is filled by a phrase or clause that can also occur in a canonical clause construction. Compare:

- [5] i *The other chapters<sub>i</sub> [she wrote \_\_<sub>i</sub> herself].*  
 ii *The other chapters<sub>i</sub> [I think she wrote \_\_<sub>i</sub> herself].*  
 iii *The other chapters<sub>i</sub> [I think she said she wrote \_\_<sub>i</sub> herself].*

*The other chapters* is an ordinary NP, functioning as object in the canonical *She wrote the other chapters herself*, but in [5] it is in an unbounded dependency relation with a gap.

These examples illustrate the main preposing construction, with the preposed element in preuclear position within a clause. It is also possible for the preposed element to

<sup>22</sup>These words are often referred to as ‘*wh* words’; the category, however, is obviously not unique to English, and we prefer to use a more general term.

occupy prenuclear position within a PP (see Ch. 7, §4.4):

- [6] i [*Stupid*<sub>i</sub> [*though he is* \_\_<sub>i</sub>],] *he saw through their little game.*  
 ii [*Stupid*<sub>i</sub> [*though you no doubt think he is* \_\_<sub>i</sub>]], *he saw through their little game.*  
 iii [*Stupid*<sub>i</sub> [*though I expect you think he is* \_\_<sub>i</sub>]], *he saw through their little game.*

The outer brackets enclose the PP, and the inner ones its nucleus, containing a gap anaphorically linked to the preposed AdjP *stupid*.

### ■ Constructions with prenuclear and external antecedents

We have now introduced five unbounded dependency constructions: *wh* relatives, open interrogatives, exclamatives, preposing in clause structure, and preposing in PP structure. In all of these, the antecedent for the gap is located in prenuclear position. There are also unbounded dependency constructions where the antecedent is located outside the clause altogether. One clear case is that of non-*wh* relatives:

- [7] i *This is the book*<sub>i</sub> [*she recommended* \_\_<sub>i</sub>].  
 ii *This is the book*<sub>i</sub> [*I think she recommended* \_\_<sub>i</sub>].  
 iii *This is the book*<sub>i</sub> [*I think you said she recommended* \_\_<sub>i</sub>].

These are just like the *wh* relatives in [1] above, except that they contain no relative phrase in prenuclear position. The gap is thus related directly to the nominal *book*, rather than indirectly, via the relative pronoun *which*. This construction still satisfies the definition given in [3]: the relative clause can contain an anaphoric gap that is embedded indefinitely deeply within it.

Another construction of this type is the comparative clause:

- [8] i *Kim made more mistakes*<sub>i</sub> *than* [*Pat made* \_\_<sub>i</sub>].  
 ii *Kim made more mistakes*<sub>i</sub> *than* [*I think Pat made* \_\_<sub>i</sub>].  
 iii *Kim made more mistakes*<sub>i</sub> *than* [*I think you said Pat made* \_\_<sub>i</sub>].

Comparative clauses function as complement to a preposition (*than*, *as*, or *like*); the gap is within the comparative clause while the antecedent is outside. Comparative clauses, however, differ in significant ways from other unbounded dependency constructions with respect to the kind of gap allowed and the way it is interpreted: we examine them in detail in Ch. 13, §2, and will pay no further attention to them here.

### ■ Major and minor unbounded dependency constructions

The final distinction to be made contrasts the major constructions listed above with minor ones, such as hollow clauses:

- [9] i *The machine*<sub>i</sub>; *was too big* [*to take* \_\_<sub>i</sub> *home*].  
 ii *The machine*<sub>i</sub>; *was too big* [*to ever want to take* \_\_<sub>i</sub> *home*].  
 iii *The machine*<sub>i</sub>; *was too big* [*to imagine ever wanting to take* \_\_<sub>i</sub> *home*].

The gap here is object of *take*, and has an external antecedent, *the machine*. As before, the gap can be embedded indefinitely deeply within the hollow clause. However, examples like [ii–iii] with respectively one and two levels of clause embedding are quite rare. Although there is in principle no limit to the depth of embedding this construction in practice allows deeply embedded gaps much less readily than those discussed above and for this reason can be regarded as a relatively minor member of the set of unbounded dependency constructions. Moreover, when the gap is located within a clause that is

embedded within the hollow clause, the embedded clause must be non-finite, like the hollow clause itself. Compare:

- [10] a. *The problem<sub>i</sub> is too difficult [to expect a ten-year-old to be able to solve \_\_<sub>i</sub>].*  
 b. *\*The problem<sub>i</sub> is too difficult [to expect [that a ten-year-old could solve \_\_<sub>i</sub>]].*

While [i] is fully acceptable, [ii] is ungrammatical. This is because the hollow clause (enclosed within the outer pair of brackets) contains a finite clause within it (enclosed within the inner brackets), and the gap is inside this finite clause. The same constraint applies to infinitival relatives and infinitival open interrogatives, and we accordingly include these too in the set of minor unbounded dependency constructions.

### ■ Summary taxonomy

Unbounded dependency constructions may be classified in terms of the above distinctions as follows:

[11] I	MAJOR CONSTRUCTIONS	
IA	<b>Prenuclear antecedent</b>	
IAi	Contain unbounded dependency word	{ <i>wh</i> relatives (finite), open interrogatives (finite), exclamatives
IAii	No such word	preposing in clause, preposing in concessive PP
IB	<b>External antecedent</b>	non- <i>wh</i> relatives (finite), comparatives
II	MINOR CONSTRUCTIONS	
IIA	<b>Prenuclear antecedent</b>	infinitival <i>wh</i> relatives and open interrogatives
IIB	<b>External antecedent</b>	hollow clauses, infinitival non- <i>wh</i> relatives

## 7.2 Gaps and antecedents

### ■ The syntactic functions of gaps

Gaps occur in certain functional positions. In most of the examples used in §7.1 the gap represents the object of a verb. This is not of course the only possibility, but there are severe constraints on what functions can be realised by a gap. One general constraint is stated summarily in [12]:

- [12] A gap in an unbounded dependency construction can function only as either:  
 (a) a post-head dependent; or  
 (b) subject in clause structure (immediate or embedded).

Compare, for example, the following open interrogatives:

[13] i	<i>What<sub>i</sub> [did you buy __<sub>i</sub>]?</i>	[complement of verb]
ii	<i>What<sub>i</sub> [are you referring [to __<sub>i</sub>]]?</i>	[complement of preposition]
iii	<i>Where<sub>i</sub> [did you see them __<sub>i</sub>]?</i>	[adjunct of verb]
iv	<i>Who<sub>i</sub> [do you think [__<sub>i</sub> was responsible]]?</i>	[subject of clause]
v	<i>*Whose<sub>i</sub> [did you borrow [__<sub>i</sub> car]]?</i>	[subject-determiner in NP]
vi	<i>*How many<sub>i</sub> [did they receive [__<sub>i</sub> applications]]?</i>	[determiner]
vii	<i>*How serious<sub>i</sub> [will it be [__<sub>i</sub> a problem]]?</i>	[pre-head modifier in NP]
viii	<i>*Who<sub>i</sub> [have they shortlisted [__<sub>i</sub> and Kim]]?</i>	[coordinate]

The inner brackets in [ii] and [iv–viii] enclose the constituent within which the gap is located: a PP in [ii], content clause in [iv], an NP in [v–vii], and an NP-coordination in [viii]. Examples [v–viii] are ungrammatical because the gap does not have one of the functions permitted by rule [12]. They can be corrected by making the gap conform to [12]:

- |      |     |   |                        |
|------|-----|---|------------------------|
| [14] | i   | <i>Whose car<sub>i</sub> did you borrow __<sub>i</sub>?</i>                     | } [complement of verb] |
|      | ii  | <i>How many applications<sub>i</sub> did they receive __<sub>i</sub>?</i>       |                        |
|      | iii | <i>How serious a problem<sub>i</sub> will it be __<sub>i</sub>?</i>             |                        |
|      | iv  | <i>Who<sub>i</sub> have they shortlisted __<sub>i</sub> in addition to Kim?</i> |                        |

In addition to rule [12], certain more specific conditions apply:

### Gaps not normally allowed in indirect object function

As we observed in Ch. 4, §4.3, one of the main syntactic differences between indirect and direct objects is that gaps are more or less excluded from the former function. The qualification ‘more or less’ is needed because there is some variation with respect to acceptability judgements on clauses with indirect object gaps, but for the most part there is a clear difference between the acceptability of direct and indirect object gaps. Compare:

- [15] i a. *This is the CD<sub>i</sub> [she got me \_\_<sub>i</sub> last Christmas].*  
       b. *\*He’s the one<sub>i</sub> [she got \_\_<sub>i</sub> that CD last Christmas].*  
       ii a. *The copies [he sold me \_\_<sub>i</sub>] were defective.*  
        b. *\*The person<sub>i</sub> [he sold \_\_<sub>i</sub> them] seemed satisfied.*  
       iii a. *How much<sub>i</sub> do you owe them \_\_<sub>i</sub>?*  
        b. *?How many people<sub>i</sub> do you owe \_\_<sub>i</sub> more than \$50?*

In each pair the gap is direct object in [a], indirect object in [b]. Most verbs that take indirect objects also occur in an alternative construction with direct object + PP complement, and this construction can be used to express the meanings of the [b] examples: *He’s the one<sub>i</sub> she got that CD for \_\_<sub>i</sub> last Christmas*, and so on. (The prepositional construction will also often be preferred over a ditransitive one with indirect object + gap in direct object function – e.g. *the story<sub>i</sub> that he was reading \_\_<sub>i</sub> to his children*, over *the story<sub>i</sub> that he was reading his children \_\_<sub>i</sub>*.)

### Gaps in subject function

As we saw in §3.4, it is necessary to distinguish between an **immediate subject** (i.e. the subject of the topmost verb in the construction) and an **embedded subject** (the subject of a clause embedded within the unbounded dependency construction).

Embedded subject gaps are permitted only in bare content clauses, i.e. declaratives without the subordinator *that* (cf. Ch. 11, §3.1). Compare:

- [16] i *He’s the man<sub>i</sub> [they think [\_\_<sub>i</sub> attacked her]].* [bare declarative]  
       ii *\*He’s the man<sub>i</sub> [they think [that \_\_<sub>i</sub> attacked her]].* [expanded declarative]  
       iii *\*He’s the man<sub>i</sub> [they wonder [whether \_\_<sub>i</sub> attacked her]].* [closed interrogative]

With immediate subjects we can have a gap in Type IB constructions (with external antecedent), but not in Type IA (with prenuclear antecedent). Compare:

- [17] i *This is the copy<sub>i</sub> [that [<sub>i</sub> is defective]].* [immediate subject gap]  
 ii *This is the copy<sub>i</sub> [which<sub>i</sub> is defective].* } [no gap]  
 iii *Who signed the letter?* }

In [i] *that* is the subordinator in prenuclear position, and the subject in the nucleus is realised by a gap anaphorically linked to the antecedent *copy*: this is a Type 1B construction, with the antecedent of the gap external to the relative clause. (As we noted in §3.5.5, the subordinator *that* is generally not omissible when the gap is in immediate subject function.) In [ii–iii], by contrast, the subjects are realised not by a gap but by relative *which* and interrogative *who*: in the absence of convincing evidence to the contrary, we take the structure to be the same as that of the canonical clauses *This copy is defective* and *Kim signed the letter*. Note, moreover, that the preposing construction does not allow preposing of an immediate subject. Compare:

- [18] i *The other chapters<sub>i</sub> [she wrote <sub>i</sub> herself].* [preposing of object]  
 ii *She wrote the other chapters herself.* [no preposing]

In [i] we have a gap in object position, but there is no gap, no preposing in [ii], where *she* is in its canonical position.

### Hollow clauses

In the hollow clause construction the gap can only be complement of a verb or preposition: see Ch. 14, §6.

## ■ Function of the antecedent

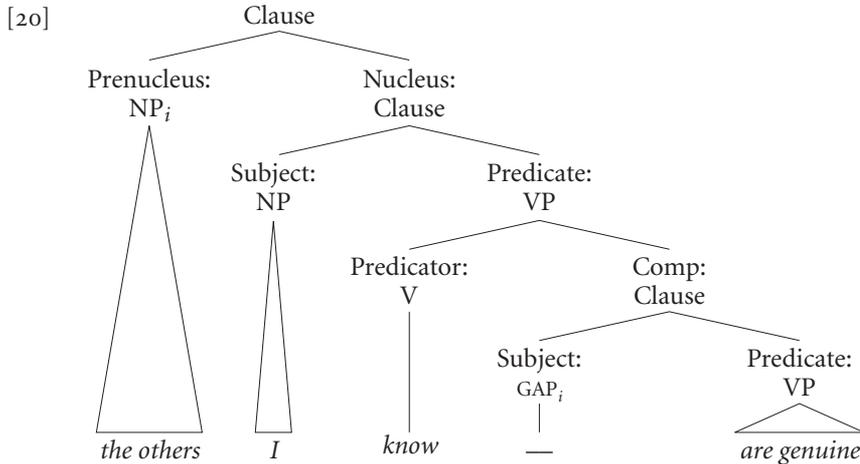

In constructions with an external antecedent, the function of the antecedent is independent of that of the gap. Compare:

- [19] i a. *Have you seen the book<sub>i</sub> [I got <sub>i</sub> from the library]?*  
 b. *Where's the book<sub>i</sub> [I got <sub>i</sub> from the library]?*  
 ii a. *Their proposal<sub>i</sub> was hard [to accept <sub>i</sub>].*  
 b. *We found their proposal<sub>i</sub> hard [to accept <sub>i</sub>].*

In [i] the bracketed clauses are non-*wh* relatives with the gap in object function. The antecedent is the nominal *book*, which is head of an NP, and this NP can occur in any NP function: it is, for example, object in [ia], subject in [ib]. In [ii] we have hollow clauses with the gap in object function. The antecedent is the NP *their proposal*, and again the function of this NP does not need to match that of the gap: in [iia] it is subject, while in [iib] it is object.

### Prenuclear antecedents inherit function of the gap

The situation with antecedents in prenuclear position is quite different. These elements are located within the unbounded dependency construction itself, and thus do not have a function outside it. Because they fall outside the nucleus the only function that can be assigned directly to them is that of prenuclear dependent. This is shown in the following tree diagram for the preposing construction *The others I know are genuine*, corresponding to canonical *I know the others are genuine*.

We could not label *the others* as subject, for it clearly does not stand in the subject relation to the clause of which it is an immediate constituent. Nevertheless, it is understood as subject of *are genuine*, just as it is in the canonical counterpart *I know the others are genuine*. Notice, moreover, that the verb form *are* agrees with *the others* – again, just as it does in *I know the others are genuine*. We will regard these prenuclear antecedents, therefore, as taking on the function of the associated gap. In a secondary, or derivative, sense, that is to say, *the others* is subject of the content clause whose head (predicate) is *are genuine*. This information is retrievable from the tree diagram as it stands: the secondary function of *the others* is that of the co-indexed gap. Similarly in *The others; I haven't yet read \_\_\_*, we will say that *the others* is, in this derivative sense, object of *read*.

The same applies with constructions where the prenuclear element consists of or contains an unbounded dependency word, as in:

- [21] i *the letters*<sub>i</sub> [*which*<sub>i</sub> [*he says she wrote \_\_\_*<sub>i</sub>]]  
 ii *Who*<sub>i</sub> [*do you think \_\_\_*<sub>i</sub> *wrote the letter*]?

We will say that *which* in [i] is object of *wrote* and *who* in [ii] is subject of *wrote*. This is of course what is said in traditional grammar too: our concern here has been to show how that kind of statement can be reconciled with the tree diagrams that are used to represent syntactic structure in this book. *Which* and *who* are not labelled object and subject directly, but are treated as inheriting this function from the gap with which they are co-indexed.

#### ■ Match between antecedent and potential realisations of the gap function

The anaphoric relation between the gap and the antecedent means that well-formedness is subject to the following condition:

- [22] The syntactic and semantic properties of the antecedent must normally match those of expressions which in other constructions can occur as overt realisations of the gap function.

In the simplest cases, the antecedent expression itself can elsewhere realise the function of the gap. Illustrations of this situation are provided by preposing and hollow clauses:

- [23] i a. To Kim<sub>i</sub> [*they gave a bicycle* \_\_<sub>i</sub>]. [preposing]  
 b. *They gave a bicycle to Kim.*  
 ii a. Kim<sub>i</sub> [*is very hard to please* \_\_<sub>i</sub>]. [hollow]  
 b. *It is very hard to please Kim.*

In [ia] the PP *to Kim* is antecedent for the complement gap in the nucleus, and this PP can itself realise the same complement function, as shown in [ib]. Similarly in [ii]: the gap in [a] is object of *please* and the antecedent for this gap, the NP *Kim*, can elsewhere fill that function, as in [b]. These examples may be contrasted with the following:

- [24] i \*To Kim<sub>i</sub> [*they bought a bicycle* \_\_<sub>i</sub>].  
 ii \*That he comes home so late<sub>i</sub> [*is very hard to enjoy* \_\_<sub>i</sub>].

In [i] the preposed complement contains the wrong preposition: we need *for Kim*, to match *They bought a bicycle for Kim*. In [ii] the antecedent is a content clause but *enjoy* does not license a complement of that kind: we need an NP, such as *his novels*, to match *I enjoy his novels*.

Compare, again, the following examples of the *it*-cleft construction:

- [25] i *It was that jar<sub>i</sub> [*that she says she put the key in* \_\_<sub>i</sub>].* [NP ~ NP]  
 ii *It was in that jar<sub>i</sub> [*that she says she put the key* \_\_<sub>i</sub>].* [PP ~ PP]  
 iii \**It was that jar<sub>i</sub> [*that she says she put the key* \_\_<sub>i</sub>].* [NP ~ PP]  
 iv \**It was in that jar<sub>i</sub> [*that she says she put the key in* \_\_<sub>i</sub>].* [PP ~ NP]

In [i] the antecedent is an NP, and this is the category needed to realise the gap function, object of the preposition *in*. In [ii] the antecedent is a PP, which can realise the function of goal complement in the *put* clause, as in *She put the key in that jar*. The other examples are ungrammatical because the antecedent fails to meet the requirements of the gap function: compare \**She put the key that jar* and \**She put the key in in that jar*.

Condition [22] is formulated in terms of matching rather than identity: there is no requirement that the antecedent expression itself should be able to realise the gap function. Three very general cases where it can't are illustrated in:

- [26] i *Every book<sub>i</sub> [*we have consulted* \_\_<sub>i</sub>] ignores this problem.* [non-*wh* relative]  
 ii *That's not the reason [*why<sub>i</sub> [he did it* \_\_<sub>i</sub>]].* [*wh* relative]  
 iii \_\_<sub>i</sub> *Don't be so hard [*to please* \_\_<sub>i</sub>].* [hollow clause]

The bracketed clause in [i] is a non-*wh* relative of the integrated type. As explained in §4.1, the antecedent is the nominal *book*, not the sequence *every book*: the sentence doesn't say that we have consulted every book. A nominal as such cannot realise the gap function, which requires a full NP: \**We have consulted book*. The antecedent can nevertheless be said to satisfy the matching requirement in that it can realise the gap function if an appropriate determiner is added to make it into a full NP: *We have read a book*.

The outer brackets in [26ii] enclose a *wh* relative clause, and here the relative phrase is required to occupy initial position, so relative *why* could not occur within the nucleus as a realisation of the gap function. The matching requirement is satisfied, however, in that *why* is a reason expression and non-relative expressions of that kind can realise the

gap function, as in *He did it for that reason*. The same applies, of course, to other relative expressions.

In [26iii] the antecedent for the gap in the hollow clause is not overtly expressed. But it is understood, by virtue of being subject of an imperative, as *you*, and this can realise the gap function: *It is hard to please you*. In *Pat<sub>i</sub> wants \_\_<sub>i</sub> to be hard [to please \_\_<sub>i</sub>]*, the antecedent (the subject of the *be* clause) is likewise missing, but this time it is recoverable from the superordinate *want* clause.

### Mismatches

There are a number of constructions where the matching requirement [22] is not strictly observed. They are illustrated in [27], but as all are dealt with elsewhere in the book only a summary commentary is needed at this point.

- [27] i *Who<sub>i</sub> [did you give it to \_\_<sub>i</sub>]?*  
 ii <sup>0</sup>*He always chose those [whom<sub>i</sub> [he thought \_\_<sub>i</sub> were most vulnerable]].*  
 iii *[What<sub>i</sub> [I'm hoping \_\_<sub>i</sub>]] is that nobody will notice my absence.*  
 iv *What on earth<sub>i</sub> [do you want \_\_<sub>i</sub>]?*  
 v *That no one realised such action might be illegal<sub>i</sub> [I find \_\_<sub>i</sub> surprising].*  
 vi *That they'll give him a second chance<sub>i</sub> [I wouldn't gamble on \_\_<sub>i</sub>].*  
 vii *[Brilliant advocate<sub>i</sub> [though she is \_\_<sub>i</sub>],] she's unlikely to win this case.*

Examples [27i–ii] show that the inflectional case of prenuclear interrogative and relative *who* does not always match that of pronouns in the position of the gap. Compare the nominative *who* of [i], with accusative *them* in *You gave it to them*, and the accusative *whom* of [ii] with the nominative required in *He thought they were most vulnerable* (see §3.4 above, and Ch. 5, §16.2.3).<sup>23</sup>

Fused relative *what* in [27iii] is an NP, but *hope* does not license an NP complement: compare *\*I was hoping some respite*. *Hope* takes declarative content clause complements, and the presence of such a content clause following the fused relative is apparently necessary for *what* to be admissible: compare *\*What I was hoping was a little peace and quiet*. The fused relative in [iii] is subject within a pseudo-cleft clause (see Ch. 16, §9.3), and the same extended use of *what* is found with a few other verbs in pseudo-clefts. Compare, for example, *What we decided was to interview all the candidates*. Although *decide* does license NP complements, they don't stand in the same semantic relation to it as *what* does here – compare *The weather will decide the outcome*, but not *\*We decided an interview*.

Example [27iv] is an open interrogative. Unlike relative phrases, interrogative phrases are not in general required to occupy initial position – compare *And so you want what, exactly?* (cf. Ch. 10, §4.5). Interrogative phrases containing emotive modifiers such as *on earth*, *the hell*, *ever*, etc., however, can only occur initially, hence not in the position of the gap in [iv]: *\*And so you want what on earth?*

The remaining examples in [27] are preposings. In [v] the function of the gap is that of object in a complex-transitive clause. The preposed content clause could not

<sup>23</sup>In constructions with an external antecedent the case of the antecedent will be determined by its function within its own clause, which is independent of the function of the gap. Compare *He<sub>i</sub> is hard to get on with \_\_<sub>i</sub>* (where *he* is subject and hence nominative) and *I find him<sub>i</sub> hard to get on with \_\_<sub>i</sub>* (where *he* is object and hence accusative). In [27i–ii], however, *who* is in prenuclear position, so its case does depend on the function of the associated gap.

occur in post-verbal position: instead of *\*I find that no one realised such action might be illegal surprising* we need the version with extraposition *I find it surprising that no one realised such action might be illegal*. In [vi] the preposed content clause could not replace the gap because the latter is complement of the preposition *on*, which does not license complements of this category: it requires an NP (see Ch. 11, §8.3, for further discussion of this very marginal type). Finally, [vii] has preposing of a predicative complement NP from within a concessive PP. Here there is a more systematic departure from the form found in non-preposed position, with the latter requiring an indefinite article: *Although she is a brilliant advocate, she's unlikely to win this case*.

### Combinations of unbounded dependency constructions

It is possible for certain unbounded dependency constructions to combine in such a way that the gap in one is the antecedent in the other. In the following, for example, an open interrogative is combined with a cleft relative:

- [28] i *Which jar<sub>i</sub> was it \_\_<sub>i</sub> [that she says she put the key in \_\_<sub>i</sub>]?  
 ii *In which jar<sub>i</sub> was it \_\_<sub>i</sub> [that she says she put the key \_\_<sub>i</sub>]?**

These are the open interrogative counterparts of the declarative clefts given in [25i–ii] above. The first gap has the interrogative phrase as its antecedent, and itself serves as antecedent for the second gap. In both examples the matching requirement is satisfied. In [i] the gap in the *put* clause is object of *in*, and hence requires an NP antecedent: this requirement is met because the gap in the *be* clause has the overt NP *which jar* as its antecedent. Similarly in [ii] the gap in the *put* clause requires a PP antecedent, and this requirement is satisfied because the gap in the *be* clause has an overt PP as its antecedent. Interrogative counterparts of the ungrammatical [25iii–iv] will thus be ungrammatical too:

- [29] i *\*Which jar<sub>i</sub> was it \_\_<sub>i</sub> [that she says she put the key \_\_<sub>i</sub>]?  
 ii *\*In which jar<sub>i</sub> was it \_\_<sub>i</sub> [that she says she put the key in \_\_<sub>i</sub>]?**

But there is an additional constraint, illustrated in:

- [30] *\*Which jar<sub>i</sub> was it [in \_\_<sub>i</sub>]<sub>j</sub> [that she says she put the key \_\_<sub>j</sub>]?*

The antecedent for the gap in the *put* clause is the PP headed by *in*: we have enclosed it in square brackets and co-indexed it with the gap in the relative clause. This PP contains a gap with the interrogative phrase as antecedent. What makes the sentence ungrammatical is that the antecedent for one gap contains another gap within it, so we have two gaps with different interpretations – “which jar” and “in which jar”. Thus while the antecedent for a gap may itself be a gap, as in [28], it cannot merely contain a gap.

## 7.3 Location of gaps

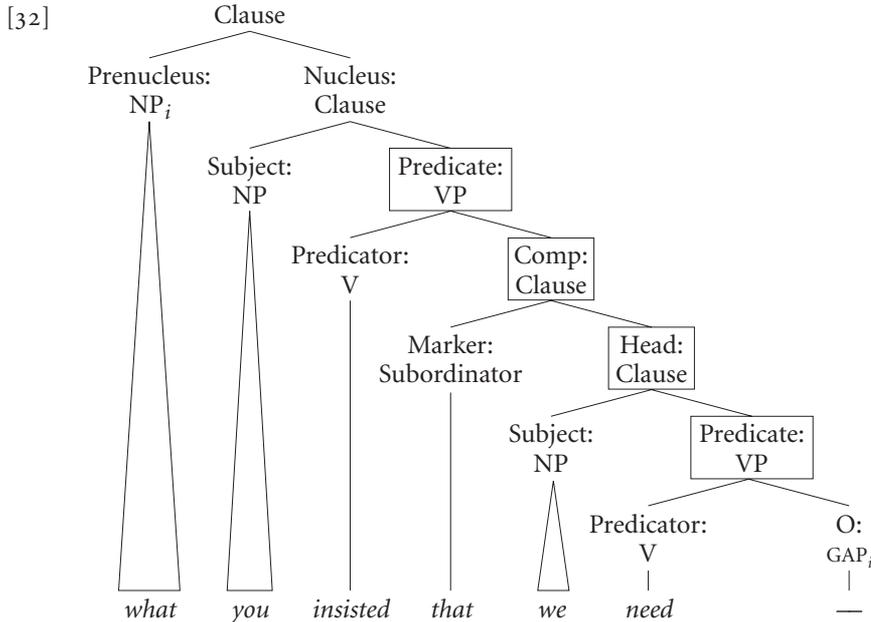

We have said that there is no upper bound on how deeply a gap may be embedded within an unbounded dependency construction. This does not mean, however, that there are no constraints on whereabouts in the construction the gap may occur. Compare, for example:

- [31] i *I told her [what<sub>i</sub> [you insisted that we need \_\_<sub>i</sub>]].  
 ii *\*I told her [what<sub>i</sub> [that we need \_\_<sub>i</sub> is agreed]].**

While [i] is acceptable, [ii] is completely unacceptable. And the cause of the unacceptability is clearly grammatical, not semantic. The meaning of [i] can be given as “I told her

the value of  $x$  in the proposition ‘You insisted that we need  $x$ ’, and the intended meaning of [ii] is similarly ‘I told her the value of  $x$  in the proposition ‘That we need  $x$  is agreed’’. This meaning can in fact be expressed by means of the extraposition construction: *I told her what it is agreed that we need.*

The structure for the interrogative clause in [31i] is as follows:

The boxes enclose points in the tree that lie on the path from the top down to the gap, and grammaticality depends on the function and category labels that occur on this path. The deviance of [31iii] is due to the fact that the path to the gap passes through a constituent with the form of a clause and the function of subject: *that we need* \_\_\_ is subject of *is agreed*. Note that we are concerned here with the path to the gap, not with the gap itself. We noted in §7.2 that (under restricted conditions) the gap can be subject, as in *Who\_i [do you think \_\_\_<sub>i</sub> wrote the letter]?*: what is not admissible is for the gap to be part of a larger clause that is functioning as subject.<sup>24</sup>

In this section we will review a range of constituent types, examining whether or not they may occur on the path leading to the gap. Before we start, however, two general points should be made. In the first place, while the status of [31i–ii] as respectively well-formed and deviant is quite clear, there are many intermediate cases where the status is uncertain. Secondly, while we can confidently say that [31iii] violates a rule of grammar, the acceptability of examples may also be affected by semantic considerations. Compare:

- [33] i *That's a subject<sub>i</sub> [that Steven Jay Gould wrote a book about \_\_\_<sub>i</sub>].*  
 ii *\*That's a subject<sub>i</sub> [that Steven Jay Gould despises a book about \_\_\_<sub>i</sub>].*

<sup>24</sup>Constituent types that do not allow gaps within them are often called ‘islands’.

These have the same grammatical structure, differing only lexically, with [i] having *write* and [ii] *despise* as the verb of the relative clause. But they differ significantly in acceptability: [i] is clearly acceptable, while [ii] is very unnatural. This difference has a semantic explanation. The relative clause combines with the antecedent *subject* to form a nominal that denotes a class of subjects. In the case of [i], this class has some coherence: to say of some subject that Steven Jay Gould wrote a book about it points to a selection of significant topics in areas like evolutionary biology, geology, palaeontology, etc. The class denoted by the nominal in [ii] has no such coherence. What would have to be true of a subject in order for it to be an *x* such that Steven Jay Gould despises a book about *x*? Someone, at some time in history, has to have written a book about *x* that Gould despises for some reason (it is badly written, or was plagiarised, or has annoyingly pretentious page design, or is full of mistakes, or whatever reason there might be). The subject in question could be shoes, ships, sealing wax, cabbages, or kings. In other words, there is no sensible characterisation of a class of subjects in [ii] at all, and as a result the example seems anomalous.

Let us turn now to the review of constituent types. In the examples, we use one pair of square brackets to delimit the constituent in question, and another to delimit the unbounded dependency construction if it is less than the whole sentence. Antecedents are underlined if they contain more than the one word that carries the subscript index.

#### (a) VP in predicate function

- [34] i Most of the criticisms<sub>i</sub>; he [accepted    <sub>i</sub> with good grace].  
 ii I don't know [where<sub>i</sub> he [found it    <sub>i</sub>]].  
 iii It was to her cousin<sub>i</sub>; [that she [sold the business    <sub>i</sub>]].

VP predicates readily allow gaps within them. In [i] we have a preposing with a direct object gap, in [ii] an open interrogative with an adjunct gap, and in [iii] a cleft relative with a complement gap linked to a PP antecedent.

#### (b) AdjPs in predicative complement function

- [35] i Whether it's ethical<sub>i</sub>; I'm not [so certain    <sub>i</sub>].  
 ii That's the only crime [of which<sub>i</sub>; they could find him [guilty    <sub>i</sub>]].

Example [i] has preposing of a clausal complement of *certain*. In [ii] the relative PP *of which* is antecedent to the gap functioning as complement of *guilty*.

#### (c) Declarative content clause in post-head complement function

- [36] i It was here<sub>i</sub>; [she said [she found the knife    <sub>i</sub>]].  
 ii I don't know [who<sub>i</sub> he thinks [he is    <sub>i</sub>]].  
 iii Here's a book<sub>i</sub>; [I think [   <sub>i</sub> might help us]].  
 iv He's the only one<sub>i</sub>; [that I'm [sure she told    <sub>i</sub>]].

Gaps are readily allowed here: an adjunct in [i], predicative complement in [ii], subject in [iii], object in [iv]. The adjunct case has the potential for ambiguity. In the interpretation indicated by the inner brackets in [i], the gap belongs in the *find* clause: it is a matter of where she found the knife. The gap could also be in the *say* clause: *It was here<sub>i</sub>; [she said [she found the knife]    <sub>i</sub>]*. In this interpretation it is a matter of where her utterance took place.

(See Ch. 10, §7.12, for discussion of such ambiguities in open interrogatives.) In [iv] the content clause is complement of an adjective rather than a verb.

#### (d) Closed interrogative clause in complement function

- [37] i *There are several books<sub>i</sub> here [that I'm not sure [if you've read \_\_<sub>i</sub>]].*  
 ii *The actor had to be careful with the amount of venom poured into a character [who<sub>i</sub> in the end we don't know [whether to hate or pity \_\_<sub>i</sub>]].*  
 iii *?The woman boarding in front of me was carrying a huge sports bag<sub>i</sub>; [that the cabin crew wondered [whether there was going to be enough room for \_\_<sub>i</sub>]].*

Interrogative content clauses accept gaps much less readily than declaratives. Examples are rarely found in published material, though [ii] is an attested example from a weekly magazine. Acceptability seems to diminish quite rapidly with increasing complexity, with [iii], for example, quite questionable in comparison with [i–ii].

#### (e) Open interrogative clauses in complement function

- [38] i *These are the only dishes<sub>i</sub>; [that they taught me [how<sub>j</sub> to cook \_\_<sub>i</sub> \_\_<sub>j</sub>]].*  
 ii *The man in the dock was a hardened criminal<sub>i</sub>; [that the judge later admitted he didn't know [why<sub>j</sub> he had ever released \_\_<sub>i</sub> \_\_<sub>j</sub> in the first place]].*  
 iii *?Here's another photograph<sub>i</sub>; [that I can't remember [where<sub>j</sub> we took \_\_<sub>i</sub> \_\_<sub>j</sub>]].*  
 iv *\*It's Max<sub>i</sub>; [that I'd like to know [who introduced \_\_<sub>i</sub> to your sister]].*

Gaps are permitted in open interrogatives only under quite restrictive conditions. Example [i], with *how* as the questioned element (and with a very short interrogative clause), seems completely acceptable. Example [ii], with *why*, is more or less acceptable in speech but this type would not normally occur in published material. Example [iii], with *where*, is more questionable, whereas [iv] can be regarded as ungrammatical, and the same will apply to other examples where the interrogative phrase is in complement function. It will be noted that in [i–iii] there are two gaps, one associated with the open interrogative construction (and having the index *j*), the other with the relative clause in which the interrogative is embedded: compare the canonical construction *I cook spaghetti bolognese this way*.<sup>25</sup>

#### (f) Non-finite clause in post-head complement function

- [39] i *It's you<sub>i</sub>; [I want [to marry \_\_<sub>i</sub>]].*  
 ii *What<sub>i</sub>; did you [tell the police \_\_<sub>i</sub>]]?*  
 iii *I wonder [what<sub>i</sub> they intend [doing \_\_<sub>i</sub> about it]].*  
 iv *They are the ones [to whom<sub>i</sub>; he had the weapons [sent \_\_<sub>i</sub>]].*

These illustrate all four types of non-finite clause: respectively *to*-infinitival, bare infinitival, gerund-participial, and past-participial. This category includes the non-finite complements of auxiliary verbs, as in [ii] or *What<sub>i</sub> are you [reading \_\_<sub>i</sub>]]?*, etc.

<sup>25</sup> In *\*There are words or terms<sub>i</sub> in this Guide [that you may not be sure [what<sub>j</sub> they<sub>i</sub> really mean \_\_<sub>j</sub>]]* (taken with minor and irrelevant modification from an Australian government publication) the personal pronoun *they* is used instead of a gap linked to the antecedent *words or terms*. Pronouns used in place of a gap in relative clauses are known as 'resumptive pronouns'. In some languages they represent a regular feature of relative clause formation, but in English they are ungrammatical, as evident from their inadmissibility in simpler constructions like *\*words or terms [which<sub>i</sub>; you may not understand them<sub>i</sub>]*.

## (g) PP

- [40] i *Some of us<sub>i</sub>*; *he wouldn't even speak* [to   <sub>i</sub>].  
 ii *This is the knife<sub>i</sub>*; [you should cut the tomatoes [with   <sub>i</sub>]].  
 iii *What day<sub>i</sub>*; *will you not be able to return the book* [until   <sub>i</sub>]?  
 iv *\*Here is a list of the objections<sub>i</sub>*; [that they went ahead [despite   <sub>i</sub>]].  
 v *\*You pay me<sub>i</sub>*; *I'll do it* [if   <sub>i</sub>].  
 vi *\*It was this proposal<sub>i</sub>*; [that they sacked me [because I criticised   <sub>i</sub>]].

In [i–iv] the gap is complement of a preposition and has an NP as antecedent. This results in what is called a stranded preposition – a transitive preposition with the complement missing but understood. It is a very common construction except in formal style: see Ch. 7, §4.1. Stranding is most generally permitted when the PP is in complement function, as in [i]. With PPs functioning as adjunct, acceptability depends on the semantic type of the adjunct and the particular preposition; for example, instrumental *with* strands easily, whereas *until* is fairly resistant to stranding, and with *despite* it is excluded.

Pps do not permit gaps linked to a finite clause antecedent, as illustrated in [40v]. The preposing here must apply to the whole PP, not just the complement: *If you pay me<sub>i</sub>*, *I'll do it*   <sub>i</sub>. Nor do they permit a gap **within** a finite clause that is complement of the preposition, as we see from [vi]. Again it can be corrected by having the gap in place of the whole reason PP: *It was because I criticised this proposal<sub>i</sub>*; *that they sacked me*   <sub>i</sub>.

## (h) NP

NPs accept gaps considerably less readily than VPs. Gaps cannot occur as or within modifiers in NP structure (see subsection (i), Modifiers, below). Complements are normally either PPs or clauses, and we will consider these two cases in turn.

## PP complements

- [41] i *Of which institute<sub>i</sub>*; *did you say they are going to make him* [director   <sub>i</sub>]?  
 ii *To which safe<sub>i</sub>*; *is this* [the key   <sub>i</sub>]?  
 iii *He knows little about any of the companies* [in which<sub>i</sub> he owns [shares   <sub>i</sub>]].  
 iv *I can't remember* [which country<sub>i</sub> she served as [prime minister of   <sub>i</sub>]].  
 v *What kinds of birds<sub>i</sub>*; *have you been collecting* [pictures of   <sub>i</sub>]?  
 vi *It's a topic<sub>i</sub>*; [that I'd quite like to write [a book about   <sub>i</sub>]].  
 vii *\*It's a topic<sub>i</sub>*; [you should read [my philosophy tutor's book on   <sub>i</sub>]].

In [i–iii] the gap itself functions as complement and has a PP as antecedent. In [iv–vi] the gap is complement of the preposition, yielding a further case of preposition stranding. The NP in [iv–vi] is indefinite, and this construction is clearly acceptable except in formal style. Where the NP is definite, however, and especially where it has a genitive determiner, acceptability is generally very much reduced, as in [vii].

## Clausal complements

- [42] i *\*That it was my fault<sub>i</sub>*; *I emphatically reject* [the insinuation   <sub>i</sub>].  
 ii *\*How the accident happened<sub>i</sub>*; *they haven't begun to address* [the question   <sub>i</sub>].  
 iii *\*How much<sub>i</sub>*; *did the secretary file* [a report that it would cost   <sub>i</sub>]?  
 iv *\*He's someone<sub>i</sub>*; [I accept your contention that we should not have appointed   <sub>i</sub>].  
 v *How many staff<sub>i</sub>*; *did he give you* [an assurance that he would retain   <sub>i</sub>]?

Examples [i–ii] have the gap itself in complement function, but this time – in contrast to [41] – the result is very clearly ungrammatical. Preposing must apply to the whole NP: *The insinuation that it was my fault<sub>i</sub>; I emphatically reject \_\_<sub>i</sub>* and *The question how the accident happened<sub>i</sub>; they haven't begun to address \_\_<sub>i</sub>*.<sup>26</sup> In [iii–v] the gap is within the declarative content clause functioning as complement in NP structure. In general, this construction is of low acceptability. There is, for instance, a very sharp difference between [iii–iv] and comparable examples where the clause is complement of a verb: *How much<sub>i</sub>; did the secretary report that it would cost \_\_<sub>i</sub>?* and *He's someone<sub>i</sub>; [that I agree we should not have appointed \_\_<sub>i</sub>]*. However, the construction is by no means wholly excluded. It is most acceptable in examples containing collocations of light verb + noun such as *give an assurance*, *make the claim*, *hold the belief*, etc., which have essentially the same meaning as the verbs *assure*, *claim*, and *believe* respectively (cf. Ch. 4, §7). Thus [v] does not differ appreciably in acceptability from *How many staff<sub>i</sub>; did he assure you that he would retain \_\_<sub>i</sub>?*

The examples in [42] involve content clauses; with infinitival complements gaps are more generally admissible:

- [43] i *What<sub>i</sub>; had Dr Harris secretly devised [a plan to steal \_\_<sub>i</sub>]?*  
 ii *It is not clear [which felony<sub>i</sub>; he is being charged with [intent to commit \_\_<sub>i</sub>]].*

#### (i) Modifiers

- [44] i *That's the car<sub>i</sub>; [that I'm saving up [to buy \_\_<sub>i</sub>]].*  
 ii *Which month<sub>i</sub>; are you taking your holidays [in \_\_<sub>i</sub>] this year?*  
 iii *\*It's this river<sub>i</sub>; [that I want to buy a house [by \_\_<sub>i</sub>]].*  
 iv *\*List the commodities<sub>i</sub>; [that you have visited countries [which produce \_\_<sub>i</sub>]].*

Gaps occur very much less readily in modifiers than in complements. One type of modifier where they are unquestionably allowed, however, is an infinitival clause of purpose in VP structure, as in [i]. Example [ii] shows a gap inside a PP functioning as modifier of temporal location, but we noted in (g) above that the stranded preposition construction has a quite strong preference for PPs in complement function. Modifiers in NP structure very strongly resist internal gaps, as illustrated in [iii–iv]. In [iii] the gap is in a PP modifying *house*, while that in [iv] is in a relative clause modifying *countries*.

#### (j) Subjects

- [45] i *They have eight children [of whom<sub>i</sub>; [five \_\_<sub>i</sub>] are still living at home].*  
 ii *\*They have eight children [who<sub>i</sub>; [five of \_\_<sub>i</sub>] are still living at home].*  
 iii *\*What<sub>i</sub>; would [to look at \_\_<sub>i</sub> too closely] create political problems?*

Gaps are almost wholly excluded from occurring within a subject. The main exception is the construction shown in [i], where the gap is complement within the subject NP and has a PP as antecedent. Examples like [ii–iii] are completely ungrammatical; in [ii] the gap is within a PP dependent in the subject NP, while in [iii] it is within a clause functioning as subject. The clause in this example is infinitival, but the same prohibition

<sup>26</sup>Examples like *Why he did it<sub>i</sub>; I have no idea \_\_<sub>i</sub>* are acceptable, but here we take the interrogative clause to be a complement in the structure of the VP, not the NP: see Ch. 4, §6.

applies to finite clauses, as seen in the example used in the introduction to this section, [31ii].<sup>27</sup>

### (k) Coordinates

We saw in §7.2 that a gap cannot itself function as a coordinate (cf. [13viii]), but there are also constraints on the occurrence of gaps within coordinates. Compare:

- [46] i *Who was the guy<sub>i</sub> [that [Jill divorced \_\_<sub>i</sub>] [and Sue subsequently married \_\_<sub>i</sub>]]?*  
 ii *\*Who was the guy<sub>i</sub> [that [Jill divorced Max] [and Sue subsequently married \_\_<sub>i</sub>]]?*

In general, a gap can occur within a coordinate element only if a gap with the same antecedent occurs in all other coordinates in the coordination construction. In [i], for example, each of the two coordinates (enclosed by the inner sets of brackets) contains a gap in object function with *guy* as its antecedent. The sentence presupposes that there was some guy *x* such that Jill divorced *x* and Sue subsequently married *x*. Example [ii] is ungrammatical because the gap figures in one coordinate but not the other.

There are certain conditions, however, under which this constraint is relaxed:

- [47] i *There are some letters<sub>i</sub> [that I must just [go downstairs] [and check \_\_<sub>i</sub> over]].*  
 ii *What is the maximum amount<sub>i</sub> [I can [contribute \_\_<sub>i</sub>] [and still receive a tax deduction]]?*  
 iii *He has built up a high level of expectations, [which<sub>i</sub> he must [either live up to \_\_<sub>i</sub>] [or suffer a backlash]].*

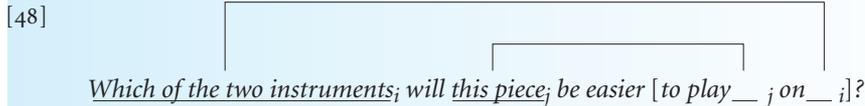

These are cases of asymmetric coordination, i.e. cases where the coordinates are not of equal status from a semantic point of view (see Ch. 15, §§2.2.3–4). This is reflected in the fact that such coordinations have approximate paraphrases where one coordinate is replaced by an adjunct. Compare *I'll go downstairs and check them over* with *I'll go downstairs to check them over*; *I contributed \$1,000 and still received a tax deduction* with *Although I contributed \$1,000, I still received a tax deduction*; *He must either live up to these expectations or suffer a backlash* with *If he doesn't live up to these expectations, he will suffer a backlash*. Note that in each case the gap appears in the coordinate corresponding to the adjunct in the paraphrase. We pointed out at the beginning of this section that the acceptability of gaps in various locations is not determined by purely grammatical factors, and the contrast between [46] and [47] is a clear instance where a grammatical constraint is overridden by semantic factors.

## 7.4 Nested dependencies

It is possible for a sequence containing a hollow clause gap and its antecedent to be nested between the gap of a major construction and its antecedent. This kind of construction is illustrated in examples like *Which of the two instruments will this piece be easier to play on?*

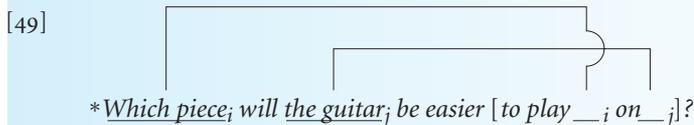

<sup>27</sup>The following is a rare attested example of a gap within an infinitival subject, showing that the constraint is not absolute: *The eight dancers and their caller, Laurie Schmidt, make up the Farmall Promenade of nearby Nemaha, a town; [that [to describe \_\_<sub>i</sub> as tiny] would be to overstate its size].*

The analysis of this example is as follows:

The brackets enclose the hollow clause, and the underlining marks the antecedents of the two gaps, one functioning as object of the verb *play*, the other as object of the preposition *on*. One plays pieces of music on instruments, as reflected in a main clause such as *Kim will play the sonata on this piano*. The NP containing the noun *piece* will thus be the antecedent for the gap which is object of *play*, and the NP containing the noun *instruments* will be antecedent for the gap which is object of *on*.

It will be noted from the diagram that the first antecedent is linked to the second gap, and the second antecedent to the first gap: the pair with the *j* index is said to be nested between the pair with the *i* index. The dependency relations are required to be nested one within the other in this way. It is not possible for them to cross each other, as in:

It is plausible to see this constraint as serving to facilitate understanding: if only [48] is an admissible structure, the hearer will know that the first gap encountered will be linked to the most recently perceived antecedent.

## 7.5 Parasitic gaps

### ■ Omission of personal pronoun with gap as antecedent

Under certain conditions it is possible to omit a non-reflexive, non-genitive personal pronoun whose antecedent is a gap in an unbounded dependency construction:

- [50] i *They do an annual report<sub>i</sub>; [that I always throw \_\_<sub>i</sub> away without reading it<sub>i</sub>].*  
 ii *They do an annual report<sub>i</sub>; [that I always throw \_\_<sub>i</sub> away without reading \_\_<sub>i</sub>].*

The second gap in [ii] is called a **parasitic gap**. It is 'parasitic' in the sense that a gap is permitted in this position only if the antecedent is also a gap. Thus in *I always throw their annual report<sub>i</sub>; away without reading it<sub>i</sub>*, the antecedent of the pronoun *it* is an overt NP, and omission of the pronoun in this case leads to ungrammaticality: *\*I always throw their annual report away without reading \_\_<sub>i</sub>*.

The most clearly acceptable cases of parasitic gaps occur, like that in [50ii], in non-finite clauses located within adjuncts functioning in clause structure.

### ■ Parasitic gaps distinct from across-the-board gaps

The construction with an ordinary gap + parasitic gap is to be distinguished from that where two ordinary gaps appear in coordinated constituents:

- [51] *It was a proposal; [that [Kim supported \_\_<sub>i</sub>] [but everyone else opposed \_\_<sub>i</sub>]].*

Here the second gap cannot be replaced by a personal pronoun. There is thus nothing parasitic about the second gap here: it is required by the rules for coordination. As

explained in Ch. 15, §2.1, a distinctive property of coordination is that such processes as relativisation must apply ‘across the board’: if relativisation applies within one coordinate it must apply within all. This is what accounts for the difference in grammaticality in [46], where [i] satisfies the across-the-board requirement and [ii] violates it.

Parasitic and across-the-board gaps can combine, as in the following attested example, where the parasitic gap is marked by an initial subscript ‘p’:

[52] *Fairbanks reached for a towel, a clean one and not the scarcely crumpled one; [that Comore himself had [used \_\_<sub>i</sub>] [and left \_\_<sub>i</sub> thriftily on the ledge below the mirror rather than consign p\_\_<sub>i</sub> to the linen basket]].*

The outer brackets enclose a relative clause within which there is a coordination functioning as complement of the perfect auxiliary *have*. The two coordinates, enclosed by the inner pairs of brackets, each have an ordinary gap as object (of *used* and *left* respectively), but in addition the second coordinate has a parasitic gap in the adjunct headed by *rather*. Again, the parasitic gap could be replaced by the personal pronoun *it*, but the ordinary gaps could not.

# Comparative constructions

6.3.1 Inflectional and analytic superlatives 1164

6.3.2 Non-superlative uses of *most* 1165

6.3.3 Absolute and relative superlatives 1166

6.3.4 The structure of superlative phrases 1167

## 1 Preliminaries

English has a rich system of specialised syntax and morphology for the expression of comparisons of various types. The two inflectionally marked terms in the system of **grade**, exemplified in such forms as *bigger* and *biggest*, have the expression of comparison as virtually their only use, and one of the three major kinds of finite subordinate clause – the type of clause underlined in *She is much bigger than she was then* or *She went to the same school as I went to* – is reserved for the expression of comparison.

We use the traditional terms **comparative form** and **superlative form** for the inflectional categories *bigger* and *biggest*, and **comparative clause** for subordinate clauses like *she was then* and *I went to*.<sup>1</sup> This chapter is concerned with constructions containing these categories and others bearing significant syntactic resemblances to them. In this preliminary section we introduce the main subtypes of comparative construction and a number of syntactic categories needed for their description.

### 1.1 Two cross-cutting distinctions: scalar vs non-scalar, equality vs inequality

Two intersecting dimensions of contrast yield the four types of comparative construction shown in [1]:

[1]	EQUALITY	INEQUALITY
SCALAR	<i>Kim is <u>as old as</u> Pat.</i>	<i>Kim is <u>older than</u> Pat.</i>
NON-SCALAR	<i>I took the <u>same bus as</u> last time.</i>	<i>I took a <u>different bus from</u> last time.</i>

#### ■ Scalar vs non-scalar

**Scalar** comparisons are concerned with relative position on some scale, such as that denoted by *old* in [1]; *old* is a gradable adjective and scalar comparison is one type of grading, potentially more complex than grading by means of such degree adverbs as *very*, *quite*, *rather*, etc., but of the same general kind.

**Non-scalar** comparisons, by contrast, are concerned not with grading but with such issues as identity and likeness. *Bus*, for example, is not gradable, and the non-scalar

<sup>1</sup>Recall that on our analysis (see Ch. 11, §8.1) *than* is a preposition taking the comparative clause as its complement, not part of the subordinate clause as in traditional grammar.

comparisons in [1] compare the two buses (the one I took and the one I had taken last time) for identity.

Scalar comparison can be regarded as the more central type: inflectionally marked comparatives are scalar and, within the inequality category, comparative clauses are rare in the non-scalar constructions.

### ■ Equality vs inequality

These terms apply reasonably transparently to scalar comparison. If Kim is as old as Pat, then Kim's age is (at least) **equal** to Pat's, and if Kim is older than Pat, their ages are **not equal**.

We do not so readily invoke these terms in describing the meaning of non-scalar comparisons (for example, *I took the same bus as last time* does not mean "The bus I took equals the bus I took last time"). Non-scalar comparison is concerned with identity vs non-identity or likeness vs unlikeness. Grammatically, however, there are grounds for recognising a single contrast applying to scalar and non-scalar comparisons alike: *as* is the main marker of equality comparison, whether scalar (*as old as Pat*) or non-scalar (*the same bus as last time*), while *than* marks both scalar inequality (*older than Pat*) and certain types of non-scalar inequality (*other than Pat* or, in some varieties of English, %*different than last time*).

#### Subtypes of inequality: superiority and inferiority

Within certain kinds of scalar comparison we need to distinguish two different kinds of inequality, giving in all a contrast between three categories, not just two:

[2]	EQUALITY		<i>as heavy as</i>	<i>as careful as</i>
	INEQUALITY	{	<i>heavier than</i>	<i>more careful than</i>
		{	<i>less heavy than</i>	<i>less careful than</i>

**Superiority** may be marked inflectionally (*heavier*) or analytically, by *more*, while the other categories are marked just analytically: **inferiority** is marked by *less*, and **equality** by *as*. What is standardly called the comparative inflection, therefore, is the marker of just one type of comparative relation, scalar superiority.<sup>2</sup>

#### Scalar orientation

Superiority and inferiority are to be interpreted relative to the particular scale at issue: *younger than* is just as much a comparison of superiority as *older than*. Scales have an **orientation**, or direction, which depends on the lexical meaning of the compared item. **Old** and **young** both denote scales concerned with age but have opposite orientations: the older something is, the further it is from age zero, whereas the younger it is the closer it is to that zero point. Superiority and inferiority are grammatical categories, marked as indicated above, whereas orientation is a matter of lexical meaning.

#### Scalar comparison of equality indicates "at least equal"

In the absence of indications to the contrary, a scalar comparison of equality is interpreted as "at least equal", not "exactly equal":

<sup>2</sup>The term 'equative' is often used in contrast to 'comparative' for what we are calling scalar comparison of equality. The view taken here is that *X is as heavy as Y* involves comparison just as much as *X is heavier than Y*, and syntactically they are alike in that the *Y* element can in both cases be realised by a comparative clause.

- [3] i *Jill is as clever as Liz.* [Jill may be cleverer]  
 ii *Jill isn't as clever as Liz.* [Jill must be less clever]

Example [i] is consistent with Jill being cleverer than Liz: we can say *Jill's as clever as Liz, somewhat more so in fact.*<sup>3</sup> Scalar equality therefore normally excludes only the relation of inferiority: it gives a lower bound. And the negative in [ii] accordingly entails inferiority, ruling out both the case where Jill and Liz are equally clever and that where Jill is cleverer.<sup>4</sup> This is just as well for the practical use of the language, for while some scales (such as those involving physical size) allow precise measurement, most do not. It would normally be nonsensical to ask whether Jill is exactly as clever as Liz, for example.

The extent to which a comparison of equality is compatible with superiority will vary with the content and context: *He made as many as eighteen mistakes* carries a much stronger suggestion that perhaps exact equality holds, for example, than *He made as many mistakes as I did.*

### ■ Sanctioning of non-affirmative items

Non-affirmative items such as *any, ever, etc.*, are permitted in three of the four subtypes of comparison given in [1]:

- [4] i *She ran faster than anyone had expected.* [scalar inequality]  
 ii *She ran as fast as she had ever run before.* [scalar equality]  
 iii *It was different from anything I'd ever seen before.* [non-scalar inequality]  
 iv *\*It was the same as anything I'd ever seen before.* [non-scalar equality]

There is an evident connection in [i–iii] with negation (the prototypical context for such items). These sentences entail, respectively, that no one had expected her to run as fast as she did, that she had never run faster before, that it was not the same as, or not like, anything I'd ever seen before.

## 1.2 Term and set comparison

A further distinction within comparative constructions is between **term comparison** and **set comparison**:

- [5] i a. *Ed is more tolerant than he used to be.* } [term comparison]  
 b. *Kim's version is much superior to Pat's.* }  
 ii a. *Ed made the most mistakes of them all.* } [set comparison]  
 b. *It sold for the highest price ever paid for a Cézanne.* }

The examples in [i] express comparison between a **primary term** and a **secondary term**, labels which reflect the fact that the secondary term is syntactically subordinate relative to the primary one. In [ia] the comparison is between how tolerant Ed is now, the primary term, and how tolerant he used to be, the secondary term: the primary term is expressed in the matrix clause, the secondary term in a subordinate clause (*he used to be*). In [ib]

<sup>3</sup>This can indeed apply also to *equal* itself, as in *Kim is the equal of Pat when it comes to solving crossword puzzles* (which is consistent with Kim being better) or *We hope to equal last year's profit* (consistent with bettering it).

<sup>4</sup>This applies to ordinary negation. With metalinguistic negation (Ch. 9, §1.2) it is possible to say *Jill isn't as clever as Pat, she's a good deal cleverer*: this rejects *Jill is as clever as Pat* not because it is false, but because it doesn't say enough.

the comparison is between Kim's version (primary) and Pat's version (secondary); in this case there is no immediate syntactic relation between the NPs expressing the two terms, but *Pat's* is lower in the constituent structure, and in that sense can be regarded as subordinate relative to the primary term.

The examples in [5ii] express comparison between the members of some set: in the type of set comparison illustrated here, one member of the set is picked out as being at the top of the scale. In [5iia] the set is identified by the NP *them all*: the comparison is between the members of this set with respect to how many mistakes they each made, with Ed ranked at the top of the scale. It is possible to omit the PP *of them all*, in which case the set being compared is identified contextually. In [5iib] the comparison is between the prices paid for paintings by Cézanne, and again one is picked out as being at the top of the scale.

### ■ Omission of secondary term in term comparison

The secondary term is commonly left implicit when it is recoverable from the context:

- [6] i *Ed was pretty difficult in those days, but now he's more tolerant.*  
 ii *Pat's version is rather pedestrian: Kim's is far superior.*  
 iii *They have moved house four times in as many years.*

We understand “more tolerant than he was in those days”, “far superior to Pat's version”, “as many as four years”;<sup>5</sup> with the missing material recovered from the preceding text. Alternatively, the secondary term may be simply recovered from the situation – as, for example, when you open the window in a stuffy room and I say *That's better!*

### ■ Equivalence between set and term comparisons

In general, set comparisons can be reformulated as equivalent term comparisons. For example, [5iia–b] are equivalent to:

- [7] i *Ed made more mistakes than all the others.*  
 ii *It sold for a higher price than had ever been paid for a Cézanne before.*

In [5iia] *them all* identifies a set that includes Ed, whereas in [7i] *all the others* excludes Ed and expresses the secondary term in the comparison. Similarly, in [5iib] one price is ranked at the top of the scale for the set of all prices ever paid, while in [7ii] one price is compared with all the others as primary term vs secondary term.

### ■ The scalar vs non-scalar and equality vs inequality contrasts apply to both types

The two dimensions of contrast introduced in §1.1 apply to set comparisons as well as to term comparisons, as illustrated in [8–9]:

[8]	SET COMPARISON	
	<b>Equality</b>	<b>Inequality</b>
<b>Scalar</b>	<i>Sue and Ed are equally good.</i>	<i>Sue is the best of the three.</i>
<b>Non-scalar</b>	<i>Sue and Ed are in the same class.</i>	<i>Sue and Ed go to different schools.</i>

<sup>5</sup>This is one place where scalar equality is interpreted as exact equality rather than as giving a lower bound: we understand “in four years”. Compare, similarly, *This is their sixth victory in as many matches* (“in six matches”).

[9]		TERM COMPARISON	
		<b>Equality</b>	<b>Inequality</b>
	<b>Scalar</b>	<i>Sue is as good as Ed.</i>	<i>Sue is better than the other two.</i>
	<b>Non-scalar</b>	<i>Sue is in the same class as Ed.</i>	<i>Sue goes to a different school from Ed.</i>

### ■ Syntactic differences

The two most important syntactic differences between term and set comparisons are the following:

- [10] i Comparative clauses occur only in term comparisons, where they are associated with the secondary term.  
 ii Superlative and comparative grades are used in comparisons of inequality; the superlative is restricted to set comparisons, while comparative grade is used predominantly in term comparison, but occurs also in set comparisons where the set has just two members.

The two uses of comparative grade are illustrated in:

- [11] i *Jill is taller than her twin sister.* [term comparison]  
 ii *Jill is the taller of the twins.* [set comparison]

In this chapter we devote §2 to the description of comparative clauses, and §3 is concerned with a special type of comparison known as metalinguistic comparison (as in *I was more worried than angry*). We then deal in §§4–6 respectively with scalar term comparison, non-scalar comparison, and scalar set comparison.

## 1.3 Comparative complements, comparative governors, and comparative phrases

The secondary term in a term comparison may be expressed by a comparative clause or some other form of expression, typically a phrase:

- [12] i *We performed better than we did last year.* [comparative clause]  
 ii *This year's performance was superior to last year's.* [other form (NP)]

While the comparative clause is a syntactically distinct construction appearing only in term comparisons, other forms of secondary term are not specialised to comparative constructions but occur readily elsewhere (cf. *It is too early to judge this year's performance, but last year's was excellent*).

### ■ Comparative complement – bare and expanded

Whether a comparative clause or not, the form expressing the secondary term has the syntactic function of complement. In the most central cases, as illustrated in [12], it is complement of a preposition which is itself governed, or selected, by some other item, as *than* in [12i] is governed by the comparative form *better* and *to* in [12ii] is governed by *superior*.<sup>6</sup> We will generalise to this construction the distinction between 'bare' and 'expanded', with **bare comparative complement** excluding the preposition

<sup>6</sup>In a few cases the secondary term is expressed in a genitive subject-determiner in NP structure, as in *my betters*, "those who are better than me".

and **expanded comparative complement** including it. As applied to the examples in [12], this gives:

- [13] i BARE COMPARATIVE COMPLEMENT      *we did last year*      *last year's*  
 ii EXPANDED COMPARATIVE COMPLEMENT      *than we did last year*      *to last year's*

The main prepositions that occur in the expanded complement vary to some extent according to the type of comparison:

[14]		EQUALITY	INEQUALITY
	SCALAR	<i>as</i>	<i>than, to</i>
	NON-SCALAR	<i>as, to, with</i>	<i>than, to, from</i>

### ■ Comparative governors

The items which license comparative complements we call **comparative governors**. The following table shows the main governors (underlined) together with the prepositions they take in expanded complements; the governors are classified according to the four types of comparison, with the pluses indicating scalar and equality, the minuses non-scalar and inequality:

[15]	SCALAR	EQUALITY	
i	+	+	<i><u>as</u> . . . as, <u>so</u> . . . as, <u>such</u> . . . as</i>
ii	-	+	<i><u>same</u> as, <u>such</u> as, <u>similar</u> to, <u>equal</u> to/with, <u>identical</u> to/with</i>
iii	+	-	<i><u>er</u> than, <u>more</u> than, <u>less</u> than, <u>rather</u> than, <u>prefer</u> . . . to/than, <u>superior</u> to, <u>inferior</u> to</i>
iv	-	-	<i><u>other</u> than, <u>else</u> than, <u>differ</u> from, <u>different</u> from/to/than, <u>dissimilar</u> to/from</i>

The *er* in [iii] represents the comparative inflection (whether realised as the suffix *er* or irregularly, as in *worse*, etc.). We include *such* in both scalar and non-scalar categories: scalar *such* expresses likeness of degree (*It isn't such a good idea as he would have us believe*), while non-scalar *such* expresses likeness of kind or identity (*I did such things as only one woman can do for another*). In addition we will see that comparison with *same* may have affinities with the scalar type when *same* modifies a gradable noun.

#### Governors taking bare complements

There are also items which take the secondary term as complement without any mediating preposition. These include *like* and *unlike* (which belong to both adjective and preposition categories), *as* and certain other prepositions such as *before* and *after*, a few verbs such as *equal*, *exceed*, *resemble* (it is the adjective *equal* that is listed in [15ii]), and so on. Thus we have *Ed is like his father*, not *\*Ed is like to his father*, etc. For *as* we need to distinguish the three occurrences shown in:

- [16] i *It wasn't as expensive as she had expected.*  
 ii *It was reasonably cheap, as she had expected.*

The first *as* in [i], an adverb, is the governor, and it licenses a complement expanded by the second *as*, a preposition. In [ii] we have just one *as*, a preposition, which is the governor and takes a bare complement (just as *like* does). In both cases the comparative clause *she had expected* is complement of the preposition *as*, but in [i] this *as* is selected

by the adverb *as* which introduces the comparison. In [ii] it is the preposition *as* itself that introduces the comparison.

### ■ Comparative phrase

We apply the term **comparative phrase** to a phrase containing a comparative governor. In [12], for example, the comparative phrases are *more satisfactorily than we did last year* and *superior to last year's*. In other cases it may be a larger phrase:

[17] *This may be a more serious problem than you think.*

Although *more* modifies *serious*, it is the phrase headed by *problem* that is the comparative phrase. This is another place where we can invoke the metaphor of upward percolation: the comparative feature percolates up from *more* to *more serious* and thence to the whole NP. We take up in §2.4 below the issue of how far such upward percolation can go, i.e. how much is encompassed by a comparative phrase.

### ■ Position of the comparative complement

The complement is found in a variety of positions relative to the head of the comparative phrase. They are illustrated in [18], where the comparative phrase is enclosed in square brackets, double underlining marks its head, and single underlining marks the expanded comparative complement.

- [18] i *He took out [a bigger loan than was necessary].* [post-head]  
 ii *She's [more experienced in these matters than I am].* [postposed in phrase]  
 iii *[More people] attended the meeting than ever before.* [postposed in clause]  
 iv *He chose Kim, than whom no one could be [more suitable].* [preposed]  
 v *They've achieved [a better than expected result].* [pre-head]  
 vi *[More people] oppose than support the proposed office reorganisation.* [before delayed right constituent]

In more detail, the possibilities shown in [18] are as follows:

- i The complement immediately follows the head, the noun *loan*.
- ii The *than* phrase is separated from the head but is still within the comparative phrase. *In these matters* is also a dependent (another complement) of *experienced*.
- iii The complement *than ever before* is separated from the head by the predicator and its object, and hence is not part of the same phrase as its governor *more* – not part of the comparative phrase.
- iv The comparative complement occupies initial position in the clause, because *whom* is a relative pronoun and hence occupies prenuclear position (along with the preposition *than*) in the relative clause. This is a relatively rare construction, found only in formal style.<sup>7</sup>
- v Here the comparative complement occurs in pre-head position within the comparative phrase. This pattern is largely restricted to inflectional comparatives with *than* followed by one of a handful of short expressions such as *anticipated*, *expected*, *hoped for*, *necessary*, *usual*.

<sup>7</sup> It is marginally possible also in open interrogatives (*Than whom is he less tolerant?*) and with complement preposing (*Than such a slogan, nothing could be more negative*). It is not found with comparisons of equality: \**Kim, as whom no-one could be as suitable*.

- vi This illustrates the delayed right constituent construction, which is more often found with coordination than with subordination (and hence is described in Ch. 15, §4.4). A typical coordinate example would be *Three-quarters of them oppose and only 15 % actually support the proposed office reorganisation*. The final NP, *the proposed office reorganisation*, is understood as object of both *oppose* and *support*. If the comparative complement were in final position, it would need a separately realised object: *More people oppose the proposed office reorganisation than support it*.

The most usual position for the comparative complement is at the end of the clause containing the comparative phrase, as in [18i–iii]. This means that if the clause contains material (other than the comparative complement itself) following the head, the complement will characteristically be postposed, very often to a position outside the comparative phrase. In [18ii–iii] postposing is optional: we can also have *She's more experienced than I am in these matters*; *More people than ever before attended the meeting*. The longer, or heavier, the complement is, relative to the other material, the more likely it is to be postposed. There are also cases where postposing is grammatically obligatory:

- [19] i *He knew more about Paris than any of his friends.* [postposing preferred]  
 ii *It is better to tell her now than to wait till after the exam.* [postposing required]

Example [i] is more natural than the version without postposing because the *than* phrase is significantly heavier than *about Paris*. In [ii] postposing is obligatory because the main contrast is between *to tell her now* and *to wait till after the exam*, and as the former belongs to the primary term it must precede the latter, which belongs to the secondary term.

It will be clear, then, that expanded comparative complements are very often indirect complements, in the sense explained in Ch. 2, §5: in these cases they are licensed not by the head of the construction in which they occur, but by some dependent of the head. In [18i], for example, *than was necessary* is complement of the bracketed NP, but it is not licensed by the head of that NP, *loan*.

## 2 Comparative clauses

**Comparative clauses** form a subcategory of subordinate clauses, contrasting with relative and content clauses. They are found in the four types of term comparison, though the non-scalar inequality type is subject to dialect restrictions described in §5.4:

- [1] i *It was better than I had expected.* [scalar inequality]  
 ii *It wasn't as good as I had expected.* [scalar equality]  
 iii *It was excellent, as<sup>%</sup>like I had expected.* [non-scalar equality]  
 iv <sup>%</sup>*It wasn't much different than I had expected.* [non-scalar inequality]

In all cases, the comparative clause (*I had expected*) is complement of one of the prepositions *than*, *as*, and *like*.

Note that it is not the matrix clause expressing the whole comparison that is traditionally called a comparative clause, but the subordinate clause that expresses the secondary term. The major distinctive feature of comparative clauses is that they are structurally reduced relative to full main clauses: in varying degrees, material is left understood that would be overtly present in comparable full main clauses. *I had expected*, for example, is not grammatical as a sentence in its own right.

### ■ Variables vs constants

The comparison in [1i] is between how good it was and how good I had expected it to be – but the sentence doesn't say how good it actually was or how good I had expected it to be. To describe the meaning we therefore need to invoke variables: we will informally represent the primary term as “It was  $x$  good” and the secondary one as “I had expected it to be  $y$  good”. The governor, the comparative inflection, then indicates that  $x$  exceeds  $y$ : “ $x > y$ ”. This kind of comparison is thus to be distinguished from that where one or both of the terms is a constant. Compare, for example:

- [2] i *It was better [than I had expected].* [variable–variable comparison]  
 ii *I stayed longer [than six weeks].* [variable–constant comparison]  
 iii *Sue is just like her mother.* [constant–constant comparison]

In [ii] the primary term again contains a variable “I stayed  $x$  long”, but the secondary term this time is simply “six weeks”. *Six weeks* here is an NP, not a clause: comparative clauses always express secondary terms involving a variable. Example [iii] illustrates the case where both terms are constants: this is simply a comparison between Sue and her mother.

### ■ Inversion

While a particular kind of structural reduction is the chief syntactic factor distinguishing comparative clauses from other clauses, there is also a difference with respect to the position of the subject, which can occur after the verb under conditions illustrated in:

- [3] i *Spain's financial problems were less acute than were those of Portugal.*  
 ii *\*The water seems significantly colder today than was it yesterday.*  
 iii *It is no more expensive than would be the system you are proposing.*  
 iv *\*It is no more expensive than would the system you are proposing be.*  
 v *\*He works harder than works his father.*

The effect of the inversion is almost invariably to place a contrastive subject in end position: in [i], for example, *those of Portugal* contrasts with *Spain's financial problems*. In [ii], then, where the contrast is between the non-subjects *today* and *yesterday* the inversion is out of place: we need *than it was yesterday*. Note, moreover, that in [iii] the subject follows the sequence *would be*: it cannot invert with *would* alone, as we see from [iv]. The construction therefore has strong affinities with postposing (cf. Ch. 16, §4) – yet it also resembles subject–auxiliary inversion in that the verb normally has to be an auxiliary: we can have *He works harder than his father works* but not [v]. The construction therefore has something of the character of a blend between subject postposing and subject–auxiliary inversion, and this mix of properties is found only in comparative clauses.

## 2.1 Reduction of comparative clauses

We confine our attention in this section to the central case where the comparative clause occurs in an expanded complement headed by *than* or *as*. We look first at two cases of obligatory reduction, (a)–(b), and then move on to optional reduction, (c)–(g).

## (a) Obligatory absence of counterpart to the comparative governor

The minimum reduction is seen in such examples as:

- [4] i *The swimming-pool is as deep as [it is \_\_ wide].*  
 ii *\*The swimming pool is as deep as [it is very / quite / two metres wide].*

The comparative governor, the underlined *as*, is a degree modifier of *deep* in the matrix clause, and the corresponding position in the bracketed comparative clause must be empty. This requirement is satisfied in [i], where the position of degree modifier (modifying *wide*) is empty, while [ii] is ungrammatical by virtue of this position being filled. The inflectional suffix *-er* counts as equivalent to the analytic marker *more*, so that the position indicated by ‘\_\_’, which we will refer to as the **gap**, must likewise remain empty in *The swimming-pool is deeper than [it is \_\_ wide].*

Although this position of the gap must remain syntactically empty, it is not semantically empty. The notation ‘\_\_’ is intended to suggest that some element is understood. What is understood is the value for the variable that we have already suggested is involved in the meaning of comparisons whose secondary term is expressed by a comparative clause.

Because of the missing but understood material, the comparative clause in [4i] does not have the same meaning as the main clause *It is wide*. The latter says that the pool is wide (relative to the norms for pools), but [4i] doesn’t say this. Rather, we understand something like “The pool is *x* units deep; the pool is *y* units wide; and *x* is (at least) equal to *y*”. In other words, there is an implicit degree modifier, and since this consists of a variable (*y*) whose value is unspecified, [4i] is consistent with the pool being wide, narrow, or in-between, depending on what the value turns out to be.

This implicit variable degree modifier explains the impossibility of filling the gap position with an explicit degree modifier, as in [4ii]: it can’t be implicitly and explicitly filled at the same time. In the matrix clause the *x* variable is also implicit rather than actually expressed, but syntactically its position is taken by the comparative governor, expressing the relation between *x* and *y*.

## (b) Counterpart of comparative phrase normally omitted unless distinct

Consider next:

- [5] i *She is older than [I am \_\_].*  
 ii *She went to the same school as [I went to \_\_].*

The comparative phrases are *older than I am* and *the same school as I went to*, and counterparts to these, corresponding phrases minus the comparative governor and complement, i.e. *old* and *the school*, are understood but unexpressed in the comparative clause. We understand “I am *y* old”, “I went to *y* school”, but *old* and *school* must be left implicit as well as the *y* variables. The syntax thus excludes:

- [6] i *\*She is older than [I am old].*  
 ii *\*She went to the same school as [I went to the school].*

The comparative clause can contain a counterpart to the comparative phrase when there is a contrast between them. This was the case in [4i], which has a contrast between the *deep* of the matrix clause and the *wide* of the comparative clause. Further

examples are:

- [7] i *She wrote more plays than [her husband wrote novels].*  
 ii *You couldn't be a worse polo-player than [you are a singer].*  
 iii *He is more afraid of her than [she is of him].*  
 iv *There is no more reason to invite him than [there was to invite her].*

In [i] *novels* contrasts with *plays* and hence we have an overt counterpart to the comparative phrase: both the comparative phrase and its counterpart are NPs functioning as object of their clause, the former headed by *plays*, the latter by *novels*. Example [ii] is similar, except that the comparative governor is here within an attributive adjective (*worse*) rather than a determinative (*more*). In [iii–iv] the contrast lies not in the heads of the comparative phrases (*afraid* and *reason*) but in the post-head dependents: ‘*of him*’ is therefore an AdjP with a missing head (and missing degree modifier), and analogously for ‘*to invite her*’. It is possible to repeat the head in such circumstances; thus [iii] can be expressed as *He is more afraid of her than [she is afraid of him]*.<sup>8</sup>

### (c) Stranding and *do*

The comparative clause is commonly further reduced by elliptical stranding of auxiliary verbs or infinitival *to*:

- [8] i *She is right more often than [the others are    ].*  
 ii *I didn't enjoy the concert as much as [Kim had    ].*  
 iii *I don't hear from my brother as often as [I used to    ].*  
 iv *She can get through more work in an hour than [I can     in a day].*

Again the bracketing here identifies the comparative clause, while the underlining indicates matrix material that is ellipsed. The ellipsis here is optional: the gaps could be filled out as *right*, *enjoyed it*, *hear from him*, *get through*, i.e. repetitions or variants of the matrix material. The elliptical versions are more frequent than those with repeated material. The gap comes at the end of the clause, as in [i–iii], or else is followed by contrastive material, as in [iv], where *in a day* contrasts with *in an hour* in the primary term. The resultant structures are like those found with stranding in non-comparative constructions (Ch. 17, §7) – compare [i] and [iv], for example, with the coordinations:

- [9] i *She is right and the others are     too.*  
 ii *I can't get through that much work in an hour, but I can     in a day.*

What distinguishes the comparative construction is that any filling in of the gaps is subject to the restrictions covered in (a) and (b) above, so while we could expand the coordinative [9ii] to *I can get through that much work in a day* the maximum expansion of the comparative clause in [8iv] is *than I can get through     in a day*.

The expressions that can be stranded are the same as in non-comparatives. Thus a lexical verb such as *enjoy* cannot be stranded in comparatives any more than in

<sup>8</sup>An exceptional case where a head is retained even though it is neither distinct nor accompanied by a distinct dependent is that where the head is contrastively stressed in a correction of what has just been said, as in A: *She writes as many books as you write articles. B: No, that's an exaggeration; but she writes as many books as I write BOOKS.*

non-comparatives:

- [10] i \**I didn't enjoy the concert as much as [Kim had enjoyed \_\_].*  
 ii \**Kim enjoyed the concert and I enjoyed \_\_ too.*

The reduced VP is commonly headed by the verb **do**, which in some varieties of English is best considered as an auxiliary verb that can be stranded like those in [8] and in other varieties as a pro-form (see Ch. 17, §7.2):

- [11] i *I get it wrong more often than [she does].*  
 ii *We treat our apprentices better than [they do their career employees].*

Here too the reduced comparative clauses are formally identical to non-comparative clauses found in other anaphoric constructions: *I often get it wrong and she does (too); We treat our apprentices well and they do their employees.* And again the possible replacements for the **do** forms are subject to the restrictions given in (a)–(b), so while we can have *I often get it wrong and she often gets it wrong too*, we can't have \**I get it wrong more often than [she often gets it wrong]*.

In varieties (especially BrE) where **do** is a pro-form, it can occur after auxiliaries or infinitival *to*, and this yields the possibility of a choice between the stranding and pro-form constructions. Compare, for example, [8ii] on the one hand and %*I didn't enjoy the concert as much as [Kim had done]* on the other.

Examples are occasionally found where the *do* clause is passivised in such a way that no simple replacement for the pro-form is possible. Compare:

- [12] i %*We must attend to it more closely than [people have usually done].*  
 ii %*We must attend to it more closely than [has usually been done].*

We can expand [i] to *people have usually attended to it*. However, if we replace *do* in [ii] by a version of its antecedent the *it* will appear as subject, and *attended to* in place of *done*: *it has usually been attended to*. The subjectless passive that we have in [ii] bears some resemblance to the construction with an understood embedded clause, to which we now turn.

#### (d) Omission of embedded clauses

Another common type of reduction is seen in:

- [13] i *The matter was more serious than [we had expected \_\_].*  
 ii *More faults had been detected than [he was willing to admit \_\_].*  
 iii *They finished the job earlier than [\_\_(had been) expected].*  
 iv *The difficulties are even greater than [\_\_ appears at first sight].*

Here an entire subordinate clause is understood. We could make the meaning of [i] explicit by replacing the gap by *than we had expected that it would be*, or *than we had expected it to be*. It is much more usual, though, to omit the subordinate clause, as in the examples given.

In [13iii–iv] the missing clause is understood as subject. Expansion to make the meaning explicit would require extraposition (*They finished the job earlier than it had been expected that they would finish it*) – but note that extraposition *it* cannot be inserted if the clause is not added: \**They finished the job earlier than it had been expected*.

In the passive construction, as in [13iii], some verbs, such as *expect*, allow the omission of auxiliaries (as indicated by the parentheses in [iii]), reducing the comparative clause

to just a past participle (*than expected*). In [14] we give a sample of verbs figuring in this construction, with the annotation ‘-AUX’ indicating the possibility of omitting the auxiliaries.

[14]	<i>acknowledge</i>	<i>admit</i> -AUX	<i>allow</i>	<i>anticipate</i> -AUX	<i>appear</i>
	<i>assume</i> -AUX	<i>believe</i>	<i>dream</i>	<i>expect</i> -AUX	<i>hope</i>
	<i>imagine</i>	<i>imply</i>	<i>indicate</i> -AUX	<i>intend</i> -AUX	<i>justify</i>
	<i>like</i>	<i>plan</i> -AUX	<i>predict</i> -AUX	<i>realise</i> -AUX	<i>recognise</i>
	<i>remember</i>	<i>require</i> -AUX	<i>schedule</i> -AUX	<i>show</i> -AUX	<i>suggest</i>
	<i>suppose</i>	<i>suspect</i>	<i>think</i> -AUX	<i>warrant</i>	<i>wish</i>

*Dream* takes the preposition *of*: *The Ariadne was going to be much hotter than our space people had ever dreamt of.*

The verbs in [14] are predominantly non-factive (in the sense explained in Ch. 11, §7.4), but it is worth noting that the class does include factive *realise*. Consider, then:

- [15] i *The draft had more mistakes in it than I had realised.*  
 ii *I had realised that the draft had five mistakes in it.*  
 iii “The draft had five mistakes in it”

Example [ii] entails [iii]: if [ii] is true, [iii] must be true too. This property of *realise* might at first seem problematic for [i]. The secondary term in the comparison is “I had realised the draft had *x* many mistakes in it”, which entails “the draft had *x* many mistakes in it” – yet the sentence says it had more than *x* mistakes in it. There is, however, no contradiction here: [ii] does not say that there were **exactly** five mistakes, only that there were **at least** five. If the draft contained seven mistakes it follows that it contained five, though one generally wouldn’t **say** that it contained five if one knew that it contained seven (cf. Ch. 5, §5.2). This is why [i] makes perfect sense. It says that there were more mistakes in the draft than I had been aware of: contrast *\*The draft didn’t have as many mistakes in it as I had realised.*

In addition to the verbs listed in [14], we also find adjectives and other predicative expressions in these missing-clause comparatives:

- [16] i *Don’t spend any longer on it than [\_\_ (is) necessary].*  
 ii *The score is higher than [\_\_ would have been the case if no one had cheated].*  
 iii *The danger may be greater than [any of us is aware (of) \_\_].*

The understood missing parts are something like “spending that long on it” in [i], “the score being that high” in [ii], and “the danger being that great” in [iii]. The lexical items allowing this sort of construction include:

[17]	<i>acceptable</i>	<i>aware</i>	<i>justifiable</i>	<i>necessary</i> -v	<i>normal</i> -v
	<i>polite</i>	<i>possible</i> -v	<i>usual</i> -v	<i>the case</i>	<i>one’s habit</i>

With *necessary* and others marked ‘-v’, the verb *be* can be omitted, so that the clause may consist simply of the adjective: *than [\_\_ necessary].*

#### (e) Verbless clauses: reduction to two (or more) elements

We turn now to constructions where the verb is omitted (beyond the special case mentioned in (d) above), beginning with those where at least two elements remain:

- [18] i *Max didn’t love Jill as much as [she \_\_ him].*  
 ii *He didn’t send as many postcards to his friends as [\_\_ letters to his mother].*

In [i] just the verb is optionally omitted (we could insert *loved* or *did*), whereas in [ii] the subject is omitted as well as the verb (we could supply *he sent* or *he did*).

The resultant structures are again like ones found in various types of coordination:

- [19] i *Max loved Jill and she* \_\_ *him*.  
 ii *He sent postcards to his friends and* \_\_ *letters to his mother*.

As before, the permitted expansions are different: in [19], for example, we could expand to *and she loved him even more* or *and he sent many letters to his mother*, but the *even more* and *many* cannot be added in [18] by virtue of conditions (a)–(b). There are also differences with respect to negation. In [18] the comparative clause is interpreted as positive (“as she loved him”, “as he sent letters to his mother”), even though the matrix clause is negative – and changing the matrix to positive has no effect on the polarity of the comparative clause (cf. *Max loved Jill as much as she* \_\_ *him* and *Max sent as many postcards to his friends as letters to his mother*). But to get a positive interpretation of the second coordinates in [19] we had to make the first coordinate positive too: *Max didn’t love Jill and she* \_\_ *him*, for example, doesn’t allow the interpretation “and she loved him”.

#### (f) Verbless clauses: reduction to a single element

The extreme case of reduction is where only a single element remains:

- [20] i *We spend more time in France than* [ \_\_ *in Germany*]. [PP]  
 ii *He seems to play better drunk than* [ \_\_ *sober*]. [AdjP]  
 iii *More believed that it was genuine than* [ \_\_ *that it was a hoax*]. [content clause]  
 iv *It is better to try and fail than* [ \_\_ *not to try at all*]. [infinitival clause]  
 v *Sue phoned Angela more often than* [( \_\_ ) *Liz* ( \_\_ )]. [NP]  
 vi *He has more enemies than* [ \_\_ *friends*]. [nominal]

In all of these it would be possible to add material in the position of the gap: for [i] we could have *We spend more time in France than* [*we spend* \_\_ *in Germany*], and so on. Reduction to an AdjP, as in [ii], is restricted to cases where the AdjP is adjunct: we cannot omit the *it is* in [4i] (*The swimming-pool is as deep as it is* \_\_ *wide*) where the AdjP is predicative complement.<sup>9</sup>

In [20iii], *that it was a hoax* is a content clause in terms of its internal structure: as a comparative clause it is reduced to just a complement with the form of a content clause, but permits expansion by the addition of *believed*, giving *than* [ \_\_ *believed that it was a hoax*]. Analogously for [iv].

The most common type of single-element construction has an NP standing on its own, as in [20v]. This example illustrates an obvious type of ambiguity resulting from reduction: it can be filled out as either *than* [*she phoned Liz* \_\_] or as *than* [*Liz phoned her* \_\_] (and such fuller versions are likely to be preferred where the context doesn’t make clear which meaning is intended).

In [20vi] the complement of *than* is an NP, but the part following the gap is a nominal and cannot be replaced by a full NP such as *these friends*.

#### Pronoun case

Where the single element is a personal pronoun, the choice between nominative and accusative follows the general rules given in Ch. 5, §16.2. Compare:

<sup>9</sup>Examples like *He was more shy than rude* involve metalinguistic comparison (§3).

be syntactically like *Bob is similar to Liz*, where there is no question of *Liz* being a clause.

One initial point to make is that there are unquestionably some constructions where a single element following *than/as* is an immediate complement, not a reduced clause:

[25] *I saw him as recently as Monday. It is longer than a foot. He's inviting more people than just us. He's poorer than poor. Sue deals with matters such as sales. I saw no one other than Bob.*

The underlined expressions here can't be reduced clauses, because they can't be expanded into clauses: cf. \**I saw him as recently as I saw him Monday*; \**I saw him as recently as Monday is*; and so on.

The question then is whether all single element constructions should be treated alike or whether a distinction should be drawn such that some, like [25], are immediate complements while others, including [23], are reduced clauses. We review below a number of factors relevant to the choice between these analyses. They do not provide conclusive evidence in favour of one over the other. We have to allow, therefore, for co-existing alternative analyses.

#### ■ Evidence for a reduced clause analysis

The immediate complement analysis is obviously the simpler of the two and hence initially the more viable. We therefore begin by dealing with three arguments that must be acknowledged as favouring a reduced clause analysis. We will point out, however, that each of the arguments is weakened by certain countervailing considerations.

##### (a) Potential for nominative case

The first is that in formal style the complement of *as/than* can be a nominative pronoun: *Bob is as generous as she*. A reduced clause analysis obviously accounts for this very simply: the pronoun is subject of the reduced clause and hence takes the same case as it would if the verb were included (*as she is*). The comparative clause construction will then differ structurally from the one with *after* or *before*: *Bob left after Liz*. Unlike [23], this does not allow a nominative: *Bob left after her! \*she*. The nominative is impossible here because the pronoun is not subject of a clause but the immediate complement of a preposition.

The fact that less formal style allows an accusative in the comparative construction (*Bob is as generous as her*) is irrelevant because it is consistent with the pronoun being either an immediate complement or a reduced clause. This is because informal style has nominatives only when a primary form of the verb is present, allowing accusative subjects when the verb is omitted (*Kim will be giving the first lecture, me the second*), or is in a secondary form (*What, me wear a kilt?*).

The possibility of a nominative certainly supports a clausal analysis, but we do not regard it as conclusive, because nominatives are found (again in formal style) in certain constructions that we would not want to regard as clausal: *Everyone other than she had signed the petition*. This is like the examples in [25] in not allowing expansion by the addition of a verb; it differs in that *other than* falls within the subject, and it is this association with the subject that motivates the nominative case.

##### (b) Range of phrase types

A second factor favouring a clausal analysis is that the range of expression types following *than* and *as* in this construction is much wider than is normally found as complement to a

preposition. Compare, for example:

- [26] i a. *I'm more confident that Kim will support us than that Pat will.*  
 b. *\*I'd prefer that Kim supported us to that Pat did.*  
 ii a. *It is more important to do it well than to do it quickly.*  
 b. *\*To do it well is different from to do it quickly.*

*Than* is followed by a declarative content clause in [ia] and an infinitival clause in [iia], but these cannot function as complement to such prepositions as *to* and *from*. It's not just a matter of *than/as* allowing a large range of expression types, however: the important point is that the content clause in [ia] is not licensed by *than* but by *confident*, and similarly the infinitival clause in [iia] is licensed by *important*. On a reduced clause analysis *than* in [i] doesn't have a content clause but a comparative clause as its immediate complement: *that Pat will*, considered as a content clause, is complement of the understood *confident*, the item which licenses it.

The range of expression types that can occur with *than/as* is similar to that found with the coordinators: cf. *I'm confident that Kim will support us and [that Pat will]*; *It is important to do it well and [to do it quickly]*. There are indeed significant similarities between coordination and comparison. Coordinated elements are normally required to be syntactically alike (Ch. 15, §3), and this likeness is seen too in the comparative construction we are concerned with here – between *that Pat will* and *that Kim will support us*, between *to do it quickly* and *to do it well*, and so on.<sup>10</sup>

Nevertheless, *than* is a preposition here, not a coordinator: the comparative is a subordinative construction, not a coordinative one. The crucial difference between *than* and *and* is that *than* is dependent for its occurrence on a comparative governor, here *more*. Within the AdjP *more confident that Kim will support us than that Pat will*, the complements *that Kim will support us* and *than that Pat will* are not coordinate, not of equal syntactic status, because the former is licensed by *confident*, the latter by *more confident*.

The force of this argument is reduced, however, by the fact that there is a small set of prepositions which do take a similarly wide range of complement types. These are the prepositions of inclusion and exclusion/exception: *including*, *excluding*, *except*, *save* (see Ch. 7, §5.1). Compare, for example: *I'm not confident of anything except that Pat will support us*. There is no plausible analysis of this in which *that Pat will support us* is an elliptically reduced version of a larger clause, but the licensing of it still involves *confident*.

Nevertheless, even these prepositions do not behave entirely like *than/as*:

- [27] i *He has more enemies than   friends.* (= [20vi])  
 ii *He'll have no one voting for him except friends.*

We have seen that it is impossible to add a determiner to *friends* in [i], but in [ii] we could have, for example, *except his friends*. On a reduced clause analysis the restriction applying to [i] follows from the general rule given in §2.1 above that the counterpart to the comparative governor must be omitted, but on the immediate complement analysis we need an extra restriction, unique to the comparative construction.

<sup>10</sup>The connection between comparison and coordination is reflected in the fact that certain comparative expressions have uses in which they have been reanalysed as marginal coordinators (Ch. 15, §2.8), e.g. *as well as* in *We have a cat as well as a dog*.

## (c) Potential for expansion

A third factor is already implicit from the discussion above. Examples like [23] (*Bob is as generous as Liz*) can be expanded into obvious clausal structures:

- [28] i a. *Bob is as generous as Liz.*                      b. *Bob is as generous as Liz is.*  
 ii a. *I enjoyed it more than the film.*                      b. *I enjoyed it more than I enjoyed the film.*

It is not just that such expansion is possible; it is an important advantage of the reduced clause analysis that it brings out the difference between such examples and those like [25], where no expansion is possible. At the same time, it ties in with the semantics. *Bob is as generous as Liz* is interpreted as a variable comparison (“Bob is  $x$  generous, Liz is  $y$  generous, and  $x$  is (at least) equal to  $y$ ”), whereas this kind of interpretation does not apply in [25] (recall the contrast between variable–variable and variable–constant comparisons illustrated in [2] of §2). Moreover, the reduced clause analysis offers a straightforward account of the ambiguity of examples like [20v] (*Sue phoned Angela more often than Liz*), with *Liz* subject of the reduced clause in one interpretation, object in the other. And given that a clause can be reduced to a sequence of two elements, as in [18], there would seem to be no principled reason for saying that it can’t be reduced to a single element.

A problem emerges, however. It is not in fact a straightforward matter to determine whether or not a verb can be added. Consider such examples as the following:

- [29] i *In a country as rich as Australia there should be no poverty.*  
 ii *He won’t waste his hard-earned dollars on something as frivolous as exercise.*  
 iii *Criticism is as old as literary art.*  
 iv *Your guess is as good as mine.*  
 v *The field was as flat as a pancake.*  
 vi *He looks as fit as a fiddle.*

The relevant verb in all cases is *be*. It can be added readily enough in [i] (*as Australia is*), but for [ii–iv] it would be very unusual, for [v] it would be almost impossible, and for [vi] it is unthinkable.

The reason we can’t add *is* in [29vi] is that *as fit as a fiddle* is an idiom meaning “very fit”. It would be nonsensical to ask how fit a fiddle is (violins do not have states of health), and hence it is impossible to insert *is*. In the case of [v] it would not be nonsensical to insert *is* because pancakes are in fact flat; it is just highly unidiomatic, because *as flat as a pancake* is a familiar established phrase. In this phrase it is possible to omit the first *as* (*was flat as a pancake*), and insertion of the *is* then becomes syntactically impossible. Example [iv] is also a familiar expression, one that this time includes the subject, not just the predicative AdjP. And this familiarity of the expression disfavors the addition of *is*, though not so strongly as in [v–vi].

In general, the more familiar the expression, the less readily will it accommodate the addition of a verb. But this does not provide a dichotomy between cases where the verb can be added and those where it can’t. Moreover, it is not a matter of syntax as such. It is not clear, therefore, that we have grounds for making any structural distinction among the comparative complements in [29], or between them and [28].

We have been tacitly assuming here that potential expansion is a sufficient condition for a reduced clause analysis: that if you can expand to make a clause, the clausal analysis is the right one. But there is one context in which this would yield the wrong results, namely in the complement of the prepositions *before* and *after*. Compare:

- [30] i *Sue phoned Angela before Liz.*  
 ii *Sue phoned Angela more often than Liz.* (= [20v])

Here [i] exhibits the same ambiguity as [ii], being expandable to either (a) *before Liz phoned her*, or (b) *before she phoned Liz*. But it would be wrong to say that *Liz* is a reduced clause in [i], because (as noted above) a pronoun in this position cannot appear in nominative case: *\*Sue phoned Angela before she* is ungrammatical. It would therefore be wrong to treat expandability as sufficient to establish that a reduced clause analysis is valid.

### ■ Evidence for an immediate complement analysis

We now present two arguments against treating every phrasal complement to *as* or *than* as some kind of reduced clause. Again, though, we note that there are complicating and weakening considerations; the arguments are not conclusive.

#### (a) Fronting and preposition stranding

Consider, first, the following constructions:

- [31] i *It was decided by Judge Darwin, than whom no one could be more impartial.*  
 ii <sup>?</sup> *How many of them do you regard yourself as better than?*

Example [31i] is a further example of the construction illustrated in [18iv] of §1. *Than* has a relative pronoun as complement, so that *than* + NP occupies prenuclear position in the relative clause, rather than the final position seen in the main clause *no one could be more impartial than Judge Darwin*. It would be quite impossible to have a clause as complement to *than* here, e.g. *\*than [who is \_\_] no one could be more impartial*.

Whereas [31i] belongs to formal style, [ii] is informal, and indeed perhaps of only marginal acceptability. Structurally, it differs from [i] in that only the complement *how many of them* is fronted, with the preposition *than* left stranded in its basic position. And again the fronted element can only be a phrase, not a clause: *\*How many of them are do you regard yourself as better than?*

In these two constructions, then, *whom* and *how many of them* do behave syntactically as immediate complements of *than* rather than as clauses.

The force of this argument is limited, however, by the fact that these are very rare constructions: they don't provide a secure foundation for building an analysis of the much more central type seen in our *Bob is as generous as Liz* example.

#### (b) Reflexives

A second point concerns the optional occurrence of reflexive pronouns, as in:

- [32] *He married a woman fifteen years younger than him/himself.*

It is not possible to add a verb here (*\*than himself was*), which suggests that the pronoun is an immediate complement.

Once again, the evidence is far from conclusive, because the reflexive form could be attributable to the omission of the verb, as in *I suggest that you give the first three lectures and myself the remaining two*.

### ■ Fused relative as complement: *than what* ...

Where the complement of *than/as* is a single element with the form of a fused relative introduced by *what*, a distinction is to be made between the following constructions:

- [33] i *She apparently liked it more than what we gave her.*  
 ii <sup>%</sup> *She apparently liked it more than what we did.*

There is nothing special about [i]: *what we gave her* is not significantly different from any other NP, such as *the book we gave her*, for example. Note, in particular, that [i] could be expanded to *She apparently liked it more than she liked what we gave her*. The meaning of [ii] (at least in the salient and intended interpretation) is “She apparently liked it more than we liked it”. Here *what we did* can’t be expanded: on the contrary, *what* can be dropped to give *She apparently liked it more than we did*. It is therefore using a fused relative NP instead of a comparative clause. This second construction is commonly encountered in speech, but it is not normally found in published writing: it is very doubtful whether it can be regarded as belonging to the standard variety of English.

## 2.3 Likeness and contrast between comparative clause and matrix

### ■ Maximum and minimum likeness

The terms in a variable comparison are partly alike and partly different. The extremes on the scale of likeness are illustrated in these two examples, where underlining indicates material shared between the comparative clause and the matrix:

- [34] i *She’s as fit as [she is \_\_\_] because she does so much swimming.*  
 (“she is x fit”, “she is y fit”)  
 ii *More people came to the show than [we could find seats for \_\_\_].*  
 (“x many people came to the show”, “we could find seats for y many people”)

In [i] the terms differ only in the implicit variables (which are asserted to be equal). Syntactically, the comparative clause differs from the matrix only in the absence of a counterpart to the comparative phrase.<sup>11</sup> The minimum likeness required is that the comparative clause include, semantically, a counterpart to the comparative phrase. This is the case with [ii], where the likeness to the matrix is confined to the understood “many people”.

Most variable comparisons fall between these extremes, having some overt contrast but also varying amounts of shared material, repeated (typically by pro-forms) or left understood:

- [35] i *There were more boys in the class than [(there were) girls].*  
 ii *Jill spends more time in London than [(she does) at home].*

### ■ Multiple contrasts

Each of the examples in [35] involves a single contrast (apart from that between the implicit variables), but one commonly finds more, e.g. two in [36i] and four in [36ii]:

- [36] i *There were more boys in 1B than [(there were) girls in 1C].*  
 ii *Kim lost more at the races in one day than [I earned at my job in a year].*

### ■ Implicit point of contrast in the matrix

There may be a contrast between an overt element in the comparative clause and one which is merely understood in the matrix:

<sup>11</sup>In this type of comparison there is generally an implicature that the value of the variables is relatively high – she’s quite high on the scale of fitness. Similarly: *With the weather being as hot as it is, the weeds should dry out quickly enough.*

- [37] i *The trains arrive on time more often than [they do in England].*  
 ii *It tastes better than [it does with sugar in].*

The implicit elements are recoverable deictically (i.e. from the time, place, or other circumstances of the speech act) or anaphorically (from previous mention). In [i] the contrast is between England and the country we are in or have been talking about; in [ii] we understand “like this/that, i.e. without sugar in”.

### ■ Temporal contrasts

The main contrast may be a matter of time, expressed by tense:

- [38] i *It is better than [it was].*  
 ii *It wasn't as good as [it is now].*

Note, however, that where contrastive present time is associated with the comparative clause the present tense normally needs reinforcing with a temporal modifier: it would be unusual to drop *now* from [ii].

### ■ Contrasts involving embedding

When the comparative phrase is contained within a content clause, the scope of the comparison may or may not extend upwards into the superordinate clause. Compare:

- [39] i *Jill thinks Max is better off than [she is].* [narrow scope]  
 ii *Jill thinks Max is better off than [he is].* [wide scope]

The salient interpretation of [i] attributes to Jill the thought “Max is better off than I am”, where the terms in the comparison are “Max is *x* well off” and “I (Jill) am *y* well off”: here *Jill thinks* is outside the scope of the comparison. But the salient interpretation of [ii] does not attribute to Jill the nonsensical thought “Max is better off than he (Max) is”. Rather, *Jill thinks* is within the scope of the comparison, whose terms are “Jill thinks Max is *x* well off” and “He (Max) is *y* well off”. As will be evident from these examples, this distinction is not encoded grammatically, and strictly speaking both examples are ambiguous as to the scope of the comparison.<sup>12</sup>

## 2.4 The comparative phrase

We have so far been talking of the comparative phrase quite loosely as the one ‘containing’ the comparative governor: we need now to consider the concept rather more carefully.

### ■ Predicative vs attributive AdjP

Note first the following data:

- [40] i *His motor-bike was more powerful than my car had been \_.*  
 ii *\*He had a more powerful motor-bike than my car had been \_.*  
 iii *He had a more powerful motor-bike than I had had \_ / than mine had been \_.*

<sup>12</sup>One respect in which there is a grammatical difference is that the comparative clause in examples like [39ii] can't be reduced to a pronoun in the ‘sensible’ reading, but allows a reflexive in the nonsensical one: *\*Jill thinks Max is better off than himself*.

In [i] the comparative phrase is *more powerful* (*than my car had been*):<sup>13</sup> we understand the secondary term as “my car had been *y powerful*”. In [ii], however, the comparative phrase is not *more powerful* but the larger sequence *a more powerful motor-bike*: this is why the example is anomalous, for we have to interpret the secondary term as “my car had been *a y powerful motor-bike*”. Instead of this we need examples like [iii], where the secondary terms “I had had *a y powerful motor-bike*” and “mine had been *a y powerful motor-bike*” make sense. As suggested in §1.3, we can think of the comparative feature as ‘percolating’ upwards from the AdjP to the NP in which it functions as attributive modifier.

#### ■ AdvP

Compare similarly:

- [41] i *She spoke more persuasively than her father had \_\_\_.*  
 ii *He was more conspicuously shy than Max was \_\_\_.*  
 iii *\*He was more conspicuously shy than Max leered \_\_\_ at Jill.*  
 iv *This is a more carefully researched article than I have read \_\_\_ this semester.*  
 v *\*This is a more carefully researched article than his book was \_\_\_.*

In [i] the comparative phrase is the AdvP *more persuasively*. In [ii–iii] it is the AdjP *more conspicuously shy*: [iii] is unacceptable because there is no place in the comparative clause for an understood “shy”. And in [iv–v] the comparative phrase is *a more carefully researched article*, with [v] being anomalous because it requires the interpretation “his book was *a y carefully researched article*”. Again, then, we have upward percolation of the comparative feature from the AdvP to the AdjP in [ii–iii], and to the NP in [iv–v].

#### ■ Postpositive AdjP

Where an AdjP modifier is postpositive (after the noun) rather than attributive (before the noun) there is normally no such upward percolation:

- [42] i *\*He had a more powerful motor-bike than my car had been \_\_\_.* [attributive]  
 ii *He had a motor-bike more powerful than my car had been \_\_\_.* [postpositive]

In [i] (discussed above as [40ii]) the comparative phrase is *a more powerful motor-bike*, whereas in [ii] it is just *more powerful*: the difference in acceptability reflects the fact that while a car can be powerful, a car cannot be a powerful motor-bike. The postpositive AdjP here behaves in the same way as a relative clause: *He had a motor-bike which was more powerful than my car had been*. It also behaves like a clause in that the comparative complement cannot be postposed out of it: *Anyone less thick-skinned than Kim would have resigned long ago*, but not *\*Anyone less thick-skinned would have resigned long ago than Kim*.

#### ■ PP

In general upward percolation does not extend from an NP to a PP containing it, but there are nevertheless some constructions where it does:

- [43] i *He lectured on more topics than \_\_\_ were included in the syllabus.*  
 ii *He lectured on more topics than I had lectured on \_\_\_ / \*than I had lectured \_\_\_.*  
 iii *He returned to us in a far less buoyant frame of mind than he had left us \_\_\_.*

<sup>13</sup>Henceforth in this section we simplify by omitting the *than* or *as* phrase (the comparative complement) when citing comparative phrases.

In [i–ii] the comparative phrase is the NP *more topics*, not the PP *on more topics*: in [i] the missing subject is understood as “*y* many topics”, not prepositional “on *y* many topics”, and in [ii] *on* cannot be omitted from the comparative clause, as would be possible (and indeed required) if it were part of the counterpart to the comparative phrase.<sup>14</sup> In [iii], however, the comparative phrase is the PP *in a far less buoyant frame of mind*: we interpret the comparative clause as “he had left us in a *y* buoyant frame of mind” and it is not possible to add *in* after *us*.

### ■ Unexpected cases of upwards percolation

One finds occasional examples where the upwards percolation goes beyond what is allowed for on the above account. In the following it applies with postpositive AdjPs:

- [44] i *They would have us face risks greater than President Kennedy’s most influential advisers seem disposed to face* \_\_ .  
 ii *He made tables of veins, nerves, and arteries five times more exact than* \_\_ *are described by any contemporary author.*

The gaps here require understood NPs, not AdjPs, since their functions are respectively object and subject: the comparative phrases must include *risks* and *tables of veins, nerves, and arteries*. Consider also the following, where the AdjP in the matrix is predicative rather than postpositive:

- [45] i *This result is better than* \_\_ *would probably be achieved by a vaccination policy.*  
 ii *The price was higher than he wished to pay* \_\_ .  
 iii *When children start school they tend to get books that aren’t as rewarding as they’ve had* \_\_ .  
 iv *The eastward movement of the Atlantic thermal ridge was forecast to be a little less than* \_\_ *actually occurred.*

Again, the missing element from the comparative clause must be understood as an NP, not an AdjP: they are equivalent to ‘... *than the result that would probably be achieved*...’, ‘... *than the price that he wished to pay*’, ‘... *as the books they’ve had*’, ‘... *than the movement that actually occurred*’. It is questionable whether such examples are frequent and systematic enough to qualify as grammatical; certainly the construction illustrated here is not generally permissible, as is evident from the clear ungrammaticality of *\*This candidate was much better qualified than they appointed* (“than the one whom”), and the like.

## 3 Metalinguistic comparison (*more apparent than real*)

Examples like *The problem was more apparent than real* differ both syntactically and semantically from the ordinary comparisons discussed so far. These differences are seen in:

- |   |   |                             |
|---|---|-----------------------------|
| [1] i <i>Ed is older than his brother.</i>  | } | [ordinary comparison]       |
| ii <i>Ed is older than middle-aged.</i>     |   |                             |
| iii <i>Ed is more old than middle-aged.</i> |   | [metalinguistic comparison] |

In [i] we have a variable comparison between the degree to which Ed is old and the

<sup>14</sup>*On* can be omitted if *lectured* is too (*than I had* \_\_), but that results in the stranding construction where more than the counterpart to the comparative element is omitted.

degree to which his brother is old. In [ii] we have a variable–constant comparison (like *Kim is taller than six foot*): *middle-aged* denotes a segment on the scale expressed by **old** and [ii] puts his age beyond that part of the scale. What [iii] says, however, is that Ed is more properly described as old than as middle-aged: we call this **metalinguistic comparison** because it is concerned not with segments on the age scale but with the relative applicability of the linguistic expressions *old* and *middle-aged*.

Syntactically, metalinguistic comparison differs from ordinary comparison in that it allows only analytic comparative forms: *older* in [ii], for example, excludes this metalinguistic interpretation. The construction here also excludes a comparative clause as complement to *than/as*: \**Ed is more old than he is middle-aged*.

Other examples of metalinguistic comparison are:

- [2] i *The office of Lord High Commissioner is now more ornamental than functional.*  
 ii *The buds were more red than pink.*  
 iii *He was more dead than alive.*  
 iv *It was more an error of judgement than a case of negligence.*  
 v *She had spoken more in sorrow than in anger.*

The commonly used expression illustrated in [iii] brings out the point that this kind of comparison can be used with non-gradable adjectives (contrast the ordinary comparison #*He was more dead than we'd expected*). The most obvious examples of metalinguistic comparison involve adjectives, where – at least with shorter ones – we can contrast the permitted analytic form (*more red*) with the excluded inflectional one (*redder*). But the category certainly applies more generally, as evident from [iv] (NPs) and [v] (PPs).

Note, however, that this construction does not apply to verbs: \**We more expect than require you to make a contribution*.

Semantically similar to the above core cases of metalinguistic comparison are:

- [3] i *He's old rather than middle-aged.*  
 ii *He's not so much stupid as lazy.*

These may be contrasted with the ordinary comparisons *I intend to do it my way rather than yours* or *I haven't got so much patience as you*.

## 4 Scalar term comparison

### 4.1 The major governors in comparisons of inequality

Scalar comparison of inequality is for the most part governed by the comparative inflection or the degree adverbs *more* and *less*. As well as being degree adverbs, however, *more* and *less* can themselves be inflectional forms of determinatives, so we need to begin by clarifying the two uses of these words.

#### 4.1.1 *More* and *less*: analytic markers vs inflectional forms

##### ■ *More* as an analytic marker corresponding to the comparative inflection

The inflectional system of grade applies to a large set of adjectives and a few adverbs, determinatives, and prepositions (see Ch. 6, §2.2). We illustrate here with adjectives and adverbs:

[1]		PLAIN	COMPARATIVE	SUPERLATIVE	
	i	ADJECTIVE	<i>tall</i>	<i>taller</i>	<i>tallest</i>
	ii	ADVERB	<i>soon</i>	<i>sooner</i>	<i>soonest</i>

Grade differs from other inflectional systems in English in that only a subset of adjectives and adverbs inflect: with others the comparative and superlative categories are marked analytically (i.e. by means of a separate word), rather than inflectionally (i.e. by morphological modification). For the comparative category, analytic marking is by means of the adverb *more*, which we will represent as *more<sub>a</sub>* (with subscript ‘a’ mnemonic for ‘analytic’). Consider, then:

[2]		INFLECTIONAL COMPARATIVE	ANALYTIC COMPARATIVE
	i	a. <i>This is <u>shorter</u> than that.</i>	b. * <i>This is <u>more<sub>a</sub></u> short than that.</i>
	ii	a. * <i>This is <u>porouser</u> than that.</i>	b. <i>This is <u>more<sub>a</sub></u> porous than that.</i>
	iii	a. <i>This is <u>commoner</u> than that.</i>	b. <i>This is <u>more<sub>a</sub></u> common than that.</i>

Some lexemes, like *short*, inflect and exclude *more<sub>a</sub>* (except in metalinguistic comparison); others, like *porous*, allow only the analytic form; and some, like *common*, allow both patterns – see Ch. 18, §3.2. *More<sub>a</sub>* thus provides an alternative means of expressing the meaning elsewhere expressed by the comparative inflection.

#### ■ More as an inflectional form

In addition, *more* can be itself an inflectional comparative form of the determinatives ***much*** and ***many***. This *more*, which we represent as *more<sub>i</sub>*, contrasts with the plain forms, as illustrated in:

[3]		PLAIN FORM	INFLECTIONAL COMPARATIVE
	i	a. <i>Did it cause <u>much</u> trouble?</i>	b. <i>Did it cause <u>more<sub>i</sub></u> trouble than last time?</i>
	ii	a. <i><u>Many</u> people complained.</i>	b. <i><u>More<sub>i</sub></u> people complained than last time.</i>

We use interrogative examples in [i] because the plain form *much* is polarity-sensitive, occurring most readily in non-affirmative contexts (see Ch. 9, §4.1.2). *More<sub>i</sub>* is of course an irregular form, standing in, as it were, for regular \**mucher* and \**manier*. Note that *more<sub>a</sub>* does not enter into any such contrast with *much*: we can say *This is more porous than that*, but not \**Is this much porous?*

The corresponding superlative form is *most*, so the set of forms matching those given in [1] above is:

[4]		PLAIN	COMPARATIVE	SUPERLATIVE	
		DETERMINATIVE	<i>much/many</i>	<i>more<sub>i</sub></i>	<i>most<sub>i</sub></i>

#### ■ The distinction applied to *less*: *less<sub>a</sub>* vs *less<sub>i</sub>*

The case with *less* is similar, though with some differences of detail, and we again make a distinction between *less<sub>a</sub>* and *less<sub>i</sub>*. We noted in §1.1 that there are two different kinds of comparison of inequality, superiority and inferiority; the former is marked inflectionally or analytically, by *more<sub>a</sub>*, while inferiority is always marked analytically – by *less<sub>a</sub>*:

[5]		SUPERIORITY	INFERIORITY
	i	a. <i>This is <u>taller</u> than that.</i>	b. <i>This is <u>less<sub>a</sub></u> tall than that.</i>
	ii	a. <i>This is <u>more<sub>a</sub></u> porous than that.</i>	b. <i>This is <u>less<sub>a</sub></u> porous than that.</i>

*Less<sub>i</sub>*, by contrast, is an inflectional form – in the central cases, the comparative form of

**little**. As such, it contrasts with the plain form:

- |     |                                 |  |
|-----|---------------------------------|--|
| [6] | PLAIN FORM                      | INFLECTIONAL COMPARATIVE                               |
|     | a. We have <u>little</u> money. | b. We have <u>less<sub>i</sub></u> money than we need. |

Again, the *less<sub>a</sub>* that modifies the adjectives in [5] does not contrast with the plain form *little*: \**This is little porous*. The *little* in [6a] belongs to the determinative category and is sharply distinct, in terms of both syntax and meaning, from the adjective *little* of a *little house*, etc.<sup>15</sup>

#### ■ Difference in relations of *more<sub>a</sub>* to *less<sub>a</sub>* and of *more<sub>i</sub>* to *less<sub>i</sub>*

*More<sub>a</sub>* and *less<sub>a</sub>* are markers of comparison of superiority and inferiority, respectively. If we include the comparison of equality, we have the three terms shown in [7] (with *strong* taking an inflectional comparative, *tactful* an analytic one):

- |     |                 |  |   |
|-----|-----------------|--|---|
| [7] | i EQUALITY      | <i>I'm <u>as</u> strong as Ed.</i>                 | <i>I'm <u>as</u> tactful as Ed.</i>                 |
|     | ii SUPERIORITY  | <i>I'm <u>stronger</u> than Ed.</i>                | <i>I'm <u>more<sub>a</sub></u> tactful than Ed.</i> |
|     | iii INFERIORITY | <i>I'm <u>less<sub>a</sub></u> strong than Ed.</i> | <i>I'm <u>less<sub>a</sub></u> tactful than Ed.</i> |

Like *old* and *young*, as discussed in §1.1, the determinatives *much* and *little* are opposite in orientation: the more money you have, the further removed from zero is the amount of money you have, but the less money you have, the closer to zero it is. We will say that *much* and *little* have respectively **positive** and **negative** orientation, since *Much has been achieved* and *Little has been achieved*, say, are syntactically positive and negative respectively (see Ch. 9, §3.3). As inflectional comparatives, *more<sub>i</sub>* and *less<sub>i</sub>* (like *older* and *younger*) both express superiority, but there are no inferiority counterparts marked by *less<sub>a</sub>* – cf. \**I've less<sub>a</sub> much tea than Ed*; \**I've less<sub>a</sub> little tea than Ed*. Thus instead of a one-dimensional contrast between three forms, as illustrated in [7], we have a two-dimensional pattern with four admissible forms:

- |     |                |  |  |
|-----|----------------|--|--|
| [8] |                | POSITIVE ORIENTATION                             | NEGATIVE ORIENTATION                             |
|     | i EQUALITY     | <i>I've <u>as</u> <u>much</u> tea as Ed.</i>     | <i>I've <u>as</u> <u>little</u> tea as Ed.</i>   |
|     | ii SUPERIORITY | <i>I've <u>more<sub>i</sub></u> tea than Ed.</i> | <i>I've <u>less<sub>i</sub></u> tea than Ed.</i> |

#### ■ Equivalences and entailments

##### *Much and little*

These determinatives denote scales that are effectively the same except for the positive or negative orientation. In comparisons the relations are as illustrated in:

- |     |  |  |         |
|-----|--|--|---------|
| [9] | i a. Kim has <u>more<sub>i</sub></u> money than Pat. | b. Pat has <u>less<sub>i</sub></u> money than Kim. | [a = b] |
|     | ii a. Kim has <u>as</u> <u>much</u> money as Pat.    | b. Pat has <u>as</u> <u>little</u> money as Kim.   | [a ≠ b] |

In [i], a comparison of superiority, [a] and [b] are equivalent: each entails the other. Neither of them says whether Kim or Pat has much or little money, the issue being merely their relative positions on the scales. The comparisons of equality, [ii], are not equivalent, however; [iib] indicates that both Pat and Kim have little money, whereas [iia] (like both examples in [i]) is neutral as to whether they have much or little money. The difference correlates with the fact that *much* is the more general member of the pair: it can be used more widely, and in particular without any implicature that an unmodified plain form

<sup>15</sup>The adjective *little* has *littler* as its comparative form, but this and superlative *littlest* are rarely used, the corresponding forms of *small* generally being preferred; see also the discussion of adjectival *less(er)* below.

### ■ Adjectival *less*<sub>i</sub>

The *less*<sub>i</sub> that we have considered above is the comparative form of the determinative *little*, but *less*<sub>i</sub> can also belong to the adjective category:

- [13] i *Is Soviet influence throughout the world greater or less than it was ten years ago?*  
 ii *They can employ apprentices provided they pay rates which are not less than those of the other workers.*  
 iii *They too had felt the influence of Christianity to a greater or less extent.*

Here *less*<sub>i</sub> contrasts with adjectival *greater* rather than with determinative *more*<sub>i</sub>. A non-comparative construction corresponding to *less* in [i] might be *Soviet influence is now quite small*, just as a positive orientation version would be along the lines of *Soviet influence is now very great/considerable* (not *much*). Similarly, in [ii] a non-comparative would have an adjective such as *low* rather than determinative *little*: *These pay rates are low/\*little*. Adjectival *less* is clearly a comparative form, but it cannot be identified as the comparative counterpart of any particular plain form. It is normally restricted to predicative function, as in [i–ii]; its occurrence in attributive function is virtually restricted to the particular phrase *a greater or less extent*. Note that in this example *less* is in construction with a count singular noun, which is not possible for the determinative *little*.

### ■ The double comparative *lesser*

- [14] i *They too had felt the influence of Christianity to a greater or lesser extent.*  
 ii *We think this is a lesser risk than taking no action at all.*  
 iii *a lesser man/journal*

*Lesser* is found only in attributive function – in [i] as an alternant of *less*. The meaning is “smaller” ([i–ii]) or “less worthy/significant” ([iii]). From a morphological point of view *lesser* is a ‘double comparative’: it is formed by the addition of the regular comparative suffix to what is itself an irregular comparative form, *less*. Other double comparative forms, such as *worser*, are no longer current in Standard English.

## 4.1.2 Comparative forms of the degree determinatives

### ■ The count vs non-count distinction

The examples in [8] above have ***much*** and ***little*** as determiner to a non-count noun. With a plural count noun as head we have the following pattern:

- |      |                |   |   |
|------|----------------|---|---|
| [15] |                | POSITIVE ORIENTATION                                | NEGATIVE ORIENTATION                                      |
|      | i EQUALITY     | <i>I've <u>as many</u> shirts as Ed.</i>            | <i>I've <u>as few</u> shirts as Ed.</i>                   |
|      | ii SUPERIORITY | <i>I've <u>more</u><sub>i</sub> shirts than Ed.</i> | <i>I've <u>fewer/less</u><sub>i</sub> shirts than Ed.</i> |

*Many* and *few* are the count plain forms corresponding to non-count *much* and *little*, but in the comparison of superiority *more* is used with count as well as non-count nouns, while with negative orientation non-count nouns take *less*, and count nouns either *fewer* or *less*. The pattern is thus as shown in:

- |      |             |                                     |                                     |
|------|-------------|-------------------------------------|-------------------------------------|
| [16] |             | POSITIVE ORIENTATION                | NEGATIVE ORIENTATION                |
|      |             | <b>Non-count sg</b> <b>Count pl</b> | <b>Non-count sg</b> <b>Count pl</b> |
|      | EQUALITY    | <i>as much</i> <i>as many</i>       | <i>as little</i> <i>as few</i>      |
|      | SUPERIORITY | <i>more</i>                         | <i>less</i> <i>fewer/less</i>       |

The relation between *less* and *fewer* is fairly complex. In non-count singulars only *less* is possible: *Kim has less/\*fewer money than Pat*. In plural NPs we have:

- [17] i *She left less than ten minutes ago.*  
 ii *Less/Fewer than thirty of the students had voted.*  
 iii *He made no less/fewer than fifteen mistakes.*  
 iv *You pass if you make ten mistakes or less/fewer.*  
 v *He took less/\*fewer pains to convince us than I'd expected.*  
 vi *He made fewer/less mistakes than the others.*

Both [i] and [ii] have *than* + numeral. In [i] *ten minutes* expresses an amount of time rather than a number of individuated units, and in such cases *fewer* is virtually impossible – just as *few* would be in a comparison of equality: *She left as little/\*few as ten minutes ago*. Similarly with *We paid less than thirty dollars for it*; *She's less than forty years old*; *We were going at less than ten miles an hour*. In [ii] we are concerned with countable individuals and *little* cannot be used in a comparison of equality (*\*as little as thirty of the students*); nevertheless, for inequality *less* is more common than *fewer* in this construction. The same applies with percentages: *Less/Fewer than 30% of the students had voted*. Construction [iii] has the comparative form following *no*: though the interpretation is count plural, *less* is here again more common than *fewer*. Construction [iv] has *or* after a numeral: *less* is the usual form here, with *fewer* quite marginal; this construction is widely seen in supermarkets, with the fast checkout labelled *eight items or less*, or the like. In [v] *pains* is plural but non-count rather than count (we can't ask how many pains he took), and here only *less* is possible. Finally in [vi] (as also in [15ii]) the comparative occurs directly with a count plural noun: both forms are found, but *less* is subject to quite strong prescriptive disapproval, so that *fewer* is widely preferred in formal style, and by many speakers in informal style too.<sup>16</sup>

#### ■ Grading of count singular nouns

- [18] i *Jill's more of a scholar than Tom is.*  
 ii *The delay turned out to be less of a problem than we'd expected.*

The comparative forms *more* and *less* are used in grading count singular heads in predicative NPs: it is a matter of the degree to which Jill is a scholar, and to which the delay was a problem. For the syntactic structure of these NPs, see Ch. 5, §9.2.

#### ■ Degree adjunct in clause structure

- [19] i *She trusts you [more than her own solicitor].*  
 ii *It hurt [less than I'd thought it would].*

The bracketed phrases are degree adjuncts modifying the verb. The plain forms *much* and *little* occur in comparisons of equality (e.g. *It hurt as much/little this time as on the previous two occasions*); unmodified *much* could occur only in non-affirmative

<sup>16</sup>Usage manuals are divided on the issue of *less* vs *fewer*. Some uncompromisingly brand such forms as *less mistakes* as incorrect, while others note that though commonly condemned they are often used by speakers of Standard English. Before the Early Modern English period (beginning around 1500) *more* was restricted to non-count NPs with *more* used as the comparative of *many*. At that time *less* was used along with *fewer* for count NPs, but came to be stigmatised and quite rare in this use: it is only within the last generation or so that it has become frequent. The current revival seems inexorable, given the strong pressure of analogy with *more*.

contexts (*She doesn't trust you much*), while unmodified *little* does not occur in this position.

## 4.2 Less central governors in scalar inequality (*rather, prefer, superior*)

### ■ *Rather*

This contains the comparative suffix *-er* but the original base *rath* (meaning “soon”) has been lost, so that *rather* is no longer analysable as an inflectional comparative. It nevertheless retains clear semantic and syntactic affinities with ordinary comparative constructions. We consider four uses where it appears in construction with *than*.

#### (a) The idiom *would rather* (“would prefer”)

- [20] i *She would rather live in danger than die of loneliness and boredom.*  
 ii *I'd far rather give it to charity than to the government.*  
 iii *I'd rather you left the position vacant than that you appointed your son.*  
 iv *I'd rather he came on Tuesday than on Wednesday.*

These are term comparisons, with the terms marked by underlining. *Would rather* takes either a bare infinitival complement ([i–ii]), or a finite one ([iii–iv]). In either case the primary term can be either the whole complement, as in [i/iii], or part of it, as in [ii/iv] (which can be expanded to make them like [i/iii]: *than give it to the government, than that he came on Wednesday*). *Sooner* is an alternant of *rather*, and we can also have the comparison of equality *would as soon* (+ *as*).

#### (b) With bare infinitival and “in preference” meaning

- [21] i *Many of them went to jail rather than pay the fine.*  
 ii *Rather than talk about it, let's do it.*

The meaning is related to that in (a), but syntactically the *than* complement is obligatory and must immediately follow *rather* – note, for example, the impossibility of putting *rather* before *went* in [i], or of omitting *than pay the fine* (without a change in the meaning of *rather*).

#### (c) Contrastive link, meaning “not, instead of”:

- [22] i *Care rather than skill is all you need.*  
 ii *Things like that would increase rather than be done away with.*

The meaning of “preference” has here been lost, and *rather than* belongs with the coordinators: see Ch. 15, §2.8. Note that in [ii] *rather than* is followed by a bare infinitival, but it differs syntactically as well as semantically from the construction of [21]. In use (c) a bare infinitival has to be paired with another one preceding *rather* (here *increase*) – compare *\*Things like that increased rather than be done away with* with [21i].

#### (d) Pleonastic use, with *rather than* equivalent to *than* alone:

- [23] i *Wouldn't it be better to travel with friends, rather than total strangers?*  
 ii *These people are more likely to be referred to courts rather than to aid panels.*

*Rather* has no independent meaning here, repeating or emphasising the superiority feature expressed earlier in *better* and *more*. Usually, of course, we have *than* on its own, and *rather* is allowed only when *than* is fairly far removed from the main comparative

governor – *than* can't be replaced by *rather than* in simple structures like *Kim is more patient than Pat*. Nor can it occur in combination with determinative *more*: \**Kim has more patience in situations of this kind, rather than Pat*.

### ■ Prefer

The meaning is the same as that of *like better*, which is overtly comparative; *prefer* itself, however, is at the periphery of syntactically comparative expressions. It occurs in the following constructions:

- [24] i *They prefer kangaroo meat to beef.*  
 ii *She prefers to read rather than watch television.*  
 iii *?He'd prefer to put David over the cliff than let him have the land for building.*  
 iv *They preferred to sell their produce for gold rather than the local currency.*  
 v *He prefers plucking the guitar string to the bow-string.*

The most usual pattern is seen in [i], a term comparison with the primary term expressed by the object NP, the secondary one by the complement of the preposition *to*. *To* cannot take an infinitival complement, however, and hence can't be used when the primary term has this form: instead we generally find *rather than*, as in [ii]. This use of *rather than* can be related to use (d) above, except that with *prefer* omitting the *rather* is not fully acceptable: the construction with *than* alone, as in [iii], is rare (and generally condemned by prescriptivists, in spite of the clear analogy with *would rather*). *Rather than* is also used when the terms are contained within an infinitival clause, as in [iv], which allows expansion to *rather than sell it for the local currency*. Example [v] shows that *to* can also be used when the terms are contained within a clause, but this is normally restricted to gerund-participials: *to* cannot substitute for *rather than* in [iv]. *Prefer* can also take a declarative content clause; an overt secondary term is rare here, but the structure would follow the pattern of infinitivals (*I'd prefer that the meeting was postponed than that it should take place without you*).<sup>17</sup>

### ■ Superior, inferior

These adjectives come from Latin comparative forms, but their syntactic resemblance to English comparative forms is very limited. Most notably, they don't take *than*, but *to*:

- [25] i *They believe their culture is superior to any in the world.*  
 ii *It is absurd to speak of philosophy as a superior enterprise to sociology.*

The meaning of *superior* here is “better” – and note that the attributive use in [ii] resembles the attributive use of a comparative form (as in *Students find philosophy a more difficult enterprise than sociology*) in that the head noun applies semantically to *sociology* as well as to *philosophy*, i.e. sociology is presupposed to be an enterprise (cf. [40] of §2.3).

The modifiers these items take can be like those of comparative forms (see §4.4): we could, for example, add *much* or *far* to *superior* in [25]. But they also accept the modifiers used with plain forms, such as *very*: *This is a very inferior design*. In such cases the comparative meaning is usually lost too, with *very inferior* interpreted simply as “very

<sup>17</sup>Other prepositions than those shown in [24] are occasionally found – e.g. *over*. This is more usual, however, with the noun *preference*: *their preference for the country over the city*.

poor quality”; the comparative meaning, “much poorer quality”, is nevertheless also possible. Note finally that while an inflectional comparative cannot itself be compared, such recursive comparison is much more acceptable with these forms:

- [26] i \**Our forces are more worse than theirs than you acknowledge.*  
 ii *Our forces are more inferior to theirs than you acknowledge.*

Other adjectives deriving from Latin comparative forms are *anterior*, *posterior*, *prior*, *senior*, *junior*, *major*, and *minor*. Except for the last two these can occur in the predicative construction with a *to* complement, and *senior/junior* can take *far* and *much* as modifiers (cf. *He’s far senior to me in experience*), but otherwise their syntactic resemblance to English comparative forms is negligible.<sup>18</sup>

### 4.3 Scalar comparisons of equality: *as*, *so*, *such*

The default degree adverb marking scalar equality is *as*: *Kim is as old as Pat*. *So* is also possible under restricted conditions:

- [27] i *It’s not so simple as that.*  
 ii *The floor and furniture didn’t gleam nearly so much as yours do.*  
 iii *Is putting a rocket in orbit half so significant as the good news that God put his son, Jesus Christ, on earth to live and die to save our hell-bound souls?*

In this use, *so* occurs only in non-affirmative contexts – most are negatives, as in [i–ii], but other types are found too, such as interrogative [iii]. *As* can replace *so* in these contexts, where it is indeed somewhat more frequent. *So* is also used in some of the comparative idioms discussed in §4.5 below: *so/as far as I know*; *No one else in the family had so/\*as much as heard of it*.

In addition, *such* occurs in scalar comparisons of equality (as well as non-scalar ones dealt with in §5.3):

- [28] i *This country has never faced such great dangers as \_\_ threaten us today.*  
 ii *Few industries were growing at such a rate as catering.*  
 iii *His second film wasn’t such a success as his first.*  
 iv *Never again would the society assume such a high profile as in the late twenties.*

Like *so*, *such* in this use is normally restricted to non-affirmative contexts. This restriction does not apply to non-scalar *such*, nor to the use of degree *such* without an *as* phrase, a use where the comparative meaning is effectively lost and *such* serves simply as an intensifier: *It seemed such a good idea at the time!*; *They are such pedants!*

#### ■ Omission of first *as*

Where the comparative complement consists of *as* + NP, the first *as* is sometimes omitted. This is primarily found with familiar similes like *good as gold*, *quick as lightning*, *safe as*

<sup>18</sup> *Senior* and *junior* allow the secondary term to be expressed as a genitive (cf. note 6 above), as in *She is [two years my senior]*. The syntactic analysis of the bracketed phrase is problematic. The genitive dependent suggests that it is an NP, but it cannot occur in core NP positions such as subject and object (cf. \*[Two years my senior] supported me). It cannot, moreover, be pluralised (*They are two years my senior*/\**seniors*), and it alternates with the clearly adjectival *She is [two years senior to me]*.

houses, etc.; cf. also the informal (*as*) *like as not*, “probably” (*He’d like as not prefer to eat his meals there*).

## 4.4 Modification

### 4.4.1 Degree modification

The governors of scalar comparison may be modified by such expressions as:

- [29] i INEQUALITY: *much, far, immensely, a great deal, a lot, somewhat, rather, slightly, a bit, (a) little, no, any*  
 ii EQUALITY: *at least, about, approximately, roughly, every bit, easily, half, twice, nearly, nothing like, nowhere near*  
 iii EITHER TYPE: *hardly, scarcely, a third, three times*

The modifiers used in comparisons of inequality are the same with inflectional comparatives as with analytic ones: *far bigger, far more careful*. *Very* does not serve this function – we need *much* instead (*much bigger*, not *\*very bigger*, and so on). *Much* itself can as usual be modified by *very*: *very much bigger*. Except for *no*, the expressions in [29i] are found with the more peripheral comparative governors *superior, inferior, preferable*.

Note that while the multipliers *half* and *twice* are restricted to the equality type, *a third* and *three times*, etc., occur with both – with the semantic relations illustrated in:

- [30] i a. *I earn four times as much as Ed.*      b. *I earn four times more than Ed.*      [a = b]  
 ii a. *I earn a third as much as Ed.*              b. *I earn a third more than Ed.*              [a ≠ b]  
 iii *I earn a third as much again as Ed.*    [= iib]

In [i], the [a] and [b] versions are equivalent: if Ed earns \$15,000 a year, I earn \$60,000. The more usual version is [ia], and this is semantically straightforward: \$15,000 is as much as Ed earns, and \$60,000 is four times that. The less usual [ib] might be seen as a blend between *I earn more than Ed* and *I earn four times what Ed earns*. In [ii] there is no such equivalence between the two constructions. In [iia] I earn \$5,000, one third of the sum Ed earns; in [iib] I earn \$20,000, which is \$5,000 more than Ed’s \$15,000, hence more by one third. This latter meaning can be expressed by a comparison of equality with *again*, as in [iii] – here I earn Ed’s \$15,000 plus a further third of that.

### 4.4.2 Modification by *the*

The main function of *the* is as determiner in NP structure, but it also occurs as modifier in various comparative constructions. Some of these involve set comparison (e.g. *It’s Jill who wins the more/most often*) and are accordingly dealt with in §6.3.4 below. In term comparison one special case is the correlative comparative construction (as in *The more you practise, the easier it becomes*) described in §4.6; other cases are illustrated in:

- [31] i *This didn’t make her achievement [any the less significant].*  
 ii *In the Swedish context, notable for its tradition of peace and non-violence, the senseless futility of this act stands out [the more starkly].*  
 iii *The plight of the four British employees greatly perturbed Urquhart, [the more] because a request to the Governor for a contingent of Cossacks to escort them to safety had been turned down.*

- iv *The result is [all the more disappointing] because she had put in so much effort.*
- v *That's [all the more reason to avoid precipitous action].*
- vi *He went prone on his stomach, [the better] to pursue his examination.*

*The* here modifies the following comparative (*more, less, better*), forming a phrase which in turn is modifier to an adjective ([i/iv]), an adverb ([ii]), a verb ([iii/vi]) or determiner to a nominal ([v]).<sup>19</sup> In [i–ii] *the* is freely omissible. In [iii] the underlined occurrence of *the* would be omissible if it introduced a modifier rather than a supplement (which would mean dropping the comma), but not as it stands. In [iv], *all the* might be glossed as “even”, or *all the* + comparative as “especially”; *the* can only be omitted if *all* is omitted too. Example [v] is similar, except that *all the more* is here a DP functioning as determiner in NP structure. In [vi] *the better* is a fronted modifier in the infinitival clause of purpose; *the* is obligatory in this position but optional in the basic position – compare *in order to pursue his examination (the) better*.

*The* is completely excluded if the secondary term is expressed: \**The result was the better than I had expected*. Nor is *the* permitted when the secondary term is recoverable anaphorically, from what has gone before. We cannot, for example, insert *the* in *It was cloudy and cold for the first two days but on the third day the weather was better*, where we understand “better than on the first two days”.<sup>20</sup>

#### 4.5 Comparative idioms and reanalysis

This section presents a sample of the numerous expressions containing comparative governors which in the course of time have become idiomatised or syntactically reanalysed.

##### (a) *More than, less than, etc., as modifiers*

In *Kim earns more/less than Pat (does)* the comparative forms *more* and *less* are heads (more precisely, fused determiner-heads), with the *than* phrases functioning as complements to them. But in some cases *than* merges syntactically with *more* or *less* to form a modifier of the item following *than*. A corresponding reanalysis is found with *as*. One clear case (not applying with *less than*) is where *than/as* is followed by a verb that can be a tensed form:

- [32] i *This more than compensated for the delay.*
- ii *She expects to more than double her capital in three years.*
- iii *She never so much as turned her eyes on any other bloke.*
- iv *He as good as admitted he'd leaked the information himself.*

*More than compensated for the delay* is a VP, and the head must be *compensated*, not *more* – note, for example, that we can drop *more than* but not *than compensated for the delay*. *More than* is therefore a modifier of the verb. Similarly in [ii]. Although *double* is a plain form of the verb, not a tensed form like *compensated* in [i], this is due to the *expect* + *to* construction and has nothing to do with *more than*. The crucial point is that

<sup>19</sup>Historically this *the* is not the usual definite article but the fossilised remnant of an Old English instrumental case-form meaning roughly “by so/that much”. It came to fall together phonologically with the definite article, but its syntactic distribution still reflects its different origin.

<sup>20</sup>In such an example as *Kim was good but Pat was better* we can insert *the* but doing so changes the term comparison into a set comparison, for we understand not “better than Kim” but “the better of the two”.

we can equally have a tensed form here: *She more than doubled her capital*. Example [iii] shows the same reanalysis with a comparison of equality; these tend to occur in non-affirmative contexts and to have the form *so much as*, as here; *as good as*, however, can also be used, as in [iv], meaning much the same as *virtually*.

*She more than doubled her capital* may be contrasted with *She did more than double her capital*, where *double* is required to be in the plain form: here there is no reanalysis, *more* being head, and *than double her capital* its complement. The construction with *do* allows *less* instead of *more* but the special construction of [32ii] does not. The two constructions differ semantically as well as syntactically. Suppose, for example, that her capital was initially \$10,000. *She more than doubled her capital* means that she increased it to over \$20,000. But that is not the meaning of *She did more than double her capital*. This says that she doubled her capital and more: the ‘more’ may involve a further increase in the capital or else something different, such as achieving promotion in her job.

The reanalysis also applies to *more than* and *less than* followed by an adjective or adverb, as in *He’d given a [more than satisfactory] explanation for his behaviour*, where *satisfactory* is head of the bracketed AdjP, and *more than* an optional modifier. (We do not postulate reanalysis, however, in examples like *more than fifty people*: see Ch. 5, §11).

#### (b) *No/any more than* + comparative clause

- [33] i *The horses were no more on parade than was their driver.*  
 ii *Kim wouldn’t do anything prematurely or in bad taste any more than Pat would.*

*More* in this construction is in modifier function, but the usual degree meaning has effectively been lost. We don’t interpret [i] as a comparison between the degree/extent to which the horses were on parade and that to which their driver was: it can be glossed without a degree modifier as “The horses weren’t on parade, just as their driver wasn’t”. The difference between this and an ordinary comparison may be fairly slight: *This prospect did not please Mrs King any more than did the possibility that her daughter might marry a Bohemian*. The literal interpretation compares degrees of pleasing (without saying what they were), whereas the idiomatic one says that neither the prospect nor the marriage possibility pleased Mrs King (at all). Where the subordinate clause expresses an obviously false proposition the rhetorical effect is to emphasise the negative: *Social invention did not have to await social theory any more than the use of the warmth of a fire had to await Lavoisier*.

#### (c) Idioms containing *sooner*

*Sooner* and *as soon* can be used as alternants of *rather* in the idiom with *would*: *I’d rather / sooner / as soon stay at home*. The inequality versions mean “I’d prefer”, and the equality *as soon* “I’d like as much”. In addition, both *as soon as* and *no sooner* have idiomatic meanings as well as their ordinary comparative ones:

- [34] i a. *The car may not be ready as soon as I said it would.* [ordinary comparison]  
 b. *I’ll phone you as soon as the meeting is over.* [idiom]  
 ii a. *We got home no sooner than if we’d taken the bus.* [ordinary comparison]  
 b. *We’d no sooner got home than the police arrived.* }  
 c. *No sooner had we got home than the police arrived.* [idiom]

[ib] *as well* on its own means “in addition” and functions as a connective adjunct. The *as well* of [ii] normally combines with one of the possibility modals *may*, *might*, *could*; it is possible to have a comparative complement consisting of *as* + bare infinitival (*We might as well have stayed at home as come here*), but the version with the secondary term unexpressed is more common. This use of *as well* is idiomatic in that there is no corresponding non-comparative use of *well*: \**We stayed at home well*. In [iia] it serves to indicate dissatisfaction with what we have done: we’re no better off than if we had taken the simpler course of staying at home. In [iib] it indicates an unenthusiastic, somewhat grudging suggestion: “There’s no reason why you shouldn’t leave it at that”. In [iii] (*just as well*) means approximately “fortunate”.

Idiomatic uses of *better* and *best* are seen in:

- [38] i *I knew better than to question his decision.*  
 ii *We’ll manage as best we can.*

*Know better than to* means “know one shouldn’t”. Example [i] has a negative implicature (“I didn’t question his decision”), but *You know better than to talk with food in your mouth!* has a positive one (“You have been talking with food in your mouth”). In [ii] we have a curious use of the superlative form instead of the regular *as well as*: *as best* occurs only with *can*. For the modal idiom *had better/best*, see Ch. 3, §2.5.6.

#### 4.6 The correlative comparative construction

What we refer to as the **correlative comparative construction** has two versions, illustrated in [39i–ii] respectively:

- [39] i a. The more sanctions bite, the worse the violence becomes.  
 b. The more conditions I impose, the less likely is he to agree. } [fronted version]  
 c. The older he gets, the more cynical he becomes.  
 ii a. The violence becomes worse the more sanctions bite.  
 b. He is less likely to agree the more conditions I impose. } [basic version]  
 c. He becomes more cynical the older he gets.

Both versions have paired – ‘correlative’ – comparative phrases (indicated by underlining). Very much the more common version is the one shown in [i], but it is the other that is syntactically the more basic. *The more sanctions bite* is a subordinate clause functioning as adjunct, and likewise *the more conditions I impose* and *the older he gets*; in [ii] they occupy the default position at the end of the matrix clause, whereas in [i] they occupy front position. The subordinate clause has the comparative phrase in front position in both versions, whereas the head clause has it fronted only when the whole subordinate clause is fronted. The comparative phrase begins with *the* when it is fronted; this is the modifier *the* discussed in §4.4.2 above. In the basic version it is possible but rare to have *the* in the non-fronted comparative phrase: *The violence becomes the worse, the more sanctions bite*.

The construction indicates parallel or proportional increase (or decrease, in the case of *less*) along the two scales expressed in the head and subordinate clauses.<sup>21</sup> It can be

<sup>21</sup>The basic version marginally allows a verb such as *increase* instead of a syntactic comparative: *The violence increases the more sanctions bite*.

approximately paraphrased by a construction in which the subordinate clause functions as complement to *as*:

- [40] i *As sanctions bite more, so the violence becomes worse.*  
 ii *The violence becomes worse as sanctions bite more.*

Because of this parallel movement along the two scales it is often possible to reverse the direction of dependency:

- [41] i *The more we pay them, the harder they work.*  
 ii *The harder they work, the more we pay them.*

In [i] the *work* clause is superordinate: the effort they put into their work increases as we pay them more. In [ii] it is the *pay* clause that is superordinate: the amount we pay them increases as they work harder. The two versions are not equivalent, however: for example, if they work harder each time we pay them more, but sometimes work harder for other reasons and without getting more pay, then [i] is true but [ii] is false.

Syntactic evidence that the first clause in [39i] (the fronted version) and the second clause in [39ii] (the basic version) is subordinate to the other is provided by examples like:

- [42] i *Won't the violence become worse, the more the sanctions bite?*  
 ii *He is clearly the sort of person [who would be less likely to agree, the more conditions I impose].*

Example [i] is a closed interrogative, and it is marked as such by subject–auxiliary inversion in the main clause. The bracketed part of [ii] is a relative clause, and again it is the superordinate clause whose structure is affected by relativisation. Note that such operations as those forming interrogatives and relatives can be performed on the basic version, not on the fronted version. The fronted version can be subordinated, but only in ways that simply involve adding the subordinators *that* or a relative phrase modifier such as *in which case*:

- [43] i *He realised [that the longer he delayed the more difficult the task would be].*  
 ii *She may call an election, in which case the sooner we resolve these differences, the better our chances will be.*

### ■ Structural reduction

Where the comparative phrase is a predicative AdjP, the verb *be* may be omitted, and in the fronted version it is possible to reduce either the head clause alone or both clauses to just the comparative phrase:

- [44] i *[The harder the task,] the more she relished it.*  
 ii *The more directly the sun strikes walls and roof, [the greater its heat impact].*  
 iii *The sooner you leave the firm, [the better].*  
 iv *[The sooner,] [the better].*

### ■ Classification of subordinate clause

The subordinate clause in both versions of the correlative comparative construction belongs to the class of content clauses. In terms of its internal structure the only special feature it has is the fronting of the comparative phrase, but that same feature also applies to the head clause in the fronted version of the construction, and hence is not a marker of subordination. We noted in Ch. 11 that content clauses do not always differ structurally from main clauses,

and the present construction is one of the cases where there is no internal marking of subordination.<sup>22</sup>

## 5 Non-scalar comparison

The differences between term and set comparison are less extensive in non-scalar comparison than in scalar comparison, and in this section we will therefore deal with them together. Two general points concerning the relation between the two types should be made before we review the various comparative governors in turn.

### ■ Potential ambiguity between set comparison and term comparison

- [1] i *They offered the same deal to Kim and Pat.*  
 ii *Our views are similar.*

There may be ambiguity between a set comparison and a term comparison in which the secondary term is left unexpressed. For example, [i] may express a set comparison where the set consists of Kim and Pat: this is equivalent to the term comparison *They offered the same deal to Kim as to Pat*. But [i] can also be equivalent to *They offered the same deal as this to Kim and Pat*, with *this* referring to some deal just mentioned. In this latter case it is purely incidental that *Kim and Pat* refers to a plurality, whereas in the former case it is essential: *They offered the same deal to Kim* can only be a term comparison with an understood secondary term. Likewise [ii] can be a set comparison between the views of those referred to by the pronoun *we* or a term comparison between our views and some view or views identified earlier.

### ■ Set comparison and reciprocals

- [2] i *These questions are very different (from each other).*  
 ii *The same question occurred to both of them: why had no one called the police?*

Set comparisons are often equivalent to term comparisons in which the secondary term is expressed by a reciprocal pronoun. The version of [i] without the parenthesised phrase is a comparison between a set of questions, whereas the version with the *from* phrase is a term comparison with the primary term expressed by *these questions*, the secondary one by *each other*. The set comparison construction is much more common than the reciprocal, which will often sound unnecessarily complex: compare *Kim and Pat have the same colour hair* and the less likely *Kim and Pat have the same colour hair as each other*. In cases like [ii] there is no equivalent reciprocal construction at all: *\*The same question occurred to both of them as to each other*. Leaving aside cases of preposing, the reciprocal is excluded in constructions where the comparative governor precedes the expression denoting the set, as *same* in [ii] precedes *both of them*.

<sup>22</sup>Some speakers, however, have *that* after the comparative phrase: *%The more that sanctions bite, the worse the violence becomes*. Another variant has a relative clause, as in the attested example *The more centralised information became and the more uses to which the Australia Card was put, the more unease the Law Council would have*. This, however, cannot be regarded as grammatical; it may have been used to enable the writer to avoid the stranding of the preposition in *the more uses the Australia Card was put to*.

5.1 *Same*

## ■ Inherent definiteness

In attributive function *same* is restricted to definite NPs, and in predicative function it occurs with *the*. Contrast, then, the distribution of *same* with that of *identical*:

- [3] i a. *The same mistake was made by Ed.*    b. *The identical mistake was made by Ed.*  
 ii a. \**A same mistake was made by Ed.*    b. *An identical mistake was made by Ed.*  
 iii a. *The two copies are the same.*    b. *The two copies are identical.*  
 iv a. *She treats them all the same.*    b. *She treats them all identically.*

In NPs *same* usually occurs with *the*, as in [ia], but demonstrative determiners are also found: *this same version*. In [iiia] *the same* is an AdjP rather than an NP, with *the* a dependent of an adjective, as in the comparisons of inequality discussed in §4.4.2. Similarly, in [iva] *same* is head of an AdvP with *the* as dependent.<sup>23</sup>

## ■ Term comparison with comparative clause

*Same* commonly occurs with *as* + comparative clause:

- [4] i *He goes to the same school as his father went to \_\_/did.*  
 ii *She'll be using the same method as \_\_proved so successful last time.*  
 iii *They behaved in the same way as you had predicted \_\_.*  
 iv *We achieved the same result as \_\_ (was) obtained in the first experiment.*

The range of possibilities is broadly like that found in scalar comparison. One restriction is that it is not possible to have a contrast involving the head noun of the comparative phrase:

- [5] i *He has the same phonetics tutor as he had \_\_ last year.*  
 ii \**He has the same phonetics tutor as he has \_\_ syntax lecturer.*

Example [5ii] may be contrasted with the well-formed scalar comparative *He wrote as many symphonies as he wrote \_\_ piano concertos*. Example [4iii] illustrates the construction discussed in (d) of §2.1, where an embedded clause is left understood (“you had predicted that he would behave in *y* way”), but it is considerably less frequent than with scalar comparisons. In [4iv] the missing counterpart to the comparative phrase is subject of a passive clause, and here the auxiliary verb *be* can be omitted.

## ■ With relative clause

Instead of *as* + comparative clause we often find an equivalent relative clause:

- [6] i *We're going to the same hotel as we stayed at \_\_ last year.*    [comparative clause]  
 ii *We're going to the same hotel that we stayed at \_\_ last year.*    [relative clause]

The equivalence follows straightforwardly from the semantics of the constructions. With the comparative we have “We’re going to hotel *x*; we stayed at hotel *y* last year;  $x = y$ ”. With the relative we have “We’re going to hotel *x*; we stayed at *x* last year” (cf. Ch. 12, §3.1). In [i] the identity of the variables *x* and *y* is expressed by *same*; in [ii] the relative construction itself builds in the identity between the variables (as reflected in our use of the

<sup>23</sup>In casual speech *the* is omissible in a few expressions: *We stayed at home, same as usual/always*. *The* is also sometimes omitted in the anaphoric use of *same* seen in examples like *Thank you for the application form; I enclose (the) same herewith, duly completed*.

same symbol *x* in our representation of the meaning). *Same* is omissible in [ii],<sup>24</sup> but its presence serves to reinforce, to emphasise, the identity. Structurally the two constructions are very similar – in [6], for example, both subordinate clauses have the complement of *at* left understood. The main difference is that comparative clauses allow for a greater amount of reduction than relatives. There is, for example, no relative corresponding to *the same hotel as \_\_ usual*, for the relative can't be reduced to a verbless structure like this. Note also that relatives do not allow the inversion that is characteristic of comparatives: *Sheep and goats turned up on Timor at the same time as/\*that did the dingo*.<sup>25</sup>

### ■ *Same as* with NP complement

It is very common for the comparative complement to consist of *as* + NP. In some cases it is possible to add a verb, in others it is not:

- [7] i a. *I am in the same class as Pat (is).* b. *I left at the same time as Pat (did/left).*  
 ii a. *Kim's views are the same as Pat's.* b. *This version looks the same as that one.*

The examples in [i] are similar to scalar comparisons – e.g. *I am in a higher class than Pat (is)*; *I left earlier than Pat (did/left)*. Those in [ii] differ from scalar comparisons (such as *Kim's views are better informed than Pat's*; *This version looks more authentic than that one*) precisely by not allowing the addition of *be*; *the same as* here is similar to *identical to* or *equivalent to*, and the examples are best regarded as simply comparisons between constants – between Kim's views and Pat's, this version and that one. Gerund-participials can also appear in this construction: *Promising to do something is not the same as doing it*.

### ■ Blurring of distinction between scalar and non-scalar equality

When *same* occurs with nouns denoting measurable properties such as *age*, *size*, *height*, *length*, and indeed more generally with gradable nouns, the interpretation will often be similar to that of a scalar comparative:

- [8] i a. *He'll soon be the same height as me.* b. *He'll soon be as tall as me.*  
 ii a. *I don't earn the same salary as you.* b. *I don't earn as much as you.*  
 iii a. *It's not the same quality as the earlier model.* b. *It's not as good as the earlier model.*

The [a] examples, with *same*, will typically convey much the same as the [b] examples, which are central cases of scalar comparisons of equality. We take the view, however, that this is a matter of implicature: the [a] and [b] examples do not have the same truth conditions. The scalar equality expressed by *as* (... *as*) means "at least equal", but that is not the meaning of *same*. Consider the questions *Is he the same age as you?* and *Is he as old as you?* It is perfectly natural to answer the first with *No, he's two years older*, but this is not a natural answer to the second (where we would have *Yes, two years older, in fact* or the like). Similarly, [iia] can naturally be continued with *I earn \$1,000 more*, but this would be possible as a continuation of [iib] only if the latter were interpreted as having metalinguistic negation. Or compare *If I*

<sup>24</sup>This leads some of the more authoritarian usage manuals to condemn the relative construction – on the grounds that *same* is here redundant. There is no empirical basis for proscribing it, however: it is very common and thoroughly acceptable.

<sup>25</sup>For these reasons we do not follow the common traditional practice of analysing *as* as a relative pronoun here: the examples in [6] belong to syntactically distinct constructions even though they are semantically equivalent.

*earn more than you, then necessarily I earn as much as you* and *\*If I earn more than you, then necessarily I earn the same as you.*<sup>26</sup>

### ■ The same as as equivalent to (just) as or like

- [9] i *They stay here the same as you do.* [= (just) as]  
 ii *You deserve a break the same as everyone else.* [= like]

This construction belongs to informal style. The interpretation of the subordinate clause in [i] would seem to be simply “you stay here”: there is no counterpart of the comparative phrase. In this respect it is a marginal member of the class of comparative clauses. The connection with central members, however, is seen in the fact that it can be reduced to such forms as *as usual*: *We’re going to the movies on Friday, the same as usual.*<sup>27</sup>

### ■ Anaphoric use of the same in term comparison

The comparative complement, and hence the secondary term in the comparison, is commonly left understood:

- [10] i *He arrived on Tuesday morning and left for Sydney the same day.*  
 ii *Kim certainly tried, and the same can be said for Jill.*  
 iii *They rejected my application and the same thing happened to Kim.*

In [i] *the same day* is interpreted anaphorically as “on Tuesday”; in [ii] what can be said for Jill is that she certainly tried; and in [iii] they rejected Kim’s application too. This represents one of the major anaphoric devices in English, not least in construction with *do* (as object) or *happen* (as subject) – see Ch. 17, §8.

### ■ The same in set comparison

- [11] a. *Kim and Pat are the same age.* b. *We asked them all the same question.*

Example [a], where the set is expressed by a coordination, is equivalent to the term comparison *Kim is the same age as Pat*. The difference between the two versions is a matter of information packaging: in the term comparison Kim and Pat are differentiated as primary and secondary terms, whereas in [11a] they are of equal status as members of the set being compared.

### ■ Modification

In NPs *same* can be modified by *very*: *the very same mistake as you made last time*. Semantically this serves to reinforce the *same* rather than to indicate degree: it is comparable to that of *That’s the very point I was making* rather than that of *That’s very good*. The compound *selfsame* achieves the same emphasis. *Same* can also be modified by such items as *much*, *almost*, *roughly*, *exactly* preceding *the*: *much the same*, etc.; apart from *much*, these are the main items that modify scalar comparisons of equality (cf. [29] of §4).

<sup>26</sup>The implicatures commonly conveyed by the [a] examples in [8] are also found with NPs that have no overt comparison: *I don’t earn your salary* will tend to implicate that I earn less. The similarity between such pairs as those in [8] provides the basis for the blend between non-scalar and scalar comparisons found in the attested example *He used a rod that was exactly the same length as the model tower was high*.

<sup>27</sup>There is a somewhat similar type of construction in more formal style: *In exactly the same way as we best see something faint (Halley’s Comet, say) by not looking directly at it, so the thinking part of our brain tends to work better when we’re not conscious of thinking*. Here too *in exactly the same way as* could be replaced by *just as*, and the comparative clause is not understood as having an implicit modifier matching *in exactly the same way*.

## 5.2 *Similar*

We here examine *similar* as representative of a set of comparative governors that occur with *to*, *from*, or *with*, but not the prototypical comparative prepositions *as* and *than*,<sup>28</sup> and hence not with comparative clauses.

### ■ *Similar with a comparative complement*

*Similar* selects *to* and is found in the following range of constructions:

- [12] i *This festival is rather similar to Munich's Oktoberfest.* [predicative]  
 ii *The tribunal has powers similar to those of the courts.* [postpositive]  
 iii *She was using a similar argument to that outlined above.* [attributive:I]  
 iv *This problem is of similar complexity to the last one.* [attributive:II]

The secondary term in the comparison is in all cases expressed by the complement of *to*. Where *similar* is used predicatively the primary term is expressed by its predicand – the subject *this festival* in [i], the object in *They have made this festival rather similar to Munich's Oktoberfest*. In the postpositive use it is given by the part of the nominal preceding *similar*, here *powers* – the comparison is between the powers the tribunal has and the powers of the courts. In the attributive use of *similar* (much less frequent than the other two) there are two possibilities. In [iii] (Type I), the primary term is given by the comparative phrase – *a . . . argument*. In [iv] (Type II), it is given by some other NP – the subject *this problem*. Type I is the more usual construction; in the following pair, for example, [i] is much more likely than [ii]:

- [13] i *She was using a similar argument to yours.* [attributive:I]  
 ii *She was using a similar argument to you.* [attributive:II]

Nevertheless, Type II examples are readily found:

- [14] i *We should set up a local Labour Party along similar lines to the London one.*  
 ii *Errors on this new task take a very similar form to those which are made on the conservation or class inclusion task.*  
 iii *A semi-synthetic molecule available in Europe and Japan, artepon, has a similar mechanism of action to the drugs currently under study.*

The comparative complement is omissible if recoverable anaphorically, except in the postpositive case. If we drop *to those of the courts* from [12ii], for example, the general rules for the placement of adjectives will require that *similar* occupy pre-head position: *The tribunal has similar powers*.

### ■ *Similar in set comparison*

Set comparisons are found corresponding to two of the term comparisons illustrated in [12], namely the predicative and the Type II attributive:

- [15] i *This festival and Munich's Oktoberfest are rather similar.*  
 ii *This problem and the last one are of similar complexity.*

<sup>28</sup>Examples with *as* are attested: *The average Australian retiring in twenty years will need up to \$2 million in assets to live at a similar standard as today*. They are not, however, frequent or systematic enough to be regarded as grammatical; they appear to be restricted to relatively complex examples facilitating the analogical influence of *same*: we do not find examples like *\*My views are similar as yours* or *\*I have similar views as you*.

### ■ Modification

*Similar* is a gradable adjective, and hence can be modified by such adverbs as *very*, *quite*, *rather*, *extremely*, etc., and can itself be subject to scalar comparison (*The Opposition's policy is more similar to the government's than they care to admit*). In general the degree of likeness conveyed by *similar* falls short of complete identity, but it is sometimes used for the latter, allowing such modifiers as *exactly* and *almost*.

### ■ Lexical derivatives

The corresponding noun and adverb are seen in:

- [16] i *The shooting had remarkable similarities with/to a terrorist execution.*  
 ii *Purchase of state vehicles is handled similarly to all state purchases.*

The adjective *dissimilar* usually takes *to*, but *from* is found too.

## 5.3 *Such*

We focus here on *such* as it appears in non-scalar comparisons with a comparative complement; for scalar *such*, see §4.3 above, and for the use of *such* with a resultative complement, see Ch. 11, §4.6. *Such* does not occur in set comparisons.

### ■ *Such as with comparative clause*

*Such* may precede or follow the noun head, as in [17i–ii] respectively:<sup>29</sup>

- [17] i a. *Would you yourself follow such advice as you give me \_\_?*  
 b. *We have been requested to discuss with you such matters as \_\_ appear to us to be relevant.*  
 c. *Applications shall be made in accordance with such regulations as the Secretary to the Treasury may prescribe \_\_.*  
 d. *Such roads as \_\_ existed were pretty much open roads.*  
 e. *We were in the worst possible shape to deal with the immediate task of trying to co-operate with the Russians, who suffered from no such disadvantages as did we.*  
 ii a. *There were no homes for old people such as there are \_\_ today.*  
 b. *A new payroll tax, such as the Minister proposes \_\_, would be highly unpopular.*  
 c. *He questioned the value of certification, such as \_\_ provided by these courses.*

The comparative phrase is the NP containing *such* and the counterpart to this is always missing in the comparative clause. Other features of the comparative construction are seen in the inverted order of [id] and the omission of the passive auxiliary *be* in [iic].

The central meaning of *such* concerns likeness of kind. For example, [17ia] might be glossed as “advice like that which you give me”, [iib] as “a new payroll tax of the kind the Minister proposes”. In [ic] – a type quite common in legal language – the sense of *such . . . as* is close to that of *whatever*. Example [id] is also comparable to a fused relative construction, but without the *-ever*: *what roads existed*. It conveys that there were

<sup>29</sup>The *such* phrase can also be postposed: *No depression occurs such as is seen clinically or may be produced in normal persons by drugs.*

relatively few roads.<sup>30</sup> But in spite of the semantic similarity with relatives, *such*, unlike *same*, does not normally take a relative clause instead of the comparative complement. Examples like *Such overseas interests that Australian companies do have are summarised in Appendix 5* are attested, but rare, and of questionable acceptability.

*Such + as* is also found occasionally without a following head noun:

- [18] i *The concern they felt for me was such as I shall never forget* \_\_ .  
 ii *We are to admit no more causes of natural things than such as \_\_ are both true and sufficient to explain their appearances.*

Note that the missing object in [i] cannot be recovered from the *such* phrase itself: we need to go to the subject NP (*the concern they felt for me*). In this respect the example differs from normal comparative constructions (but compare [45] of §2 above); it may represent a blend between the comparative and the resultative content clause construction *The concern they felt for me was such that I shall never forget it*. In [ii] *such* is fused modifier-head.

#### ■ *Such as with phrase*

The most common use of *such* ( . . . ) *as* is with a single element after *as*, usually an NP:

- [19] i *What is one to make of such statements as this?*  
 ii *The choice depends on such factors as costs and projected life expectancy.*  
 iii *Traditional sports such as tennis, cricket, and football led in popularity.*  
 iv *It is no interference with sovereignty to point out defects where they exist, such as that a plan calls for factories without power to run them.*

In the majority of cases (unlike those cited for scalar *such* in [28] of §4.3) it is not possible to add a verb, and the NP following *as* is best regarded as an immediate complement, not a reduced clause (§2.2). Especially when *such* follows the head noun, the element of likeness may be attenuated, with *such as* just introducing examples, as in [iii].<sup>31</sup>

## 5.4 *Different, other, else*

### ■ Term comparison: *different + from*

The comparative complement usually has *from* as head; the range of constructions matches that discussed above for *similar + to*:

- [20] i *My brushes are different from those used by most watercolourists.* [predicative]  
 ii *They have an examination system not very different from ours.* [postpositive]  
 iii *You're answering a different question from the one I asked.* [attributive:I]  
 iv *Do Catholics have different attitudes from Anglicans?* [attributive:II]

In Type I attributives the primary term is expressed in the comparative phrase (*a . . . question . . .*), while in Type II it is expressed elsewhere, here in the subject.

<sup>30</sup>Such a deprecatory interpretation is also found in the idiomatic frame *such as they are*, etc.: *My opinions, such as they are, are my own* suggests that the opinions are of limited value or significance.

<sup>31</sup>In existential constructions with *thing* the comparison involves identity rather than likeness: *There's no such thing as a free lunch*, "There are no (genuinely) free lunches".

Construction [iv] is simpler than the equivalent Type I construction formed by replacing *Anglicans* by *those of Anglicans*.<sup>32</sup>

### ■ Different + to and than

While the verb *differ* selects only *from*, *different* also takes *to* or *than*:

- [21] i This version is very different to the one we shall hear in the simulcast.  
 ii %Records provide a different sort of experience than live music.  
 iii %The focus of interpersonal relationships is different in marriage than in a pre-marital situation.  
 iv %There was no evidence that anything was different than it had been.

They are, however, very much less frequent than *from*. *Than* is subject to regional variation: it is hardly used at all in BrE, but is well established in AmE, though even there it is unlikely in the simplest predicative and postpositive constructions (<sup>?</sup>*My needs are different than yours*; <sup>?</sup>*We expected a result rather different than this*). As elsewhere, *than* can be followed by a single element (NP in [ii], PP in [iii]) or a clearly clausal construction ([iv]). *From* and *to* are normally restricted to NP complements, so that replacement of *than* by *from* or *to* in cases like [iii–iv] requires a more complex formulation involving nominalisation, for example by means of a fused relative: *different in marriage from what it is in a pre-marital situation*, *different from what it had been*.<sup>33</sup>

### ■ Differently

The adverb is found with the same range of prepositions as the adjective:

- [22] i We need to remember that Israel treated sheep differently from us.  
 ii %People often behave differently in a crowd than they would individually.

Note that in [i] the primary term is expressed by the subject *Israel*, but in [ii] it is given in the comparative phrase *differently*, understood as “in a different way”. The comparison is between the way people behave in a crowd and the way they behave individually.

### ■ Set comparison

- [23] i The two versions of the incident are very different.  
 ii They proposed three different ways of solving the problem.  
 iii Different people hold different views on this matter.  
 iv The various candidates had reacted quite differently.

*Different*, like *similar* above, is used in set comparisons in predicatives ([i]) or Type I attributives ([ii]). In the latter case *different* may occur in more than one NP, as in [iii]; the effect of the repetition is to pair people and views, excluding the case where a single

<sup>32</sup>A comparable simplification is seen in the predicative *Public attitudes to historical material were very different then from now*. The primary term here is expressed by *then*, not the subject, as it would be with *from what they are now*.

<sup>33</sup>The choice of preposition with *different* is much discussed in usage manuals. The most authoritarian insist that only *from* is correct, but the majority recognise that this rule is in clear conflict with accepted usage. American manuals accept *than*, especially with clausal complements, while British ones vary in their attitude to it: some defend it as permitting a simpler construction in cases like [21iii–iv] (and on the grounds that *different* takes modifiers like *no* and *much*, which makes it like a comparative form), but most do not allow it as standard in BrE.

person holds different views. Example [iv] illustrates the use of the adverb *differently* in set comparison.

#### ■ Modification

*Different* (like *similar*) is a gradable adjective, allowing the usual range of modifiers for this class, such as *very* and a scalar comparative (*His views were more different from mine than I'd expected*). At the same time, however, it takes those found with scalar comparison of inequality (cf. [29] of §4): *no, any, much* (generally in non-affirmative contexts: *It isn't much different from the previous version*), *far, a great deal*, and so on.

#### ■ Other + than

*Other* occurs only in term comparison. The comparative complement has *than* as preposition.<sup>34</sup> As an adjective, *other* occurs predicatively, postpositively, and in the Type I attributive construction:

- [24] i *It turns out that the US policy is in fact other than he stated.* [predicative]  
 ii *He has no income other than his pension.* [postpositive]  
 iii *We must find some other means of restricting imports than tariffs.* [attributive:I]

The predicative use is comparatively rare, and *other* here requires a complement. We cannot therefore say, for example, *\*Our policy is other*; instead we need *Our policy is different*. The construction with *other* used predicatively is the only one where the *than* can take a comparative clause, as in [i] – compare *\*He has no income other than the government provides* and *He has no income other than that which the government provides*, with an NP as immediate complement of *than*.

The attributive use is much less frequent than the postpositive, but syntactically more straightforward in that the *than* phrase is omissible and clearly a separate dependent in the structure of the NP. *Other* can be coordinated with a scalar comparative form, showing that we are here not far removed from the central type of comparative construction: *My mother had the faculty of gazing beyond people into space inhabited by other and more exciting ones than those who were actually in the room*. Also straightforward is the construction where **other** is a nominal pro-form: *These wrongs are public in the sense that they involve others than the agent*, with *others* head (“other people”) and *than the agent* comparative complement.

In the postpositive construction *than* cannot be omitted: *\*He has no income other*. This is conducive to a reanalysis whereby *other than* is construed as a compound preposition with a meaning like “besides, except, apart from”. Such a reanalysis certainly seems to have applied in the construction where *other than* is not in construction with a head noun, but introduces an adjunct:

- [25] i [Other than *this very significant result,*] *most of the information now available about the radio emission of the planets is restricted to the intensity of radiation.*  
 ii *Little has changed [other than *that it is now a silent and deserted place*].*  
 iii *For a long time we didn't talk [other than *to confirm our common destination*].*

<sup>34</sup>*Other* is occasionally found in combination with *but* instead: *I wouldn't want any other pet but a dog* – a blend between *any pet but* and *any other pet than*. This is different from the combination with *except*, as in *He has no other friends except you*, which doesn't say that you are his only friend: the interpretation here is “He has no other friends than these except you” – i.e. there is an understood secondary term for comparative *other*.

Further constructions where *other than* appears to function as a constituent are illustrated in:

- [26] i *Did he consider the possibility of recording other than popular music in this way?*  
 ii *No one suggests these deals are other than legitimate commercial operations.*  
 iii *He is at pains to define his key terms other than anecdotally.*

Again, *other* could not occur on its own in these positions, and it is doubtful if it can properly be regarded as head. The underlined sequences are NPs in [i–ii] and an AdvP in [iii], and it is plausible to take *music*, *operations*, and *anecdotally* as syntactic head with *other than* a modifier, comparable to the reanalysed uses of *more than* and *less than* discussed in §4.5.

### ■ Else

This is semantically equivalent to *other*, but it takes a complement headed by either *than* or *but* that is always optional: *anyone else (than/but you)*, *nowhere else (than/but in France)*. Like non-predicative *other*, it cannot take *than* + comparative clause: *anything else than what she gave you*, not \**anything else than she gave you*. *Else* is restricted to occurrence with interrogatives (*who/what/how else*, etc.), the compound determinatives (*everyone, anything*, etc.), and *much, little*, and *all* in fused determiner-head function.

## 5.5 As

In this section we are concerned with term comparisons of equality where the preposition *as* appears on its own, without a superordinate comparative governor such as *same, such, so*, or a preceding *as*:

- [27] i *As you know, we face a difficult year.* [adjunct of comparison]  
 ii *I did it as I was told to do it.* [manner]  
 iii *The universe today looks just as it did millions of years ago.* [predicative]  
 iv *The plan as currently conceived is seriously flawed.* [dependent of nominal]

This *as* is itself the comparative governor, and takes a bare comparative complement (cf. §1.3). It does not occur in set comparison: it always introduces the secondary term in term comparison.

We focus primarily on constructions where *as* takes a clausal complement, considering in turn the four categories illustrated in [27]. The causal *as* of *As it was raining they cancelled the match* and the temporal one of *She fell as she was going downstairs* are excluded as falling outside the domain of comparison: these simply take content clauses as complement, whereas the complements of *as* in [27] are comparative clauses.

### ■ Adjunct of comparison

The underlined adjunct or complement in [27ii–iv] is only incidentally comparative: the *as* phrase could be replaced without change of function by, for example, *carefully, remarkable, in its present state*, and so on. The adjunct in [27i], however, is inherently comparative, not replaceable by an expression with the same function that is not comparative: it is for this reason that we call it an adjunct of comparison, a semantic type of

adjunct on a par with those described in Ch. 8. Further examples are given in:

- [28] i [As I have already observed \_\_,] no reason has yet been offered for this change.  
 ii The event was sponsored, [as \_\_ is the fashion these days,] by a brewery.  
 iii He didn't report the matter to the police [as you'd predicted \_\_].

The comparative clauses functioning as complement to *as* are structurally incomplete in that the clausal complements which their verbs would have in main clauses are missing. They are recoverable from the matrix: in [28i], for example, what I have already observed is that no reason has yet been offered for this change. Similarly in [ii]: what is the fashion these days is for comparable events to be sponsored by a brewery. Example [iii] is ambiguous: what you'd predicted may be that he would report the matter to the police or that he wouldn't.

Adjuncts of this kind cannot be foregrounded in the *it*-cleft construction (*\*It's as you know that we face a difficult year*). Nor can they fall within the scope of a negative – note, for example, that in neither interpretation of [28iii] does the negative have the subordinate clause within its scope: it cannot be used to convey that you had not predicted that he would/wouldn't report the matter to the police. They are generally prosodically detached, having the status of supplements. As for the interpretation, the truth of the subordinate clause is not at issue: it is taken for granted or presupposed.<sup>35</sup>

Other verbs often found in the comparative clause in this construction include:

- |      |                    |               |              |                    |                 |
|------|--------------------|---------------|--------------|--------------------|-----------------|
| [29] | <i>acknowledge</i> | <i>argue</i>  | <i>claim</i> | <i>demonstrate</i> | <i>discover</i> |
|      | <i>expect</i>      | <i>find</i>   | <i>hear</i>  | <i>insist</i>      | <i>note</i>     |
|      | <i>promise</i>     | <i>remark</i> | <i>say</i>   | <i>show</i>        | <i>suggest</i>  |

These are verbs that take content clauses as internal complement; such adjectives as *aware* follow the same pattern (*as you will be aware*). The missing complement may likewise be understood as subject of these verbs in the passive (*as is widely known*), or of other expressions taking clausal subjects (*as happens frequently*), or verb + predicative (*as will be obvious*). The structure is like that found in central comparative constructions: compare [28iii] with *Not as many people came [as you'd predicted \_\_]*. One difference, however, is that in the present construction the *as* phrase can occupy a range of positions, like many other adjuncts: front, end, or central (*We face, as you know, a difficult year*). This difference is attributable to the fact that the *as* here is itself the comparative governor, rather than being selected by some superordinate governor that it must follow.

#### Relationship with relative construction

The construction containing an adjunct of comparison bears a significant resemblance to one with a supplementary relative clause:

- [30] i a. *He phoned home every day, [as he'd promised to do].* [comparative]  
 b. *He phoned home every day, which he'd promised to do.* [relative]

<sup>35</sup> *As I recall* (or *as I remember*) has a somewhat different interpretation from the examples in [28]. The truth of the subordinate clause is not here taken for granted; rather, the *as* phrase serves as a 'hedge', a modal qualification, indicating that the information in the matrix clause is based on recollection. The meaning is similar to that of *as far as I recall*. Note, by contrast, that *as I well recall* follows the usual pattern. Compare *As I recall, no one had raised any objections to the proposal*, and *The Society to which I myself belonged in my own college at Oxford was, as I well recall, of this latter sort*.

- ii a. *She has recovered quickly*, [*as her doctor will confirm*]. [comparative]  
 b. *She has recovered quickly*, *which confirms that it wasn't serious*. [relative]

The underlining marks the subordinate clauses, comparative or relative, while the brackets in the [a] examples mark the adjunct of comparison. In [ia] we have a comparison of equality between two variables: “*x* (he phoned home every day); he promised to do *y*;  $x = y$ ”. In the relative construction [ib] we have two occurrences of the same variable: “*x* (he phoned home every day); he'd promised to do *x*”. The end result is the same in the two constructions, just as we saw that *same + as* can be equivalent to *same + relative* (§5.1). Nevertheless, there are pragmatic and syntactic differences between the two constructions.

The informational content of the comparative clause is backgrounded, whereas the relative presents the information it expresses as separate from that of the main clause. In [3oia] *as* is much more likely than *which*, whereas in [iib] *as* would be impossible: the relative here takes the matrix as the starting-point or basis for new information of equal importance.

Syntactically, the comparative displays distinctive properties of the central comparative construction, as illustrated in:

- [31] i *He was a devout Catholic*, [*as were* \_\_ *both his brothers*].  
 ii *They claimed it as a deductible expense*, [*as* \_\_ *permitted under US tax law*].  
 iii *Kim won convincingly*, [*as* \_\_ *usual*].  
 iv *I've also felt at times like leaving my wife*, [*as she has* \_\_ *me*].

In [i] we have postposing of the subject, which would not be possible in a relative: *which both his brothers were too*, but not \**which were both his brothers too*. In [ii] the passive auxiliary *be* is omitted, and again this is not permitted in a relative: cf. *which is permitted*, but not \**which permitted*. In [iii] the comparative clause is reduced to an adjective: *which* would require a finite construction, *which is usual*. And in [iv] *has* is stranded, but with an object following the missing verb: relative \**which she has me* would again be quite impossible.

#### Reduction not always obligatory

One respect in which this *as* construction differs from more central types is that the subordinate clause is not necessarily structurally incomplete. Instead of [31iv], for example, we could have *as she has felt at times like leaving me*, with no material missing but understood. The minimum reduction required in central comparatives is that the counterpart to the comparative governor be missing (cf. §2.1), but in this construction the governor, *as*, is head of an adjunct which has no counterpart in the subordinate clause.

This is not to say, however, that reduction is always optional: it is most clearly obligatory in cases like [27i], [28], or [31ii–iii], where it would be impossible to add a pronoun in place of the missing complement (\**as you know it*, \**as I have already observed it*, etc.). In these cases the *y* variable is understood as embedded as complement of a verb or verb + predicative, rather than as constituting the whole complement of *as*.

#### No requirement for new or contrasting material

The comparative clause usually contains material distinct from that in the matrix: in [27i] *you know* appears only in the subordinate clause, in [31iv] we have contrasting subjects

(*she* vs *I*) and contrasting objects (*me* vs *my wife*), and so on. But as with scalar comparisons of equality (*She's as fit as she is because . . .*) the subordinate clause need not contain new or contrastive lexical material:

- [32] i *If the aim is to create disunity, [as it is \_\_,] we should reject his proposal.*  
 ii *She suggested he hadn't been honest with her, [as indeed he hadn't \_\_].*  
 iii *The deadlock is a disappointment coming [as it does] after such a promising start.*

What makes these possible is that the matrix does not **state** that the proposition is true, whereas the comparative clause does. The latter does therefore introduce a new feature, but it is not a matter of the lexical content. In [i] *the aim is to create disunity* is complement to *if* and hence merely entertained conditionally, rather than stated, in the matrix. Similarly in [ii] the *x* variable is expressed by the complement of *suggested*, and hence is not entailed. And [iii] has non-finite *coming*, which is not itself a construction used for stating; note that we could not here replace *coming* by *because it comes*.

### Reduction to a single element

The comparative clause can be reduced to a single element:

- [33] i *In sport, [as in everything else], attitude is all important.*  
 ii *We took the precaution, [as always], of having the paintings authenticated.*  
 iii *These qualities are necessary today [as never before] if we are to march together to greater security, prosperity, and peace.*

We understand “as it is in everything else”, “as we always do/did”, “as they have never been before”. Again the construction resembles central comparatives – cf. *Attitude is as all important in sport as in everything else; These qualities are more necessary today than ever before*. There is, however, one major difference: in the present construction a clause cannot normally be reduced to an NP understood as subject or object. For example, we can't omit the verb from [31i]: \**He was a devout Catholic, as both his brothers*. Instead we need *like*: *He was a devout Catholic, like both his brothers*.

### ■ Manner

Here the *as* phrase functions as manner element in the matrix and the comparative clause has an implicit manner element that is compared with it:

- [34] i *He uses statistics [as a drunk uses a lamppost \_\_], for support rather than illumination.*  
 ii *The louvres are constructed [as \_\_ shown in the diagram].*  
 iii *These people don't know how to go about complaining [as Europeans do].*

Example [i] may therefore be analysed along the lines proposed for central comparatives: “He uses statistics in way *x*; a drunk uses a lamppost in way *y*;  $x = y$ ”. And again there is an equivalent with a relative clause: *He uses statistics in the way a drunk uses a lamppost*. Example [ii] gives another illustration of the past-participial construction, with the passive auxiliary *be* omitted; the missing subject can be interpreted as “how louvres are constructed”.

There may be ambiguity between the manner and adjunct of comparison types, as in [34iii]. The manner interpretation is concerned with the way Europeans go about complaining – these people don't know how to go about doing it in this way. In the adjunct of comparison interpretation the equality is simply between what they don't

know and what Europeans do know. Only the adjunct of comparison interpretation is possible if the *as* phrase is placed before *how*: *They don't know, as Europeans do, how to go about complaining.*

### ■ Predicative

Here there is a comparison between two kinds or states:

- [35] i *His behaviour was [as we'd expected it to be \_\_].*  
 ii *Make sure you leave everything [as you find it \_\_].*  
 iii *The design of the building is [as \_\_ shown \_\_ in Figure 12].*

These fit the familiar analysis: “His behaviour was *x*, we'd expected it to be *y*;  $x = y$ ”, with the variables representing predicative complements. Example [ii] is equivalent to a relative construction with the noun *state* as head: *leave everything in the state in which you find it.* And [iii] is a further past-participial passive. The *as* phrase functions as predicative complement: subjective in [i/iii], objective in [ii]. The comparative clause has a missing predicative complement in [i–ii]; [iii] has a missing subject, interpreted as “the design of the building”, and it is arguable that there is also a missing predicative complement here too: it's a matter of **how** Figure 12 shows the design.

### ■ In construction with a nominal or NP

- [36] i *This is a photograph of the church [as it was \_\_ in 1900].*  
 ii *Computer technology may make the car, [as we know it \_\_], a Smithsonian antique.*  
 iii *No one thought that Margot, [as she was then known \_\_], would last the distance.*

The *as* phrase in [i] is a modifier in the structure of the nominal headed by *church*, while those in [ii–iii] are supplements to the anchor NPs *the car* and *Margot*. This construction differs semantically somewhat from the others we have been considering, and doesn't lend itself to an analysis of the familiar kind involving variables *x* and *y*. Rather, the *as* phrase specifies some property or aspect of what is denoted by the head noun or the anchor NP: in [i] we are concerned with how the church was in 1900, in [ii] with how we know (conceive of) the car, in [iii] with how (by what name) the person concerned was known at the time in question.

Syntactically the complement of *as* is still a comparative clause, still structurally incomplete relative to a main clause. This is most obvious in [36i], which may be compared with main clause *The church was in such-and-such a state in 1900.* The comparative clauses in [ii–iii] may similarly be contrasted with *We know it in such-and-such a form* and *She was then known as such-and-such.*

### ■ Idiomatic uses

Examples such as the following are of limited productivity:

- [37] a. *As it happens, I met her only yesterday.*      b. *Do as I say / as you like.*

*It happens* is structurally incomplete in that it couldn't stand alone, but it is not clear what missing element is understood: *as it happens* is a fixed phrase. Compare also *as things stand, as it is*. Both versions of [b] have exceptional syntax in that *do* normally takes an NP object (cf. *Do this; Do what I say*); the pattern does not occur with other transitive verbs (e.g. *\*Take as you like*). A relatively recent such idiom is *as is*: *All items are sold as is* (“in their present state”).

### ■ *As if and as though*

These introduce phrases with the same range of functions as those discussed above for *as* alone, except that they do not function as dependents to a noun:

- [38] i *He had scurried up the hatch as if we were abandoning ship.*  
 ii *They were treated as if they were Commonwealth citizens.*  
 iii *There was a ragged edge to her voice now, as if she'd been crying.*  
 iv *The effect is as if he had materialised out of nowhere.*

The *as if* phrase is a manner adjunct in [i], a manner complement in [ii], an adjunct of comparison in [iii], and a predicative complement in [iv].

### *As if and as though as compound prepositions*

In the examples of [38] it is possible to fill out the construction, inserting material between *as* and *if*:

- [39] i *He had scurried up the hatch as he would if we were abandoning ship.*  
 ii *They were treated as they would be if they were Commonwealth citizens.*  
 iii *There was a ragged edge to her voice, as there would have been if she'd been crying.*  
 iv *The effect is as it would have been if he had materialised out of nowhere.*

This might suggest that there is nothing special about [38] – that the underlined phrases simply consist of *as* as head with the *if* phrase as complement. Thus [38iii], for example, would be comparable to *There was a ragged edge to her voice, as when she'd been crying*. There is strong syntactic and semantic evidence, however, for saying that *as* and *if* have merged into a single compound preposition taking a content clause as complement, that the examples of [38] cannot be analysed as reduced versions of [39].

The first argument for the compound analysis is that *as if* in [38] can be replaced without change of meaning by *as though*, whereas *if* in [39] cannot be replaced by *though*.

The second argument is that it is not possible to repeat *if* in coordination: \**They were treated as if they were Commonwealth citizens or if they had resided here for ten years or more*.

The third argument is that expansion of the kind shown in [39] is very often not possible:

- [40] i *Don't attack a mouth as if you're dipping a mop into a slop-bucket!*  
 ii *It was highly imprudent of him to drink as if he were a youngster like ourselves.*  
 iii *She acts as if she hates me.*  
 iv *It seems/looks as if we've offended them.*  
 v *Max seems/looks as if he's in difficulties.*  
 vi *As if this news wasn't bad enough, I found that the printer wasn't working either.*

In [i] we have a comparison of equality (interpreted as resemblance) not between two ways of attacking a mouth but between a way of attacking a mouth and the way of dipping a mop into a slop-bucket. In [ii] the comparison is not between the way he drank and the way he would drink if he were a youngster but between the way he drank and the way it would be acceptable, appropriate, or reasonable to drink if he were a youngster. Example [iii] could be expanded if it had modal preterite *hated* (*She acts as she would act if she hated me*), but it can't be expanded as it stands, with present tense *hates*.

Whereas in [40i–ii] the idea of comparison associated with *as* remains very evident, it is much attenuated in [iii]: it is more a matter of the way she acts suggesting that she hates me. This shift from comparison to the issue of whether the content clause is true is carried a step further in [40iv]. In the version with *seem*, *as if* could be replaced by *that* with virtually no

change in meaning. In this construction the *as if* reinforces or harmonises with the modal meaning expressed in the verb (essentially medium strength epistemic modality, in the sense of Ch. 3, §9) – thus, roughly, “Judging from appearances, it is likely that we have offended them”.

Other verbs of similar meaning likewise take a complement of this form: *appear, feel, sound, taste*, and also *be*.<sup>36</sup> In addition to the impersonal construction of [40iv] we find ordinary subjects, as in [v].

Finally, [40vi] involves a special use of *as if/though*, where the matrix clause presents some situation as a further instance of something, normally something bad – in this example, of further bad news. In this use, the *as if* always has a negative complement, and again it is less a matter of comparison than of the status of the content clause. This time the construction indicates that the content clause is true (not merely likely): this news wasn’t bad enough (i.e. bad enough to satisfy a malevolent fate, as it were, bad enough to make it unnecessary to inflict further bad things on me).

### The *as if/though* phrase standing on its own

The *as if/though* phrase may form an exclamatory clause by itself:

- [41] i *As if I didn’t have enough on my plate as it was!*  
 ii *As if I would try to cheat you!*

The first of these is a structurally incomplete version of the construction shown in [40vi]: the indication of what else I had on my plate is left unexpressed, being recoverable from the context. Example [41ii] presents the content clause as false: it is an indignant rejection of the suggestion that I would try to cheat you.

### Irrealis *were* and the preterite

The *as if/though* construction is one of those that allow irrealis *were* or a modal preterite. Where the matrix clause has present tense, we have the expected contrast in the content clause between *were* or modal preterite and present tense:

- [42] *He moves about on camera, angular, emaciated, graceful, as if his body were/is weightless.*

The version with irrealis *were* is motivated by the fact that his body is not actually weightless, i.e. by the counterfactuality of the content clause. The version with *is*, by contrast, presents his body’s being weightless as an open possibility, thereby suggesting that he gives the appearance of being weightless. Compare also *She acts as if she hated me* and *She acts as if she hates me* (= [40iii]). The latter conveys that the way she acts suggests that she does hate me or may well do so, whereas the modal preterite *hated* presents her hating me as a more remote possibility (though it is certainly not presented as counterfactual).

Less straightforward is the case where the matrix clause is in the preterite:

- [43] i *He was treated as if he were a Commonwealth citizen.*  
 ii *As the trooper left the room, the gambler turned to the army girl with an odd expression, as though he were remembering painful things.*

<sup>36</sup>With *be* in the negative we actually have an entailment that the content clause is false: *It’s not as if he wasn’t trying* entails that he was trying. This construction is used to deny a proposition that might otherwise have been deduced (perhaps he didn’t perform as well as expected).

The natural interpretation of [i] is that he was treated like a Commonwealth citizen although he wasn't one. Example [ii], however, doesn't imply that he wasn't remembering painful things: on the contrary, it suggests that he was or appeared to be. In [i] we could have *as if he had been a Commonwealth citizen*, with the perfect marking backshift (or past time) and the preterite marking modal remoteness; it is, however, much more usual in such contexts to have an irrealis or simple preterite after *as if/though* than a preterite perfect.

The irrealis in [43ii] does not appear to be semantically motivated: certainly if we had a simple preterite in this context we would have no reason to regard it as a modal preterite. This *were* is therefore probably best regarded as belonging with the 'extended' uses of the irrealis discussed in Ch. 3, §1.7. Like them, it has the flavour of a hypercorrection: *was* is a less formal variant of *were* in modal remoteness constructions like [i], so that some speakers feel *were* to be stylistically preferable to *was* in similar constructions where *was* was not traditionally stigmatised.<sup>37</sup>

#### *As if/though* with infinitival and verbless complement

A further difference between *as if/though* and *if* is that the former can take a subjectless infinitival or verbless clause as complement:

- [44] i *He examined the notes thoroughly, as if to see if they were real.*  
 ii *She combed her hair back with her fingers as if to see better.*  
 iii *Unruly hair goes straight up from his forehead, standing so high that the top falls gently over, as if to show that it really is hair and not bristle.*  
 iv *He rose up as if weightless.*

The infinitival is interpreted as involving purpose or intention. The subject of the matrix clause is normally a human agent: exceptional examples like [iii] are interpreted as involving personification, with the hair conceived of as acting purposefully. The force of the *as if/though* is much like that in [40iii]: his examining the notes thoroughly (or the way he did so) suggested that his intention was to see if they were real. Example [44iv] illustrates the case where subject + *be* is omitted to yield a verbless complement.

#### *As if/though* in scalar comparison

We have been concerned so far with non-scalar comparison (diluted in some cases in such a way that there is little sense of comparison at all). Consider, finally, examples of scalar comparison like the following:

- [45] i *Our aim is to be as competitive as if we had rivals breathing down our necks.*  
 ii *The part of her that was in control was as calm as though she were just shedding an outer garment during a photo session.*

In [i] the second *as* is head of the comparative phrase and has the *if* phrase as its complement: *as if* is not here a compound preposition. Nevertheless one finds occasional examples with *though* instead of *if*, as in [ii]; they are, however, of questionable acceptability, and probably best treated as blends between the construction where *as* and *if/though* form a compound preposition, as in the non-scalar examples, and

<sup>37</sup>This extended use of irrealis *were* is occasionally found in constructions where the matrix has present tense: *It sounds from the guide book as if Verona were worth a visit*. The flavour of hypercorrectness is stronger here: the example falls under the use of *as if* seen in [40iv], which indicates that the content clause is relatively likely to be true, making the irrealis semantically inappropriate.

thought him like his father, \*This got him like a raving lunatic, and so on). In [iv] *like this* is a predicative adjunct.

### (b) Manner complement

- [48] i *Liz is behaving like a prima donna.*  
 ii *Jill treated Max like the others.*  
 iii *You shouldn't treat her like that.*

The few verbs that take a manner phrase as complement readily allow it to have the form of a *like* phrase. Thus [i] expresses resemblance between Liz and a prima donna with respect to the way or manner in which Liz is behaving. Example [ii] is ambiguous, in that the primary term in the comparison can be either Jill or Max: “Jill treated Max in the same way as the others treated him” or “Jill treated Max in the same way as she treated the others”. This ambiguity is like that found in scalar comparisons such as *Sue phoned Angela more often than Liz* (= [20v] of §2), though there can be no question of analysing the complement of *like* as a reduced clause here. Finally, [iii] is an instance of what we have called a variable–constant comparison (cf. *I stayed longer than six weeks* discussed in §1.3). The meaning can be given as “You shouldn’t treat her in manner *x*; *x* = that”, so that it is equivalent to the non-comparative construction *You shouldn't treat her that way*.

### (c) Non-predicative adjunct

*Like* phrases are very common in this function, where they have a rather wide range of interpretation. We consider three cases, though the distinction between the second and third is by no means sharp:

- [49] i *Like his brother, Max is a keen gardener.* [likeness of predication]  
 ii *Max talks like his brother.* [likeness of manner]  
 iii *Like a fool, Max believed everything they told him.* [other likeness]

#### Likeness of predication

The likeness between Max and his brother in [49i] is that both are keen gardeners: in this type, something is said about the primary term that also applies to the secondary term. The primary term is almost always expressed by the subject of the clause, and hence we call this ‘likeness of predication’ in that the same predicate applies to both terms. The distinction we are drawing between the primary and secondary terms in a comparison is reflected here in the status of the two propositions conveyed: “Max is a keen gardener” is asserted as the main information, while “His brother is a keen gardener” is backgrounded, presupposed information, something that is taken for granted.

This type differs from the others with respect to negation, in that *like* can take the negative prefix *un-*. Compare, for example:

- [50] i *Unlike his brother, Max is a keen gardener.*  
 ii \**Max talks unlike his brother.*

Example [ii] is inadmissible in the meaning “Max talks in a way which is unlike that in which his brother talks” – it would be acceptable with a comma after *talks*, but in that case it would be the counterpart not of [49ii] but of *Max talks, like his brother*, which involves likeness of predication, not likeness of manner. Example [50i] has subclausal negation, *unlike* serving to negate the secondary proposition, so that the meaning is:

“Max is a keen gardener, but his brother is not”. With clausal negation we have (changing the content of the propositions for greater naturalness):

- [51] i *Like his brother*, Max had not received a distribution from the family trust.  
 ii Max had not, *like his brother*, received a distribution from the family trust.  
 iii Max had not been to university *like his brother*.

In [i] the *like* is outside the scope of negation: Max and his brother are alike in that they had both not received a distribution from the family trust. Example [ii] is ambiguous: *like* can be outside the scope of negation, giving the same meaning as for [i]; or it can be inside the scope of negation, so that Max and his brother are not alike – Max’s brother had received a distribution, but Max himself had not. In abstraction from prosody, the same ambiguity applies in [iii]. If the sentence is read as a single intonation phrase, the *like* phrase is inside the scope of negation (“His brother had been to university, but Max hadn’t”), but if *like his brother* is read as a separate intonation phrase it will normally be outside the scope of negation (“Both of them hadn’t been”).

Where the complement of *like* is a personal pronoun it normally takes accusative case; this is the only possibility when the *like* phrase precedes the subject or follows the VP, but when it comes between subject and verb nominative forms are occasionally attested:

- [52] i *Like us/\*we*, Max is a keen gardener.  
 ii *The Russians, like us/ %we*, have an obvious interest in avoiding war.

The nominative suggests that the pronoun is construed as a subject, but it is not coordinate with *the Russians* and could not in this position be expanded into a finite clause; it is probably best regarded, therefore, as a hypercorrection (cf. Ch. 5, §16.2).

In the great majority of cases, the primary term in the comparison is expressed by the subject of the clause – by *Max* in [52i], *the Russians* in [52ii], and so on. Departures from this pattern are illustrated in:

- [53] i *Like any stray*, his response to these comforts was instantaneous.  
 ii *Like Moscow*, the main streets in Leningrad are wide and tree-lined.  
 iii *Like certain expensive restaurants*, just sitting there gave you the illusion of being wealthy yourself.  
 iv *Like so many great successes*, the ideas are surprisingly simple.

In [i] the primary term is expressed by the pronoun *his*, determiner within the subject NP, not subject of the clause itself. In [ii] it is expressed by the complement of *in* within the subject NP. In [iii] it is expressed by the locative adjunct *there* within the clause functioning as subject. And in [iv] it is not expressed at all, but is understood as the work or whatever whose ideas are surprisingly simple. Such examples are widely condemned in style manuals, and would generally be avoided in careful writing. This can be done by reformulating the clause so that the primary term is expressed by the subject (*he responded . . .*), or by using a construction with *as* + PP (*as with so many great successes, . . .*).

#### Likeness of manner

- [54] i *These birds walk like human beings*.  
 ii *These birds don’t walk like human beings*.

We interpret [i] as “These birds walk in the same way/manner as human beings” – hence the label ‘likeness of manner’. In [ii] the *like* phrase falls within the scope of negation:

“These birds don’t walk in the same way/manner as human beings”; the implicature is that the birds do walk, but in a different way from humans. As with manner complements, the NP following *like* can itself refer to a manner: *You should do it like this*. The comparison here is between the way you should do it and ‘this’.

Again, the primary term in the comparison is not invariably expressed by the subject:

- [55] i *He loved her like a sister.*  
 ii *Bergs will simply rip through sea ice like tissue-paper if the overall current is at variance to the top few metres of the watermass.*

#### Less specific likeness

- [56] i *The girls shrieked their applause like a mob of cockatoos.*  
 ii *The afternoon sun shone through her chestnut hair like a fiery halo.*  
 iii *He just slid his hand slowly out again like a snake.*  
 iv *I followed his instructions, like a coward.*

The examples in [i–iii] bear some similarity to [54i], but the comparison is not with the manner in which a mob of cockatoos might shriek their applause, in which a fiery halo might shine through her hair, or in which he might slide a snake slowly out. It is simply that the girls resembled a mob of cockatoos as they shrieked out their applause, the afternoon sun resembled a fiery halo as it shone through her hair, his hand resembled a snake as he slid it slowly out again. *Like a coward* in [iv] is somewhat different. It is not a matter of any visual resemblance: rather, I was like a coward simply by virtue of following his instructions.

#### (d) Modifier of a nominal or supplement to an NP

- [57] i *She gave an account of their meeting very like the one published in the press.*  
 ii *I don’t think there’ll ever be another rider like him.*  
 iii *Tossing around terms like ‘new right’ benefits no one but the left.*  
 iv *I hope that wearing a dress like this will give me confidence.*  
 v *There were others who ingested strange objects, like live fish.*  
 vi *<sup>3</sup>She had an accent like a Dutch kid I used to know.*

The *like* phrase in [i] can be expanded into a relative clause, *which was very like the one published in the press*: it is straightforwardly a matter of resemblance. A similar expansion is possible in [ii], but less natural: the interpretation is similar to that of a scalar comparison, *as good as him*. *Like* in [iii] is equivalent to *such as*: *new right* is an example of the terms in question. Some of the more authoritarian style manuals condemn this usage, but there is no empirical basis for doing so: it is very common and in no way restricted to informal style. *Like* expresses what we are calling a comparison of equality, and there is no requirement that the resemblance stop short of inclusion or identity. In [iv], for example, it is likely that ‘this’ is precisely the dress that will be worn: in this context the difference between *this dress* and *a dress like this* is that the latter is concerned with the **kind** of dress involved. In all of [i–iv] the *like* phrase is integrated into the structure of the NP as a modifier. In [v], by contrast, it is a supplement. Finally, [vi] is attested but of doubtful acceptability. The comparison is not between a Dutch kid I used to know and an accent, but between the Dutch kid and the referent of *she* – compare *She had an accent like that of a Dutch kid I used to know*. As it stands, [vi] is stylistically comparable to the examples in [53].

### 5.6.2 *Like* + finite clause

*Like* may take either a comparative clause or a content clause as complement:

- [58] WITH COMPARATIVE CLAUSE
- i *He wanted to see if she was really like [she always seemed to be \_\_ in his dreams].*
  - ii *You talk like [my mother talks \_\_].*
  - iii *You didn't look both ways before crossing the road like [you promised \_\_].*
  - iv *She was pushing a pram, a high-riding one with large wheels like [you see \_\_ in English movies].*
- [59] WITH CONTENT CLAUSE
- i *It looked like [the scheme would founder before it was properly started].*
  - ii *You look like [you need a drink].*
  - iii *She clasped it in her hand like [it was a precious stone].*
  - iv *It was like [I had lost something valuable in a vault full of my own money].*

In [58] *like* is in competition with *as* (or *such as* in the case of [iv]), and the bracketed clause is structurally incomplete in the way discussed above for the complement of *as* in §5.5. The missing element is predicative complement in [i], manner adjunct in [ii], complement in [iii], object in [iv] – compare *You see high-riding prams with large wheels in English movies*, and so on. In [59] *like* is in competition with *as if/though*, and its complement is structurally complete.

There is a quite strong tradition of prescriptive opposition to these constructions: it is alleged that *like* requires an NP complement and cannot take a finite clause (or, to put it in terms of the traditional analysis, that *like* is a ‘preposition’, not a ‘conjunction’). Undoubtedly some speakers follow this rule, avoiding *like* in such examples as [58–59] in favour of the competing forms. Such speakers are, however, very much in the minority: both constructions are commonly used, though somewhat more widely in AmE than in BrE. In BrE they are mainly restricted to informal style; in AmE they are also associated with informal style, but less exclusively, as evident from such examples as:

- [60] *There is nothing to suggest that the brain can alter past impressions to fit into an original, realistic and unbroken continuity like [we experience \_\_ in dreams].*

### 5.6.3 Other constructions

#### (a) With PP complement

- [61] *The shops stay open all night, just like [in the States].*

Here again, *like* is in competition with *as*, which would generally be preferred in formal style (and required by the more authoritarian prescriptivists). The construction is comparable to that where *than* or *as* is followed by a PP (*They aren't as good as in the States*): it may be that the complement of *like* should be analysed as a reduced clause (see §2.2). We should also include here examples like *They're going to Bournemouth like last year*; although *last year* is an NP, it is one of those that can function as adjunct, so that the example is comparable in acceptability to *They are going to Bournemouth like they did last year*.

## (b) NP + PP

*Like* is often followed by the sequence (det) + nominal + PP, and it may be unclear whether the PP is a post-head modifier of the nominal (with the whole sequence therefore forming a single NP), or a separate element (with the sequence forming a verbless clause). Compare the bracketed word sequences in these examples:

- [62] i *He looks like [a guy in my tutorial].* [single NP]  
 ii *She took to it like [a duck to water].* [NP + PP]  
 iii *At every problem he goes running to the sergeant like [a child to its mother].*  
 iv *Hate rose in him like [mercury in a thermometer].*  
 v *There were countless boats bobbing up and down like [corks in a bathtub].*

The two possible structures are illustrated in the first two examples respectively. In [i], *in my tutorial* is a modifier of *guy*, but *to water* in [ii] cannot be a dependent of *duck*, as evident from the ungrammaticality of *\*She saw a duck to water*, and suchlike. *Like a duck to water* is a familiar expression, but the same structure must apply in [iii]: *child* does not belong to the restricted set of nouns that can take a *to* phrase as dependent. Examples [ii] and [iii] are quite grammatical, and not subject to prescriptive condemnation; it would be unusual, of perhaps questionable acceptability, to replace *like* by *as* here. Examples [iv–v], and numerous similar ones, can be construed either like [i] or like [ii–iii]. There is nothing to stop the *in* phrase being modifier to *mercury* and *corks*, but nor is there anything to block the other structure, with the interpretations “as mercury rises in a thermometer”, “as corks bob up and down in a bathtub”. Note that the *in* phrase is relevant to the comparison, whereas in [i] it simply gives information limiting the denotation of the nominal. In [v] we could drop the PP because the boats were in the sea and corks would bob up and down in the sea as well as in a bathtub. But it would be pragmatically odd to drop the PP in [iv], for it is not a general characteristic of mercury to rise.

## (c) Gerund-participials

The distribution of gerund-participials is very similar to that of NPs, so that in most of the constructions discussed in §5.6.1 above the NP complement of *like* could be replaced by a gerund-participial. Instead of *Max is just like his father*, for example, we can have *Talking to Max is just like taking an oral examination*. In addition, we should note the following uses of the gerund-participial:

- [63] i *He shook the barman once more, like a bull-terrier shaking a rat.*  
 ii *The project looks like continuing another few years.*

Example [i] raises the same issues as were discussed in (b) above: it is unclear whether the complement of *like* is an NP (with *shaking a rat* a modifier to *bull-terrier*) or a non-finite clause (with *a bull-terrier* as subject and *shaking a rat* as predicate). Example [ii] illustrates a special use of *look + like*, with the gerund-participial an oblique catenative complement; the meaning is the same as for *look as if* (cf. *The project looks as if it will last another few years*).

## (d) Reanalysis

- [64] i *We have [nothing like finished].*  
 ii *His results aren't [anything like as good as they were last year].*

We noted in §4.5 a number of places where sequences containing scalar *than* or *as* have been reanalysed as modifying expressions: [64] illustrates a similar reanalysis with non-scalar *like*. Example [i] cannot be analysed in the same way as, for example, *We have nothing like this specimen*, where *nothing* is head of the object NP and *like this specimen* is modifier. Rather, the bracketed sequence is complement of perfect *have*, so its head must be *finished*, with *nothing like* a modifier; the example may be compared with *We haven't [even nearly finished]*. Similarly, in [ii] *anything like* is a modifier of *as*, and in *We found something like thirty major errors* the sequence *something like* is a modifier of *thirty*.

(e) *Like as a noun and attributive adjective*

- [65] i *I'd never seen the like of it.*  
 ii *We want to protect our privacy from ID cards and the like.*  
 iii *She had no mind to condemn the Queen's weakness knowing herself guilty of the like.*  
 iv *A quarter of a million pounds was provided for preserving historic properties and a like amount for purchasing.*

In [i–iii], *like* is the head noun in the underlined NP, while in [iv] it is an attributive adjective modifying *amount*. The secondary term in the comparison is expressed by the complement of *of* in [i] and is recovered anaphorically in the other examples: the NPs are understood as “things like that”, “a weakness like (or identical to) the Queen's”, “a similar amount to that for purchasing”. Pattern [i] allows a plural in informal style: *the likes of us*, “people like us”.

(f) *Set comparison: like and alike*

- [66] i *We are of like mind on this question.*  
 ii *They seem to be growing more and more alike.*  
 iii *She insisted on treating us all alike.*  
 iv *Revenues have been a great disappointment to planners and investors alike.*  
 v *The prospect of mediocrity and the dread of oblivion were alike past bearing.*

*Like* can be used for set comparison as an attributive adjective, as in [i], but elsewhere set comparison requires *alike*. It is a predicative adjective in [ii], a manner adverb in [iii], while [iv–v] illustrate its most frequent use, as an adverb associated with coordination. In [iv] it is adjunct in an expanded coordination (Ch. 15, §4.1), and in [v] distributive adjunct in clause structure: the coordination identifies the set being compared. Coordination inherently implies likeness between the coordinates, and *alike* simply makes this explicit.

### 5.6.4 *Unlike*

The negative form occurs in a subset of the constructions available with *like*:

- [67] i *Like poles repel, unlike poles attract.*  
 ii *Jill is quite unlike her mother.*  
 iii *It's unlike Max to be late.*  
 iv *She came up with a proposal quite unlike any we had considered so far.*  
 v *Ice-bergs, unlike sea ice, are not greatly affected by winds.*

- vi *Unlike other fruits, one cannot eat the skin of an avocado.*
- vii *Unlike in Europe, very few popular books about the natural world were printed in Australia.*

In [i–iv] it is an adjective (attributive, predicative, or postpositive), in [v–vii] a preposition. Example [iii] matches [47ii] above, with *unlike* interpreted as “uncharacteristic of”. The modifier use in [67v–vii] matches the ‘likeness of predication’ use of *like*, with [v] illustrating the most usual pattern. Example [vi] departs from this pattern in that the primary term in the comparison is not expressed by the subject but by the complement of a preposition (*an avocado*) within the object NP – compare [53] for *like*.

*Unlike* does not take a finite clause as complement, but it is sometimes found with a PP, as in [67vii]. The acceptability status of this matches that of the corresponding *like* construction seen in [61]; note, however, that while *as* would be preferred in formal style to *like*, *as* has no negative counterpart that could be substituted for *unlike*.

## 6 Scalar set comparison

### 6.1 Plain, comparative, and superlative grade

We approach the description of superlatives by returning to the contrast between plain, comparative, and superlative forms, as illustrated in:

- |     |   |               |
|-----|---|---------------|
| [1] | i <i>Sam is <u>good</u>.</i>                    | [plain]       |
|     | ii <i>Pat is <u>better</u> than Sam.</i>        | [comparative] |
|     | iii <i>Kim is the <u>best</u> of the three.</i> | [superlative] |

A trio of examples like this can be joined together to form a coherent sentence (*Sam is good, but Pat is better and Kim is the best of the three*) and this might suggest that the three categories express progressively higher degrees of the property denoted by the lexical base. But it would be a mistake to interpret them in that way. In the first place, recall that *Pat is better than Sam* does not entail that Pat is good – Pat could be bad, but simply not as bad as Sam. *Older women*, moreover, is generally construed as denoting a subset of women whose average age is less than that of those denoted by the phrase *old women*: see below. Secondly, *Kim is the best of the three* is equivalent to *Kim is better than the other two*: there is no difference in degree.

The system of grade, therefore, is not a matter of different degrees ordered on a scale. The plain form differs from the others in that it does not express comparison. The main difference between the comparative and the superlative is that for the most part they express different kinds of comparison: the comparative is used predominantly for term comparison while the superlative is used exclusively for set comparison.

Thus [i] does not explicitly compare Sam with anybody else. This is not to say, however, that there is no implicit comparison. Suppose Sam, Pat, and Kim are students and are being evaluated as to how good they are as students. Not all students are good students, so that saying Sam is good, or a good student, involves some comparison with the standards of students in general. Such relativity is particularly evident in examples like *Jumbo is a small elephant*. This does not say that Jumbo is small in any absolute sense: we interpret it as saying that Jumbo is small relative to the standards applicable

to elephants. Note, moreover, that it is possible to express comparison in accompanying phrases: *Sam is a good student compared with the others in the class*. The point remains, however, that the plain grade does not itself express comparison.<sup>39</sup>

Example [1ii] is an instance of what we are calling term comparison; the terms in the comparison are either Pat and Sam (if we take the complement of *than* to be simply an NP) or the degree *x* to which Pat is good and the degree *y* to which Sam is good (if we take the complement of *than* to be a reduced clause). Example [1iii] is a set comparison: the comparison is between the members of the set of three, with Kim ranked at the top of the scale of 'goodness' for that set.

Non-scalar set comparison has been dealt with in §5, and scalar set comparison of equality (as in *Kim and Pat are equally guilty*) needs no further discussion: our concern in this final section of the chapter is therefore with scalar set comparison of inequality. This is primarily marked by superlative grade, but we will look first at constructions containing comparative grade.

## 6.2 Comparative grade in set comparison

### ■ The central case: *the better of the two*

Comparative forms are found in set comparison when the set contains just two members:

- | [2] | COMPARATIVE   | SUPERLATIVE  |
|-----|---|--|
| i   | a. <i>Pat is the <u>more reliable</u> of the <u>two</u>.</i>  | b. <i>Pat is the <u>most reliable</u> of the <u>three</u>.</i> |
| ii  | a. <i>Which of the <u>two</u> is the <u>better</u> value?</i> | b. <i>Which of the <u>three</u> is the <u>best</u> value?</i>  |

Comparative *more* and *better* cannot substitute for superlative *most* and *best* in [b]: a superlative is required if the set contains three or more. In [a], however, the superlative is found as an alternant to the comparative, though it is generally restricted to informal style. The superlative is used more readily in those cases where the dual nature of the set is less immediately or explicitly indicated than it is in [ia/iia] themselves – as in the following example from a linguistics textbook:

- [3] *For lexical units with identical grammatical properties, two alternative criteria for membership of the same lexeme will be proposed. The first is the most important.*

### ■ Comparatives of the type *older women*

- [4] i *The programme is designed for older women.*  
 ii *Taller students are asked to use the top shelves.*  
 iii *This was not one of his better suggestions.*

The comparatives here are better regarded as set comparisons than as term comparisons: it is not possible to add a *than* phrase (without a fundamental change of meaning), and such comparatives readily take definite determiners, as in *This programme is designed for the younger listener*, or *The obvious solution is for the taller students to use the top shelves* – or the genitive of [iii]. *Older women* implies a comparison within the set of women: it

<sup>39</sup>The traditional term for plain grade is 'positive grade', but we have preferred to restrict 'positive' to the sense where it contrasts with 'negative'. Another term found in the literature is 'absolute', but we regard this as semantically inappropriate for reasons given in the text; 'absolute comparative', moreover, is a traditional term for a comparative in which the secondary term is left unexpressed, as in *This is cheaper*.

to be used for the last-named of a larger set – a manifestation of the weak degree of grammaticalisation of the dual category in English. An alternative to *latter* in such cases is *last*, and the ordinal numerals can also be used in a similar way.

## 6.3 Superlatives

### 6.3.1 Inflectional and analytic superlatives

The formation of superlatives is very similar to that of comparatives. They can be marked inflectionally, with the suffix *-est* corresponding to comparative *-er*, or analytically, with the adverbs *most* and *least* corresponding to comparative *more* and *less*. Again we add subscript 'a' to indicate the analytic marker use:

[8]		COMPARATIVE		SUPERLATIVE	
i	SUPERIORITY	<i>easier</i>	<i>more<sub>a</sub> difficult</i>	<i>easiest</i>	<i>most<sub>a</sub> difficult</i>
ii	INFERIORITY	<i>less<sub>a</sub> easy</i>	<i>less<sub>a</sub> difficult</i>	<i>least<sub>a</sub> easy</i>	<i>least<sub>a</sub> difficult</i>

Superlatives of superiority and inferiority are illustrated in:

- [9] i *This is the most<sub>a</sub> difficult problem of them all.* [superlative of superiority]  
 ii *This is the least<sub>a</sub> difficult problem of them all.* [superlative of inferiority]

We have here a comparison on a scale of difficulty between the members of a set of problems: [i] picks out the problem at the top of the scale, [ii] the one at the bottom.

Like comparative *more* and *less*, superlative *most* and *least* can also be inflectional forms of the degree determinatives, and as before we add subscript 'i' to represent this inflectional use. The various forms are given in [10], with the superlatives illustrated in [11]:

[10]	POSITIVE ORIENTATION		NEGATIVE ORIENTATION	
	<b>non-count sg</b>	<b>count pl</b>	<b>non-count sg</b>	<b>count pl</b>
PLAIN	<i>much</i>	<i>many</i>	<i>little</i>	<i>few</i>
COMPARATIVE	<i>more<sub>i</sub></i>		<i>less<sub>i</sub></i>	<i>fewer/less<sub>i</sub></i>
SUPERLATIVE	<i>most<sub>i</sub></i>		<i>least<sub>i</sub></i>	<i>fewest/least<sub>i</sub></i>

- [11] i *Kim shows (the) most<sub>i</sub> promise.* [non-count } positive orientation]  
 ii *Kim has (the) most<sub>i</sub> friends.* [count }  
 iii *Kim has (the) least<sub>i</sub> patience.* [non-count } negative orientation]  
 iv *Kim made (the) fewest/least<sub>i</sub> errors.* [count }

The variation between *least<sub>i</sub>* and *fewest* is broadly similar to that between *less<sub>i</sub>* and *fewer*, but superlative *fewest* and *least<sub>i</sub>* are very much less frequent than *fewer* and *less<sub>i</sub>*, and do not enter into the wide range of construction types that we noted for the latter pair.

There is a traditional prescriptive rule requiring *fewest* with count plurals. This is more often followed when the determinative is in construction with a plural noun than when it is functioning as fused determiner-head, as in *No one made many errors, but Kim made the fewest/least<sub>i</sub>.*

*Most*<sub>i</sub> and *least*<sub>i</sub> also function as adjunct of degree in clause structure, but unlike comparative *more*<sub>i</sub> and *less*<sub>i</sub> they are not used in the grading of count singular nominals:

- [12] i *Kim enjoyed it the most<sub>i</sub>/least<sub>i</sub>.*  
 ii *\*Of all my teachers Kim was the most<sub>i</sub>/least<sub>i</sub> of a scholar.*

### ■ Adjectival *least*

*Least*<sub>i</sub> is not only a determinative but also an adjective:

- [13] i *Its attractiveness as an investment is least during periods of high inflation.*  
 ii *[Even the least alteration to the plan] could prove fatal.*  
 iii *That's [the least of my worries].*  
 iv *She didn't seem [the least bit] interested in what they were saying.*

*Least* here is the opposite of *greatest*, and means “smallest/slightest”. Example [i] illustrates the predicative use, where it is the superlative counterpart of adjectival *less*. In [ii–iv] *least* is used attributively: it functions as modifier in NP structure (fused with the head in [iii]). To a limited extent it here corresponds to adjectival *lesser* – [iii] is comparable with *That's the lesser of my worries*, and *to the least degree* with *to a lesser degree*.

## 6.3.2 Non-superlative uses of *most*

*Most* has a number of uses besides those where it is a superlative form or marker.

### ■ Intensifier *most*

- [14] i *Kim is a [most enthusiastic] supporter.* [intensifying]  
 ii *This one is [most useful].* [superlative or intensifying]  
 iii *This one is [cheapest].* [superlative only]  
 iv *You are [most kind].* [intensifying as salient reading]

The *most* of [i], which belongs to relatively formal style, is an intensifier, a degree adverb meaning approximately “highly, very, extremely”. It does not express comparison any more than other intensifiers such as *very*.

There is a clear semantic difference between *most enthusiastic* here and in the superlative *Kim is the most enthusiastic supporter I've come across*, where we do have a comparison within the set of supporters I've come across. In this case, the two uses of *most* are distinguished by the article, with *a* requiring the intensifying interpretation, *the* the superlative one. Example [14ii] is ambiguous between a superlative reading equivalent to “This one is more useful than all the others”, and an intensifying one, “This one is extremely useful”; adding *the* before *most* forces the superlative reading.

In general, forms marked with the inflectional suffix *-est* are not used in the intensifying sense: we cannot, for example, replace *most enthusiastic* in [14i] with such a form: *\*Kim is a keenest supporter*. *Cheapest* in [iii] is thus unambiguously superlative, and allows the insertion of *the* without change of meaning.

Example [14iv] has in principle the same ambiguity as [ii], but since *kind* allows inflectional marking of grade, we would expect *You are kindest* as the superlative. As a result, [iv] itself would generally be construed as intensifying.<sup>41</sup>

<sup>41</sup>One exceptional case where an inflected form expresses intensification rather than set comparison is with terms of endearment, as in *my dearest Anna* (“my very dear Anna”). Precisely because it is so exceptional, we retain the term superlative for the inflectional form and treat *my dearest Anna* as an intensifying use of the superlative form rather than saying, as we do of *a most enthusiastic supporter*, that it doesn't belong to the

There is no corresponding use of *least*. *This one is least useful*, for example, is unambiguous, meaning “This is the least useful one among them”, not “This one is not very useful”.

### ■ Proportional quantifier

- |        |  |   |                               |
|--------|--|---|-------------------------------|
| [15] i | <i>Most people think he's guilty.</i>              | } | [proportional quantifier]     |
| ii     | <i>I agree with most of your points.</i>           |   |                               |
| iii    | <i>Kim had interviewed most candidates.</i>        | } | [superlative or proportional] |
| iv     | <i>Kim had interviewed the most candidates.</i>    |   |                               |
| v      | <i>Kim had interviewed (the) least candidates.</i> |   |                               |

*Most* in [i–ii] means “more than half, the majority”: it expresses a kind of proportional quantification (Ch. 5, §7.11). *Many* and *much*, by contrast, are non-proportional: *I agree with many of your points*, for example, doesn't indicate whether or not the number of your points that I agree with exceeds the number that I don't agree with, and analogously for *I agree with much of what you say*.

The difference between this proportional sense and the superlative one can be brought out by considering ambiguous examples like [15 iii]. In the superlative reading Kim had interviewed more candidates than anybody else: we have a comparison between the set of interviewees with respect to how many candidates each had interviewed, with Kim placed at the top of the scale. In this reading there is no indication as to what proportion of the candidates Kim had interviewed. In the proportional reading of [iii], Kim had interviewed more than half the candidates; this time there is no comparison between Kim and anybody else, no indication that anybody else was interviewing candidates.

The two readings are grammatically distinguished in that only the superlative one allows the insertion of *the*: [iv] is unambiguously superlative. Similarly *most* can be replaced by *least* or *fewest* only in the superlative reading, so that [v] is likewise unambiguously superlative: *least* expresses set comparison, not proportion.

### ■ Reduction of *almost*

*Most* can also be a reduced form of *almost*, as in %*I think most everybody would agree*. This use of *most* is found primarily in AmE and is characteristic of relatively informal style. It functions as modifier to *all*, *any*, and *every*, and compounds containing them, such as *anything*, *everybody* – and *always*.

### 6.3.3 Absolute and relative superlatives

NPs containing superlatives may have either **absolute** or **relative** interpretations:

- |        |   |            |
|--------|---|------------|
| [16] i | <i>Kim lives in <u>the smallest house in England</u>.</i>                 | [absolute] |
| ii     | <i>Of all members of the team, Kim had <u>the most difficult job</u>.</i> | [relative] |

In [i] the comparison is between the set of houses in England: the underlined NP refers to the member of this set which is at the top of the scale of smallness. The comparison here doesn't involve anything outside the NP containing the superlative form. In [ii], by contrast, the comparison crucially involves Kim: it is a matter of how difficult a job Kim had in comparison with how difficult a job other members of the team had. The

superlative category at all. One additional special use of intensifying *most* is in titles for people holding certain high offices in the judiciary or the church: *Most Honourable*, *Most Reverend*.

job here, then, is not the most difficult in an absolute sense, but only relative to the jobs assigned to members of the team. The difference can be brought out by comparing these set comparisons with equivalent term comparisons:

- [17] i *Kim lives in a smaller house than any other house in England.*  
 ii *Kim had a more difficult job than any other member of the team.*

In [ii] *any other member of the team* means “any other member than Kim”: Kim is involved in the comparison in [ii] but not in [i].

*Most* in [16ii] is the analytic marker; the determinative *most*<sub>i</sub>, by contrast, is virtually always relative:

- [18] *Kim scored the most points.* [relative]

An absolute use of this *most* might be *Kim scored the most possible points*, but this is quite marginal: we would generally express the intended meaning as *Kim scored the highest possible number of points* or the like.

Absolute superlatives are often concerned with possible maximum or minimum degrees:

- [19] i *We want to ensure that the fullest discussion takes place.*  
 ii *I have the strangest feeling of having lived through this very same event before.*  
 iii *The ground was so soft that the lightest step made a deep imprint.*  
 iv *She hasn't the slightest/least recollection of what happened.*

In such contexts *the slightest/smallest/least* and the like are equivalent to *any at all*: *She hasn't any recollection at all of what happened*. Special cases of this use are seen in the phrases *at least*, *at most*, *in the least*. Note finally the contrast in meaning and structure in such a pair as the following:

- [20] i *Kim was not the least concerned about what people might think.* [absolute]  
 ii *Kim was the least concerned about these developments.* [relative]

In [i] *the least* is a constituent modifying *concerned*: *the* is obligatory and the modifying phrase could be replaced by *the least bit*, *in the least*, *at all*. In [ii] *the* is optional and does not form a constituent with *least*, and the superlative implies a comparison between Kim and some set of which Kim is a member.

### 6.3.4 The structure of superlative phrases

In describing the structure of superlative phrases we need to distinguish between two cases, which we call **incorporated** and **free** superlatives. They are illustrated in [21i–ii] respectively, where the underlined sequence is the superlative phrase:

- [21] i a. *They rejected [the two best novels she has written].*  
 b. *Kim has [the most valuable collection of all].*  
 c. *This is [her most perfectly constructed novel].*  
 d. *Pat made [the most mistakes].*  
 e. *He offered me [the least valuable of the paintings].*  
 f. *[The most we can hope for] is a 2% rise.* } [incorporated]  
 ii a. *She's [the candidate most likely to be elected].*  
 b. *These were the ones that the grown-ups laughed at loudest.*  
 c. *He's the least able to look after himself.*  
 d. *It was Jill who presented her case the most effectively.* } [free]

The superlative phrases in [i] are incorporated into the structure of an NP, marked by the bracketing – more precisely they occur before the head ([a–d]) or fuse with it ([e–f]). Those in [ii] are either not contained within an NP at all ([b–d]) or are in post-head position ([a]).

In [21ia–c] the superlative phrase constitutes all or part of a modifier of the head of the NP. The *the* in [ia–b] does not form part of the superlative phrase but is determiner in NP structure: it can be separated from the superlative by another modifier, as in [ia], and can be replaced by other definite determiners, such as the genitive in [ic] or a demonstrative (*this most recent edition*).

The *most* of [21id], however, is the inflectional superlative of *many*, and here *the most* forms a DP functioning as determiner in the NP; this *the* is optional and cannot be replaced by a genitive or demonstrative.

The same distinction applies in [21ie–f], where the superlative phrase is fused with the head of the NP. In [ie] *the* is determiner and *least valuable* fused modifier-head. Note again the possibility of inserting a modifier such as *two* between them. In [if] *the most* is fused determiner-head; *the* is obligatory this time, but again not replaceable by a genitive or demonstrative.

The free superlatives in [21ii] are more straightforward. The initial *the* in [iic–d] is not determiner in a matrix NP, but part of the superlative phrase; it cannot be separated from the superlative phrase and is not in contrast with definite determiners like genitives. We will see below that there are also differences between the free and incorporated constructions with respect to post-head elements.

#### ■ Presence or absence of *the*

In free superlative phrases *the* is usually permitted but optional. It can, for example, be dropped from [21iic–d], and it can be inserted in [iia–b], though it is much more usual for it to be omitted in the construction shown in [iia], where the superlative phrase is an AdjP used postpositively, i.e. as post-head modifier in NP structure. One construction where it is not possible to have *the* is in supplements like those in [22].

- [22] i *Most important of all, the weather at the time was dry: there was no rain to bring down the radioactive materials.*  
 ii *Most surprisingly of all, they continued to believe in his innocence.*

Incorporated superlatives generally confer definiteness on the NP containing them and are therefore incompatible with indefinite determiners: \**a brightest girl in the class*.<sup>42</sup> *The* (or some other determiner) is always permitted in definite NPs, normally quite strongly preferred, and often obligatory. Consider the following, where the bracketing marks NPs:

- [23] i *The prize was won by [the youngest competitor].*  
 ii *These are [the two tallest buildings in the city].*  
 iii *The programme gives [(the) best results] if you begin before the age of thirty.*  
 iv *The rebates should be given to those in [(the) greatest need].*  
 v *It was Kim who attracted [(the) most attention].*

<sup>42</sup>Occasional exceptions are found where the NP is indefinite: *Several of the competitors achieved personal best times*. Such examples tend to involve highly lexicalised collocations.

*The* is obligatory in [i–ii], optional in the others. In [i] *competitor* is a count singular noun and hence requires a determiner by the general rules of NP structure: the only effect of the superlative *youngest* is to add the requirement that the determiner be definite. In [ii] the impossibility of dropping *the* is not attributable to the head noun, but to the fact that omission of *the* would make *two* the determiner: this would mark the NP as indefinite, which is incompatible with the inherent definiteness conferred by the superlative.

No such factors apply in [23iii–v], and here *the* can be omitted. Note, however, that its omission does not result in a change of meaning – in particular, there is no change from definite to indefinite. In [v] *the* is part of the DP, as in [21id] above.

### ■ Relative clauses

One distinctive property of superlatives is that they can take integrated relative clauses as dependents even when not incorporated into NP structure:

- [24] i *The price of gold is the lowest it has been for ten years.*  
 ii *The system seems to be working the most efficiently that it has ever worked.*

*Lowest* in [i] is an adjective, *efficiently* in [ii] an adverb, and there is no plausible reason to propose that the underlined phrases they head are NPs. Note, for example, that *wh* relatives are not permitted (*\*the lowest which it has been for years*) and that the equivalent term comparisons are simply *lower than it has been for ten years*, *more efficiently than it has ever worked before*. *The* is obligatory in this construction.

### ■ Other post-head dependents

Besides relative clauses, superlatives take such dependents as *ever*, *imaginable*, *possible*, *practicable*, and *of* phrases indicating the set whose members are compared:

- [25] i a. *We'll aim for the best possible result.*      b. *We'll aim for the best result possible.*  
 ii a. *Kim's essay was the best of all.*              b. *Kim wrote the best essay of them all.*

With incorporated superlatives, the single word dependents are optionally delayed so as to become indirect dependents in the structure of the NP, as illustrated in [ib/iib]. Such delay is obligatory for *of* phrases (compare [iib] with *\*the best of them all essay*). Note also that *them* in [iib] can refer either to the set of essays, in which case we have an absolute superlative, or to the set of essay writers, in which case we have a relative superlative.

### ■ Pre-head dependents

These fall into two groups, as follows:

- [26] i *very*; *next* and ordinal numerals other than *first*  
 ii *absolutely*, *almost*, *altogether*, *barely*, *by far*, *easily*, *entirely*, *fully*, *hardly*,  
*more or less*, *much*, *nearly*, *practically*, *quite*, *scarcely*, *virtually*, . . .

Those in [i] follow *the*, while those in [ii] precede it:

- [27] i *It was the very best performance I can recall.*  
 ii *Kim's the second youngest in the class.*  
 iii *This one works easily the most efficiently.*  
 iv *I made by far the most errors.*

*Very* here means “absolutely”; it occurs with inflectional but not analytic superlatives. The ordinal numerals indicate position in a rank ordering, counting from the top (or

from the bottom in the case of comparisons of inferiority, as in *the third least expensive model*). In [27ii], for example, there is just one person younger than Kim. The fact that the items in [26ii] precede *the* means that with incorporated superlatives such as that in [27iv] they function as peripheral modifier in the structure of the NP rather than in the structure of the superlative phrase itself (see Ch. 5, §13).

## 1 Preliminaries

### 1.1 Matters of form and function

#### ■ Non-finite vs finite

Non-finite clauses are distinguished from finites largely but not wholly by the inflectional form of the verb. Clauses whose verb is a gerund-participle or past participle are always non-finite, and those whose verb is a preterite or present tense form (or irrealis *were*) are always finite: only the plain form appears in both classes of clause (Ch. 3, §1.8). Of the three main syntactic constructions having a plain-form verb, two are finite and one non-finite:

[1]	i IMPERATIVE	<i>Be patient.</i>	}	[finite]
	ii SUBJUNCTIVE	<i>It's essential <u>that he be more careful.</u></i>		
	iii INFINITIVAL	<i>It's important <u>for him to be more careful.</u></i>		[non-finite]

Infinitivals are distinguished from the two finite constructions by the following properties:

- [2]
- i Most infinitivals, apart from the complements of modal auxiliaries and supportive *do*, contain the VP subordinator *to*: this is a clear marker of the infinitival.
  - ii Unlike imperatives, they do not take auxiliary *do* in negatives, etc.: compare *Don't be late* and *It's important not to be late.*
  - iii Unlike imperatives, they are almost invariably embedded in a larger clause.
  - iv Unlike subjunctives, they usually have no subject, and where there is a subject it appears in accusative (or plain) form, not nominative (compare *him* in [1iii] with *he* in [1ii]).
  - v Whereas the most common type of subjunctive construction, the mandative, takes the finite-clause subordinator *that*, the infinitival subordinator (used only when a subject is present) is *for*.

#### ■ Form-types

On the basis of the inflectional form of the verb we distinguish three main kinds of non-finite clause: **infinitival**, **gerund-participial**, and **past-participial**. We refer to these as **form-types**. They are illustrated by the bracketed clauses of [3] (all of which are

complements of the preceding verb):

- [3] i *Max wanted [to change his name].* [infinitival]  
 ii *I remember [locking the door].* [gerund-participial]  
 iii *His father got [charged with manslaughter].* [past-participial]

Precisely because it is only the plain form that can occur in both finite and non-finite clauses, it is only for [i] that we need a label that is not simply derived from the name of the inflectional form of the verb. For [ii–iii] we use gerund-participle and past participle for the verb-forms, gerund-participial and past-participial for the clauses.

#### Subtypes of infinitival: *to*-infinitivals and bare infinitivals

Infinitivals are subdivided into *to*-infinitivals and bare infinitivals according to the presence or absence of the subordinator *to*:

- |     |   |   |
|-----|---|---|
| [4] | TO-INFINITIVAL  | BARE INFINITIVAL                                    |
|     | i a. <i>They forced me <u>to sign</u> the petition.</i> | b. <i>They helped me <u>move</u> the furniture.</i> |
|     | ii a. <i>You ought <u>to sell</u> it.</i>               | b. <i>You should <u>sell</u> it.</i>                |
|     | iii a. <i>All I did was <u>to ask</u> a question.</i>   | b. <i>All I did was <u>ask</u> a question.</i>      |

The *to*-infinitival occurs in a very wide range of constructions, whereas the bare infinitival is very restricted. It occurs primarily as complement to a small number of verbs, but these include the modal auxiliaries and supportive *do*, which makes it a very common construction.

#### ■ Form-types, auxiliaries, and voice

The modal auxiliaries and supportive *do* are excluded from all non-finite clauses. Infinitivals admit the remaining three auxiliaries:

- [5] i *I expect [to have finished soon].* [perfect *have*]  
 ii *I expect [to be working all week-end].* [progressive *be*]  
 iii *I expect [to be interviewed by the police].* [passive *be*]

Gerund-participials accept *have* and passive *be*, but not progressive *be*:<sup>1</sup>

- [6] i *I regret [having told them].* [perfect *have*]  
 ii *I resent [being given so little notice].* [passive *be*]  
 iii *\*I remember [being working when they arrived].* [progressive *be*]

The past participle form of the verb has two uses, perfect and passive. Clauses with a perfect past participle as head occur as complement to auxiliary *have*, and accept progressive and passive *be*, while those with a passive past participle as head accept no auxiliaries:

- [7] i *Ed has [seen her].* *Ed has [been seeing her].* *Ed has [been seen].* [perfect]  
 ii *He had it [checked by the manager].* [passive]

<sup>1</sup>Examples with progressive *be* are occasionally encountered in casual speech: *I've missed endless buses through [not being standing at the bus stop when they arrived].* This cannot, however, be regarded as an established construction in Present-day English.

## ■ Subjectless non-finites

The great majority of non-finite clauses have no subject, as in:

- [8] i *Kim was glad* [— *to reach home*].  
 ii *It has been a pleasure* [— *meeting you*].  
 iii *Anyone* [— *living nearby*] *will be evacuated*.  
 iv *The sum* [— *spent on gambling*] *was extraordinary*.

Whereas the subject is an obligatory element in canonical clauses, there are no non-finite constructions in which a subject is required.<sup>2</sup> There are, moreover, many constructions where it is impossible to add a subject, as in [iii–iv], or the examples of [4] above.

It will be evident from this formulation that we take the subject to be an optional element in non-finite clauses, not an element whose presence is necessary for an expression to qualify as a clause. That is, the bracketed expressions in [8] are analysed as clauses that consist of just a VP rather than simply as subclausal expressions with the form of a VP. We take the VP to be the head of the clause and the presence of a VP is normally sufficient to establish clausal status. The main exception is with attributive VPs in NP structure:

- [9] i *our rapidly approaching deadline* } [VPs, not clauses]  
 ii *a poorly drafted report* }

Expansion of the verbs in this construction is virtually limited to adverbial modifiers preceding the verb: the range of structural possibilities here is quite different from that found in clauses.

## Hollow clauses

In a relatively small number of constructions, almost exclusively *to*-infinitivals, some non-subject element is missing:

- [10] i *The letter isn't legible enough* [*for you to read* —].  
 ii *The letter isn't legible enough* [*to read* —].  
 iii *I don't think they are worth* [*spending much time on* —].

The bracketed clauses here we call **hollow clauses**. The missing non-subject is normally recoverable from the matrix clause. In [i–ii] the object of *read* is recoverable from *the letter*, while in [iii] the object of *on* is recoverable from *they*. Missing subjects, by contrast, are not always recoverable from the matrix, as evident from [8ii] and [10ii].

## ■ Interrogative and relative *to*-infinitivals

Interrogative and relative clauses may have the form of *to*-infinitivals:

- [11] i a. *I can't decide* *whether to go with them*. [closed interrogative]  
 b. *He doesn't know* *how to placate her*. [open interrogative]  
 ii a. *They have funds* *with which to conduct a survey*. [*wh* relative]  
 b. *Another option* *for you to consider* *is renting a caravan*. [non-*wh* relative]

These will receive little attention in the present chapter, as they are covered along with other subordinate interrogatives (Ch. 11, §5.3.5) and relatives (Ch. 12, §5).

<sup>2</sup>The subordinator *for* cannot occur without a subject, but we do not find constructions where *for* + subject is required.

### ■ Distribution of non-finite clauses

Non-finite clauses occur as dependent or supplement in a wide range of constructions.<sup>3</sup> The major distinction we draw is between non-finites in complement function, and those in non-complement function (modifiers or supplements); these are illustrated for infinitivals in [12i–ii] respectively:

- |           |  |                                |
|-----------|--|--------------------------------|
| [12] i a. | <i>His aim was <u>to intimidate us</u>.</i>                        | [comp in clause structure]     |
| b.        | <i>She is [<u>keen to regain control</u>].</i>                     | [comp in AdjP structure]       |
| c.        | <i>I've missed [<u>the opportunity to have my say</u>].</i>        | [comp in NP structure]         |
| d.        | <i>She left at six [<u>in order to catch the early train</u>].</i> | [comp in PP structure]         |
| ii a.     | <i>She left at six <u>to catch the early train</u>.</i>            | [modifier in clause structure] |
| b.        | <i>He's a charlatan, <u>to put it bluntly</u>.</i>                 | [supplement to a clause]       |
| c.        | <i>I've found [<u>a box to keep the tapes in</u>].</i>             | [modifier in NP structure]     |

The complement functions are similar to those of content clauses, but the non-complement uses are more varied and frequent than those of content clauses.

### 1.2 The catenative construction

The functions of complement non-finites in clause structure include the following:

- |        |   |                      |
|--------|---|----------------------|
| [13] i | <i><u>To underestimate her</u> would be foolish.</i>    | [subject]            |
| ii     | <i>I found <u>talking to her</u> quite helpful.</i>     | [object]             |
| iii    | <i>I call that <u>taking liberties</u>.</i>             | [predicative comp]   |
| iv     | <i>It was natural <u>to be worried</u>.</i>             | [extraposed subject] |
| v      | <i>I found it <u>distressing to see her so ill</u>.</i> | [extraposed object]  |
| vi a.  | <i>She wants <u>to leave the country</u>.</i>           | [catenative comp]    |
| b.     | <i>She seems <u>to like them</u>.</i>                   |                      |
| c.     | <i>She hopes <u>to hear from them soon</u>.</i>         |                      |

In the case of [i–v] the non-finite clause has the same function as expressions of other kinds, e.g. NPs in [i–iii], finite clauses in [iv–v]. Compare:

- |        |   |                      |
|--------|---|----------------------|
| [14] i | <i><u>Such behaviour</u> would be foolish.</i>            | [subject]            |
| ii     | <i>I found <u>the discussion</u> quite helpful.</i>       | [object]             |
| iii    | <i>I call that <u>an outrage</u>.</i>                     | [predicative comp]   |
| iv     | <i>It was natural <u>that they should be worried</u>.</i> | [extraposed subject] |
| v      | <i>I found it <u>distressing that she was so ill</u>.</i> | [extraposed object]  |

In the case of [13vi], on the other hand, we take the view that the non-finite clause cannot be satisfactorily subsumed under a complement type filled by other classes of expression. The governing verbs *want*, *seem*, and *hope* appear elsewhere with such complements as we see in:

- |        |   |                              |
|--------|---|------------------------------|
| [15] i | <i>She wants <u>a holiday</u>.</i>          | [object]                     |
| ii     | <i>She seems <u>fond of them</u>.</i>       | [predicative comp]           |
| iii    | <i>She hopes <u>for an early reply</u>.</i> | [comp of prepositional verb] |

<sup>3</sup>They also occur in some minor main clause constructions, such as polar echoes and certain kinds of directive: see Ch. 10, §§4.8.3, 9.6.3.

We will argue in §4.1, however, that the differences between these do not carry over to [13<sub>via</sub>-c], so that the latter cannot satisfactorily be regarded as containing respectively an object, a predicative complement, and the complement of a prepositional verb. Instead, we analyse the underlined clauses in [13<sub>vi</sub>] as examples of a distinct type of complement realised exclusively by non-finite clauses; we refer to them as **catenative complements**.

The term ‘catenative’ applies to a large class of constructions where a verb has a non-finite internal complement. The name reflects the fact that the construction can be repeated recursively, yielding a concatenation (‘chain’) of verbs:

- [16] i *I wanted to arrange for Kim to do it.*  
 ii *She intends to try to persuade him to help her redecorate her flat.*

In [i] we have a chain of three verbs, with *for Kim to do it* complement of *arrange* and *to arrange for Kim to do it* complement of *want*. We apply the term ‘catenative’ both to the non-finite complement and to the verb in the matrix clause that licenses it, so that *want* and *arrange* here belong to the class of catenative verbs. The last verb in the chain, *do*, is not a catenative verb as it does not have a non-finite complement. Similarly, the underlined verbs in [ii] are catenative verbs with the non-finite complements shown in:

[17]	CATENATIVE VERB	CATENATIVE COMPLEMENT
	i <i>intend</i>	<i>to try to persuade him to help her redecorate her flat</i>
	ii <i>try</i>	<i>to persuade him to help her redecorate her flat</i>
	iii <i>persuade</i>	<i>to help her redecorate her flat</i>
	iv <i>help</i>	<i>redecorate her flat</i>

Note that *persuade* and *help* take an NP complement (an object) in addition to the catenative complement, namely *him* and *her* respectively.

### ■ Auxiliary verbs

Auxiliary verbs in their core use as markers of mood, tense, aspect, and voice also belong in the class of catenative verbs. On this account, *She may like it*, for example, will be analysed with *like it* a non-finite complement of *may* just as *to like it* is a complement of *seems* in *She seems to like it*; we take up this point in §4.2.

### ■ Simple vs complex catenative constructions

Catenative constructions may be classified on one dimension according to form-type, and on another as **simple** or **complex**, according as they lack or contain an **intervening NP**, i.e. an NP positioned between matrix and subordinate verbs and functioning as complement of one or other of them.

[18]	SIMPLE	COMPLEX	
	i a. <i>I hope to finish soon.</i>	b. <i>I advise <u>you</u> to sell it.</i>	[to-infinitival]
	ii a. <i>I helped wash up.</i>	b. <i>I made <u>them</u> apologise.</i>	[bare infinitival]
	iii a. <i>I stopped worrying about it.</i>	b. <i>I saw <u>them</u> fighting.</i>	[gerund-participial]
	iv a. <i>I got arrested.</i>	b. <i>I had <u>my car</u> stolen.</i>	[past-participial]

More precisely, the simple construction has no intervening NP in the active: passives like *You are advised to sell it* are subsumed under the complex construction.

Four subtypes of the (active) complex construction can then be distinguished:

- |        |   |                    |
|--------|---|--------------------|
| [19] i | <i>I arranged <u>for them</u> to go by bus.</i>                       | [for-complex]      |
| ii     | <i>I rely <u>on them</u> to look after themselves.</i>                | [oblique-complex]  |
| iii    | <i>I resented <u>their</u> being given such favourable treatment.</i> | [genitive-complex] |
| iv     | <i>I want <u>them</u> to be happy.</i>                                | [plain-complex]    |
| v      | <i>I resented <u>them</u> being given such favourable treatment.</i>  |                    |

In the *for*-complex construction the intervening NP is preceded by the subordinator *for*; it is subject of the non-finite but in accusative (or plain) case. The oblique-complex is found with certain prepositional verbs: the intervening NP is an oblique complement of the matrix verb, i.e. complement of the preposition that the verb selects. In the genitive-complex the intervening NP is in the genitive case and functions as subject of the non-finite clause. Finally, in the plain-complex the intervening NP is in plain or accusative case, and (depending on factors discussed in §3) either object of the matrix, as in [iv], or subject of the subordinate, as in [v].<sup>4</sup>

### 1.3 To-infinitivals with and without a subject

#### ■ To-infinitivals with overt subject require the subordinator *for*

To-infinitivals containing a subject are always introduced by the subordinator *for*:

- |        |  |                       |
|--------|--|-----------------------|
| [20] i | <i>[For them to withdraw now] would be a mistake.</i>            | [subject]             |
| ii     | <i>It's not necessary [for them to wait any longer].</i>         | [extraposed subject]  |
| iii    | <i>The best plan would be [for them to go alone].</i>            | [predicative comp]    |
| iv     | <i>I can think of no solution except [for them to sack him].</i> | [comp of preposition] |

If we drop the *for* we must also drop the subject, and conversely, *for* cannot appear without a following subject. Compare [20ii], for example, with:

- |        |   |
|--------|---|
| [21] i | <i>It is not necessary [to wait any longer].</i>                  |
| ii     | <i>*It is not necessary [them to wait any longer].</i>            |
| iii    | <i>*It is not necessary [for to wait any longer].<sup>5</sup></i> |

Notice, moreover, that the interrogative *to*-infinitivals shown in [11i] and the *wh* relative [11iia] cannot contain a subject:

- |        |   |
|--------|---|
| [22] i | a. <i>I can't decide [whether to go with them]. (= [11ia])</i>          |
|        | b. <i>*I can't decide [whether (for) us to go with them].</i>           |
| ii     | a. <i>He doesn't know [how to placate her]. (= [11ib])</i>              |
|        | b. <i>*He doesn't know [how (for) us to placate her].</i>               |
| iii    | a. <i>They have funds [with which to conduct a survey]. (= [11iia])</i> |
|        | b. <i>*They have funds [with which (for) us to conduct a survey].</i>   |

The well-formed examples here all exclude *for* because the prenuclear position is occupied – by the interrogative subordinator *whether*, the interrogative phrase *how*, or the relative phrase *with which*. And because an infinitival cannot contain a subject

<sup>4</sup>The infinitival version of the plain-complex is often referred to as the 'accusative + infinitive construction'.

<sup>5</sup>There are, however, non-standard varieties where certain catenative verbs may take *for* without a subject: <sup>1</sup>*He wanted for to see you.*

unless introduced by *for* the asterisked examples here are as bad in the version without *for* as in the one where *for* illicitly appears.

### ■ The catenative construction not an exception

At first glance examples like the following might appear to cast doubt on the rule that *to*-infinitivals with a subject require *for*:

- |        |   |                        |
|--------|---|------------------------|
| [23] i | <i>They arranged for the performance to begin at six.</i>   | [ <i>for</i> required] |
| ii     | <i>They expected the performance to begin at six.</i>       | [ <i>for</i> excluded] |
| iii    | <i>They intended (for) the performance to begin at six.</i> | [ <i>for</i> optional] |

*For* is required after *arrange*, excluded after *expect*, and optional after *intend*. The structural difference between [i] and [ii], however, is not just a matter of the presence or absence of the subordinator *for*: in [i] *the performance* is subject of the infinitival clause, but in [ii] it is object of the matrix clause. This means that [ii] is not an exception: there is no *for* here because the infinitival clause has no subject. And in [iii] the version with *for* has the same structure as [i], while the version without *for* has *the performance* as matrix object, like [ii].

Semantically, of course, *the performance* does belong with *begin* in [23ii], just as it does in [i], for the meaning is “They expected that the performance would begin at six”. Nevertheless, there are several pieces of evidence showing that syntactically it belongs in the matrix clause, that *the performance* and *to begin at six* in [ii] do not combine to form a single constituent (a clause) but are separate complements of *expect*: object and catenative complement respectively.

#### (a) Passivisation

Examples [23i] and [ii] behave quite differently under passivisation:

- |        |   |
|--------|---|
| [24] i | <i>It was arranged for the performance to begin at six.</i> |
| ii     | <i>*It was expected the performance to begin at six.</i>    |
| iii    | <i>The performance was expected to begin at six.</i>        |

In the construction with *for*, passivisation is accompanied by extraposition, so that *for the performance to begin at six* becomes extraposed subject. But where *for* is absent the sequence *the performance to begin at six* does not become extraposed subject: rather it is just the NP *the performance* that is promoted to subject. This is strong evidence that *the performance* is a separate complement of *expect* in [23ii] – its object. Note that with *intend*, where *for* is optional, we have two passive versions: *It was intended for the performance to begin at six* (matching [24i]), and *The performance was intended to begin at six* (matching [24iii]). Thus *for* marks the beginning of the infinitival clause, with the following NP therefore subject of the subordinate clause, but where *for* is absent the NP behaves syntactically as object of the matrix clause.

It is true that not all catenatives taking an NP without *for* allow passives like [24iii]:

- |        |   |
|--------|---|
| [25] i | <i>They wanted the performance to begin at six.</i> |
| ii     | <i>*The performance was wanted to begin at six.</i> |

However, there is no other relevant difference between *want* and *expect*, and given that passivisation doesn't provide a necessary condition for objects, we shall not wish to assign different structures to the *want* and *expect* examples. Note, moreover, that *want* takes *for*

when there is a preceding adjunct, but does not allow passivisation in the *for* construction either:

- [26] i *They had wanted all along for the performance to begin at six.*  
 ii *\*It had been wanted all along for the performance to begin at six.*

This suggests that the deviance of [25ii] is due to a property of the verb *want*, not to the structure of the active clause [25i].

The important point, then, is that while there are verbs which exclude passives like [24iii], there are none that accept those like [24ii]: the latter is grammatically impossible because the sequence NP + *to*-infinitival does not form a constituent and thus cannot function as extraposed subject any more than it can function as an ordinary subject.

#### (b) Position of adjuncts

In general, adjuncts cannot occur between a verb and an NP object, but they are permitted between a verb and a clausal complement:

- [27] i *\*We expected all along an improvement.*  
 ii *We expected all along that things would improve.*

In the catenative construction such an adjunct can follow the matrix verb in the construction with *for*, but not in the one without:

- [28] i a. *He arranged at once for the performance to be postponed.*  
 b. *\*He expected all along the performance to be postponed.*  
 ii a. *I'd prefer if at all possible for you to do it tomorrow.*  
 b. *\*I'd prefer if at all possible you to do it tomorrow.*

As in the passive case, therefore, *the performance* behaves as an NP object of *expect*, rather than as part of a larger clausal complement. The contrast is particularly striking with verbs like *prefer* which occur with or without *for*: if we drop *if at all possible* from [ii] both versions are well formed.

#### (c) Pseudo-cleft

While a *for*-infinitival can occur as complement in pseudo-cleft and related constructions the sequence NP + infinitival VP cannot:

- [29] i a. *\*What they expected was the performance to begin at six.*  
 b. *What they arranged was for the performance to begin at six.*  
 ii a. *\*All I want is you to be happy.*  
 b. *All I want is for you to be happy.*

Note again the particularly clear contrast with verbs like *want* in [ii] that occur in catenative constructions with and without *for*.<sup>6</sup>

#### (d) With some verbs the intervening NP is obligatory

There is a class of verbs including *believe*, *assume*, etc., where the intervening NP cannot be omitted even when it is coreferential with the subject of the matrix clause:

- [30] i *Max believed Kim/himself to be in the right.*  
 ii *\*Max believed to be in the right.*

<sup>6</sup>In the catenative construction *want* takes *for* only when the catenative complement is preceded by an adjunct, as in [26i], but this is sufficient to sanction the *for*-infinitival in [29iib].

This indicates that there is a direct syntactic relation between the matrix verb and the NP: the NP is an obligatory complement of the verb. Note by contrast that in the *for* construction, where the NP is not a complement of the matrix verb, it can normally be readily omitted (along with *for*):<sup>7</sup>

- [31] i *Max arranged for Kim to see a solicitor.*  
 ii *Max arranged to see a solicitor.*

(e) The intervening NP may belong semantically in the matrix clause

With some verbs appearing in the plain-complex structure the NP is semantically related to the matrix verb:

- [32] *They persuaded the students to cancel the performance.*

Here there is no reason at all to suggest that *the students to cancel the performance* is a single complement, for the meaning is that persuasion was applied to the students in order that they should agree to cancel the performance. The only plausible structure is one with the NP and the infinitival as separate complements, and this structure is then available to accommodate examples like [23ii] above. We will examine the semantic difference in detail in §3.1.1, but what is relevant at this point is that [32] is like [23ii] with respect to all the properties discussed in (a)–(c) above:

- [33] i a. *The students were persuaded to cancel the performance.* } [passivisation]  
 b. *\*It was persuaded the students to cancel the performance.* }  
 ii *\*They persuaded easily the students to cancel the performance.* [adjunct]  
 iii *\*What they persuaded was the students to cancel the performance.* [pseudo-cleft]

In passivisation the intervening NP is promoted to subject, adjuncts cannot come between the verb and the intervening NP, and the intervening NP + infinitival VP cannot form the complement of a pseudo-cleft.

The conclusion must be that there is no construction where the sequence NP + *to*-infinitival, with no preceding *for*, behaves as a subordinate clause, a single constituent.

## 1.4 The structure of infinitivals

Two special features of the *to*-infinitival construction are, firstly, the *for* that introduces the clause if it contains a subject and, secondly, the *to* itself that marks the VP. We consider them here in turn, and then take up briefly the bare infinitival construction.

### 1.4.1 The clause subordinator *for*

Historically, the *for* which introduces *to*-infinitivals containing a subject derives from the preposition *for*. This prepositional source is reflected in a number of current properties, but there are nevertheless good reasons for saying that it has come to be reanalysed as a subordinator.

<sup>7</sup>An exception is *call*: *He called for her to be released*, but not *\*He called to be released*. Note, however, that a reflexive is also normally excluded: *\*He called for himself to be released*.

## ■ Syntactic reflection of the prepositional source of *for*

### (a) Case

Accusative rather than nominative forms of personal pronouns are used for the subject:

[34] *He arranged for her/\*she to be interviewed first.*

### (b) Subject must immediately follow *for*

No clause element can come between *for* and the subject NP:

[35] i *It's important for you to read the first one immediately.*

ii *\*It's important for the first one you to read immediately.*

Note the contrast here between *for* and the finite subordinator *that*: *It's important that the first one you read immediately.*

### (c) Distribution

There is a very large overlap between the positions where we find *for* clauses and those where *for* PPs appear:

[36] i a. *the need for peace*

b. *the need for us to cooperate*

ii a. *too cold for a swim*

b. *too cold for us to go out*

iii a. *ready for departure*

b. *ready for us to start*

iv a. *We arranged for a postponement.*

b. *We arranged for it to be postponed.*

Similarly, a *for* clause is like a *for* PP in that it can't generally occur as complement of a preposition:

[37] a. *\*I'm thinking of for a holiday.*

b. *\*I'm thinking of for us to leave.*

## ■ Reanalysis of *for* as subordinator

The item *for* that appears with *to*-infinitivals differs in important ways from the one that takes NP complements. Although traditional grammars and dictionaries classify it as a preposition, there are strong grounds for analysing it as a subordinator, with the following NP functioning as subject of the infinitival VP. The subordinator *for* does for infinitival clauses with subjects what the subordinator *that* does for finite content clauses.

### (a) Occurrence of *to*-infinitivals in non-PP positions

In spite of the similarities illustrated in [36], *for* clauses commonly appear in places that do not allow *for* PPs:

[38] i *For you to give up now would be tragic.* [subject]

ii *It's rare for the bus to be so late.* [extraposed subject]

iii *This made it necessary for the meeting to be postponed.* [extraposed object]

iv *I can't afford for them to see me like this.* [complement of *afford*]

Most importantly, they occur as subject or as extraposed subject/object, as in [i–iii]: PPs do not appear in extraposed position and appear as subject only under highly restrictive conditions. In addition, [iv] shows that the class of verbs taking *for* clause complements is not limited to those allowing *for* PPs: while [iv] is grammatical, *\*I can't afford for an investigation* is not (cf. also *agree* and *say*).

### (b) Range of subject NPs

Except for the matter of accusative case, the NPs following *for* are the same as those which occur as subject of finite main clauses. Note in particular that dummy *there* occurs freely

here though it can't occur as complement in a *for* PP, and the same applies to numerous NPs that form parts of idioms:

- [39] i *It's essential for there to be no misunderstanding on this point.*  
 ii *He called for close tabs to be kept on the new recruits.*

#### (c) Constituent structure

It is clear that *for* + NP + VP forms a constituent – the subject of [38i], for example, is uncontroversially *for you to give up now*, and similarly for the other examples cited.<sup>8</sup> Within this sequence there is no reason to say that the NP combines directly with *for*; rather the NP and VP combine to form a clause nucleus showing the same range of contrasts as a main clause – or as a clause nucleus following the subordinator *that*:

- [40] i *It's necessary [for both your parents to sign the form].*  
 ii *It's necessary [for the form to be signed by both your parents].*  
 iii *It's necessary [for your parents both to sign the form].*

The underlined clauses in [i] and [ii] contrast as active vs passive, while that in [iii] contrasts with [i] with respect to the position of *both*: the NP following *for* behaves like an ordinary clause subject.

#### (d) Absolute initial position and contrast with *that*

*For* must occupy initial position in the subordinate clause. We have noted that it can't occur in the interrogative and *wh* relative constructions [22]: this is because the initial position is there pre-empted by the interrogative subordinator *whether* and the interrogative and relative phrases. Its syntactic role is therefore closely parallel to that of the finite clause subordinator *that*, which is likewise excluded from interrogative and *wh* relative constructions. Like *that*, *for* has no identifiable meaning of its own, but serves as a syntactic marker of a particular syntactic construction. The functional similarity to *that* is particularly clear in such pairs as the following, where we find a direct contrast between finite and infinitival clauses:

- [41] i a. *It is important that detailed records be kept.*  
 b. *It is important for detailed records to be kept.*  
 ii a. *That's the best course that you can take.*  
 b. *That's the best course for you to take.*  
 iii a. *In order that the bill may be passed major amendments were made.*  
 b. *In order for the bill to be passed major amendments were made.*

### 1.4.2 The infinitival subordinator *to*

#### Constituent structure

It is important that *to* enters into construction with a VP, not just a verb. This is shown by such data as:

- [42] i *She wants me to lend him the money, so lend him the money I have to.*  
 ii *She wants me to lend him the money, but I don't have to \_\_\_.*  
 iii *I have to lend him the money and find a solicitor for him.*

<sup>8</sup> Examples like *It would be good for us to have a period on our own* are ambiguous according as *for us* is a PP dependent of *good* (cf. *To have a period on our own would be good for us*) or part of the *to*-infinitival (cf. *For us to have a period on our own would be good*).

*Lend him the money* acts as a constituent in [i]. It is separated from *to* and occupies prenuclear position. In [ii] *lend him the money* as a whole is ellipled. And in [iii] it is coordinated with another constituent of the same category, *find a solicitor for him*.<sup>9</sup>

Traditional grammar treats *to lend* as a form of the lexeme **lend**, as if *to* were an inflectional prefix, comparable to the inflectional suffix that marks the infinitive in such languages as Latin and French. This is quite inappropriate for English. The evidence from [42] shows that *to* is not syntactically in construction with the verb base, let alone morphologically bound to it.

### ■ Syntactic reflection of the prepositional source of *to*

Like *for*, *to* derives historically from the homophonous preposition. This source is again reflected in the present properties of the construction – though to a much lesser extent than in the case of *for*.

#### (a) Distributional restrictions

*To*-infinitivals, like PPs consisting of *to* + NP, do not in general occur as complement to a preposition:

- [43] a. \**We're thinking of to London.*      b. \**We're thinking of to travel by bus.*

This is an extension of the point made above in connection with *for*: the restriction applies to *to*-infinitivals whether or not they contain *for*.

#### (b) Contrast with prepositions *from* and *against*

The prepositional history of *to* is reflected in the contrast we find between *to*-infinitival and *from* + gerund-participial complements with certain pairs of verbs of opposite meaning such as *encourage* vs *discourage*, *persuade* vs *dissuade*. Compare:

- [44] i a. *I persuaded her to buy it.*      b. *I dissuaded her from buying it.*  
 ii a. *I assented to her proposal.*      b. *I dissented from her proposal.*

The non-finite complement is comparable to a goal in [ia] (metaphorically, persuasion moves someone towards an action, and assent to a proposal is likewise seen as movement towards it) and source in [ib] (dissuasion and dissent involve pulling back or moving away).

We find a somewhat similar contrast between a *to*-infinitival and *against* + gerund-participial with verbs like *warn*, though this time *to* is not used with NP complements:

- [45] a. *I warned her to stay indoors.*      b. *I warned her against staying indoors.*

Here [b] is equivalent to *I warned her not to stay indoors*, as [44ib] is equivalent to *I persuaded her not to buy it*.

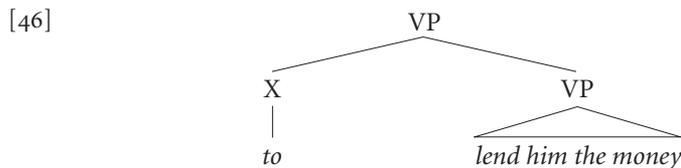

However, points (a) and (b) are not nearly sufficient to justify treating infinitival *to* as a preposition in Present-day English. It cannot coordinate with any preposition (\**I don't want you warning her to or against*); its complement cannot coordinate with

<sup>9</sup>The validity of coordination data as evidence for constituent structure is discussed in some detail in Ch. 15, §4.6. There are some types of 'non-basic' coordination where the coordinates are not constituents in corresponding non-coordinate constructions: in *the American proposal*, for example, *the American* is not a constituent but it occurs as a coordinate in *the American and the Russian proposals*. The fact then that we can say *I have to chlorinate and to vacuum the pool* does not demonstrate that *to chlorinate* is a constituent in *I have to chlorinate the pool*: it too involves non-basic coordination, in contrast to the basic, and much more likely, *I have to vacuum and chlorinate the pool*.

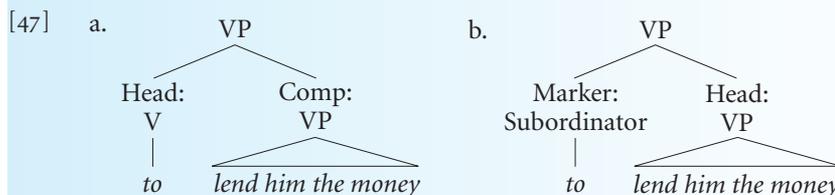

the complement of prepositional *to* (although *I agreed [to it]* and *I agreed [to go]* are both grammatical, *\*I agreed [to it and go]* is not); and the phrases it introduces cannot be systematically substituted for PPs or vice versa. It is quite clear that the distribution of *to*-infinitivals has to be described independently of that of PPs.

### ■ Reanalysis of *to* as a VP subordinator

*To* introduces phrases that function as predicate in clause structure, and all the evidence is compatible with these phrases being of the same category as phrases functioning as predicate in canonical clauses. That is, *to lend him the money* can be assumed to be a VP. And as already noted, *to* combines with a VP to make this larger VP. We can therefore assume the partial structure in [46].

To fill out the details we must decide which constituent (*to* or *lend him the money*) is the head of the upper VP. If the constituent labelled X is the head, then it follows from general principles that it belongs to the verb category, and we would have the structure in [47a] below. The alternative is that *lend him the money* is the head. In that case *to* will have a function in the VP comparable to that of *that*, *whether*, and *for* in the structure of the clause, namely as a marker of the subordination, and we will have the structure in [47b].

It is difficult to find compelling evidence to choose between these alternative analyses. It would not be impossible to maintain [a], if *to* were assumed to be an auxiliary verb, albeit a rather problematic defective one with no forms other than the plain form. Some linguists have defended that view. But the case for *to* being a VP subordinator is stronger. *To* has no meaning independently of the semantic properties of the infinitival complement construction as a whole. It functions with respect to the VP *lend him the money* in much the same way as *whether* functions in *whether she ever lent him the money*, or *that* in *that she lent him the money*. It would seem both syntactically and semantically appropriate to place *to* in the same category as *whether* and *that*, the category of subordinators.

It must be acknowledged that it differs from the clause subordinators in two significant respects, but those differences are not sufficient to motivate choosing structure [a].

The first difference is that in elliptical constructions, *to* can stand alone without the lower VP – i.e. it can be ‘stranded’, as in [42ii] (*I don’t have to* \_\_\_). Indeed, in this respect it is like the auxiliary verbs, for these can be stranded too (cf. *but I won’t* \_\_\_). The similarity is strengthened when we note the strong tendency not to stress secondary forms of auxiliaries stranded by ellipsis: *He* MAY *have* \_\_\_ is preferred over *He* MAY HAVE \_\_\_; *They* COULD *be* \_\_\_ is preferred over

?*They could* BE \_\_\_; and parallelling these, *You HAVE to* \_\_\_ is strongly preferred over ?*You have TO* \_\_\_. In this respect, *to* and the secondary forms of auxiliaries appear to function alike.

In response to this argument, however, note that there are special conditions on the stranding of *to* that do not apply to clear cases of auxiliaries (see Ch. 17, §7.3, on contrasts like *Not to would be a mistake* vs \**To would be a mistake*). Some special mention of *to* is necessary either way: either it is the only subordinator that can be stranded under ellipsis of the constituent it introduces, or it is the only auxiliary verb subject to these special conditions on stranding. And the stress facts are expressible in a different way: we can say that it is strongly preferred for a stranded item that is stressed to bear tense.

The second acknowledged difference between *to* and clause subordinators is that *to* does not always occupy absolute initial position in the constituent it marks:

- [48] i *She taught her children always to tell the truth.*  
 ii *I'll try not to underestimate the opposition next time.*

*Always* and *not* here belong in the subordinate clause, not the matrix, but they precede the subordinator *to*. With clause subordinators this is not the case (*He thought always that there would be some way to work it out* has *always* unambiguously interpreted in the matrix clause, and *He thought that always there would be some way to work it out* has it unambiguously in the subordinate clause – but see [13] in Ch. 11, §3). It is of course unlike the other subordinators anyway, in that it is a marker of VPs rather than clauses, so what we have to say is that the VP subordinator allows for various adjuncts in its VP to precede it.

Again, this does make *to* an unusual subordinator. But there are two further arguments that militate against its being treated as an auxiliary verb, one that suggests it is unlike heads in general, and one that weighs specifically against its being a verb. The argument that it is not a head is that under certain conditions it is omissible without any change in meaning or grammatical construction type. One such case is [49].

- [49] a. *All I did was to ask a question.* b. *All I did was ask a question.*

In this respect *to* is like the finite subordinator *that* (though the latter is of course very much more freely omissible). It is not at all like heads, which seem never to be freely and optionally omissible in this way without a change of construction. Note also that when causative verbs like *make* and *let* are passivised, infinitival *to* switches from being disallowed in the complement to being required:

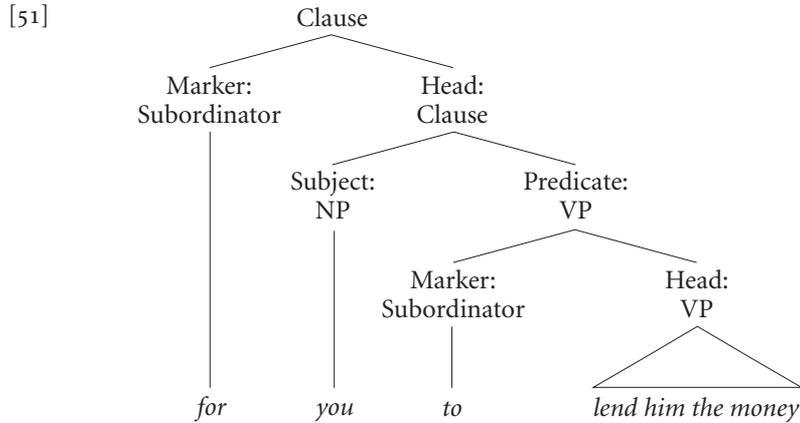

- [50] i *They made the general public pay for it / \*to pay for it.*  
 ii *The general public was made \*pay for it / to pay for it.*

For a verb to select a different subordinator for its complement depending on whether it is active or passive seems less strange than for the head verb of the complement to be required to change.

Finally, the general argument against *to* being a verb is that there are no counterexamples in English to this very broad generalisation: **all verbs can occur as head of a main clause**. Even the highly anomalous verb *beware*, which has no inflected forms at all, occurs in main clauses like *Beware the jabberwock*. If admitted as a meaningless and defective auxiliary verb, the item *to* would be the unique exception to a principle that holds for all of English and, as far as we know, for all languages, because it can only appear in non-elliptical sentences when some other verb is superordinate to it. Being limited to

subordinate clauses is precisely the property that we do expect in subordinators, and is a property that we expect never to find in verbs.

We conclude that *to* is a VP subordinator. Our analysis for a *to*-infinitival clause containing a subject can now be displayed in more detail:

### 1.4.3 Bare infinitivals

These lack both the VP subordinator *to* and the clause subordinator *for*. They are almost always subjectless, in which case they consist simply of a VP headed by a verb in the plain form. There are two constructions, however, where a subject is present:

- [52] i *Kim tell a lie! Surely not.*  
 ii *Rather than Kim give the introductory lecture, why don't you do it yourself?*

Example [i] belongs to the main clause polar echo construction discussed in Ch. 10, §4.8.3, while subordinate construction [ii] is found only as complement to *rather than*. The first is characteristic of informal style, and a personal pronoun would therefore generally appear in accusative case (*Me tell a lie!*), though a nominative cannot be entirely excluded. In [ii] we illustrate a rather rare construction where a nominative pronoun would be very unlikely – the choice of case for the subject is easily avoided by using a subjectless construction as in *Rather than have Kim give the introductory lecture, why don't you do it yourself?*

### 1.5 The structure of gerund-participials

The verb in gerund-participials ends with the suffix *-ing*, a suffix which also appears on nouns and adjectives, so that it is necessary to distinguish (by the criteria given in Ch. 3, §1.4) between a gerundial noun, a gerund-participle form of a verb, and a present-participial adjective:

- [53] i *She had witnessed the breaking of the seal.* [gerundial noun]  
 ii a. *There's no point in breaking the seal.* } [gerund-participle form of verb]  
 b. *They were entertaining the troops.* }  
 iii *an entertaining show* [present-participial adjective]

Traditional grammar, we have noted, distinguishes between *breaking* in [iia], a gerund, and *entertaining* in [iib], a present participle – but since no verb lexeme has distinct forms in these constructions there is no basis for saying that they involve different inflectional forms: our gerund-participle thus covers both gerund and present participle of traditional grammar insofar as these terms are applied to verbs rather than nouns or adjectives.

#### ■ Complement and non-complement uses of gerund-participials

We also take the view that even from a purely syntactic point of view the traditional distinction between gerundial and participial uses of the verb-form ending in *·ing* is not well motivated: see §4.3. Instead, we distinguish primarily between gerund-participials with complement function and those in non-complement function (modifiers or supplements):

- [54] i a. *Telling her father was a big mistake.* } [complement]  
       b. *He stopped seeing her.* }  
       ii a. *Being a foreigner himself, he understood their resentment.* } [non-complement]  
        b. *Anyone knowing his whereabouts should contact the police.* }

In terms of the traditional analysis, the non-complement uses all involve participles, while the complement uses contain primarily gerunds but also some participles.

#### ■ Nominal source of the traditional gerund

Historically, the *·ing* suffix derives from two distinct sources, corresponding respectively to traditional grammar's present participle and gerund. The gerund suffix formed nouns from verbs – as it still does in what we are calling gerundial nouns, such as *the breaking of the seal* ([53i]). In the course of time, however, the syntactic use of this form was greatly extended, so that it came to combine not just with dependents of the kind associated with nouns, as in that example, but also with those associated with verbs, as in *breaking the seal* in [53iia]. It was this extension that led to the split between nominal and verbal 'gerunds', though the traditional definition of the gerund as a 'verbal noun' fails to recognise the reanalysis of the form as a verb in the latter type.

The nominal source of the *·ing* verb that is found in most gerund-participial complements is reflected in certain properties that still hold in the present-day language.

##### (a) Distributional similarity to NP

The distribution of gerund-participial complements is much closer to that of an NP than is that of any of the other non-finite form-types, or indeed of finite subordinate declaratives. In particular, they freely occur as complement to a preposition and can follow the verb in subject–auxiliary inversion constructions. Compare the gerund-participials with the *to*-infinitivals in:

- [55] i a. *It's a matter of breaking the seal.*                    b. *\*It's a matter of to break the seal.*  
       ii a. *Is breaking the seal wise?*                        b. *\*Is to break the seal wise?*

With regard to extraposition, gerund-participials fall somewhere between NPs and *to*-infinitivals (cf. Ch. 16, §7):

- [56] i a. *\*It was silly the breaking of the seal.*            b. *\*It amused him the breaking of the seal.*  
       ii a. *It was silly breaking the seal.*                    b. *\*It amused him breaking the seal.*  
       iii a. *It was silly to break the seal.*                    b. *It amused him to break the seal.*

Extraposition is normal with *to*-infinitivals, as in [iii], but not generally possible with NPs, as illustrated in [i]; with gerund-participials speaker judgements vary, but in general it tends to be possible over a short VP like the intransitive *was silly* but not over longer ones like transitive *amused him*.

### (b) Hybrid constructions

Examples occasionally arise where the dependents are of mixed types:

- [57] i a. *This constant telling tales has got to stop.*  
 b. *Let's have no more of this bringing food into the computer room.*  
 ii a. *There was no telling what he might do next.*  
 b. *There'll be no stopping her.*

The relevant heads are double-underlined. The pre-head dependents are characteristic of NP structure, the post-head ones characteristic of VP structure (except that *into the computer room* occurs readily in either).

The examples in [57i] are of somewhat marginal acceptability. Those in [ii] are fully acceptable in the present-day language, but this use of *no* with a gerund-participial is virtually restricted to the existential construction with *there*; we don't get, for example, \**No telling what he might do next was possible*.

The examples in [57] illustrate the kind of hybrid construction that can arise when a historical change has not been fully carried through to completion. Such examples resist elegant description.

### (c) Genitive case

The NP preceding the *·ing* word can be in genitive case in the verbal construction just as in the nominal one:

- [58] i *I resented [his constant questioning of my motives].* [noun]  
 ii *I resented [his constantly questioning my motives].* [verb]

That *questioning* is a noun in [i] and a verb in [ii] is evident from the contrast between *constant* (adjective) and *constantly* (adverb), and between *of my motives* (PP) and *my motives* (NP – object), but in both we have genitive *his*. And the characteristic use of genitive case is of course to mark the dependent of a noun, not of a verb.

## ■ Analysis of the genitive NP as subject of the gerund-participial

It might be argued that *his constantly questioning my motives* in [58ii] should be described in terms of some kind of nominal–verbal hybrid construction such as we evidently need for [57], but we believe it is better, for several reasons, to regard the genitive as having been reanalysed as a clause subject.

### (a) Marginal status of the determiner + VP construction

The examples like [57] certainly involve a determiner in construction with a VP as head, but they are very peripheral to the present language-system by virtue of the questionable acceptability of [i] and the semi-formulaic nature of [ii]: this construction should not be allowed to determine our analysis of the much more central and productive construction with a genitive.

### (b) Relation with accusative/plain case

The genitive can be replaced in informal style by an accusative (or plain) case: [*I resented*] him constantly questioning my motives (see §1.6 below). In this non-genitive construction

the historical process of changing from noun to verb has been taken a step further: there is nothing noun-like about the structure here, and its analysis as a clause is unproblematic. It is then simpler to treat the stylistic alternation between genitive and non-genitive as a matter of the case of the subject NP than as a major difference between two quite separate constructions: the preference for the non-genitive in informal style can be seen as regularising the clausal construction.

### (c) Optionality of the genitive NP

The genitive NP can normally be omitted:

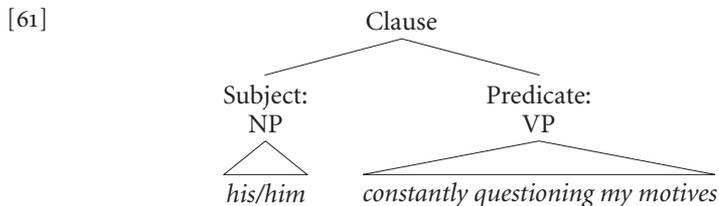

- [59] i a. *I regretted [his leaving the firm].*                      b. [Your being a shareholder] is important.  
       ii a. *I regretted [leaving the firm].*                                b. [Being a shareholder] is important.

The significant point here is that the presence or absence of the genitive NP is not like that of a genitive determiner in NP structure. In *I regretted his decision*, for example, we cannot drop *his*: \**I regretted decision*. This is ungrammatical because *decision* is a singular count noun and requires the presence of some determiner. In the gerund-participial construction, however, the presence or absence of the genitive is like the presence or absence of the subject in a *to*-infinitival:

- [60] i a. *I arranged [for him to leave the firm].*                      b. [For you to be a shareholder] is essential.  
       ii a. *I arranged [to leave the firm].*                                b. [To be a shareholder] is essential.

We interpret [59iia] as “I regret my leaving the firm” and [60iia] is interpreted as “I arranged for me to leave the firm”; and similarly [59iib] and [60iib] may be glossed roughly as “One’s being a shareholder is important”, “For one to be a shareholder is essential”. Moreover, we have noted that the genitive can be replaced by a non-genitive: if *I regretted [his leaving the firm]* and *I regretted [him leaving the firm]* are analysed as quite different constructions, with only the second of them a clause, then which of the constructions would *I regretted [leaving the firm]* belong to? This problem would be particularly difficult to resolve with those gerund-participials where it is not possible to include an NP before the verb, as in *He didn’t bother [giving me a copy]*. We avoid these problems by treating the optionality of the initial NP as simply a matter of the optionality of subjects in non-finite clauses.

The structure of the gerund-participial in [58ii] will therefore be as follows:

### ■ Subject must be in absolute initial position

Whether genitive or not, the subject always occupies initial position in a gerund-participial clause. It is therefore not possible to prepose elements or to postpose the subject:

- [62] i *I resented [them/their going without me].*  
       ii \**I resented [without me them/their going].*  
       iii *I remember [a troop of boy scouts suddenly appearing over the hill].*  
       iv \**I remember [suddenly appearing over the hill a troop of boy scouts].*

### ■ Comparison between genitive marking and the subordinator *for*

Genitive marking in gerund-participials bears some resemblance to the marking of *to*-infinitivals by the subordinator *for*.<sup>10</sup> *For* marks the clause boundary, so that the following NP must belong in the subordinate clause; the genitive case relates the NP to the following VP and hence as again belonging in the subordinate clause. In *to*-infinitivals the subject must immediately follow *for* and in gerund-participials the subject must be the first element: neither construction allows for elements to be fronted to pre-subject position or for the subject to be postponed.

Nevertheless, the analogy is not a close one, for there are several important differences.

#### (a) Status and position

*For* is a separate word belonging to the category of subordinators; it occupies initial position in what we are calling the marker function. The genitive, by contrast, is an inflectional case. Compare, then, structure [61] with [51] above.

#### (b) Restrictions on NP

Genitive case is incompatible with certain types of NP: for example, we can't say \**I resented this's being made public* – only non-genitive *this* is possible. No such restrictions apply to *for*.

#### (c) Omissibility

*For* cannot in general be omitted unless the following subject is omitted too, and in those constructions where it is omissible – after such catenatives as *intend*, *prefer*, etc. – its presence or absence correlates with a major difference in structure, the NP belonging in the subordinate clause when *for* is present but in the matrix clause when it is absent (cf. §1.4). The genitive inflection, by contrast, is systematically omissible (subject to considerations of style), and there is no reason to suppose that its omission has any further effect on the structure. Most importantly, genitive case is not necessary in gerund-participials for the sequence of NP + VP to form a constituent. This is evident from such examples as [63], where the status of the bracketed sequences as constituents is unproblematic in both genitive and non-genitive versions:

- [63] i *I have no objection to [their/them taking notes].* [comp of preposition]  
 ii *What he doesn't like is [Kim/Kim's taking all the credit].* [predicative comp]  
 iii [His son's / His son being a friend of the judge] hadn't helped at all. [subject]

## 1.6 Case of the subject NP in gerund-participials

### ■ Nominative or plain case in non-complement gerund-participials

Gerund-participials functioning as supplement to a clause may contain a subject; pronouns with a nominative–accusative contrast usually appear in the nominative, with accusative a somewhat marginal alternant in informal style, while other NPs take plain case:

- [64] i *They appointed Max, [he/him being the only one who spoke Greek].*  
 ii [His mother being ill,] *Max had to withdraw from the expedition.*

This construction is the only one where we find a nominative subject in a non-finite clause; it belongs to fairly formal style, and hence the informal accusative form in [i] is

<sup>10</sup>Modern works that adopt a parallel treatment usually represent the elements as 'for-to' and 'poss-ing'.

unlikely: the alternation here is not like that between *It's I/me*, where the accusative is much more common.

### ■ Genitive vs non-genitive subjects in gerund-participial complements

When the clause is functioning as complement, we find both genitive and accusative/plain case, and our main concern in this section is to investigate the factors favouring one or other of them. A preliminary point to emphasise is that potential alternation between these cases arises only when the NP is subject of a gerund-participial clause – compare:

- [65] i [I enjoyed] his/\*him reading of the poem. [determiner in NP: genitive required]  
 ii [I caught] him/\*his reading my mail. [object of matrix: genitive excluded]  
 iii [I remember] his/him reading my mail. [subject: genitive or accusative allowed]

In [i] *reading* is a noun: the preceding NP is therefore determiner and has to be in the genitive. Note then that while *Kim didn't like his singing* is ambiguous according as *singing* is a noun or a verb, *Kim didn't like him singing* is unambiguous, with *singing* necessarily a verb.<sup>11</sup> In [65 ii] *him* is the object of *caught*, with *reading my mail* a second complement: *him* is not subject of the gerund-participial clause and therefore cannot be genitive. Only in [iii], where the pronoun is subject of the subordinate clause, do we have alternation between the cases. (For the structural distinction between [ii] and [iii], see §3.2.1.)

In constructions of this third kind, where the NP is subject of a gerund-participial complement,<sup>12</sup> the choice between genitive and accusative/plain depends on the following factors:

#### (a) Style

Genitives are more likely to occur in formal than in informal style.<sup>13</sup>

#### (b) Type of NP

Some NPs cannot take genitive marking, however formal the style: dummy pronouns (particularly *there*); fused-head NPs like *this*, *that*, *all*, *some*; pronoun-final partitive NPs like *both of them*, *some of us*; and so on. Such NPs cannot occur as determiner in NP structure but readily appear in non-genitive form as subject of a gerund-participial:

- [66] i *He resented* [there/\*there's *having been so much publicity*].  
 ii *I won't accept* [this/\*this's *being made public*].

There are others which, while they do not exclude genitive marking in general, disfavour it in the subject of a gerund-participial:

- [67] i *He objected to* [the girls / ?the girls' *being given preferential treatment*].  
 ii *It involved* [the Minister of Transport / ?the Minister of Transport's *losing face*].

<sup>11</sup>In the noun interpretation we are concerned with the **manner** of his singing (cf. *Kim didn't like his singing of this difficult aria*), whereas in the verbal interpretation it is a matter of the **activity** or **fact** of his singing (cf. *Kim didn't like him singing obscene songs*).

<sup>12</sup>We should also add the condition that the subject immediately precede the verb. If it is followed by a supplement, a non-genitive subject is required: *He resented Kim, after only two years, being promoted manager*. And the same applies if the verb is omitted in the gapping construction: *He objected to Kim having three tries and Pat — only two*. Contrastive stress on the subject also strongly favours a non-genitive: *I've no objection to KIM doing it*.

<sup>13</sup>Modern usage manuals generally do not condemn non-genitives altogether (as Fowler did in early work), though they vary in their tolerance of them, the more conservative ones advocating a genitive except where it sounds awkward, stilted, or pedantic – by virtue of the type of NP involved (our factor (b)).

The regular plural *girls* in [i] is identical to its corresponding genitive in speech, but in writing they are distinguished by the apostrophe, and in this construction the form without the apostrophe is much the more likely. In [ii] the NP contains a post-head dependent PP *of Transport*, and while such NPs can take genitive marking when determiner to a noun (*the Minister of Transport's performance*), such marking is very unlikely in a gerund-participial.

More generally, the genitive in a gerund-participial is awkward with NPs of any significant length or complexity, especially those with post-head dependents. It is most likely with personal pronouns, and after that singular NPs that refer to people and have no more than one or two words as pre-head dependents.

### (c) Matrix construction

A gerund-participial in subject function is somewhat more likely to select a genitive than one in other complement functions. There are also differences within the class of catenative verbs: verbs like *appreciate*, *countenance*, *mind*, etc. (class 2ci of §5.3) take a genitive more readily than *like* and *hate* (class 2Bi), while with *stop* a genitive is not likely to occur at all (we find *She stopped them using it*, not \**She stopped their using it*).

## 1.7 Understood subjects

Most non-finite clauses have no subject, but the interpretation requires that we find an 'understood subject': characteristically, the VP represents a semantic predicate and we need to find the argument that it is predicated of.

We distinguish three main ways in which the interpretation of a subjectless clause is completed:

- |        |   |                                |
|--------|---|--------------------------------|
| [68] i | <i>Pat persuaded <u>Kim</u> [to travel by bus].</i> | [controlled interpretation]    |
| ii     | <i>Pat intended <u>Kim</u> [to travel by bus].</i>  | [raised interpretation]        |
| iii    | <i>It was necessary [to travel by bus].</i>         | [non-syntactic interpretation] |

In [i] and [ii] we understand it to be Kim who was to travel by bus, but there is a difference between them. In [i] *Kim* is associated with two semantic roles, patient of *persuade* (Pat applied pressure to Kim) and agent of *travel*, but in [ii] *Kim* has only the latter role: *intend* expresses a relation between Pat and the situation where Kim travels by bus. Nevertheless, *Kim* is syntactic object of the matrix clause in both.

These two cases involve **controlled** and **raised** interpretations of the missing subject. In [68i] the interpretation of the missing subject is controlled by an antecedent in the matrix clause – in this example by the matrix object, in *Kim wanted to travel by bus* by the matrix subject. In [ii] the missing subject is retrievable from the raised complement in the matrix clause. But [iii] is sharply different in that there is nothing in the sentence itself to identify the traveller: the understood subject here has to be identified from the context. It could be the speaker, someone else, or a group including or excluding the speaker. We say here that the interpretation is determined **non-syntactically**, i.e. the missing subject is not linked to an antecedent in some syntactically specified position.

The distinction between constructions with controlled and raised interpretations is discussed in detail in §§2–3, and we return at the end of the chapter to that between controlled and non-syntactic interpretations.

## 2 The simple catenative construction

Our primary concern in this section will be with the semantic status of the subject: in some cases it represents an argument of the catenative verb, whereas in others it does not, having a semantic role only with respect to the non-finite, so that it has the status of a raised complement. We will examine this distinction first in *to*-infinitivals and then in gerund-participials.

### 2.1 *To*-infinitivals (*I hoped to convince them vs I seemed to convince them*)

The semantic difference between the two kinds of subject can be illustrated with the verbs *hope* and *seem*:

- [1] i *Liz* *hoped to convince them.* [ordinary subject]  
 ii *Liz* *seemed to convince them.* [raised subject]

In [i] *Liz* is an ordinary subject in that it is an argument of the verb: *hope* denotes a psychological attitude on the part of someone to some situation (here *Liz*'s attitude to the later, potential, situation where she convinces them). But in [ii] *Liz* is not an argument of *seem*. The meaning is something like "Seemingly, *Liz* convinced them"; *seem* has a modal meaning, serving to make [ii] weaker than the unmodalised *Liz convinced them*. Syntactically *Liz* is subject of *seem*, but semantically it relates only to the subordinate *convince* clause, not to *seem*. *Liz* in [ii] is then a raised subject: the verb that *Liz* relates to syntactically is higher in the constituent structure than the one it relates to semantically.

In [1i], *Liz* has two semantic roles, as experiencer of *hope* and as agent of *convince*; but in [1ii], *Liz* has only one semantic role, as agent of *convince*. The difference is like that between [68i] and [68ii] of §1.7 (*Pat persuaded Kim to travel by bus* and *Pat intended Kim to travel by bus*), and we will again say that the missing subject of the non-finite clause has a controlled interpretation in [1i] and a raised interpretation in [1ii]. Verbs like *seem* which take a raised complement are called **raising verbs**.

#### ■ Evidence for the distinction between an ordinary subject and a raised subject

##### (a) Relation with finite complement construction

With verbs which take either infinitival or finite complements the semantic relations are more transparent in the construction with a finite complement. Compare:

- [2] i *Liz<sub>i</sub> hoped that she<sub>i</sub> would convince them.* [two arguments]  
 ii *It seemed that Liz convinced them.* [one argument]

In [i] *hope* clearly has two arguments, represented by the subject and the content clause. The identical indices on *Liz* and *she* indicate that we are concerned with [i] in the interpretation where *she* has *Liz* as its antecedent: the double reference to *Liz* thus makes transparent that *Liz* has two semantic roles, as experiencer of *hope* and agent of *convince*. In [ii], by contrast, there is only one reference to *Liz*, in the subordinate clause: again, then, the construction shows transparently that *Liz* has just one semantic role, agent of *convince*. There is no syntactic relation between *Liz* and *seem*, and this reflects the absence of any semantic relation between them. The subject *it* is a dummy element: it satisfies the syntactic requirement for a subject but is not an argument of the verb. Thus while *hope*

has two semantic arguments, *seem* has only one. The semantic difference is the same as in [1], but this time it is reflected syntactically because raised subjects are found only with non-finite complements.

### (b) Relation with passive infinitivals

Compare now the following superficially similar pairs:

- |     |    |   |   |                          |
|-----|----|---|---|--------------------------|
| [3] | i  | a. <i>Liz hoped to convince them.</i>         | } | [voice-sensitive: a ≠ b] |
|     |    | b. <i>They hoped to be convinced by Liz.</i>  |   |                          |
|     | ii | a. <i>Liz seemed to convince them.</i>        | } | [voice-neutral: a = b]   |
|     |    | b. <i>They seemed to be convinced by Liz.</i> |   |                          |

Such pairs bring out very clearly the difference between *hope* and *seem*, for with *hope* [a] and [b] differ sharply in meaning, whereas with *seem* they are equivalent. In [i] the content of the hope remains constant (namely, that Liz convince them or, equivalently, that they be convinced by Liz), but the experiencer is different: *Liz* in [ia], *they* in [ib]. The subject of *hope* has the experiencer role, and changing the subject therefore changes the meaning. In [ii], however, the subject is not an argument of *seem* and this is why it is possible to change the subject without affecting the overall propositional meaning: the equivalence of [iia] and [iib] matches that found in the main clause pair *Liz convinced them* and *They were convinced by Liz*, or in *It seemed that Liz convinced them* and *It seemed that they were convinced by Liz*. Here, then, the subject has a semantic role relative to *convince*, but not to *seem*. We speak of *hope*-type verbs as **voice-sensitive** and of *seem*-type verbs as **voice-neutral** – sensitive or neutral, that is, to a change of voice in the sequence consisting of their subject and the non-finite VP.

### (c) Selection restrictions

*Hope* imposes selection restrictions on its subject: it must denote some entity capable of filling the experiencer role, and hence be animate and typically human. But *seem* does not restrict its subject: any NP is permitted provided only that it satisfies any selection restrictions imposed by the subordinate clause verb. Compare, then, the anomaly of [i] with the acceptability of [ii] in:

- |     |    |   |                            |
|-----|----|---|----------------------------|
| [4] | i  | <i>#This news hoped to convince them.</i> | [violation of restriction] |
|     | ii | <i>This news seemed to convince them.</i> | [no violation]             |

This property of *hope* demonstrates conclusively that there is a direct semantic relation between it and its subject. And the absence of restrictions with *seem* is predicted by the raised subject analysis: if there is no direct relation between the two elements there could be no comparable restrictions.

### (d) Dummy subjects – subjects with no independent meaning.

With raising verbs, the dummy subject NPs *there* and *it* are possible:

- |     |    |   |                       |
|-----|----|---|-----------------------|
| [5] | i  | <i>There seemed/*hoped to be enough food available.</i> | [dummy <i>there</i> ] |
|     | ii | <i>It seemed/*hoped to be unwise to dissent.</i>        | [dummy <i>it</i> ]    |

The subjects here have no identifiable meaning of their own, so the unacceptability of the *hope* versions can be seen as following from point (c) above: such NPs could not satisfy the requirement that the subject denote an animate being capable of filling the experiencer role.

## (e) Choice between simple and complex constructions.

[6]	SIMPLE	COMPLEX
i	a. <i>Ed expected to die.</i>	b. <i>Ed expected Pat to die.</i>
ii	a. <i>Ed arranged to go.</i>	b. <i>Ed arranged for Pat to go.</i>
iii	a. <i>Ed tried to help us.</i>	b. * <i>Ed tried (for) Pat to help us.</i>
iv	a. <i>Ed seemed to faint.</i>	b. * <i>Ed seemed (for) Pat to faint.</i>

Verbs entering into the simple catenative construction vary according to whether they can also appear in the complex construction – either the plain subtype, as in [i], or the one with *for*, as in [ii]. All raising verbs are like *seem* in being restricted to the simple construction. This restriction follows directly from the fact that they take raised subjects. In [iva] *Ed* represents an argument of *faint* but not of *seem*: *Ed* simply refers to the one who seemingly fainted; if we then add another NP as the subject-argument of *faint* there is no semantic role left for *Ed*, so [ivb] is uninterpretable. This problem doesn't arise with the non-raising verbs, many of which allow a choice between the simple and complex constructions. In [ia] *Ed* is the experiencer of *expect* and the theme of *die*: when we add *Pat* in [ib] it takes over the latter role but leaves the former to *Ed*. Similarly in [ii]: whether or not we have the subordinator *for* before the inserted NP is irrelevant to the issue of the semantic roles. There are nevertheless some non-raising verbs, like *try* in [iii], which are incompatible with either version of [b]. In such cases there is often a semantic explanation for the restriction. Thus trying involves internal effort that is necessarily directed towards one's own actions: *Ed* could try to persuade *Pat* to help us or try to make *Pat* help us, but it is not possible for the trying itself to apply directly to *Pat*.<sup>14</sup>

## (f) Matrix passivisation

A few non-raising catenatives allow passivisation, with the infinitival appearing as extraposed subject, but this is quite impossible with raising verbs:

[7]	i	a. <i>We hope to return to this issue.</i>	b. <i>It is hoped to return to this issue.</i>
	ii	a. <i>We seem to be in danger.</i>	b. * <i>It is seemed to be in danger.</i>

*Hope* takes two arguments, and the passive allows the active subject to be left unexpressed, with the infinitival appearing as extraposed subject; *seem* takes only one argument, so passivisation is quite impossible.

■ Summary of differences between *hope*-type verbs and *seem*-type verbs

The six differences between non-raising verbs like *hope* and raising verbs like *seem*, described in (a)–(f) above, are summarised in [8]:

[8]	PROPERTY	NON-RAISING VERBS	RAISING VERBS
	(a) Finite complement	Two arguments (or N/A)	One argument (or N/A)
	(b) Infinitival voice	Voice-sensitive <sup>15</sup>	Voice-neutral
	(c) Restrictions on subject	Yes	No
	(d) Dummy subject	No	Yes
	(e) Simple/complex choice	Yes for many verbs	No
	(f) Matrix passivisation	Yes for a few verbs	No

For footnotes 14–15, see next page.

‘N/A’ in (a) means “not applicable”: this is the case when the verb doesn’t allow a finite complement; (e) and (f) provide a distinguishing criterion only in the case of a ‘yes’ answer, which indicates a non-raising verb, ‘no’ being consistent with either type.

### ■ The problem of agentivity

With so many factors involved, the distinction between ordinary and raised subjects is generally clear, but it is not always so. The main problem involves agentivity, and it arises primarily with aspectual verbs like *begin*. These verbs don’t take finite complements, so point (a) is not applicable. Consider, then, the following examples:

- [9] i     *There began to be some doubt in our minds as to whether he was trustworthy.*  
 ii a.   *His behaviour began to alienate his colleagues.*  
       b.   *His colleagues began to be alienated by his behaviour.*  
 iii a.   *Jill began to unwrap the parcel.*  
       b. <sup>?</sup>*The parcel began to be unwrapped by Jill.*

In [i–ii] *begin* behaves like a raising verb. We see from [i] that it allows a semantically empty subject (property (d)), and hence does not impose selection restrictions (property (c)). In [ii] we have a clear example of voice-neutrality (property (b)). But [iiib] is not an acceptable alternant to [iiia]. The difference between [ii] and [iii] is that the situation described in the infinitival is non-agentive in the former, agentive in the latter: compare the corresponding main clauses *His behaviour alienated his colleagues* and *Jill unwrapped the parcel*, where *his behaviour* has a non-agentive role, *Jill* an agentive one. And if the whole situation of Jill’s unwrapping the parcel is agentive, isn’t the initial phase of it, the beginning, likewise agentive? If so, *Jill* in [iiia] will be an ordinary subject, not a raised one – which will account for the apparent difference in the relation of [a] to [b] in [ii] and [iii]. This reasoning has thus led to a position where *begin* can take either an ordinary or a raised subject according to whether the subordinate situation is agentive or not.

There are good grounds, however, for rejecting this solution to the problem posed by [9iib]. The important point to note is that while [iiib] is of low acceptability it does not describe a different situation from [iiia]: there is no difference in truth conditions such as we have in [3i] (*Liz hoped to convince them* vs *They hoped to be convinced by Liz*). Indeed, we can find examples involving *begin* with an agentive infinitival where the two members of the pair are not only equivalent but also both fully acceptable: *Max began to court Jill* and *Jill began to be courted by Max* (or compare *They began to sell the shares at a discount* and *The shares began to be sold at a discount*). Voice neutrality does not require that the two alternants be equally likely and acceptable (for this condition does not hold for many simple active–passive pairs: compare *I opened my eyes* and <sup>?</sup>*My eyes were opened by me*), only that they be truth-conditionally equivalent. The data in [9iii] are thus quite consistent with a unitary treatment of *begin* as a raising verb in all of

<sup>14</sup>Our model verb *hope* takes *for* (*She was hoping for Kim to return safely*), but a finite construction (*She was hoping that Kim would return safely*) is much more likely than the complex infinitival, and hence we have used other examples in [6].

<sup>15</sup>Examples are occasionally attested where non-raising verbs are treated as though they were voice-neutral: *The exam papers are trying to be marked by next week* (“We are trying to mark them”). There can be no doubt, however, that they are rare and unsystematic enough for us to be able to dismiss them as mistakes.

[9i–iii], which is much preferable to putting it in both classes, with a great deal of resulting indeterminacy over the analysis of particular examples.

The issue of agentivity also arises, but with a larger set of verbs, in cases like:

- [10] i *It's time you began to relax.*  
 ii *It's essential that you at least APPEAR to be enjoying yourself.*

Here *begin* and *appear* occur in subordinate clauses where the matrix confers an agentive interpretation on their subjects: it is a matter of your volitionally bringing about the situations where you begin to relax and appear to be enjoying yourself. Although agentive subjects characteristically represent arguments of their verbs, it is reasonable to maintain that they don't necessarily do so, for in cases like [10] it is not the verbs *begin* and *appear* themselves that confer agentivity on the subject, but the larger context. These examples are comparable to the passive given in note 16 of Ch. 4, *They advised the twins not to be photographed together*, where *advise* confers agentivity on the understood subject of the infinitival, although the role assigned by *photograph* itself is clearly not agent. The fact that the agentivity in [10] is not attributable to the verbs *begin* and *appear* is quite consistent with *you* being a raised subject, i.e. as representing an argument of *relax* and *enjoy* rather than *begin* and *appear*.

## 2.2 Gerund-participials (*We enjoyed sailing vs We kept sailing*)

The distinction between ordinary and raised subjects applies to gerund-participials too:

- [11] i *Kim enjoyed heckling him.* [ordinary subject]  
 ii *Kim kept heckling him.* [raised subject]

In [i] *Kim* is an argument of *enjoy*, with the semantic role of experiencer. In [ii], however, there is no direct semantic relation between *Kim* and *keep*: [ii] simply says that the situation in which Kim heckled him recurred over and over again. The parallel with the infinitival construction is made clearer by the fact that there are both raising and non-raising catenatives that take either infinitival or gerund-participial complements, e.g. raising *begin* and *continue*, non-raising *like* and *hate*.

Three of the six distinguishing properties discussed above apply here quite straightforwardly: we therefore first review these summarily together, and then take up the other three.

### ■ Passive infinitivals, selection restrictions, dummy subjects

- [12] i a. *He enjoyed being heckled by Kim.* [≠[11i]: *enjoy* is voice-sensitive]  
 b. *He kept being heckled by Kim.* [= [11ii]: *keep* is voice-neutral]  
 ii a. *\*My papers enjoyed blowing away.* [violates selection restrictions on subject]  
 b. *My papers kept blowing away.* [no selection restrictions on subject]  
 iii a. *\*There enjoyed being problems with the radio.* [dummy subjects excluded]  
 b. *There kept being problems with the radio.* [dummy subjects allowed]

These show respectively that the raising catenative *keep*, like *seem* and in contrast to non-raising *enjoy* and *hope*, is neutral as to the voice of the non-finite (property (b)), imposes no selection restrictions on its subject (property (c)), and hence allows dummy subjects such as *there* (property (d)).

### ■ Relation with finite complement construction

Property (a) is less useful as a diagnostic this time because fewer verbs taking a gerund-participial also allow a finite complement. None of the raising verbs do, but some non-raising ones do and exhibit the predicted behaviour:

- [13] i *I regret giving him my address.*  
 ii *I regret that I gave him my address.* [two arguments]

It is transparent in [ii] that *regret* has two semantic arguments, represented by the subject and the content clause. *I* here has two semantic roles, experiencer of *regret* and agent of *give*.

### ■ Choice between simple and complex constructions

With respect to property (e), the gerund-participial construction differs from the infinitival in that there are raising as well as non-raising verbs that occur either with or without an intervening NP:

- [14] i a. *Ed likes reading aloud.*                      b. *Ed likes me reading aloud.*  
 ii a. *Ed kept sitting on the stool.*                      b. *Ed kept me sitting on the stool.*

However, the semantic relation between the two constructions is not the same in the two cases. With *like*, which takes an ordinary subject, the difference is the same as in the infinitival case: the meaning of the verb remains constant and *Ed* remains experiencer, so that the difference is simply a matter of who is doing the reading – *Ed* in [a], *me* in [b]. But in [ii] the meaning of *keep* does not remain constant: in [b] it has a causative sense (“*Ed* made *me* stay sitting on the stool”) and in [a] there is an element of interruption and repetition (*Ed* repeatedly got on and off the stool) that is missing in [b]. Given this difference in meaning, [iib] is not inconsistent with a raising analysis of [iia]: *Ed* is an argument (agent) of *keep* in [iib] but not in [iia].

### ■ Matrix passivisation

Gerund-participials differ from infinitivals in that they do not readily allow extraposition, so we focus here on the construction without extraposition. Matrix passivisation of this kind is predictably quite impossible with raising verbs; with non-raising verbs it tends to be somewhat marginal, but acceptability can be increased by adding motivating context:<sup>16</sup>

- [15] i \**Heckling people was kept by Kim.*  
 ii ?*Heckling people was enjoyed by Kim.*  
 iii *Watching TV is enjoyed by far more people than reading novels.*

## 2.3 Concealed passives (*The house needs painting*)

With a small number of catenative verbs, notably *need*, *require*, *deserve*, and *want*, a gerund-participial may be passive while lacking the usual marking of the passive – we

<sup>16</sup> A fully acceptable type of passive is illustrated in *Swimming after a heavy meal is not recommended*. *Recommend* is clearly a non-raising verb, but it differs from *enjoy* in that the matrix subject is not the understood subject of the gerund-participial: in *Doctors don't recommend swimming after a heavy meal* it's a matter of people in general, not doctors, swimming after a meal.

refer to this as the **concealed passive construction**. Compare:

- |  |   |                     |
|--|---|---------------------|
| [16] i a. <i>The house needs <u>to be painted</u>.</i>             | } | [ordinary passive]  |
| b. <i>These books want <u>to be taken back to the library</u>.</i> |   |                     |
| ii a. <i>The house needs <u>painting</u>.</i>                      | } | [concealed passive] |
| b. <i>These books want <u>taking back to the library</u>.</i>      |   |                     |

The catenative complements in [i] are overtly marked as passives by the auxiliary *be* and the past participle forms *painted* and *taken*, while those in [ii] lack such marking although they are interpreted in the same way.<sup>17</sup>

In the absence of distinctive kinds of dependent there will often be syntactic ambiguity between a concealed passive gerund-participial and a gerundial noun, but commonly with negligible difference in meaning:

- [17] i *The children need coaxing.*  
 ii *It's an attractive feature of avocados that they do not require processing.*

In [i] *coaxing* can be a verb, “to be coaxed”, or a noun, as in *They need a little coaxing*, but we understand that the coaxing should apply to the children, so the meaning is effectively the same as with the verbal reading. Likewise in [ii]: *processing* can be a verb, “to be processed”, or a noun, as in *processing of any kind*, and in either case it is a matter of processing the avocados. Similar examples can be formed with *training*, *teaching*, and numerous others.

The concealed passive is to be distinguished from a hollow clause, an active with a missing non-subject element, object of the verb or of a preposition:

- [18] i *The article needs checking.* [concealed passive]  
 ii *The article is worth reading \_\_\_.* [hollow: active]

Note that the first construction is possible only where there is a corresponding ordinary passive, but this is not so with the second. Compare, then:

- [19] i *\*The article was had a careful look at.* [ordinary passive]  
 ii *\*The article needs having a careful look at.* [concealed passive]  
 iii *The article is worth having a careful look at \_\_\_.* [hollow: active]

The deviance of [ii] here reflects that of the main clause [i], whereas the acceptability of [iii] matches that of an active main clause like *We will have a careful look at the article*.

A second point is that the concealed passive can contain the *by* phrase that appears in ordinary passives as an internalised complement:

- [20] i *The article needs checking by the editor.* [concealed passive]  
 ii *\*The article is worth reading \_\_\_ by the editor.* [hollow: active]

The concealed passive is found only with gerund-participials and in the catenative construction; the hollow active is more often found with non-catenative *to*-infinitivals, as in *an easy problem to solve* (§6).

### 3 The complex catenative construction

In the complex construction the matrix and subordinate verbs are separated by an intervening NP which functions as complement in one or other of the clauses. As with the simple construction, we look first at *to*-infinitivals and then at gerund-participials.

<sup>17</sup> *Want* with the sense “need” is more characteristic of BrE/AusE than AmE, and is more likely with a concealed passive gerund-participial than with a *to*-infinitival (where there is more danger of confusion with the primary sense of “desire”).

### 3.1 To-infinitivals

#### 3.1.1 The plain-complex construction (*I persuaded Liz to go vs I intended Liz to go*)

In this construction the intervening NP always belongs syntactically in the matrix: it functions as matrix object, as argued in §1.3 above. Semantically, however, we find a contrast according as the object represents an argument of the matrix (an ordinary object) or only of the subordinate clause (a raised object):

- [1] i *Pat persuaded Liz to interview both candidates.* [ordinary object]  
 ii *Pat intended Liz to interview both candidates.* [raised object]

In [i] the syntactic structure matches the semantics quite straightforwardly. *Persuade* has three complements (*Pat*, *Liz*, and the infinitival) and each represents an argument: the matrix situation involves one who applies the persuasion (*Pat*), one to whom it is applied (*Liz*), and the situation aimed for (that *Liz* interview both candidates). *Liz* is thus an ordinary complement, an argument of the verb which governs it. But in [ii] there is no such simple relation between syntax and semantics. In particular, *Liz* is not an argument of *intend*: the situation simply involves one who has the intention (*Pat*) and the content of the intention (that *Liz* interview both candidates). With *intend*, therefore, we have three complements but only two arguments: *Liz* is a raised object.

The distinction is parallel to that discussed in §2 for the simple catenative construction: there we were concerned with the semantic status of the subject, here with that of the object (the intervening NP). We will therefore extend the term ‘raising verb’ to cover *intend* as well as *seem* – where necessary we can distinguish them as ‘raised object verb’ and ‘raised subject verb’ respectively. The first five factors discussed in §2 for the contrast between ordinary and raised subjects apply again here with suitable adjustments.<sup>18</sup>

#### (a) Relation with finite complement construction

Compare [1i–ii] first with corresponding finite constructions:

- [2] i *Pat persuaded Liz; that she; should interview both candidates.* [three arguments]  
 ii *Pat intended that Liz should interview both candidates.* [two arguments]

Even more clearly than with the *hope vs seem* contrast the switch to a finite complement brings out the semantic difference between *persuade* and *intend*. In [2] *persuade* has three syntactic complements, and three semantic arguments, while *intend* has two of each – this time there is no dummy *it* to complicate the picture. In [i] the dual semantic role of *Liz*, as patient of *persuade* and agent of *interview*, is now transparent, with *Liz* appearing as matrix object and co-referential *she* as subordinate subject.<sup>19</sup> With *intend* the fact that there is no direct semantic relation between *intend* and *Liz* is likewise transparent in the finite construction, where *Liz* is not a complement of *intend*.<sup>20</sup>

<sup>18</sup>The sixth factor, matrix passivisation, does not apply here because in the complex catenative construction it is the intervening NP, not the infinitival, that is promoted to subject, and this kind of passivisation applies with ordinary and raised objects alike (though in either case there are some verbs which block it: see §5).

<sup>19</sup>There is a slight difference in meaning between the infinitival and finite constructions with *persuade*. Whereas [1i] entails that *Liz* agreed or undertook to interview the candidates, [2i] is a little weaker: she accepted that there was an obligation on her to do so. But this doesn't affect the semantic status of *Liz*: in both cases *Pat* applied persuasion directly to *Liz*, producing a change in her psychological state.

<sup>20</sup>We have noted that the subordinator *for* is like *that* in marking clause boundaries very clearly, so that the *for*-complex construction provides the same kind of evidence for a raising analysis with the few verbs that enter into both plain- and *for*-complex constructions. Compare, then, *I'd prefer Liz to do it herself* and *I'd prefer*

## (b) Relation with passive infinitivals

Compare next the following superficially similar pairs:

- |     |    |   |   |                            |
|-----|----|---|---|----------------------------|
| [3] | i  | a. <i>Pat persuaded Liz to interview both candidates.</i>         | } | [voice-sensitive<br>a ≠ b] |
|     |    | b. <i>Pat persuaded both candidates to be interviewed by Liz.</i> |   |                            |
|     | ii | a. <i>Pat intended Liz to interview both candidates.</i>          | } | [voice-neutral<br>a = b]   |
|     |    | b. <i>Pat intended both candidates to be interviewed by Liz.</i>  |   |                            |

In [i] there is an obvious difference in meaning: in [ia] Pat applied persuasion to Liz, but in [ib] to the candidates. This shows that the object is an argument of *persuade*. In [ii], by contrast, [a] and [b] are equivalent, just as they are in the main clause pair *Liz interviewed both candidates* and *Both candidates were interviewed by Liz*. The fact that we can change the object in this way without affecting the propositional meaning shows that there can't be any direct semantic relation between it and the matrix verb.

## (c) Selection restrictions

*Persuade* imposes selection restrictions on its object: except when used in an extended, metaphorical sense it requires that its object denote a sentient being capable of making decisions. But *intend* does not restrict its object: any NP is permitted that is compatible with the infinitival. Compare the anomaly of [i] with the acceptability of [ii] in:

- |     |    |  |                            |
|-----|----|--|----------------------------|
| [4] | i  | <i>#Liz persuaded the spotlight to intimidate Pat.</i> | [violation of restriction] |
|     | ii | <i>Liz intended the spotlight to intimidate Pat.</i>   | [no violation]             |

## (d) Dummy objects – objects with no independent meaning

Dummy objects are found with *intend*, but not *persuade*, and again the unacceptable versions with *persuade* can be regarded as special cases, more grammaticalised, of a violation of selection restrictions:

- |     |    |   |                       |
|-----|----|---|-----------------------|
| [5] | i  | <i>Pat intended/*persuaded <u>there</u> to be one student on the board.</i> | [dummy <i>there</i> ] |
|     | ii | <i>Pat intended/*persuaded <u>it</u> to be easy to obtain a pass grade.</i> | [dummy <i>it</i> ]    |

## (e) Choice between complex and simple constructions

- |     |     |  |  |                                    |
|-----|-----|--|--|------------------------------------|
| [6] |     | COMPLEX                                |  | SIMPLE                             |
|     | i   | a. <i>Liz persuaded Pat to leave.</i>  |  | b. <i>*Liz persuaded to leave.</i> |
|     | ii  | a. <i>Liz intended Pat to read it.</i> |  | b. <i>Liz intended to read it.</i> |
|     | iii | a. <i>Liz believed Pat to be ill.</i>  |  | b. <i>*Liz believed to be ill.</i> |

We have noted that catenative verbs differ according to whether they enter into both simple and complex constructions or only one. In §2.1 the contrast was between simple only (*seem*) vs both (*expect*), whereas here it is between complex only (*persuade*) and both (*intend*). In [i] *Pat* is an argument in the matrix and is obligatory: even if the understood subject of the infinitival is referentially identical with the subject of *persuade* we need the intervening NP, which will be a reflexive, *Liz persuaded herself to try again*. In [ii] *Pat* has no role relative to *intend*, but is simply agent of *read*; if we make the agent of *read* identical with the experiencer of *intend* then it can be left understood, as in [iib]. As in §2.1 we find here an imperfect correlation with the ordinary vs raised distinction.

*for Liz to do it herself*: there is no perceptible difference in meaning and the lack of a direct semantic relation between *prefer* and *Liz* is transparent in the *for* construction.

The main complicating factor (one which has no evident semantic explanation) is that there is a rather large class of verbs of cognition and saying, like *believe*, which require an intervening NP even when there is referential identity with the matrix subject: instead of [iii**b**] we have *Liz believed herself to be ill*.

### ■ Summary of differences between *persuade* and *intend*

The distinctions between non-raising verbs like *persuade* and raised object verbs like *intend* are summarised in [7]:

[7]	PROPERTY	NON-RAISING VERBS	RAISING VERBS
(a)	Finite complement	Three arguments (or N/A)	Two arguments (or N/A)
(b)	Infinitival voice	Voice-sensitive	Voice-neutral
(c)	Restrictions on object	Yes	No
(d)	Dummy object	No	Yes
(e)	Simple/complex choice	Normally no <sup>21</sup>	Yes for many verbs

Property (e) provides a distinguishing criterion only when the answer is ‘yes’, indicating a raising verb, since a ‘no’ answer is consistent with either type.

### 3.1.2 The *for*-complex construction (*I arranged for her to go by bus*)

This construction is fairly straightforward: *for* is a subordinator marking the start of the non-finite clause and is obligatorily followed by the subject NP, in accusative or plain case. There are no catenative verbs that appear only in this construction. All but a few are found also in the simple construction with the meaning contrast illustrated in:

[8]	i	<i>I arranged for her to go by bus.</i>	[ <i>for</i> -complex]
	ii	<i>I arranged to go by bus.</i>	[simple; control by subject]

In [i] the infinitival has an overt subject, in [ii] a covert one, controlled by the matrix subject – it’s a matter of **my** going by bus.

The verbs which don’t follow this pattern appear in contrasting complex constructions:

[9]	i	a. <i>He pressed for Ed to be admitted.</i>	b. <i>He pressed Ed to join the club.</i>
	ii	a. <i>He called for Ed to be sacked.</i>	b. <i>He called on Ed to resign.</i>

In [ia] *Ed* belongs straightforwardly to the subordinate clause, whereas in [ib] *Ed* is an ordinary object of *press* and controller of the understood subject of *join*. *Ed* has one semantic role in [ia], the ‘admittee’, but two in [b], patient of *press* and agent of *join*. The semantic difference is like that between *He intended Ed to be admitted* and *He persuaded Ed to be admitted* but with *press* the semantics is reflected directly by the syntax. Other verbs that follow the pattern of *press* are *push* (informal style) and *signal*; *ask* combines the contrasts shown by *arrange* and *press* (*He asked for Kim to chair the meeting*; *He asked to chair the meeting*; *He asked Ed to chair the meeting* – but see, further, §5.3). *Call* in [9ii] is similar to *press* except that in [b] *Ed* is an oblique, not an object: [9iib] belongs to the oblique-complex construction.

<sup>21</sup>There are one or two cases of non-raising verbs where the intervening NP is omissible, but the semantic effect is not the same as with raising verbs. For example, the difference between *I’ll help you wash up* and *I’ll help wash up* does not match that between [6iia] and [6iib], for in *I’ll help wash up* it is a matter of helping some unspecified person(s).

### 3.1.3 The oblique-complex construction (*I signalled to her to move off the road*)

A few prepositional verbs take a subjectless infinitival complement as well as the prepositional one:

- [10] i *I signalled to her to move off the road.*  
 ii *She relies on him to look after the shop while she's out.*

The oblique NP serves as controller for the missing subject of the infinitival. It cannot be a dummy pronoun, and hence not a raised complement: \**I signalled to there to be a pause*; \**She relies on there to be a daily delivery of fresh bread.*

## 3.2 Gerund-participials

Here too we need to distinguish according as the intervening NP is or is not an argument of the matrix verb – but syntactically the plain-complex gerund-participial construction is not wholly parallel to the infinitival one. We need to recognise three matrix verb types, not just two.

### 3.2.1 *Catch vs resent (I caught him doing it vs I resented him doing it)*

#### ■ Semantic difference between *catch* and *resent*

From a semantic point of view, these verbs are comparable to *persuade* and *intend* respectively, in that the intervening NP is a matrix argument with *catch* but not with *resent*:

- [11] i *I caught Kim mistreating my cat.* [matrix argument]  
 ii *I resented Kim mistreating my cat.* [not matrix argument]

Example [i] might be glossed as “I caught Kim in the act of mistreating my cat”: *Kim* is the patient-argument of *catch*. In [ii], however, it wasn't Kim the person that I resented but the whole situation in which Kim mistreated my cat. This semantic distinction is borne out by the familiar kind of evidence:

- [12] i a. ?*I caught my cat being mistreated by Kim.* [voice-sensitive: ≠ [11i]]  
 b. *I resented my cat being mistreated by Kim.* [voice-neutral: = [11ii]]  
 ii a. \**I caught there being several non-members present.* [dummy excluded]  
 b. *I resented there being several non-members present.* [dummy allowed]  
 iii *I resented that Kim mistreated my cat.* [two arguments]

*Catch* doesn't take a finite complement, so only one example is given in [iii], but it still shows that *resent* behaves in the predictable way, with the NP appearing in the subordinate clause and hence transparently an argument of *mistreat*, not of *resent*.

#### ■ Syntactic difference between *catch* and *resent*

When we turn to matters of syntax, however, we find that the relation between the two verbs is not the same as with *persuade* and *intend*. A crucial difference between gerund-participials and *to*-infinitivals is that a non-genitive NP can function as subject of the former but not of the latter unless *for* is present (cf. §§1.4–5):

- [13] i *What I resented was Kim mistreating my cat.*  
 ii \**What I intended was Kim to interview both candidates.*  
 iii *What I intended was for Kim to interview both candidates.*

We have no reason, therefore, to analyse the NP following *resent* as a raised object – instead we take it as subordinate subject, so that the syntactic structure matches the semantics:

- [14] i *I caught Kim mistreating my cat.* [matrix argument; matrix object]  
 ii *I resented Kim mistreating my cat.* [not matrix argument; subordinate subject]

Evidence for a syntactic difference of this kind is as follows:

#### (a) Possibility of genitive marking

This can be added only when the NP is subject of the gerund-participial:

- [15] i *I caught Kim/\*Kim's mistreating my cat.* [matrix object: genitive excluded]  
 ii *I resented Kim/Kim's mistreating my cat.* [subordinate subject: genitive allowed]

#### (b) Matrix passivisation

The intervening NP can be promoted to subject only if it is matrix object:

- [16] i *Kim was caught mistreating my cat.*  
 ii *\*Kim was resented mistreating my cat.*

With *resent* it is even marginally possible for the NP together with the gerund-participial VP to be promoted, especially with genitive marking: <sup>2</sup>*Kim*(<sup>3</sup>*s*) *being given such an unfair advantage was deeply resented by everyone.*

#### (c) Choice between simple and complex constructions

- |     |  |                                     |
|-----|--|-------------------------------------|
| [17 | COMPLEX                                  | SIMPLE                              |
| i   | a. <i>I caught myself apologising.</i>   | b. <i>*I caught apologising.</i>    |
| ii  | a. <i>I resent them being exploited.</i> | b. <i>I resent being exploited.</i> |

*Resent* enters into both constructions: if the subordinate subject-argument is identical with that of the matrix it is left unexpressed. With *catch* the intervening NP is obligatory, part of the complementation of the verb: a reflexive is therefore required in comparable cases of identity, as in [ia].

### 3.2.2 See (I saw him doing it)

*See* falls in between the sharply distinct patterns found with *catch* and *resent*: it is like *resent* in that the intervening NP is not a matrix argument, but like *catch* in that it is syntactic object of the matrix clause:

- |      |  |                 |               |
|------|--|-----------------|---------------|
| [18] |  | MATRIX ARGUMENT | MATRIX OBJECT |
| i    | <i>I caught <u>Kim</u> mistreating my cat.</i>   | Yes             | Yes           |
| ii   | <i>I saw <u>Kim</u> mistreating my cat.</i>      | No              | Yes           |
| iii  | <i>I resented <u>Kim</u> mistreating my cat.</i> | No              | No            |

Semantically, *see* involves an experiencer and a stimulus: in [ii] the stimulus is the event wherein Kim mistreats my cat.<sup>22</sup> Generally, when one sees an event one also sees the participants in the event, so that it will normally be inferred from [ii] that I saw Kim – but this should not mislead us into thinking that *Kim* is an argument of *see*. For note first that I presumably also saw my cat, but there can be no question of *my cat* being an argument of *see* in [ii]. And, secondly, the intervening NP need not refer to something

<sup>22</sup>We ignore at this point the aspectuality: in *I saw Kim mistreating my cat* the subordinate clause is progressive in contrast to the non-progressive of *I saw Kim mistreat my cat* (see §5.4).

visible: *I saw the stress of these last few months taking its toll of her.*<sup>23</sup> Because the intervening NP is not a matrix argument, *see* behaves like *resent* with respect to voice-neutrality and the occurrence of dummy elements:

- [19] i *I saw my cat being mistreated by Kim* [voice-neutral: = [18ii]]  
 ii *We had seen there developing between them a highly destructive antagonism.* [dummy allowed]

In the syntactic structure, however, the intervening NP belongs in the matrix clause, as object of *see*. *See* is therefore like our model verb *intend* in taking a raised object.<sup>24</sup> The evidence for this analysis is given in:

- [20] i *I saw Kim/\*Kim's mistreating my cat.* [genitive excluded]  
 ii *Kim was seen mistreating my cat.* [matrix passivisation]  
 iii *\*I saw opening the safe.* [simple construction excluded]

These examples show that *see* behaves syntactically like *catch*, not *resent* – compare [20i–iii] with [15–17] respectively.

### 3.2.3 Concealed passives with intervening NP (*He needs his hair cutting*)

Concealed passives are found in the complex as well as the simple construction:

- [21] i *Your hair needs cutting by a professional.* [simple]  
 ii *You need your hair cutting by a professional.* [complex]

Semantically *your hair* is not a matrix argument in either case – we can gloss as “There is a need for your hair to be cut by a professional” and “You have a need for your hair to be cut by a professional”. We take it to be a raised subject in [i], a raised object in [ii]. The syntactic structure is less clear than with *see* since there is here no possibility of matrix passivisation. The main reason for taking *your hair* as matrix object in [ii] is that genitive marking is completely unacceptable.

## 4 The catenative complement as a distinct type of complement

### 4.1 Non-finites in relation to NP and AdjP complements

The traditional classification of subordinate clauses as nominal, adjectival, and adverbial implies that they can be identified functionally with phrases headed by nouns, adjectives, and adverbs respectively. Certainly there are places where such identifications can validly be made. The clearest case is that of the subject, the type of complement that is syntactically most clearly distinguished from others:

- [1] i a. *The first answer was wrong.* b. *Pretending you were ill was wrong.*

Another is the complement of *be* in its specifying use, where subject and predicative complement can be switched:

<sup>23</sup>This point is even more evident with *feel*: *I felt him running the feather down my back* clearly doesn't entail that I felt him.

<sup>24</sup>The catenative use of *see* is to be distinguished from that where the gerund-participial is an adjunct, as in *I saw Kim at the back of the class talking to her neighbour*; the two kinds of gerund-participial can combine: *I saw them walking across the courtyard, arguing vociferously*.

- [2] i a. *His goal is total victory.* b. *His goal is to win at all costs.*  
 ii a. *Total victory is his goal.* b. *To win at all costs is his goal.*

The view taken in this grammar, however, is that it is not always possible to identify the function of subordinate clauses with that of non-clausal constituents such as NPs, AdjPs, and AdvPs. We argued this case for finite clauses in Ch. 11, §8.2; here we focus on catenative complements, arguing that they cannot be systematically analysed as objects or predicative complements.

#### ■ Irrelevance to *to*-infinitivals of the distinction between object and oblique

With NPs we have a clear distinction between an object (related directly to the verb) and an oblique (related via a preposition), but this distinction does not apply to *to*-infinitivals, for they cannot occur as complement to a preposition (or at least not to a preposition of the relevant kind). Compare, for example:

- [3] i a. *Kim started the riot.* b. *Kim started to riot.*  
 ii a. *Kim remembered the cat.* b. *Kim remembered to feed the cat.*  
 iii a. *They came to an agreement.* b. *They came to agree on the main points.*  
 iv a. *He proceeded to the next task.* b. *He proceeded to shred the documents.*

The underlined complements in the [a] examples are objects in [i–ii] but PP complements in [iii–iv] (where the NPs *an agreement* and *the next task* are related only obliquely to the verb), but the [b] examples show no such difference. There is then no reason to draw a functional distinction between the non-finite clauses of [ib/iib] and those of [iiib/ivb], and no reason to identify their functions with those of the object or oblique NPs in the [a] examples. The fact that the NP complements of *start* and *remember* in [ia/iiia] are objects is not reason enough for saying that the non-finite complements are objects too, because there are significant syntactic differences between the two types of complement. For example, NPs can be promoted to subject through passivisation but *to*-infinitivals cannot: *The riot was started by Kim* but not *\*To riot was started by Kim*. Note, moreover, that as far as the non-finite complements are concerned the significant distinction is not between the constructions of [ib/iib] and those of [iiib/ivb] but between those with a raised subject, the *start* and *come* examples, and those with an ordinary subject, the *remember* and *proceed* examples.

#### ■ Irrelevance to non-finites of the distinction between objects and predicatives

With NP complements we have a clear distinction between objects and predicative complements, but again this distinction is in general irrelevant to non-finite complements:

- [4] i a. *Kim offered financial advice.* b. *Kim offered to help.*  
 ii a. *Pat needs a large loan.* b. *Pat needs to consult a solicitor.*  
 iii a. *Ed seems a nice guy.* b. *Ed seems to like him.*

*Financial advice* and *a large loan* are objects, while *a nice guy* is predicative complement. The main grammatical differences between objects and predicative complements concern passivisation and realisation by an AdjP, but these differences do not carry over to the examples with non-finite complements. Examples [ia] and [iia] can be passivised, though [iiia] cannot (*Financial advice was offered by Kim*; *A large loan is needed by Pat*; *\*A nice guy is seemed by Ed*); but none of the [b] examples can undergo passivisation. And with the NP complements *seem* again differs from *offer* and *need* in systematically allowing a replacement of the NP a

*nice guy* by the AdjP *nice*, but here too there is no equivalent difference with the non-finites. It is true, of course, that we can replace *to like him* in [iiib] by *nice*, but this simply reflects the fact that *seem* can take a predicative complement as well as an infinitival one: it doesn't show that the latter is a predicative, for the relationship is not the same as with the replacement of *a nice guy* by *nice* in [iia] (note, for example, that we couldn't replace the infinitival by an AdjP in *There seems to be a serious misunderstanding here*). It follows that there is no valid basis for generalising to the non-finites the analysis that applies to the NP complements. Again, the examples have been chosen to bring out the point that the syntactic grouping of verbs in the [a] examples is different from the semantic grouping in the [b] examples: with infinitival complements *need* belongs with *seem*, not *offer*, for *need* and *seem* take a raised subject while *offer* takes an ordinary one (cf. *There seems/needs/\*offers to be ample justification for such a course of action*).

### ■ Application of the argument to the plain-complex catenative construction

The same points apply to constructions with two internal complements. Consider first:

- [5] i a. *She taught him Greek.*                      b. *She taught him to drive.*  
 ii a. *She invited him to her party.*                b. *She invited him to chair the meeting.*

In the [a] examples, *teach* takes two objects, *invite* an object and a PP complement, but this distinction is irrelevant to the [b] examples: there's no evidence for a comparable difference in structure here.

Similarly with the contrast between objects and predicatives:

- [6] i a. *I told him the new duties.*                      b. *I told him to sweep the floor.*  
 ii a. *I consider him a failure.*                      b. *I consider him to have failed.*

*The new duties* in [ia] is direct object, *a failure* in [iia] a predicative complement (with *him* as predicand); and at the same time the function of *him* is different, indirect object in [ia], direct object in [iia]. But again the syntactic properties distinguishing [ia] from [iia] do not apply to the catenatives. For example, an indirect object is resistant to fronting in relativisation, etc. (cf. *\*[the one] whom I told the new duties*), but such restrictions do not apply to plain-complex structures like [6ib] (*[the one] whom I told to sweep the floor*): the intervening NP here behaves like a direct object rather than an indirect one. There are semantic differences between [ib] and [iib], with *him* a matrix argument in [ib] but not [iib], and the time of the subordinate situation being later than that of the matrix one in [ib] but not [iib]; but these do not provide any basis for saying that they differ in syntactic structure in the way that [ia] differs from [iia].

### ■ Varying degrees of likeness to objects

Catenative verbs vary in the extent to which their non-finite complements resemble objects, but overall the similarities are fairly slight. Relevant factors are as follows:

#### (a) Passivisation

The catenative complements that are most like objects are those which can be promoted to subject by passivisation. All are gerund-participials, as in:

- [7] i *Kim's leaving early wasn't mentioned.*  
 ii *Going out alone at night isn't recommended.*

All the verbs concerned also take NP objects, and passivise much more readily with an NP object than with a gerund-participial: the above construction is quite rare and felt to be rather awkward and marginal.

With a few verbs an infinitival complement can be promoted to extraposed subject:

- [8] i *It is planned to complete the work in three stages.*  
 ii *It is hoped to return to this issue.*

This can hardly be regarded, however, as indicative of a significant resemblance to an object, for clauses with NP objects do not undergo this kind of passivisation, and while *plan* allows an NP object *hope* does not.

#### (b) Pronouns and clefts

It is not normally found with non-finite complements as antecedent: *Yes, I want it*, for example, is not an appropriate response to *Do you want to see them?*, nor *Yes, I avoided it* to *Did you avoid implicating your father?* Questioning with *what* is possible with some verbs: the questions *What do you want?*, *What have you decided?*, *What do you recommend?* might be answered respectively *I want to see the manager*, *I've decided to accept the offer*, *I recommend leaving things as they are*. But this is very restricted, especially with infinitivals: *I'd like to go to Spain*, for example, is not an answer to *What would you like?*, nor *You should stop drinking coffee* to *What should I stop?* Relativisation in a pseudo-cleft is possible with more verbs (*What I'd like is to go to Spain for a few days*; *All I ask is to be allowed to get on with my work in peace*) – but again with severe limitations (*\*What they began first was to arrange/arranging the cards in order*).<sup>25</sup> *It*-clefts are marginally possible with some gerund-participials (*It's having to do the job under such appalling conditions that I resent*) but quite impossible with infinitivals (compare *It's encouragement that she needs* and *\*It's to consult a solicitor that she needs*).

In general, gerund-participials tend to be more like objects than *to*-infinitivals, reflecting the nominal source of the traditional gerund. But there are considerable differences among them, and (except for the cases defined in §7) it is better to treat gerund-participials along with other non-finites in the catenative construction than to separate some of them out and handle them with NP complements as object.

## 4.2 The analysis of auxiliary verbs

The syntactic class of auxiliary verbs is defined in English by the NICE properties – occurrence with Negation, Inversion, Code, and Emphasis (see Ch. 3, §2.1). We have distinguished between **core** and **non-core** uses of the auxiliaries: in the core uses they appear with a following verb in one of its secondary forms (plain form, gerund-participle, or past participle), whereas in the non-core uses they take an NP, a finite clause, or some other kind of complement:

- |     |   |  |
|-----|---|--|
| [9] | CORE USES                                 | NON-CORE USES                                      |
|     | i a. <i>He <u>isn't</u> working.</i>      | b. <i>He <u>isn't</u> a liar.</i>                  |
|     | ii a. <i>I <u>haven't</u> seen it.</i>    | b. <i>%I <u>haven't</u> time.</i>                  |
|     | iii a. <i><u>Would</u> you regret it?</i> | b. <i><u>Would</u> you rather <u>I did</u> it?</i> |

<sup>25</sup> In some cases a *to*-infinitival can occur instead of an NP as complement of a pseudo-cleft whose subject contains a prepositional verb: *What she agreed to was his proposal for a cooling-off period / to accept a cooling-off period* or *What he longed for was her forgiveness / to know he was forgiven*. But relatively few verbs behave in this way: compare, for example, *What he applied for was two months' deferment / \*to defer his enrolment* or *What she decided on was a partial sale of the business / \*to sell part of the business*, and so on.

All auxiliaries have core uses, whereas non-core uses are found only with *be*, stative *have* (in some varieties), and *would* in the idioms *would rather / sooner / as soon*.

There are two competing analyses of the core auxiliaries: on the **dependent-auxiliary analysis**, they are dependents of a following **main verb**, whereas in the **catenative-auxiliary analysis** they belong to the larger class of catenative verbs which take non-finite complements. Now that we have examined the catenative construction in some detail, we will present our arguments for adopting the catenative-auxiliary analysis; we first set out the case for the dependent-auxiliary analysis and then show why the catenative analysis is to be preferred.

#### 4.2.1 The dependent-auxiliary analysis

Since the NICE properties are found with a few verbs which clearly take complements, as in the non-core uses illustrated in [9], these properties cannot provide the justification for taking the core auxiliaries as dependents rather than heads: the special treatment of core auxiliaries must be based on other factors.

##### ■ General motivation for the dependent-auxiliary analysis

These other factors can be brought out by comparing the following constructions:

- |        |   |                            |
|--------|---|----------------------------|
| [10] i | <i>Ed had a busy morning: he read the report.</i> | [sequence of main clauses] |
| ii     | <i>Ed says that he read the report.</i>           | [finite subordination]     |
| iii    | <i>Ed asked to read the report.</i>               | [non-finite subordination] |
| iv     | <i>Ed had read the report.</i>                    | [auxiliary construction]   |

##### (a) Sequence of main clauses

In [10i] there are two main clauses; they are of equal syntactic status, neither being subordinate to the other. This relational independence is reflected in the internal independence of the two clauses. That is, each selects independently of the other for tense, polarity, clause type, subject, and so on. This is illustrated for polarity in:

- |        |  |                       |
|--------|--|-----------------------|
| [11] i | <i>Ed <u>had</u> a busy morning: he <u>read</u> the report. (= [10i])</i>      | [positive + positive] |
| ii     | <i>Ed <u>had</u> a busy morning: he <u>didn't read</u> the report.</i>         | [positive + negative] |
| iii    | <i>Ed <u>didn't have</u> a busy morning: he <u>read</u> the report.</i>        | [negative + positive] |
| iv     | <i>Ed <u>didn't have</u> a busy morning: he <u>didn't read</u> the report.</i> | [negative + negative] |

Similarly for subject selection: as it stands, the subject of the second clause is related anaphorically to that of the first, but the two subjects could be quite unrelated, as in *Ed had a busy morning: the phone rang continuously*. And so on: there are no grammatical limitations on either clause imposed by the other.

##### (b) Finite subordination

As we move down to [10ii], we find that this internal independence of the two clauses has diminished, though to a relatively modest extent. Here, *that he read the report* is a subordinate clause serving as complement to *say*: there is therefore a clear structural interdependence in that one clause is functioning within the structure of the other. By virtue of its subordination, the *read* clause loses its potential illocutionary force. That is, in uttering [ii] I do not assert that he read the report (as I normally do if I utter the simple sentence *He read the report*): I don't make two separate assertions, as in [i], but a single composite assertion. Related to this is the fact that the choice of clause type in the complement clause is restricted. It would not be possible to have an imperative clause here. And a closed interrogative is just about excluded too (*Ed says whether he read the report*) though it would become completely normal if we

made the main clause negative or interrogative (*Ed doesn't say / Does Ed say whether he read the report?*), an indication of the interdependence between the two clauses. In other respects, however, the *read* clause has the same range of options available as in a main clause: the options for tense, polarity, subject, for example, are unaffected by the subordination (cf. *Ed says that the boss doesn't read the reports*, which differs in all three of these respects).

#### (c) Non-finite subordination

Moving from [10ii] to [iii] takes us from a finite to a non-finite subordinate clause, and non-finites have a reduced range of clausal options open to them. Non-finite clauses tend to be significantly less explicit than finite clauses: components of meaning that in finites are directly expressed are in non-finites often left to be derived from the context in which the clause appears. The non-finite has no inflectional tense – and no possibility therefore of including a modal auxiliary (the possible contrast in [10ii] between *that he may/must/can/will read the report* is not available in [iii]). Instead, the superordinate verb contributes a great deal to the interpretation of the lower clause: in [iii], for example, the reading is merely potential and in a time sphere subsequent to the time of asking, whereas in *Ed remembered to read the report* it is actual and not temporally separable from the remembering. Like most non-finites, the *read* clause of [iii] has no overt subject – but the understood subject is retrievable from the superordinate subject *Ed*.

#### (d) The auxiliary construction

Finally, when we come to [10iv], the range of structural options available is further reduced, so much so (the argument goes) that it is no longer justifiable to talk in terms of two clauses, one embedded within the other. Historically it is a two-clause construction, comparable to [iii], but the two clauses have lost their separate identities, merging together into a single clause. This evolution has been accompanied by a reinterpretation of the direction of grammatical dependence, with *have* now dependent on *read*, rather than the other way round.

The reduced independence of *have* and *read* in [10iv] relative to that of *ask* and *read* in [10iii] is reflected in a number of ways, most notably [12i–iii], which we examine in turn:

- [12] i *Ask* takes an argument subject, whereas *have* takes a non-argument subject.  
 ii With *ask* there is a very clear distinction between negating *ask* itself and negating the complement, but *have* does not follow the same pattern.  
 iii *Ask* and its complement show a greater degree of temporal independence than we find with *have* and the following verb.

### ■ The distinction between argument and non-argument subjects

Both [10iii], *Ed asked to read the report*, and [10iv], *Ed had read the report*, have only a single subject, but there is nevertheless a major difference between them. In the semantic interpretation of [iii] we understand *Ed* to be an argument of both the verbs – to have two semantic roles. *Ed* is the ‘asker’ and also the (potential) ‘reader’. But we cannot similarly attribute two distinct roles to *Ed* in [iv]. *Ed* is here the reader, but not the ‘haver’. Semantically, *have* relates to *Ed*’s reading the report as a whole, not just to *Ed*. This is the distinction we have discussed in contrasting *hope* and *seem* in §2.1, where we talked of ordinary subject vs raised subject; the way in which we defined ‘raised subject’, however, assumed a two-clause structure and hence the term is not appropriate in discussing the dependent-auxiliary analysis: we will simply say here that *ask* takes an argument subject, whereas *have* takes a non-argument subject. The distinction between the two kinds of subject is reflected in ways that will be familiar from the earlier discussion.

(a) *Ask* is voice-sensitive, *have* voice-neutral

- |      |    |  |   |                          |
|------|----|--|---|--------------------------|
| [13] | i  | a. <i>Kim asked to interview the PM.</i>         | } | [voice-sensitive: a ≠ b] |
|      |    | b. <i>The PM asked to be interviewed by Kim.</i> |   |                          |
|      | ii | a. <i>Kim had interviewed the PM.</i>            | } | [voice-neutral: a = b]   |
|      |    | b. <i>The PM had been interviewed by Kim.</i>    |   |                          |

In [i] there is a clear contrast in meaning, with Kim doing the asking in [a], the PM in [b]: *ask* is sensitive to the voice of the following infinitival. But in [ii] the propositional meaning is the same in [a] and [b]: *have* is voice-neutral. The relation between [iia] and [iib] is just the same as in the simple active–passive pair *Kim interviewed the PM* and *The PM was interviewed by Kim*. That is what we would expect if *have* were simply an optional dependent of *interview*.

(b) *Ask* imposes selection restrictions on the subject, *have* does not

- |      |    |  |                                |
|------|----|--|--------------------------------|
| [14] | i  | <i>*The knife asked to touch the baby.</i> | [selection restrictions apply] |
|      | ii | <i>The knife had touched the baby.</i>     | [no selection restrictions]    |

Example [i] is anomalous because catenative *ask* imposes selection restrictions on its subject: normally it is only people who ask to do something. This indicates a direct semantic relation between *ask* and the subject: verbs generally impose selection restrictions on their arguments. Perfect *have*, by contrast, imposes no such restrictions. In [ii] *the knife* satisfies the restrictions imposed by *touch* (compare *\*Infinity had touched the baby*). This indicates a direct relation between the subject and *touch* but not *have*: again this is what we would expect if *touch* were the head element, and *have* a dependent.

(c) *Have* allows subjects with no independent meaning, *ask* does not

- |      |    |   |                                |
|------|----|---|--------------------------------|
| [15] | i  | <i>*There asked to be a mistake in the proof.</i> | [dummy <i>there</i> excluded]  |
|      | ii | <i>There had been a mistake in the proof.</i>     | [dummy <i>there</i> permitted] |

Example [i] is unacceptable because *there* has no meaning of its own and hence cannot satisfy the selection restrictions imposed by *ask*. But [ii] is acceptable because *There was a mistake in the proof* is: adding *have* to this doesn't affect acceptability, and this too is what one would expect if it were a dependent of *be*.

## ■ Negation

With *ask* we find a sharp semantic and syntactic distinction between negating *ask* and negating its complement. Negation of the complement occurs most naturally with passives, so we may contrast [16ia–b], whereas with *have* we have the single negation [ii]:

- |      |    |  |                                 |
|------|----|--|---------------------------------|
| [16] | i  | a. <i>She didn't ask to be included in the survey.</i> | [negation of <i>ask</i> clause] |
|      |    | b. <i>She asked not to be included in the survey.</i>  | [negation of complement]        |
|      | ii | <i>She had not been included in the survey.</i>        |                                 |

The dependent-auxiliary analysis treats *She had been included in the survey* as a single clause and hence predicts that there will be just one negation of it, as in [ii].

With the modals, moreover, we find that the clear semantic contrast between [16ia] and [16ib] may be syntactically neutralised. Compare:

- |      |    |                                |                     |
|------|----|--------------------------------|---------------------|
| [17] | i  | <i>You may not start yet.</i>  | [external negation] |
|      | ii | <i>You must not start yet.</i> | [internal negation] |

As explained in Ch. 3, §9.2.1, we use the term 'external negation' for the interpretation where the negation has scope over the modal, and 'internal negation' for that where the negation is within the scope of the modal. Thus [17i] is comparable semantically to [16ia] in that *may* (here indicating permission) falls within the scope of the negative, so that we have negation

of the modality: it says that you do not have permission to start yet. It differs syntactically from [16ia] because *may* is an auxiliary and can hence be negated directly, without *do*-support. However, [17ii] is comparable semantically to [16ib] in that *must* (here indicating requirement or obligation) is outside the scope of the negative. The meaning is “You are required not to start yet” rather than “You aren’t required to start yet”; what is negative, therefore, is not the modality but the propositional content that the modality applies to. This is why [17i–ii] effectively mean the same even though *may* and *must* themselves are of course very different in meaning. In spite of the difference in the semantic scope of the negative, however, they are syntactically alike, not just superficially in terms of the position of *not*, but more fundamentally in terms of their behaviour with respect to the tests for clausal negation set out in Ch. 9, §1.1; compare, for example:

- [18] i a. *She didn’t ask to be included in the survey and nor/\*so did your brother.*  
 b. *She asked not to be included in the survey and so/\*nor did your brother.*  
 ii a. *You may not start yet and nor/\*so may your brother.*  
 b. *You must not start yet and nor/\*so must your brother.*

In [ia] *ask* is negated and hence we have matching *nor* following, whereas in [ib] *ask* is positive and hence selects positive *so* following. But the parallel semantic difference between [iia] and [iib] is not reflected in this way: [17ii] no less than [17i] is treated as syntactically negative. This suggests that from a syntactic point of view *You must start* is a single clause, so that it has only one negative counterpart.

### ■ Temporal specification

Consider the following contrast:

- [19] i *She asked to read the report on Saturday.*  
 ii *She had read the report on Saturday.*

Example [i] is ambiguous in that *on Saturday* can specify the time of the asking or the time of the (potential) reading. The ambiguity can be resolved in favour of the former meaning by moving the adjunct: *She asked on Saturday to read the report.* And it can be resolved in favour of the second meaning by changing *on* to *next*, giving *She asked to read the report next Saturday,* since the future meaning of the adjunct is incompatible with the past time meaning of *asked*. The point is that the asking and the reading are temporally quite distinct, and we can therefore add temporal specification relating to either. Or, indeed, to both: *She asked yesterday to read the report on Saturday.* But it would not be possible to say *\*She had yesterday read the report on Saturday.* Again, the data suggest that *have* and *read* have significantly less independence than do *ask* and *read*, and this can be captured by assigning them to a single clause.

### ■ The verb group

Under the dependent-auxiliary analysis, sequences like *had read*, *must start*, *was interviewed*, *had been interviewed*, etc., constitute single syntactic units, resulting from the historical reanalysis of earlier catenative constructions. We will call them **verb groups** (‘VGps’).<sup>26</sup> Within the structure of the VGp, the main verb functions as head and the auxiliaries as dependents.

<sup>26</sup>The term ‘verb group’ is an ad hoc one: if the main verb is head and the auxiliaries dependents, it would more properly be called a ‘verb phrase’. The ad hoc term reflects our view that the category is not theoretically justified but may have some practical descriptive value. We prefer, therefore, to reserve the term ‘verb phrase’ for the unit which includes the complements and modifiers of the verb, in accordance with widespread usage in modern grammars. Traditional grammar generally uses the term ‘verb’ itself for the VGp as well as for the individual words within it, but it is undesirable to lose the distinction between the word and the larger unit.

The auxiliaries are optional elements, but their order is rigidly fixed. A simplified structure of the VGp (ignoring *do*, *use*, and the *have* of *I have to go*) is shown in [20], where parentheses indicate optionality:

[20]	(Modal)	(Perfect)	(Progressive)	(Passive)	Main Verb
	<i>will</i>	<i>have</i>	<i>be</i>	<i>be</i>	<i>take</i>
	<i>can</i>				<i>write</i>
	etc.				etc.

Such a structure accounts neatly for the possible combinations of auxiliary verbs and their relative order. Note, for example, that we have *She has been reading* (perfect + progressive), not \**She is having read* (progressive + perfect). The fixed order of the modals and perfect **have** similarly handles such data as the following:

[21]	i	<i>I may have mentioned it yesterday.</i>	[internal perfect]
	ii	<i>I should have mentioned it yesterday.</i>	[external perfect]
	iii	<i>Kim needn't have written it.</i>	[ambiguous]

In [i] the past time expressed by *have* is associated not with the modality, but with the proposition that the modality applies to, thus “It is possible that I mentioned it yesterday” (cf. Ch. 3. §9.9). In [ii], by contrast, the modality – which here involves the concept of the ‘right’ thing to do – falls within the semantic scope of *have*, for it is a matter of what was right in the past: “the right thing to do was (or would have been) to mention it yesterday”. Example [iii] is ambiguous, for it can be interpreted in either way. The more salient reading follows the pattern of [ii]: “There was no need for Kim to write it yesterday” (with *need* inside the semantic scope of *have*); but it has a second interpretation along the lines of [i]: “It isn’t necessarily the case that Kim wrote it” (with *need* now outside the scope of *have*). The phenomenon is similar to that involving negative scope illustrated in [17] – where *You must not start yet* is interpreted differently from *You may not start yet*. The development of a VGp unit with a rigidly ordered syntactic structure results in certain semantic scope distinctions being left implicit. The VGp selects as a whole for negative polarity and perfect tense, and the markers of these categories occupy a fixed syntactic position within the structure irrespective of their semantic scope.<sup>27</sup>

#### 4.2.2 The catenative-auxiliary analysis

Although the category of VGp is in many ways descriptively very useful, the position taken here is that there are nevertheless compelling grounds for preferring an analysis of the modal, tense, aspectual and voice auxiliaries as catenative verbs taking non-finite complementation. On this account, [10iii–iv], *Ed asked to read the report* and *Ed had read the report*, have essentially the same structure. We will argue that there is no principled basis for drawing a structural distinction between catenative + complement and dependent-auxiliary + main-verb constructions.

<sup>27</sup> A further case of mismatch between syntactic and semantic scope is to be found in the position of adverbs. Although the order illustrated in *He must always/never have filed the letters* represents the usual one, it is also possible to have the adverb before the auxiliary, as in *He never/always must have filed the letters*. *Must* here has its epistemic sense, roughly “I am forced to conclude”. And it is clear that the frequency adverbs relate semantically to the filing, not to the epistemic judgement: the meaning is “I am forced to conclude that he always/never filed the letters”, not “I am always/never forced to conclude that he filed the letters”. Semantically, then, it is comparable to *He promised always to do his best*, although the order matches that of *He always promised to do his best*: the semantic contrast between the two *promise* examples is lost with *must*.

The argument has both a negative and a positive side to it. The negative side involves re-considering the differences between *ask* and *have* presented in the last section as supporting a dependent-auxiliary analysis, and showing that on closer examination they do not in fact do so. The positive side involves introducing other phenomena which can be handled more satisfactorily under the catenative analysis.

#### (a) The distinction between argument and non-argument subjects

The first point we made was that while *ask* takes an argument subject, *have* does not. But as we in fact noted when discussing this difference, it isn't only auxiliary verbs that take non-argument subjects: verbs such as *seem*, *appear*, *begin*, *tend* do so too. The following examples with *seem* thus match the above ones with perfect *have* in [13–15]:<sup>28</sup>

- [22] i a. *Kim seemed to intimidate the PM.* } [voice-neutral: a = b]  
       b. *The PM seemed to be intimidated by Kim.* }  
       ii a. *The knife seemed to touch the baby.* [no selection restrictions]  
        b. *There seemed to be a mistake in the proof.* [there permitted]

It is also important to note that the concept of catenative can be applied to adjectives as well as to verbs. Adjectives like *certain*, *likely*, *eager*, *keen* take non-finite complements, and can be chained together recursively in the same way as catenative verbs: cf. *She is likely to be keen to accept* or (with a mixture of verbs and adjectives in a chain of four catenatives) *She is likely to at least appear to be keen to try to win*. And catenative adjectives show the same split between those that take argument subjects and those that take non-argument subjects. Compare:

- [23] i a. *Kim was keen to interview the PM.* } [voice-sensitive: a ≠ b]  
       b. *The PM was keen to be interviewed by Kim.* }  
       ii a. *Kim was likely to intimidate the PM.* } [voice-neutral: a = b]  
        b. *The PM was likely to be intimidated by Kim.* }

Furthermore, this split is to be found in the class of auxiliaries too: it is not quite true that all auxiliaries take non-argument subjects, for *dare* and the *would* of *would rather* take argument subjects:

- [24] i a. *Neither dare interview the PM.* } [voice-sensitive: a ≠ b]  
       b. *The PM daren't be interviewed by either.* }  
       ii *\*The piano-lid daren't be open.* [selection restrictions apply]  
       iii *\*There daren't be any dust on the piano.* [dummy there excluded]

What we find, then, is the cross-classification shown in:

[25]	ARGUMENT SUBJECT	NON-ARGUMENT SUBJECT	
i	<i>dare, would (rather)</i>	<i>be, can, have, may, need</i>	[auxiliaries]
ii	<i>expect, hope, try, want</i>	<i>appear, begin, seem, tend</i>	[lexical verbs]
iii	<i>anxious, determined, keen</i>	<i>apt, certain, liable, likely</i>	[adjectives]

The contrast in the semantic relation to the subject thus provides no basis for treating auxiliaries differently from lexical verbs. Moreover, the behaviour of *dare* and *would (rather)* is inconsistent with the dependent-auxiliary analysis: they are clearly heads, not dependents.

#### (b) Negation

Although the core auxiliary construction normally has just one negation, the possibility does in fact exist for contrasts in syntactic as well as semantic scope and for negating more than

<sup>28</sup>We have changed the non-finite complement of [13] because both *Kim seemed to interview the PM* and *The PM seemed to be interviewed by Kim* sound somewhat unnatural. They are equivalent, nevertheless.

one verb at a time. Compare:

- [26] i *She can't always answer his questions, can she?* [negation of *can*]  
 ii *She can always not answer his questions, can't she?* [negation of *answer*]  
 iii *She can't always not answer his questions, can she?* [negation of both verbs]

There is an equivalence between [i] and *It isn't always possible for her to answer his questions, is it?*: the negation clearly includes the *can/possible* within its scope semantically, and the interrogative tag shows that it does so syntactically too – the standard type of tag reverses the polarity of the clause to which it attaches (cf. Ch. 9, §1.1).

By contrast, [26ii] is equivalent to *It is always possible for her not to answer his questions, isn't it?* (“to refrain from answering”), where the *can/possible* is now outside the scope of the negative, hence positive, as reflected in the negative tag. And [iii] is equivalent to *It is not possible for her to always not answer his questions, is it?* The two negatives here do not of course cancel each other out because they are negating different verbs; the tag is the same as in [i], because it is determined by the polarity of the *can* clause.

The *always* in these examples makes it easy to see the scope of the negatives. If we omit it, there is no longer anything in the linear sequence of elements alone to determine the scope: *She + can + not + answer his questions* could in principle have either the first or second interpretation. The second requires a special prosodic reading in which there is a break after *can* and the *not* is closely linked to *answer*; in writing *cannot* would force the first interpretation, whereas *can not* would tend to be used for the second. An inflectional negative always indicates that the negative has syntactic scope over that verb: *She can't answer his questions* unambiguously has the first interpretation.

The same range of possibilities is even available with perfect *have*:

- [27] i *He has not always accepted bribes, has he?* [negation of *have*]  
 ii *He has always not accepted bribes, hasn't he?* [negation of *accept*]  
 iii *He has not always not accepted bribes, has he?* [negation of both verbs]

*Have* is negated in [i] and [iii], where *has not* is replaceable by inflectional *hasn't*, but in [ii] the *have* clause is positive (as evident from the tag), and the *not* belongs syntactically as well as semantically with *accept*: “It has always been his practice to not accept (i.e. to refuse) bribes”.

Examples like [26ii/27ii] are just like the earlier [16iib] (*She asked not to be included in the survey*), and the catenative analysis enables them to be handled in just the same way, as non-finite complement negation, secondary negation in the sense of Ch. 9, §2.3. This is not possible in the dependent-auxiliary analysis, where they have to be treated as exceptions. The above contrasts show that the proposed VGp does not in fact form a unit with a single syntactic negation. It is true that examples like [i] represent the normal pattern, but the catenative analysis caters more satisfactorily for the range of options that the verbal system makes available.<sup>29</sup> (It should also be borne in mind that in the ordinary catenative construction negation of the matrix is much more frequent than negation of the complement.) Other

<sup>29</sup>Attested examples of the construction shown in [iii] are rare, but the following is a slightly more complex version of it: *Not since 1992 had Sampras not taken at least one among the Australian Open, French Open, Wimbledon and the US Open*. The initial negative phrase negates the *have* clause, while the second *not* negates the *take* clause.

examples of secondary negation after auxiliaries are given in:

- [28] i *He will sometimes not answer the phone.*  
 ii *You should just occasionally not give everyone the benefit of the doubt.*  
 iii *They are always not accepting new orders.*

### ■ Temporal specification

The same kind of argument applies here. Initially we can distinguish two types of catenative: Type I are not temporally distinct from their complement, but Type II are. Some examples are given in:

- [29] i *forget/remember (to); begin, continue, stop; manage, try* [Type I: non-distinct]  
 ii *ask, expect, intend, promise, want* [Type II: distinct]

With Type I it is not possible to give separate time specifications (of the same kind) or to give a time specification that conflicts with the time sphere required by the inflectional tense of the catenative, whereas with Type II it is:

- [30] i *\*This morning it began to rain this evening.*  
 ii *This morning he promised to return this evening.*

On this dimension, Type II verbs clearly involve a higher degree of internal independence between the clauses than do Type I. Of the auxiliaries, however, only passive *be* and supportive *do* belong clearly to Type I – compare:

- [31] i *At that time he was still arriving tomorrow.*  
 ii *He may have seen her yesterday.*  
 iii *We can now set out tomorrow.*  
 iv *When I arrived she had already left just a few minutes earlier.*  
 v *He had left when Kim arrived.*

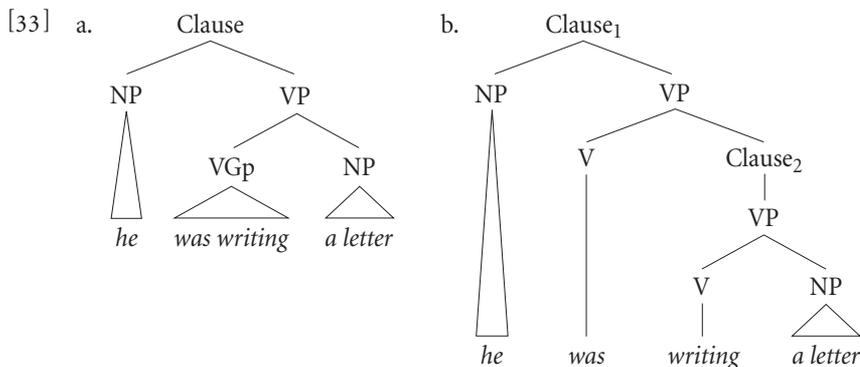

Progressive *be* belongs to Type I when expressing progressive aspectuality but not with the futurate meaning seen here in [i]. The modals in general belong to Type II. In [ii], the *yesterday* gives the time of the seeing: it does not relate to the modality expressed by *may*, as evident from the fact that the modal is in the present tense. And in [iii] there are separate time specifications: *now* relates to *can*, *tomorrow* to *set out*. Perfect *have* also belongs basically to Type II. In [iv] *just a few minutes earlier* gives the time of her leaving, whereas *when I arrived* is associated with the *have*: it gives the time of orientation to which the leaving is anterior. Example [v] is ambiguous, in a way which parallels the earlier [19i] (*She asked to read the report on Saturday*). In one interpretation *when Kim arrived* gives the time of his leaving. In another it is like *when I arrived* in [31iv], and associated with *have* rather than *leave*: it specifies a time prior to which he had left. (Adding *already* after *had* makes this second reading more salient.) And in both the *have* and *ask* cases, moving the adjunct to the front just about forces its association with the first verb:

- [32] i *On Saturday she asked to read the report.* [specifies time of asking]  
 ii *When Kim arrived he had left.* [specifies time of orientation]

The Type II behaviour of the auxiliaries provides strong support for the catenative analysis, where the time adjuncts can be assigned to the superordinate or complement clause as appropriate, just as they are when the catenative is a lexical verb.

### ■ Constituency

The dependent-auxiliary and catenative-auxiliary analyses assign different constituent structures. For *He was writing a letter*, say, we have (omitting functional labels):

The major difference is that in [a], the dependent-auxiliary analysis, *writing* first enters into construction with the auxiliary *was* to form the VGp *was writing*, whereas in [ii], the catenative analysis, it first enters into construction with its complement *a letter* to form the VP *writing a letter*. Evidence supporting this second constituent structure is as follows:

#### (a) Preposing

The VP can occupy prenuclear position in the clause:

[34] *She said he'd be writing a letter, and [writing a letter he was].*

Here *writing a letter* has been preposed, and it is characteristic of fronting that it applies to whole constituents.

#### (b) Coordination

Coordination provides particularly strong evidence for the catenative analysis when it occurs in combination with negation:<sup>30</sup>

- [35] i *You can't [join a debating society and not speak].*  
 ii *He surely hasn't [read the letter and failed to see its implications].*  
 iii *I'm quite sure he didn't [write the letter and not post it].*

*Can't join* and *can't join a debating society* are clearly not constituents in [i] (as they are predicted to be under the dependent-auxiliary analysis): it doesn't say that you can't join a debating society, but rather that you can't 'join-a-debating-society-and-not-speak'. Thus *join a debating society* must form a unit, which coordinates with (*and*) *not speak*, with the resulting coordination as a whole serving as complement to *can't*. The same applies to [ii], where we find coordination within the complement of *have*. And similarly in [iii], where the coordination is complement of supportive *do*. Such coordination would not be possible without *do* (*\*He wrote the letter and not post it*), but introduction of *do* detaches the tense inflection from *write*, making the way for coordination of two plain form VPs.

#### (c) Position of adjuncts

Adjuncts frequently occur between an auxiliary and the lexical verb: *He was slowly writing a letter*. It is difficult to see how this can be accounted for under the dependent-auxiliary analysis without invoking the concept of discontinuous constituents, whereas the catenative

<sup>30</sup>Coordination without negation is not so straightforwardly conclusive, for we can have either *He was writing a letter and listening to the radio* (favouring analysis [33b]) or *He has written or is writing his letter of resignation* (which might appear to favour [33a], but is best treated as a case of delayed right constituent coordination: see Ch. 15, §4.4).

analysis allows the construction to be handled with a simpler model of constituency. The ease with which we can insert elements between auxiliary and ‘main verb’ casts serious doubt on the idea that they form a syntactic constituent comparable with, say, NP, AdjP, PP, and the like.

### ■ Ordering constraints

Under the dependent-auxiliary analysis the fixed ordering of the auxiliaries is catered for by stipulating that the VGp has the structure shown in [20]. Under the catenative analysis the order results from certain independently needed constraints.<sup>31</sup>

#### (a) Initial position of the modals

This is attributable to their defective morphology: they have no secondary forms and so can't appear in the non-finite complement of another verb.<sup>32</sup>

#### (b) Final position of passive *be*

This is due to the fact that it is the following verb that is passivised: the preceding auxiliaries – the modals, *have*, and progressive *be* – don't have objects and are outside the scope of the voice contrast. Compare now:

- [36] i *The king appears to be hated by his subjects.*  
 ii *The king may be hated by his subjects.*

*Be* occupies second position among the verbs in [ii] for the same reason as in [i]: *may*, like *appear*, is outside the scope of the passive.

#### (c) Fixed order of perfect and progressive

*Be* can't precede *have* because of a more general constraint excluding perfect *have* from the complements of aspectual verbs:

- [37] i *\*He was having read the book.*  
 ii *\*He began having read the book.*  
 iii *\*He stopped having read the book.*

### ■ Conclusion

The dependent-auxiliary analysis has certain attractions for textual analysis, in that it very much reduces the amount of embedding that has to be recognised. *It may have been raining*, for example, will be a simple clause instead of a complex one with three layers of embedding. Given the high frequency of auxiliary verbs, this will result in a very considerable ‘saving’ in the analysis of most texts. It is also simpler in that we don't have to decide which clause temporal and similar dependents should be assigned to – e.g. whether *at noon* belongs with *be* or with *sleep* in *They were still sleeping at noon*. And the cases where we have shown it to give clearly unacceptable results are textually quite rare. Nevertheless, we believe we have shown that from a more theoretical perspective the catenative analysis is very much sounder.

It follows that in [10] above we distinguish just three categories, sequence of main clauses, finite subordination, and non-finite subordination. Within this last category, catenative

<sup>31</sup>In languages where mood, tense, and aspect are marked inflectionally there is some tendency for an aspect marker to be closer to the lexical base than a tense marker, and for the latter to be closer than a mood marker; the English syntactic order matches that morphological order.

<sup>32</sup>The *have* of *We have to stop* and the like is not a member of the syntactic category of modal auxiliaries, and in particular is not defective. It is therefore not catered for by structure [20] – e.g. it can precede or follow the perfect (*You have to have completed three years of undergraduate study; I have had to put it aside*). Nevertheless, in some varieties it can be used as a core auxiliary (Ch. 3, §2.5.6), and there is no evident reason why it should then be treated differently from other core auxiliaries.

complementation, we find a considerable range of differences in the degree of internal independence between the two clauses, but there is no principled basis for drawing a distinction between two quite different constructions. The dependent-auxiliary analysis implies that the auxiliaries have come, over time, to be reanalysed so as to lose their status as verbs taking non-finite complements: what we have seen, however, is that they have retained too much syntactic independence for this thesis to be sustainable. We believe, moreover, that the proposed analysis is much more viable in a descriptive framework that recognises the catenative complement as a distinct kind of complement – there is no question of suggesting that the non-finite complements of the core auxiliaries are objects or predicative complements.

### 4.3 The traditional distinction between ‘gerunds’ and ‘present participles’

The verb-forms we are calling gerund-participles are traditionally divided into gerunds and present participles, as illustrated in:

- |  |   |                      |
|--|---|----------------------|
| <p>[38] i a. [<u>Inviting</u> the twins] was a bad mistake.<br/>         b. We're thinking of [<u>giving</u> them one more chance].<br/>         c. I remember [<u>seeing</u> them together].<br/>         d. She found [<u>talking</u> to Pat] surprisingly stressful.</p>                          | } | [gerund]             |
| <p>ii a. Those [<u>living</u> alone] are most at risk.<br/>         b. [Not <u>having</u> read his book,] I can't comment.<br/>         c. She is [<u>mowing</u> the lawn].<br/>         d. We saw him [<u>leaving</u> the post office].<br/>         e. I caught them [<u>reading</u> my mail].</p> | } | [present participle] |

We argued in Ch. 3, §1.4, that there is no justification for making any inflectional distinction: all the underlined forms belong to a single inflectional category. We call this form gerund-participle to reflect the fact that it covers the ground of both gerunds and present participles in other languages. At the level of words, what is important is to distinguish gerund-participle forms of verbs from nouns (*the reading of the poem*) and adjectives (*a very inviting prospect*). Our aim in this section is to show that even from a purely syntactic point of view no viable distinction can be drawn between the bracketed clauses in [i] and those in [ii]: we refer to them all as gerund-participial clauses.

In terms of their function we distinguish between complement and non-complement gerund-participials. Non-complement ones, we have noted, are traditionally present participles, while the complement ones include both traditional categories.

#### ■ A difference in internal form: case of the subject NP

There is one respect in which ‘gerund’ and ‘present participle’ clauses differ in their internal form: with ‘gerunds’ the subject may take genitive case, with plain or accusative case a less formal alternant, but with ‘present participles’ the genitive is impossible and pronouns with a nominative–accusative contrast appear in nominative case, with accusative an alternant restricted to informal style.<sup>33</sup> Compare, then:

- [39] i *She resented his/him/\*he being invited to open the debate.*  
 ii *We appointed Max, he/him/\*his being much the best qualified of the candidates.*

<sup>33</sup> We simplify here by ignoring constructions involving coordinate pronouns: see Ch. 5, §16.2.2.

Note also that there is an unsatisfactory asymmetry in the traditional treatment of catenative complements. The object vs predicative complement distinction is applied to both gerund-participials and infinitivals, but in the former case it provides the basis for a distinction between ‘gerunds’ and ‘present participles’ whereas no such distinction is drawn among the infinitivals. In neither case is there any difference in internal form in the subjectless construction, and the motivation for drawing a distinction within the gerund-participials but not in the infinitivals is primarily historical: ‘gerund’ and ‘present participle’ have different historical sources, whereas there is only one source for infinitivals. In a grammar aimed at describing the present state of the language, a syntactic distinction based on historical factors in this way cannot be justified.

#### ■ No systematic difference in aspectuality

The traditional ‘present participle’ covers not only forms in modifier or supplement function but also the form of the verb that occurs with the progressive auxiliary *be*. It is evident, however, that ‘present participles’ do not always have progressive meaning, that there is no systematic difference in aspectual meaning between ‘present participles’ and ‘gerunds’. Compare:

- [42] i a. On hearing his cry, she dashed into the garden.  
       b. Hearing his cry, she dashed into the garden.  
       ii a. Despite having no TV himself, he was able to see the programme.  
        b. Although having no TV himself, he was able to see the programme.

In each pair, the verb in the underlined clause is traditionally analysed as a ‘gerund’ in [a] and a ‘present participle’ in [b], but in neither case is there any difference in aspectuality. In [ia/b] the aspectuality is perfective, while in [iia/b] it is imperfective but not progressive. Note, for example, that if we substitute a finite clause for the non-finite one in [iib], the appropriate form is the non-progressive *he had no TV himself*.

We conclude that there is no difference of form, function, or interpretation that correlates systematically with the traditional distinction between ‘gerund’ and ‘present participle’. The distinction introduces an unmotivated complication into the grammar: it is one of the features of traditional grammar that should be discarded.

### 4.4 Catenative complements, adjuncts, and coordinates

In a number of cases, catenative complements bear some resemblance to various kinds of adjunct or to elements in a coordination.

#### ■ Adjunct of purpose

In general, infinitival clauses functioning as adjunct of purpose are sharply distinct from catenative complements. Syntactically, they can be preceded by *in order* and characteristically can be moved to front position:

- [43] i *He walked [(in order) to save money].* }  
       ii *[(In order) to save money], he walked.* } [purpose adjunct]

Semantically, they of course express the purpose of some agentive act, and we accordingly have a very clear ambiguity in:

[44] *He swore to impress his mates.* [catenative complement or purpose adjunct]

The catenative interpretation is “He swore that he would impress his mates (in some unspecified way)”, whereas with an adjunct the meaning is “He swore in order to impress his mates (by swearing)”. In the adjunct reading, *swore* receives greater phonological prominence and in writing is likely to be followed by a comma.

With a few verbs, such as *wait* and *hurry*, the semantic distinction is at times somewhat blurred – compare:

[45] i a. *She was waiting for his letter to arrive.* [catenative complement]

b. *She waited a while to make sure he wasn't coming back.* [purpose adjunct]

c. *She was waiting to use the photocopier.*

ii a. *He hurried to reassure her.* [catenative complement]

b. *He hurried, to prove he wasn't as slow as she claimed.* [purpose adjunct]

c. *He hurried to catch the train.*

With *wait* the contrast is clear in [ia–ib]: the catenative complement identifies the event she was waiting for and the adjunct gives the purpose of her waiting; [ic] can be construed as a catenative construction, but at the same time there is an element of purpose. Presumably she couldn't use the photocopier immediately (someone else was using it or it needed attention), so it was necessary for her to wait. In [ii] *hurry* is equivalent to *hasten* in [iia], where the meaning is that he quickly reassured her, or tried to do so; [iib] is straightforwardly purposive and readily allows *in order* and fronting; such fronting is very unlikely in [iii], but it is probably best treated as also purposive, for we could not here substitute *hasten*.

*Go* is a borderline member of the catenative category:

[46] i *She went to the Old Vic to see 'Hamlet'.* [purpose adjunct]

ii *She went to see 'Hamlet'.* [catenative complement]

It is quite clear that in [i] the phrase *to the Old Vic* is a complement with the role of goal and the infinitival is an adjunct of purpose. In [ii] (spoken without any prosodic break after *went*) the concept of a spatial goal is very much backgrounded and it is not implausible to regard the infinitival as having been reanalysed as a complement: we certainly cannot insert *in order* and do not interpret it as answering the question *Why did she go?*

There is a use of *be* that is restricted to the perfect and has a similar sense to *go* as in *Jill has been to Moscow* (see Ch. 8, §4.3). This *be* too occurs with an infinitival, as in *She has been to see 'Hamlet'*. The infinitival here is in contrast with a goal such as *to Moscow*, and must qualify as a complement. Similar is *move*, as in *The government has moved to allay fears of a rise in interest-rates*. The sense of physical movement is lost, with *move* here meaning “take action”; the infinitival is virtually obligatory, and has the character of a complement rather than an adjunct.

### ■ Adjunct of result

To-infinitivals may be used as adjuncts to express a resultant or subsequent situation, but with some verbs it is not easy to distinguish sharply between this construction and the catenative one:

- [47] i *I ran all the way to the station only to find the train had just left.* } [adjunct]  
 ii *She opened the curtains to see that the ground was covered in snow.* }  
 iii *She lived to be ninety / to regret her decision.* [complement]

The first two are clearly adjuncts: they are fully optional and there is here no question of licensing by the verb. In [iii], by contrast, the infinitival can hardly be said to be optional, for although *She lived* is acceptable, the interpretation is different than in [iii] (we would understand it as “She survived”, i.e. “She didn’t die”). Note that while [i–ii] can be roughly paraphrased with a coordinative construction (. . . *but found the train . . .* ; . . . *and saw that the ground . . .*), there is no comparable relation between [iii] and *She lived and was ninety* or *She lived and regretted her decision*.

We take *live* therefore to be a catenative. Likewise *go on*, as in *She went on to become Prime Minister*. Less clear are *wake* and *grow up*, as in *She woke to find he’d gone*, *He grew up to be a complete introvert*: they commonly occur in this construction, but the infinitival can be omitted without apparent effect on the meaning of what remains, and there is again a close relation with a coordinative construction, so that they are best treated with [47i–ii]. Note then that *grow up* differs from *grow*, which is undoubtedly a catenative in *He grew to like it*.

### ■ Adjunct of cause

A number of verbs appear in the following range of constructions:

- [48] i *They rejoiced because they had won the war.* [adjunct]  
 ii *They rejoiced at their victory.*  
 iii *They rejoiced to hear they had won the war.*  
 iv *They rejoiced that they had won the war.* [complement]

The *because* phrase in [i] is clearly an adjunct and the finite content clause in [iv] a complement, while [ii–iii] fall towards the boundary between adjuncts and complements. Other verbs of this kind are: *blush*, *delight*, *grieve*, *grin*, *laugh*, *marvel*, *shudder*, *smile*, *tremble* (though only *grieve* and *marvel* of these readily enter into construction [iv]).

### ■ Depictive adjunct

Compare next:

- [49] i *He came in / went out looking rather pleased with himself.* [adjunct]  
 ii *It came / went hurtling through the window.* [?complement]  
 iii *She sat / lay / stood reading the newspaper.* [adjunct]

The gerund-participial clause is undoubtedly an adjunct in [i], but it is somewhat closer to a complement in [ii]: it can be freely omitted in [i], but this is not possible in [ii] without a significant change of interpretation. In [iii] we illustrate a common construction for

the positional verbs; the non-finite is not easily omissible here – but it is if we add a locative phrase like *on the patio*, and is probably better regarded as an adjunct than as a catenative complement.

### ■ Coordination

A link between catenative complementation and coordination is seen with *try* and *go*:

- [50] i a. *I always try and please him.*                      b. *Try and not be so impatient.*  
       ii *Go get yourself something to eat.*

In [i] *and* is both semantically and syntactically more like a subordinator than a coordinator. As explained in Ch. 15, §2.2.3, *and* + VP here is best treated as a non-finite complement, a further form-type beyond those given in §1.1. *Go* occurs with *and* in coordination, as in *Go and get yourself something to eat, I went and got myself something to eat*, but under restrictive conditions it appears without *and*, as in [50ii]. Both verbs must be in the plain form and as the construction is specific to *go* it is best treated as a special case of bare infinitival complementation.

## 5 Classification of catenative verbs

In this section we present a classification of catenative verbs (together with some catenative idioms) based on the analysis given in §§2–4 above.

### 5.1 Framework of classification

#### ■ Dimensions of classification

The primary dimension derives from the distinction we have drawn between the simple and complex catenative constructions. Class 1 verbs appear only in the simple construction, Class 2 in simple or complex, and Class 3 only in the complex construction. Within each major class, the first subdivision then concerns the form-types: *to*-infinitivals, bare infinitivals, gerund-participials, and past-participials.

#### ■ Multiple entries

Where a verb has different senses in different constructions, we give it multiple listings, with subscripts distinguishing the uses. Compare, for example:

- [1] i a. *He intends to leave at six.*                      b. *He intends leaving at six.*  
       ii a. *He should try<sub>1</sub> to eat less.*                      b. *He should try<sub>2</sub> eating less.*

*Intend* has the same meaning in [a] as in [b]: we therefore list it once, in the class of verbs taking either a *to*-infinitival or a gerund-participial. With *try*, on the other hand, we have a difference of meaning: in [a] it means “endeavour”, in [b] “test the effectiveness of”. We therefore list *try*<sub>1</sub> and *try*<sub>2</sub> separately, the former in the class taking a *to*-infinitival, the latter in the class taking a gerund-participial.

### ■ Passivisation

In considering whether the matrix clause can be passivised we distinguish three kinds of passive construction, and the symbols shown on the right in [2] will be used as annotations for verbs taking them:

- |     |     |   |  |                   |
|-----|-----|---|--|-------------------|
| [2] | i   | a. <i>They <u>advised me</u> to enrol.</i>  | b. <i><u>I</u> was <u>advised</u> to enrol.</i>                                    | [P]               |
|     | ii  | a. <i>We <u>intended (for it)</u> to resume.</i>                                    | b. <i>It was <u>intended (for it)</u> to resume.</i>                               | [P <sub>X</sub> ] |
|     | iii | a. <i>We <u>don't recommend getting</u><br/><u>involved in options trading</u>.</i> | b. <i><u>Getting involved in options trading</u><br/><u>isn't recommended</u>.</i> | [P <sub>G</sub> ] |

In [i], with *advise* as the catenative verb, the intervening NP is promoted to subject; this is the usual case, and where 'passivisation' is used without qualification it is to be understood in this sense. In [ii] an infinitival complement (of *intend*) is promoted to extraposed subject, whereas in [iii] a gerund-participial complement (of *recommend*) is promoted to subject proper. With some verbs passivisation (of type [P]) is obligatory, and with others it is blocked, and these are marked as in:

- |     |    |   |  |      |
|-----|----|---|--|------|
| [3] | i  | a. <i>*They <u>said him</u> to be ill.</i>  | b. <i>He was <u>said</u> to be ill.</i>    | [+P] |
|     | ii | a. <i>They <u>wanted him</u> to see it.</i> | b. <i>*He was <u>wanted</u> to see it.</i> | [-P] |

### ■ Alternation with finite complements

In many cases the non-finite complement has a finite alternant or near-alternant:

- |     |     |  |   |                   |
|-----|-----|--|---|-------------------|
| [4] | i   | a. <i>I <u>believe him</u> to be ill.</i>          | b. <i>I <u>believe that he is</u> ill.</i>            | [T <sub>U</sub> ] |
|     | ii  | a. <i>I'd <u>prefer you</u> to do it yourself.</i> | b. <i>I'd <u>prefer that you did</u> it yourself.</i> | [T <sub>P</sub> ] |
|     | iii | a. <i>He <u>decided</u> to resign.</i>             | b. <i>He <u>decided that he would</u> resign.</i>     | [T <sub>W</sub> ] |
|     | iv  | a. <i>They <u>demanded</u> to be heard.</i>        | b. <i>They <u>demanded that they be</u> heard.</i>    | [T <sub>M</sub> ] |
|     | v   | a. <i>She <u>persuaded me</u> to go.</i>           | b. <i>She <u>persuaded me that I should</u> go.</i>   | [T <sub>S</sub> ] |

The 'T' annotation is mnemonic for the *that* which occurs (usually optionally) in finite declarative complements. We distinguish five types, as marked by the subscripts. In [i] the finite is unmodalised (T<sub>U</sub>), in [ii] a modal preterite (T<sub>P</sub>), in [iii] it contains modal **will** (T<sub>W</sub>), in [iv] it is mandative (T<sub>M</sub>), in [v] it contains modal *should* (T<sub>S</sub>). As noted earlier (§3.1.1), the constructions are not strictly alternants in [v].

### ■ Further annotations

To reduce the number of classes we add annotations to members of a class instead of dividing it into two or more smaller classes. The annotations used are as follows:

- |     |    |   |
|-----|----|---|
| [5] | B  | Takes bare infinitival ( <i>I <u>helped her mend</u> the fuse</i> )                             |
|     | F  | Takes <i>to</i> -infinitival with <i>for</i> ( <i>She <u>asked for it</u> to be postponed</i> ) |
|     | N  | Occurs predominantly in non-affirmatives ( <i>I don't <u>mind</u> waiting a little</i> )        |
|     | NS | Non-syntactic interpretation of understood subject ( <i>She <u>said</u> to meet at six</i> )    |
|     | P  | Matrix passivisation, with further specification as in [2–3]                                    |
|     | PP | Takes past-participial ( <i>He <u>reported them</u> killed</i> )                                |
|     | T  | Also takes finite declaratives (with comparable sense); subtypes as shown in [4]                |

In addition, '?' indicates that the verb's membership of the class is questionable.

## ■ Omissions

We avoid setting up one-member or very small classes for verbs which have already been dealt with in the discussion – e.g. for *call*, the only verb appearing in *for*-complex but not simple constructions.

## 5.2 Class 1: catenative verbs appearing only in the simple construction

Here we need only two dimensions of subclassification, one based on the form-type of the non-finite, one on the semantic status of the matrix subject, whether raised or ordinary.

### ■ Class 1A: bare infinitival complement (*She may know the answer*)

[6]	<i>can</i>	<i>dare</i> <sub>1</sub>	<i>do</i>	<i>had better</i>	<i>may</i>
	<i>must</i>	<i>need</i> <sub>1 N</sub>	<i>shall</i>	<i>will</i> <sub>1</sub>	<i>would rather</i>

This class consists of supportive *do*, the modal auxiliaries, and the modal idioms.<sup>34</sup> All take raised subjects, except for *dare* and *would rather*.

### ■ Class 1B: *to*-infinitival complement

#### 1Bi: ordinary subject (*Kim decided to leave*)

[7]	<i>affect</i>	<i>aspire</i>	<i>choose</i> <sub>1</sub>	<i>condescend</i>	<i>consent</i>
	<sup>?</sup> <i>contrive</i>	<i>dare</i> <sub>2 (B)</sub>	<i>decide</i> T <sub>W</sub> P <sub>X</sub>	<i>decline</i>	<i>deign</i>
	<i>demand</i> T <sub>M</sub>	<i>determine</i> T <sub>W</sub>	<i>disdain</i>	<i>elect</i> <sub>1</sub>	<i>endeavour</i>
	<i>forget</i> <sub>1</sub>	<sup>?</sup> <i>get</i> <sub>1</sub>	<sup>?</sup> <i>go on</i> <sub>1</sub>	<sup>?</sup> <i>grow</i>	<i>hasten</i>
	<i>hate</i> <sub>1</sub>	<i>hesitate</i>	<i>know</i> <sub>1</sub>	<i>learn</i>	<i>live</i>
	<i>look</i> <sub>1</sub>	<i>manage</i>	<i>move</i> <sub>1</sub>	<i>offer</i>	<i>omit</i>
	<i>plot</i>	<sup>?</sup> <i>prepare</i> <sub>1</sub>	<i>presume</i> <sub>1</sub>	<i>pretend</i> T <sub>U</sub>	<i>proceed</i>
	<i>refuse</i>	<i>regret</i> <sub>1</sub>	<i>remember</i> <sub>1</sub>	<i>resolve</i> T <sub>W</sub>	<i>seek</i>
	<i>serve</i>	<i>stand</i>	<i>strain</i>	<i>strive</i>	<i>struggle</i>
	<i>survive</i>	<i>swear</i> T <sub>W</sub>	<i>think</i> <sub>1 N</sub>	<i>threaten</i> <sub>1</sub> T <sub>W</sub>	<i>trouble</i> <sub>1</sub>
	<i>try</i> <sub>1</sub>	<i>undertake</i> T <sub>W</sub>	<i>venture</i>	<i>volunteer</i>	<i>vow</i> T <sub>W</sub>

In some cases it is not quite clear whether a *for*-complex is possible in addition to the usual simple infinitival; thus *contrive* and *prepare*<sub>1</sub> are marked questionable because of the marginal possibility of examples like <sup>?</sup>*He had contrived for his son to be admitted to the course*; <sup>?</sup>*I hadn't prepared for them to question me on that issue*. *Dare*<sub>2</sub> is a lexical verb, while *dare*<sub>1</sub> is an auxiliary: see Ch. 3, §2.5.5.

#### 1Bii: raised subject (*She seemed to like it*)

[8]	<i>appear</i> T <sub>U</sub>	<i>be</i> <sub>1</sub>	<i>chance</i> <sub>1</sub> T <sub>U</sub>	<i>come</i> <sub>1</sub>	<i>fail</i>
	<i>happen</i> T <sub>U</sub>	<i>have</i> <sub>1</sub>	<i>have got</i>	<i>look</i> <sub>2</sub>	<i>ought</i> (B)
	<i>promise</i> <sub>1</sub>	<i>prove</i> <sub>1</sub>	<i>seem</i> T <sub>U</sub>	<i>tend</i>	<i>threaten</i> <sub>2</sub>
	<i>turn out</i> T <sub>U</sub>	<i>use</i>			

<sup>34</sup>Also in this class are (for the varieties of English that have them) the compounds *wanna*, *gonna*, *hafta*, *gotta*, etc., which incorporate *to* into the lexical base; see Ch. 18, §6.3. In the negative *can* occurs with an idiomatic use of *but* meaning “not”: *It cannot but improve*, “cannot not improve – i.e. must improve”. (This is to be distinguished from the *but* in conditionals: *if I could but explain how I feel*, “if only I could explain how I feel”.)

No other verbs follow the patterns of *help* and *promise*, and indeed [iib] is rather marginal: many speakers find this unacceptable and it would be much more usual to use a finite complement here (*Liz promised me that she would phone at six*). The case with *ask* is complicated by the fact that, under very restrictive conditions, control by subject applies (again somewhat marginally) in the complex construction. Compare:

- [16] i *Liz asked Pat to be allowed to leave.* [control by matrix subject]  
 ii *Liz asked Pat to be photographed with the children.* [control by matrix object]

In [i] we understand that Liz asked for permission to leave, but it is only complements like *to be allowed* and synonyms that permit matrix subject control in this way. In [ii], for example, we have a passive infinitival, but it still takes control by object, like the active [15ib]. *Beg, pray, petition*, and perhaps *request* exhibit the same behaviour as *ask* (*begged Pat to be allowed to leave* has matrix subject control, *begged Pat to be photographed* does not). *Pay* is similar but takes control by subject in the complex construction under somewhat different conditions – compare:

- [17] i *They paid her \$100 to dance naked.* [control by object]  
 ii *They paid her \$100 to see her dance naked.* [control by subject]

Example [ii] is one of those where the non-finite clause falls at the boundary between catenative complement and purpose adjunct (see §4.3). The complement expressing the price paid is of course irrelevant to the issue of control: *They paid (\$100) to see it. Pledge and train* follow the pattern of [15i] with no possibility of control by subject in the complex construction:<sup>38</sup>

- [18] a. *They have pledged to end the fighting.* b. *She pledged herself to support us.*

*Ask* and the others marked '(F)' also allow *for* – compare:

- [19] a. *He asked Pat to be interviewed.* b. *He asked for Pat to be interviewed.*

In [a] *Pat* represents the goal of *ask* as well as the patient of *interview*, but in [b] only the latter. Note here the contrast between *ask* and a raising verb like *intend*: *He intended Jill to be interviewed* and *He intended for Jill to be interviewed* are equivalent, whereas [19a–b] differ sharply in meaning.

#### 2Aii: plain-complex with raised object (*I expect to finish soon; I expect you to finish soon*)

- [20] *claim* T<sub>U</sub>      *desire* T<sub>M</sub> (F)      *expect* T<sub>W</sub>      *mean*<sub>1</sub> T<sub>M</sub> (F)      *profess* T<sub>U</sub>  
*reckon*      *wish* –P (F)

#### 2Aiii: for-complex (*He longed to return home; He longed for her to return home*)

- [21] *ache*      *agree* P<sub>X</sub>      <sup>?</sup>*aim* P<sub>X</sub>      *apply*      *arrange* P<sub>X</sub> T<sub>W</sub>  
*be dying*      *burn*      *burst*      *can afford* N      *care*  
*clamour*      *hope* P<sub>X</sub> T<sub>W</sub>      *itch*      *long*      *opt*  
*pine*      *say*<sub>1</sub> T<sub>S</sub> NS      *wait*      *yearn*

Most of these also take complements of the form *for* + NP: compare *She longed for him to be dismissed* and *She longed for his dismissal*. The exceptions are *agree* (*They agreed for it to be postponed* ~ *They agreed to/on!\**for a postponement), *can afford* (*I can't afford for*

<sup>38</sup>With *pledge* the complex commonly has a reflexive object, but not invariably: *The treaty pledges the Sultan to co-operate with a democratically elected government*.

The gerund-participial with *want*<sub>2</sub> generally has a progressive interpretation, but in non-affirmative contexts it can be non-progressive. Example [iia] is equivalent to *I want them to be standing when the Minister enters*, contrasting with non-progressive *I want them to stand when the Minister enters*. But in [iib] the meaning is “to bring”, not “to be bringing”.

In the complex *to*-infinitival *intend* takes a raised object, *plan* an ordinary one:

- [27] i *I intended there to be more time for discussion.*  
 ii *We planned the seminar to coincide with her visit.*

2Biv: *to*-infinitival plain-complex, gerund-participial simple (*He admits it to have been a mistake; He admits breaking it*)

- [28] *acknowledge* T<sub>U</sub>      *admit* T<sub>U</sub>      *confess* T<sub>U</sub>      *deny* T<sub>U</sub>

The simple construction has an ordinary subject, the complex one a raised object. These verbs belong semantically with the verbs of cognition/saying in Class 3Aii, but differ syntactically in allowing a simple construction with a gerund-participial.

2BV: *to*-infinitival plain-complex, gerund-participial simple or complex (*I remember him to be irascible; I remember telling you; I remember his/him telling you*)

- [29] *advise* NS T<sub>M</sub>      *encourage* NS      *forget*<sub>2</sub> T<sub>U</sub> -P      *recollect* T<sub>U</sub> -P  
*recommend* NS T<sub>M</sub>      *remember*<sub>2</sub> T<sub>U</sub>      *report* T<sub>U</sub> PP

Both genitive and non-genitive forms are permitted in the complex gerund-participial, with the genitive as usual more formal. In the simple construction, *advise*, *encourage*, and *recommend* have a non-syntactic interpretation of the missing subject, while the others have subject control. Compare :

- [30] i *I wouldn't recommend buying it.*      [potential buyer unspecified]  
 ii *I remember buying it.*      [buyer = speaker]

### ■ 2c: gerund-participial only

All verbs in this class allow a genitive subject in the gerund-participial. The non-finite complements here are relatively close to objects: except where marked ‘-P<sub>G</sub>’ they can marginally be promoted to subject through passivisation (whereas the intervening NP never can). There are two subclasses to distinguish.

2ci: simple construction has control by subject (*You risk being arrested; I won't risk them/their seeing us together*)

- [31] *abhor*      *anticipate*      *appreciate*      *begrudge*      *can help* N<sup>39</sup>  
*celebrate*      *chance*<sub>2</sub>      *contemplate*      *countenance*      *defer*  
*delay*      *describe*      *detest*      *discuss*      <sup>?</sup>*dislike*  
<sup>?</sup>*dread*      *endure*      *enjoy*      *envisage*      *fancy*<sub>1</sub>  
*foresee*      *imagine*<sub>1</sub>      *mention*      *mind* N -P<sub>G</sub>      *miss*  
*put off*      *recall*      *regret*<sub>2</sub>      *relish*      *resent*  
*risk*      *tolerate*      *welcome*

<sup>39</sup>Non-affirmative *can help* also occurs with *but* + bare infinitival: compare *I couldn't help overhearing / couldn't help but overhear what you were saying to Jill*.

2cii: simple construction has non-syntactic interpretation of the missing subject  
(It will mean getting up earlier; It will mean you/your getting up earlier)

[32]	<i>advocate</i>	<i>deplore</i> P <sub>G</sub>	<i>deprecate</i> P <sub>G</sub>	<i>discourage</i> P <sub>G</sub>	<i>facilitate</i>
	<i>fancy</i> <sub>2</sub> N	<i>include</i>	<i>involve</i> -P <sub>G</sub>	<i>justify</i>	<i>mean</i> <sub>2</sub> -P <sub>G</sub>
	<i>necessitate</i>	<i>oppose</i>	<i>save</i> -P <sub>G</sub>	<i>suggest</i>	<i>support</i>
	<i>understand</i> <sub>1</sub>				

## 5.4 Class 3: catenative verbs appearing only in the complex construction

### ■ Class 3A: infinitival but not gerund-participial

3Ai: plain-complex with ordinary object (*She urged me to go*)

[33]	<i>accustom</i>	<i>aid</i>	<i>appoint</i>	<i>assist</i>	<i>authorise</i>
	<i>back</i>	<i>badger</i>	<i>beckon</i>	<i>beseech</i>	<i>blackmail</i>
	<i>bribe</i>	<i>bring</i>	<i>bring up</i>	<i>caution</i>	<i>challenge</i>
	<i>choose</i> <sub>2</sub>	<i>coax</i>	<i>command</i>	<i>commission</i>	<i>compel</i>
	<i>condemn</i>	<i>constrain</i>	<i>dare</i> <sub>3</sub>	<i>defy</i>	<i>design</i>
	<i>direct</i>	<i>discipline</i>	<i>drive</i>	<i>elect</i> <sub>2</sub>	<i>empower</i>
	<i>entice</i>	<i>entitle</i>	<i>entreat</i>	<i>equip</i>	<i>exhort</i>
	<i>fit</i>	<i>forbid</i>	<i>force</i>	<i>implore</i>	<i>incite</i>
	<i>induce</i>	<i>inspire</i>	<i>instruct</i>	<i>invite</i>	<i>lead</i>
	<i>leave</i> <sub>1</sub>	<i>make out</i>	<i>move</i> <sub>2</sub>	<i>nag</i>	<i>nominate</i>
	<i>oblige</i>	<i>persuade</i> T <sub>S</sub>	<i>pester</i>	<i>prepare</i> <sub>2</sub>	<i>press</i> (F)
	<i>pressure</i>	<i>program</i> (me)	<i>prod</i>	<i>prompt</i>	<i>provoke</i>
	<i>push</i> (F)	<i>remind</i>	<i>school</i>	<i>second</i>	<i>select</i>
	<i>sentence</i>	<i>spur on</i>	<i>stimulate</i>	<i>stir</i>	<i>summon</i>
	<i>teach</i>	<i>tell</i> T <sub>S</sub>	<i>tempt</i>	<i>thank</i>	<i>trouble</i> <sub>2</sub> -P
	<i>trust</i>	<i>urge</i>	<i>warn</i> T <sub>S</sub>	<i>will</i> <sub>2</sub>	

This class includes certain verbs of causation such as *compel* and *force* which we discuss with some semantically related verbs under Class 3B.

3Aii: plain-complex with raised object (*I assumed there to be a mistake in the instructions*)

[34]	i	<i>accept</i>	<i>affirm</i>	<i>allege</i>	<i>announce</i>	<i>argue</i>
		<i>ascertain</i>	<i>assert</i>	<i>assume</i>	<i>attest</i>	<i>believe</i>
		<i>certify</i>	<i>concede</i>	<i>conceive</i>	<i>conclude</i>	<i>conjecture</i>
		<i>consider</i> <sub>2</sub>	<i>declare</i>	<i>deduce</i>	<i>deem</i>	<i>demonstrate</i>
		<i>discern</i>	<i>disclose</i>	<i>discover</i> <sub>1</sub>	<i>establish</i>	<i>estimate</i>
		<i>fear</i> <sub>2</sub> PP	<i>find</i> <sub>1</sub>	<i>gather</i>	<i>grant</i>	<i>guarantee</i>
		<i>guess</i>	<i>hold</i>	<i>imagine</i> <sub>2</sub>	<i>intuit</i>	<i>judge</i>
		<i>know</i> <sub>2</sub> (B) T <sub>U</sub>	<i>note</i>	<i>presume</i> <sub>2</sub>	<i>presuppose</i>	<i>proclaim</i>
		<i>pronounce</i>	<i>prove</i> <sub>2</sub>	<i>recognise</i>	<i>represent</i>	<i>repute</i> +P
		<i>reveal</i>	<i>rule</i>	<i>rumour</i> +P	<i>say</i> <sub>2</sub> +P	<i>show</i> <sub>1</sub>
		<i>state</i>	<i>stipulate</i>	<i>suppose</i>	<i>surmise</i>	<i>suspect</i>
		<i>take</i>	<i>think</i> <sub>2</sub>	<i>tip</i>	<i>understand</i> <sub>2</sub>	<i>verify</i>
	ii	<i>allow</i>	<i>cause</i>	<i>enable</i>	<i>let</i> -P B	? <i>make</i> B
		? <i>order</i> T <sub>M</sub> PP	<i>permit</i>			

The ‘b’ annotation for *make* applies only in the active: in the passive it takes a *to*-infinitival:

- [35] i *They made us feel guilty.* [active + bare infinitival]  
 ii *We were made to feel guilty.* [passive + *to*-infinitival]

This class contains a rather large number of verbs of cognition or saying, illustrated in [34i], and a handful of verbs of permission, ordering, and causation, listed in [34ii]. The verbs in [34i], except for informal *tip*, also occur with an unmodalised finite complement: *I assumed that there was a mistake in the instructions.*<sup>40</sup> All allow perfect infinitivals (*I assumed there to have been a mistake*) and, in the absence of perfect marking, the time of the subordinate situation is the same as that of the matrix. This means that we cannot have, say, *\*I believe her to win tomorrow’s semi-final* corresponding to finite *I believe that she will win tomorrow’s semi-final*. In the non-perfect the infinitival normally has a stative interpretation: *be* is especially common. Matrix passives are always possible and tend to be more frequent than actives; with *say* and others marked ‘+P’ passivisation is obligatory: *He is said to be dying* (not *\*They say him to be dying*).

Consider now the verbs of permission and ordering in [34ii] (we take up the causatives in the discussion of Class 3Bi). *Allow* appears in examples like:

- [36] i *Will you allow me to audit your course?*  
 ii *We mustn’t allow there to be any repetition of this behaviour.*  
 iii *The weather didn’t allow us to finish the game.*

Example [i] illustrates a conventional way of requesting permission, which might suggest an interpretation where *me* is an argument of *allow*, with the role of recipient of permission. In [ii], however, *allow* is clearly behaving like our model raising verb *intend*: there is certainly no question here of giving someone permission to do something. This is even clearer in [iii], where we have an inanimate subject. *Allow* has a much more general meaning than “give permission”, the core being something like “not prevent, make possible, enable”, and it would be difficult to maintain that the construction was ambiguous in such a way that in *He allowed Kim to take all the credit for this achievement*, say, the object is raised (it’s fair to assume that Kim didn’t seek permission to take the credit) while in *He allowed Kim to audit my course* we have an ordinary object (with Kim seeking and receiving permission). For even where giving permission is apparently involved we still find equivalence between active and passive infinitival constructions:

- [37] i *He allowed the postgraduates to audit the course.*  
 ii *He allowed the course to be audited by the postgraduates.* } [voice-neutral]

The recipient of permission can be encoded with *give permission*, but even here it need not be, so that we have a contrast between *He gave them permission to audit the course* (recipient encoded) and *He gave permission for them to audit the course* (recipient not encoded). This contrast is not available with *allow*, which is best treated as a raising verb in all cases; it does not encode the giving of permission to anyone, though it

<sup>40</sup>It has been suggested that the finite and non-finite constructions are not entirely equivalent, that *I believe him to be telling the truth*, for example, is more acceptable than *I believe him to be lying* (by reason of being compatible with *I believe him*), but we are sceptical about the validity of a distinction along these lines.

may, in favourable circumstances, trigger an implicature that permission is given to the object-referent. *Permit* and *let* behave in essentially the same way. So indeed do the modals *can* and *may* in their deontic sense, except that here only one argument is encoded: the raised complement is thus subject, not object. *You can come in now* may be interpreted in context as “I give you permission to come in now”, but the giver and receiver of permission are not encoded as arguments of *can*.

*Order* has a meaning comparable in specificity to *give permission* rather than *allow*: it involves issuing some (normally verbal) order. But the object clearly doesn't encode the recipient of the order in examples like *He ordered the documents to be destroyed*: this has a raised object and is equivalent to the finite construction *He ordered that the documents be destroyed*. Nevertheless, *order* differs from *allow* in that the cases where the object clearly does not represent the recipient of the order predominantly have passive infinitivals.<sup>41</sup> Thus whereas we can say *He ordered that the data be freely available to all interested parties*, the infinitival *\*He ordered the data to be available to all interested parties* is anomalous (since it requires us to take the data as recipient of the order).

With a human object and active infinitival there is a strong implicature that the object represents the recipient, so that *He ordered Kim to unlock the safe*, say, is not equivalent to *He ordered that Kim unlock the safe*. *Command* is more straightforward in that it does not normally allow a raised object with a passive: *\*He commanded the documents to be destroyed*.

### 3Aiii: oblique-complex (*Kim appealed to them to release the hostages*)

[38] *appeal* [to] *bank* [on] *count* [on] *depend* [on] *keep on*<sub>2</sub> [at] *rely* [on]

These take a catenative complement only in combination with a prepositional complement; in addition *call* uniquely occurs either in this construction or in the *for*-complex: cf. [9iia–b] of §3 (*He called for Ed to be sacked*; *He called on Ed to resign*).

### Class 3B: infinitival, gerund-participial, or past-participial

Verbs in this class all take non-genitives in the gerund-participial. We distinguish two subclasses on the basis of matrix passivisation.

#### 3Bi: no matrix passivisation (*I got them to talk / talking*; *I got my car repaired*)

[39] *get*<sub>4</sub> *have*<sub>3, B</sub>

These belong semantically with the verbs of causation, but occur in a wider range of constructions than the others, which are found in classes 3Ai and 3Aii: we consider them all together here. The distinction between ordinary and raised complements is seen in:

[40] i *They forced/compelled Kim to unlock the safe.* [ordinary object]  
 ii *This caused both of us to overlook the inconsistency.* [raised object]

*Force* and *compel* (3Ai) impose selectional restrictions on the object and assign an agentive role to the covert subject of the infinitival: in [i] force/compulsion is applied directly

<sup>41</sup>Not exclusively, however: cf. *France has ordered nuclear testing to resume*. Occasional examples of this kind are also found with *instruct*: *I instructed prison routine to continue as normal*.

to Kim and the verbs clearly belong with our model verb *persuade*. *Cause* and *enable*, on the other hand, belong equally clearly with the raising verbs (3Aii): note, for example, the equivalence between [ii] and *This caused the inconsistency to be overlooked by both of us*; the second argument in [ii] is thus the whole event of our overlooking the inconsistency, and there is no direct relation between the matrix verb and its object. *Make*, *get*, and *have* are less clear-cut. *Make* could substitute with little effect on the meaning both for *force/compel* in [i] and for *cause* in [ii]. It does not readily take a passive infinitival, but <sup>?</sup>*Pat made both candidates be interviewed by Kim* seems to differ in propositional meaning as well as acceptability from *Pat made Kim interview both candidates*, suggesting that it takes an ordinary object, like *force/compel*. On the other hand, it can take a dummy object, certainly extrapositional *it*, as in *He made it appear that he had been acting under duress*, where it is difficult to see any direct relation between verb and object. *Make* thus seems to allow either control by object or raised construal, with a good deal of indeterminacy between the two. *Get* allows a wider range of objects than *force/compel* (cf. *He finally got the car to start*, where the car's role is non-agentive), but it cannot take dummy *there* as object (cf. *\*He finally got there to be a reconciliation*). As for voice, we have:

- [41] i *He got a specialist to examine his son.*  
 ii *He got his son to be examined by a specialist.*  
 iii *He got his son examined by a specialist.*

Examples [i] and [ii] are not equivalent and *get* here clearly takes an ordinary object (as also with a gerund-participial). But [iii] is not an alternant of [ii]: *get* takes a raised object in the past-participial construction (which has no active counterpart). With *have* the analogue of [ii] is not acceptable (*\*He had his son be examined by a specialist*), and we have equivalence between *He had a specialist examine his son* and *He had his son examined by a specialist*; this indicates a raised object, which ties in with the fact that *have* is also used with a non-causative “undergo” sense: *He had the police call round in the middle of the night to question him about his secretary's disappearance*, where the visit was something that happened to him rather than something he arranged – and where there would seem to be no direct semantic relation between verb and object.

### 3Bii: matrix passive allowed (*I heard them arrive/arriving; I heard the window broken*)

- [42] *feel* T<sub>U</sub> (B)      *hear* T<sub>U</sub> (B)      *notice* T<sub>U</sub> B      *observe* T<sub>U</sub> (B)      *overhear* (B)  
           *see*<sub>1</sub> T<sub>U</sub> (B)      *watch* B

These verbs, together with *smell* from Class 3cii below, are the verbs of sensory perception. All take bare infinitivals, while those where the ‘B’ is parenthesised take a *to*-infinitival as well. For *see* we have the following possibilities:

- [43] i a. *We saw Kim leave the bank.*                      b. *\*Kim was seen leave the bank.*  
       ii a. *We saw Kim leaving the bank.*                b. *Kim was seen leaving the bank.*  
       iii a. *We saw Spurs beaten by United.*            b. <sup>?</sup>*Spurs were seen beaten by United.*  
       iv a. *We saw him to be an impostor.*                b. *He was seen to be an impostor.*

We put the *to*-infinitival last because this does not represent the primary sense: it is not a matter of sensory perception but of mental inference. In this construction, *see* behaves

like the verbs of cognition/saying (Class 3Aii), following their pattern of favouring a matrix passive and the verb *be* in the subordinate clause, of allowing the perfect (*He was seen to have altered the figures*), and of alternating with the finite construction (*We saw that he was an impostor*).

The primary sense, illustrated in [43i–iii], involves two arguments, an experiencer and a stimulus (the situation perceived): *Kim* in [i–ii] thus does not represent an argument of *see*. We demonstrated this for the gerund-participial construction in §3.2.2, but it holds for the other form-types too; this is why there is equivalence between [iiia] and *We saw United beat Spurs*.

The gerund-participial in [43ii] has progressive meaning: in [i] we saw the whole event of *Kim's* leaving the bank, in [ii] a segment of it – the contrast is the same as that between *Kim left the bank* and *Kim was leaving the bank*. The progressive auxiliary *be* cannot be used (*\*We saw Kim be leaving the bank*), and passive *be* is likewise omitted to give [iiia] instead of *\*We saw Spurs be beaten by United*.<sup>42</sup>

The bare infinitival does not allow matrix passivisation, as is evident from [43ib]. The *to*-infinitival, however, has a wider range of use in the passive than in the active:

- [44] a. *\*We saw Kim to leave the bank.*      b. *Kim was seen to leave the bank.*

It is therefore tempting to see [44b] as filling the gap created by the ungrammaticality of [43ib] (parallel to the case with *make*: *We made Kim leave the bank*; *\*Kim was made leave the bank*; *Kim was made to leave the bank*). Yet it is doubtful if the sense is quite the same: [44b] has at least a trace of the cognitive component of meaning noted above for [43iv]. Compare, for example:

- [45] i *They had seen him drive, so everyone decided to go by bus.*  
 ii *He had been seen to drive, so everyone decided to go by bus.*

Notice that [i] is perfectly coherent, but [ii] is not. In [i] they had perceived the event, and hence the manner of his driving, and we infer that it was the latter that made them decide to go by bus. But in [ii] it is the fact of his driving that had been registered, and this doesn't provide an obvious reason for them to go by bus.

None of the other sense verbs shows quite the same range as *see*. The closest is *feel* but construction [43iii] is here virtually restricted to reflexives or body parts (*I felt myself/my leg grabbed from behind*). With *hear* and *overhear* [iv] is virtually excluded in the active (*\*We'd heard him to be an impostor*) and in the passive we have again the problem of distinguishing between the senses of [i] and [iv]: we do not have *\*He was heard to be an impostor* (where *see* would be quite normal), but only examples like *He was heard to lock the door*, which is very close to *They heard him lock the door*.<sup>43</sup> *Watch* wholly excludes the *to*-infinitival, whether active or passive. *Notice* and *observe* are hardly possible in [iii], and *notice* is also marginal in [iv]. *Smell* is generally restricted to [ii], and hence is listed in Class 3cii below; it combines predominantly with *burn* (*I can smell something burning*).

<sup>42</sup> *Get*, however, is perfectly possible: *We saw Spurs get annihilated by United*.

<sup>43</sup> With a finite complement *hear* characteristically involves hearing something said; it also occurs in the fixed expressions *hear say/tell*, a simple catenative construction with contextual construal.

## Class 3c: gerund-participial only

3ci: genitive possible (*They prevented us/our speaking to her*)

[46]	<i>excuse</i> –P	<i>forgive</i> –P	<i>pardon</i> –P	<i>preclude</i> –P	<i>prevent</i>
	<i>prohibit</i> –P	<i>stop</i> <sub>2</sub>			

These verbs have alternants containing prepositions: *for* in the case of *excuse*, *forgive*, *pardon*, and *from* with *preclude*, *prevent*, *prohibit*, *stop*:

[47]	i	a. <i>Forgive me/my saying so, but . . .</i>	b. <i>Forgive me for saying so, but . . .</i>
	ii	a. <i>He prevented us/our seeing her.</i>	b. <i>He prevented us from seeing her.</i>

Passivisation is restricted to the prepositional construction (*He was never forgiven for abandoning his children*), except very marginally with *prevent* and *stop* (*She was prevented/stopped writing to us*). *Stop* is a questionable member of this class because it does not generally allow a genitive in the [a] construction (*\*He stopped our seeing her*); moreover it has a wider range of meaning in [a] than in [b]. In the [a] construction we find the two meanings illustrated in:

[48]	i	<i>We must stop him coming back tomorrow.</i>	[“not allow, prevent”]
	ii	<i>They stopped us playing before we had finished the first set.</i>	[“made us stop”]

Construction [47iib], with *from*, generally yields the “prevent” meaning; *from* can thus be inserted in [48i] but not in [48ii]. In the second sense *stop* belongs with *keep*<sub>2</sub> and *start*<sub>2</sub> below (3cii) as a causative of an aspectual verb.

In [47i] it is a matter of forgiving the offence in [a], the offender in [b], but the difference is negligible. In [47ii] the [a] version involves preventing an event, while [b] is more problematic. The [b] structure suggests that *us* is an argument of *prevent*, but some speakers allow dummy *there* here, % *We must prevent there from being any repetition of this error*. The semantically empty *there* cannot be an argument and hence must be a raised object, but the construction is unique in that the raised object precedes a PP rather than a non-finite VP; it is probably to be accounted for in terms of a blend between the [a] and [b] constructions.

3cii: no genitive (*I caught them/\*their smoking*)

[49]	<i>catch</i>	<i>discover</i> <sub>2</sub>	<i>depict</i>	<i>envy</i> –P	<i>find</i> <sub>2</sub>
	<i>keep</i> <sub>2</sub>	<i>leave</i> <sub>2</sub>	<i>picture</i>	<i>portray</i>	<i>see</i> <sub>2</sub> –P
	<i>set</i>	<i>show</i> <sub>2</sub>	<i>smell</i>	<i>start</i> <sub>2</sub> –P	

There are several subgroups here. *Catch*, *discover*, and *find* clearly take ordinary objects, as do *depict*, *picture*, *portray*, and *show*; with all of these the gerund-participial has a progressive interpretation. *Leave* is more problematic: *I left them quarrelling among themselves* entails that I left them, suggesting an ordinary object; but *The quarrel left me feeling insecure* does not entail that the quarrel left me: the meaning here is approximately “result in”, suggesting a raised object. *Keep*, *set*, and *start* have causative meanings; they allow a quite limited range of non-finites, especially the last two: they do not accept passives (*\*He kept them being washed*; *\*We started them being vaccinated*), and generally require dynamic situations (*It started them talking / \*liking her*). *See*<sub>2</sub> (which usually occurs with *can*) is voice-neutral (*I can't see Kim beating Pat = I can't see Pat being beaten by Kim*), but differs from *see*<sub>1</sub> in not allowing passivisation: it is like *imagine*<sub>1</sub> (2ci) and *fancy*<sub>2</sub> (2cii) except that it is restricted to complex constructions.

## 5.5 Index to the classification

The following index includes all the verbs and verbal idioms mentioned in §§5.2–5.4, showing the class to which they belong.

<i>abhor</i> 2Ci	<i>accept</i> 3Aii	<i>accustom</i> 3Ai	<i>ache</i> 2Aiii	<i>acknowledge</i> 2Biv
<i>admit</i> 2Biv	<i>advise</i> 2Bv	<i>advocate</i> 2Cii	<i>affect</i> 1Bi	<i>affirm</i> 3Aii
<i>agree</i> 2Aiii	<i>aid</i> 3Ai	<i>aim</i> 2Aiii	<i>allege</i> 3Aii	<i>allow</i> 3Aii
<i>announce</i> 3Aii	<i>anticipate</i> 2Ci	<i>appeal</i> 3Aiii	<i>appear</i> 1Bii	<i>apply</i> 2Aiii
<i>appoint</i> 3Ai	<i>appreciate</i> 2Ci	<i>argue</i> 3Aii	<i>arrange</i> 2Aiii	<i>ascertain</i> 3Aii
<i>ask</i> 2Ai	<i>aspire</i> 1Bi	<i>assert</i> 3Aii	<i>assist</i> 3Ai	<i>assume</i> 3Aii
<i>attempt</i> 1Ci	<i>attest</i> 3Aii	<i>authorise</i> 3Ai	<i>avoid</i> 1Di	<i>back</i> 3Ai
<i>badger</i> 3Ai	<i>bank</i> 3Aiii	<i>be</i> <sub>1</sub> 1Bii	<i>be</i> <sub>2</sub> 1Dii	<i>be</i> <sub>3</sub> 1E
<i>be dying</i> 2Aiii	<i>bear</i> 2Bi	<i>beckon</i> 3Ai	<i>beg</i> 2Ai	<i>begin</i> 1Cii
<i>begrudge</i> 2Ci	<i>believe</i> 3Aii	<i>beseech</i> 3Ai	<i>blackmail</i> 3Ai	<i>bother</i> 1Ci
<i>bribe</i> 3Ai	<i>bring</i> 3Ai	<i>bring up</i> 3Ai	<i>burn</i> 2Aiii	<i>burst</i> 2Aiii
<i>can</i> 1A	<i>can afford</i> 2Aiii	<i>can bear</i> 2Bi	<i>can help</i> 2Ci	<i>can stand</i> 2Bi
<i>care</i> 2Aiii	<i>catch</i> 3Cii	<i>cause</i> 3Aii	<i>caution</i> 3Ai	<i>cease</i> 1Cii
<i>celebrate</i> 2Ci	<i>certify</i> 3Aii	<i>challenge</i> 3Ai	<i>chance</i> <sub>1</sub> 1Bii	<i>chance</i> <sub>2</sub> 2Ci
<i>choose</i> <sub>1</sub> 1Bi	<i>choose</i> <sub>2</sub> 3Ai	<i>claim</i> 2Aii	<i>clamour</i> 2Aiii	<i>coax</i> 3Ai
<i>come</i> <sub>1</sub> 1Bii	<i>come</i> <sub>2</sub> 1Di	<i>command</i> 3Ai	<i>commence</i> 1Cii	<i>commission</i> 3Ai
<i>compel</i> 3Ai	<i>complete</i> 1Di	<i>concede</i> 3Aii	<i>conceive</i> 3Aii	<i>conclude</i> 3Aii
<i>condemn</i> 3Ai	<i>condescend</i> 1Bi	<i>confess</i> 2Biv	<i>conjecture</i> 3Aii	<i>consent</i> 1Bi
<i>consider</i> <sub>1</sub> 1Di	<i>consider</i> <sub>2</sub> 3Aii	<i>constrain</i> 3Ai	<i>contemplate</i> 2Ci	<i>continue</i> 1Cii
<i>contrive</i> 1Bi	<i>count</i> 3Aiii	<i>countenance</i> 2Ci	<i>dare</i> <sub>1</sub> 1A	<i>dare</i> <sub>2</sub> 1Bi
<i>dare</i> <sub>3</sub> 3Ai	<i>decide</i> 1Bi	<i>declare</i> 3Aii	<i>decline</i> 1Bi	<i>deduce</i> 3Aii
<i>deem</i> 3Aii	<i>defer</i> 2Ci	<i>defy</i> 3Ai	<i>deign</i> 1Bi	<i>delay</i> 2Ci
<i>demand</i> 1Bi	<i>demonstrate</i> 3Aii	<i>deny</i> 2Biv	<i>depend</i> 3Aiii	<i>depict</i> 3Cii
<i>deplore</i> 2Cii	<i>deprecate</i> 2Cii	<i>describe</i> 2Ci	<i>deserve</i> 2Bii	<i>design</i> 3Ai
<i>desire</i> 2Aii	<i>determine</i> 1Bi	<i>detest</i> 2Ci	<i>direct</i> 3Ai	<i>discern</i> 3Aii

## 5.6 Further remarks on the form-types

### 5.6.1 *To*-infinitival vs gerund-participial

Which form-type(s) a particular catenative selects must be specified lexically for that verb: we cannot assign distinct meanings to the form-types and treat the selection as semantically determined. On the other hand, the selection is not random: verbs with

in this case the infinitival is not appropriate: compare *If it starts to rain / raining, bring the washing in*, where either form-type is appropriate.<sup>44</sup>

(c) Verbs of liking (and not liking)

- [52] i a. *I like to stay home at weekends.*      b. *I like staying home at weekends.*  
 ii a. *I'd like to be a politician.*                      b. *I'd like being a politician.*

With [i] there are many contexts where [a] and [b] would be equally appropriate, but there are also some favouring one or the other. Suppose you ask me to go bushwalking next week-end but I wish to decline: [a] would here be more appropriate than [b]. Conversely if I am currently enjoying a week-end at home [b] is more appropriate than [a].

The infinitival is more associated with change, the gerund-participial with actuality. Thus someone who has recently turned forty or got married might say *I like being forty* or *I like being married*. An infinitival would be strange here, suggesting repeated changes from not being forty or married to being forty or married. In this case the meaning is close to that of *enjoy*, which only allows gerund-participials.<sup>45</sup> *Would like*, by contrast, projects into the future and resembles a verb of wanting, with a strong preference for the infinitival, as in [iia]; [iib] is possible, but the interpretation is roughly “I'd like/enjoy the life of a politician”. If we change the example to *I'd like to start the meeting a little earlier this week* the gerund-participial becomes quite implausible: *I'd like starting the meeting a little earlier* suggests that the starting is itself something to be enjoyed, which is an odd idea.

*Hate* with a *to*-infinitival has an idiomatic use seen in

- [53] *I hate<sub>1</sub> to tell you this, but your battery is flat.*

This can be thought of as involving projection into the immediate future: “I'm going to tell you, though I hate having to do so”. What is special about this use (virtually confined to the 1st person) is the combination of simple present tense in the matrix and single dynamic event in the complement – contrast [52ia], where we have repetition of staying home; other verbs of liking and not liking do not allow this pattern, though it is found with adjectives: *I am happy / \*like to tell you that you've passed your test* (cf. also *regret* in [56] below).

(d) Memory verbs

- [54] a. *I remembered<sub>1</sub> to lock up.*                      b. *I remembered<sub>2</sub> locking up.*

In [a] the locking up is simultaneous with the remembering – but I remembered some kind of prior obligation to lock up and hence there is projection into the future with respect to that implicit earlier time. In [iib], however, I simply remembered some actual past event. *Forget* behaves in the same way, but *recollect* takes only the second form and meaning.

<sup>44</sup>It is sometimes said that the infinitival is preferred in examples like *I had just begun to sign / signing the cheque when he snatched it away*, where there is hardly time for ongoing activity, but many speakers find the two types equally acceptable here.

<sup>45</sup>*Detest* and for the most part *dislike* likewise are restricted to the gerund-participial.

## (e) Gerund-participial expressing progressive meaning

- [55] a. *I've finally got the program to work.*      b. *I've finally got the program working.*

Here [a] entails that the program now works, [b] that it is now working; the difference of meaning here is therefore aspectual, with the infinitival non-progressive and the gerund-participial progressive. Compare also *want* in [26ii] – though *want* differs from *get* in that we can also have a progressive infinitival: *I want them to be standing when the Minister enters*, but not *\*I've finally got the program to be working*. This semantic contrast is more often found between the gerund-participial and a bare infinitival, as with the sense verbs of Class 3Bii and *have*<sub>3</sub> of 3Bi. The gerund-participial also has a progressive interpretation after certain verbs that don't take infinitivals: *catch*, *discover*<sub>2</sub>, *find*<sub>2</sub>, *smell* (from Class 3cii).

## (f) Some individual cases

- [56] i a. *She tried<sub>1</sub> to open the window.*      b. *She tried<sub>2</sub> opening the window.*  
 ii a. *They fear<sub>1</sub> to go out at night.*      b. *They fear<sub>1</sub> going out at night.*  
 iii a. *He scorns to compromise.*      b. *He scorns compromising.*  
 iv a. *I regret<sub>1</sub> to inform you that . . .*      b. *I regret<sub>2</sub> telling her that . . .*  
 v a. *They reported him to have left*  
     *the safe unlocked.*      b. *They reported his leaving the safe*  
     *unlocked.*

*Try*<sub>1</sub> (“endeavour”) involves effort towards a goal: the opening is only potential; *try*<sub>2</sub> (“test the effectiveness of”) indicates actual activity: she opened the window to see whether this would achieve the desired result. With *fear* infinitival [a] involves an element of volition/intentionality: [a] implicates that they don't/won't go out, while the gerund-participial [b] lacks this meaning and is comparable to an NP object (*They fear an attack*). Similarly [iiia] conveys that he doesn't/won't compromise, while in [b] the complement is more nominalised (cf. *He scorns compromise*) and arguably the missing subject is interpreted non-syntactically, i.e. it is a matter of compromising in general rather than specifically on his part. *Regret* usually takes a gerund-participial, describing some actual present state or past situation, as in [b]; with the *to*-infinitival, characteristically found with 1st person simple present followed by a verb of informing (cf. *hate* in [53] above), the subordinate situation follows (albeit immediately) the expression of regret. *Report* in [v] is one of the few verbs of cognition/saying that allows a contrast between the two main form-types; the difference is that [b] presents the report as true while [a] is non-committal – a difference that relates to that between actual and potential, and which also reflects the greater similarity of the gerund-participial to an NP, for *They reported his failure to lock the safe* likewise presupposes that he failed to lock it.

■ The *doubl-ing* constraint

Some verbs that license gerund-participial complements cannot themselves occur in the gerund-participle form when they have such a complement. Compare:

- [57] i a. *They started quarrelling.*      b. *\*They are starting quarrelling.*  
 ii a. *The lawn needs mowing.*      b. *\*The lawn is always needing mowing.*  
 iii a. *We considered buying one.*      b. *We are considering buying one.*

The succession of gerund-participles in [ib/iib] is excluded by what is known as the ‘*doubl-ing* constraint’. As evident from [iiib], it applies to only a subset of catenative

verbs – a small subset, in fact. The clearest cases are aspectual verbs such as *begin*, *cease*, *continue*, *start*, *stop*, and verbs taking concealed passives, like *need* in [ii]. We should probably also include others, such as *intend*, but there is a good deal of variation between speakers as to their acceptance of the [b] construction. We noted in §1.1 that gerund-participials cannot have the progressive auxiliary *be* as head (*\*They accused him of being running away when the alarm sounded*), and this can be seen as a special case of the constraint.

### 5.6.2 The minor form-types: bare infinitivals and past-participials

#### ■ Bare infinitivals

Only a relatively small number of catenatives take bare infinitivals: the auxiliaries in Class 1A (the modals and supportive *do*), the sensory perception verbs (3Bii), and *have*, *let*, and *make* among the causatives. In addition a few are found either with or without *to*: *ought*, *dare*<sub>2</sub>, *know*, and *help*.

*Know* takes a bare infinitival only in the perfect and with a special sense:

- [58] i *I'd never known him (to) lose his temper before.*  
 ii *I know him to be thoroughly reliable.*

In [i] it's a matter of knowledge based on more or less direct experience of his losing his temper. The bare infinitival here is characteristic of BrE: AmE requires *to* in [i] as well as [ii].<sup>46</sup>

With *help* some speakers restrict the bare infinitival to cases of relatively direct assistance – compare:

- [59] i *He helped me (to) finish on time by doing the bibliography for me.*  
 ii *He helped me to finish on time by taking the children away for the week-end.*

In [i] he actually did some of the work, whereas in [ii] he enabled me to do it myself. But it is questionable how widely shared such judgements are: many speakers would allow a bare infinitival in [ii] no less than [i], and there is certainly no clear-cut distinction between direct and indirect help.

The bare infinitival is virtually restricted to constructions where the matrix is active. *Have* and *let* do not passivise with infinitival complements, while the other transitive catenatives always take *to* in the passive: *He had never been known to lose his temper before.* With *make*, *to* is restricted to the passive: *They made her regret it ~ She was made to regret it*; for the relation between *They saw him pocket the key* and *He was seen to pocket the key*, see the discussion of Class 3Bii.

#### ■ Past-participials

In the simple construction these occur with just three verbs (Class 1E): the perfect marker *have* and the passive markers *be* and *get*. In the complex construction they are found, as

<sup>46</sup>Some speakers of BrE also allow a bare infinitival with *find* with a sense like “see” or “notice”: *Outside you will find Wren create new green dimensions with sensitive landscaping that creates a community and not just a row of houses.*

passives, with a fairly small subset of verbs taking infinitivals:

- [60] i Most of the sense verbs (3Bii) – *I heard the window broken*.  
 ii *Get*<sub>4</sub> and *have*<sub>3</sub> (3Bi): *She got/had the house painted; I had my wallet stolen*.  
 iii *Like* from 2Bi, *want*<sub>2</sub> from 2Biii, *report* from 2Bv, *fear*<sub>2</sub> and *order* from 3Aii; here the past-participial is an alternant of a passive *to*-infinitival: *He'd like / wants them (to be) killed humanely; The captain was reported (to have been) killed; They are feared (to have been) abducted; He ordered it (to be) destroyed*.  
 iv *Need*<sub>2</sub> and *want*<sub>1</sub> from 2Bii as an alternant of the concealed passive: *He needs/ wants his hair %cut/cutting*, but the past-participials are restricted to certain regional dialects such as Scottish.

Except with *report*, *fear*, and *order*, past-participials are wholly or virtually restricted to occurrence with an active matrix: \**They were wanted killed; ?The door was heard slammed*. Past-participial complements are to be distinguished from adjectival passives (Ch. 16, §10.1.3), which are found with most verbs taking adjectival predicative complements: *He remained mistrusted by his colleagues; She considered it superseded*, etc.

## 6 Hollow non-finite clauses

### 6.1 General properties

Hollow non-finite clauses are clauses other than relatives or open interrogatives where some non-subject NP is missing but recoverable from an antecedent NP or nominal. The missing NP is normally object of the verb or object of a preposition. In the following examples, the hollow clause is enclosed in brackets, with the site of the missing NP, the gap, shown as usual by ‘\_\_\_’, and the antecedent that determines its interpretation is underlined:

- [1] i The problem took her only a few minutes [to solve \_\_\_]. [object of verb]  
 ii I found her father a very easy person [to get on with \_\_\_]. [object of prep]

Examples that further illustrate the range of possibilities are as follows:

- [2] i That he would do such a thing is hard [to believe \_\_\_]. [clausal internal comp]  
 ii Pat is easy [to be intimidated by \_\_\_]. [comp of passive by]  
 iii ?An ideal husband is not easy [to be \_\_\_]. [predicative comp]  
 iv \*You won't find these kids easy [to teach \_\_\_ Greek]. [indirect object]

The gap can be object of the preposition *by* in the passive, though examples of this kind are very rare. Examples with the gap in predicative complement function, as in [iii], are at best very marginal. And indirect object function is excluded, as seen in [iv]: this is comparable to the resistance of the indirect object to being realised as a gap in open interrogatives, relatives, or preposing (cf. Ch. 4, §4.3). Since the missing element can be object of either the verb or a preposition, it is possible to find paired examples that are alike save with respect to which function in the infinitival clause is missing:

- [3] i Serious music is hard [to play \_\_\_ on an instrument like this]. [object of verb]  
 ii An instrument like this is hard [to play serious music on \_\_\_]. [object of prep]

Construction [ii], however, with the missing element object of a preposition in a transitive clause, is relatively uncommon. It is most likely when the object is part of an idiom: *They are hard to make sense of* / *get the better of* / *do justice to* / *take advantage of* .

Hollow non-finite clauses belong to the minor type of unbounded dependency constructions: see Ch. 12, §7.1. They usually have *to*-infinitival form-type; we examine these in §6.3 but look first at constructions involving hollow gerund-participials.

## 6.2 Gerund-participials

These are licensed as complement to the adjectives *worth* and *worthwhile*, and to the preposition *for* with a purpose sense:

- [4] i *Your idea is certainly worth* [giving some further thought to \_\_\_].  
 ii *The plan is so unpopular that it wouldn't be worthwhile* [our pursuing \_\_\_].  
 iii *This knife isn't very good for* [cutting meat with \_\_\_].

Recall (from §3.2.3) that the superficially similar construction governed by such verbs as *need* is a concealed passive not a hollow active, as evident from the possibility of having a *by* phrase: *The proposal needs* [\_\_\_ evaluating by a specialist]. The missing element here, therefore, is subject, not object.<sup>47</sup>

## 6.3 Hollow *to*-infinitivals

There are six constructions where hollow *to*-infinitivals are required or permitted.

### (a) As complement to predicative adjectives and nouns

- [5] i *Max is impossible to live with* \_\_\_.  
 ii *The assignment was an absolute pain to do* \_\_\_.

A sample of adjectives and nouns (or nominals) licensing this construction is given in:

- [6] i a. *awkward*      *bad*              *boring*              *convenient*              *cumbersome*  
           *dangerous*      *depressing*              *desirable*              *difficult*              *dreadful*  
           *easy*              *embarrassing*              *essential*              *exciting*              *expensive*  
           *fashionable*      *fine*              *good*              *hard*              *ideal*  
           *impossible*      *instructive*              *interesting*              *nice*              *odd*  
           *painful*              *pleasant*              *safe*              *simple*              *tedious*  
           *ticklish*              *tough*              *tricky*              *useful*              *wonderful*  
       b. *bastard*              *bitch*              *breeze*              *cinch*              *delight*  
           *devil*              *doddle*              *dream*              *embarrassment*              *joy*  
           *nightmare*              *pain*              *piece of cake*              *pig*              *pleasure*  
       ii *available*              *beautiful*              *fit*              *free*              *frosty*  
           *homely*              *pretty*              *ready*              *soft*              *suitable*

The adjectives and nouns in [6i] have to do mainly with the ease or difficulty of the situation described in the infinitival clause or with one's emotional attitude to it. Note that *impossible* belongs in the class but *possible* does not: *That claim is impossible/\*possible*

<sup>47</sup> *Bear* occurs with a very limited range of gerund-participials, as in the familiar phrase *It doesn't bear thinking about*; the complement here is probably a hollow clause rather than a concealed passive.

to substantiate. PPs with similar meanings are also occasionally found: *The temptation was beyond his capacity to resist*. A number of nouns used in this construction (including, for example, the first four cited in [ib]) belong to colloquial style. The adjectives in [ii] are semantically and syntactically less homogeneous. Some are collocationally quite restricted: *The air was frosty to breathe*; *They were pretty to look at*; *It was soft to touch*.

The main difference between [6i] and [6ii], however, is that the former also license ordinary to-infinitivals as subject or extraposed subject:

- [7] i a. *His speech was embarrassing / an embarrassment [to listen to \_\_].*  
 b. *It was embarrassing / an embarrassment [to listen to his speech].*  
 ii a. *The document is now ready [for you to sign \_\_].*  
 b. \**It is now ready [for you to sign the document].*

The semantic equivalence between [7ia] and [ib] bears some resemblance to that between constructions with infinitival and finite clauses as complement to verbs like *seem*, discussed in §2.1. Compare, for example:

- [8] i a. *Her criticism was hard [for Ed to accept \_\_].*  
 b. *It was hard [for Ed to accept her criticism].*  
 ii a. *Ed seemed [to accept her criticism].* [raised subject + non-finite comp]  
 b. *It seemed [that Ed accepted her criticism].* [dummy subject + finite comp]

We have said that with an infinitival complement *seem* takes a raised subject – that the *Ed* of [8iia], like that of [iib], is not a semantic argument of *seem* but only of *convince*. It has been suggested that a corresponding treatment is appropriate for [ia]. This would be to say that *her criticism* is likewise a raised subject, that it doesn't represent an argument of *hard* but only of *accept*, as is transparently the case in [ib]. On this account *her criticism* in [ia] and *Ed* in [iia] would both be raised subjects of the matrix clause, with *her criticism* and *Ed* interpreted respectively as an object-argument and a subject-argument of the subordinate clause.<sup>48</sup>

There is, however, an important difference between the two pairs that leads us to reject a raised subject analysis for [8ia]. The subject of *seem* in [8iia] can be a dummy element, but the subject of *be hard* in [8ia] cannot. Compare [9i–ii] with [9iii–iv]:

- [9] i a. *It seems to have been Kim who leaked the news.*  
 b. *It seems that it was Kim who leaked the news.*  
 ii a. *There seems to have been a conspiracy between them.*  
 b. *It seems that there was a conspiracy between them.*  
 iii a. \**It'll be hard for us to prove \_\_ to have been Kim who leaked the news.*  
 b. *It'll be hard for us to prove it to have been Kim who leaked the news.*  
 iv a. \**There will be hard for us to prove \_\_ to have been a conspiracy between them.*  
 b. *It will be hard for us to prove there to have been a conspiracy between them.*

We are saying that with an infinitival complement *seem* has a raised subject: this means that *seem* itself imposes no constraints on what can occur in subject function but accepts any element that is licensed as subject by the infinitival clause predicate. In [ia] *it* is accepted as

<sup>48</sup>In the classical transformational-generative analysis *her criticism* appears in 'underlying structure' in the subordinate clause and is moved (raised) into the matrix subject position. The rule concerned is commonly called 'Tough movement', *tough* being one of the adjectives that allows this upward movement of a non-subject NP.

subject of the *seem* clause because the infinitival clause belongs to the *it*-cleft construction, which in finite clauses takes *it* as subject, as in [ib]. *Hard*, however, does not behave in this way. The infinitival clause *for us to prove it to have been Kim who leaked the news* is syntactically and semantically impeccable, but this does not suffice to sanction [iia]. Similarly with dummy *there*. This is allowed as subject of *seem* in [iia] because it is licensed by the infinitival complement, which belongs to the existential construction. But again it is not acceptable as subject in [iva] in spite of the well-formedness of *for us to prove there to have been a conspiracy between them*. The conclusion must be that the external complement of *hard* + infinitival is not raised, not licensed purely within the infinitival clause. It must represent a semantic argument of *hard*.

In [8ia], therefore, *hard* + infinitival denotes a property that is predicated of her criticism: the subject must represent an entity of a kind that such a property can be ascribed to it. Cleft *it* and dummy *there* do not satisfy this requirement. The equivalence between [8ia] and [8ib] is quite consistent with this account. Her criticism has the property that for Ed to accept it is hard, but the fact that there is such a property is sufficient to establish that it is hard for Ed to accept her criticism. And if [8ib] is true it must follow that her criticism had the property that it was hard for Ed to accept it. Similarly, in the matching pair [3], [i] assigns a property to serious music, while [ii] assigns a property to the instrument, but each is deducible from the other. Note also the contrast in such a pair as:

- [10] i *It has been a pleasure to listen to someone with so much enthusiasm.*  
 ii ?*Someone with so much enthusiasm has been a pleasure to listen to* \_\_\_\_.

The underlined NP is completely acceptable as the complement of the preposition in [i], but it is quite marginal as the subject of [ii]: if we were dealing with a raised subject construction there should be no such difference.

#### Potential ambiguity between hollow and ordinary constructions

For many of the items in [6] an infinitival internal complement must always be of the hollow type. Some of them, however, license ordinary as well as hollow complements, and there is then the potential for ambiguity:

- [11] i *They are ready to use* \_\_\_\_ . [hollow]  
 ii *They are ready to depart* . [ordinary]  
 iii *They are ready to eat* (\_\_\_\_) . [ambiguous]

In [i] *use* is transitive: the missing object is recovered from the antecedent *they*, while the user is not explicitly indicated. In [ii] *depart* is intransitive, with *they* antecedent for the missing subject – note, then, that an overt subject can be supplied for [i], but not [ii] (*They are ready for you to use* \_\_\_\_, but not \**They are ready for you to depart*). *Eat* in [iii] is a dual-transitivity verb, so that *they* can be antecedent for either a missing object (cf. *The jam tarts are ready to eat* \_\_\_\_) or the missing subject (cf. *The guests are ready to eat*). *Ready* may be contrasted with, for example, *easy*, where we have hollow *This knife is easy to cut with* \_\_\_\_, but not ordinary \**This knife is easy to cut*. Other adjectives that behave like *ready* include:

- [12] *available*                      *bad*                      *fit*                      *free*                      *good*                      *nice*

#### (b) Licensed by an attributive adjective

- [13] i *London is an easy place to get lost in* \_\_\_\_ .  
 ii *The price was a difficult one to better* \_\_\_\_ .

These initial examples bear a clear resemblance to the construction just discussed: they are comparable to *London is easy to get lost in* and *The price was difficult to better*. The applicability of the adjective is contingent on it being construed with the infinitival: [i] doesn't say that London is an easy place, but that London is a place which it is easy to get lost in. Likewise in [ii] it is not a matter of a difficult price, but of a price that it would be difficult to better. It makes sense, therefore, to treat the infinitivals here as indirect complements in the structure of the NP: they are licensed not by the head of the construction, the noun, but by a dependent of it, the attributive adjective.

Very often, however, the adjective is applicable derivatively to the noun:

- [14] i *It's a difficult book to understand.*  
 ii *That wasn't a very sensible remark to make.*  
 iii *This was a surprising decision for them to take.*  
 iv *It is an extremely stressful and emotional decision for any woman to make.*

If a book is difficult to understand, that makes it a difficult book. In [ii] the remark itself as well as the act of making it will be construed as not very sensible. And likewise in [iii–iv] both taking or making the decision and the decision itself were surprising or extremely stressful and emotional. This is a very common type: compare similarly *a difficult person to get on with, an impossible price to pay, an easy problem to solve, a good book to buy*. Note that [iii], for example, is appreciably more likely than, say, *This was a surprising decision for them to criticise*, though the latter is certainly grammatical.

The range of adjectives used in the attributive construction is somewhat wider than that found in predicative function. Compare, for example:

- [15] i *That's a stupid book to set as a text for Year 1.*  
 ii *\*The book was stupid to set as a text for Year 1.*

There is likewise no corresponding predicative use of *sensible* and *surprising* in [14ii–iii]; semantically similar adjectives such as *clever, unusual, exciting* show the same pattern. Note, however, that the attributive adjective construction usually has the adjective within an NP that is itself in predicative function, as in all the examples in [13–15i]. We would not say, for example, *\*The catalogue contained several stupid books to set as a text for Year 1, \*They are charging us a difficult price to better*. This restriction is less applicable to those cases like [14] where the adjective can be interpreted as applying to the head noun as well as to the subordinate clause: *She is married to a rather difficult guy to get on with*.

This construction is not sharply distinct from that containing a noun postmodified by a non-*wh* relative clause. Compare:

- [16] i *The premier's health is another significant issue to bear in mind.* [relative]  
 ii *That would be an interesting issue to explore.* [structurally ambiguous]

In [i] the infinitival is quite independent of the attributive adjective *significant*, which could be dropped without affecting acceptability. An approximate gloss is “an issue that we should bear in mind which is significant”. And [ii] can be interpreted in the same way: “an issue that we should/might explore which is interesting”. But it can also be interpreted with the infinitival an indirect complement licensed by *interesting*: “an issue which it would be interesting to explore”. Though there are two different syntactic structures, the meanings they yield are effectively the same. Cases where the present construction yields a clearly

different meaning from the relative are illustrated in [15i] and [14iii]. The relative interpretation of the former would be the implausible “That’s a book that we could/should set as a text for Year 1 which is stupid”. And what differentiates [14iii] from a relative is that it conveys that the decision was in fact taken: the infinitival relative generally has a modal meaning, involving what could or should be done.

### (c) As complement to verbs

There are five verbs that take hollow *to*-infinitivals as internal complement: *be* and the transitive *cost*, *need*, *require*, *take*.

- [17] i *The decision* is for you to make \_\_\_\_.  
 ii *The car* cost over \$1,000 to repair \_\_\_\_.  
 iii *The dispute* needed/required a great deal of tact to resolve \_\_\_\_.  
 iv *The letter* took me all morning to write \_\_\_\_.

With *be* the hollow clause usually has *for* + subject, but we also find exceptional cases of subjectless ones: *The house is to let* \_\_\_\_ and *You are to blame* \_\_\_\_ . These are restricted to *let* (perhaps also *rent*) and *blame*: compare \**The house is to sell* or \**You are to criticise*. The construction with the transitive matrix verbs shows the same alternation as we illustrated in [8] for the adjective *hard*;<sup>49</sup> compare [17ii–iv] with:

- [18] i *It* cost over \$1,000 to repair the car.  
 ii *It* needed/required a great deal of tact to resolve the dispute.  
 iii *It* took me all morning to write the letter.

### (d) With dummy *there*, *have (got)*, *with/without*, and predicative genitive

- [19] i *There is/remains Kim* [to consider \_\_\_\_].  
 ii *Jill has (got) her elderly parents* [to look after \_\_\_\_].  
 iii *With her elderly parents* [to look after \_\_\_\_], *Jill is finding life somewhat stressful*.  
 iv *The money wasn't yours* [to spend \_\_\_\_].

The infinitival here has a modal interpretation. In [i–iii] it is a matter of deontic necessity: Kim needs to be considered, Jill’s elderly parents need to be looked after. In [iv] it is deontic possibility, and since the matrix clause is negated we understand “You weren’t entitled to spend the money”.

In the deontic necessity case we again find a close relationship with the relative clause construction. Compare:

- [20] *There are several assignments to mark* / *that I have to mark*.

The examples in [19] were chosen as ones where the object NP would not accommodate an integrated relative clause, with *Kim* a proper noun (in its proper name use) and *her elderly parents* containing a genitive determiner and being referentially fully determinate. The finite relative clause in [20] differs from an ordinary integrated relative, however, and it is uncertain whether the infinitival should here be included in the relative category or not.

<sup>49</sup>There is also an alternant for [17i] with *it*: *It is for you to make the decision*. But this does not belong to the same construction as [18]. In particular, *for you* is a PP functioning in the matrix clause, not subordinator + subject in the infinitival, as is evident from the fact that *for* is replaceable by *up to*.

(e) Complements licensed by *too*, *enough*, *sufficient*(ly)

- [21] i *My coffee* was *too hot* to drink \_\_\_\_.  
 ii *I haven't enough money* left to spare \_\_\_\_ for luxuries like that.  
 iii *The proposal* isn't sufficiently developed for us to accept \_\_\_\_ in its present form.

These items also license ordinary infinitivals (*He's too young to go to school*): we discuss both types together briefly in §8.4.

## (f) Purpose infinitivals

- [22] i *I bought them* to give \_\_\_\_ to the children.  
 ii *I need it* for the children to do their homework on \_\_\_\_.

Again the purpose clause is not required to have a non-subject gap, and we therefore postpone further discussion of the construction to §9.

## 7 Non-catenative complements in clause structure

We have argued in §4.1 that non-finite complements of verbs cannot in general be assigned the same function as NPs or AdjPs, but are best analysed as constituting a distinct type of complement, the catenative complement. The cases not covered by the latter are illustrated in:

- [1] i *For you to accept liability* would be a serious mistake. [subject]  
 ii *It is important to ascertain the cause of the malfunction.* [extraposed subject]  
 iii *He considers taking advice* beneath his dignity. [object]  
 iv *I thought it better to wait.* [extraposed object]  
 v *His aim is to gain control of the company.* [subjective predicative comp]  
 vi *I'd call that taking unfair advantage of a beginner.* [objective predicative comp]

The subject is an external complement sharply distinguished in English from other types of complement: there is therefore no problem in distinguishing the infinitival in [i] from our catenative complements and identifying it functionally with other forms of subject. The infinitival in [ii] is distinguished from catenatives by virtue of its relationship with the dummy element *it* in subject position.

In [iii] the subordinate clause serves as predicand for the predicative complement *beneath his dignity*. The relationship between the gerund-participial and the PP matches that between NP object and PP in *He considers such action beneath his dignity* and is sufficient to distinguish the gerund-participial from a catenative complement and to enable us to subsume [iii] under the complex-transitive construction. In [iv] we have another extrapositional construction, and the relationship with *it* is again sufficient to distinguish the infinitival from a catenative complement.

Example [1v] is an instance of the specifying *be* construction, with the infinitival complement distinguishable from a catenative by its ability to switch function with the subject (*To gain control of the company is his aim*), a property it shares with other forms, such as the PP in *The best place is in the garden* ~ *In the garden is the best place* (Ch. 4, §5.5.2). We also include various other non-finite complements to *be* under the predicative complement function. The catenative uses of *be* are the progressive (*She is working*), the

passive (*She was nominated for the position of treasurer*), and the quasi-modal (*Everyone is to remain seated*).

Finally, [1vi] is a further case of the complex-transitive construction, but this time the gerund-participial is in predicative function. The relationship between it and the object clearly matches that between adjectival predicative and object in *I'd call that unfair*. The distinction between catenative and non-catenative is not so sharp here. We take the gerund-participial in *He kept them waiting*, for example, to be a catenative complement, not a predicative, because the relationship between it and *them* is not the same as that between predicative and object in *He kept them warm*. Compare here the following sets:

- |     |     |  |  |
|-----|-----|--|--|
| [2] | i   | a. <i>I call that unfair.</i>                  | b. <i>That is unfair.</i>                  |
|     | ii  | a. <i>I call that taking advantage of him.</i> | b. <i>That is taking advantage of him.</i> |
|     | iii | a. <i>He kept them warm.</i>                   | b. <i>They were warm.</i>                  |
|     | iv  | a. <i>He kept them waiting.</i>                | b. <i>They were waiting.</i>               |

The sets do not match because while the *be* of [ib/iib] is the same (the copula), this is not so for [iib/ivb], where the former is the copula and the latter the progressive marker: *warm* is a predicative complement but *waiting* is not.<sup>50</sup>

## 7.1 Subject and extraposed subject

### (a) To-infinitivals

- |     |    |   |
|-----|----|---|
| [3] | i  | a. <i><u>For you to take the children</u> could seriously endanger our mission.</i> |
|     |    | b. <i><u>To refuse her request</u> would be unthinkable.</i>                        |
|     | ii | a. <i>It embarrassed her <u>to see him so drunk</u>.</i>                            |
|     |    | b. <i>It would be a good idea <u>for you to consult a solicitor</u>.</i>            |

Subjects of the infinitival are freely admissible, as in [ia] and [iib], though the subjectless form is much more frequent.

A sample of items that license infinitival subjects is given in:

- |     |     |                   |                   |                 |                   |                |
|-----|-----|-------------------|-------------------|-----------------|-------------------|----------------|
| [4] | i   | <i>amuse</i>      | <i>cause</i>      | <i>cost</i>     | <i>delight</i>    | <i>disturb</i> |
|     |     | <i>embarrass</i>  | <i>occur [to]</i> | <i>pay</i>      | <i>please</i>     | <i>take</i>    |
|     | ii  | <i>easy</i>       | <i>essential</i>  | <i>foolish</i>  | <i>good</i>       | <i>hard</i>    |
|     |     | <i>impossible</i> | <i>necessary</i>  | <i>possible</i> | <i>ridiculous</i> | <i>usual</i>   |
|     | iii | <i>mistake</i>    | <i>offence</i>    | <i>pleasure</i> | <i>task</i>       | <i>way</i>     |

Verbs, adjectives, and nouns are listed in [i–iii] respectively. With the verbs, the licensing often involves internal complements as well as the verb head: *It took courage to tell them*, but not *\*It took Kim by surprise to tell them*; *It didn't occur to me to invite him*, but not *\*It didn't occur last Tuesday to invite him*. The adjectives and nouns head phrases in predicative complement function, as in [3ib/iib]; this pattern is much more frequent than the one with verb as licenser ([3ia/iaa]). PPs with meanings comparable to adjectives are also found: *out of the question*, *of considerable interest*, and so on.

There is a large overlap between the items that license infinitivals and those that license declarative finites (content clauses). The latter can be either mandative or non-mandative (Ch. 11, §7.1.1), and for those that take mandatives there is in general little difference in

<sup>50</sup>There is of course an interpretation of [2iib] where *be* is the progressive auxiliary, but that doesn't stand in any significant relation to [2iia], and hence is irrelevant to the argument.

meaning between the infinitival and finite constructions. Compare, for example:

- [5] i a. *It is important for you to lock up carefully.*  
 b. *It is important that you lock up carefully.*  
 ii a. *It was necessary for him to walk to school.*  
 b. *It was necessary that he walk to school.*

Where the finite is non-mandative, it tends to be concerned with facts or propositions while the infinitival is concerned with situations (actions, events, states, etc.), though in some cases the difference is again very slight. Compare:

- [6] i a. *It was good to be back at school.*  
 b. *It was good that they were back at school.*  
 ii a. *It pleased her to be honoured in this way.*  
 b. *It pleased her that she was honoured in this way.*

In [ia] the situation of being back at school was good (for whoever it was who was back at school), while in [ib] the fact of their being back at school was good (for whoever it was who judged it good – in the default case, the speaker). But there is no perceptible difference in [6ii].

The distinction is particularly clear with *possible* as the licensing adjective:

- [7] i *It was possible for him to walk to school.*  
 ii *It was possible that he walked to school.*

With an infinitival complement, *possible* expresses dynamic or deontic modality, whereas with a finite complement it is epistemic. A rough paraphrase for [ii] would be *Maybe he walked to school*: concerning whether the proposition that he walked to school is true, [ii] says maybe it is. But in [i] the issue is not the truth of a proposition, but his abilities. Note, however, that the modal adjective *necessary* does not exhibit the same difference: the modality is deontic in both constructions in [5ii].

The tendency for non-mandative finites to be associated with facts/propositions and infinitivals with situations ties in with the two main cases of items restricted to one or other form of complement. These restrictions are stated in [8], and exemplified in [9].

- [8] i Adjectives concerned with truth or likelihood take declaratives, not infinitivals.  
 ii Adjectives concerned with the ease or difficulty of doing something take infinitivals, not declaratives.
- [9] i a. \**It was obvious for him to be lying.*  
 b. *It was obvious that he was lying.*  
 ii a. *It was easy for me to sympathise with her.*  
 b. \**It was easy that I sympathised with her.*

*Obvious* in [ib] can be glossed as “obviously true”; other adjectives likewise restricted to finites are *likely*, *probably*, *certain*, *clear*, *evident*, *apparent* – and *true* and *false*.<sup>51</sup> Conversely, facts or propositions can’t be easy, hence the difference in [ii]. *Hard* can take a finite complement, but its sense is then quite different from the sense it has with an

<sup>51</sup>These last two can take an infinitival if its verb is *say* (or a near-synonym): *It’s true that he cheated*, *It’s true to say that he cheated* (with the content clause an internal complement of *say*, not an extraposed subject of *be true*), but not \**It’s true for him to have cheated*.

infinitival:

- [10] i *It's hard for them to work twelve hours a day.*  
 ii *It's hard on them that they have to work twelve hours a day.*

The situation described in the infinitival is often merely potential rather than actualised, and this is reflected in the frequent occurrence of the infinitival in construction with *would be*, where the corresponding non-mandative finite has *if*, not *that*:

- [11] i a. *It was good to invite them both.*                      b. *It would be good to invite them both.*  
 ii a. *It was good [that you invited them both].*                      b. *It would be good [if\*that you invited them both].*

In [iia] *good* is factive: it is taken for granted that you invited them both. This factivity is inconsistent with the conditional implication of *would be*, and hence we need a conditional adjunct in [iib] instead of a factive complement.

### (b) Bare infinitivals

These are occasionally found, in informal style, as subject in the reversed version of the specifying *be* construction; the internal complement contains the verb *do*:

- [12] i *Plead mitigating circumstances is all you can do.*  
 ii *Seek professional advice is what we should do.*

### (c) Gerund-participials

- [13] i a. *Their reporting him to the manager led to his dismissal.*  
           b. *Inviting your uncle was a bad mistake.*  
 ii a. *It's no use his/him asking for special consideration.*  
           b. *It has been nice meeting you.*

The subject of the gerund-participial is much more often left understood, as in [ib/iib], than overtly expressed. The overt subject is particularly unlikely in the extraposed construction.

The gerund-participial is considerably less frequent in these functions than the infinitival, and there is also a major difference with respect to the extraposed and non-extraposed constructions: infinitivals are usually extraposed, gerund-participials comparatively rarely. To a significant extent, then, the difference between infinitival and gerund-participial is a matter of information packaging: end position tends to favour the infinitival while basic subject position tends to favour the gerund-participial.

For the most part, items that license a gerund-participial also license an infinitival, and vice versa. An infinitival could, for example, be substituted for the gerund-participial in [13ib] and [ii]. But such substitution would not be possible in [ia]: *\*For them to report him to the manager led to his dismissal*. Compare, similarly:

- [14] i *Paying off the mortgage last year has put us in a strong position.*  
 ii *\*It has put us in a strong position to pay off the mortgage last year.*

The gerund-participial here and in [13ia] denotes a specific, actualised situation, and although the infinitival is not wholly excluded in such cases (cf. *It was a mistake to invite your uncle*), its use is considerably constrained. Note, then, that if we change from actual to hypothetical, the infinitival becomes acceptable:

- [15] i *(For them) to have reported him to the manager would have led to his dismissal.*  
 ii *To have paid off the mortgage last year would have put us in a strong position.*

The gerund-participial is certainly not restricted to actualised situations (cf. *Changing the arrangements would be very difficult at this stage*), but for non-actualised situations the infinitival will often be required or at least quite strongly preferred, especially where the non-finite contains a subject:

- [16] i a. *It would be better for the lecture to be rescheduled.*  
 b. *\*The lecture's being rescheduled would be better.*  
 ii a. *To doubt her word would never have occurred to me.*  
 b. *?Doubting her word would never have occurred to me.*

## 7.2 Object and extraposed object

As explained at the beginning of §7, we take non-finite clauses to be objects, rather than catenative complements, only when they occur in some distinctively object relation with some element other than the head verb. The main case is the complex-transitive construction:

- [17] i *This made obtaining a loan virtually impossible.*  
 ii *I regard solving this problem as my first priority.*

Infinitivals cannot occur in this position between verb and predicative complement; normally, then, they occur in extraposed object position, though it is marginally possible for them to be preposed in prenuclear position, without extrapositional *it*:

- [18] i *I thought it wise to adopt a low profile.*  
 ii *For them to sack him we would regard as a gross miscarriage of justice.*

A gerund-participial, generally short and simple in structure, can also function as indirect object in the ditransitive construction, though it is likely to be considered stylistically somewhat awkward:

- [19] *We've been giving moving to Sydney a good deal of thought recently.*

## 7.3 Predicative complement

The construction most clearly distinct from the catenative is the reversible specifying construction, where the internal complement can be a *to*-infinitival, a bare infinitival, or a gerund-participial:

- [20] i *His intention was (for the meeting) to begin at six [to-infinitival]*  
 ii *All I did was print out the table of contents. [bare infinitival]*  
 iii *The funniest thing was (Kim) trying to hide in the coal-box. [gerund-participial]*

The bare infinitival is restricted to cases where the subject NP contains *do* in a relative clause; as we have noted, *to* can be added here (*All I did was to print out ...*). Since a subjectless gerund-participial can also be catenative complement to progressive *be*, some examples are ambiguous between the specifying and progressive constructions. This potential ambiguity is exploited in the advertising slogan *Our business is working*

for you: as a specifying construction this identifies what our business is; with *be* a marker of progressive aspect, it says what our business is doing.

In addition a *to*-infinitival can occur as purpose complement, replaceable by a purpose PP such as *for the purpose of* . . . :

[21] *The grid is to prevent the cattle from wandering off.*

One other construction that belongs here is the idiomatic one illustrated in:

- [22] i *To discuss melodrama, then, is to raise questions about ‘culture’ itself and the categories and oppositions by which we conceptualise it.*  
 ii *For any German director to attempt to make a film about Josef Mengele, the notorious Auschwitz concentration camp doctor, is to court controversy.*

This construction has a *to*-infinitival as both subject and internal complement of *be*. It differs from the specifying construction in that it cannot be reversed – *To raise questions about culture itself . . . is to discuss melodrama* is not equivalent to [i]. The construction indicates what the situation described in the subject entails or necessarily involves: “The discussion of melodrama necessarily raises questions about culture itself . . .”. In general, it can be paraphrased by means of *if* or *when*: *If/When a German director attempts to make a film about Josef Mengele, they necessarily court controversy.*

Finally, we have noted that a gerund-participial can function as objective predicative complement under very restricted conditions, mainly with *call* as matrix verb, as in [2iia].

## 8 Further complement uses of non-finite clauses

### 8.1 Non-finite complements of adjectives

These are predominantly *to*-infinitivals. We review these first, and then turn very briefly to gerund-participials; adjectives do not license past-participial complements.

#### ■ *To*-infinitivals

The construction where an adjective is followed by a direct complement – i.e. one licensed by the adjective lexeme itself – is to be distinguished from a number of superficially similar ones. Compare:

- |       |   |                               |
|-------|---|-------------------------------|
| [1] i | <i>You are [free to leave when you want].</i> | [direct comp of adj]          |
| ii    | <i>She’s [too young to go to school].</i>     | [indirect comp]               |
| iii   | <i>She’s [young] to be going to school.</i>   | [adjunct in clause structure] |
| iv    | <i>I was [mad] to volunteer.</i>              |                               |
| v     | <i>It would be [foolish] to ignore them.</i>  | [extraposed subject]          |

In [ii] the infinitival is a constituent of the AdjP, but is licensed by *too* rather than by the adjective *young*. It is therefore an indirect complement; complements of this kind are dealt with in §8.4. In [iii–iv] the infinitival is an adjunct, not a complement. It is not lexically licensed, and though it could not be preposed there is some evidence that it does not form part of the AdjP. Note in particular that the adjective + infinitival could not function as postmodifier in NP structure: compare *\*She is one of those young to be going to school* and *\*Anyone mad to volunteer can’t expect much sympathy*. While [ii] says that she is young to a degree higher than that at which she can or should go to school, [iii]

between [4iib] and [3b] shows that the likelihood does not apply to Liz or ‘them’, but to the situation of Liz convincing them and their being convinced by Liz. In [4iii] the [a] example is anomalous because *determined* takes an animate subject, while [b] is acceptable because there is no direct semantic relation between *likely* and the subject. This is why *determined* does not permit a dummy pronoun like *there* as subject, while *likely* does, as shown in [4iv]. Finally, the examples in [4v] show that with *determined* but not *likely* the infinitival can take a different subject from the matrix clause: the raised subject in the *likely* clause belongs semantically in the infinitival clause, and there is therefore no possibility of adding another subject to the latter.

The adjectives taking a raised subject, besides *likely*, are as follows:

[5]	<i>about</i>	<i>apt</i>	<i>bound</i>	<i>certain</i>	<i>due</i>
	<i>fated</i>	<i>liable</i>	<i>set</i>	<i>sure</i>	<i>wont</i>

The complement is obligatory: omitting it leads either to ungrammaticality (*He is wont to be late* but not \**He is wont*) or to a change in the meaning of the adjective (compare *She is sure to win*, “It is certain that she will win”, and *She is sure*, “She is not in any doubt”).

Adjectives taking ordinary subjects are much more numerous. A sample is given in:

[6]	<i>able</i>	<i>accustomed</i>	<i>afraid</i>	<i>annoyed</i>	<i>anxious</i>
	<i>ashamed</i>	<i>astonished</i>	<i>careful</i>	<i>concerned</i>	<i>content</i>
	<i>curious</i>	<i>delighted</i>	<i>depressed</i>	<i>disgusted</i>	<i>disposed</i>
	<i>eager</i> <sup>F</sup>	<i>eligible</i>	<i>embarrassed</i>	<i>fascinated</i>	<i>fit</i>
	<i>free</i>	<i>frightened</i>	<i>furios</i>	<i>glad</i>	<i>happy</i>
	<i>hesitant</i>	<i>impatient</i>	<i>impotent</i>	<i>inclined</i>	<i>indignant</i>
	<i>interested</i>	<i>jubilant</i>	<i>keen</i> <sup>F</sup>	<i>loath</i>	<i>perturbed</i>
	<i>poised</i>	<i>powerless</i>	<i>prepared</i>	<i>prompt</i>	<i>prone</i>
	<i>puzzled</i>	<i>qualified</i>	<i>quick</i>	<i>ready</i> <sup>F</sup>	<i>relieved</i>
	<i>reluctant</i> <sup>F</sup>	<i>satisfied</i>	<i>slow</i>	<i>sufficient</i> <sup>F</sup>	<i>surprised</i>
	<i>thankful</i>	<i>welcome</i>	<i>willing</i> <sup>F</sup>	<i>worried</i>	<i>worthy</i>

Many of these do not allow a subject in the infinitival clause, or do so only marginally: those that most readily accept *for* + subject are annotated with ‘F’. Compare *They are willing for the proposal to be resubmitted* and \**You are welcome for your children to come with you*.

*Able* is a somewhat peripheral member of this class. It differs from clear members in that pairs such as the following do not differ in truth conditions:

- [7] i *Primary schoolchildren are able to solve these problems.*  
 ii *These problems are able to be solved by primary schoolchildren.*

*Are able to* could here be replaced by *can*, which is a raising verb. Yet *able* differs from *can* in that it does not allow dummy pronouns as subject. Compare:

- [8] i *There can't be any progress without goodwill on both sides.*  
 ii \**There isn't able to be any progress without goodwill on both sides.*

The clear inadmissibility of [ii] indicates that *able* cannot take a raised subject. The equivalence of [7i–ii] must then be handled along the lines suggested for the pair given in [8i] of §6. Example [7i] ascribes a property to primary schoolchildren, not to the situation of their solving these problems, and [7ii] ascribes a property to the problems. But if the children have the property that they are able to solve the problems, the problems must necessarily have

the property that they are able to be solved by the children. The truth conditions of [7i–ii] must therefore be the same even though they do not belong to the raised subject construction.

### ■ Gerund-participial complements

The adjectives *busy* and *worth/worthwhile* license complements of this form:

- [9] i *She was busy [preparing her report].* [ordinary]  
 ii *These objections<sub>i</sub> aren't worth [bothering about \_\_\_<sub>i</sub>].* [hollow]  
 iii *It isn't worth [taking the matter any further].* [ordinary; impersonal]

Numerous adjectives take gerund-participials as oblique complements, i.e. with a governing preposition (*engaged in preparing her report, keen on playing games, etc.*), but *busy* takes the gerund-participial directly, as in [i]. *Worth* and *worthwhile* take hollow gerund-participials, as in [ii], where the gap functioning as complement of *about* is anaphorically linked to the predicand *these objections*. They also license ordinary gerund-participials, as in [iii], where there is no non-subject gap in the bracketed clause. This type is restricted to the construction with impersonal *it* as subject; it is comparable to extraposition, but does not allow the subordinate clause to appear in subject position: \**Taking the matter further isn't worth*.

## 8.2 Non-finite complements of nouns

Many nouns license non-finite complements, all *to*-infinitivals:

- [10] i *advice*      *aim*      *application*<sub>F</sub>      *appointment*      *arrangement*<sub>F</sub>  
*attempt*      *authorisation*<sub>F</sub>      *claim*      *command*      *compulsion*  
*consent*<sub>F</sub>      *decision*      *desire*<sub>F</sub>      *determination*      *exhortation*  
*failure*      *hope*<sub>F</sub>      *incitement*      *inducement*      *inspiration*  
*instruction*<sub>F</sub>      *intention*      *invitation*      *longing*<sub>F</sub>      *move*<sub>F</sub>  
*need*<sub>F</sub>      *obligation*      *offer*      *order*<sub>F</sub>      *permission*<sub>F</sub>  
*plan*<sub>F</sub>      *pledge*      *plot*      *pressure*      *promise*  
*proposal*<sub>F</sub>      *provocation*      *recommendation*      *refusal*      *reminder*  
*request*      *resolution*      *selection*      *struggle*<sub>F</sub>      *tendency*<sub>F</sub>  
*threat*      *undertaking*<sub>F</sub>      *vow*      *warning*      *will*  
*wish*<sub>F</sub>      *yearning*<sub>F</sub>  
 ii *ability*      *eagerness*<sub>F</sub>      *eligibility*      *fitness*      *freedom*<sub>F</sub>  
*impatience*      *keenness*<sub>F</sub>      *readiness*<sub>F</sub>      *reluctance*<sub>F</sub>      *willingness*<sub>F</sub>  
 iii *chance*<sub>F</sub>      *concern*      *opportunity*<sub>F</sub>      *power*      *strength*

The great majority of the head nouns are morphologically derived from (or homonymous with) verbs of matching senses that take the same complementation, as with those in [i]. Those in [ii] are similarly derived from adjectives, while with those in [iii] the complementation is not predictable in this way. Compare then:

- [11] i a *Kim decided to go to Bonn.*      b. *Kim's decision to go to Bonn*  
 ii a. *Pat was eager to help us.*      b. *Pat's eagerness to help us*  
 iii a. [no relevant counterpart]      b. *the opportunity to make a quick profit*

We include *strength* in [iii], not [ii], because the adjective *strong* does not take an infinitival complement. Note, then, that the following do not have matching structures or

interpretations:

- [12] i *She was strong to withstand this pressure.*  
 ii *She had the strength to withstand this pressure.*

In [i] the infinitival is an adjunct in the clause; the meaning is that she withstood the pressure, this indicating that she was strong. In [ii] the infinitival is a complement, and the meaning is “She had the strength necessary to withstand the pressure”.

All the nouns in [10] take subjectless infinitivals, and those with the annotation ‘F’ also allow the construction with subordinator *for* + subject:

- [13] i *This provided an opportunity [for them to plan the next step].*  
 ii *Permission [for the ceremony to be held in the church itself] was finally granted.*

A number of other nouns in our list could probably also occur with *for* + subject in the infinitival, but it is in general a relatively infrequent construction, and judgements as to whether a given noun could appear here are not always clear-cut.

In the subjectless construction, the antecedent for the missing subject may be found within the NP (as genitive determiner or within a PP complement), as in [14i], or outside the NP, as in [ii], and in cases like [iii] there is no antecedent in the sentence at all:

- [14] i a. *your/Kim's promise to help me with my tax return*  
 b. *a proposal by the government to introduce a goods-and-services tax*  
 c. *the willingness of the other members to agree to the proposal*  
 d. *an instruction to the secretary to call an extraordinary meeting*  
 ii a. *They gave me instructions [to evacuate the building].*  
 b. *I received instructions [to evacuate the building].*  
 c. *What I hadn't expected to receive was an instruction [to evacuate the building].*  
 iii *They were discussing a proposal [to introduce a summer semester].*

In general, the recovery of the understood subject is determined by semantic principles, not rules of syntax. But in some cases the matter is more grammaticalised; with *selection*, for example, the antecedent is normally required to appear as complement to *of*:

- [15] i *The selection of Judge Carter to head the inquiry is to be welcomed.*  
 ii *\*The selection to head the inquiry hasn't yet been announced.*  
 iii *\*Judge Carter is their selection to head the inquiry.*

#### ■ Nouns do not take raised complements

In general, clauses with raised complements, licensed by raising verbs or adjectives, do not have counterparts with the form of NPs:

- [16] i a. *Kim seemed to be distressed.*                      b. *\*the seeming of Kim to be distressed*  
 ii a. *I believe them to be genuine.*                      b. *\*my belief in/of them to be genuine*  
 iii a. *They are certain to resent it.*                      b. *\*their certainty to resent it*

One exception involves the verb *tend*, which has the noun counterpart *tendency*. Corresponding to clausal *The tabloids tend to support Labour* and the equivalent *Labour tends to be supported by the tabloids* we have:

- [17] i a. *the tendency for the tabloids to support Labour*  
 b. *the tendency for Labour to be supported by the tabloids*  
 ii a. *the tendency of the tabloids to support Labour*  
 b. *Labour's tendency/the tendency of Labour to be supported by the tabloids*

In [ia/ib] *the tabloids* and *Labour* are subjects of the infinitival clauses, and the equivalence between the whole NPs simply reflects the equivalence holding between the active and passive subordinate clauses they contain. In [ii], however, *the tabloids* and *Labour* are oblique or genitive complements of *tendency*: here, therefore, they appear to bear some resemblance to raised complements. There is, however, a major difference between the NP and clause constructions. Dummy elements can occur as raised complements in clause structure, but they cannot occur as oblique or genitive complement of *tendency* – or of any other noun. *There* does not have a genitive form and cannot normally occur as complement of a preposition, but these general restrictions do not apply to *it*, and yet this too cannot be used in the relevant positions when it is a dummy element:

- [18] i a. *It tends to be the wife who provides this support.*  
 b. \**its tendency to be the wife who provides this support*  
 ii a. *It tends to be more efficient to pay by credit card than by cheque.*  
 b. \**its tendency to be more efficient to pay by credit card than by cheque*

Such data argue that nouns, unlike verbs and adjectives, do not take raised complements. We take *the tabloids* and *Labour*, therefore, to represent arguments of *tendency* in [17iia–b] respectively, though not of course in [17i]. The relation between [17ia] and [17iia] is thus the same as that between [8ib] and [8ia] of §6.3 (*It was hard for Ed to accept her criticism* and *Her criticism was hard for Ed to accept*).

The same applies to *failure*, derived from the raising verb *fail*. The verb allows dummy subjects, but the noun does not:

- [19] i *It had failed to become apparent, even after a day, what their intentions were.*  
 ii \**its failure to become apparent, even after a day, what their intentions were*

Consider finally the case of *order*:

- [20] i a. *They ordered the building to be evacuated.*  
 b. \**the order to the building to be evacuated*  
 c. *the order for the building to be evacuated*  
 ii a. *They ordered the doctor to examine the victims.*  
 b. *the order to the doctor to examine the victims*  
 c. *the order for the doctor to examine the victims*

The verb takes a raised object: *the building* is not an argument of the verb in [ia]. But with the noun the complement of *to* is an argument, with the role of recipient of the order. Hence the anomaly of [ib]: one doesn't give orders to buildings. The nominal structure thus differs from the verbal one in allowing for this role to be explicitly encoded. It does not have to be, however, for we can also have [ic/iic]: these match the verbal (clausal) construction in not encoding who received the order. Here *the building* and *the doctor* function as subject of the infinitival, not as oblique complement of the noun. Again, then, oblique complements of the noun are not raised: they have to be interpretable as arguments of the noun.

### 8.3 Non-finite complements in the structure of PPs

#### ■ Gerund-participials

These occur very freely as complement of a preposition:

- [21] i *I'm looking forward [to (you/your) returning home].*  
 ii *[On hearing the news] she immediately telephoned her father.*  
 iii *She was reported [as saying that she would appeal against the ruling].*  
 iv *[Although claiming to have a Ph.D.,] he didn't in fact have any degree at all.*

*Although* more often occurs with a finite complement (as in *although he claimed to have a Ph.D.*). Such clauses can be reduced to gerund-participials, past-participials, or verbless clauses: see [3] of §10 for a list of prepositions of this kind.

#### ■ To-infinitivals

In contrast to gerund-participials, *to*-infinitivals occur in this function only under very restrictive conditions. The only prepositional expressions that take *to*-infinitivals other than interrogatives as direct complement are purposive *in order*, and *as if/though*:

- [22] i *We got up at five [in order to catch the early train].*  
 ii *He raised his hand [as if to defend himself].*  
 iii *She glanced out of the window at the phaeton [as though to say that he was not the only man to have a new carriage that morning].*

The *as if/though* construction is related to purpose in that it can be glossed as “as if/though with the purpose/intention of”. *In order* allows *for* + subject, but *as if/though* does not.

#### ■ Past-participials

These occur in the complement of prepositions like *although*, *until*, etc., that allow reduction of a finite complement, and also in comparative clauses (see Ch. 13, §2.1):

- [23] i *Please remain seated [until requested to board your flight].*  
 ii *He had more debts [than previously acknowledged].*  
 iii *The problem turned out to be more serious [than expected].*

### 8.4 Indirect and matrix-licensed non-finite complements

#### ■ Infinitivals indirectly licensed by *too*, *enough*, *sufficient*, *sufficiently*

- [24] i a. *It is too late [for you to go out now].*  
 b. *Enough people turned up [to form a quorum].*  
 c. *The instructions weren't sufficiently clear [for us to be able to assemble it].*  
 ii a. *Too good [to miss \_\_\_] is how I'd describe it.*  
 b. *The problem isn't important enough [to worry about \_\_\_].*  
 c. *Have you had sufficient [to eat \_\_\_]?*

The underlined degree expressions license ordinary infinitivals, as in [i], or hollow ones, as in [ii]. The complements are indirect in that in constituent structure they are not dependents of the licensor, but of a head item that is modified by the latter. In [ia], for example, the infinitival is a dependent of *late*, not directly of *too*. The infinitival strongly favours end position in the matrix clause: [ib], for example, is strongly

preferred over *Enough people to form a quorum turned up*. The latter is not ungrammatical, however, and in the specifying *be* construction [iia], the infinitival cannot be moved to the end.

The licensors indicate degree relative to some need, purpose, desire, etc. *Too* expresses a degree that exceeds the maximum or upper bound consistent with fulfilling the need, purpose, or desire. In [ia] it is late to a degree higher than the maximum at which you can or should go out: it follows that you can't or shouldn't go out now. Note that *excessively* is not substitutable for *too*: compare *My coffee is too/\*excessively hot to drink*. *Enough* and *sufficient(ly)* express a degree that is at least as high as the minimum or lower bound. In [ib], for example, the number of people who turned up was at least as high as that needed to form a quorum.

#### Hollow infinitivals indirectly licensed by an attributive adjective

[25] *That was a silly thing [to do \_\_\_].*

The infinitival is licensed by *silly* but in constituent structure is a complement in the NP headed by *thing*; for this construction, see §6.3.

#### ■ Matrix-licensed complements

A number of prepositions take non-finite complements if the larger construction licenses them (see Ch. 7, §5.1). There are three main cases.

##### (a) With prepositions of inclusion or exception *including, but, except, save*

- [26] i *He does nothing but/save/except waste people's time.*  
 ii *I couldn't help but notice her embarrassment.*  
 iii *You have no choice but to accept her offer.*  
 iv *There's nothing he wants save to pursue his studies in peace.*  
 v *This would achieve nothing except to antagonise some of our supporters.*

In [i] the bare infinitival is licensed by *do nothing* + the preposition of exception: compare *\*He likes nothing but waste people's time* (in this context we need gerund-participial *wasting*) or *\*He does wonderful things but waste people's time*. In [ii] the licensor is the non-affirmative idiom **can help but**. The other examples have *to*-infinitivals, but the licensing is again a property of the matrix construction, with *choice, want, achieve* the decisive elements. *Want* straightforwardly takes a *to*-infinitival itself: *He wants to pursue his studies*. *Achieve* does not, but nevertheless *to antagonise some of our supporters* is to achieve something, and hence the infinitival is admissible: contrast *\*He found nothing except to antagonise our supporters*.

##### (b) With the prepositions of comparison *as* and *than*

- [27] i *I'd rather stay at home than go out in this weather.*  
 ii *That wouldn't be as bad as for you to lose your job.*  
 iii *They visit the area for such recreational purposes as to attend hockey matches.*

In [i] the infinitival is permitted after *than* because the matrix *would rather* licenses a complement of the same form (*stay at home*). In [ii] the predicate *be bad* licenses infinitival subjects (*For you to lose your job would be bad*). And in [iii] the infinitival denotes a purpose.

(c) With *as* in purposive and resultative complements

- [28] i *They were asked to stand back so as not to hamper the efforts of the firefighters.*  
 ii *Blood for transfusion cannot be chosen so as to exclude every possibility of sensitisation.*  
 iii *On this matter their views are so close as to be indistinguishable.*  
 iv *His art is such as to render the familiar original and mysterious.*  
 v *Will you be so good as to order your men not to molest my maid.*

The *as* here is itself licensed by *so* or *such*. In most cases, *as* + infinitival alternates with a finite clause optionally or obligatorily introduced by the subordinator *that*: *so (that) they would not hamper the efforts of the firefighters*; *so (that) it will exclude every possibility of sensitisation*; *so close (that) they were indistinguishable*; *such that it renders the familiar original and mysterious*. No such replacement is possible in [v], where *be so good as to* is an idiom meaning “kindly”. None of these constructions allows *for* + subject in the infinitival.

The *so* phrase in [28i] is a purpose adjunct, while that in [ii] is a manner adjunct; in the latter construction *so* can be separated from the *as* complement: *cannot be so chosen as to ...* Unlike *so* + finite clause, *so* + *as* + infinitival does not serve by itself as a resultative adjunct: there is no *as* + infinitival counterpart of examples like *He didn't wake up until ten, so that he wasn't able to see his mother before she went to work*.

## 8.5 Interrogative infinitival clauses

While the distribution of non-interrogative infinitival clauses is very different from that of content clauses, this is not so with interrogatives. Interrogative infinitival complements are found in a large subset of the environments where interrogative content clauses are licensed. Compare, for example:

- [29] i a. *I don't know whether I should go.*      b. *I don't know whether to go.*  
 ii a. *She decided what she would do.*      b. *She decided what to do.*  
 iii a. *It doesn't matter what you say.*      b. *\*It doesn't matter what to do.*

The interrogative phrase cannot have subject function (*\*I don't know who to go first*), and no other subject is permitted either (*\*She didn't say what for me to do*). For further discussion, see Ch. 11, §5.3.5.

## 9 Non-finite clauses as modifiers and supplements

We turn now, very much more briefly, to non-finite clauses in non-complement function.

### ■ Post-head modifier in NP structure

- [1] i a. *This provides [a solid foundation on which to build].*      [*wh* relative]  
 b. *This provides [a solid foundation to build on].*      [non-*wh* relative]  
 ii a. *[People living near the site] will have to be evacuated.*      [gerund-participial]  
 b. *I came across [a letter written by my great-grandfather].*      [past-participial]

Clauses in this function cannot contain an overt subject. Infinitivals, as in [i], belong to the class of integrated relative clauses; they are discussed in Ch. 12, §5.

Gerund-participials and past-participials are semantically similar to relative clauses: compare *people who live near the site* and *a letter that was written by my great-grandfather*. We do not analyse them as relative clauses since there is no possibility of them containing a relative phrase (cf. \**people who living near the site*, etc.).

Past-participial modifiers are bare passives (Ch. 16, §10.1.1), as evident from the admissibility of a *by* phrase in internalised complement function. Gerund-participials can be active or passive. Passive gerund-participials contrast with the past-participials in aspectuality as progressive vs non-progressive, but with actives the progressive vs non-progressive distinction is lost:

[2]		VOICE	ASPECTUALITY	FORM-TYPE	
	i	<i>people <u>earning this amount</u></i>	active	neutralised	gerund-participial
	ii	<i>the amount <u>being earned by Kim</u></i>	passive	progressive	gerund-participial
	iii	<i>the amount <u>earned by Kim</u></i>	passive	non-progressive	past-participial

The active neutralises the distinction between *people who are earning this amount* and *people who earn this amount*. Features of form or context in particular cases may favour or require one or other kind of interpretation – compare *anyone knowing his whereabouts* (“who knows”) and *Who’s the guy making all that noise?* (“who is making”). The construction itself, however, is quite neutral between the two interpretations. In the passive, on the other hand, [ii–iii] contrast like *the amount which is being earned by Kim* and *the amount which is earned by Kim*. Note, though, that we are concerned here with the semantic category of aspectuality, not the syntactic category of aspect (see Ch. 3, §3, for this distinction). It must be emphasised that *being* in [ii] is the passive auxiliary: as pointed out in §1.1, gerund-participials do not accept the progressive auxiliary.

### ■ Modifiers in clause structure

- [3] i *They are saving up to buy a washing-machine.*  
 ii *They arrived home to find the house had been burgled.*  
 iii *He was a fool to say he’d go.*  
 iv *Liz was lying by the pool reading a novel.*

The infinitival in [i] is an adjunct of purpose, while that in [ii] indicates a resultant or subsequent situation. In [iii] it indicates the respect in which he was a fool, a reason or explanation for the judgement. The gerund-participial in [iv] is a depictive adjunct, giving descriptive information about Liz; note that it is interpreted with progressive aspectuality: “she was reading a novel”.

Adjuncts that are integrated into clause structure as modifiers tend not to be sharply distinct from complements: see §§4.4, 8.1.

### ■ Supplements

- [4] i a. *His hands gripping the door, he let out a volley of curses.*  
 b. *This done, she walked off without another word.*  
 ii a. *Realising he no longer had the premier’s support, Ed submitted his resignation.*  
 b. *Born in Aberdeen, Sue had never been further south than Edinburgh.*  
 iii *Whether working or relaxing, he always has a scowl on his face.*

The underlined non-finites are supplements with the main clause as anchor. Those in [i] contain a subject, and belong to what is known as the **absolute** construction, one

which is subordinate in form but with no syntactic link to the main clause. Those in [ii] have no subject, and are syntactically related to the main clause in that the missing subject is controlled by the subject of the main clause: it was Ed who realised he no longer had the premier's support, and Sue who was born in Aberdeen. In neither [i] nor [ii] is there any explicit indication of the semantic relation between the supplement and the anchor. This has to be inferred from the content of the clauses and/or the context. The natural interpretation of the supplement in [ib], for example, is temporal ("when this was done"), and of that in [iia] causal ("because he realised . . ."). Both constructions allow gerund-participials or past-participials – and also verbless forms, as exemplified in §10. Example [iii] belongs to the exhaustive conditional construction discussed in Ch. 11, §5.3.5.

While the missing subject in [4ii] is controlled by the subject of the anchor clause, we also find supplements where it has to be interpreted non-syntactically:

- [5] i *To put it bluntly, they're utterly incompetent.*  
 ii *But, judging from their reaction, the decision was a complete surprise to them.*  
 iii *Based on the latest inflation data, there'll be another rate-rise soon.*

Such supplements belong to the category of speech act-related adjuncts (Ch. 8, §18): they are concerned with the manner in which the main assertion is expressed, or the evidence for it. In [i–ii], the missing subject is understood by reference to the speaker, while with the past-participial in [iii] it is the prediction of another rate-rise that is based on the inflation data. The past-participial (which is less clearly established as grammatical than the others) is more or less restricted to *based on*; for the relation between the gerund-participials and deverbal prepositions, see Ch. 7, §2.3.

Non-finites can also serve as supplements to NP anchors:

- [6] i *Kim and Pat, both of them suffering from hypothermia, were winched into the helicopter.*  
 ii a. *Kate's proposal – to dismiss the manager – was greeted with dismay.*  
 b. *Jim's hobby – collecting beer mats – is taking up all his time.*  
 c. *There was only one thing to do: call in the police.*

The supplement [i] is of the ascriptive type, comparable to a relative clause (compare *who were both of them suffering from hypothermia*). Those in [ii], by contrast, are of the content-specifying type: see Ch. 15, §5, for this distinction. Note that while *proposal* licenses infinitival complements, *hobby* does not license gerund-participials. The supplements here are thus sanctioned semantically (collecting beer mats is a possible hobby), rather than being lexically licensed.

## 10 Verbless clauses

We confine our attention here to verbless clauses in dependent or supplement functions comparable to those realised by non-finite clauses, as described in the main part of the chapter.

(a) Complement to *with* and *without*

- [1] i *They were standing against the wall* [*with their hands above their heads*].  
 ii *They were wandering around* [*without any clothes on*].  
 iii [*With the children so sick,*] *we weren't able to get much work done.*  
 iv *Who is that guy* [*with his hands in his pockets*]?

The underlined clauses have subject + predicate structure, but with no verb in the predicate. *With* and *without* do not license finite complements, but non-finites are found in addition to the verbless forms (see §8.3 above). The bracketed PPs function as adjunct to a clause ([i–iii]) or post-modifier in NP structure ([iv]). *With* is semantically similar to *have*, and *without* to *not have*: [i–ii], for example, entail *They had their hands above their heads, They didn't have any clothes on.*<sup>52</sup>

## (b) Complement to prepositions that license reducible clauses

We have observed that a number of prepositions like *although* usually take finite clause complements, but allow the complement to be reduced – either to a non-finite clause, as illustrated in §8.3, or else a verbless one, as in:

- [2] i *Although no longer a minister, she continued to exercise great power.*  
 ii *Once away from home, she quickly learned to fend for herself.*  
 iii *He spoke in an injured voice, as though resentful of the fact that she had not given him proper warning.*  
 iv *He can be very dangerous when drunk.*  
 v *While in Paris, I visited Uncle Leonard.*

A finite clause can be reconstructed by adding a subject and a form of the verb *be*: *although she was no longer a minister*, and so on.

We noted in Ch. 12, §6.4, that *when* and *whenever*, *while* and *whilst* fall at the boundary between relative words and prepositions taking content clause complements; the fact that they enter into the present construction is a feature they share with the prepositions taking content clause complements. Including them, the governing items are:

- [3]    *although*            *as if*            *as though*            *if*            *once*  
       *though*            *when*            *whenever*            *while*            *whilst*

In addition to the construction illustrated in [2], *if*, *when(ever)*, *where(ver)*, and marginally *unless* take *necessary* and *possible* as complements, as in:

- [4] i *Don't hesitate to call me at home* [*if necessary*].  
 ii *He was anxious to learn and helped me* [*wherever possible*].

The interpretation of the missing subject derives from a proposition expressed in the matrix: we can expand as *if it is necessary to call me* and *wherever it was possible to help me*. Note that the locative meaning has been bleached out of *where* in this example: it could be replaced by *whenever*.

<sup>52</sup>This use of *on* applied to clothing is one where the construction with *be* is somewhat unidiomatic: ?*Their clothes weren't on*.

## (c) Supplements

- [5] i *His face pale with anger, he stormed out of the room.*  
 ii *The contestants, some of them primary school children, were kept waiting for two hours.*  
 iii *The Chinese, whether drunk or sober, never kiss in public.*

These are verbless analogues of the non-finite supplements given in [4i] and [6i] of §9.

## ■ Condensed structures and reanalysis

Verbless clauses may appear ‘condensed’, with the subject consisting of a single word even when it is a count singular noun:

- [6] i *Dinner over, they resumed their game of chess.*  
 ii *He stood glowering at us, face red with anger.*  
 iii *They threw him head first into the pond.*

Note that *head first* in [iii] is integrated into clause structure, having the status of modifier rather than supplement.

A small number of expressions of this kind can function as predicative complement as well as adjunct. Compare:

- [7] i a. *They walked away arm in arm.*      b. *They were arm in arm.*  
 ii a. *He stood at the door, hat in hand.*      b. *\*He was hat in hand.*

Predicative complement is not a function that normally accepts verbless clauses, and it is plausible to suggest that *arm in arm* has been reanalysed, losing its status as a clause and coming to be construed as a PP. The head will be *in*, with the second *arm* an internal complement, and the first an external complement: see Ch. 7, §4.3.<sup>53</sup> It is also possible for such PPs to consist of an external complement NP + intransitive preposition, as in *face down* (compare *She was face down*, but not *\*She was palms up*). Further examples are: *side by side, back to back, inside out, upside down*.<sup>54</sup>

## 11 Further remarks on the interpretation of subjectless non-finites

The subject is an obligatory element in canonical clauses, and the interpretation of clauses which lack a subject requires that the omission be somehow made good. For non-finite clauses we have distinguished three cases, involving raised, controlled, and non-syntactic interpretations.

In the raised case, the missing subject is retrievable from the subject or object of the matrix clause. Raised complements are licensed only by verbs and adjectives; they have been discussed at length in earlier sections of the chapter and need not be considered

<sup>53</sup>The structure proposed bears a significant resemblance to that of the verbless clause. Thus *in* is also the ultimate head of *hat in hand* in [7iia], with *hand* an internal complement (*in hand* constituting the predicate) and *hat* an external complement (more specifically, the subject).

<sup>54</sup>*Upside down*, a reworking of earlier *up-so-down*, differs etymologically from the others in that *upside* postdates – and is probably derived by back-formation from – the whole phrase. PPs of the type discussed in Ch. 7, §4.2, with *ago* and *apart* as head (e.g. *a week ago* or *this apart*) also derive historically from absolute clauses. *Ago* derives from *agone*, related to the past participle of *go*, while *this apart* is comparable to the *dinner over* of [6i].

further here. The relation between the other two types of interpretation, however, does merit additional discussion.

### ■ The distinction between controlled and non-syntactic interpretations

The relation between a missing or covert subject and the controller is a special case of anaphora. It is thus analogous to the relation between a personal pronoun and its antecedent: compare *Jill expected to finish on time* and *Jill expected that she would finish on time* (in the interpretation where *she* is co-referential with *Jill*). We can thus use the familiar notational device of co-indexing: *Jill<sub>i</sub> expected [\_\_<sub>i</sub> to finish on time]*. It is not only in the case of control, however, that a missing subject may be co-indexed with an antecedent located elsewhere in the sentence. Compare:

- |     |    |    |  |                                  |
|-----|----|----|--|----------------------------------|
| [1] | i  | a. | <u>I<sub>i</sub></u> hope [__ <sub>i</sub> to see her next week].                              | } [controlled interpretation]    |
|     |    | b. | Jill asked <u>Pat<sub>i</sub></u> [__ <sub>i</sub> to help her].                               |                                  |
|     | ii | a. | This would involve [__ moving to Sydney].  | } [non-syntactic interpretation] |
|     |    | b. | All <u>Sue<sub>i</sub></u> has had so far is a request [__ <sub>i</sub> to accept nomination]. |                                  |

In [i] the underlined NPs are the antecedents, and more specifically the controllers, of the missing subjects. In [iia] there is no antecedent at all, while in [iib] *Sue* is the antecedent, but not the controller. It is understood that *Sue* is the potential acceptor of the nomination, but this interpretation is not determined by the syntactic relation between *Sue* and the missing subject. It is arrived at, rather, by semantic inference along the following lines:

- [2]
- i The matrix clause (with specifying *be*) entails that *Sue* has had a request.
  - ii *Sue* therefore fills the semantic role of recipient of the request.
  - iii The understood subject of a non-finite complement to the noun *request* represents either the maker of the request (*his request to see the files*) or the recipient (*I received a request to make a donation to the Scholarship Fund*).
  - iv Only the recipient is expressed in [iib], and the content of the request makes it more likely that the understood subject will represent the recipient of the request.

Similar factors are at work in:

- [3]
- i *Jill<sub>i</sub> found it difficult [\_\_<sub>i</sub> to understand what he was getting at]*.
  - ii *Max<sub>i</sub> admitted it had been a mistake [\_\_<sub>i</sub> to leave so little time for revision]*.

In [i] the infinitival is extraposed object in a complex-transitive construction: this makes it the predicand of the adjective *difficult*. The missing subject in an infinitival predicand of *difficult* is co-indexed with the NP with the semantic role of experiencer, and this role is associated with the subject of *find*, i.e. *Jill*. Contrast this example with *This made it difficult to understand what he was getting at*: *make* assigns the role of causer, not experiencer, to its subject, so that this time we do not have co-indexing between matrix and subordinate subjects. In [ii] the infinitival is extraposed subject and predicand of *a mistake*: the missing subject represents the one who made the mistake, and *admit* in the next higher clause suggests that it was *Max* who made the mistake. Note, however, that it doesn't have to have been *Max* who left so little time for revision. This is a likely interpretation but not the only possible one: admitting something doesn't entail that one is responsible for it.

Control is the case where the identification of the missing subject can be described by reference to syntactic functions rather than in terms of semantic roles. One of the

clearest cases is the catenative construction:

- [4] i *Kim<sub>i</sub> wants* [<sub>i</sub> *to enter the competition*]. [control by matrix subject]  
 ii *Kim wants me<sub>i</sub>* [<sub>i</sub> *to enter the competition*]. [control by matrix object]

Here, as in almost all non-raising cases, the simple construction has control by the subject of the matrix clause, while the plain-complex construction has control by the object.

To say that control is defined syntactically is not to suggest that it is semantically arbitrary. On the contrary, it is strongly motivated by the semantics. Compare, for example:

- [5] i *Sue told Tim<sub>i</sub>* [<sub>i</sub> *to arrange the interviews*]. [control by matrix object]  
 ii *Sue<sub>i</sub> promised Tim* [<sub>i</sub> *to arrange the interviews*]. [control by matrix subject]

The infinitival subject is co-indexed with the object of *tell* and the subject of *promise*, but this reflects semantic differences between *tell* and *promise*. *Tell* belongs with the set of verbs of ‘influence’: it denotes an attempt to influence someone’s behaviour, and the one (potentially) influenced corresponds to the missing subject of the infinitival complement. *Promise*, by contrast, belongs with the verbs of ‘commitment’, and the missing subject with such verbs corresponds to the one making the commitment. Control, then, is semantically motivated, but these examples differ from those like [1iib] and [3] in that the missing subject is anaphorically linked to an antecedent in a specified syntactic function. Notice, moreover, that the use of *promise* shown in [5] is quite rare: it is much more usual to have a simple catenative construction (*Sue<sub>i</sub> promised* <sub>i</sub> *to arrange the interviews*) or to have a finite complement (*Sue<sub>i</sub> promised Tim that she<sub>i</sub> would arrange the interviews*). In the overwhelming majority of cases, then, the controller for the plain-complex construction is the matrix object.

A related difference between *tell* and *promise* concerns passivisation:

- [6] i *Tim<sub>i</sub> was told by Sue* [<sub>i</sub> *to arrange the interviews*].  
 ii \**Tim was promised by Sue<sub>i</sub>* [<sub>i</sub> *to arrange the interviews*].

*Tell* passivises readily, and it is now the subject that controls the missing subject of the infinitival. But *promise* does not passivise: the antecedent for the missing subject in [ii] is complement of the preposition *by*, and that is not a syntactically permitted function for a controller.

### ■ Non-finite clauses functioning in NP structure

The interpretation of non-finite clauses functioning in the structure of NPs is determined very differently. We observed in §8.2 that raised complements do not occur in NP structure, and the data in [7] show that we do not have syntactic control either:

- [7] i *Tim was satisfied with* [*Sue’s<sub>i</sub> promise* [<sub>i</sub> *to pay the rent*]].  
 ii *Tim was satisfied with* [*the promise by Sue<sub>i</sub>* [<sub>i</sub> *to pay the rent*]].  
 iii *Tim extracted from Sue<sub>i</sub>* [*a promise* [<sub>i</sub> *to pay the rent*]].  
 iv *Tim will not be satisfied with* [*a mere promise* [ *to pay the rent*]].

The missing subject of the complement of the noun *promise* is anaphorically linked to the NP denoting the one making the promise, irrespective of the syntactic function of that NP. And indeed, as we see from [iv], there does not have to be any such NP in the sentence: it can be left to the context to determine the interpretation.

As a second example, compare the verb *request* with the corresponding noun:

- [8] i a. *Kim requested us<sub>i</sub> [\_\_<sub>i</sub> to enter the competition].*  
 b. *We<sub>i</sub> requested [\_\_<sub>i</sub> to enter the competition].*  
 ii a. [*Sue's<sub>i</sub> request [\_\_<sub>i</sub> to enter the competition]*] *has not yet been considered.*  
 b. *We<sub>i</sub> received a request from Sue<sub>j</sub> [\_\_<sub>i/j</sub> to enter the competition].*  
 c. *We still haven't received any requests [\_\_ to enter the competition].*

The plain-complex catenative construction [i] has control by the object, with the object representing the recipient of the request, while the simple catenative [ii] has control by the subject, with the subject representing the maker of the request. But with the NP construction there is no control, no anaphoric link between the missing subject and an antecedent in some specified syntactic function. The antecedent may be in the NP headed by *request*, or it may be in the matrix clause, or there may be no antecedent at all, as in [iic]. Note, moreover, that [iib] is ambiguous, interpretable with either *we* or *Sue* as antecedent: Sue may have been requesting us to enter, or requesting to enter herself.

The verb *request* is a marginal member of a small class of verbs that allow the normal syntactic rule of control to be overridden under highly restrictive conditions. In *We<sub>i</sub> requested them \_\_<sub>i</sub> to be allowed to enter the competition*, the antecedent is the subject, not the object, as in [8ia]. This, however, is a very exceptional departure from the normal pattern of object control, not possible beyond a very narrow range of cases like *to be allowed* (see the discussion of Class 2A1 in §5.3): it is not comparable with the situation found with non-finites embedded in NPs.

### ■ The anaphoric relation between the antecedent and the missing subject

In examples where the antecedent is a simple NP such as a proper name, the missing subject can be recovered quite straightforwardly: in *Kim<sub>i</sub> remembered \_\_<sub>i</sub> to lock the door*, for example, it was Kim who locked the door. Where negation or quantification is involved, however, matters are more complex:

- [9] a. *No one<sub>i</sub> intends [\_\_<sub>i</sub> to harm you].*      b. *Both of them<sub>i</sub> hope [\_\_<sub>i</sub> to speak first].*

Example [a] does not mean “No one intends that no one should harm you”, and [b] does not mean “Both candidates hope that both candidates will speak first”. We understand, rather, “No one intends that he or she should harm you” and “Each of the two of them hopes that he or she will speak first”. What is understood is something more abstract than a repetition of the antecedent: we need to invoke the concept of variables, as in the informal representations “No one *x* intends [*x* to harm you]” and “Both of them *x* want [*x* to speak first]”. This, however, is not a special feature of subjectless non-finites, but rather a quite general feature of anaphora, and for this reason further discussion can be left to Ch. 17.

It is also a general feature of anaphora that we can have a sequence of links between a missing element or pro-form and its antecedent, forming an ‘anaphoric chain’, as in:

- [10] *Jill<sub>i</sub> intends [\_\_<sub>i</sub> to try [\_\_<sub>i</sub> to mediate between them]].*

The missing subject of *mediate* is controlled by the subject of *try*, but that itself is missing, controlled by the subject of the next higher clause, with *intend* as predicator. *Jill* is thus associated with the role of experiencer relative to *intend*, and agent relative to *try* and *mediate*.

  - 5.1 General properties of supplementation 1350
  - 5.2 The form of supplements 1356

The preceding chapters have been concerned with constructions which consist of a head element, alone or accompanied by one or more dependents. In this chapter we turn to two types of **non-headed** construction, namely **coordination** and **supplementation**. Compare:

- [1] i *I left the room and Pat followed me*. [coordination]  
 ii *The tourists – most of them exhausted – got into the bus.* [supplementation]

Construction [i] is non-headed because the two underlined constituents are of equal syntactic status: we cannot say that one is head and the other dependent. Construction [ii] is not so clearly distinct from a headed construction: the difference is that the underlined constituent is not tightly integrated into the syntactic structure. We treat it therefore as a supplement rather than as a dependent (such as we have in *The exhausted tourists got into the bus*). We look in detail at coordination in §§1–4, and then turn more briefly to supplementation in §5.

## 1 The structure of coordinate constructions

### 1.1 Coordinations, coordinates, and coordinators

Coordination is a relation between two or more elements of syntactically equal status, the **coordinates**; they are usually linked by means of a **coordinator** such as *and* or *or*:

- [2] i [*Kim and Pat*]  *speak excellent French.* [NP-coordination]  
 ii  *He can see you [this afternoon or on Tuesday].* [NP/PP-coordination]

The equality of the coordinates is reflected in the fact that usually **either** of them could stand alone in place of the whole coordination (with adjustment of agreement features where necessary): *Kim speaks excellent French; Pat speaks excellent French.*<sup>1</sup> A second indication of the equality of the coordinates is that in the most straightforward cases we can reverse their order without significant effect on structure or meaning: *Pat and Kim speak excellent French; He can see you on Tuesday or this afternoon.*

#### ■ Coordination as a non-headed construction

Coordination contrasts with subordination, where the elements are of unequal status. In subordination one element is head, the other(s) dependent, but precisely because

<sup>1</sup>In cases like *Kim and Pat [are a happy couple]*, such replacement is not possible, but the coordinates are again of equal status in that **neither** can replace the whole: see §1.3.2.

coordinates are of equal status the functions of head and dependent are not applicable to coordination. We therefore refer to *Kim and Pat* as an NP-coordination, not an NP: it is functionally like an NP but does not have the structure of one. Examples like [2ii] show, moreover, that the coordinates do not have to be of the same syntactic category, *this afternoon* being an NP, *on Tuesday* a PP. The whole cannot belong to either one of these categories, and we analyse it therefore as an NP/PP-coordination, i.e. a coordination of an NP and a PP.

### ■ Contrasting structures

The examples in [3] contain two coordinates and one coordinator, but there are other possibilities. We have three contrasts of structure to note.

#### (a) Binary vs multiple coordination

There can be more than two coordinates – in which case we speak of **multiple coordination** in contrast to **binary coordination**, with just two:

- [3] i *Kim wrote a letter and Ed watched TV.* [binary coordination]  
 ii *She wants to live [in Sydney, in London, or in Paris].* [multiple coordination]

#### (b) Syndetic vs asyndetic coordination

Although the construction is usually marked by a coordinator, it does not have to be; the coordination is said to be **syndetic** when it is overtly marked in this way, and **asyndetic** when it is not:

- [4] i *He invited [all his colleagues and all his students].* [syndetic]  
 ii *He invited [all his colleagues, all his students].* [asyndetic]

With multiple coordination we have two subtypes of syndetic coordination:

- [5] i *He can see you on [Monday, Tuesday, or Friday].* [simple-syndetic]  
 ii *He can see you on [Monday or Tuesday or Friday].* [polysyndetic]

Example [i] has *or* marking just the final coordinate, whereas in [ii] it marks all except the first. These are the only possibilities even when we have more than three coordinates: all **medial** coordinates (those which are neither initial nor final) must be treated alike, either all unmarked (*on Monday, Tuesday, Thursday, or Friday*) or else all marked (*on Monday or Tuesday or Thursday or Friday*) – not, for example, \**on Monday or Tuesday, Thursday or Friday*.

#### (c) Correlative vs non-correlative coordination

All syndetic coordination has a marker before the final coordinate; the initial coordinate may also be marked, by a determinative that is **correlative** (paired) with the one marking the final coordinate. *Both* correlates with *and*, *either* with *or*, and so on (see §2.3).

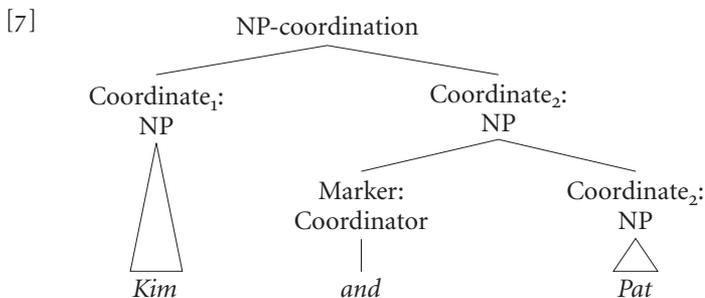

- [6] i a. *He invited [both his father and his uncle].* [correlative]  
 b. *He invited [his father and his uncle].* [non-correlative]  
 ii a. *He can see you [either on Monday or on Tuesday].* [correlative]  
 b. *He can see you [on Monday or on Tuesday].* [non-correlative]

*Either* can appear in multiple coordination, and we then find again the contrast between simple-syndetic *either on Monday, on Tuesday, or on Friday* and polysyndetic *either on Monday or on Tuesday or on Friday*.

The most usual pattern has a single coordinator located before the final coordinate; the extra elements in correlative and polysyndetic structures emphasise the coordinative relation (but see also §2.3), while the absence of a marker in asyndetic coordination makes this not always clearly distinguishable from non-coordinative constructions.

### ■ Place of coordinators in the constituent structure

From a semantic point of view a coordinator expresses the relation between the coordinates, but syntactically it belongs with the coordinate that follows it (i.e. they form a constituent together), so that the structure for *Kim and Pat* will be as in [7]:

The numerical subscripts indicate the sequential order of the coordinates: as we have said, they are of equal syntactic status, and this is reflected in the fact that they are not differentiated in terms of syntactic function, but only in terms of their linear position.

There are three reasons for saying that the coordinator forms a syntactic constituent with the coordinate that follows:

#### (a) Variable position of second coordinate

Under certain conditions it is possible to vary the position of the second coordinate in a binary coordination (cf. §4.5). Compare:

- [8] i a. *They allowed the others but not me a second chance.*  
 b. *They allowed the others a second chance but not me.*  
 ii a. *Did the boss or her secretary tell you that?*  
 b. *Did the boss tell you that or her secretary?*

In both versions the coordinator is located next to its coordinate: what varies is the position of *but not me* and *or her secretary*, which indicates that each of these forms a unit.

#### (b) Sentence-initial *and*, *or*, *but*

Such coordinators as *and*, *or*, and *but* can occur in sentence-initial position. For example, speaker A might say, *She thoroughly enjoyed it*, and B then add, *And so did her mother*. It is clear that *and* here forms a unit with *so did her mother*.

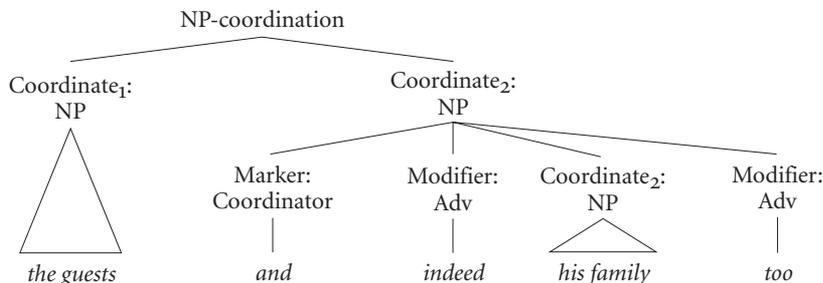

#### (c) Prosody and punctuation

The natural intonation break is before the coordinator, not after. This is particularly clear in polysyndetic and correlative coordination. A natural reading of *He invited his brother and his sister and his mother*, for example, will have a prosodic break before each *and*: *He invited his brother |and his sister |and his mother*. Similarly with writing: if punctuation is used between the coordinates, it occurs in these same places.

### ■ Bare and expanded coordinates

In [7] we have generalised the functional term ‘coordinate’ so as to have it apply not only to *Pat* but also to the larger element *and Pat*; where it is necessary to make clear which is intended, we use **bare coordinate** for *Pat* itself and **expanded coordinate** for *and Pat*. We also allow for an expanded coordinate to contain various modifiers in addition to (or instead of) a coordinator – modifiers like *too*, *as well*, *else*, and so on. The structure for the coordination in *He offended the guests and indeed his family too* will therefore be as in [9].

[9]

The bare coordinates are *the guests* and *his family* (just as they are in *He invited the guests and his family*), but *his family* is expanded by the modifiers *indeed* and *too*, as well as by the marker *and*. (See §4.1 for fuller discussion of this kind of expansion.)<sup>2</sup>

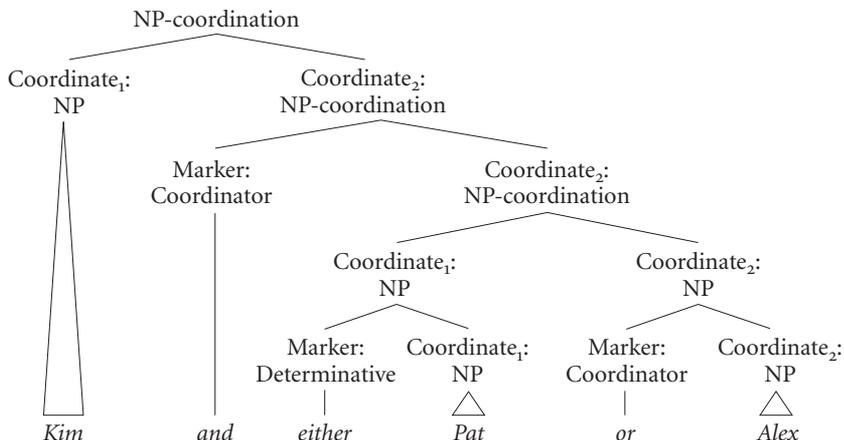

### 1.2 Layered coordination (*Kim and either Pat or Alex*)

A coordination can function as a coordinate within a larger one, resulting in what we call a **layered coordination**:

- [10] i *We should invite [Kim and either Pat or Alex].*  
 ii *I tried to persuade him and so did Kim, but he was quite inflexible.*

The underlining marks the lower coordination. In [i] the NP-coordination *either Pat or Alex* is coordinated with *Kim* to form the larger NP-coordination enclosed in brackets, whose structure is as follows:

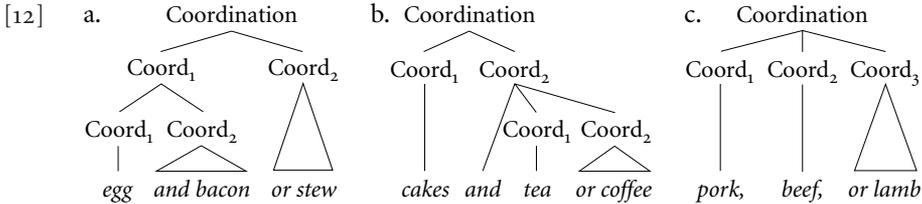

[11]

<sup>2</sup>Formal grammar often uses ‘conjunction’ in place of ‘coordination’, but we see no reason to change the traditional term, which contrasts transparently with ‘subordination’. ‘Conjunction’ is in any case an unfortunate

Similarly in [10ii]: the underlined sequence is a clause-coordination which realises the first coordinate in a larger clause-coordination that forms the whole sentence. *But* is the coordinator at the upper layer, *and* at the lower.

The possibility of layering means that with three bare coordinates we can in principle have three contrasting structures, as shown in the following simplified representations:

The word sequences in [a] and [b] are ambiguous, but the interpretations represented in the diagrams are the natural ones. In [a] the choice (*or*) is between egg and bacon on the one hand, stew on the other, whereas in [b] the choice is between tea and coffee. The second layer of coordination is on the left in [a], and on the right in [b], whereas in [c] there is only a single layer.

In [10] and [12a–b] it is immediately clear that there is layering because of the contrasting coordinators: *and* vs *but* or *and* vs *or*. Within any single coordination the coordinators must match: all non-initial ones must be identical and any initial markers must correlate with the non-initial ones, *both* with *and*, *either* with *or*, etc. Moreover, as we noted above in introducing polysyndetic coordination, if any **medial** coordinate is marked by a coordinator, all must be – which means that while [13i] may be a single coordination [13ii] cannot be:

- [13] i *He invited [Kim and Tom and Pat and your parents].*  
 ii *He invited [Kim, Tom and Pat, and your parents].*

In [ii] we have four bare coordinates but only two coordinators, so that there must be layering. There are two possible structures: the first layer has either two coordinates (*[Kim, Tom and Pat] + [your parents]*) or three (*[Kim] + [Tom and Pat] + [your parents]*). Example [i] has no grammatical marking of layering, but it does not exclude a layered interpretation and indeed allows numerous different ones (*[Kim and Tom] + [Pat] + [your parents]*; *[Kim] + [Tom and Pat] + [your parents]*; and so on) – the layering in this case would have to be signalled purely by prosody or punctuation.

### ■ Scope

In [12a] (*egg and bacon or stew*) we say that *or* **has scope over** *and*, in that the *and*-relation holds within one of the coordinates linked by *or*. Scope is a semantic concept, but in simple examples like this it is reflected straightforwardly in the syntactic structure: *or* is a marker at the upper layer of coordination, *and* at the lower layer. An alternative type of formulation we shall use is to say that *or* has **wide scope** relative to *and* – or that *and*

choice because this term is used in logic for a relation corresponding closely to just one type of coordination, that marked by *and* as opposed to *or* (*or*-coordination corresponding in turn to logical disjunction) – see §2.2.1 below. In traditional grammar, moreover, ‘conjunction’ is used for a class of words used in both coordinative and subordinative constructions. ‘Coordinate’ is not widely used in traditional grammar, and for this concept formal grammar almost invariably uses ‘conjunct’.

has **narrow scope** relative to *or*. In [12b] (*cakes and tea or coffee*), of course, the scope relations are reversed: here *and* has scope over *or*.

### 1.3 Syntactic constituency and semantic scope

#### 1.3.1 Clausal and subclausal coordination

In **clausal coordination** the bare coordinates are full main clauses; other cases we refer to as **subclausal coordination**.

##### ■ Semantic equivalence

In the absence of special factors, a subclausal coordination is semantically equivalent to the corresponding clausal coordination:

- |        |  |                |
|--------|--|----------------|
| [14] i | a. <i>There is a copy [on the desk and in the top drawer].</i>               | } [subclausal] |
|        | b. <i>They arrived [on [Tuesday or Wednesday].</i>                           |                |
|        | c. <i>He told me [who she was but not what she wanted].</i>                  |                |
| ii     | a. <i>There is a copy on the desk and there is a copy in the top drawer.</i> | } [clausal]    |
|        | b. <i>They arrived on Tuesday or they arrived on Wednesday.</i>              |                |
|        | c. <i>He told me who she was but he didn't tell me what she wanted.</i>      |                |

Example [ia] is equivalent to [iia], and similarly for the other pairs. Note that coordination of subordinate clauses, as in [ic], is subsumed under subclausal coordination: the coordinates, although themselves clauses, are nevertheless constituents of the main clause just as much as the coordinates of [ia–b], and in that sense are subclausal.

Given this equivalence, we will say that the semantic scope of the coordinator is the same in both cases. So although the coordination is syntactically subclausal in [14i] the semantic scope of the coordinator extends over the whole clause, just as it does in [ii]. It can also be convenient to speak of [i] as a **reduction** of [ii], or of [ii] as an **expansion** of [i], with the understanding that this does not imply that [i] is syntactically derived by ellipsis from [ii].

##### ■ Non-equivalence

There are also numerous cases where corresponding subclausal and clausal coordinations are not semantically equivalent. A typical example is found in:

- |        |   |                |
|--------|---|----------------|
| [15] i | <i>One candidate was [very young and very energetic].</i>                 | } [subclausal] |
| ii     | <i>One candidate was very young and one candidate was very energetic.</i> | } [clausal]    |

In [i] there is a single candidate with two properties, whereas [ii] implicates that the one who was very young and the one who was very energetic were different candidates. Again we will talk in terms of semantic scope: in [ii] *and* has scope over the determiner *one*, so that a referent for *one candidate* is selected independently in the two coordinates. But in [i] *one* has scope over *and*, so that the two properties are predicated of the same candidate. Where the coordination does not have scope over the whole clause we say that it has **narrow scope**, and it is precisely when subclausal coordination has narrow scope that it is not equivalent to clausal coordination.

Further examples of narrow scope coordination are given in:

- [16] i *No one* [*treats me like that and gets away with it*].  
 ii *Nothing is wrong with* [*the amplifier or the tuner*].  
 iii *Who* [*lives in college and has a car*]?  
 iv *Did she* [*go to the meeting and make her report*]?  
 v *The* [*first and most impressive*] *speaker was from Wales*.  
 vi *She'd like* [*a cricket bat or a tennis racquet*] *for her birthday*.

Example [i] doesn't say that no one treats me like that – but that no one gets away with it if they do. And [ii] is quite different from *Nothing is wrong with the amplifier or nothing is wrong with the tuner*, for the meaning is “Nothing is wrong with the amplifier **and** nothing is wrong with the tuner”. These two illustrate one of the most frequent cases where scope factors prevent expansion: the case where the coordinator is within the scope of a negative (to be discussed in §2.2.2). In [iii] interrogative *who* similarly has scope over *and*: it is a single question asking about a set of people combining two properties, whereas the clausal coordination *Who lives in college and who has a car?* is two questions, asking about two sets of people. Example [iv] likewise expresses a single question as to whether she both went to the meeting and made a report, whereas *Did she go to the meeting and did she make her report?* is two questions about two separate events. In [v] *and* falls within the scope of the definite article *the*, so that there is a single speaker with the twin properties of being first and being the most impressive. Finally, the salient interpretation of [vi] has *or* falling within the scope of *would like*: she is as if were offering a choice, she would be happy with either a cricket bat or a tennis racquet.<sup>3</sup>

### 1.3.2 Joint coordination (*Kim and Pat are a happy couple*)

A special case of narrow scope coordination is **joint coordination**, which contrasts with the default **distributive coordination**:

- [17] i *Kim and Pat know Greek*. [distributive]  
 ii *Kim and Pat are a happy couple*. [joint]

Example [i] is equivalent to *Kim knows Greek and Pat knows Greek*, but if we attempt to expand [ii] in the same way the result is incoherent: *\*Kim is a happy couple and Pat is a happy couple*. The difference is that knowing Greek applies to Kim and Pat **distributively**, i.e. individually or separately, but being a happy couple does not – it is Kim and Pat together, jointly, who are a happy couple (cf. Ch. 5, §5.1).

Further examples of joint coordination like [ii] are:

- [18] i *Kim and Pat are two of his best friends*.  
 ii *Kim and Pat disliked each other*.  
 iii *Kim and Pat went to Bonn and Paris respectively*.

Example [i] is like [17ii] in that the coordination is within the scope of the predicative complement: we must first form a set consisting of Kim and Pat before we can assign the properties “a happy couple” and “two of his best friends”. In [18ii] the coordination is within the scope of *each other* (*dislike each other* can only apply to a plural set) and

<sup>3</sup> Example [16vi] also has a less likely interpretation where *or* has scope over *would like*, and in this case it is equivalent to the clausal coordination *She'd like a cricket bat for her birthday or she'd like a tennis racquet for her birthday* (i.e. I'm not saying which she would like, with the implicature that I don't know).

in [iii] both coordinations are within the scope of *respectively* (hence the incoherence of \**Kim and Pat went to Bonn respectively* and \**Kim went to Bonn and Paris respectively*).

### ■ Ambiguity between distributive and joint coordination

Examples like the following allow both kinds of interpretation:

- [19] i *Kim and Pat are in love.*  
 ii *Kim and Pat are studying law and economics.*  
 iii *Kim and Pat told me they were going to New York.*

The distributive interpretation of [i] is equivalent to the clausal coordination *Kim is in love and Pat is in love*, while the joint interpretation is equivalent to *Kim and Pat are in love with each other*: the reciprocal relation can be implicit. And the same applies to the *respectively* relation, so that [ii] has not only the distributive reading “Kim is studying law and economics, and Pat is studying law and economics”, but also the joint one “Kim and Pat are studying law and economics respectively”. In the distributive interpretation of [iii] there were two acts of telling, one performed by Kim, the other by Pat, whereas in the joint reading there was a single act of telling. This might have been in a letter from the two of them, but it could also be that in fact just one of them actually said this to me: if they were both engaged in the conversation it would be perfectly reasonable to attribute the information to the two of them jointly.

### ■ Distinctive grammatical features of joint coordination

Joint coordination differs from other kinds of coordination in the following respects:

#### (a) Restriction to *and*

Joint coordination virtually requires *and* as coordinator:<sup>4</sup>

- [20] i *Kim or Pat will be going to Bonn.* [distributive]  
 ii \**Kim or Pat will be going to Bonn and Paris respectively.* [joint]

#### (b) Exclusion of correlative *both*

For most speakers at least, *both* is not permitted in joint coordination:

- [21] i *Both Kim and Pat are friends of his.* [distributive]  
 ii \**Both Kim and Pat are two of his best friends.* [joint]

#### (c) No expansion by modifier

*And* cannot be accompanied by any modifiers to the coordination, such as *too*, *as well*, *especially*, *probably*, etc.:

- [22] i *Kim and probably Pat too resented your intervention.* [distributive]  
 ii \**Kim and probably Pat too disliked each other.* [joint]

The ambiguity of [19i–ii] is resolved in favour of a distributive interpretation if they are amended in any of these respects: *Kim or Pat had been in love*; *Both Kim and Pat had been in love*; *Kim and probably Pat too had been in love*. But the restrictions do not apply to the narrow scope coordinations cited in §1.3.1: [15i], for example, can be manipulated to give *One of the candidates was very young and probably very energetic too*; *One of the candidates was both very young and very energetic*; *One of the candidates was very young but very energetic*. Note also the contrast between reflexive and reciprocal pronouns, at

<sup>4</sup>The qualification ‘virtually’ is needed because *or* is marginally possible in a narrow range of cases when the predicate contains some such word as *choice*: *Hamburgers or sausages is a miserable choice to have to make*.

least with respect to correlative *both*:

- [23] i *Both Kim and Pat had hurt themselves.* [reflexive: distributive]  
 ii *\*Both Kim and Pat had hurt each other.* [reciprocal: joint]

Example [i] is not strictly expandable (we can have *Kim had hurt herself and Pat had hurt himself* or the like, but this involves changing the pronoun and incorporating information about their sex that is not encoded in [i]). It is for such reasons that we prefer to contrast ‘joint’ with ‘distributive’ rather than ‘separable’: [i] doesn’t belong to the joint construction, but it is not separable in the sense of involving wide scope coordination.

### ■ Verb agreement

In addition to the above, there is a fourth grammatical property, singular agreement, that holds distinctively for certain special cases of joint coordination:

- [24] i *Two ham rolls and a glass of milk were hidden behind the lamp.* [distributive]  
 ii *Two ham rolls and a glass of milk was more than she wanted.* [joint]

The 3rd person singular verb-form *was* indicates that the subject is understood collectively as denoting a quantity – e.g. a quantity of food/drink to be consumed for lunch.

### ■ Other cases of joint coordination

Our examples so far have involved NP-coordinations in subject function, but joint coordination is found more widely than this.

In the first place, joint NP-coordinations occur in other functions besides subject:

- [25] i *I introduced Kim and Pat to each other.* [object]  
 ii *I sat between Kim and Pat.* [comp of preposition]

Secondly, the coordinates may belong to other categories:

- [26] i *He was eating and reading at the same time.* [verbs]  
 ii *The latter two were French and German respectively.* } [adjectives]  
 iii *He was wearing a black and white silk tie.* }  
 iv *Telling him you were busy and then going out dancing was a mistake.* [VPs]

Example [26i] is implicitly reciprocal in that the eating and reading were taking place at the same time as each other (this is the salient interpretation: it is just possible to take the coordination as distributive, with the events taking place at the same time as something specified in the preceding context). The joint interpretation of the coordination in [26ii] is due to the *respectively*, whereas that in [iii] reflects a “partly–partly” sense: we understand the tie in [iii] to be partly black and partly white. It is therefore quite different from the pragmatically unlikely *He was wearing a black tie and a white tie*, which has him wearing two ties. In [iv] what was a mistake was the combination of the two actions, not each of them individually; it is not equivalent to the clausal coordination *Telling me you were busy was a mistake and then going out dancing was a mistake* precisely because the latter says that the two actions were separately mistaken.

## 1.3.3 NPs with discrete set interpretations (*new and second-hand books*)

NPs containing a dependent with the form of a coordination may be interpreted as denoting discrete sets, each associated with a different coordinate. Compare:

- [27] i *They sell [new and second-hand books].* [discrete]  
 ii *They offer [new and highly sophisticated programs].* [not discrete]

In [i] we have two discrete sets of books, a set of new books and a set of second-hand books; in [ii], by contrast, we have a single set of programs, all of them being new and highly sophisticated. The difference reflects the fact that while *new* and *second-hand* denote mutually exclusive properties, *new* and *highly sophisticated* do not.

These examples involve count plural NPs, but the distinction is found also with non-count NPs: *They sell new and second-hand furniture* (discrete types of furniture) vs *They offer new and highly sophisticated software* (not discrete: the software is simultaneously new and highly sophisticated). A discrete interpretation is inconsistent with a count singular NP, though it is possible for the head of a count plural NP to be singular when the coordination includes determiners (§4.4) – compare *a new and a second-hand copy* (discrete: two copies, one new, one second-hand) and *a new and highly sophisticated program* (not discrete, a singular NP: one program, simultaneously new and highly sophisticated).

Discrete set interpretations can also be found when the dependent does not itself have the form of a coordination but contains a coordination within it:

- [28] i *It will be opposed by [the premiers of Queensland and Tasmania].* } [discrete]  
 ii *I need the names of [the hotels he stayed at in Rome and Paris].* }

These have discrete interpretations like [27i], but in the first the coordination is within the complement of *of* and in the second it is within the relative clause modifying *hotels*. The discrete interpretations here derive from the knowledge that Queensland and Tasmania are separate states and hence have separate premiers, that Rome and Paris are distinct cities and hence have different hotels (compare *the books he read in Rome and Paris*, where there is nothing to force a discrete interpretation).

#### ■ Discrete vs not discrete can't be identified with distributive vs joint

The distinction illustrated in [27] bears some resemblance to that between distributive and joint coordination, but there are several reasons for not identifying it with the latter:

##### (a) Lack of grammaticalisation

The distinction in [27] is not reflected grammatically in the same way as that between distributive and joint coordination – indeed it can hardly be said to be grammaticalised at all. Thus both cases allow modifiers and coordinators other than *and*: *They sell new but also second-hand books*; *They offer new but nevertheless thoroughly tested programs*. And while correlative *both* strongly favours a discrete interpretation (it could readily be inserted before *new* in [i] but hardly in [ii]), it nevertheless does not require a discrete interpretation in cases of post-modification:

- [29] i *Comments both favourable and critical had poured in.* [discrete]  
 ii *Comments both brief and to the point will be very welcome.* [not discrete]

##### (b) Relation with clausal coordination

Secondly, we do not find the same sharp difference as with distributive vs joint coordination when we compare with clausal coordination:

- [30] i *They sell new books and they sell second-hand books.*  
 ii *They offer new programs and they offer highly sophisticated programs.*

Example [30i] is equivalent to [27i], but [30ii] does not contrast with [27ii] in the way that *Kim is in love and Pat is in love* contrasts with the joint (reciprocal) interpretation of *Kim and*

*Pat are in love* ([19i]), for it quite readily allows an interpretation where two properties are assigned to a single set of programs.

(c) **Indeterminacy**

Consider also the range of contexts for such an example as

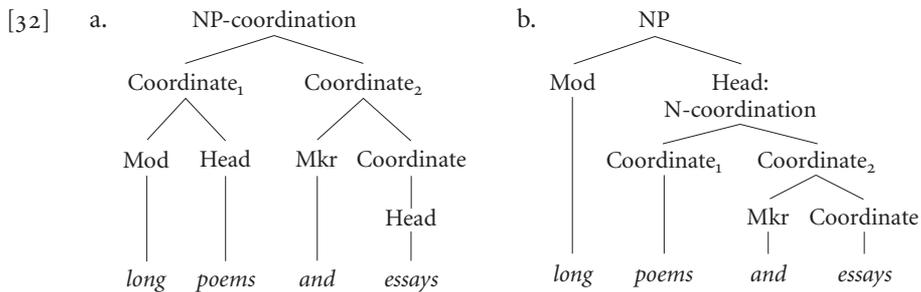

[31] *I have seen the films showing on Saturday and Sunday.*

If there is a single film showing each night, [31] will be interpreted discretely, as involving two separate films (otherwise singular *film* would be used). Suppose, however, there is more than one film each night: the Saturday and Sunday films may then be completely different (programs change on Sunday – a discrete interpretation) or completely the same (perhaps programs change on Thursday). But it is also possible that some change and others don't – there is partial overlap. And we also have the case where only one film is showing on Saturday but more than one on Sunday, or vice versa, again with or without a change. There is no reason to say that these numerous different scenarios yield different **meanings** for the NP: it simply gives no indication concerning the distribution of the films over the two days (the same applies to *the films showing at the week-end*, where there is no coordination). It is for this reason that [27ii] is labelled 'not discrete' rather than 'non-discrete': it doesn't say that the sets are discrete, but nor does it actually **say** that they are non-discrete.

### 1.3.4 Constituent structure and scope ambiguities (*long poems and essays*)

In sequences of the form 'Dependent–X<sub>1</sub>–C–X<sub>2</sub>' or 'X<sub>1</sub>–C–X<sub>2</sub>–Dependent', where C is a coordinator and X<sub>1</sub> and X<sub>2</sub> are elements of the same kind able to function as head to the dependent, there may be ambiguity according as the dependent applies to just the X element adjacent to it or to the coordination 'X<sub>1</sub>–C–X<sub>2</sub>'.

The NP *long poems and essays*, for example, can have either of the following (simplified) structures:

In [a] the dependent *long* belongs in the first coordinate and modifies just *poems*: this corresponds to the interpretation where the poems are long while the length of the essays is not specified. In [b] *long* modifies the coordination *poems and essays*, which matches the interpretation where both poems and essays are long: in this case the NP is equivalent to the NP-coordination *long poems and long essays*.

The example just given involves an adjective modifying a nominal head, but the structural contrast shown in [32] is found over a very wide range of dependent–head constructions, as indicated in the formulation given at the beginning of this section.

The range of the phenomenon is illustrated in the paired examples given below. In each pair, [a] has a salient interpretation where the dependent applies to just the adjacent ‘X’ element, and [b] one where it applies to the ‘X’ coordination: the constituent structures will thus be similar to [32i] and [32ii] respectively (or to their mirror images in cases where the dependent follows the head). Single underlining marks the dependent, double underlining the associated head: thus in [33ia] *extremely* modifies the adjective *rare* in [a] and the adjective-coordination *tired and irritable* in [b].

- [33] i a. It was [extremely rare or unique]. } [Mod-Adj]  
       b. He was [extremely tired and irritable]. }
- ii a. He did it [very hurriedly but satisfactorily]. } [Mod-Adv]  
       b. She spoke [very quickly and fluently]. }
- iii a. He [often goes to bed before nine and likes plenty of exercise]. } [Mod-VP]  
       b. He [often gets up at six and has a swim before breakfast]. }
- iv a. Yesterday Ed was taken ill and the lecture’s been cancelled. } [Mod-Clause]  
       b. Yesterday Ed was taken ill and the lecture was cancelled. }
- v a. women and children under sixteen } [N-Mod]  
       b. men and women over fifty }
- vi a. He [left and phoned his wife]. } [V-O]  
       b. He [hugged and kissed his wife]. }
- vii a. I [went to bed and read the paper for a while]. } [VP-Mod]  
       b. I [called the police and complained as soon as the party began]. }

Other things being equal, structure [b] – with the dependent applying to the coordination – is in general more likely. ‘Other things being equal’ requires that the dependent could apply equally readily to either ‘X’ element.<sup>5</sup> This condition is not met in four of the examples. In [33ia] the adjective *unique* is hardly gradable in this context: the choice must be between being extremely rare and being actually unique. In [iiiia] going to bed before nine is a serial state but liking plenty of exercise is a non-serial state, and hence resists modification by *often* (cf. Ch. 3, §3.2). In [iva] the first clause is in the preterite (*was*), while the second is present perfect (*has been*), and as such excludes the modifier *yesterday* (cf. Ch. 3, §5.3.1). And in [va] women are all adults and hence not under sixteen.

In [33iia] a type [b] reading is excluded by the contrary-to-expectation combination of *hurriedly* and *satisfactorily* marked by the coordinator *but*. Example [via] allows in principle a type [b] structure, but it is very unlikely because leaving one’s wife and phoning her are not normally comparable, the former being a major and drastic occurrence, the latter an everyday one. Finally in [viia] a type [b] interpretation is possible but unlikely because it is much more usual to go to bed, read for a while, and then go to sleep for the night than to go to bed, read for a while, and then get up.

<sup>5</sup>The ‘other things being equal’ proviso also implies the absence of special prosody: a sharp prosodic break after the first coordinate can signal a type [a] reading. Often, of course, this kind of interpretation can also be unambiguously conveyed by reversing the order: in *He was irritable and extremely tired*, for example, the dependent *extremely* clearly applies to *tired* alone.

## 1.4 Order of coordinates

### ■ Reversible and irreversible coordination

In the simplest cases, the order of bare coordinates is free, so that we can change the order without discernible effect on interpretation or acceptability:

- [34] i *She [was very bright and had a warm personality].* } [reversible: i = ii]  
 ii *She [had a warm personality and was very bright].* }

We say here, then, that the coordination is **reversible**. In many other cases, however, the coordination is **irreversible**, so that changing the order of the bare coordinates leads to a different interpretation or to loss of acceptability, as in:

- [35] i a. *She [fell ill and went back to her mother's].* } [irreversible: ia ≠ ib]  
 b. *She [went back to her mother's and fell ill].* }  
 ii a. *She had [far and away] the best outline.* } [irreversible: only iia is acceptable]  
 b. *\*She had [away and far] the best outline.* }

We interpret [ia] with the falling ill preceding the return to her mother's and [ib] with the opposite order of events, and in [ii] only [a] is acceptable since *far and away* is a fixed expression.

In this section we will consider certain general factors which cause the different orders to be less than fully interchangeable; certain more specific ones (such as that involved in [35i]) will be taken up in the discussion of the individual coordinators in §2.

### ■ Anaphora

Often, reversal is blocked for the simple reason that the second coordinate contains (or has as a supplement) an item explicitly or implicitly anaphoric to the first or to an element within it:

- [36] i *Her father had once lied to her and because of this she never really trusted him.*  
 ii *Jill was rich and Pat, moreover, was even richer.*

In [i] *this* has the first coordinate as antecedent and *him* has *her father*: since an anaphoric item and its antecedent cannot in general be located in successive coordinates, the order can only be as in [i] itself. The same applies with [ii], where there is implicit anaphora: the supplement *moreover* means roughly “besides this”, and *richer* is here understood as “richer than her”. Quite similar are cases like *I'll tell the truth and nothing but the truth* or *You and you alone will be held responsible*, where there is repetition rather than anaphoric reduction. The second coordinate must follow because it presupposes the first: *I'll tell nothing but the truth* presupposes that I'll tell the truth, and so on.

### ■ Lexicalised coordinations

A large number of coordinations – mainly pairs of words joined by *and* or *or* – are partially or fully lexicalised. The **fully lexicalised** ones constitute composite lexical items with the order completely fixed and with meanings generally not fully predictable from those of the coordinates and the coordinator:

- [37] *aid and abet*      *betwixt and between*      *by and large*      *common or garden*  
*first and foremost*      *hem and haw*      *high and dry*      *hither and yon*  
*let or hindrance*      *part and parcel*      *rhyme or reason*      *rough and ready*  
*rough and tumble*      *spick and span*      *to and fro*      *well and truly*

Some of these contain words that no longer occur in contemporary English other than in the coordination: *fro*, *hem*, *spick*, etc.

**Partially lexicalised** coordinations are combinations where the items regularly go together in a particular order; reversal is not impossible but represents a quite sharp departure from the expected order:

- [38]    *buy and sell*            *come and go*            *cup and saucer*        *cuts and bruises*  
           *fish and chips*        *for and against*        *friend and foe*        *head and shoulders*<sup>6</sup>  
           *hope and pray*        *husband and wife*     *life and death*        *loud and clear*  
           *mEEK and mILD*        *trIED and tESTED*

In both [37] and [38] the coordinates are often either near-synonyms (*trIED/tESTED*, *mEEK/mILD*, *firSt/foremost*) or opposites of one kind or another (*come/go*, *husband/wife*, *buy/sell*).<sup>7</sup>

### ■ Ordering tendencies

In many cases, the fixed or preferred order of coordinates in fully or partially lexicalised coordinations reflects certain tendencies that favour one order over another in ordinary, non-lexicalised coordinations too.<sup>8</sup>

#### (a) Temporal order

Coordinates denoting periods or points of time tend to be ordered so as to match the temporal order: *past*, *present*, and *future*; *yesterday*, *today*, and *tomorrow*; *the morning*, *afternoon*, and *evening*; *sooner or later*; *on Tuesday*, *Wednesday*, and *Friday*. Similarly with states ordered in time, as in *life and death*, or parts of a whole, as *beginning and end*.

#### (b) Spatial hierarchy

With items arranged on the vertical dimension, there is a tendency to put the higher before the lower: *up and down*, *upstairs and downstairs*, *upper and lower*, *above and below*, *head and shoulders*, *top and bottom*. It may be that this order reflects the greater salience of the higher in important cases like *above and below ground*, *above and below the horizon*, and arguably a similar salience hierarchy is reflected on the horizontal dimension in the ordering of *front and back*, *fore and aft*, etc.

#### (c) Deixis

The order in *here and there*, *hither and thither*, *now and then*, *this and that* reflects a deictic hierarchy, with the reference of the first coordinate being closer to the deictic centre, the time and place of the speech act. With the category of person, however, the hierarchy is overridden by a convention of politeness, which has 1st person in final position. Compare *you and your sister* (which accords with the hierarchy: 2nd person before 3rd) and *my sister and I* (reversing the hierarchy, with 3rd person before 1st).<sup>9</sup>

<sup>6</sup>This is fully lexicalised in its metaphorical sense: *This model is head and shoulders above the rest*.

<sup>7</sup>Comparable to lexicalisation is institutionalisation in the form of proper names – of books, public houses, organisations, etc. Many such names consist of or include coordinations, and the order of the coordinates is of course fixed as part of the name: *Pride and Prejudice*; *the Hare and Hounds*; *the Department of Employment, Education and Training*.

<sup>8</sup>Lexicalisation may also have been facilitated in expressions following certain phonologically favoured patterns, such as shorter before longer (in terms of number of syllables, *stuff and nonsense*, *out and about*, or length of vowel, *stress and strain*, *brush and comb*), high vowels before low in monosyllables (*dribs and drabs*, *fits and starts*), more sonorant before less sonorant initial consonant (*high and dry*, *hope and pray*).

<sup>9</sup>Non-standard *Me and my sister were alone* simply follows the deictic hierarchy. With time and space factors (a) and (b) may outweigh (c): *yesterday, today, and tomorrow*; *up there and down here*.

#### (d) Polarity and evaluation

Positive terms tend to precede negatives: *yes and no, admit or deny, accept or refuse, with or without*. The concepts of positive and negative are extended to many scales of evaluation, and it is again the positive (more highly valued) term that tends to come first: *good and bad, for [better or worse], friend or foe, right or wrong*. The concepts are also relevant to pairs like *come and go* and *arrive and depart*, where the positive–negative contrast is a matter of being at a certain place and not being there.

#### (e) Social hierarchy

Another tendency is for the order to reflect social status: *employers and employees; officers and men; peers and commoners*. Two special cases of this hierarchy rank adults above children and males above females: *father and son; Mr and Mrs; the Duke and Duchess of Penzance; husband and wife; brothers and sisters; he or she; men, women, and children*. The male–female order is reversed, however, in *Ladies and Gentlemen; bride and groom; mums and dads*.<sup>10</sup> Precisely because the usual male–female order can be seen as reflecting the social hierarchy, it can be regarded as a case of ‘sexism’ in language – and it may then be consciously reversed for that reason; it has, however, received very much less attention and criticism than more obvious cases of sexist language such as the use of masculine terms like *he* to subsume females (Ch. 5, §17.2.4).

## 2 Coordinators and related linking items

Coordination, we have said, is a relation between elements of equal syntactic status, and as such contrasts with subordination, a relation between elements of unequal status, dependent and head. As so often, however, we find that while the central or prototypical cases of coordination and subordination are sharply distinct, there is no clear boundary between the peripheries of the constructions and therefore some uncertainty concerning the precise membership of the category of coordinators. In this section we will first outline the distinctive grammatical properties of prototypical coordination and its markers, and then consider in turn a range of linking items including those that are clear members of the coordinator category, others that lie at the periphery, and some with insufficient similarity to justify inclusion in the coordinator category.

### 2.1 Properties of prototypical coordinators

#### (a) Unlimited number of coordinates

Arguably the most important distinctive property of coordination is that there is no grammatical limit to the number of coordinates that can be joined in a single layer of coordination.

<sup>10</sup>The order in *Ladies and Gentlemen* is widely felt to be a matter of conventional politeness, though historically it may be related to the origin of *lady* as the female counterpart of *lord* and hence higher in the social hierarchy than *gentleman*. There is also a historical explanation for *bride and groom*: the second term derives from *bride's groom*, which followed *bride* because it is defined in terms of its relation to the latter. With names, the male–female hierarchy is likely to take second place to the pragmatic principle of ordering according to primary interest: in a context where Kim and Pat are married, for example, Kim's parents are likely to refer to them as *Kim and Pat*, Pat's as *Pat and Kim*, and so on.

- [1] i He invited Kim and Ed and Max and Pat and Tom and Bob and Sue and Di.  
 ii He invited Kim, Ed, Max, Pat, Tom, Bob, Sue, and Di.

These have eight coordinates, but clearly we could add as many more as we wished: the limits are set by style, comprehensibility, etc., not by grammar.

Coordinators are in this respect clearly distinct from prepositions and subordinators: repetition of these necessarily involves further layers of subordination. Compare, for example, coordinator *and* with preposition *of*. There are three possible structures for a sequence ‘*X and Y and Z*’, two with layering, one without (cf. §1.2), but for ‘*X of Y of Z*’ there are only two, both with layering:

- [2] a. LEFT-LAYERED                      b. RIGHT-LAYERED                      c. UNLAYERED
- 
- fish and chips and ice-cream      soup and fish and chips      beans (and) peas and carrots  
 works of art of value      threats of loss of face      [not possible with of]

In [a] *fish and chips* and *works of art* form a unit on the left, and in [b] *fish and chips* and *loss of face* form a unit on the right; but in [c] (where the first *and* is omissible) there is no such intermediate grouping – and *of* cannot occur in this kind of structure. Similarly with *if* + clause: *Stay indoors if it's wet, if you want* has a left-layered structure comparable to [a], and *Don't appoint him if he'd panic if there was a crisis* has a right-layered one comparable to [b], but there is no possibility of an unlayered sequence ‘*X (if) Y if Z*’. The clause subordinator *that* allows unlimited iteration in structures like *Kim said that Pat thought that you had recommended that we accept the offer*, but again this clearly involves layering (on the right). There is therefore no subordinative analogue of the unlayered multiple coordination [c].

### (b) Coordinates must be syntactically alike

Since coordination is a relation between elements of equal status, they must be syntactically alike. Just what this means is a question we take up in §3.1, but it is sufficient for present purposes to note that the coordinates are usually of the same syntactic category. Coordinators can thus be seen to contrast sharply with clause subordinators and prepositions, both of which relate a subordinate element to a superordinate one that can be syntactically quite unlike it:

- [3] i a. The [fact that he's a politician] makes it worse. } [clause subordinators]  
 b. He was [unsure whether to accept her offer]. }  
 ii a. His anger contrasted with his [mood before he'd seen them]. } [prepositions]  
 b. He [collapsed on hearing the news]. }

In [i] the clause subordinator *that* relates the finite clause *he's a politician* to the noun *fact*, while *whether* relates the infinitival clause *to accept her offer* to the adjective *unsure*. In [ii] the preposition *before* likewise relates a finite clause to a noun, *he'd seen them* to *mood*, while *on* relates non-finite *hearing the news* to finite *collapsed*. Substitution of coordinator *and* leads to complete unacceptability in all such cases – it requires

structures like *She's a doctor and he's a politician, I plan [to resign and to accept her offer]*, etc., where like is coordinated with like.

### (c) Wide range of categories that can be coordinated

Almost any syntactic category can be coordinated. The categories that can be related by a coordinator are thus considerably more numerous and diverse than those that can be related by a preposition.

#### Coordination of finite VPs

One category that occurs freely with coordinators but not with prepositions is that of finite VP:

- [4] i *She finished the report and went home.* [coordination]  
 ii *She finished the report before going home.* [subordination]

Finite *went home* is impossible in [ii],<sup>11</sup> while gerund-participial *going home* is excluded from [i] by the requirement that the coordinates be alike (both finite or both gerund-participial).

#### Coordination of nominals

A second category of elements that can occur readily with coordinators but not generally with prepositions is that of nominals, elements smaller than full NPs:

- [5] i *They found [her son and younger daughter].* [coordination]  
 ii *\*They found [her son with younger daughter].* [subordination]

In [i] the coordinates *son* and *younger daughter* are nominals, not NPs, for the determiner *her* is outside the coordination. The ungrammaticality of [ii] shows that the preposition *with* cannot similarly combine with a nominal, but requires a full NP: *They found her son with her younger daughter.*

### (d) Impossibility of fronting an expanded coordinate

A coordinator and its coordinate cannot be moved to front position. Note here the contrast between the coordinator *but* and the preposition *although*:

- [6] i a. *He joined the club but he had little spare time.* } [coordination]  
 b. *\*But he had little spare time he joined the club.* }  
 ii a. *He joined the club although he had little spare time.* } [subordination]  
 b. *Although he had little spare time he joined the club.* }

This restriction reflects the fact that the coordinates are of equal status. The structure we have assigned to a binary coordination is  $\text{Coordinate}_1 + \text{Coordinate}_2$ : the numerical subscripts indicate only the linear position, not a functional difference. There can therefore be no alternation between ' $\text{Coordinate}_1 + \text{Coordinate}_2$ ' and ' $\text{Coordinate}_2 + \text{Coordinate}_1$ ', for the latter is incoherent, given this interpretation of the subscripts.<sup>12</sup>

### (e) Across the board application of syntactic processes

A special consequence of the requirement that coordinates be syntactically alike is that certain syntactic processes must apply **across the board**, i.e. to each one of the

<sup>11</sup>We can have *She finished the report before she went home*, but the complement of the preposition is here a clause, not a finite VP.

<sup>12</sup>We can of course have *He had little spare time but he joined the club*, but this has exactly the same structure as [6i] ( $\text{Coordinate}_1 + \text{Coordinate}_2$ ); property (d) is concerned with expanded coordinates, not bare ones.

coordinates. Compare from this point of view the coordinative and subordinative constructions in:

- [7] i *They attended the dinner but they are not members.* [coordinator]  
 ii *They attended the dinner although they are not members.* [preposition]

If we relativise these and embed them as modifier within NP structure, we must relativise both clauses in [i], i.e. across the board, but only the superordinate clause in [ii]:

- [8] i *Those [who attended the dinner but who are not members] owe \$20.*  
 ii *Those [who attended the dinner although they are not members] owe \$20.*

The contrast here is very sharp: coordinates are treated alike, but a subordinate clause is unaffected by processes applying to its superordinate.

Compare now:

- [9] i a. *You recommended the book and she enjoyed it so much.*  
 b. *It was a cold, wet evening and she enjoyed the book so much.* } [coordination]  
 c. *He said that she enjoyed the book so much.* [subordination]  
 ii a. *the book [which you recommended and she enjoyed so much]*  
 b. *\*the book [which it was a cold, wet evening and she enjoyed so much]*  
 c. *the book [which he said that she enjoyed so much]*

This time, instead of a coordination of relative clauses, as in [8i], we have a coordination within a single relative construction, but the across the board requirement still holds. What it means here is that the relative pronoun *which* must relate to both coordinates: in [9iia] it is understood as object of both *recommended* and *enjoyed*. This is why [iib] is ungrammatical: the first coordinate is *it was a cold wet evening*, which is a complete clause, with no gap understood as linked to *which* (“the book”). The relative construction in [iic] also involves two clauses, but since they are related by subordination *which* does not have to have a role in each: it is understood simply as object of *enjoyed*.

For the same reason *which* cannot itself coordinate with a non-relative NP – compare *Kim and Pat invited them* and *\*I blame Kim, who and Pat invited them*. Similarly with other unbound dependency constructions such as open interrogatives: *\*Who and Pat invited them?*<sup>13</sup>

#### (f) Only one coordinator per coordinate

The coordinators are mutually exclusive, with a single coordinate containing at most one of them. This property distinguishes coordinators not from prepositions but from connective adverbs such as *yet*, *moreover*, etc.:

- [10] i *\*She was extremely bright and but very humble.* [coordinator + coordinator]  
 ii *She was extremely bright and yet very humble.* [coordinator + adverb]

There is a very sharp contrast here between the adverb *yet*, which can combine with *and* (as a modifier within the expanded coordinate) and *but*, which can't – we need *She was extremely bright but very humble*.

<sup>13</sup>An interesting exception to this constraint is seen in the attested example *Even Barbara, [between whom and Juliet there should by rights have existed a great awkwardness,] was in some ways easier to grasp than Frances*. Such exceptions would seem to be restricted to relative clauses containing a coordination functioning as complement to *between*.

## (g) Coordinators must occupy initial position

In expanded coordinates, the coordinator always comes first. Compare:

- |        |   |               |
|--------|---|---------------|
| [11] i | <i>It had rained all week <u>and</u> we were short of food.</i>         | [coordinator] |
| ii     | <i>It had rained all week; <u>moreover</u>, we were short of food.</i>  | }             |
| iii    | <i>It had rained all week; we were, <u>moreover</u>, short of food.</i> |               |
|        |   | [adverb]      |

Again, this property distinguishes coordinators from connective adverbs. The only position available to *and* in the second clause is the initial one shown in [i], but the adverb *moreover* can occur in a variety of positions, as illustrated in [ii–iii] (it could also occur after *we* or at the end of the clause).

The two most central coordinators are *and* and *or*: these have all the above properties. The next most important coordinator is *but*, which lacks property (a), however. *Nor* is also a clear member of the category. In addition, there are a few items, such as *as well as*, *plus*, etc., which in some uses have arguably been reanalysed to become marginal members of the coordinator category.

2.2 *And and or*

The relation between *and* and *or* is comparable to that between *all* and *some*—or universal and existential quantification (Ch. 5, §5.1). Compare:

- [12] a. *We'll invite [Kim, Pat, and Alex].*      b. *We'll invite [Kim, Pat, or Alex].*

Example [a] entails that we will invite **all** members of the set expressed by the coordination, while [b] says that we'll invite **some** member of that set. With *and* we are concerned with a set in its totality, whereas with *or* the members of the set are regarded as alternatives.

## 2.2.1 Logical conjunction and disjunction

We will focus first on clausal coordination of declaratives and subclausal coordination that is equivalent to it.

- |        |   |   |              |
|--------|---|---|--------------|
| [13] i | a. <i>He came to work by bus today <u>and</u> he has gone home early.</i> | } | [clausal]    |
|        | b. <i>He came to work by bus today <u>or</u> he has gone home early.</i>  |   |              |
| ii     | a. <i>There is a copy [on the desk <u>and</u> in the top drawer].</i>     | } | [subclausal] |
|        | b. <i>There is a copy [on the desk <u>or</u> in the top drawer].</i>      |   |              |

In [i] the bare coordinates express the simple propositions “He came to work by bus today” and “He has gone home early”, while the whole coordination expresses a composite proposition containing the two simple ones. In [ia], where the coordinates are joined by *and*, the composite proposition is true if and only if **both** simple propositions are true; in [ib], where they are joined by *or*, the composite proposition is true if and only if **either** simple proposition is true. Because the subclausal coordination in [ii] is equivalent to clausal coordination we can handle these examples in the same way: [iia] is true if and only if both simple propositions (“There is a copy on the desk” and “There is a copy in the top drawer”) are true, while [iib] is true if and only if either of them is true.<sup>14</sup>

<sup>14</sup>When we talk of a clause or clause-coordination being true, this is a shorthand way of saying that the proposition that in some context it is or can be used to assert is true.

*Or* is most characteristically used when the speaker believes that only one of the component propositions is true. A plausible context for [13ib], for example, is one where his car is not in the place it would be expected to be if he had come to work by car and had not yet gone home: I am offering alternative explanations for the absence of the car, not envisaging the possibility that both might apply. And with [iib] it may well be that I have in mind a single copy that is in one or other location – in this case the component propositions are mutually exclusive, just as they are in *Kim is in the study or in the rumpus-room*.

But *or* doesn't **mean** that only one of the alternatives is true. Example [13ib] doesn't explicitly exclude the possibility that both explanations apply. And if we modify our contextualisation of [iib] so that there could be more than one copy, then the possibility arises of there being a copy in both locations. *There's a copy in the office or in the library*, for example, is perfectly consistent with both component propositions being true – and indeed I might say it knowing that both are true, using *or* rather than *and* because I'm thinking of a choice as to which copy to consult.

We will take up this point below, arguing that the 'only one' feature commonly associated with *or* has the status of an implicature. And where we have this implicature that only one of the component propositions is true, there will generally be a further implicature that the speaker doesn't know which it is. If I utter [13iib] in a context where there is only one copy, for example, you will normally assume that I don't know precisely where it is, whether on the desk or in the top drawer – because if I did know I would surely tell. But, very clearly, this is again not part of the meaning of *or* but a matter of pragmatics. There is, for example, nothing anomalous about *The question in Part 2 is on Molière or Racine, but I'm not telling you any more than that*. The second clause implicates that I do know which of the alternatives is the true one, and yet it is quite consistent with the *or* in the first clause – the *but* clause here cancels or blocks the "I don't know which" implicature commonly found with *or*.

The collective and alternative relations expressed by *and* and *or* in such examples as [13] correspond closely to the relations known to logicians as **conjunction** and **disjunction**. These are operations on propositions that are entirely defined by their effects on truth; the truth value of a proposition formed by conjunction or disjunction is fully determined by the truth values of the component propositions.

### ■ Conjunction

Suppose "P" and "Q" are two propositions. The logical conjunction of "P" and "Q" is often symbolised as "P & Q". By the definition of conjunction, "P & Q" is true if and only if both "P" and "Q" are true. In all other circumstances, "P & Q" is false. This matches what we said above about the coordinations with *and*. In [13ia] "P" = "He came to work by bus today" and "Q" = "He has gone home early", and the whole coordination is true if and only if both of these propositions are true, and likewise in [iia], with "P" now having the value "There is a copy on the desk", and "Q" the value "There is a copy in the top drawer".

### ■ Inclusive and exclusive disjunction

Logicians distinguish two kinds of disjunction: **inclusive** and **exclusive** disjunction. The inclusive disjunction of "P" and "Q" is often written "P ∨ Q". It is true if and only if at least one of the propositions "P" and "Q" is true. The exclusive disjunction of "P" and "Q" will be written here as "P ⊕ Q". It is true if and only if exactly one of "P" and "Q" is true.

### ■ Truth tables for conjunction and disjunction

Because these definitions are given entirely in terms of conditions under which propositions are true, we can express them in the form of truth tables. We assume that “P” and “Q” can be true or false independently of each other. We list the four possible combinations of truth values for them at the left of the table, and then show the truth values that “P & Q”, “P ∨ Q”, and “P ⊄ Q” would have for each of the four combinations:

[14]	Truth values		Conjunction	Inclusive disjunction	Exclusive disjunction
	P	Q	P & Q	P ∨ Q	P ⊄ Q
i	true	true	true	true	false
ii	true	false	false	true	true
iii	false	true	false	true	true
iv	false	false	false	false	false

For example, row [i] of the table corresponds to a situation in which “P” and “Q” are both true. In such a situation, “P & Q” makes a true claim, as shown in the column labelled ‘Conjunction’; so does “P ∨ Q”, as shown in the ‘Inclusive disjunction’ column; but “P ⊄ Q” is false, as the final column indicates. Row [ii] covers the case where “P” is true but “Q” is false, and so on.

*And* in [13ia/iia], we have said, expresses conjunction: the whole coordination is true in situations corresponding to [14i] and false in situations corresponding to [14ii–iv]. *Or* in [13ib/iib] expresses **inclusive** disjunction: the coordinations are true in situations corresponding to [14i–iii] and false only in a situation like [iv] – i.e. for [13ib], in a context where he didn’t come to work by bus today and he hasn’t gone home early, or for [13iib], where there is no copy on the desk and no copy in the top drawer.

### ■ Exclusiveness as an implicature of *or*

Of the three contexts where these *or*-coordinations are true, the ones I am most likely to intend in uttering [13ib/iib] are those corresponding to [14ii–iii], where just one of the alternatives is true. Indeed, the alternatives joined by *or* are often mutually exclusive, or are intended by the speaker to be seen as mutually exclusive:

- [15] i *He was born on Christmas Day 1950 or 1951.*  
 ii *I shall walk or catch the bus.*  
 iii *You can have a pork chop or an omelette.*

In [i] we know that he can’t have been born on two different Christmas Days; in [ii] it will normally be a matter of going the whole distance on foot or taking the bus; and [iii] will generally be used to offer or report a choice between two alternatives. It does not follow, however, that *or* here expresses exclusive disjunction. We shall say, rather, that *or* expresses inclusive disjunction but that a statement with the form ‘*P or Q*’ is typically interpreted as carrying the implicature “P and Q are not both true”.

Some *or*-coordinations are clearly not inconsistent with situation [14i]:

- [16] i *There’s a copy in the office or in the library.*  
 ii *Either the mailman hasn’t got here yet or there’s no mail for us today.*

As noted above, [i] does not exclude the possibility that there’s a copy in the office and in the library – and we could indeed add *perhaps both*, explicitly allowing for it. Similarly<sup>15</sup>

<sup>15</sup> Compare also *They had contacted some or all of the witnesses*: in cases like this, if “Q” (“They had contacted all of the witnesses”) is true then “P” (“They had contacted some of them”) must be too (cf. Ch. 5, §5.2), so the choice is between contexts [14i] and [ii].

[ii] certainly does not rule out the case where the mailman is still on his way but has no mail for us. The *or* in [16] must be inclusive, which means that if we were to say that *or* expresses exclusive disjunction in [15] we would be saying that *or* is **ambiguous** between inclusive and exclusive meanings. There are, however, several reasons why it would not be satisfactory to handle the relation between [15] and [16] in terms of a difference between two meanings of *or*.

#### (a) Disambiguation

Assigning two meanings to *or* does not itself account for the exclusive interpretation of [15]: we would still have to show how *or* is disambiguated here, how we select one meaning, the exclusive one, rather than the other. In [15i], for example, the inclusive reading is ruled out by our knowledge that one cannot be born on successive Christmas Days. But instead of this knowledge selecting one meaning of *or* over another it can be seen as simply narrowing down the range of possible contexts for the whole coordination: *or* itself rules out only context [14iv] and our knowledge about the world (that you can't be born twice) further excludes context [14i].

#### (b) Not a matter of false vs true

If we analyse [15i] as having the logical form “ $P \vee Q$ ” and [16i], say, as “ $P \vee Q$ ”, we are saying that in context [14i] the former is false and the latter true, but this is not in fact how they differ. It is not that [15i] is **false** in this context, but that this context is not a practical possibility for [15i], so that the question of whether it is true in that context doesn't arise, or has no intuitively clear answer.

#### (c) Negation

Thirdly, and most importantly, a logically negated *or*-coordination is true only in context [14iv]:

- [17] i *There isn't a copy on the desk or in the top drawer.*  
 ii *I shan't walk or go by bus.*

These entail that both alternatives are false, i.e. “There isn't a copy on the desk and there isn't a copy in the top drawer”, “I shan't walk and I shan't go by bus”. Logical negation reverses the truth value, and the truth values for these examples are the reverse of those for inclusive disjunction, namely false, false, false, true for contexts [14i–iv] respectively. Thus [17ii], for example, is true only when “I shall walk” and “I shall go by bus” are both false, i.e. in context [14iv]. If the *or* of [15ii] expressed exclusive disjunction, [17ii] should have the values true, false, false, true, “Maybe I'll both walk and go by bus, maybe I'll do neither”, but that is clearly not what it means. It means I'll do neither. The force of this argument becomes even greater when we consider multiple *or*-coordination:

- [18] i *They will appoint Kim, Pat, or Alex to oversee the election.*  
 ii *They won't appoint Kim, Pat, or Alex to oversee the election.*

Although [i] will normally **convey** that they will appoint just one of Kim, Pat, and Alex, this is not what it **means**, for [ii] is not the negation of the proposition that they will appoint just one of them. If it were, it would mean that they will appoint all three of them, or any two, or none at all: in fact, of course, [ii] means simply that they will appoint none of them.

The “not and” implicature associated with *or* belongs to the family of scalar implicatures – it is, for example, closely comparable to the “not all” implicature of *some* (cf. Ch. 5, §5.2).

A scalar implicature arises when two items are arranged on a scale where one is ‘stronger’ than the other: use of the weaker one implicates the negation of the stronger. *And* is stronger than *or*: ‘*P and Q*’ entails ‘*P or Q*’ (since whenever ‘*P and Q*’ is true, i.e. in context [14i], ‘*P or Q*’ is true too) but ‘*P or Q*’ does not entail ‘*P and Q*’ (since ‘*P or Q*’ can be true while ‘*P and Q*’ is false, namely in contexts [14ii–iii]). In general we don’t use the weaker of two terms if we could use the stronger – e.g. we don’t generally say ‘*P or Q*’ if we know ‘*P and Q*’ to be true. If I know they appointed Kim and Pat to oversee the election, it will normally be inappropriate to say *They appointed Kim or Pat to oversee the election*, for this is likely to suggest that they appointed just one but that I don’t know which of the two it was. Similarly, if I intend to invite Kim and Pat to dinner, it is normally misleading to say *I’ll invite Kim or Pat to dinner*. The most likely reason for saying ‘*P or Q*’ rather than ‘*P and Q*’, therefore, is that the latter would be false, which leads to the “not and” implicature. But that isn’t the only reason for saying ‘*P or Q*’: it may be that I know that one or other of “P” and “Q” is true, but don’t know whether both are, as is likely to be the case in [16ii].

As usual, the implicature can be made explicit in a *but*-coordinate: *He’ll invite Kim or Pat, but not both* (comparable to *He’ll invite some of them, but not all*).<sup>16</sup> And it can be cancelled in similar ways: *He’ll invite Kim or Pat, perhaps both* (comparable to *He’ll invite some of them, perhaps all*).

#### ■ When or implicates “and”

In certain cases ‘*P or Q*’ has the opposite implicature, namely “P and Q”:

- [19] i *Houses are cheaper in Perth than in Sydney or Melbourne.*  
 ii *They are obtainable at Coles or Woolworths.*

In their salient interpretations, these are pragmatically equivalent to sentences with *and* instead of *or*.<sup>17</sup> The crucial feature is that although they present a choice it doesn’t matter to the speaker which alternative is chosen. In [i] there is a choice (hence *or*) between comparing Perth with Sydney and comparing it with Melbourne, but it makes sense to state that Perth is cheaper than whichever alternative you might pick only in one circumstance: that Perth is cheaper than both. Similarly in [ii] you have a choice between obtaining them at Coles and obtaining them at Woolworths, but this choice presupposes that both stores stock them; hence the implicature that they are obtainable at Coles **and** at Woolworths. This phenomenon occurs in the same contexts as those where *any* is pragmatically equivalent to *all* (Ch. 5, §7.5). Such contexts most commonly involve comparison, as in [i], or – with varying degrees of explicitness – the modality of possibility, as in [ii] (cf. also *She can speak French, German, or Russian*, and so on).

<sup>16</sup>This provides further evidence against saying that *or* expresses exclusive disjunction: if ‘*P or Q*’ has “not both P and Q” as part of its **meaning**, *but* should be inappropriate in ‘*P or Q but not both*’, for it implies contrast (§2.5). The implicature can also be cancelled by metalinguistic negation (as opposed to logical negation: Ch. 9, §1.2), as in *They didn’t appoint Kim OR Pat, they appointed BOTH*; metalinguistic negation of inclusive disjunction differs from logical negation of exclusive disjunction in that it doesn’t allow situations corresponding to [14iv].

<sup>17</sup>In a less likely interpretation the “not both” implicature applies, accompanied by an implication of ignorance – e.g., for [ii], “They are obtainable at one or other of Coles and Woolworths, but I don’t know (can’t remember) which”.

### ■ Or in questions

One special case where *or*-coordination is interpreted exclusively is the alternative question (Ch. 10, §4.4). In this type of question (which has an intonational rise on the initial coordinate, and fall on the final one) *or* is essential, whereas when it appears in other types of question it is merely incidental:

- |      |  |   |               |
|------|--|---|---------------|
| [20] | WITHOUT OR                               | WITH OR                                     |               |
|      | i a. [not possible: <i>or</i> essential] | b. <i>Would you like tea ↗ or coffee ↘?</i> | [alternative] |
|      | ii a. <i>Would you like a drink ↗?</i>   | b. <i>Would you like tea or coffee ↗?</i>   | [polar]       |
|      | iii a. <i>Who would like a drink?</i>    | b. <i>Who would like tea or coffee?</i>     | [variable]    |

In [ib] *or* does not appear in the answers, which are simply “I would like tea” and “I would like coffee” – they are presented as alternative answers, such that one and only one of them is true. “Both” is not a possible **answer** in that it rejects this presupposition of mutual exclusiveness. In [iib] and [iiib], *or* is retained in the answers: e.g. “Yes, I would like tea or coffee” and “No, I would not like tea or coffee” for [iib].<sup>18</sup>

#### 2.2.2 *And* and *or* in combination with negation

When a subclausal *or*-coordination falls within the scope of a negative, it is equivalent to an *and*-coordination of negative clauses:

- |      |   |                                      |
|------|---|--------------------------------------|
| [21] | i <i>I didn't like his mother <u>or</u> his father.</i>                 | } ["not A-or-B" = "not-A and not-B"] |
|      | ii <i>I didn't like his mother <u>and</u> I didn't like his father.</i> |                                      |

Similarly *He can't read or write* means “He can't read and he can't write”, *No one had seen Kim or Pat* means “No one had seen Kim and no one had seen Pat”, and so on.

Conversely, when a subclausal *and*-coordination falls within the scope of a negative it is equivalent to an *or*-coordination of negative clauses:

- |      |  |                                      |
|------|--|--------------------------------------|
| [22] | i <i>He isn't both treasurer <u>and</u> secretary.</i>     | } ["not A-and-B" = "not-A or not-B"] |
|      | ii <i>He isn't treasurer <u>or</u> he isn't secretary.</i> |                                      |

Note that both of [22i–ii] implicate that he is either treasurer or secretary. In the case of [ii] *or* triggers the usual “not and” implicature – that “He isn't treasurer” and “He isn't secretary” are not both true. It then follows from this that “He is treasurer” and “He is secretary” are not both false, i.e. that he is either treasurer or secretary. In the case of [i] the implicature that he is either treasurer or secretary derives from the familiar type of scalar implicature: [i] is weaker than *He isn't either treasurer or secretary* and hence implicates that the latter is not true.

Matters are complicated, however, by the fact that a negative does not always have scope over a following subclausal coordination. Whereas *and* falls within the scope of the negative in [22i], it is more often the other way round, with *and* having scope over the negative:

- |      |  |
|------|--|
| [23] | i <i>I didn't like his mother and father.</i>  |
|      | ii <i>I'm not free on Saturday and Sunday.</i> |

<sup>18</sup> It is nevertheless likely to be dropped from a **response** in the interests of greater informativeness: *Yes, thank you, I'd love some coffee*. For the contrast between answer and response, see Ch. 10, §4.1.

Natural interpretations are “I didn’t like his mother and I didn’t like his father” and “I’m not free on Saturday and I’m not free on Sunday (i.e. I’m not free this week-end)”. There is also a less salient reading in which the scopes are reversed, e.g. for [ii]: “I’m not free on **both** days” (with an implicature that I’m only free on one); this kind of interpretation characteristically has *and* stressed.

*Or* generally falls within the scope of a preceding negative, as in [21i], but wide scope readings are often possible as less likely interpretations:

[24] *He wasn’t at work on Monday or Tuesday.*

The salient interpretation is “He wasn’t at work on Monday and he wasn’t at work on Tuesday”, but it can also be read as “On Monday or Tuesday (I can’t remember precisely which day it was) he wasn’t at work”.<sup>19</sup>

*Not* cannot have scope over a coordination of full main clauses. In *He didn’t like it or he was in a hurry*, for example, the negative applies just to the first clause. To express negation of *or* and *and* we thus generally need coordination within a single main clause, either of phrases, as in [21i], or of subordinate clauses, as in *It’s not the case that he was being investigated by the fraud squad or that he had offered to resign* (equivalent to *He wasn’t being investigated by the police and he hadn’t offered to resign*).<sup>20</sup> Analogously for *and*.

### ■ Equivalences in conditionals

The equivalence between narrow scope *or* and wide scope *and* seen in [21] in the context of negation is found also in the context of explicit or implicit conditionals:

- [25] i a. *You’ll see more if you walk or cycle.*  
       b. *You’ll see more if you walk and if you cycle.*  
       ii a. *Those who are late or (who) are improperly dressed will be punished.*  
        b. *Those who are late and those who are improperly dressed will be punished.*

In [ia] *or* is within the scope of *if*, while in [iia] it is within a relative clause, but the whole construction is implicitly conditional, conveying “If anyone is late or improperly dressed they will be punished”, where *or* is again within the scope of *if*.

### 2.2.3 Asymmetric constructions, I: *and* (*He got up and had breakfast, etc.*)

Example [13iia], *There is a copy on the desk and in the top drawer*, is **symmetric** in that it is equivalent to *There is a copy in the top drawer and on the desk*, where the coordinates appear in the reverse order. Similarly for the corresponding example with *or* and indeed the other examples considered in §§2.2.1–2. We have noted, however, that the order of coordinates is not always reversible in this way, and where the different orders convey different meanings we will speak of the coordination as **asymmetric**. The fact that the orders are not interchangeable indicates that the linked

<sup>19</sup>If the coordination is moved to the front, as in this gloss, it will be unambiguously outside the scope of the negative. Expanding the second coordinate by a modifier can also give the coordination wide scope, as in *He wasn’t at work on Monday or perhaps Tuesday*.

<sup>20</sup>The qualification ‘generally’ is needed because there is another possibility, involving gapping (§4.2), as in *Kim hadn’t been at home on Monday or Pat on Tuesday*. Here *or* is within the scope of the negative in the first clause, so that the meaning is “Kim hadn’t been at home on Monday and Pat hadn’t been at home on Tuesday”.

terms are not, strictly speaking, of equal status, and hence the constructions concerned are not cases of prototypical coordination. We will see that they exhibit varying degrees of affinity with subordination: in particular, they do not always conform to the ‘across the board’ requirement that applies to symmetric coordination (cf. property (e) of §2.1).

We look first at asymmetric uses of *and* and then turn to *or* in §2.2.4.

### ■ Temporal sequence: ‘*X and Y*’ implicates “*X and then Y*”

Where the coordinates denote occurrences rather than states, the linear order generally reflects the temporal sequence of the events:

- [26] i *He got up and had breakfast.*  
 ii *I went over to Jill’s and we checked the proofs.*

We interpret [i] as “He got up and then had breakfast”, [ii] as “I went over to Jill’s and then we checked the proofs (there)”. Reversing the coordinates would reverse the sequence of events – *He had breakfast and got up*, for example, conveys that he had breakfast before getting up (i.e. he had breakfast in bed).

We analyse this “then” interpretation as an implicature, not part of a distinct meaning of *and*. There are three reasons for treating it in this way.

#### (a) Not dependent on *and*

The same implicature can be found across sentences with no coordinative link between them – e.g. if we substitute a full stop for *and* in [26ii].

#### (b) Variation in strength

The implicature varies in strength according to the context: for example, it is stronger in *In the afternoon I mowed the lawn and had a game of tennis* (narrating past events) than in *In the afternoon I will mow the lawn and have a game of tennis* (intended future events).

#### (c) Possibility of cancellation

Thirdly and most importantly, the implicature can be cancelled: *Before leaving town he handed in his resignation and phoned his wife, though I don’t know which he did first.*

Nevertheless, the temporal sequence can be treated as part of the propositional content of the utterance, as when I ask: *Did he get up and have breakfast, or have breakfast and get up?* Moreover, this is one of the places where we find some relaxation of the usual ‘across the board’ requirement – notably in coordinations of VPs where the first expresses motion: *I’ve mislaid the proofs which I had gone over to Jill’s and checked so carefully with her.*

### ■ Consequence: ‘*X and Y*’ implicates “*X and therefore Y*”

Another common implicature is that the event expressed in the second coordinate is not only later than that expressed in the first but also a consequence of it:

- [27] i *The principal came in and everybody immediately stopped talking.*  
 ii *I fell off the ladder and broke my leg.*

Here you will infer that the principal’s entrance caused everybody to stop talking, that I broke my leg as a result of falling off the ladder.

### ■ Condition: ‘X and Y’ implicates “if X then Y”

Closely related to consequence is condition, as in:

- [28] i *I express the slightest reservation and he accuses me of disloyalty.*  
 ii *Come over here and you’ll be able to see better.*  
 iii *Do that again and you’ll be fired.*

Example [i] is interpreted as “If I express the slightest reservation, he accuses me of disloyalty”. In the form given, it belongs to informal style, but a somewhat less restricted version is found with modal necessity added to the first coordinate: *I only have to express the slightest reservation and he accuses me of disloyalty*. Examples [ii–iii] illustrate the special case of the conditional implicature where the whole coordination has directive force (Ch. 10, §9.5). The implicature of [ii] is “If you come over here you’ll be able to see better”, which provides a reason for complying with the directive “Come over here”. Similarly, [iii] implicates “If you do that again you’ll be fired” but – assuming being fired is something you will want to avoid – this provides a reason for **not** complying with the apparent directive, so the end result is “Don’t do that again”. These examples have the form imperative + declarative; we also find two imperatives, as in *Join the Navy and see the world* (the fact that you’ll see the world if you join the Navy is an incentive for joining), or the first coordinate can be of another form used with directive force, as in *I suggest you come over here and then you’ll be able to see better*.

The logical link between conjunction and condition that facilitates the implicature is that both “P & Q” and “if P then Q” exclude the case where “P” is true and “Q” false, e.g. (for [28i]) where I express some slight reservation and he doesn’t accuse me of disloyalty.

### ■ Concession: ‘X and Y’ implicates “despite X, Y”

Here we have a “nevertheless/despite” relation between a second coordinate VP and the first:

- [29] i *You can eat as much of this as you like and not put on weight.*  
 ii *They expect us to get up at 3 a.m. and look bright and cheerful.*

This is the opposite of consequence: your not putting on weight will be in spite of your eating as much as you like, not the result of your doing so. Again the inequality of status is reflected syntactically by relaxation of the ‘across the board’ condition. This time, however, we find unmatched extractions from the first rather than second coordinate: *How much of this can one eat and not put on weight?*

### ■ Temporal inclusion: ‘X and Y’ implicates “X while Y”

In informal style *and* may be interpreted as “while”:

- [30] i *He came in and I was still asleep.*  
 ii *Did he come in and I was still asleep?*

The inequality of status is especially apparent in [ii], where the first clause is interrogative and the second declarative, and yet the whole is a single question: the question component has scope over the second clause just as it would if it were subordinate, as in *Did he come in while I was still asleep?*

### ■ Formulaic frames

Under this heading we include constructions of the form ‘X and Y’ where X is fixed (or nearly so), but Y is not, and the whole is partially idiomatic.

#### (a) *Nice/good and Adj/Adv*

- [31] i *The coffee is nice and hot.*  
 ii *He hit it good and hard.*

Example [i] is not understood in the same way as the ordinary coordination *The coffee is sweet and hot*: in the latter each coordinate expresses a property of the coffee, but in [i] *nice* applies rather to the heat (“It was nice by virtue of being hot, nicely hot, hot to a nice extent”), so that the interpretation is more like that of a subordinative construction than of a coordination. Compare also *It was nice and not too expensive* (ordinary) and *It was nice and cheap* (idiomatic – unless the *nice* and the *and* are each given prosodic prominence to mark the coordinates as of equal status). Only the ordinary case allows correlative *both*: *It was both nice and not too expensive*. Where the Y element is an adverb, as in [ii] (or *Take it nice and slowly*), the difference in status is reflected by a difference in syntactic category (adjective + adverb) – and thus only an idiomatic interpretation is available.<sup>21</sup>

#### (b) *Try / be sure and V*

- |      |   |  |           |
|------|---|--|-----------|
| [32] | PLAIN FORM + PLAIN FORM                           | PLAIN PRESENT + PLAIN FORM                             |           |
| i    | a. <i><u>Try</u> and not <u>be</u> so touchy.</i> | b. <i>We always <u>try</u> and <u>do</u> our best.</i> | [try]     |
| ii   | a. <i><u>Be</u> sure and <u>lock</u> up.</i>      | b. [not possible]                                      | [be sure] |

This is very different, semantically and syntactically, from the ordinary use of *and*. Note first that, unlike the clausal coordination *We always try and we do our best*, [ib] does not entail that we do our best. Secondly, this idiomatic construction is syntactically restricted so that *and* must immediately follow the lexical base *try*; this means that there can be no inflectional suffix and no adjuncts: *She always tries and does her best* and *We try hard and do our best* can only be ordinary coordinations. There are two forms that consist simply of the lexical base: the plain form, as in [ia], and the plain present tense, as in [ib]. But the verb following *and* is always a plain form, as is evident when we test with **be**: *We always try and be\*are helpful*. In spite of the *and*, therefore, this construction is subordinative, not coordinative: *and* introduces a non-finite complement of *try*. *And* can be replaced by the infinitival marker *to*, *and* being slightly more informal than *to*. *Be sure* works in the same way as *try*, except that the lexical base of **be** is only the plain form, so this time there is no plain present tense matching [ib]: *We are always sure and do our best* is not possible as an example of this construction (and unlikely as an ordinary coordination). Because the construction is subordinative, the across the board restriction does not apply: *This is something [that you must try / be sure and remedy].*

<sup>21</sup>The term ‘hendiadys’ is used for coordinations like [31], where the first coordinate is understood as modifying the second. In attributive position the *and* is omitted but we can still discern a difference between the idiomatic meaning of *I’d like a nice hot coffee* (“nicely hot, nice by virtue of being hot”) and the ordinary meaning of *I’d like a large hot coffee* (“a hot coffee that is large, i.e. a large serving of hot coffee”). With *good* the range of second coordinates is very small and adverbs are restricted to words which also belong to the adjective category, like *hard* in [31ii]. In the predicative adjective case *nice* can be replaced by such related items as *lovely* and *beautiful*: *It was lovely/beautiful and hot*.

(c) *Go and V*

- [33] i *The TV has gone and broken down.*  
 ii *He went and told the teacher.*

In this colloquial use of *go* the verb has lost its motional meaning and has a purely emotive role. The propositional content of [i] is simply “The TV has broken down”, with *go and* adding an overlay of disapproval, annoyance, surprise, or the like. *He went and told the teacher* can be interpreted in the same way, or else literally, with *go* retaining its sense of movement. In the idiomatic sense *go* must immediately precede *and*: *He went to the office and told the teacher*, for example, can only have the literal movement interpretation. Any inflectional form of *go* is possible, and the following verb must match: both past participles in [i], preterites in [ii]. In this respect it is closer to coordination than the *try and* construction, but again there is no across the board restriction: *What a mess he’s gone and made!* Even more colloquial is the multiple coordination *been and gone and + past participle* (*He’s been and gone and told the teacher*), which has only the emotive idiomatic meaning.

(d) *Sit (etc.) and V*

- [34] i *They sat and talked about the wedding.*  
 ii *Don’t just stand there and watch.*

The first verb here is a verb of posture/stance, most often *sit*, *stand*, or *lie*. These verbs also take gerund-participials: *They sat talking about the wedding*. The latter is equivalent to [i], but the more informal coordinative construction arguably gives greater prominence to the talking; the sitting is backgrounded, and the impossibility of reversing the coordinates (without a change of meaning) reflects the difference in prominence assigned to them.

(e) *Be an angel (etc.) and V*

- [35] i *Be an angel and make me some coffee.*  
 ii *Would you be an angel and make me some coffee?*

The two clauses here are of quite different pragmatic status: the second is the important one, the first having a role comparable to an adjunct like *kindly* or *please*. The first term allows for a range of alternatives to *an angel*: *a dear*, *a good boy/girl*, and so on. The coordinates can be imperative clauses, as in [i], or VPs within a clause used with indirect request force (Ch. 10, §9.6.1), as in [ii] – or in the reporting of a request: *She asked me to be an angel and make her some coffee*.

2.2.4 Asymmetric constructions, II: *or (Hurry up or we’ll be late, etc.)*

## ■ Condition: ‘X or Y’ implicates “if not X, then Y”

*Or*, like *and*, occurs in constructions with a conditional interpretation:

- [36] i *I’m leaving before the end or I’ll miss my train.*  
 ii *I left early or I would have missed my train.*  
 iii *Hurry up or we’ll be late.*  
 iv *Don’t do that again or you’ll be fired.*

With *or* the implicated condition is obtained by negating the first coordinate: “If I don’t leave before the end, I’ll miss my train”.<sup>22</sup> In [ii] the implied conditional is of the remote category, as indicated by the *would have*: “If I hadn’t left early I would have missed my train”, implicating that I did leave early and didn’t miss my train. Again, modal necessity will often figure in the first coordinate: *I must leave before the end or I’ll miss my train*; *I had to leave early or I would have missed my train*. In [iii–iv] the conditional interpretation provides a reason for complying with the directive given in the imperative: “Hurry up, because if you don’t we’ll be late”; “Don’t do that again, because if you don’t not do that again (i.e. if you don’t refrain from doing that again) you’ll be fired”. Note that [iv] arrives via a different route at the same result as [28iii]. With *or* the second coordinate is always presented as the less desirable alternative, and may be left unexpressed: *Do as I say, or else!*

The pragmatic inequality between the clauses is again reflected syntactically in the relaxation of the normal across the board requirement. In *She hadn’t spoken to John, [who had had to leave early or he would have missed his train]*, for example, the first clause is relative but the second is not, and doesn’t allow the replacement of *he* by *who*.

The logical link between coordination and condition is more direct with *or* than with *and*: “P or Q” says that one or other of the propositions is true, so if “P” isn’t, then “Q” must be – “P or Q” entails “If not P, then Q”.

#### ■ Numerical approximations: *two or three*

*Or*-coordinations like *two or three*, *four or five*, etc., are commonly used as approximations rather than sets of alternatives. *I have three or four letters to write* can be interpreted literally as “I have either three or four letters to write (I’m not quite sure which)” but it is more likely to be taken as an approximation, “I have a few letters to write, something like three”.

When *three* and *four* are taken as alternatives, they can be reversed, but the approximation interpretation is possible only where the smaller number comes first. With NPs we have a contrast between, say, *a glass or two*, an approximation, and *one glass or two*, a set of alternatives. *Three or so/thereabouts*, “about three”, and the like can only be irreversible approximations.<sup>23</sup>

#### 2.2.5 Coordinator-marked reduplication (*louder and louder, dozens and dozens*)

An idiomatic use of *and* is found in intensifying reduplication:

- [37] i *The noise grew louder and louder. She felt more and more confident.*  
 ii *I laughed and laughed and laughed. I’ve told you about it again and again.*  
 iii *I made dozens and dozens of mistakes. It rained for days and days.*

In [i] *and* joins inflectional comparatives (*louder*) or the marker *more* in analytic comparatives – and similarly *less* (*He was showing less and less interest in his family*). The meaning here is “progressively more/less”. In [ii] we have verbs and adverbs, with the reduplication conveying a high degree of continuity or repetition. Prepositions can work

<sup>22</sup>Note that in deriving the conditional implicature of [i] we have changed *I’m not leaving* to *I don’t leave*: this change reflects the different ways of referring to future time in conditionals and main clauses.

<sup>23</sup>For the use of *or* to present a revision, see the discussion of supplements in §5.2 below.

### ■ Distributional restrictions on correlative coordination

Correlative coordination is considerably more restricted in its distribution than the default non-correlative coordination.

#### (a) Largely excluded from position following a pre-head dependent

- [40] i \**It had been approved by [the both federal and state governments].*  
 ii \**Your speech must be [very either witty or brief].*

The inadmissible correlative coordinations (underlined) are here located after the dependent *the* in NP structure and after the dependent *very* in AdjP structure. The ungrammaticality can be removed by dropping either *the* or *both* from [i], *very* or *either* from [ii].<sup>26</sup>

#### (b) *Both* (unlike *either*) can't be used before first coordinate in main clause coordination

- [41] i \**Both he overslept and his bus was late.*  
 ii *Either he overslept or his bus was late.*

#### (c) *Both* excluded from joint coordination

- [42] i *Both Kim and Pat are happy.* [distributive]  
 ii \**Both Kim and Pat are a happy couple.* [joint]

*Both* is also excluded from examples like *I want to see Kim and no-one else / Kim and only Kim*, where the second coordinate serves to exclude everyone other than Kim.

#### (d) *Either* excluded from alternative questions

- [43] i *Are they coming on either Monday or Tuesday?*  
 ii \**Are you either coming or not?*

Example [i] can only be a polar question, one with *Yes* and *No* as answers, while [ii] is simply inadmissible.

#### (e) Generally excluded from coordinations with asymmetric *and* and *or*

*Both* and *either* tend to emphasise the equality of the coordinates and hence do not in general combine with the asymmetric uses of *and* and *or* described in §§2.2.3–4 above. As we noted, *The coffee is both nice and hot* is not possible except as an ordinary coordination, assigning two separate properties to the coffee, and *He has both gone and told the teacher* likewise has only a literal interpretation. In *He both got up and had breakfast* and *I both fell off the ladder and broke my leg* the *both* is unexpected, and calls into question the temporal sequence and consequence implicatures of the versions without *both*. Similarly *either two or three* can't be used as an approximation like *two or three*, but presents two alternatives. There is, however, one asymmetric use of *or* that permits *either* in certain cases – the one where it has a conditional and directive interpretation, as in *Either you tidy your room or you lose your pocket money*. The *either* here reinforces the implicature (“Tidy your room!”) by emphasising that there is no third alternative.

<sup>26</sup>Under certain conditions correlative coordination is possible in this position: *A similar [both very negative and very positive] appraisal of the theoretical importance of such research may be found in Jones (1982); It was clearly an [either misinformed or else simply malicious] suggestion.*

### ■ *Either and the exclusiveness implicature*

*Either* emphasises that one of the coordinates must obtain, and tends to strengthen the exclusive implicature that only one of them does. *I'll be seeing her on either Friday or Saturday* conveys somewhat more strongly than the version without *either* that I'll be seeing her on just one of these days. Exclusiveness nevertheless is still only an implicature: *They are obtainable at either Coles or Woolworths* emphasises the choice but, like the version without *either*, could readily be used in a context where they are obtainable at both stores.<sup>27</sup>

### ■ *Linear position of both and either*

The usual position for *both* and *either* is at the beginning of the first coordinate, as in all the above examples. They can, however, occur to the left of the basic position, as in [44i], or to the right, as in [44ii]:

- [44] i a. *This was made clear both to [the men] [and their employers].*  
 b. *He was quite taken by either my [cheek] [or cheerfulness].*  
 c. *They will either have to [reduce expenditure] [or increase their income].*  
 ii a. *[He both overslept] [and his bus was late].*  
 b. *Usually he [is either too busy to come with us] [or else has no money].*  
 c. *We must prevent rapid changes [in either the mixed liquor] [or in the effluent].*

The coordinates are enclosed in brackets, and the markers underlined. With placement to the left, the coordinator is separated from the first coordinate; with placement to the right (which is less common, especially with *both*) it occurs non-initially within it. The most frequent cases involve constructions containing a preposition, as in [44ia/iic], or a determiner, as in [44ib].

Placement in these non-basic positions is quite common, particularly with *either*, though usage manuals tend to regard it as stylistically undesirable. In some cases, it is the only possibility other than omission or reformulation. This is so in [44iia]: the version with *both* at the beginning of the first coordinate is the ungrammatical [41i] above. Similarly in [44ib] placement of *either* before *cheek* gives \**my either cheek or cheerfulness*, which violates constraint (a) above. Placement in non-basic position here can be avoided by repeating the determiner: *either my cheek or my cheerfulness*.<sup>28</sup>

By virtue of their ability to occur elsewhere than before the coordinate, *both* and *either* are clearly distinct from the coordinators. Given the relationship with the NP constructions shown in [38], we analyse them as determinatives which can realise the same function as coordinators. In some cases the position of the determinatives matches that of modifiers in clause structure: compare *It [will both solve the present problem] [and may also prevent future conflict]*, where *both* follows the auxiliary verb, like the modifier in *It will probably solve the present problem*.

<sup>27</sup> An explicitly inclusive *either* is found in this attested (but surely ungrammatical) example with *and/or*: \**The majority of the manufacturing firms were engaged in importing, either of materials and components for use in production and/or final goods to complement their product range*.

<sup>28</sup> In *I always find myself next to some oaf who either overflows onto my seat or who talks endlessly about his hideous life* the non-basic position can be avoided only by omitting the second *who*, for a further restriction on correlative coordination is that the initial marker cannot precede a relative clause.

*both*) it cannot occur initially in a coordination of main clauses:

- [48] i *She found it [neither surprising nor alarming].* [binary]  
 ii *He was [neither kind, handsome, nor rich].* [multiple]  
 iii *\*Neither did he oversleep nor was his bus late.* [main clause coordination]

### ■ Position of *neither*

Like *both* and *either*, *neither* can occur to the left or right of its basic position:

- [49] i *This serves the interests neither of [producers] [nor consumers].*  
 ii *[We are neither trying to keep out immigrants,] [nor are we favouring the well-to-do].*

Example [i] is again less favoured than *of neither producers nor consumers* (or *neither of producers nor of consumers*). The position of *neither* in [ii], however, is obligatory in view of the ungrammaticality of *\*Neither are we trying to keep out immigrants, nor are we favouring the well-to-do* (cf. [48iii]), but such structures are usually avoided in favour of subclausal coordination (*We are [neither trying to keep out immigrants] [nor favouring the well-to-do]*).

### ■ *Nor* as coordinator

*Nor* appears as a coordinator paired correlatively with *neither* ([50i]), or non-correlatively as a variant of *or* in negative contexts ([50ii]):

- [50] i a. [Neither Jill nor her husband] could help us.  
 b. A good conversationalist talks [neither too much nor too little].  
 ii a. *The change won't be [as abrupt as in 1958 nor as severe as in 1959].*  
 b. *No state shall have a share [less than 50% nor more than 70%].*  
 c. *Serious art is not [for the lazy, nor for the untrained].*

In [ii] *nor* could be replaced by *or*, which is much more common: the version with *nor* perhaps gives added emphasis to the negation. There is no possibility of adding *and* or *but* before *nor* here, and hence every reason to treat *nor* as a coordinator in [ii] as well as in [i]. The difference is that in [i] all the coordinates are marked as negative, whereas in the non-correlative [ii] the first coordinate (*as abrupt as in 1958*, etc.) is not marked as negative within the coordination itself, but falls within the scope of a preceding negative.

### ■ *Nor* with subject–auxiliary inversion

The following non-correlative use of *nor* differs from that in [50ii] in that *nor* is not here replaceable by *or*:

- [51] i *The Germans haven't yet replied; nor have the French.*  
 ii *He didn't attend the meeting, nor was he informed of its decisions.*  
 iii *He was one of those people who can't relax. Nor did he have many friends.*  
 iv *The hotel had good views and a private beach; nor were these its only attractions.*

In this use *nor* introduces a clause (normally a main clause) and triggers subject–auxiliary inversion. Some speakers allow a preceding *and* or *but* (cf. <sup>o</sup>*The Germans haven't yet replied and nor have the French*), so that for them *nor* here is a connective

adverb, like the *neither* that could replace it (. . . *and neither have the French*). For many, however, this *nor* cannot combine with *and* and *but*,<sup>30</sup> and hence is again best regarded as a coordinator, though it very often occurs in sentence-initial position, as in [51iii].

This use also differs from that in [50ii] with respect to polarity. In [50ii] the first coordinate is within the scope of a negative; in [51] the first clause is usually negative, as in [i–ii], but in relatively formal style it need not be. In [iii] the first clause contains a negative but it is within the subordinate clause: the main clause itself is syntactically positive, though it has an obvious negative entailment, “He couldn’t relax”. In [iv], however, the first clause is completely positive.

### ■ Analysis of *neither* and *nor*

All three of the following are logically equivalent:

- [52] i *She found it neither surprising nor alarming.* (= [48i])  
 ii *She didn't find it either surprising or alarming.*  
 iii *She found it both not surprising and not alarming.*

(The subclausal coordination in [iii] is in turn equivalent to clausal *She didn't find it surprising and she didn't find it alarming*.) It is tempting to analyse [i] as related to [ii] by the incorporation of the negative into *either . . . or*, reflecting the transparent morphological structure of *neither* as *n + either* and *nor* as *n + or*. This matches the analysis suggested for the adverb *neither* in [47]. The only difference is that while there is only one negative in [52ii], in [52i] the negative appears in both coordinates – but this could be regarded as a kind of negative agreement.

However, while the semantic analysis of *nor* as “not-or” is perfectly consistent with [50], it does not cater for all the cases of *nor* seen in [51]. It would be possible to regard [51i–ii] as negated disjunctions (“It isn’t the case either that the Germans have replied or that the French have”), but a paraphrase like this is not possible in [51iii–iv], because the first clauses here are positive, as we have seen. It appears then that under the influence of the equivalence between negated disjunction and conjunction of negatives, *nor* has been reanalysed as “and-not”, or “also-not”.

## 2.5 *But*

*But* belongs to several categories: it is a coordinator in *He tried but failed*, a preposition in *I couldn't have done it but for your help*, an adverb in *He is but a child*, a noun in *Let's have no more buts*. We focus here of course on *but* as a coordinator, but we will see at the end of the section that the distinction between coordinator and preposition uses is not sharply drawn.

### ■ Adversative coordination

As a coordinator *but* characteristically has an adversative meaning, indicating a contrast between the coordinates:

- [53] i *Kim left at six but Pat stayed on till noon.*  
 ii *My parents enjoyed the show but I didn't like it at all.*  
 iii *He wasn't [at all arrogant but on the contrary quite unassuming].*  
 iv *He has [many acquaintances but few friends].*  
 v *She likes [not only opera but also chamber music].*

<sup>30</sup>This is particularly so in AmE, but in other varieties too we find coordinator + *neither* much more often than coordinator + *nor*.
