# Notational conventions

## Abbreviations of grammatical terms and special symbols

Where appropriate, page references are given to the initial explanation. For the symbols used in phonological representations, see p. 13.

A	adjunct
Adj	adjective
AdjP	adjective phrase
Adv	adverb
AdvP	adverb phrase
AmE	American English
AusE	Australian English
BrE	British English
C, Comp	complement
Coord	coordinate
d	dependent
D	determinative
declar	declarative
Det	determiner
DP	determinative phrase
exclam	exclamative
FCF	final combining form (p. 1661)
GEN	genitive
h	head
IC	immediate constituent
ICF	initial combining form (p. 1661)
impve	imperative
interrog	interrogative
LOC	locative
Mkr	marker
Mod	modifier
N	noun
N/A	not applicable
N/D	non-distinctive
Nec	necessity (p. 176)
Nom	nominal
NP	noun phrase
NPI	negatively-oriented polarity-sensitive item (p. 822)
NZE	New Zealand English

o	oblique
O	object
O <sup>d</sup>	direct object
O <sup>i</sup>	indirect object
O <sub>ditrans</sub>	object of ditransitive (pp. 296–7)
O <sub>mono</sub>	object of monotransitive (pp. 296–7)
O <sub>trans</sub>	object of transitive (pp. 296–7)
P	predicator
PC, PredComp	predicative complement
pl	plural
Poss	possibility (p. 176)
PP	preposition phrase
Prep	preposition
PPI	positively-oriented polarity-sensitive item (p. 822)
Q–A	question–answer (p. 897)
REL	relative
S	subject
S <sub>intr</sub>	subject of intransitive (pp. 296–7)
S <sub>trans</sub>	subject of transitive (pp. 296–7)
sg	singular
Subj-det	subject-determiner
T <sub>d</sub>	deictic time (p. 125)
T <sub>m</sub>	matrix time (p. 160)
T <sub>o</sub>	time of orientation (p. 125)
T <sub>r</sub>	time referred to (p. 125)
T <sub>sit</sub>	time of situation (p. 125)
univ	universal
V	verb
VGp	verb group (p. 1213)
VP	verb phrase
&	conjunction (logical) (p. 1294)
∨	inclusive disjunction (p. 1294)
⊄	exclusive disjunction (p. 1294)
<	is anterior to (p. 125)
>	(i) is greater/stronger than; (ii) is posterior to (p. 125); (iii) precedes (labile ordering constraint) (p. 452)
⊃	precedes (rigid ordering constraint) (p. 452)
~	(i) grammatical correspondence; (ii) the meaning of the morphological base (p. 1631)
X → Y; Y ← X	X is morphological source of Y (p. 1633)

## Presentation of examples

*Italics* are used for all expressions cited in orthography.

**Bold italics** are used to emphasise that we are citing a lexeme in abstraction from any of its inflectional forms, as in ‘the verb **go**’ (p. 27).

“Double quotation marks” enclose meanings, or propositions.

Underlining (single or double) and square brackets serve to highlight part of an example.

SMALL CAPITALS are used, where appropriate, to indicate focal stress: *I DID tell you.*

Arrows mark intonation, with ↗ representing a rising pitch, ↘ a falling pitch, as in *Is it a boy ↗ or a girl ↘?*

The symbol ‘—’, as in ‘*what Kim bought —*’, represents a gap (p. 49).

The symbol ‘·’ marks a morphological division within a word or a component part of a word, as in ‘*work·er·s*’ or ‘the suffix *·s*’.

Subscript indices, such as ‘*i*’ or ‘*j*’, mark pairs of items related as antecedent and anaphor (p. 49); thus in ‘*Jill<sub>i</sub> said she<sub>j</sub> would help*’, the pronoun *she* is to be interpreted as anaphoric to the antecedent *Jill*.

The following symbols indicate the status of examples (in the interpretation under consideration):

* ungrammatical	* <i>This books is mine.</i>
# semantically or pragmatically anomalous	# <i>We frightened the cheese.</i>
% grammatical in some dialect(s) only	% <i>He hadn’t many friends.</i>
? of questionable grammaticality	? <i>Sue he gave the key.</i>
! non-standard	! <i>I can’t hardly hear.</i>

The slash symbol ‘/’ separates alternatives: *The picture seemed excellent/distorted* represents an abbreviation of the two examples *The picture seemed excellent* and *The picture seemed distorted*. Similarly, *I asked you not to leave / \*to don’t leave until tomorrow* is an abbreviation of *I asked you not to leave until tomorrow* and *\*I asked you to don’t leave until tomorrow*. The slash is flanked by spaces unless both alternatives consist of a single word.

Parentheses enclose optional elements: *The error was overlooked (by Pat)* is an abbreviation of *The error was overlooked by Pat* and *The error was overlooked*.

The letters ‘A’ and ‘B’ represent different speakers in an interchange, as in A: *Where’s the key?* B: *It’s in the top drawer.*

## Specialist passages

Certain passages are set off from the main text by being printed in smaller type against a shaded background, as illustrated here. They are designed mainly for the specialist grammarian rather than the more general reader, being mostly concerned with linguistic argumentation in favour of the analysis presented in the main text. Such passages can be omitted without loss of continuity.

## Tree diagrams

Tree diagrams for the expressions listed in [1–40] below are given on the pages indicated. The conventions used in the diagrams are explained in the commentaries on [1] (the major concepts), [3] (for the ‘gap’ notation), and [8] (for the abbreviatory triangle).

- [1] *a bird hit the car* 20, 23, 26
- [2] *some children; children* 26
- [3] *Liz bought a watch; what Liz bought* 48
- [4] *what Max said Liz bought* 49
- [5] *he is ill; is he ill?* 50
- [6] *the old man; those Ministry of Defence officials* 329
- [7] *both those copies; the car alone* 331
- [8] *even all the preposterous salary from Lloyds that Bill gets* 332
- [9] *a number of protesters* 351
- [10] *few of her friends; someone I know; the second* 412
- [11] *Kim’s father; Kim’s* 468
- [12] *Mary’s careful analysis of the issues; Mary carefully analysed the issues* 473
- [13] *occasionally very offensive; quite unbelievably offensive* 548
- [14] *in front of the car* 620
- [15] *spoonful by spoonful* 632
- [16] *incredible though it seems* 633
- [17] *what size shoes; how big a hole* 911
- [18] *that your secretary might be leaving* 954
- [19] *which my neighbour gave me* 1038
- [20] *no candidate who scored 40% or more was ever failed* 1061
- [21] *they interviewed Jill, who had lent money to the victim* 1062
- [22] *what she wrote* 1073
- [23] *the others I know are genuine* 1085
- [24] *what you insisted that we need* 1089
- [25] *as Liz* 1113
- [26] *to lend him the money* 1185
- [27] *for you to lend him the money* 1187
- [28] *his/him constantly questioning my motives* 1190
- [29] *he was writing a letter* 1218
- [30] *Kim and Pat* 1277
- [31] *the guests and indeed his family too* 1278
- [32] *Kim and either Pat or Alex* 1278
- [33] *egg and bacon or stew; cakes and tea or coffee; pork, beef, or lamb* 1279
- [34] *long poems and essays* 1285

- [35] *fish and chips and ice-cream; works of art of value; soup and fish and chips; threats of loss of face; beans (and) peas and carrots* 1290
- [36] *both to the men and their employers* 1308
- [37] *gave \$100 to Kim and \$5 to Pat* 1342
- [38] *either telephoned or written a letter to his son's boss* 1345
- [39] *Jill sold her internet shares in January, a very astute move; the necklace, which her mother gave her, was in the safe* 1354
- [40] *ungentlemanly; disinterestedness* 1626

## Preface

This book aims to bridge the large gap that exists between traditional grammar and the partial descriptions of English grammar proposed by those working in the field of linguistics. We do not assume any familiarity with theoretical linguistics on the part of the reader and aim for as comprehensive a coverage as space allows, but we have made significant changes to the traditional analysis to take account of the progress that has been made by linguists in our understanding of English grammar.

The task of producing a new grammar of English that incorporates as many as possible of the insights achieved in modern linguistics is too great for two people, and we are fortunate to have been able to enlist the help of a team of distinguished linguists. A grammar, however, requires a very high degree of integration between the parts, so that it would not have been possible simply to put together a collection of papers by different scholars writing within their area of specialisation. Instead, one or both of us have worked closely with the other contributors in co-authoring the chapters concerned: we are grateful to them for their willingness to engage in this somewhat unusual kind of collaboration. They are not of course to be held responsible for any shortcomings in the description relating to topics whose primary coverage is in other chapters than those that bear their names.

The lengthy business of producing this grammar has occupied one of us (RDH) for over a decade, most of it full-time, and the other (GKP) part-time for over six years. Naturally, many intellectual and personal debts have piled up during the lengthy process of research, consultation, collaboration, writing, revising, and editing. We cannot hope to convey the full extent of these debts, but we will attempt to sketch the outlines of those that are the most central.

The project has benefited from the support and advice provided by a group of eminent linguists who served as a Board of Consultants: Barry Blake, Bernard Comrie, Greville Corbett, Edward Finegan, John Lyons, Peter Matthews, Keith Mitchell, Frank Palmer, John Payne, Neil Smith, Roland Sussex, and the late James D. McCawley.

During the first six years of the project, workshops were held regularly in Brisbane and Sydney to develop ideas for the framework and content of the grammar: we are grateful for the contributions to these workshops provided by Ray Cattell, Peter Collins, Peter Fries, David Lee, Pam Peters, and Peter Peterson. Pam Peters and staff at Macquarie University helped us with gathering data by providing online access to the Brown, ACE, and LOB corpora.

A number of scholars were good enough to let us have comments on one or more whole draft chapters: Barry Blake (a stalwart, who studied eight chapters with care), Bas Aarts, Francis Bond, Jill Bowie, Bernard Comrie, Greville Corbett, Annabel Cormack, David Denison, Edward Finegan, David Lee, James D. McCawley, Peter Matthews,

Keith Mitchell, Frank Palmer, Mário Perini, Peter Peterson, Aimo Seppänen, Neil Smith, and Mariangela Spinillo. Others commented on specific topics: Vic Dudman (tense, modality, conditionals), Peter Fries (verb inflection and auxiliaries); Janet Holmes and Anne Pauwels (gender); Henk Kylstra (numerals); John Lyons (clause type); Gregory Ward and Arnold Zwicky (unbounded dependencies). Edmund Weiner of Oxford University Press made available to us lexicographical data on *themselves*. Aimo Seppänen provided us with comments, draft material, and corpus examples on a wide range of topics, including extraposition, relative clauses and verb complementation. John Payne also contributed ideas on a considerable number of issues that lie outside the two chapters bearing his name. Frank Palmer and Roland Sussex gave invaluable advice on matters of presentation.

Some scholars who did not end up being full collaborators in the drafting of any particular chapter nonetheless provided crucial draft material for particular sections or for notes at various points in the book: Ray Cattell (on light verbs), David Denison (on issues in the history of English), and David Lee (on the meanings of prepositions). Jill Bowie and Tom Mylne worked for the project in a research support role, and did enormously useful work; we thank them warmly. Tom also played a major part in compiling the index, while James Huddleston provided valuable additional help with this massive task.

Our more general intellectual debts will, we hope, be obvious, though not as obvious as they would have been if we had been writing a linguistics monograph with literature citations rather than a descriptive grammar with none. It should be kept in mind that we have maintained strictly a policy of not interrupting our exposition at all with references to the grammatical literature or source citations for examples, even in the footnotes. Those who wish to see a brief summary listing of some of the literature that influenced us most and a few works that we would recommend for additional information should turn to our 'Further Reading' section at the end of the book.

Special mention should be made here, however, of the work of Randolph Quirk and his colleagues, whose Survey of English Usage and the series of grammars resulting from it culminated in the publication of *A Comprehensive Grammar of the English Language* in 1985. Although the present work often pursues a very different theoretical approach and analysis from that of Quirk *et al.*, their grammar proved an indispensable source of data and ideas. We might never have attempted this grammar if Quirk, Greenbaum, Leech and Svartvik had not pointed the way.

The University of Queensland provided a special projects grant to launch our work in 1989, while the Australian Research Council provided the major financial support in the form of two Large Grants covering the period 1990–1996 and a Senior Research Fellowship funding RDH's full-time involvement from 1994 to 1998. GKP's work involved five visits to the project's Australian headquarters totalling over a year, together with two sabbatical quarters in California. These were made financially possible by the Gladys Kriebel Delmas Foundation (New York), various grants programmes at the University of Queensland, Cambridge University Press, and the Division of Humanities and Department of Linguistics at the University of California, Santa Cruz.

We are also grateful to staff at Cambridge University Press, notably to Judith Ayling in the early part of the project and then to Kate Brett, who has provided invaluable support over the last few years. Thanks are due too to Leigh Mueller for her very thorough work as copy-editor.

Last of all, though only to ensure the pragmatic prominence associated with final constituents, we note that each of us is in the position of having married just a couple of years before starting work on this enormous task, and with some surprise we note that both our marriages have survived it. This is mainly because of great forbearance, resilience, unselfishness, supportiveness, and love supplied by our spouses.

Barbara Scholz faced five consecutive years of summertime choices between dislocation and desertion as her partner (GKP) decamped to Australia to work full-time on the grammar through the Australian winter. But through the years, whether she stayed behind or moved to Australia, she was unfailingly supportive and even enthusiastic about the project. Her generosity and fortitude is deeply appreciated.

Vivienne Huddleston provided an immense amount of warm hospitality to members of the project – in early years at the annual Brisbane workshops, and later to overseas contributors staying in her home for lengthy periods of collaboration with RDH. And she accepted with extraordinary patience and good humour prolonged and ever-increasing neglect during a writing process that went on three or four years longer than it was ever supposed to. And in the final stages of the work she provided more direct help with the proof-reading and indexing.

Both Vivienne and Barbara took a positive interest in the grammar itself, and we often derived benefit from examples they spotted or observations they made. We owe them more than could be expressed by the words of an acknowledgement note.

RDH · GKP

## 1 The aim of this book

This book is a description of the grammar of modern Standard English, providing a detailed account of the principles governing the construction of English words, phrases, clauses, and sentences. To be more specific, we give a synchronic, descriptive grammar of general-purpose, present-day, international Standard English.

### ■ Synchronic versus diachronic description

A **synchronic** description of a language is a snapshot of it at one point in time, the opposite of a **diachronic** or historical account. English has a rich history going back over a millennium, but it is not the aim of this book to detail it. We include only a few notes on historical points of interest that will assist the reader to understand the present state of the language.

Of course, at any given moment English speakers with birthdates spread over about a century are alive, so the idea of English as it is on one particular day is a fiction: the English used today was learned by some speakers at the end of the twentieth century and by others near the beginning. But our practice will be to illustrate relevant points mainly with examples of use of the language taken from prose produced since the mid twentieth century. Examples from earlier periods are used only when particularly apposite quotations are available for a point on which the language has not subsequently changed. Wherever grammatical change has clearly occurred, our aim will be not to describe the evolutionary process but rather to describe the current state of the language.

### ■ Description versus prescription

Our aim is to **describe** and not **prescribe**: we outline and illustrate the principles that govern the construction of words and sentences in the present-day language without recommending or condemning particular usage choices. Although this book may be (and we certainly hope it will be) of use in helping the user decide how to phrase things, it is not designed as a style guide or a usage manual. We report that sentences of some types are now widely found and used, but we will not advise you to use them. We state that sentences of some types are seldom encountered, or that usage manuals or language columnists or language teachers recommend against them, or that some form of words is normally found only in informal style or, conversely, is limited to rather formal style, but we will not tell you that you should avoid them or otherwise make recommendations about how you should speak or write. Rather, this book offers a description of the context common to all such decisions: the linguistic system itself.

### ■ General-purpose versus special-purpose

We exclude from consideration what we refer to as **special-purpose** varieties of the language. Newspaper headlines, road signs, notices, and the like have their own special styles of abbreviation (*Man bites dog, arrested; EXIT ONLY THIS LANE*), and we do not provide a full treatment of the possibilities. Likewise, we do not provide a description of any special notations (chemical formulae, telephone numbers, email addresses) or of the special language found in poetry, heraldic descriptions, scientific works, chemical compound naming, computer jargon, mathematical proofs, etc. To some small extent there may be idiosyncratic grammatical patterns found in such areas, but we generally set them aside, avoiding complicated digressions about usages found within only a very narrow range of discourse.

### ■ Present-day English versus earlier stages

Modern English is generally defined by historians of English to be the English used from 1776 onwards. The recent part of the latter period (say, since the Second World War) can be called Present-day English. Linguistic changes have occurred in the grammar of English during the Modern English period, and even during the last half-century. Our central aim is to describe Present-day English in its standard form. This means, for example, that we treat the pronoun system as not containing a contrast between familiar and respectful 2nd person pronouns: the contrast between *thou* and *you* has been lost, and we do not mention *thou* in this grammar. Of course, this does not mean that people who use *thou* (actors in period plays, people addressing God in prayers, or Quakers who have retained the older usage) are making a mistake; but they are not using the general-purpose standard Present-day English described in this book.

### ■ Grammar versus other components

A **grammar** of a language describes the principles or rules governing the form and meaning of words, phrases, clauses, and sentences. As such, it interacts with other components of a complete description: the **phonology** (covering the sound system), the **graphology** (the writing system: spelling and punctuation), the dictionary or **lexicon**, and the **semantics**.

Phonology and graphology do not receive attention in their own right here, but both have to be treated explicitly in the course of our description of inflection in Ch. 18 (we introduce the concepts that we will draw on in §3 of this chapter), and Ch. 20 deals with one aspect of the writing system in providing an outline account of the important system of punctuation.

A lexicon for a language deals with the vocabulary: it brings together information about the pronunciation, spelling, meaning, and grammatical properties of the **lexical items** – the words, and the items with special meanings that consist of more than one word, the idioms.

The study of conventional linguistic meaning is known as **semantics**. We take this to cut across the division between grammar and lexicon. That is, we distinguish between **lexical semantics**, which dictionaries cover, and **grammatical semantics**. Our account of grammatical meaning will be quite informal, but will distinguish between semantics (dealing with the meaning of sentences or words as determined by the language system itself) and **pragmatics** (which has to do with the use and interpretation of sentences

as used in particular contexts); an introduction to these and other concepts used in describing meaning is given in §5 of this chapter.

A grammar itself is divisible into two components, **syntax** and **morphology**. Syntax is concerned with the way words combine to form phrases, clauses, and sentences, while morphology deals with the formation of words. This division gives special prominence to the **word**, a unit which is also of major importance in the lexicon, the phonology and the graphology.

### ■ Standard versus non-standard

Perhaps the most subtle concept we have to rely on is the one that picks out the particular variety of Present-day English we describe, which we call Standard English. Briefly (for we will return to the topic below), we are describing the kind of English that is widely accepted in the countries of the world where English is the language of government, education, broadcasting, news publishing, entertainment, and other public discourse.

In a large number of countries (now running into scores), including some where most of the people have other languages as their first language, English is used for most printed books, magazines, newspapers, and public notices; for most radio and television broadcasting; for many or most film scripts, plays, poetry, and other literary art; for speeches, lectures, political addresses, proclamations, official ceremonies, advertisements, and other general announcements. In these countries there is a high degree of consensus about the appropriate variety of English to use. The consensus is confirmed by the decisions of broadcasting authorities about the kind of English that will be used for public information announcements, newscasts, commentaries to broadcasts of national events such as state funerals, and so on. It is confirmed by the writing found in magazines, newspapers, novels, and non-fiction books; by the editing and correcting that is done by the publishers of these; and by the way writers for the most part accept such editing and correcting of their work.

This is not to say that controversy cannot arise about points of grammar or usage. There is much dispute, and that is precisely the subject matter for prescriptive usage manuals. Nonetheless, the controversy about particular points stands out against a backdrop of remarkably widespread agreement about how sentences should be constructed for such purposes as publication, political communication, or government broadcasting. This widespread agreement defines what we are calling Standard English.

### ■ National versus international

Finally, we note that this book is not intended to promote any particular country's variety of Standard English as a norm; it is to apply internationally. English is the single most important language in the world, being the official or *de facto* language of the United Kingdom, the United States of America, Canada, Australia, New Zealand, South Africa, and dozens of others, and being the *lingua franca* of the Internet. Many varieties of English are spoken around the world – from lectures in graduate schools in Holland to parliamentary proceedings in Papua New Guinea – but interestingly the vast majority of the variation lies in pronunciation and vocabulary. The number of differences in grammar between different varieties of Standard English is very

small indeed relative to the full range of syntactic constructions and morphological word-forms.

Nevertheless, there undoubtedly are differences of this kind that need to be noted. For example, the use of the verb *do* following an auxiliary verb, as in <sup>%</sup>*I'm not sure that I'll go, but I may do* is not found in American English, and conversely the past participle verb-form *gotten*, as in <sup>%</sup>*I've just gotten a new car*, is distinctively American. We use the symbol <sup>%</sup> to mark constructions or forms that are restricted to some dialect or dialects in this way.

The regional dialects of Standard English in the world today can be divided into two large families with regional and historical affinities. One contains standard educated Southern British English, henceforth abbreviated **BrE**, together with a variety of related dialects, including most of the varieties of English in Great Britain, Australia, New Zealand, South Africa, and most other places in the British Commonwealth. The second dialect family we will refer to as American English, henceforth **AmE** – it contains the dialects of the United States, Canada, and associated territories, from Hawaii and Alaska to eastern Canada.

## 2 Prescriptivism, tradition, and the justification of grammars

The topic of prescriptivism and its relation to the long tradition of English grammatical scholarship needs some further discussion if the basis of our work, and its relation to other contributions to the field, is to be properly understood. It relates to the issue of how the statements of a grammar are justified: what the support for a claimed grammatical statement might be.

### 2.1 Prescriptive and descriptive approaches: goals and coverage

The distinction between the prescriptive and descriptive approaches to grammar is often explained by saying that prescriptivists want to tell you how you **ought** to speak and write, while descriptivists want to tell you how people actually **do** speak and write. This does bring out the major difference between the two approaches: it is a difference in goals. However, it is something of an oversimplification, because writing a descriptive grammar in practice involves a fair amount of idealisation: we need to abstract away from the errors that people make, especially in speech (this point is taken up again in §3 below). In addition, it glosses over some significant differences between the kinds of works prescriptivists and descriptivists characteristically produce.

#### ■ Differences in content

The basic difference in goals between prescriptive and descriptive works goes hand in hand with a striking difference in topics treated. The subject matters overlap, but many topics dealt with by prescriptive works find no place in a descriptive grammar, and some topics that must be treated in a descriptive grammar are universally ignored by prescriptive works.

The advice of prescriptivists is supplied in works of a type we will refer to as **usage manuals**. They are almost invariably arranged in the style of a dictionary, containing an

alphabetically arranged series of entries on topics where the issue of what is correct or acceptable is not altogether straightforward. In the first few pages of one usage manual we find entries on *abacus* (should the plural be *abaci*?), abbreviations (which ones are acceptable in formal writing?), *abdomen* (is the stress on the second syllable or the first?), *abduction* (how does it differ in meaning from *kidnapping*?), and so on. These points concern inflection, formal writing, pronunciation, and meaning, respectively, and on all of them a degree of variation and occasional uncertainty is encountered even among expert users of English. Not all of them would belong in a grammatical description. For example, our grammar does cover the plural of *abacus* (Ch. 18, §4.1.6), but it does not list abbreviations, or phonological topics like the placement of stress in English words, or lexical semantic topics like the distinction between *abduction* and *kidnapping*. These we take to be in the province of lexicon – matters for a dictionary rather than a grammar.

Usage manuals also give a great deal of attention to matters of style and effective expression that lie beyond the range of grammar as we understand it. Thus one prescriptive usage dictionary warns that *explore every avenue* is a tired cliché (and adds that it makes little sense, since exploration suggests a more challenging environment than an avenue); that the phrase *in this day and age* ‘should be avoided at all costs’; that *circling round* is tautologous (one can only circle by going round) and thus should not be used; and so on. Whether or not one thinks these are good pieces of advice, we do not take them to fall within the realm of grammar. A sentence like *In this day and age one must circle round and explore every avenue* may be loaded with careworn verbiage, or it may even be arrant nonsense, but there is absolutely nothing **grammatically** wrong with it.

There are also topics in a descriptive grammar that are uniformly ignored by prescriptivists. These include the most salient and well-known principles of syntax. Prescriptive works tend to be highly selective, dealing only with points on which people make mistakes (or what are commonly thought to be mistakes). They would never supply, for example, the grammatically important information that determinatives like *the* and *a* precede the noun they are associated with (*the house*, not *\*house the*),<sup>1</sup> or that modal auxiliaries like *can* and *must* are disallowed in infinitival clauses (*\*I’d like to can swim* is ungrammatical), or that in subordinate interrogative clauses the interrogative element comes at the front (so we get *She asked what we needed*, not *\*She asked we needed what*). Native speakers never get these things wrong, so no advice is needed.

## 2.2 Disagreement between descriptivist and prescriptivist work

Although descriptive grammars and prescriptive usage manuals differ in the range of topics they treat, there is no reason in principle why they should not agree on what they say about the topics they both treat. The fact they do not is interesting. There are several reasons for the lack of agreement. We deal with three of them here: (a) the basis in personal taste of some prescriptivist writers’ judgements; (b) the confusion of informality with ungrammaticality; and (c) certain invalid arguments sometimes appealed to by prescriptivists. These are extraneous features of prescriptive writing about language rather than inherent ones, and all three of them are less prevalent now than they were

<sup>1</sup>Throughout this book we use an asterisk to indicate that what follows is ungrammatical.

in the past. But older prescriptive works have exemplified them, and a few still do; their influence lingers on in the English-speaking educational world.

### (a) Taste tyranny

Some prescriptivist works present rules that have no basis in the way the language is actually used by the majority of its native speakers, and are not even claimed to have any such basis – as though the manual-writer’s own judgements of taste took precedence over those of any other speaker of the language. They expect all speakers to agree with their judgements, no matter what the facts of language use might show.

For example, one usage manual, discussing why it is (supposedly) incorrect to say *You need a driving instructor who you have confidence in*, states that ‘The accusative *whom* is necessary with the preposition *in*, though *whom* is a word strangely shunned by most English people.’ We take the implication to be that English people should not shun this word, since the writer (who is English) does not. But we are inclined to ask what grounds there could be for saying that *whom* is ‘necessary’ if most English people (or speakers of the English language) would avoid it.

The same book objects to *centre (a)round*, calling it incorrect, although ‘probably more frequently used than the correct *centre on*’. Again, we wonder how *centre (a)round* can be determined to be incorrect in English if it is indeed more commonly used by English speakers than what is allegedly correct. The boundary would appear to have been drawn in the wrong place.

Prescriptive works instantiating this kind of aesthetic authoritarianism provide no answer to such obvious questions. They simply assert that grammar dictates things, without supporting their claim from evidence. The basis for the recommendations offered appears to lie in the writer’s taste: the writer quoted above simply does not like to see *who* used where it is understood as the object of a preposition, and personally hates the expression *centre around*. What is going on here is a universalising of one person’s taste, a demand that everyone should agree with it and conform to it.

The descriptivist view would be that when most speakers use a form that our grammar says is incorrect, there is at least a *prima facie* case that it is the grammar that is wrong, not the speakers. And indeed, even in the work just quoted we find the remark that ‘*Alright* is common, and may in time become normal’, an acknowledgement that the language may change over time, and what begins as an isolated variant on a pattern may eventually become the new pattern. The descriptive grammarian will always adopt a stance of something more like this sort, thus making evidence relevant to the matter at hand. If what is involved were a matter of taste, all evidence would be beside the point. But under the descriptive viewpoint, grammar is not a matter of taste, nor of aesthetics.

This is not to say that the expression of personal aesthetic judgements is without utility. The writer of a book on usage might be someone famous for brilliant use of the language, someone eminently worthy of being followed in matters of taste and literary style. It might be very useful to have a compendium of such a person’s preferences and recommendations, and very sensible for a less expert writer to follow the recommendations of an acknowledged master of the writer’s craft (assuming such recommendations do reliably accord with the master’s practice). All we are pointing out is that where the author of an authoritarian usage manual departs from recommendations that agree with the way most people use the language, prescriptivist and descriptivist

form *I* that belongs to (very) formal style, while accusative *me* is neutral or informal (again, see Ch. 5, §16.2.1 for a fuller description of the facts). Confusing informality with ungrammaticality again, a strong prescriptivist tradition says that only [2a] is grammatical. The accusative *me* is claimed to be the case of the direct object, as in *It hurt me*, but in [2] the noun phrase after the verb is a predicative complement. In Latin, predicative complements take nominative, the same case as the subject. An assumption is being made that English grammar too requires nominative case for predicative complements. Use of the accusative *me* is regarded as a departure from the rules of grammar.

The mistake here, of course, is to assume that what holds in Latin grammar has to hold for English. English grammar differs on innumerable points from Latin grammar; there is no reason in principle why the assignment of case to predicative complements should not be one of them. After all, English is very different from Latin with respect to case: the nominative–accusative contrast applies to only a handful of pronouns (rather than to the full class of nouns, as in Latin). The right way to describe the present situation in Standard English (unlike Latin) is that with the pronouns that have a nominative–accusative case distinction, the choice between the cases for a predicative complement noun phrase varies according to the style level: the nominative is noticeably formal, the accusative is more or less neutral and always used in informal contexts.

Another kind of illegitimate argument is based on analogy between one area of grammar and another. Consider yet another construction where there is variation between nominative and accusative forms of pronouns:

- [3] a. *They invited me to lunch.*                      b. %*They invited my partner and I to lunch.*

The ‘%’ symbol is again used to mark the [b] example as typically used by some speakers of Standard English but not others, though this time it is not a matter of regional variation. The status of the construction in [b] differs from that of *It’s me*, which is undisputedly normal in informal use, and from that of <sup>1</sup>*Me and Kim saw her leave*, which is unquestionably non-standard. What is different is that examples like [b] are regularly used by a significant proportion of speakers of Standard English, and not generally thought by ordinary speakers to be non-standard; they pass unnoticed in broadcast speech all the time.

Prescriptivists, however, condemn the use illustrated by [3b], insisting that the ‘correct’ form is *They invited my partner and me to lunch*. And here again they seek to justify their claim that [3b] is ungrammatical by an implicit analogy, this time with other situations found in English, such as the example seen in [a]. In [a] the pronoun functions by itself as direct object of the verb and invariably appears in accusative case. What is different in [b] is that the direct object of the verb has the form of a coordination, not a single pronoun. Prescriptivists commonly take it for granted that this difference is irrelevant to case assignment. They argue that because we have an accusative in [a] we should also have an accusative in [b], so the nominative *I* is ungrammatical.

But why should we simply assume that the grammatical rules for case assignment cannot differentiate between a coordinated and a non-coordinated pronoun? As it happens, there is another place in English grammar where the rules are sensitive to this distinction – for virtually all speakers, not just some of them:

- [4] a. *I don’t know if you’re eligible.*                      b. \**I don’t know if she and you’re eligible.*

The sequence *you are* can be reduced to *you're* in [a], where *you* is subject, but not in [b], where the subject has the form of a coordination of pronouns. This shows us not only that a rule of English could apply differently to pronouns and coordinated pronouns, but that one rule actually does. If that is so, then a rule could likewise distinguish between [3a] and [3b]. The argument from analogy is illegitimate. Whether [3b] is treated as correct Standard English or not (a matter that we take up in Ch. 5, §16.2.2), it cannot be successfully argued to be incorrect simply by virtue of the analogy with [3a].

The claim that [1ib] (*It's clear who they had in mind*) is ungrammatical is supported by the same kind of analogical reasoning. In *They had me in mind*, we have accusative *me*, so it is assumed that the grammar likewise requires accusative *whom*. The assumption here is that the rules of case assignment are not sensitive to the difference in the position of the pronoun (after the verb for *me*, at the beginning of the clause for *who*), or to the difference between interrogative and personal pronouns. There is, however, no basis for assuming that the rules of grammar cannot make reference to such differences: the grammar of English could assign case to clause-initial and non-clause-initial pronouns, or to interrogative and non-interrogative pronouns, in slightly different ways.<sup>2</sup>

We should stress that not all prescriptive grammarians exhibit the shortcomings we have just catalogued – universalising taste judgements, confusing informality with ungrammaticality, citing spurious external justifications, and arguing from spurious analogies. There are usage manuals that are accurate in their understanding of the facts, clear-sighted in their attitudes towards usage trends, and useful in their recommendations; such books can be an enormous help to a writer. But the good prescriptive manuals respect a crucial tenet: that their criterion should always be the use of the standard language by its native speakers.

As we have said, to some extent good usage manuals go far beyond grammar into style, rhetoric, and communication, giving advice about which expressions are over-used clichés, or fail to make their intended point, or are unintentionally ambiguous, or perpetuate an unfortunate malapropism, or any of a large number of other matters that lie beyond the scope of this book. But when it comes to points of grammar, the only legitimate basis for an absolute judgement of incorrectness in a usage manual is that what is being rejected is **not in the standard language**.

The aspects of some prescriptivist works that we have discussed illustrate ways in which those works let their users down. Where being ungrammatical is confused with merely being informal, there is a danger that the student of English will not be taught how to speak in a normal informal way, but will sound stilted and unnatural, like an inexperienced reader reading something out from a book. And where analogies are used uncritically to predict grammatical properties, or Latin principles are taken to guarantee correct use of English, the user is simply being misled.

<sup>2</sup>A further type of invalid argument that falls under the present heading confuses grammar with logic. This is illustrated in the remarkably widespread but completely fallacious claim that non-standard *I didn't see nobody* is intrinsically inferior to standard *I didn't see anybody* because the two negatives cancel each other out. We discuss this issue in Ch. 9, §6.2.

The stipulations of incorrectness that will be genuinely useful to the student are those about what is actually not found in the standard language, particularly with respect to features widely recognised as characteristic of some definitely non-standard dialect. And in that case evidence from use of Standard English by the people who speak it and write it every day will show that it is not regularly used, which means prescriptive and descriptive accounts will not be in conflict, for evidence from use of the language is exactly what is relied upon by descriptive grammars such as we present here.

The evidence we use comes from several sources: our own intuitions as native speakers of the language; the reactions of other native speakers we consult when we are in doubt; data from computer corpora (machine-readable bodies of naturally occurring text),<sup>3</sup> and data presented in dictionaries and other scholarly work on grammar. We alternate between the different sources and cross-check them against each other, since intuitions can be misleading and texts can contain errors. Issues of interpretation often arise. But always, under the descriptive approach, claims about grammar will depend upon evidence.

### 3 Speech and writing

There are significant and interesting differences between spoken and written language, but we do not regard written English as a different language from spoken English. In general, we aim to describe both the written standard variety that is encountered in contemporary newspapers, magazines, and books and the spoken standard variety that is heard on radio and television programmes in English-speaking countries.

#### ■ ‘Speaker’ and ‘utterance’ as medium-neutral terms

Most of what we say will apply equally to the spoken and written varieties of the language. As there is no non-technical term covering both one who utters a sentence in speech and one who writes a sentence, we will follow the widespread practice in linguistics of extending the ordinary sense of ‘speaker’ so as to subsume ‘writer’ – a practice that reflects the fact that speech is in important respects more basic than writing.<sup>4</sup> We likewise take ‘utterance’ to be neutral between the mediums, so that we will refer to both spoken and written utterances.

#### ■ Practical bias towards written English

Despite our neutrality between speech and writing in principle, there are at least three reasons why the reader may perceive something of a bias in this work towards data from

<sup>3</sup>The computer corpora that we have made use of are the Brown corpus of a million words of American English; the Lancaster/Oslo/Bergen (LOB) corpus of British English; the Australian Corpus of English (ACE); and the *Wall Street Journal* corpus distributed by the Association for Computational Linguistics. The British National Corpus (BNC) was only released to scholars working outside the UK after the book was in final draft. We have also drawn on a variety of other sources, including collections of our own from sources such as magazines, newspapers, plays, books, and film scripts.

<sup>4</sup>Since our discussion of sentences will very often make reference to the way they are used we will have very frequent occasion to talk of speakers, and in order to avoid repeatedly using the term ‘speaker’ we will often simply use the 1st person pronoun *I*. Given that the book has joint authorship this pronoun could not be used in reference to any specific person, and hence is available as a convenient variant of ‘the speaker’.

written English. To the extent that it is present, it stems from practical considerations rather than matters of principle. We will discuss here the three factors motivating the choices we have made.

#### Citation of forms and examples

First, we normally follow the usual practice in grammars of citing words or sentences in their written form. This is mainly a matter of practical convenience: it is much more straightforward typographically, and more widely accessible to readers, to supply examples in this form. In certain cases – as, for example, in describing the inflectional forms of verbs and nouns in Ch. 18 – it is necessary to indicate the pronunciation, and for this purpose we use the system of transcription described in §3.1.2 below. Representations in written form are given in italics, while phonological representations are enclosed in obliques.

#### Accessibility of print sources

Second, we make frequent use of genuinely attested examples (often shortened or otherwise modified in ways not relevant to the point at issue), and it is significantly easier to obtain access to suitable large collections, or corpora, of written data in a conveniently archived and readily searchable form than it is for speech.

#### Error rates in speech

Third, and most importantly, it must be acknowledged that the error content of spoken material is higher than that of written material. Those who have listened to tape recordings of spontaneous conversation are likely to have been struck by the high incidence of hesitation noises, false starts, self-corrections, repetitions, and other dysfluencies found in the speech of many people. It is not hard to see why speech contains a higher number of errors than writing. The rapid production of speech (quite often several words per second) leaves little time for reflection on construction choices or planning of sentence structure, so that at normal conversational pace slip-ups of the kind mentioned are very common. As a result, what speakers actually come out with reflects only imperfectly the system that defines the spoken version of the language. Hardly noticed by the listener, and often compensated for by virtually unconscious repair strategies on the part of the speaker, these sporadic interruptions and imperfections in speech production are inherently outside the purview of the grammarian (the discipline of psycholinguistics studies them in order to learn about the planning, production, and perception of speech). They therefore have to be screened out through judicious decision-making by a skilled native speaker of the language before grammatical description is attempted. The original speaker is not always available for the tedious editing task, and so someone else has to interpret the transcript and remove the apparent errors, which means that misunderstandings can result (word sequences that were actually due to slips might be wrongly taken to represent grammatical facts).

Written English has the advantage that its slow rate of composition has generally allowed time and opportunity for nearly all these slips and failures of execution to be screened out by the actual author of the sentence. This provides a practical reason for us to show a preference for it when selecting illustrative examples: we have very good reason to believe that what ultimately gets printed corresponds fairly closely to what the writer intended to say.

The nature of the written medium and the slower sentence-planning environment permits the construction of longer sentences than typically occur in speech, but we take this to be a matter of degree, not a matter of written English instantiating new possibilities that are completely absent from the spoken language. The basic point of most written material is that people who are ordinary native speakers of the language should read it and understand it, so the pressure will always be in the direction of keeping it fairly close to the language in which (ignoring the speech errors referred to above) ordinary people talk to each other.

Thus while we acknowledge a tendency for the exemplification in this grammar to be biased towards written English, we assume that the goal of providing a description that is neutral between spoken and written English is not an unreasonable one. Sharp divergences between the syntax of speech and the syntax of writing, as opposed to differences that exist between styles within either the spoken or the written language, are rare to the point of non-existence.

### 3.1 The representation of English pronunciation

This section provides an introduction to the system of representation we use in this book in those cases where it is necessary to indicate the pronunciation of words or word sequences. Developing a system that will be readily usable by non-specialists is by no means a trivial enterprise; English has a remarkably complex vowel system compared to most other languages, and one of the most complex patterns of fit between sound and spelling found in any language. Taken together, these facts raise some significant and unavoidable difficulties even if only one variety of English is under consideration. But an additional problem is that English is a global language with something like 400 million native speakers pronouncing the language in many different ways: pronunciation differs across the world more than any other aspect of the language.

#### 3.1.1 Rhotic and non-rhotic accents

We will use the term **accent** for varieties of a language distinguished by pronunciation, opposing it to **dialect**, which applies to varieties distinguished by grammar or vocabulary. The most important accent distinction in English concerns the sound we represent as /r/. Most speakers in the BrE family of dialects have a **non-rhotic accent**: here /r/ occurs in **pre-vocalic** position, i.e. when immediately preceding a vowel, as in *run* or *area*, but not in **post-vocalic** position, after the vowel of a syllable. For example, in a non-rhotic accent there is no /r/ in any of the words in [1] (as pronounced in isolation):

- [1] i a. *mar, bear, floor, stir, actor*      b. *care, hire, bore, sure, cure*  
 ii a. *hard, torque, term, burn*      b. *hammered*

The words in [i] all end in a vowel sound, while those in [ii] end in a vowel followed by just one consonant sound; note that the letter *e* at the end of the words in [ib] and of *torque* in [iia], and also that before the *d* in [iib] are ‘silent’ – i.e. there is no vowel in this position in the spoken form. In many of the non-rhotic accents such pairs of words as *mar* and *ma*, *floor* and *flaw*, or *torque* and *talk* are pronounced the same. A non-rhotic accent is thus one which lacks post-vocalic /r/.

Most speakers in the AmE family of dialects, by contrast, have a **rhotic accent**, where there is no such restriction on the distribution of /r/: all the words in [1] are pronounced with an /r/ sound after the (final) vowel, or (in the case of *stir* and *term*) with a rhotacised ('r-coloured') vowel sound, a coalescence of /r/ with the vowel.<sup>5</sup>

The English spelling system reflects the pronunciation of rhotic accents: in non-rhotic accents post-vocalic /r/ has been lost as a result of a historical change that took place after the writing system became standardised.

### ■ Linking and intrusive /r/

A further difference between non-rhotic and rhotic accents is seen in the pronunciation of such words and word sequences as those given in [2], where we use the symbol '·' to mark grammatical boundaries within a word (in these examples, between base and suffix):

- [2] i a. *marr·ing, sur·est, soar·ing*                      b. *the fear of death*  
 ii a. *saw·ing, thaw·ing*                                      b. *the idea of death*

In non-rhotic accents the words in [ia] are all pronounced with /r/: the dropping of post-vocalic /r/ in the words *mar*, *sure*, *soar* does not apply here because the addition of a suffix beginning with a vowel makes the /r/ at the end of the base pre-vocalic. Similarly the word sequence [ib] is usually pronounced with an /r/ at the end of *fear* because the initial vowel of the next word makes it pre-vocalic.

The /r/ in pronunciations of [2i] in non-rhotic accents is called a **linking /r/**. Within a word, as in [ia], linking /r/ is obligatory; in word boundary position, as in [ib], the /r/ is optional though strongly preferred in most styles of speech. In [ii], where there is no *r* in the spelling, an /r/ pronounced at the end of the bases *saw·* and *thaw·* or of the word *idea* is called an **intrusive /r/**. Word-boundary intrusive /r/ in the pronunciation of sequences like [iib] is very common; word-internal intrusive /r/ in words like those in [iia] is much less common and quite widely disapproved of.

Rhotic accents do not have intrusive /r/ at all: they maintain a sharp distinction between [2i] and [ii], with /r/ appearing only in the former. And although they pronounce /r/ in the forms in [i], this is not linking /r/, since the bases *mar*, *sure*, *soar*, and *fear* have /r/ in these accents even when not followed by a vowel.

### 3.1.2 An accent-neutral phonological representation

Where we need to give pronunciations of words or larger expressions, it would be inconsistent with our goals to confine ourselves to one accent, but to attempt a complete listing of the pronunciations in each significant regional or other variety would be tedious. We therefore present here a unitary way of representing pronunciations for major BrE and AmE accents, whether rhotic or non-rhotic. For this purpose it is necessary to indicate more distinctions than would be needed in a system constructed for any one accent. In

<sup>5</sup>The correlation between the rhotic vs non-rhotic accent distinction and that between the BrE and AmE family of dialects is not perfect. Ireland, Scotland, the west of England, and some English-speaking Caribbean countries have rhotic accents and yet belong to the BrE family, and, conversely, there are various non-rhotic accents within the United States, including some working-class northeastern varieties and some upper-class southeastern varieties. The term 'rhotic' derives from the Greek name of the letter *r*.

particular, since it cannot be determined from the pronunciation in a non-rhotic accent where post-vocalic /r/ would occur in a rhotic one (for example, southern British English has /tɔ:k/ for both *torque* and *talk*), post-vocalic /r/ will have to be shown in some way even though it is not pronounced in the non-rhotic accents. Other differences have to be dealt with similarly.

The system we adopt is set out in [3], with illustrative examples in which the letter or letter sequence that symbolises the sound in question is underlined. Some notes on the system follow below.

## ■ Notes on the transcription system

### Post-vocalic /r/

This is represented by a superscript /<sup>r</sup>/. In rhotic AmE, it is pronounced as a separate /r/ consonant or coalesces with the preceding sound to give a rhotacised vowel. In non-rhotic BrE it is not pronounced at all – though, as we noted above, a word-final /<sup>r</sup>/ will typically be pronounced in connected speech as a pre-vocalic linking /r/ when followed by a word beginning with a vowel. Pre-vocalic /r/ corresponds to an *r* in the spelling. We do not include intrusive /r/ in our representations, since it is predictably present (between a low vowel or /ə/ and a following vowel) in those accents that have it.

### /ɪ/, /ə/, and /ɨ/

The unstressed vowel in the second syllable of *orange*, *wanted*, *wishes*, *lozenge*, etc., is a significant difficulty for an accent-neutral transcription. In BrE it is typically identical with the vowel of *kit*, which we represent as /ɪ/; in most AmE and some Australian varieties it is usually identical with the second vowel of *sofa*, /ə/. Many of its occurrences are in the inflectional endings; but there is one inflectional suffix in English that contains /ɪ/ in virtually all accents, namely *-ing*, and there are suffixes containing a vowel that is /ə/ in all accents (e.g. *-en* in *written*). Hence we need a third symbol for the vowel that varies between accents. We use /ɨ/. This has been used by American phonologists as a phonetic symbol for a vowel slightly less front than /ɪ/ and slightly higher than /ə/, so it is a good phonetic compromise, and visually suggests the /ɪ/ of those BrE accents that have a minimal contrast between *counted* /'kaʊntɪd/ and *countered* /'kaʊntəd/. It should be kept in mind, however, that it is used here not with an exact phonetic value but rather as a cover symbol for either /ɪ/ or /ə/ according to accent.

### /ɒ/ versus /ɑ/

For the vowel of *pot*, *rock*, *not*, etc., we use /ɒ/. Most varieties of AmE never have /ɒ/ phonetically in any context, so the American pronunciation can be derived simply by replacing our /ɒ/ by /ɑ/ everywhere. Hence there is no possibility of ambiguity.

### /oʊ/ versus /əʊ/

For the vowel of *grow*, *go*, *dough*, etc., we write /oʊ/, in which the 'o' makes the phonological representation closer to the spelling; for most BrE speakers /əʊ/ would be a phonetically more appropriate representation.

### /ɔː/ versus /ɑː/

BrE has distinct vowels in *caught* and *calm*: we represent them as /ɔː/ and /ɑː/ respectively. AmE standardly has the same vowel here, so for AmE the transcription /ɔː/ should be read as /ɑː/.

### /æ/ versus /ɑː/

Both BrE and AmE have distinct vowels in *fat*, /fæt/, and *calm*, /kɑːm/, but there are a considerable number of words where most BrE accents have /ɑː/ while AmE (but also some accents within the BrE family) has /æ/. Very few of these arise in our examples, however, so instead of introducing a third symbol we give separate BrE and AmE representations when necessary.

### /ʌ/ versus /ə/

The opposition between /ʌ/ and /ə/ is a weak one in that there are very few word-pairs kept distinct solely by this vowel quality difference. It is absent in many AmE accents – those in which *butt* and *but* are pronounced alike in all contexts, in which *just* has the same pronunciation whether it means “merely” or “righteous”, and in which *lust* always rhymes with *must* regardless of stress. We show the distinction between these vowels here (it is generally clear in BrE), but for many Americans both vowels could be written as /ə/.

### /ju:/ versus /u:/

In many words that have /ju:/ following an alveolar consonant in BrE, AmE has /u:/. Thus *new*, *tune*, *due* are /nju:z/, /tju:n/, /dju:/ in BrE but usually /nu:z/, /tu:n/, /du:z/ in AmE. We write /ju:/ in these cases; for AmE, ignore the /j/.

### Intervocalic /t/

We ignore the AmE voicing of intervocalic /t/, contrasting *latter* as /lætə<sup>f</sup>/ and *ladder* as /lædə<sup>f</sup>/ with the medial consonants distinguished as in BrE accents.

## 3.2 Pronunciation and spelling

The relation between the sounds shown by our transcription and the ordinary English spelling of words is a complex one, and certain analytical concepts will help in keeping clear about the difference.

### ■ Symbols and letters

When we match up written and spoken forms we find that in the simplest cases one letter corresponds to one sound, or **phoneme**: *in* /ɪn/, *cat* /kæt/, *help* /help/, *stand* /stænd/, and so on. But very often the match is more complex. For example, in *teeth* the two-letter sequence *ee* corresponds to the single phoneme /i:/ and *th* to /θ/; in *plateau* the three-letter sequence *eau* corresponds to /ou/ (a diphthong, analysed phonologically as a single phoneme); in *through* the last four letters correspond to the phoneme /u:z/.

We will use **symbol** as a technical term for a unit of writing that corresponds to a phoneme, and we will refer to those symbols consisting of more than one letter as **composite symbols**.<sup>6</sup> The letter *e* can form **discontinuous composite vowel symbols** with any of the letters *a*, *e*, *i*, *o*, *u*: *a . . . e* as in *pane*, *e . . . e* as in *dene*, *i . . . e* as in *bite*, *o . . . e* as in *rode*, and *u . . . e* as in *cute*.

### ■ Vowels and consonants

The categories **vowel** and **consonant** are defined in terms of speech. Vowels have unimpeded airflow through the throat and mouth, while consonants employ a significant constriction of the airflow somewhere in the oral tract (between the vocal cords and the lips). The terms can be applied to writing derivatively: a **vowel symbol** is a symbol representing a vowel sound, and a **consonant symbol** is a symbol representing a consonant sound. We will speak of a **vowel letter** or a **consonant letter** only in the case

<sup>6</sup>‘Digraph’ is widely used for a two-letter symbol and ‘trigraph’ is also found (though much less frequently) for a three-letter symbol, but there is no established term for a four-letter symbol, and no cover term for composite symbol.

of non-composite symbols: a single letter constituting a whole symbol may be called a vowel letter if it is a vowel symbol or a consonant letter if it is a consonant symbol. Thus *y* is a vowel letter in *fully* (representing /i/); it is a consonant letter in *yes* (it represents /j/); and in *boy* it is just part of a complex vowel symbol (representing /ɔɪ/). Similarly, *u* is a vowel letter in *fun* (/ʌ/), a consonant letter in *quick* (/w/), and part of a composite symbol in *mouth* (/aʊ/).<sup>7</sup>

It should be noted, however, that *r* counts as a consonant letter even in non-rhotic accents, as shown by the rule of final consonant letter doubling in inflected forms discussed in Ch. 18, §2.2.1: *map/mapping*, *bat/batting*, *trek/trekking*, *pin/pinning*, etc., are paralleled by *mar/ marring*, with *r* doubling like other consonant letters. Similarly, the *e* of the suffix *-ed* counts as a vowel symbol even when no vowel is pronounced (e.g. it determines consonant doubling in forms like *sipped* /sɪpt/ and *banned* /bænd/). In both cases, of course, the spelling corresponds more closely to an earlier stage of the language than to the contemporary language.

## 4 Theoretical framework

The primary goal of this grammar is to describe the grammatical principles of Present-day English rather than to defend or illustrate a theory of grammar. But the languages human beings use are too complex to be described except by means of a theory. In this section we clarify the relation between description and theory in this book, and outline some of our most important theoretical distinctions.

### 4.1 Description and theory

The problem with attempting to describe English without having a theory of grammar is that the language is too big to be described without bringing things together under generalisations, and without a theory there are no generalisations.

It does not take much reflection to see that there is no definite length limit to sentences in English. Sentences 100 words long, or longer, are commonly encountered (especially in writing, for written sentences are on average longer than spoken ones). And, given any sentence, it is always easy to see how it could have been made even longer: an adjective like *good* could be replaced by *very good*, or a verb like *exceed* could be supplied with a preceding adverb to make something like *dramatically exceed*, or a noun like *tree* could be replaced by *tall tree*, or the words *I think* could be added at the beginning of a whole declarative clause, or the words *and that's what I told the police* could be added at the end, and so on through an endless series of different ways in which almost any grammatical sentence of English could be lengthened without the result being something that is recognisably not English.

The importance of the fact that English sentences can be constructed to be as long as might be necessary to express some meaning is that it makes the sentences of English impossible to encapsulate in a list. The number of sentences that have been spoken or

<sup>7</sup>It will be clear, then, that we do not follow the traditional practice of simply dividing the alphabet into five vowels (*a, e, i, o, u*) and twenty-one consonants: we will see that the traditional classification does not provide a satisfactory basis for describing the spelling alternations in English morphology.

written so far is already astronomically vast, new ones are being produced every second around the world by hundreds of millions of people, and no matter what the information storage resources available, the problem is that there would be no way to decide where to end the list.

An alternative to listing sentences is therefore needed. To describe the sentences that belong to English we have to provide a general account of their structure that makes their form follow from **general** statements, not about particular sentences but about sentences of English quite generally. We need to bring together the principles that sentences all conform to, so that we can use those principles to appreciate the structure of new sentences as they are encountered, and see how new ones can be constructed. This means developing a **theory** of the ways in which sentences can be put together by combining words. This book is an attempt to summarise and illustrate as much as possible of what has so far been determined about the ways in which sentences can be constructed in English, and it presupposes a theory that classifies the words of the dictionary and specifies ways in which they are combined to form sentences.

We emphasise, however, that it is not the aim of this book to convince the reader of the merits of the theory for general linguistic description. Quite the reverse, in a sense: wherever it is possible to make a factual point overshadow a general theoretical point, we attempt to do that; whenever a theoretical digression would fail to illuminate further facts about English, we curtail the digression; if ever the facts at hand can be presented in a way that is neutral between competing theoretical frameworks, we try to present them that way.

However, a significant amount of space is devoted here to arguing carefully that the particular analysis we have decided to adopt, within the framework of theory we assume, is the right **analysis**. What we mean by that is that even someone with a different idea about how to design a theory of syntax would have to come to a conclusion tantamount to ours if they considered all the facts. It is necessary for us to provide arguments concerning specific grammatical analyses in this book because, although this grammar is descriptive like the great traditional grammars that have been published in the past, it is not traditional in accepting past claims and analyses.

We depart from the tradition of English grammar at many points, sometimes quite sharply. For example, in this book the reader will find nothing of ‘noun clauses’, ‘adjective clauses’, or ‘adverb clauses’, because that traditional distinction in subordinate clause classification does not divide things satisfactorily and we have abandoned it. The reader will likewise find nothing of the traditional distinction between *since* as a preposition (*I haven’t seen them since Easter*), *since* as an adverb (*I haven’t seen them since*), and *since* as a subordinating conjunction (*I haven’t seen them since they went overseas*), because we have concluded that this multiplication of categories for a single word with a single meaning makes no sense; we claim that *since* belongs to the same category (preposition) in all of its occurrences. On these and many other aspects of syntactic analysis we depart from traditional analyses (we draw attention to the major cases of this kind in Ch. 2). At such points we provide detailed arguments to convince the reader that we have broken with a mistaken tradition, and – we hope – made the correct decision about how to replace it.

The reader will therefore find much more discussion of grammatical concepts and much more syntactic argumentation than is usually found in grammars of English. It

is supplied, however, not to establish some wider theoretical point applying to other languages, but simply to persuade the reader that our description is sound. While the application of grammatical theories to the full range of human languages is an important matter within linguistics, it is not the purpose of this book to develop that point. Detailed technical or descriptive discussions that can be skipped by non-specialists without loss of continuity have been set off in smaller type with a shaded background.

## 4.2 Basic concepts in syntax

Three essential concepts figure in the theory we use to describe English syntax in this grammar. Each is very simple to grasp, but together they permit extremely broad and powerful theories to be constructed for indefinitely large collections of sentences. We express them tersely in [1].

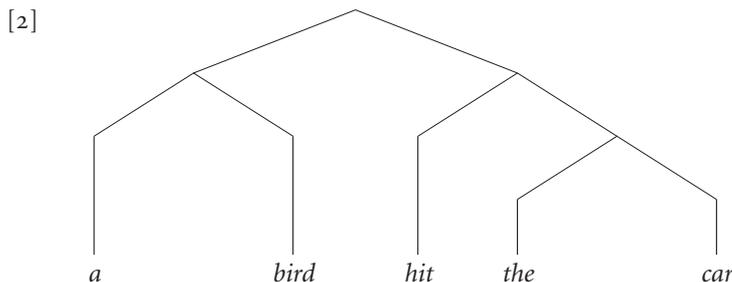

- [1] i Sentences have parts, which may themselves have parts.  
 ii The parts of sentences belong to a limited range of types.  
 iii The parts have specific roles or functions within the larger parts they belong to.

The idea that sentences have parts which themselves may have parts, i.e. that larger stretches of material in a sentence are made up by putting together smaller stretches, is the basis of ‘constituent structure’ analysis. The idea that the parts fall into a limited range of types that we can name and refer to when giving a grammatical description is the root of the concept of ‘syntactic categories’. And the idea that the parts also have specific roles or functions, or special slots that they fill in the larger parts they belong to, is the idea of ‘grammatical functions’. The next three subsections are devoted to explaining these three fundamental ideas.

### 4.2.1 Constituent structure

Sentences contain parts called **constituents**. Those constituents often have constituents themselves, and those are made up from still shorter constituents, and so on. This hierarchical composition of wholes from parts is called **constituent structure**.

Consider a simple one-clause sentence like *A bird hit the car*. It is divisible in the first instance into two parts, *a bird* (the subject) and *hit the car* (the predicate). The phrase *a bird* is itself made up of smaller parts, *a* and *bird*; so is *hit the car*, which we divide into *hit* and *the car*; and finally *the car* also has two parts, *the* and *car*. This structure can be represented as in [2].

Such representations of the constituent structure are called **trees** or **tree-diagrams** (though the trees are upside down, with the root at the top and the ends of the smallest

branches at the bottom). The words are the smallest constituents, and the points closer to the root where branches join identify the larger constituents. *A bird*, for example, is identified as a constituent because this word sequence can be traced via the branches to a single point in the tree; similarly with *the car* and *hit the car*. The sequence *bird hit*, on the other hand, is not a constituent, as there is no point in the tree that leads down branches to just these two words and no others.

The parts of the sentence shown at the first level down, *a bird* and *hit the car* are said to be the **immediate constituents** of the sentence; similarly, *hit* and *the car* are the immediate constituents of *hit the car*. The words are the **ultimate constituents** of the sentence.

The evidence that this is the correct analysis of the sentence comes from the whole of the rest of the grammar, all of which provides, by virtue of the coherence of the description it gives, the evidence that the lines of separation have been drawn in the right place. We can give an illustrative example of how other parts of the grammar can provide supportive evidence by considering where we can insert an adverb such as *apparently* (indicating that what the rest of the sentence asserts appears to be true). A rough account of where English grammar permits it to be positioned (at least in clauses as simple as our example) is that it can be anywhere in the clause it modifies, provided it does not interrupt a constituent. This is illustrated in [3], where the grammatical [a] examples conform to this rule, and the ungrammatical [b] ones do not:

- [3] i a. *Apparently a bird hit the car.*      b. \**An apparently bird hit the car.*  
 ii a. *A bird apparently hit the car.*      b. \**A bird hit apparently the car.*  
 iii a. *A bird hit the car, apparently.*      b. \**A bird hit the apparently car.*

The five words of our example sentence permit six different logically possible placements for *apparently* that are between words (before any of the five words, or after the last one), but only three are permissible. Breaking the sentence into constituents in exactly the way we have done, we are able to make a general statement about where an adverb like *apparently* (a ‘modal’ adverb) can be positioned in it: such an adverb must not interrupt a constituent of the clause. Hence [ib] above is disallowed because it would interrupt the constituent *a bird*; [iib] is disallowed because it would interrupt *hit the car*; and [iiib] is disallowed because it would interrupt *the car*. Inspecting the diagram in [2], we see that each of these uninterruptible sequences is a constituent smaller than the whole sentence.

The full support for a decision in grammatical description consists of confirmation from hundreds of mutually supportive pieces of evidence of many kinds, this being only one very simple example.

#### 4.2.2 Syntactic categories

Diagram [2] shows just the hierarchical part–whole relationships in the sentence. This is only the starting-point for a description, identifying the constituents that have to be described. The next step is to classify these constituents, to say what **syntactic category** they belong to. For words, these syntactic categories correspond to what are traditionally

called the ‘parts of speech’, and most of the categories for larger constituents are based on the ones for words. Where we need to refer to just the categories that have words as members, we will call them **lexical categories**.

### ■ Lexical categories

Any theory of syntax of the general sort we provide, and most types of dictionary, must include a list of the lexical categories or parts of speech assumed. For nearly all theories and nearly all dictionaries, **noun**, **verb**, **adjective**, and **adverb** will be among them, these being terms that have a history going back to the grammar of Classical Latin and Classical Greek some 2,000 years ago, but they are apparently applicable to almost all human languages. Our complete list is given, with some illustrations of membership, in [4]:

[4]	CATEGORY	LABEL	EXAMPLES
	i noun	N	<i>tree, pig, sugar, hatred, union, Picasso, London</i>
	ii verb	V	<i>do, fly, melt, think, damage, give, have, be, must</i>
	iii adjective	Adj	<i>good, nice, big, easy, ugly, helpful, reddish, fond</i>
	iv adverb	Adv	<i>obviously, easily, helpfully, frankly, soon, so, too</i>
	v preposition	Prep	<i>of, to, by, into, between, over, since, toward(s)</i>
	vi determinative	D	<i>the, this, that, a(n), some, all, every, each</i>
	vii subordinator		<i>that, for, to, whether, if</i>
	viii coordinator		<i>and, or, but, nor</i>
	ix interjection		<i>ah, damn, gosh, hey, oh, ooh, ouch, whoa, wow</i>

This scheme differs in several respects from the classification familiar from traditional grammar. Our determinatives are traditionally subsumed under the adjective category: they are said to be ‘limiting adjectives’ as distinct from the ‘descriptive adjectives’ illustrated in [4iii] – though some traditional grammars do recognise the articles *the* and *a(n)* as a distinct part of speech. We also take subordinators and coordinators to be distinct categories, not subclasses of the traditional conjunction category. Conversely, we regard pronouns as a subclass of nouns, not a distinct primary category. Our reasons for departing from the traditional analysis are given in the relevant chapters.

### ■ Phrasal categories

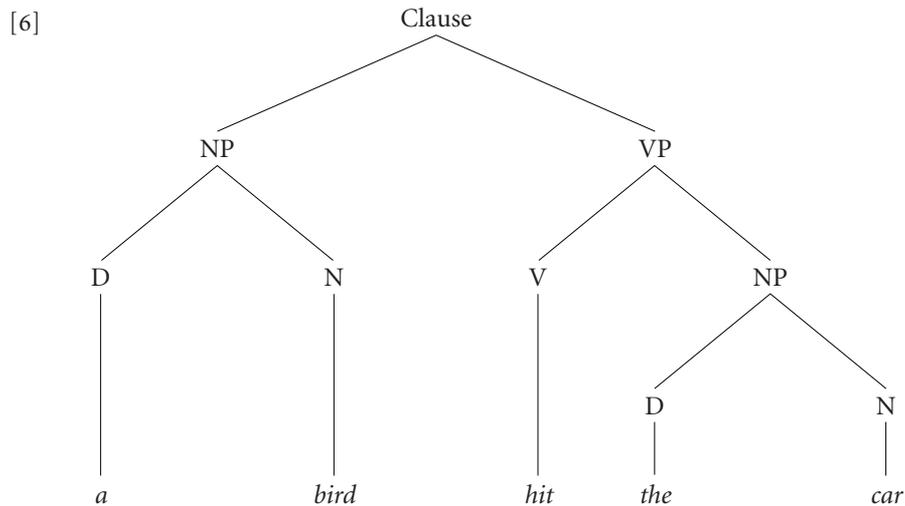

Constituents containing more than one word (more specifically, containing a central and most important word augmented by appropriate accompanying words that elaborate its contribution to the sentence) are called **phrases**, and are assigned to **phrasal categories**.<sup>8</sup> The lexical categories have corresponding phrase types that are in a sense expansions of them. A phrase consisting of a noun and the constituents that go with it most closely is a **nominal**; a nominal plus a determinative makes a **noun phrase**; a verb and its various complements makes up a **verb phrase**; a noun phrase and a verb phrase make up a **clause**; and so on. The full list of phrasal categories we employ in this book, together with our abbreviatory labels for them and an example phrase of each type, is given in [5].<sup>9</sup>

<sup>8</sup>There are circumstances in which phrases may consist of a single word: see the discussion of ‘singular branching’ in §4.2.3.

<sup>9</sup>The term ‘sentence’ does not figure here. As will be explained more fully in Ch. 2, §1, a sentence in our terms is typically either a main clause or a coordination of main clauses.

[5]	CATEGORY	LABEL	EXAMPLE
i	clause	Clause	<i>she saw something in there</i>
ii	verb phrase	VP	<i>saw something in there</i>
iii	noun phrase	NP	<i>this clear case of dedication to duty</i>
iv	nominal	Nom	<i>clear case of dedication to duty</i>
v	adjective phrase	AdjP	<i>very eager for further news</i>
vi	adverb phrase	AdvP	<i>quite separately from this issue</i>
vii	preposition phrase	PP	<i>right out of the area</i>
viii	determinative phrase	DP	<i>almost every</i>

We can represent the structure of sentences in more detail than is done in a diagram like [2] if we show the category to which each constituent belongs, as in [6].

### 4.2.3 Grammatical constructions and functions

The third central theoretical idea we must introduce is that constituents always have particular roles to play in the **constructions**, the larger units, that they belong to. We call these roles **grammatical functions**. In our example sentence the phrases *a bird* and *the car* belong to the same category, NP, but they have different functions, subject and object respectively. They belong to the same category because they are alike in their internal structure (both have a noun as the major element), but they have different functions because they stand in different relations to the verb. The opposite type of situation is illustrated in such a pair as:

- [7] a. His guilt was obvious.      b. That he was guilty was obvious.

Here the underlined constituents have the same function (subject) but belong to different categories (NP and clause respectively). They have the same function because they stand in the same relation to the predicate, and they belong to different categories because the first is centred on a noun (*guilt*) while the second is centred, ultimately, on a verb (*was*). We say that the subject is **realised** by an NP in [a], by a clause in [b].

## ■ Heads and dependents

There is a set of functions that to a large extent apply in the same way within all phrasal categories. The first division we make is that between the **head** and the various **dependents** that can combine with it.

The head, normally obligatory, plays the primary role in determining the **distribution** of the phrase, i.e. whereabouts in sentence structure it can occur. Note, then, that while *his guilt* and *that he was guilty* can both function as subject they differ in other aspects of their distribution – we can have, for example, *The news that he was guilty was devastating*, but not *\*The news his guilt was devastating* (we need a preposition: *The news of his guilt was devastating*), and this difference is attributable to the fact that the head of the former is a noun while the (ultimate) head of the latter is a verb.

Dependents, often optional, are syntactically subordinate elements. The term ‘dependent’ reflects the fact that in any given construction what kinds of dependent are permitted depends on the head. For example, *too* (with the sense “excessively”) can function as dependent to an adjective or adverb (*too careful*, *too carefully*), but not to a noun or verb (*\*their too extravagance*, *\*You shouldn’t too worry*). Similarly *sufficiently* can function as dependent to an adjective, adverb, or verb, but not to a noun (*sufficiently good*, *sufficiently often*, *practised sufficiently*, *\*sufficiently reason*).

### Predicate and predicator as special cases of the head function

Within this framework, what is traditionally called the **predicate** is a special case of the head function: the predicate is the head of a clause. Similarly, the term **predicator** is commonly used for the function of the verb itself, i.e. for the head of a verb phrase. We will retain the traditional terms, which indicate the characteristic semantic role of the element concerned, but it should be kept in mind that they are particular kinds of head.

## ■ Subtypes of dependent

Dependent is a very general function, and for many purposes we need to distinguish different subtypes of dependent according to their more specific relation to the head. At the first level of subdivision we distinguish **complements**, **modifiers**, and **determiners**, illustrated here in NP structure:

- [8] i *the photographs of their dog that they had brought with them* [complement]  
 ii *the photographs of their dog that they had brought with them* [modifier]  
 iii *the photographs of their dog that they had brought with them* [determiner]

In these examples, *of their dog* **complements** the head noun *photographs*; *that they had brought with them* **modifies** the head nominal *photographs of their dog*; and *the* **determines** the head nominal *photographs of their dog that they had brought with them*. At the next level we distinguish different kinds of complement, such as subject (*the photographs are excellent*), object (*He destroyed the photographs*), predicative (*these are excellent photographs*), and so on. A head element is said to **govern** its complements.

The determiner function is found only in the structure of the NP, whereas complements and modifiers occur quite generally. Note that the function ‘determiner’ is distinct from the lexical category ‘determinative’ (D). These need to be distinguished for the same

reason as we distinguish subject and NP. Thus although *this* functions as determiner in *this height*, it functions as modifier in the structure of an AdjP in examples like *She is about this tall*. Conversely, while the determiner function is realised by a determinative in *a doctor*, it is realised by a genitive NP in *my neighbour's doctor*.<sup>10</sup>

### ■ Non-headed constructions

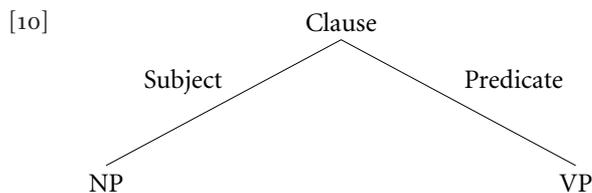

Although the functions of head and dependent apply to a very wide range of constructions, we must also allow for non-headed constructions, as in:

- [9] i *She bought [a hamburger, some chips and a glass of milk].* [coordination]  
 ii *A storm damaged – or so I'm told – the roof of their house.* [supplementation]

The underlined NPs in [i] are of equal syntactic status: we cannot say that one is head and the others dependents. Each of them has the same function within the bracketed construction, that of **coordinate**. In [ii] the underlined constituent is what we call a **supplement**: instead of being integrated into the constituent structure of the sentence as a dependent or coordinate, it is loosely attached, set off from the rest in speech by separate intonational phrasing and in writing by punctuation. Note that it interrupts the sentence at a point where a dependent could not occur, between the predicator and the object: compare [3iib] above.<sup>11</sup> These two types of non-headed construction are described in Ch. 15.

### ■ Diagrammatic representation of functions

Functions, we have said, are essentially relational concepts: to specify the function of a constituent is to say what its relation is to the construction containing it.<sup>12</sup> One way to capture this would be to write the name of the function on the line (branch) of the diagram joining the constituent to the construction. The first level in the structure of our model sentence might then look as in [10].

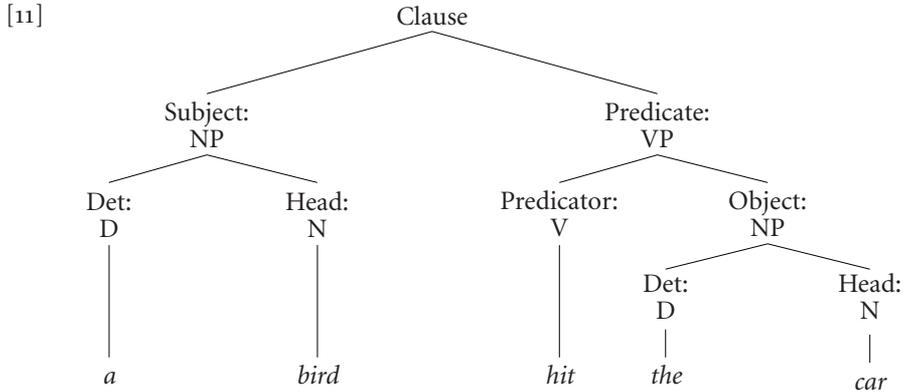

In more complex cases, though, diagram design becomes a problem, and we have found it preferable to present the functional labels separated from the category labels by a colon, and written above them in diagrams. In this format the analysis of our earlier example sentence looks as in [11].

<sup>10</sup>In other works ‘determiner’ is often used as a category term. The corresponding function is then sometimes called ‘specifier’, sometimes called ‘determinative’, and sometimes not clearly distinguished from the category term.

<sup>11</sup>It must be emphasised, therefore, that [3iib] was marked as ungrammatical with the understanding that *apparently* is integrated into the structure (as indicated by the absence of any punctuation). If *apparently* were set apart as a supplement, the sentence would not be ungrammatical – but it would be a different sentence from [3iib].

<sup>12</sup>‘Grammatical relation’ is indeed commonly used as an alternative term to ‘grammatical function’.

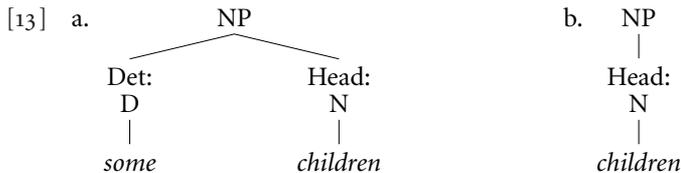

(Note that we use ‘Det’ as the abbreviation for the function ‘determiner’, and ‘D’ for the category ‘determinative’.)

### ■ Singulary branching

We have said that dependents are often optional, and this implies that we can have a head on its own, without any dependents. Compare, for example:

- [12] i Some children were playing in the park.  
 ii Children were playing in the park.

The underlined expressions are NPs functioning as subject of the clause: *children* is the head, determined by *some* in [i], but standing alone in [ii]. The relevant parts of the structure are thus as in [13].

In [b] there is a single branch descending from the category label NP, and this part of the tree-diagram is said to exhibit **singulary branching**, in contrast to the **binary branching** of [a].

## 4.3 Morphology, inflectional and lexical

A grammar, we have said, is divided into two major components, syntax and morphology. This division follows from the special status of the word as a basic linguistic unit, with syntax dealing with the combination of words to make sentences, and morphology with the form of words themselves. In some respects the formation of words is comparable to the formation of larger units, but in others it is significantly different, and it is these differences that motivate dividing the grammar into two separate components.

### ■ Words, lexemes, and inflection

The term ‘word’, as used in traditional grammar, has two rather different senses. We can approach the difference by asking how many distinct words there are in, for example:

[14] *You are working hard, but your sister is working even harder.*

It is clear that the third and ninth words are not distinct: they are tokens (instances) of the same word. But what about *hard* and *harder*: are these the same word or different words? The answer depends on what you mean by ‘word’. In one sense they are obviously different: *harder* has a suffix that is missing from *hard*. This enables it to occur in constructions like that of *Your sister works harder than you*, where it could not be replaced by *hard*; and conversely *hard* could not be replaced by *harder* in *Your sister works very hard*. So from a syntactic point of view they are different words. But there’s another sense in which they are traditionally said to be ‘different forms of the same word’. The perspective this time is that of the dictionary, which would have just one entry, labelled *hard*. The same applies to *are* and *is* in [14]: syntactically these are different words, but lexically (i.e. as far as the dictionary is concerned) they are the same. In order to avoid possible misunderstanding we will restrict the term **word** to the syntactically-oriented sense, so that *hard* and *harder* are different words, and likewise *are* and *is*. For the more abstract, lexically-oriented sense we will use the term **lexeme**. *Hard* and *harder* are then forms of the same lexeme, as are *are* and *is*.

In many cases it makes no difference whether we take a syntactic or a lexical perspective. Lexemes such as *the* and *and* are **invariable**, i.e. there is only one word corresponding to each. Also invariable are lexemes like *efficiently*: although *more efficiently* is in some respects like *harder*, it is not a single word, but a sequence of two, and hence *efficiently* and *more efficiently* are not forms of a single lexeme. **Variable** lexemes, by contrast, are those which have two or more forms. Where we need to make clear that we are considering an item as a lexeme, not a word, we will represent it in bold italics. ***Hard***, for example, represents the lexeme which has *hard* and *harder* – and also *hardest* – as its forms.<sup>13</sup> Similarly *are* and *is*, along with *be*, *been*, *being*, etc., are forms of the lexeme ***be***. In example [14], then, we have two occurrences of the lexeme ***hard***, but only one of the word *hard*, and of course just one of the word *harder*. A variable lexeme is thus a word-sized lexical item considered in abstraction from grammatical properties that vary depending on the syntactic construction in which it appears.

The variation found in variable lexemes is known, more specifically, as **inflection**, and the various forms are called **inflectional forms** of the lexeme. For the most part, inflectional categories apply to large sets of lexemes. Almost all verb lexemes, for example, inflect for tense (e.g. preterite *took* vs present tense *take*), most nouns inflect for number (e.g. singular *dog* vs plural *dogs*), many adjectives one or two syllables in length inflect for grade (e.g. plain *old* vs comparative *older* vs superlative *oldest*). The inflectional contrast of nominative case vs accusative case (e.g. *we* vs *us*), however, applies to just a handful of pronoun lexemes.

<sup>13</sup> We minimise the use of bold type for lexemes, because in many cases it would simply distract. If we are simply listing adjective lexemes that can occur in the construction *They are difficult to please*, for example, we will generally list them as ‘*difficult, easy, hard, impossible, tough*’, etc., rather than ‘*difficult, **easy, hard, impossible, tough***’, etc.; the fact that *easy* is inflectionally variable and *difficult* invariable has no relevance in that context.

### ■ Inflectional morphology and lexical word-formation

The distinction between words and lexemes provides the basis for the division of morphology into two branches: **inflectional morphology** and **lexical word-formation**.

Inflectional morphology deals with the inflectional forms of variable lexemes. It has something of the character of an appendix to the syntax, the major component of the grammar. Syntax tells us when a lexeme may or must carry a certain inflectional property, while inflectional morphology tells us what form it takes when it carries that inflectional property. For example, a rule of syntax stipulates that a verb in construction with the perfect auxiliary *have* must carry the past participle inflection (as in *They have killed it, She had rung the bell*), while inflectional morphology describes how the past participles of verbs are formed from the **lexical base**: *killed* is formed from the base *kill* by adding the suffix *·ed*, *rung* from *ring* by changing the vowel, and so on.

Lexical word-formation, by contrast, is related to the dictionary. It describes the processes by which new lexical bases are formed and the structure of complex lexical bases, those composed of more than one morphological element. The traditional term is simply ‘word-formation’: we add ‘lexical’ to exclude the formation of words by inflectional processes.

The three major processes involved in lexical word-formation are the following:

- [15] i COMPOUNDING: forming a new base by combining two bases  
 ii DERIVATION: forming a new base by adding an affix to an existing base  
 iii CONVERSION: forming a new base using the pronunciation/spelling of a base of related meaning in some other category

An example like *blackbird* illustrates compounding: it is formed by combining two smaller bases, *black* and *bird*. *Efficiently* illustrates derivation: an affix (the suffix *·ly*) is added to an adjective base (*efficient*) to form an adverb. Another example, this time not involving a change from one category to another, is the derivation of *inefficient* by adding the prefix *in·* to the same base. And conversion is illustrated by the underlined verb in *I managed to elbow my way to the front*. The base *elbow* is primarily a noun (having the singular form *elbow* and the plural form *elbows*) denoting a part of the body. The verb base *elbow* (the base of the lexeme whose forms are *elbow, elbows, elbowed, elbowing*) is formed from the noun by conversion – the shape of the noun is simply borrowed to make a verb of related meaning.

## 4.4 Defining grammatical concepts

A grammatical description of a language inevitably draws on a large repertoire of grammatical terms and concepts – **noun, verb, preterite, imperative, subject, object**, and countless more. A question arises concerning how these concepts are to be explained and defined.

### ■ Traditional grammar’s notional definitions

It is useful to begin by considering the kind of definition familiar from dictionaries and traditional school grammars, which are known as **notional definitions**, i.e. they are based on the meaning of the expressions being classified, not on their grammatical

properties. These are typical examples:

[16]	i	NOUN:	the name of a person, place, or thing	} [notional definitions]
	ii	PRETERITE:	a tense expressing past action or state	
	iii	IMPERATIVE:	a clause expressing a command	

To determine whether a word is a noun, for example, one asks what it means or denotes; to determine the tense of a verb one asks in what time period it locates the action or state expressed by the verb; and so on.

Such definitions have long been criticised by linguists. Indeed, it takes only a moment or two's reflection to see that they do not provide satisfactory criteria for determining the correct classification of words or verb-forms or clauses. Take first the definition of preterite, and consider such examples as the following:

- [17] i a. *The finals started yesterday.*      b. *You said the finals started tomorrow.*  
 ii a. *I gave them his address.*              b. *I regret giving them his address.*

In [i] we find *started* associated with past time in [a] but with future time in [b], as indicated by the temporal modifiers *yesterday* and *tomorrow* respectively. The *started* of [ia] thus satisfies the definition for preterite tense, while that of [ib] clearly does not. Nevertheless, everyone agrees that *started* in [ib] is a preterite form: this represents a different use of the same form as we have in [ia], not a different form, for the phenomenon is quite general, applying to all verbs, not just *start*. The opposite kind of problem arises in [ii]. Here the [a] and [b] versions are alike not in the form of the verb, but in the time of the associated event, which is located in the past. Both verbs therefore satisfy the definition of preterite tense, but while *gave* is certainly a preterite form, *giving* is not.

The notional definition thus gives the wrong results in both the [b] examples, excluding the *started* of [17ib], and including the *giving* of [iib]. If definitions are supposed to give necessary and sufficient conditions for belonging to some category, this one fails completely, for it gives neither: [ib] shows that past time reference is not necessary for a word to be a preterite verb form, and [iib] shows that it is not sufficient either. The problem is that the relation between the grammatical category of tense (form) and the semantic category of time (meaning) is highly complex, whereas the notional definition assumes the former can be defined directly in terms of the latter.

The same kind of problem arises with imperative clauses.<sup>14</sup> Compare:

- [18] i a. *Go to bed.*                                      b. *Sleep well.*  
 ii a. *Please close the door.*                      b. *Would you mind closing the door.*

'Command', in the everyday sense of the term, is too narrow and specific for the meaning typically conveyed by imperatives: we will use the term 'directive' to cover commands, orders, requests, and other acts whose aim is to get the addressee to do something. With this modification, [ia] and [iia] both clearly satisfy the definition. But [ib] does not:

<sup>14</sup>Strictly speaking, the traditional category of imperative applies in the first instance to verb-forms rather than clauses. We take the view, however, that there are no imperative verb-forms in English, and hence consider the concept of imperative as it applies to clauses; the argument is in no way affected by this modification.

if I say this I am not telling you, or asking you, to sleep well, but expressing the hope or wish that you will. Yet grammatically it belongs with [ia] and [iia]: it is clearly an imperative clause. Conversely, [iib] conveys the same kind of meaning as [iia], but has a quite different grammatical structure: it is not imperative but interrogative. Again, then, satisfying the terms of the definition is not necessary for a clause to be imperative (as [ib] shows), nor is it sufficient (as [iib] shows). The relation between form and meaning here is too complex for one to be able to determine whether a clause is imperative or not simply on the basis of its meaning.

The traditional definition of noun is unsatisfactory for a somewhat different reason. The problem here is that the concept of ‘thing’ (or perhaps ‘name’) is too vague to provide a workable criterion. There are countless abstract nouns such as *absence*, *fact*, *flaw*, *idea*, *indeterminacy*, *lack*, *necessity*, etc., so ‘thing’ cannot be intended as equivalent to ‘physical object’; but we have no way of telling whether a word denotes (or is the name of) a thing unless we already know on independent, grammatical, grounds whether it is a noun. Take, for example:

- [19] i *I was annoyed at their rejection of my proposals.* [noun]  
 ii *I was annoyed that they rejected my proposals.* [verb]

These have essentially the same meaning, but *rejection* is a noun and *rejected* a verb. What enables us to tell that *rejection* but not *rejected* belongs to the category of noun is not that *rejection* denotes a thing while *rejected* does not, but that they figure in quite different grammatical constructions. Thus *rejection* contrasts with *rejections* as singular vs plural, whereas *rejected* contrasts with *reject* as preterite vs present tense. The transitive verb *rejected* takes a direct object (*my proposals*), but nouns do not take direct objects, so we need a prepositional complement in [i] (*of my proposals*). Similarly, *rejected* takes a nominative subject (*they*), whereas *rejection* takes a genitive like *their* or a determinative like *the*. And if we wanted to add some modification we would need an adjective in [i] (e.g. *their immediate rejection of my proposals*), but an adverb in [ii] (*that they immediately rejected my proposals*).

The problem with notional definitions is that they do not refer to the kinds of property that motivate the use in the grammar of the theoretical concepts being defined. The reason we need such concepts as noun, preterite, imperative clause in writing a grammar of English is that they enable us to make general statements about words, about the inflection of verbs, about the structure of clauses. Lexemes fall into a number of major categories on the basis of their inflection, the kinds of dependent they take and the function in larger constructions of the phrases they head: noun belongs in this system of lexeme categories. Verbs have a variety of inflectional forms, and the preterite is one of these. Clauses show structural contrasts on one dimension according to the presence or absence of a subject, its position relative to the verb, and the inflectional form of the verb, so that we have contrasts between such sets as (a) *You are punctual*, (b) *Are you punctual?*, (c) *Be punctual*: ‘imperative clause’ is one of the terms in this system of clausal constructions.

A satisfactory definition or explanation of concepts like noun, preterite, and imperative clause must therefore identify the grammatical properties that distinguish them from the concepts with which they contrast. The discussion of *rejection* and *rejected* in [19] illustrated some of the major ways in which nouns differ from verbs. As for the

preterite, it is distinguished in part by its form (in regular verbs it is marked by the suffix *·ed*, though this also marks the past participle), in part by its distribution (like the present tense, but unlike other forms, a preterite form can occur as the verb of a declarative main clause: *Kim gave it away*, but not, for example, *\*Kim given it away*), in part by its lack of agreement with the subject (with the single exception of the verb **be**), and so on. Imperative clauses differ from declaratives and interrogatives in the form of the verb **be** (*Be punctual* vs *You are punctual*), the optionality of a 2nd person subject (*you* is omissible in *You be punctual*, but not in *You are punctual*), the formation of the negative (compare *Don't be punctual*, formed with auxiliary **do**, and *You aren't punctual*, with no **do**), and so on.

In this grammar we will be at pains, therefore, to specify the distinctive grammatical properties of the concepts we introduce. This is not to suggest that we are not interested in the meaning, but rather to say that we need to distinguish between grammatical concepts and semantic ones; indeed, making such a distinction is a prerequisite for describing the relation between them.

#### ■ General and language-particular definitions

In criticising the traditional notional definitions, we assumed that they were intended to enable us to determine what expressions in English belong to the categories concerned. It must be emphasised, however, that most of the terms that figure in a grammatical description of English are not unique to English but appear in the grammars of other languages too – in some cases, in the grammars of all languages. There are therefore two issues to be considered in defining or explaining such terms. At one level there is the issue of what grammatical properties distinguish one category from another in English. We call this the **language-particular** level. This is the level we have been concerned with so far. A language-particular definition will enable us to decide which expressions in the language concerned belong to the category. At another level there is the issue of what principled basis we have for using the same grammatical terms in the grammars of different languages, given that the language-particular distinctive properties will vary from language to language. We call this the **general** level. The fact, for example, that the negative imperative *Don't be punctual* requires auxiliary **do** while the negative declarative *You aren't punctual* does not is clearly a specific fact about English: it belongs in the language-particular definition of imperative clause for English, but not in a general definition.

It might then be suggested that the traditional notional definitions should be construed as applying at the general rather than the language-particular level. Certainly they are not intended to apply uniquely to English. But at the same time there can be no doubt that as they are presented in school textbooks, for example, they purport to be language-particular definitions: the student is meant to be able to apply them to decide whether a given word in English is a noun, whether a verb is in the preterite, whether a clause is imperative. In effect, the traditional definitions aim to work at both levels simultaneously, and our objection is that the levels need to be distinguished, and approached differently. At the language-particular level, as we have argued, it is necessary to focus on form: to specify the grammatical features that distinguish expressions which belong to the category from those that do not. At the general level it is quite legitimate to invoke meaning: languages serve to express meaning, and it

is rare to find grammatical distinctions that have no correlation at all with semantic distinctions.

We need to make it clear when giving a general definition that it is to apply at the general level, not the language-particular. And we need to acknowledge that the correlation between grammatical form and meaning is typically complex rather than one-to-one. The general definitions we propose for the categories discussed above are as follows:

- [20] i NOUN: a grammatically distinct category of lexemes of which the morphologically most elementary members characteristically denote types of physical objects (such as human beings, other biological organisms, and natural or artificial inanimate objects)
- ii PRETERITE: a grammatically distinct inflectional form of the verb whose primary use is to locate the situation in past time (relative to the time of utterance)
- iii IMPERATIVE: a grammatically distinct clause construction whose members are characteristically used to issue directives

The move to an avowedly general definition, together with the reference to characteristic use of the most elementary members, enables us to avoid the vagueness of the term ‘thing’ (or ‘name’) in [16i]. The fact that such lexemes as *rejection*, *arrival*, *idea* do not denote physical objects is not a problem for a definition at this level. By virtue of the distinctive grammatical properties specified in the language-particular definition, these lexemes belong to the same category as *girl*, *boy*, *daffodil*, *window*, etc., and this category as a whole satisfies the general definition of noun because it contains lexemes like these last examples that do denote physical objects. Note that the abstract nouns *rejection* and *arrival* are morphologically derived from lexemes of another category (verb); morphologically elementary nouns, such as *girl*, *boy*, etc., characteristically denote kinds of physical object.

Definition [20ii] allows for the fact that verb inflections often have more than one use. In [17ia] (*The finals started yesterday*), we have the past time use. In [17ib] (*You said the finals started tomorrow*) the preterite form *started* is within a subordinate clause functioning as complement to *said*: this is a case of what is traditionally called indirect reported speech. Your actual words will have been, say, *The finals start tomorrow*, but present tense *start* is shifted into the preterite *started* in my report. Another use of the preterite is seen in *I wish the finals started tomorrow*, where it indicates counterfactuality: we understand that the finals do not start tomorrow. Of these three uses, it is the one that indicates past time that is primary. The others are found only in special contexts, such as the complement of a preterite verb of reporting or the complement of *wish*. This verb-form therefore qualifies for the label **preterite**.

Definition [20iii] likewise overcomes the problems we noted in [16iii]. The language-particular criteria assign *Sleep well* to the same category as *Go to bed* and *Please open the door*, and since most clauses with this form are normally used as directives we call the category imperative clause. *Would you mind closing the door* is excluded from the category at the language-particular level: it does not have the distinctive grammatical form of imperative clauses in English.

### The grammatical distinctiveness requirement in general definitions

It will be noted that the general definitions in [20] all impose a condition of grammatical distinctiveness. This requirement means that the general term being defined will be applicable in the grammar of a given language only if it can be given a distinct language-particular definition in that language.

A significant weakness of traditional grammars of English is that they incorporate a number of categories that in fact have no place in a grammar of Present-day English, although they are perfectly valid for Latin (and in some cases older stages of English). A simple example is provided by the dative case inflection. A traditional dictionary or schoolbook definition is given in [21i], while our proposed revision is given in [ii]:

- [21] i DATIVE: the case of nouns, etc., expressing the indirect object or recipient  
 ii DATIVE: a grammatically distinct case characteristically used to mark the indirect object

Definition [i] suggests that in *He gave Caesar a sword*, for example, *Caesar* is in the dative case, as it is in indirect object function and expresses the semantic role of recipient. And that indeed is the analysis found in many traditional grammars and school textbooks (especially older ones). But Present-day English has no dative case. In the Latin counterpart of the above sentence *Caesar* has a different form (*Caesari*) from the one it has when functioning as subject (*Caesar*) or direct object (*Caesarem*), so the distinctiveness condition of definition [ii] is satisfied for Latin. In English it is not satisfied: the form is simply *Caesar* whether the function is subject, direct object, or indirect object. There is no noun, not even a pronoun, with a distinct inflectional form for the indirect object, and hence no basis at all for including dative among the inflectional categories of the English noun.<sup>15</sup>

## 5 Semantics, pragmatics, and meaning relations

Few grammars even attempt to describe the ways in which sentences are formed without making reference along the way to meaning and how sentences express it. After all, few would take it to be controversial that a human language such as English is in some sense a system for framing thoughts and making meaningful messages expressible, and this would make it a natural supposition that meaning and grammar would be to some extent intertwined. This grammar, while not attempting a full and detailed semantic description of the language (which would be an unrealistically large and difficult enterprise), touches on the topic of meaning frequently. But as we will explain, we do not treat meaning as a unitary phenomenon.

### ■ The semantics/pragmatics distinction

We treat the analysis of meaning as divisible in the first instance into two major domains. The first deals with the sense conventionally assigned to sentences independently of the contexts in which they might be uttered. This is the domain called **semantics**. The second

<sup>15</sup>Our definition omits the reference to recipients in the traditional definition because this will appear in the definition of indirect object – a grammatically distinct subtype of object characteristically expressing the recipient.

throne would allow [ia] to continue to assert a true proposition, but [ib] would assert a false proposition under those circumstances. The sentences accordingly have different truth **conditions**: circumstances could obtain under which one would express a truth and the other a falsehood. Similarly, though perhaps less obviously, in [ii]. For [iia] to be true, it is sufficient for the committee to feel broadly favourable to my plan, but for [iib] to be true it is necessary that they actually took some action to give my plan the go-ahead signal. The conditions under which the first would be true are not quite the same as those under which the second would be true, so the meanings differ.

### ■ Entailments

One way of describing truth conditions is in terms of **entailments**. An entailment is defined as follows (the definitions in this chapter use ‘ $\equiv$ ’ to symbolise the relation ‘is by definition equivalent to’):

[3]  $X$  entails  $Y \equiv$  If  $X$  is true, then it follows necessarily that  $Y$  is true too.

In the first instance, entailment is a relation between propositions, since it is propositions, strictly speaking, that have truth values. But we can apply the concept derivatively to sentences, as illustrated in:

[4] i	<i>Kim broke the vase.</i>	[entails [ii]]
ii	<i>The vase broke.</i>	[entailed by [i]]
iii	<i>Kim moved the vase.</i>	[does not entail [ii]]

If the proposition asserted by [i] in any context is true, then the proposition asserted by [ii] in that same context must also be true. The first proposition entails the second, and sentence [i] entails sentence [ii]. If  $X$  entails  $Y$ , then it is inconsistent to assert  $X$  and deny  $Y$ . It is inconsistent, for example, to say <sup>#</sup>*Kim broke the vase but the vase didn't break* (the ‘#’ symbol indicates that what follows is grammatical but semantically or pragmatically anomalous). In the case of [iii] and [ii] there is no such inconsistency: *Kim moved the vase but the vase didn't break*. And [iii] of course does not entail [ii]: it is perfectly possible for [iii] to be true and [ii] false.

We can state entailments in a variety of equivalent ways: we can say that *Kim broke the vase* entails that the vase broke, or that it entails “The vase broke”, or that it entails *The vase broke*. Whichever mode of presentation we adopt, it follows from the definition given in [3] that if  $X$  entails  $Y$  then  $X$  cannot be true unless  $Y$  is true. And that is to say that  $Y$  is a condition for the truth of  $X$ . So to give the entailments of a sentence is to give its truth conditions.

### ■ Closed and open propositions

A refinement of our notion of proposition is called for in discussing certain constructions. What we have described so far as propositions could be described more precisely as **closed propositions**. They are closed in the sense of not leaving anything available to be filled in: a proposition like “Sandy showed me that at the office last week” identifies what was done, who did the showing, what was shown, where it happened, and when this occurred. There are also **open propositions**, which have a place left open. Consider the meaning of *What did Sandy show you at the office last week?*: it could be represented informally as “Sandy showed you  $x$  at the office last week”, where  $x$  is a placeholder, or **variable**, for a piece of information not supplied. The point of open interrogative sentences like *What*

is some relevant contrast related to the second coordinate – perhaps one would have expected her to use a return flight and she is acting counter to that expectation, or it might be that although she will be going up there at air travel speed she will have much more time for reading on the slow return trip, and so on. The precise nature of the contrast is not made explicit, but the use of *but* rather than the neutral coordinator *and* indicates that the two parts are being presented as involving some sort of contrast. As we have said, this extra meaning contributed by the choice of *but* rather than *and* is not part of the propositional meaning: it would not be legitimate for you to respond to [ib] by saying, *That's false, though I concede that she is flying up there and taking the train back.*

Similarly with [6ii], except that here the two sentences differ not in the choice of one word rather than another, but in the presence or absence of a word, namely *even*. *Even* conveys that it is somehow noteworthy that the property of having agreed that his behaviour was outrageous applies to Max: it is less expected that Max should have agreed than that the others who agreed should have done so. Again, this is not part of the propositional meaning. The truth conditions of [iia–iib] are the same: there is no context where one could be true and the other false. But it is intuitively clear that the sentences do not have exactly the same meaning.

The same applies in [6iii]. *Bloody* serves in some rather vague way to express anger or ill will towards sales tax reporting regulations, or towards the idea of having to work out sales taxes, or something of the sort. But the anger or ill will is not expressed as part of the propositional meaning: the truth conditions for [iiib] are exactly the same as those for [iiia].

We will handle the non-propositional meaning conveyed by items such as *but*, *even*, and *bloody* in these examples in terms of the concept of **conventional implicature**. In uttering [6ib], I indicate, or **implicate**, that there is some kind of contrast between her taking the train back and flying up there, but I do not actually state that there is. And analogously for the others. Unlike entailments, conventional implicatures are not restricted to sentences that are characteristically used to make statements. *Is she flying up there but taking the train back?*, *Did even Max agree that his behaviour had been outrageous?* and *Have you ever had to do a bloody sales tax report?* carry the above implicatures even though they do not themselves have truth conditions.

### 5.3 Pragmatics and conversational implicatures

Pragmatics is concerned not with the meaning of sentences as units of the language system but with the interpretation of utterances in context. Utterances in context are often interpreted in ways that cannot be accounted for simply in terms of the meaning of the sentence uttered.

Let us again illustrate the point by means of a few representative examples:

- [7] i *Do you think I could borrow five dollars from you?*  
 ii *If you agree to look after my horses after I die, I'll leave you my whole estate.*  
 iii *Some of the audience left the room before the first speaker had finished.*

Imagine that Sue and Jill are at the cash register in a cafeteria buying sandwiches. Jill has \$20 in her hand. Sue finds she only has a few cents in her purse, and utters [i]. As far as the literal meaning of the sentence is concerned, this is a question as to whether or not

Jill thinks Sue could borrow five dollars from her. It has two possible answers: “Yes” (i.e. “I do think you could”) and “No” (i.e. “I don’t think you could”). But for Jill to respond *Yes*, *I do* would seem strange and uncooperative in this context. It would force Sue to be more direct: *Well, lend it to me then, right now, because I can’t afford to pay for this sandwich.*

What would normally be expected of Jill would be to act on the basis of the following reasoning. We both have to pay for our sandwiches. Sue has reached the cash register and, after finding her purse almost empty, is asking whether in my opinion it would be possible for me to extend a \$5 loan. Sue can see that I have \$20, and sandwiches only cost about \$5, so I could obviously afford it. Sue must see that the answer to the question is “yes”. Why am I being asked for my opinion about my financial status? What is the point of this question? The only reasonable conclusion is that Sue actually wants me to advance such a loan, right now.

The message “Please lend me \$5” is thus indirectly conveyed by a question that does not itself actually express it. A cooperative addressee will understand the speaker’s intention immediately, without consciously going through the process of reasoning just sketched. But for the student of language it is important to see: (a) that “Please lend me \$5” is not the semantic meaning of sentence [7i], but the pragmatic meaning of an utterance of [i] in a certain range of contexts; (b) that the pragmatic interpretation can be derived in a systematic way from the interaction between the sentence meaning and the context.

Semantics is thus concerned with the meaning that is directly expressed, or encoded, in sentences, while pragmatics deals with the principles that account for the way utterances are actually interpreted in context. A central principle in pragmatics, which drives a great deal of the utterance interpretation process, is that the addressee of an utterance will expect it to be **relevant**, and will normally interpret it on that basis.

This principle of relevance was very evident in our first example: the relevance of Sue’s question was that she needed Jill to lend her the money. It is equally important in deriving the pragmatic interpretation of [7ii]. This sentence does not actually make the statement that you won’t get the estate if you don’t agree to look after my horses: that is not part of the sentence meaning. A proposition of the type “if P then Q” does not require “P” to be true in order for “Q” to be true.<sup>16</sup> We therefore need an explanation for this fact: anyone who is told *If you agree to look after my horses after I die then I’ll leave you my whole estate* will always assume that the bequest will not be forthcoming without the agreement to look after the horses. Why? Because otherwise it would not have been relevant to mention the horses. If that part of the sentence had some relevance, it must be as a necessary condition for getting the bequest, and we normally try to find an interpretation for an utterance that makes everything in it relevant. The semantics of the sentence does not tell us that the horse care will be a precondition for the bequest, but the pragmatics of interpreting the utterance certainly does.

<sup>16</sup>If this is not obvious, consider the sentence *If a house collapses directly on me I will die*. This does not entail that provided no house falls on me I will be immortal. Eventually I will die anyway. Or consider *If you need some more milk there’s plenty in the fridge*. This does not state that there is plenty of milk in the fridge only if you need some. If there is milk in there, it will be there whether you need it or not. A sentence meaning “if P then Q” will often strongly suggest “if not P then not Q”, but that is not part of the semantic meaning.

Consider, finally, example [7iii], as uttered, say, in the context of my giving you an account of a weekend seminar I recently attended. You will infer that not all of the audience left the room before the first speaker had finished. But again that is not part of the meaning of the sentence. *Some* does not **mean** “not all”. The “not all” interpretation can be accounted for by pragmatic principles. I am describing an event at which I was present, so I presumably know whether or not all of the audience left before the first speaker had finished. Suppose I know that all of them left. Then I would surely be expected to say so: such a mass walkout would be much more worth mentioning than one where only part of the audience left. So the natural assumption is that I said *some* rather than *all* because it would not have been true to say *all*: what other reason could I have for making the weaker statement?

Compare this with the case where you ask *Have all the questionnaires been returned?* and I reply *I don't know: some have, but I can't say whether they all have*. If *some* meant “not all” this would be incoherent, but clearly it is not. This time my reason for saying *some* rather than *all* is not that it would be false to say *all*, but merely that I do not have enough knowledge or evidence to justify saying *all*.

We will again invoke the concept of implicature in describing the above interpretations of utterances of [7i–iii], but we will classify them more specifically as **conversational implicatures**. We will say, for example, that an utterance of [7iii] in the context described conversationally implicates “Not all of the audience left before the first speaker had finished”.

#### ■ Relation between entailment and the two kinds of implicature

The differences between entailment, conventional implicature, and conversational implicature are summarised in [8].

[8]	ENTAILMENT	semantic	truth-conditional
	CONVENTIONAL IMPLICATURE	semantic	non-truth-conditional
	CONVERSATIONAL IMPLICATURE	pragmatic	non-truth-conditional

Implicatures are distinguished from entailments in that they are not truth conditions; hence they are not restricted to sentences that can be used to make statements. The two types of implicature are distinguished according to whether they are part of the conventional meaning of sentences or derive from the interaction between the sentence meaning and the context of utterance by means of general principles of conversational cooperation. In this book we will be much more concerned with conversational implicatures than with conventional ones, as they play a larger part in the interpretation of discourse; we will take them to represent the default case, therefore, and when the term implicature is used without qualification it is intended to be understood in the conversational sense in the absence of indications to the contrary. The verb corresponding to ‘implicature’ is **implicate**; in addition, we will use the term **convey** in a way which is neutral between entail and (conventionally or conversationally) implicate.

Conversational implicatures are not part of sentence meaning at all. They are suggested to the hearer by the combination of the sentence meaning and the context, but they are not part of what is **said**. Nevertheless, many of them are of very general application, so that we can say that such-and-such an implicature will normally accompany the utterance of a given sentence unless special factors exclude that possibility. In such cases

it is convenient to talk about the sentence normally implicating something – e.g. that [7iii] normally implicates that not all of the audience left before the first speaker had finished. This is to be understood as a shorthand way of saying that an utterance of the sentence in a normal context would carry that implicature in the absence of factors which exclude it. We will therefore apply the term to sentences in the following sense:

- [9]  $X$  normally **conversationally implicates**  $Y \equiv X$  does not entail  $Y$  but in saying  $X$  the speaker makes an implicit commitment to the truth of  $Y$  in the absence of indications to the contrary.

When such ‘indications to the contrary’ are present, we will say that the implicature is **cancelled**. Take, for example:

- [10] *Some if not all of the delegates had been questioned by the police.*

Without the underlined sequence, *some* would again trigger a “not all” implicature – that not all of the delegates had been questioned by the police. This implicature, however, is inconsistent with *if not all*, which explicitly allows for the possibility that all of the delegates had been questioned. The implicature is therefore cancelled, i.e. is here not part of the interpretation. A context where the request-to-borrow implicature of [7i] could be cancelled might be one where I’m concerned with the legality of borrowing: perhaps I’m the treasurer of some institution and am uncertain whether I am permitted to go into debt.

The possibility of cancellation is an essential feature of conversational implicatures. If something conveyed by an utterance were an invariable component of the interpretation of the sentence, whatever the context, it would be part of the sentence meaning, either a conventional implicature or an entailment. Some conversational implicatures, however, are very **strong** in the sense that it is not easy to imagine them being cancelled – and these run the risk of being mistaken for components of sentence meaning. But it is important to make the distinction. It would be impossible, for example, to give a satisfactory account of quantification in the noun phrase if the “not all” component in the interpretation of *some* were not recognised as merely a conversational implicature.

## 5.4 Pragmatic presupposition

Finally, we consider the relation of **presupposition**, exemplified in:

- [11] i *She has stopped trying to secure her son’s release.*  
 ii *She hasn’t stopped trying to secure her son’s release.*  
 iii *Has she stopped trying to secure her son’s release?*  
 iv *She formerly tried to secure her son’s release.* } [all presuppose [iv]]

Presupposition has to do with informational status. The information contained in a presupposition is backgrounded, taken for granted, presented as something that is not currently at issue. In [11] all of [i–iii] presuppose that she formerly tried to secure her son’s release: what is at issue is not whether she tried to secure his release in the past but whether she is doing so now.

This example brings out an important property of presupposition, namely that it is generally unaffected by negation or questioning. When a sentence is negated, the negation characteristically applies to that part of the content that is presented as being at

issue. If she in fact never tried to secure her son's release, [ii] is strictly speaking true, but it would normally be a very inefficient or misleading way of conveying that information. A simpler, more direct and more explicit way of doing so would be to say *She never tried to secure her son's release*. The fact that I didn't say this but said [ii] instead will lead you to infer that the negation applies to the stopping, so that [ii] implicates that she is still trying. Similarly with questioning. If I didn't know, and wanted to find out, whether she formerly tried to secure her son's release, I would be expected to ask *Did she try to secure her son's release?* If I ask [iii] instead, the natural inference will be that I am trying to find out about the present state of affairs.

The kind of reasoning just described is similar in kind to that invoked in discussing conversational implicatures, reflecting the fact that both phenomena are pragmatic.<sup>17</sup> Like conversational implicature, presupposition applies in the first instance to utterances, but we can apply it derivatively to sentences with the same 'normally' qualification as before:

- [12]  $X$  normally presupposes  $Y \equiv$  in saying  $X$  the speaker, in the absence of indications to the contrary, takes the truth of  $Y$  for granted, i.e. presents it as something that is not at issue.

Again, then, we allow that in special circumstances a presupposition may be cancelled. Consider, for example, the following exchange:

- [13] A: *Have you stopped using bold face for emphasis?*  
 B: *No I haven't (stopped using bold face for emphasis); I've always used small caps.*

A's question presupposes that B formerly used bold face for emphasis. But suppose it turns out that A was mistaken in believing this. B answers the question with a negative, and since this reflects the form of the question it too would normally presuppose that B formerly used bold face for emphasis. But in the context given here that presupposition is cancelled.

The presupposition associated with the verb *stop* coincides with an entailment when  $X$  is positive and declarative, as in [11i], but with a conversational implicature when  $X$  is negative or interrogative, as in [11ii–iii]. You cannot stop doing something that you have never done before, so [11i] cannot be true unless [11iv] is true. This gives the latter the status of an entailment. But it is not an entailment of the negative [11ii], as evident from the example in [13]. Nevertheless, if I say [11ii] I will normally be taken to have implicitly committed myself to [11iv], and the latter therefore counts as a conversational implicature. Likewise with the interrogative [11iii], which does not have entailments.

This represents the most usual pattern for presuppositions. For the most part they are entailed if  $X$  is positive and asserted to be true, and otherwise they are conversationally implicated. But this is not a necessary feature of presuppositions: we will see that they do not always follow this pattern.

<sup>17</sup>An alternative view is that presupposition is a logical or semantic concept. On one version of this account, a presupposition is a proposition that must be true if the presupposing proposition (or the sentence expressing it) is to be either true or false. In the case of [11], for example, in a context where [iv] was false, where she had never tried to secure her son's release, [i–ii] would be neither true nor false: they would simply lack a truth value (or would take a third truth value distinct from both truth and falsity). We do not adopt that concept of presupposition here, and take the view that if a proposition is not true, then it is false.

# Syntactic overview

Given the length and nature of this book, there will be relatively few readers who begin at the beginning and work their way through the chapters in order to the end. We envisage, rather, that readers will typically be reading individual chapters, or parts thereof, without having read all that precedes, and the main purpose of this syntactic overview is to enable the separate chapters to be read in the context of the grammar as a whole.

We begin by clarifying the relation between sentence and clause, and then introduce the distinction between canonical and non-canonical clauses, which plays an important role in the organisation of the grammar. The following sections then survey very briefly the fifteen chapters that deal with syntax (as opposed to morphology or punctuation), noting especially features of our analysis that depart from traditional grammar.

## 1 Sentence and clause

Syntax is concerned with the way words combine to form sentences. The sentence is the largest unit of syntax, while the word is the smallest. The structure of composite words is also a matter of grammar (of morphology rather than syntax), but the study of the relations between sentences within a larger text or discourse falls outside the domain of grammar. Such relations are different in kind from those that obtain within a sentence, and are outside the scope of this book.

We take sentences, like words, to be units which occur sequentially in texts, but are not in general contained one within another. Compare:

- [1] i *Jill seems quite friendly.*  
 ii *I think Jill seems quite friendly.*  
 iii *Jill seems quite friendly, but her husband is extremely shy.*

*Jill seems quite friendly* is a sentence in [i], but not in [ii–iii], where it is merely part of a sentence – just as in all three examples *friend* is part of a word, but not itself a word.

In all three examples *Jill seems quite friendly* is a clause. This is the term we apply to a syntactic construction consisting (in the central cases) of a subject and a predicate. In [iii] one clause is contained, or embedded, within a larger one, for we likewise have a subject–predicate relation between *I* and *think Jill seems quite friendly*. In [iii] we have one clause coordinated with another rather than embedded within it: *her husband* is subject, *is extremely shy* predicate and *but* is the marker of the coordination relation. We will say, then, that in [i–ii] the sentence has the form of a clause, while in [iii] it has the

form of a coordination of clauses (or a ‘clause-coordination’).<sup>1</sup> Within this framework, the clause is a more basic unit than the sentence.

To say that sentence [1i] **has the form of** a clause is not to say that it consists of a clause, as the term ‘consists of’ is used in constituent structure analysis of the type introduced in Ch. 1, §4.2. There is no basis for postulating any singularity branching here, with the clause functioning as head of the sentence. This is why our tree diagram for the example *A bird hit the car* had the topmost unit labelled ‘clause’, not ‘sentence’. ‘Sentence’ is not a syntactic category term comparable to ‘clause’, ‘noun phrase’, ‘verb phrase’, etc., and does not figure in our constituent structure representations.

Most work in formal grammar makes the opposite choice and uses sentence (abbreviated S) rather than clause in constituent structure representations. There are two reasons why we do not follow this practice. In the first place, it creates problems for the treatment of coordination. In [1iii], for example, not only the whole coordination but also the two clauses (*Jill seems quite friendly* and *but her husband is extremely shy*) would be assigned to the category sentence. The coordination, however, is quite different in its structure from that of the clauses: the latter are subject–predicate constructions, while the coordination clearly is not. Most importantly, assigning the whole coordination to the same category as its coordinate parts does not work in those cases where there is coordination of different categories, as in:

[2] *You must find out [the cost and whether you can pay by credit card].*

Here the first coordinate, *the cost*, is an NP while the second is, on the analysis under consideration, a sentence, but the whole cannot belong to either of these categories. We argue, therefore, that coordinative constructions need to be assigned to different categories than their coordinate parts. Thus we will say, for example, that *Jill seems quite friendly* is a clause, while [1iii] is a clause-coordination, *Jill and her husband* an NP-coordination, and the bracketed part of [2] an NP/clause-coordination (a coordination of an NP and a clause).

The second reason why we prefer not to use ‘sentence’ as the term for the syntactic category that appears in constituent structure representations is that it involves an unnecessary conflict with the ordinary, non-technical sense of the term (as reflected, for example, in dictionary definitions). Consider:

[3] a. *The knife I used was extremely sharp.*      b. *I’m keen for it to be sold.*

The underlined sequences are not sentences in the familiar sense of the term that we adopted above, according to which sentences are units of a certain kind which occur in succession in a text. The underlined expressions nevertheless contain a subject (*I, it*) and a predicate (*used* and *to be sold*), and hence belong in the same syntactic category as expressions like *Jill seems quite friendly*. If we call this category ‘sentence’ rather than ‘clause’, the term ‘sentence’ will have two quite different senses.

<sup>1</sup>Traditional grammar classifies the sentences in [1] as respectively simple, complex, and compound, but this scheme conflates two separate dimensions: the presence or absence of embedding, and the presence or absence of coordination. Note that in *I think Jill seems quite friendly, but her husband is extremely shy* there is both embedding and coordination. We can distinguish [i–ii] from [iii] as non-compound (or clausal) vs compound; [i–ii] could then be distinguished as simple vs complex clauses but no great significance attaches to this latter distinction, and we shall not make further use of these terms.

## 2 Canonical and non-canonical clauses

There is a vast range of possible clause constructions, and if we tried to make descriptive statements covering them all at once, just about everything we said would have to be heavily qualified to allow for numerous exceptions. We can provide a simpler, more orderly description if in the first instance we confine our attention to a set of basic, or **canonical**, constructions, and then describe the rest derivatively, i.e. in terms of how they differ from the canonical constructions.

The contrast between canonical and non-canonical clauses is illustrated in the following examples:

[1]      CANONICAL	NON-CANONICAL
i a. <i>Kim referred to the report.</i>	b. <i>Kim did not refer to the report.</i>
ii a. <i>She was still working.</i>	b. <i>Was she still working?</i>
iii a. <i>Pat solved the problem.</i>	b. <i>The problem was solved by Pat.</i>
iv a. <i>Liz was ill.</i>	b. <i>He said <u>that Liz was ill.</u></i>
v a. <i>He has forgotten the appointment.</i>	b. <i>Either he has overslept <u>or he has forgotten the appointment.</u></i>

### ■ Dimensions of contrast between canonical and non-canonical constructions

The examples in [1] illustrate five major dimensions of contrast between canonical and non-canonical clauses. In each case the canonical clause is syntactically more basic or elementary than the non-canonical one.

The examples in [1i] differ in polarity, with [a] positive and [b] negative. In this example, the negative differs from the positive not just by virtue of the negative marker *not* but also by the addition of the semantically empty auxiliary **do**.

The contrast in [1iii] is one of clause type, with [a] declarative and [b] interrogative. The syntactic difference in this particular pair concerns the relative order of subject and predicator: in [a] the subject occupies its basic or default position before the predicator, while in [b] the order is inverted. In the pair *She finished the work* and *Did she finish the work?* the interrogative differs from the declarative both in the order of elements and in the addition of the auxiliary **do**. All canonical clauses are declarative; non-canonical clauses on this dimension also include exclamatives (*What a shambles it was!*) and imperatives (*Sit down*).

In [1iii], canonical [a] is active while [b] is passive. These clauses differ strikingly in their syntactic form, but their meanings are very similar: there is a sense in which they represent different ways of saying the same thing. More precisely, they have the same propositional content, but differ in the way the information is presented – or ‘packaged’. The passive is one of a number of non-canonical constructions on this dimension. Others include preposing (e.g. *Most of them we rejected*, contrasting with canonical *We rejected most of them*), the existential construction (e.g. *There were several doctors on board*, contrasting with *Several doctors were on board*), and the *it*-cleft (e.g. *It was Pat who spoke first*, contrasting with *Pat spoke first*).

The underlined clause in [1ivb] is subordinate, whereas [a] is a main clause. In this example, the non-canonical clause is distinguished simply by the presence of the subordinator *that*, but many kinds of subordinate clause differ from main clauses more

radically, as for example in *This tool is very easy to use*, where the subordinate clause consists of just the VP subordinator *to* together with the predicator, with both subject and object left unexpressed. The clause in which a subordinate clause is embedded is called the **matrix** clause – in [ivb], for example, subordinate *that Liz was ill* is embedded within the matrix clause *He said that Liz was ill*. Subordination is recursive, i.e. repeatable, so that one matrix clause may be embedded within a larger one, as in *I think he said that Liz was ill*.

Finally, the underlined clause in [ivb] is coordinate, in contrast to non-coordinate [a]; it is marked as such by the coordinator *or*. A greater departure from canonical structure is seen in *Jill works in Paris, and her husband in Bonn*, where the predicator *works* is missing.

It is of course possible for non-canonical constructions to combine, as in:

[2] *I can't understand why I have not been questioned by the police.*

The underlined clause here is negative, interrogative, passive, and subordinate. But these are independent properties, and we can describe the structure in terms of its difference from canonical clause structure on four separate dimensions.

### ■ Counterparts

In the examples of [1] we presented the non-canonical clauses side by side with their canonical **counterparts**, i.e. canonical clauses differing from them simply as positive rather than negative, declarative rather than interrogative, and so on. Where a clause combines two non-canonical features, its counterpart with respect to each feature will be non-canonical by virtue of retaining the other. Thus *It wasn't written by Sue* has as its active counterpart *Sue didn't write it* (non-canonical by virtue of being negative) and as its positive counterpart *It was written by Sue* (non-canonical by virtue of being passive).

It must be emphasised, however, that not all non-canonical clauses have grammatically well-formed counterparts. Compare, for example:

- |     |  |  |
|-----|--|--|
| [3] | i a. <i>I can't stay any longer.</i>   | b. <i>*I can stay any longer.</i>      |
|     | ii a. <i>Have they finished yet?</i>   | b. <i>*They have finished yet.</i>     |
|     | iii a. <i>Kim was said to be the culprit.</i>                                    | b. <i>*Said Kim to be the culprit.</i> |
|     | iv a. <i>There was an accident.</i>  | b. <i>*An accident was.</i>            |
|     | v a. <i>If <u>it hadn't been for you</u>,</i><br><i>I couldn't have managed.</i> | b. <i>*It had been for you.</i>        |

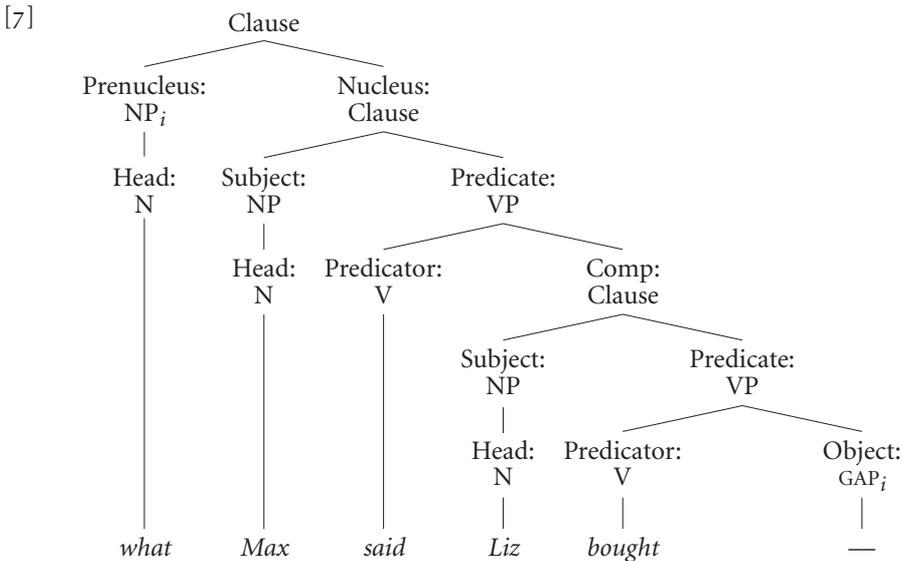

Example [ia] has no counterpart differing from it as positive vs negative, and similarly there is no declarative counterpart to interrogative [iia]. There is no active counterpart to the passive [iiia], partly because **say** + infinitival (with this sense) is restricted to the passive construction, partly – and more generally – because there is no element corresponding to the subject of an active clause. Existential [iva] differs from the one cited above (*There were several doctors on board*) in that again there is no non-existential counterpart. And finally [va] contains a subordinate clause with no main clause counterpart. *It had been for you* is of course grammatical in the interpretation where *it* refers to something identifiable in the context (cf. *The parcel had been for you*), but that is not how *it* is interpreted in [va].

the **nucleus**, which is realised by a clause with the familiar subject–predicate structure. Within this nuclear clause there is no overt object present. But the prenuclear *what* is understood as object, and this excludes the possibility of inserting a (direct) object after *bought*: \**I wonder what Liz bought a watch*. We represent this by having the object realised by a **gap**, an abstract element that is **co-indexed** with *what* (i.e. annotated with the same subscript index, here *i*): this device indicates that while *what* is in prenuclear position, it also functions in a secondary or derivative sense as object of *bought*.

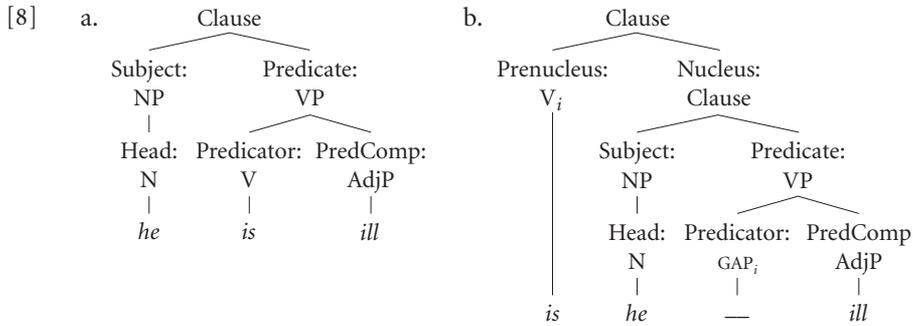

Note that it would not be satisfactory to replace the ‘prenucleus’ label by ‘object’, and then simply dispense with the object element on the right of *bought*. Functions, we have said, are relational concepts and ‘object’ is a relation between an NP and a VP construction. Directly labelling *what* as object would not show that it is object of the VP headed by *bought*. This can be seen more easily by considering such an example as [6], where the bracketed clause has the structure shown in [7]:

[6] *I can't remember [what Max said Liz bought \_\_\_].*

*What* is in prenuclear position in the clause whose ultimate head is the verb *said*, but it is understood as object of *bought*, not *said*. Simply labelling *what* as object would not bring this out, whereas the co-indexed gap device does serve to relate *what* to the *bought* VP whose object it is.

We make use of the same device to handle subject–auxiliary inversion. Compare the structures in [8] for canonical *He is ill* and interrogative *Is he ill?* The nucleus in [b] is identical to structure [a] except for the gap, and this accounts for the fact that the functional relations between *he*, *is*, and *ill* are the same in the two clauses: *he* is subject, *ill* is predicative complement, and *is* in [b] is shown to be predicator by virtue of its link to the gap element that fills the predicator position directly. Main clause interrogatives like *What had Liz bought?* will thus have one prenucleus + nucleus construction (*had* + *Liz bought*) functioning as nucleus within another (*what* + *had Liz bought*).

### ■ Organisation of the grammar

The distinction between canonical and non-canonical clauses plays a major role in the organisation of the present grammar. The early chapters deal predominantly with the structure of canonical clauses, and with units smaller than the clause: phrases headed by nouns, adjectives, adverbs, and prepositions. Chs. 9–16 then focus on non-canonical constructions; subordination requires more extensive treatment than the other dimensions mentioned above, and is covered in Chs. 11–14. The final chapter devoted to syntax (Ch. 17) deals with deixis and anaphora, phenomena which cut across the primary part-of-speech distinction between nouns, verbs, etc. There follow two chapters dealing with the major branches of morphology, and we end with a short account of punctuation.

## 3 The verb

The head of a clause (the predicate) is realised by a VP, and the head of a VP (the predicator) is realised by a verb. The verb thus functions as the ultimate head of a clause, and is the syntactically most important element within it: properties of the verb determine what other kinds of element are required or permitted.<sup>3</sup>

### ■ Inflection

Most verbs have six inflectional forms, illustrated here for the lexeme **take**:

[1]		<b>preterite</b>	<i>I <u>took</u> her to school.</i>
	PRIMARY FORMS	<b>3rd sg present tense</b>	<i>He <u>takes</u> her to school.</i>
		<b>plain present tense</b>	<i>They <u>take</u> her to school.</i>
		<b>plain form</b>	<i>I need to <u>take</u> her to school.</i>
	SECONDARY FORMS	<b>gerund-participle</b>	<i>We are <u>taking</u> her to school.</i>
		<b>past participle</b>	<i>They have <u>taken</u> her to school.</i>

Auxiliary verbs also have negative forms (*She isn't here, I can't help it, etc.*), while the verb **be** has two preterite forms (*was* and *were*) and three present tense forms (*am, is, are*). The *were* of *I wish she were here* we take to be an irrealis mood form, a relic of an older system now found only with the verb **be** with a 1st or 3rd person singular subject.

<sup>3</sup>Since the verb is the ultimate head, we can identify clauses by the verb. In [6] of §2, for example, we can refer to the most deeply embedded clause as the *buy* clause.

The plain form occurs in three main constructions, one of which has two subtypes:

- |     |        |                     |  |
|-----|--------|---------------------|--|
| [2] | i      | IMPERATIVE          | <i>Take great care!</i>                                  |
|     | ii     | SUBJUNCTIVE         | <i>It is essential [that he <u>take</u> great care].</i> |
|     | iii a. | TO-INFINITIVAL      | <i>I advise you [to <u>take</u> great care].</i>         |
|     |        | b. BARE INFINITIVAL | <i>You must [<u>take</u> great care].</i>                |

Note, then, that on our account imperative, subjunctive, and infinitival are clause constructions, not inflectional forms of the verb. *To* in [iiia] is a VP subordinator, not part of the verb.

### ■ Finite and non-finite

These terms likewise apply to clauses (and by extension VPs), not to verb inflection. Finite clauses have as head a primary form of a verb or else a plain form used in either the imperative or the subjunctive constructions. Non-finite clauses have as head a gerund-participle or past participle form of a verb, or else a plain form used in the infinitival construction.

### ■ Auxiliary verbs

Auxiliary verbs are distinguished syntactically from other verbs (i.e. from lexical verbs) by their behaviour in a number of constructions, including those illustrated in:

- |     |    |   |  |  |
|-----|----|---|--|--|
| [3] |    | AUXILIARY VERB                          |  | LEXICAL VERB                                 |
|     | i  | a. <i>I <u>have</u> not seen them.</i>  |  | b. * <i>I <u>saw</u> not them.</i>           |
|     | ii | a. <i><u>Will</u> you go with them?</i> |  | b. * <i><u>Want</u> you to go with them?</i> |

Thus auxiliary verbs can be negated by a following *not* and can invert with the subject to form interrogatives, but lexical verbs cannot. To correct [ib/iib] we need to insert the dummy (semantically empty) auxiliary **do**: *I did not see them* and *Do you want to go with them?* It follows from our syntactic definition that **be** is an auxiliary verb not only in examples like *She is working* or *He was killed* but also in its copula use, as in *They are cheap* (cf. *They are not cheap* and *Are they cheap?*).

Our analysis of auxiliary verbs departs radically from traditional grammar in that we take them to be heads, not dependents. Thus in *She is writing a novel*, for example, *is* is a head with *writing a novel* as its complement; the constituent structure is like that of *She began writing a novel*. Note, then, that *is writing* here is not a constituent: *is* is head of one clause and *writing* is head of a non-finite subordinate clause.

### ■ Tense and time

There are two tense systems in English. The primary one is marked by verb inflection and contrasts preterite (*She was ill*) and present (*She is ill*). The secondary one is marked by the presence or absence of auxiliary **have** and contrasts perfect (*She is believed to have been ill*) and non-perfect (*She is believed to be ill*). The perfect can combine with primary tense to yield compound tenses, preterite perfect (*She had been ill*) and present perfect (*She has been ill*).

We distinguish sharply between the grammatical category of tense and the semantic category of time. In *It started yesterday*, *You said it started tomorrow*, and *I wish it started tomorrow*, for example, *started* is a preterite verb-form in all three cases, but only in the

first does it locate the starting in past time. Once this distinction is clearly drawn, it is easy to see that English has no future tense: *will* and *shall* belong grammatically with *must*, *may*, and *can*, and are modal auxiliaries, not tense auxiliaries.

### ■ Aspect and aspectuality

We make a corresponding distinction between grammatical aspect and semantic aspectuality. English has an aspect system marked by the presence or absence of the auxiliary *be* contrasting progressive (*She was writing a novel*) and non-progressive (*She wrote a novel*). The major aspectuality contrast is between perfective and imperfective. With perfective aspectuality the situation described in a clause is presented in its totality, as a whole, viewed, as it were, from the outside. With imperfective aspectuality the situation is not presented in its totality, but viewed from within, with focus on the internal temporal structure or on some subinterval of time within the whole. The main use of progressive VPs is to express a particular subtype of imperfective aspectuality.

### ■ Mood and modality

Again, mood is a matter of grammatical form, modality a matter of meaning. Irrealis *were*, mentioned above, is a residual mood-form, but the main markers of mood in English are the modal auxiliaries *can*, *may*, *must*, *will*, *shall*, together with a few less central ones.

Three main kinds of modal meaning are distinguished:

- |     |              |                                       |  |
|-----|--------------|---------------------------------------|--|
| [4] | i DEONTIC    | <i>You must come in immediately.</i>  | <i>You can have one more turn.</i>           |
|     | ii EPISTEMIC | <i>It must have been a mistake.</i>   | <i>You may be right.</i>                     |
|     | iii DYNAMIC  | <i>Liz can drive better than you.</i> | <i>I asked Ed to go <u>but he won't</u>.</i> |

Deontic modality typically has to do with such notions as obligation and permission, or – in combination with negation – prohibition (cf. *You can't have any more*). In the central cases, epistemic modality qualifies the speaker's commitment to the truth of the modalised proposition. While *It was a mistake* represents an unqualified assertion, *It must have been a mistake* suggests that I am drawing a conclusion from evidence rather than asserting something of whose truth I have direct knowledge. And *You may be right* merely acknowledges the possibility that "You are right" is true. Dynamic modality generally concerns the properties and dispositions of persons, etc., referred to in the clause, especially by the subject. Thus in [iii] we are concerned with Liz's driving ability and Ed's willingness to go.

All three kinds of modality are commonly expressed by other means than by modal auxiliaries: lexical verbs (*You don't need to tell me*), adjectives (*You are likely to be fined*), adverbs (*Perhaps you are right*), nouns (*You have my permission to leave early*).

## 4 The clause: complements

Dependents of the verb in clause structure are either complements or modifiers. Complements are related more closely to the verb than modifiers. The presence or absence of particular kinds of complement depends on the subclass of verb that heads the clause: the verb *use*, for example, requires an object (in canonical clauses), while *arrive* excludes one.

Moreover, the semantic role associated with an NP in complement function depends on the meaning of the verb: in *He murdered his son-in-law*, for example, the object has the role of patient (or undergoer of the action), while in *He heard her voice* it has the role of stimulus (for some sensation). Ch. 4 is mainly concerned with complements in clause structure.

### ■ Subject and object

One type of complement that is clearly distinguished, syntactically, from others is the subject: this is an external complement in that it is located outside the VP. It is an obligatory element in all canonical clauses. The object, by contrast, is an internal complement and, as just noted, is permitted – or **licensed** – by some verbs but not by others. Some verbs license two objects, indirect and direct. This gives the three major clause constructions:

[1]	INTRANSITIVE	MONOTRANSITIVE	DITRANSITIVE
	a. <i>She smiled</i>	b. <i>He washed the car</i>	c. <i>They gave me the key</i>
	S P	S P O <sup>d</sup>	S P O <sup>i</sup> O <sup>d</sup>

The terms intransitive, monotransitive, and ditransitive can be applied either to the clause or to the head verb. Most verbs, however, can occur with more than one ‘complementation’. *Read*, for example, is intransitive in *She read for a while*, monotransitive in *She read the newspaper*, and ditransitive in *She read us a story*.

Example [1c] has the same propositional meaning as *They gave the key to me*, but *to me* is not an indirect object, not an object at all: it is syntactically quite different from *me* in [1c]. Objects normally have the form of NPs; *to me* here is a complement with the form of a PP.

### ■ Predicative complements

A different kind of internal complement is the predicative (PC):

[2]	COMPLEX-INTRANSITIVE	COMPLEX-TRANSITIVE
	a. <i>This seems a good idea / fair.</i>	b. <i>I consider this a good idea / fair.</i>
	S P PC	S P O <sup>d</sup> PC

We use the term **complex-intransitive** for a clause containing a predicative complement but no object, and **complex-transitive** for one containing both types of complement.

The major syntactic difference between a predicative complement and an object is that the former can be realised by an adjective, such as *fair* in these examples. Semantically, an object characteristically refers to some participant in the situation but with a different semantic role from the subject, whereas a predicative complement characteristically denotes a property that is ascribed to the referent of the subject (in a complex-intransitive) or object (in a complex-transitive).

#### Ascriptive and specifying uses of the verb *be*

Much the most common verb in complex-intransitive clauses is *be*, but here we need to distinguish two subtypes of the construction:

[3]	ASCRPTIVE	SPECIFYING
	a. <i>This is a good idea / fair.</i>	b. <i>The only problem is the cost.</i>

The ascriptive subtype is like the construction with *seem*: the PC *a good idea* or *fair* gives a property ascribed to ‘this’. Example [b], however, is understood quite differently: it serves to identify the only problem. It specifies the value of the variable *x* in ‘the *x*

such that *x* was the only problem?”. Syntactically, the specifying construction normally allows the subject and predicative to be reversed. This gives *The cost is the only problem*, where the subject is now *the cost* and the predicative is *the only problem*.

### ■ Complements with the form of PPs

The complements in [1–3] are all NPs or AdjPs. Complements can also have the form of subordinate clauses (*I know you are right*, *I want to help*), but these are dealt with in Ch. 11 (finite clauses) and Ch. 14 (non-finites). In Ch. 4 we survey a range of constructions containing prepositional complements. They include those illustrated in:

- [4] i a. *He referred to her article.*                      b. *He blamed the accident on me.*  
 ii a. *This counts as a failure.*                         b. *He regards me as a liability.*  
 iii a. *She jumped off the wall.*                        b. *She took off the label.*

The verbs *refer* and *blame* in [i] are prepositional verbs. These are verbs which take a PP complement headed by a specified preposition: *refer* selects *to* and *blame* selects *on*. (*Blame* also occurs in a construction in which the specified preposition is *for*: *He blamed me for the accident*.) Although the *to* in [ia] is selected by the verb, it belongs in constituent structure with *her article* (just as *on* in [ib] belongs with *me*): the immediate constituents of the VP are *referred* + *to her article*. *Count* and *regard* in [ii] are likewise prepositional verbs; these constructions differ from those in [i] in that the complements of *as* are predicatives, not objects.

The clauses in [4iii] look alike but are structurally different: the VP in [4iiia] contains a single complement, the PP *off the wall*, while that in [4iiib] contains two, *off* and the NP *the label*. *Off* is a PP consisting of a preposition alone (see §7 below). It can either precede the direct object, as here, or follow, as in *She took the label off*. Complements which can precede a direct object in this way are called particles.

## 5 Nouns and noun phrases

Prototypical NPs – i.e. the most central type, those that are most clearly and distinctively NPs – are phrases headed by nouns and able to function as complement in clause structure: *The dog barked* (subject), *I found the dog* (object), *This is a dog* (predicative). The three main subcategories of noun are common noun (e.g. *dog* in these examples), proper nouns (*Emma has arrived*), and pronouns (*They liked it*). As noted in Ch. 1, §4.2.2, we take pronoun to be a subcategory of noun, not a distinct primary category (part of speech).

### ■ Determiners and determinatives

One important kind of dependent found only in the structure of NPs is the determiner: *the book*, *that car*, *my friend*. The determiner serves to mark the NP as definite or indefinite. It is usually realised by a determinative or determinative phrase (*the*, *a*, *too many*, *almost all*) or a genitive NP (*the minister's speech*, *one member's behaviour*). Note then the distinction between **determiner**, a function in NP structure, and **determinative**, a lexical category. In traditional grammar, determinatives form a subclass of adjectives: we follow the usual practice in modern linguistics of treating them as a distinct primary category.

Just as the determiner function is not always realised by determinatives (as illustrated by the genitive NP determiners above), so many of the determinatives can have other

functions than that of determiner. Thus the determinative *three* is determiner in *three books*, but modifier in *these three books*. Similarly, determinative *much* is determiner in *much happiness* but a modifier in AdjP structure in *much happier*.

### ■ Modifiers, complements, and the category of nominal

Other dependents in NP structure are modifiers or complements:

- [1] i a. *a young woman*                      b. *the guy with black hair*                      [modifiers]  
 ii a. *his fear of the dark*                      b. *the claim that it was a hoax*                      [complements]

In these examples, the first constituent structure division is between the determiner and the rest of the NP, namely a head with the form of a **nominal**. *Young woman* in [ia], for example, is head of the whole NP and has the form of a nominal with *woman* as head and *young* as modifier. The nominal is a unit intermediate between an NP and a noun. The three-level hierarchy of noun phrase, nominal, and noun is thus comparable to that between clause, verb phrase, and verb.

In an NP such as *a woman*, with no modifier or complement, *woman* is both a nominal and a noun – so that, in the terminology of Ch. 1, §4.2.1, we have singulary branching in the tree structure. For the most part, however, nothing is lost if we simplify in such cases by omitting the nominal level and talk of the noun *woman* as head of the NP.

The underlined elements in [1], we have said, function in the structure of a nominal; as such, they are, from the point of view of NP structure, **internal dependents**, as opposed to the **external dependents** in:

- [2] a. *quite the worst solution*                      b. *all these people*

The underlined elements here modify not nominals but NPs, so that one NP functions as head of a larger one. *Quite* is, more specifically, an NP-peripheral modifier, while *all* in [b] is a predeterminer. There are also post-head peripheral modifiers, as in [*The director alone*] *was responsible*.

The internal pre-head dependent *young* in [1ia] is called, more specifically, an attributive modifier. The most common type of attributive modifier is adjectival, like this one, but other categories too can occur in this function: e.g. nominals (*a federal government inquiry*), determinatives (*her many virtues*), verbs or VPs (in gerund-participle or past participle form: *a sleeping child*, *a frequently overlooked problem*). With only very restricted exceptions, attributive modifiers cannot themselves contain post-head dependents: compare, for example, *\*a younger than me woman* or *\*a sleeping soundly child*.

### ■ Indirect complements

The complements in [1ii] are licensed by the heads of the nominals, *fear* and *claim*: we call these **direct** complements, as opposed to **indirect** complements, which are licensed by a dependent (or part of one) of the head. Compare:

- [3] a. *a better result than we'd expected*                      b. *enough time to complete the work*

The underlined complements here are licensed not by the heads *result* and *time*, but by the dependents *better* (more specifically by the comparative inflection) and *enough*. Indirect complements are not restricted to NP structure, but are found with most kinds of phrase.

Nouns – or, more precisely, senses of nouns – are classified as count (e.g. *a dog*) or non-count (*some equipment*). Count nouns denote entities that can be counted, and can combine with the cardinal numerals *one, two, three*, etc. Certain determiners occur only, or almost only, with count nouns (*a, each, every, either, several, many*, etc.), certain others with non-count nouns (*much, little, a little*, and, in the singular, *enough, sufficient*). Singular count nouns cannot in general head an NP without a determiner: *Your taxi is here*, but not *\*Taxi is here*.

## 6 Adjectives and adverbs

The two major uses of adjectives are as attributive modifier in NP structure and as predicative complement in clause structure:

- |     |                               |                                     |
|-----|-------------------------------|-------------------------------------|
| [1] | ATTRIBUTIVE MODIFIER          | PREDICATIVE COMPLEMENT              |
|     | a. <i>an excellent result</i> | b. <i>The result was excellent.</i> |

Most adjectives can occur in both functions; nevertheless, there are a good number which, either absolutely or in a given sense, are restricted to attributive function (e.g. *a sole parent*, but not *\*The parent was sole*), and a few which cannot be used attributively (*The child was asleep*, but not *\*an asleep child*).

Adjectives may also function postpositively, i.e. as post-head modifier in NP structure: *something unusual, the money available*.

### ■ The structure of AdjPs

The distinction between modifiers and complements applies to the dependents of adjectives too: compare *It was [very good]* or *He seems [a bit grumpy]* (modifiers) and *She is [ashamed of him]* or *I'm [glad you could come]* (complements). Complements always follow the head and hence are hardly permitted in attributive AdjPs – though they commonly occur in postpositives (*the minister [responsible for the decision]*). Complements generally have the form of PPs or subordinate clauses: with minor exceptions, adjectives do not take NPs as complement.

The structure of AdjPs is considerably simpler than that of clauses or NPs, and we need only two category levels, AdjP and adjective. In examples like those in [1], *excellent* is both an AdjP (consisting of just a head) and an adjective, but as with nominal we will simplify when convenient and omit the AdjP level.

### ■ Adverbs and AdvPs

Adverbs generally function as modifiers – or as supplements, elements prosodically detached from the clause to which they relate, as in *Unhappily, the letter arrived too late*. Unlike adjectives, they do not occur in predicative complement function: *Kim was unhappy* but not *\*Kim was unhappily*.

As modifiers, adverbs differ from adjectives with respect to the categories of head they combine with: adjectives modify nominals, while adverbs modify other categories (including NPs). Thus the adverb *almost* can modify verbs (*She [almost died]*), adjectives (*an [almost inaudible] response*), adverbs (*He spoke [almost inaudibly]*), or NPs (*They ate [almost the whole pie]*).

Not all adverbs can modify heads of all these categories, however, and differences on this dimension make the adverb the least homogeneous of the traditional parts of

speech. Some unity is accorded to it, however, by the fact that a high proportion of adverbs are morphologically derived from adjectives by suffixation of *·ly*, as in pairs like *excellent* ~ *excellently*. In this grammar, moreover, we have significantly reduced the syntactic heterogeneity of the adverb category by redrawing the boundary between adverbs and prepositions: see §7 below.

Adverbs can themselves be modified in a similar way to adjectives: compare *quite excellent* and *quite excellently*. However, only a very small number of adverbs license complements, as in *independently of such considerations*. As with adjectives, we need only two category levels, AdvP and adverb, and again we will often simplify by omitting the AdvP level in examples like *a [remarkably good] performance*.

## 7 Prepositions and preposition phrases

One of the main respects in which the present grammar departs from traditional grammar is in its conception of prepositions. Following much work in modern linguistics, we take them to be heads of phrases – preposition phrases – which are comparable in their structure to phrases headed by verbs, nouns, adjectives, and adverbs. The NPs in *to you*, *of the house*, *in this way*, etc., are thus complements of the preposition, and the underlined expressions in *a few minutes before lunch* or *straight after lunch* are modifiers.

Complements of a preposition, like those of a verb, may be objects, as in the examples just cited, or predicatives, as in *They regard him [as a liability]* or *It strikes me [as quite reasonable]*. Some prepositions, moreover, can take AdvPs or clauses as complement: *I didn't meet him [until recently]* and *It depends [on how much they cost]*. Within this framework, it is natural to analyse words such as *before* as a preposition in *I saw him [before he left]* (with a clause as complement) as well as in *I saw him [before lunch]* (with an NP as complement). And just as phrases of other kinds do not necessarily contain a complement, so we allow PPs with no complement. Thus in *I hadn't seen him [before]*, for example, *before* is again a preposition. And in *I saw him [afterwards]* we have a preposition *afterwards* that never takes a complement. Many of traditional grammar's adverbs and most of its subordinating conjunctions, therefore, are here analysed as prepositions.

### ■ Preposition stranding

An important syntactic property of the most central prepositions is that they can be **stranded**, i.e. occur with a gap in post-head complement position. Compare:

- |  |   |
|--|---|
| [1] i a. <i>She was talking [to a man].</i>                        | b. <i>I cut it [with a razor-blade].</i>                                  |
| ii a. <i>[To whom] was she talking?</i>                            | b. <i>the razor-blade<sub>i</sub> [with which<sub>i</sub>] I cut it</i>   |
| iii a. <i>Who<sub>i</sub> was she talking [to __<sub>i</sub>]?</i> | b. <i>the razor-blade<sub>i</sub> that I cut it [with __<sub>i</sub>]</i> |

In [i] we have the ordinary construction where *to* and *with* have an NP complement, with the whole PP occupying its basic position in the clause. In [ii] the PP is in preuclear position, in an interrogative clause in [iia], a relative clause in [iib]. In [iii], however, the preposition is stranded, with the complement realised by a gap. In [iiia] the gap is co-indexed with the interrogative phrase *who* in preuclear position, while in [iiib] it is

co-indexed with *razor-blade*, the head of the nominal containing the relative clause as modifier.

## 8 The clause: adjuncts

We use the term ‘adjunct’ to cover modifiers in clause (or VP) structure together with related supplements, such as the above *Unhappily, the letter arrived too late* (see §15).

Ch. 8 is complementary to Ch. 4. The latter focuses on core complements (subjects, objects, predicatives) and complements realised by PPs where the preposition is specified by the verb; Ch. 8 is mainly concerned with adjuncts, but also covers certain types of complement that are semantically related to them. Manner expressions, for example, are mostly adjuncts, but there are a few verbs that take manner complements: in *They treated us badly*, the dependent *badly* counts as a complement by virtue of being obligatory (for *They treated us* involves a different sense of *treat*). Similarly, while locative expressions are generally adjuncts in clauses describing static situations, as in *I spoke to her in the garden*, those occurring with verbs of motion are generally complements, licensed by the verb of motion. We distinguish here between source and goal, as in *Kim drove from Berlin to Bonn*, where the source *from Berlin* indicates the starting-point, and the goal *to Bonn* the endpoint.

The adjuncts considered are distinguished, and named, on a semantic basis. They include such traditional categories as time (or temporal location, as we call it, in order to bring out certain similarities between the spatial and temporal domains), duration, frequency, degree, purpose, reason, result, concession, and condition, as well as a number of less familiar concepts.

## 9 Negation

Negative and positive clauses differ in several respects in their syntactic distribution, i.e. in the way they combine with other elements in larger constructions. Three such differences are illustrated in:

[1]      NEGATIVE CLAUSE	POSITIVE CLAUSE
i a. <i>He didn't read the report, <u>not even</u> the summary.</i>	b. * <i>He read the report, <u>not even</u> the summary.</i>
ii a. <i>He didn't read the report, and <u>nor</u> did his son.</i>	b. <i>He read the report, and <u>so</u> did his son.</i>
iii a. <i>He didn't read it, <u>did he?</u></i>	b. <i>He read it, <u>didn't he?</u></i>

Negative clauses allow a continuation with *not even*, but positive clauses do not. The connective adjunct *nor* (or *neither*) follows a negative clause, whereas the corresponding adjunct following a positive clause is *so*. The third difference concerns the form of the confirmation ‘tag’ that can be appended, with [iiia] taking a positive tag (*did he?*), and [iiib] taking a negative one (*didn't he?*).

Clauses which count as positive by the above criteria may nevertheless contain negative elements within them, and we accordingly distinguish between **clausal negation**, as in [1], and **subclausal negation**, as in:

- [2] i *Not for the first time, she found his behaviour offensive.*  
 ii *We'll do it in no time.*  
 iii *They were rather unfriendly.*

These do not allow *not even* (e.g. *\*They were rather unfriendly, not even towards me*), take *so* rather than *nor* (e.g. *Not for the first time, she found his behaviour offensive, and so indeed did I*), and take negative confirmation tags (*We'll do it in no time, won't we?*).

### ■ Polarity-sensitive items

A number of words or larger expressions are sensitive to polarity in that they favour negative over positive contexts or vice versa. Compare:

- [3] i a. *She doesn't live here any longer.*      b. *\*She lives here any longer.*  
 ii a. *He was feeling somewhat sad.*      b. *\*He wasn't feeling somewhat sad.*

(We set aside the special case where [iib] is used to deny or contradict a prior assertion that he was feeling somewhat sad.) We say, then, that *any longer* is negatively oriented, and likewise (in certain senses at least) *any*, *anyone*, *ever*, determinative *either*, *yet*, *at all*, etc. Similarly *somewhat* is positively oriented, and also *some*, *someone*, *pretty* (in the degree sense), *already*, *still*, and others.

It is not, however, simply a matter of negative vs positive contexts: *any longer*, for example, is found in interrogatives (*Will you be needing me any longer?*) and the complement of conditional *if* (*If you stay any longer you will miss your bus*). These clauses have it in common with negatives that they are not being used to make a positive assertion: we use the term **non-affirmative** to cover these (and certain other) clauses. *Any longer* thus occurs in non-affirmative contexts, and we can also say that *any longer* is a non-affirmative item, using this as an alternative to negatively-oriented polarity-sensitive item.

### ■ The scope of negation

One important issue in the interpretation of negatives concerns the scope of negation: what part of the sentence the negation applies to. Compare, for example, the interpretation of:

- [4] i *Not many members answered the question.*      [*many* inside scope of *not*]  
 ii *Many members did not answer the question.*      [*many* outside scope of *not*]

These sentences clearly differ in truth conditions. Let us assume that there are a fairly large number of members – 1,000, say. Then consider the scenario in which 600 answered, and 400 didn't answer. In this case, [ii] can reasonably be considered true, but [i] is manifestly false.

The difference has to do with the relative scope of the negative and the quantification. In [4i] *many* is part of what is negated (a central part, in fact): "The number of members who answered was not large". In [ii] *many* is not part of what is negated: "The number of members who didn't answer was large". We say, then, that in [i] *many* is inside the

scope of *not*, or the negation, or alternatively that the negative has scope over *many*. Conversely, in [ii] *many* is outside the scope of the negation or, alternatively, *many* has scope over the negation, since it applies to a set of people with a negative property.

In [4] the relative scope of *not* and *many* is determined by the linear order. But things are not always as simple as this. Compare:

- [5] i *You need not answer the questionnaire.* [need inside scope of *not*]  
 ii *You must not answer the questionnaire.* [*must* outside scope of *not*]  
 iii *I didn't go to the party because I wanted to see Kim.* [ambiguous]

In [i] the negative has scope over *need* even though *need* comes first: “There isn't any need for you to answer”; in [ii], by contrast, *must* has scope over the negative: “It is necessary that you not answer”. In abstraction from the intonation, [iii] is ambiguous as to scope. If the *because* adjunct is outside the scope of the negation, it gives the reason for my not going to the party: “The reason I didn't go to the party was that I wanted to see Kim (who wasn't going to be there)”. If the *because* adjunct is inside the scope of negation, the sentence says that it is not the case that I went to the party because I wanted to see Kim (who was going to be there): here there is an implicature that I went for some other reason.

## 10 Clause type and illocutionary force

As a technical term, ‘clause type’ applies to that dimension of clause structure contrasting declaratives, interrogatives, imperatives, etc. The major categories are illustrated in:

- [1] i DECLARATIVE *She is a good player.*  
 ii CLOSED INTERROGATIVE *Is she a good player?*  
 iii OPEN INTERROGATIVE *How good a player is she?*  
 iv EXCLAMATIVE *What a good player she is!*  
 v IMPERATIVE *Play well!*

We distinguish systematically between categories of syntactic form and categories of meaning or use. For example, *You're leaving?* (spoken with rising intonation) is syntactically a declarative but would be used to ask a question.

A question defines a set of possible answers. On one dimension we distinguish between polar questions (*Is this yours?* – with answers *Yes* and *No*), alternative questions (*Is this Kim's or Pat's?* – in the interpretation where the answers are *Kim's* and *Pat's*), and variable questions (*Whose is this?* – where the answers specify a value for the variable in the open proposition “This is *x*'s”).

Making a statement, asking a question, issuing an order, etc., are different kinds of speech act. More specifically, when I make a statement by saying *This is Kim's*, say, my utterance has the **illocutionary force** of a statement. The illocutionary force typically associated with imperative clauses is called directive, a term which covers request, order, command, entreaty, instruction, and so on. There are, however, many different kinds of illocutionary force beyond those associated with the syntactic categories shown in [1]. For example, the declarative *I promise to be home by six* would generally be used with the force of a promise, *We apologise for the delay* with the force of an apology, and so on.

### ■ Indirect speech acts

Illocutionary meaning is often conveyed indirectly, by means of an utterance which if taken at face value would have a different force. Consider, for example, *Would you like to close the window*. Syntactically, this is a closed interrogative, and in its literal interpretation it has the force of an inquiry (with *Yes* and *No* as answers). In practice, however, it is most likely to be used as a directive, a request to close the door. Indirect speech acts are particularly common in the case of directives: in many circumstances it is considered more polite to issue indirect directives than direct ones (such as imperative *Close the window*).

## 11 Content clauses and reported speech

Ch. 11 is the first of four chapters devoted wholly or in part to subordinate clauses. Subordinate clauses may be classified in the first instance as finite vs non-finite, with the finites then subclassified as follows:

- |     |     |             |  |   |
|-----|-----|-------------|--|---|
| [1] | i   | RELATIVE    | <i>The one <u>who laughed</u> was Jill.</i>  | <i>This is the book <u>I asked for</u>.</i> |
|     | ii  | COMPARATIVE | <i>It cost more than <u>we expected</u>.</i> | <i>He isn't as old as <u>I am</u>.</i>      |
|     | iii | CONTENT     | <i>You said <u>that you liked her</u>.</i>   | <i>I wonder <u>what he wants</u>.</i>       |

Of these, content clauses represent the default category, lacking the special syntactic features of relatives and comparatives.

We do not make use of the traditional categories of noun clause, adjective clause, and adverb clause. In the first place, functional analogies between subordinate clauses and word categories do not provide a satisfactory basis for classification. And secondly, a high proportion of traditional adverb (or adverbial) clauses are on our analysis PPs consisting of a preposition as head and a content clause as complement: *before you mentioned it*, *if it rains*, *because they were tired*, and so on.

### ■ Clause type

The system of clause type applies to content clauses as well as to main clauses. The subordinate counterparts of [1i–iv] in §10 are as follows:

- |     |     |                      |   |
|-----|-----|----------------------|---|
| [2] | i   | DECLARATIVE          | <i>They say <u>that she is a good player</u>.</i>           |
|     | ii  | CLOSED INTERROGATIVE | <i>They didn't say <u>whether she is a good player</u>.</i> |
|     | iii | OPEN INTERROGATIVE   | <i>I wonder <u>how good a player she is</u>.</i>            |
|     | iv  | EXCLAMATIVE          | <i>I'll tell them <u>what a good player she is</u>.</i>     |

(There is, however, no subordinate imperative construction.) One special case of the declarative is the mandative construction, as in *It is important that she be told*. In this version, the content clause is subjunctive, but there are alternants with modal *should* (*It is important that she should be told*) or a non-modal tensed verb (*It is important that she is told*).

Content clauses usually function as complement within a larger construction, as in [2]. They are, however, also found in adjunct function, as in *What is the matter, that you are looking so worried?* or *He won't be satisfied whatever you give him*. The content clause in this last example is a distinct kind of interrogative functioning as a conditional adjunct – more specifically, as what we call an exhaustive conditional adjunct.

### ■ Reported speech

One important use of content clauses is in indirect reported speech, as opposed to direct reported speech. Compare:

- [3] i *Ed said, 'I shall do it in my own time.'* [direct report]  
 ii *Ed said that he would do it in his own time.* [indirect report]

The underlined clause in [i] is a main clause, and the whole sentence purports to give Ed's actual words. The underlined clause in [ii] is a subordinate clause and this time the sentence reports only the content of what Ed said.

## 12 Relative constructions and unbounded dependencies

The most central kind of relative clause functions as modifier within a nominal head in NP structure, as in:

- [1] a. *Here's [the note which she wrote].* b. *Here's [the note that she wrote].*

The relative clause in [a] is a *wh* relative: it contains one of the relative words *who*, *whom*, *whose*, *which*, *when*, etc. These represent a distinct type of 'pro-form' that relates the subordinate clause to the antecedent that it modifies. The *that* in [b] we take to be not a pro-form (i.e. not a relative pronoun, as in traditional grammar) but the subordinator which occurs also in declarative content clauses like [2i] in §11. We call this clause a *that* relative; often, as here, *that* can be omitted, giving a 'bare relative': *Here's [the note she wrote]*. In all three cases the object of *wrote* is realised by a gap (cf. §2 above): in [a] the gap is co-indexed with *which* in prenuclear position, and this is co-indexed with the antecedent *note*; in [b] and the version with *that* omitted the gap is simply co-indexed with the antecedent *note*.

The relative clauses in [1] are **integrated**: they function as a dependent within a larger construction. They are to be distinguished from **supplementary** relative clauses, which are prosodically detached from the rest of the sentence, as in *We invited Jill, who had just returned from Spain*. The two kinds of relative clause are traditionally distinguished as restrictive vs non-restrictive, but these are misleading terms since relative clauses that are syntactically and phonologically integrated into the sentence are by no means always semantically restrictive.

Consider finally the construction illustrated in:

- [2] *I've already spent what you gave me yesterday.* [fused relative construction]

The underlined sequence here is an NP, not a clause; it is distributionally and semantically comparable to expressions that are more transparently NPs, such as *the money which you gave me yesterday* or the very formal *that which you gave me yesterday*. The underlined NP in [2] belongs to the **fused relative construction**, a term reflecting the fact that *what* here combines the functions of head of the NP and prenuclear element in a modifying relative clause.

### ■ Unbounded dependency constructions

Relative clauses belong to the class of **unbounded dependency constructions**, along with open interrogatives, exclamatives, and a number of others. The distinctive property

of these constructions is illustrated for *wh* relatives in:

- [3] i *Here's the note; [which<sub>i</sub> she wrote \_\_<sub>i</sub>].*  
 ii *Here's the note; [which<sub>i</sub> he said she wrote \_\_<sub>i</sub>].*  
 iii *Here's the note; [which<sub>i</sub> I think he said she wrote \_\_<sub>i</sub>].*

In each of these *which* is understood as object of *wrote*: we are representing this by co-indexing it with a gap in the position of object in the *write* clause. In [ii] the *write* clause is embedded as complement in the *say* clause, and in [iii] the *say* clause is in turn embedded as complement within the *think* clause. And clearly there is no grammatical limit to how much embedding of this kind is permitted. There is a dependency relation between the gap and *which*, and this relation is unbounded in the sense that there is no upper bound, no limit, on how deeply embedded the gap may be in the relative clause.

### 13 Comparative constructions

Comparative clauses function as complement to *than*, *as*, or *like*. They differ syntactically from main clauses by virtue of being structurally reduced in certain specific ways. Consider:

- [1] a. *She wrote more plays than [he wrote \_\_ novels].*      b. *He's as old as [I am \_\_].*

In [a] we have a comparison between the number of plays she wrote and the number of novels he wrote: we understand “she wrote *x* many plays; he wrote *y* many novels; *x* exceeds *y*”. The determiner position corresponding to “*y* many” must be left empty, as evident from the ungrammaticality of *\*She wrote more plays than he wrote five novels*. In [b] we understand “He is *x* old; I am *y* old; *x* is at least equal to *y*”, and not only the modifier corresponding to *y* but also *old* itself is inadmissible in the comparative clause: *\*He's as old as I am old*.

The *more* of [1a] is an inflectional form of the determinative **many**, syntactically distinct from the adverb *more* in phrases like *more expensive*. The latter is an analytic comparative, i.e. one marked by a separate word (*more*) rather than inflectionally, as in *cheaper*. Similarly, *less* is the comparative form of determinative **little** in *I have less patience than you* and an adverb in *It was less painful than I'd expected*.

Example [1a] is a comparison of inequality, [b] one of equality – where being equal is to be understood as being at least equal. Comparisons of equality are also found following *same* (*She went to the same school as I did*), *such* (*Such roads as they had were in appalling condition*), and with *as* on its own (*As you know, we can't accept your offer*).

### 14 Non-finite and verbless clauses

Non-finite clauses may be classified according to the inflectional form of the verb. Those with a plain form verb are infinitival, and are subdivided into *to*-infinitivals and bare infinitivals depending on the presence or absence of the VP subordinator *to*. Including

verbless clauses, we have, then, the following classes:

[1]	i	TO-INFINITIVAL	<i>It was Kim's idea <u>to invite them all</u>.</i>
	ii	BARE INFINITIVAL	<i>She helped them <u>prepare their defence</u>.</i>
	iii	GERUND-PARTICIPIAL	<i><u>Calling in the police</u> was a serious mistake.</i>
	iv	PAST-PARTICIPIAL	<i>This is the proposal <u>recommended by the manager</u>.</i>
	v	VERBLESS	<i>He was standing with <u>his back to the wall</u>.</i>

The suffix 'al' in 'infinitival', etc., distinguishes the terms in [i–iv], which apply to clauses (and, by extension, to VPs), from those used in this grammar or elsewhere for inflectional forms of the verb.

Most non-finite clauses have no overt subject, but the interpretation of the clause requires that an understood subject be retrieved from the linguistic or non-linguistic context. There are also non-finite clauses in which a non-subject NP is missing: *John<sub>i</sub> is easy [to please \_\_<sub>i</sub>]* (where the missing object of *please* is understood as *John*) or *This idea<sub>i</sub> is worth [giving some thought to \_\_<sub>i</sub>]* (where the complement of the preposition *to* is understood as *this idea*). Clauses of this kind we call **hollow** clauses.

*To*-infinitivals containing an overt subject are introduced by *for*, as in [*For them to take the children*] *could endanger the mission*. We take this *for* to be a clause subordinator, comparable to the *that* of finite declaratives.

#### ■ The catenative construction

Non-finite clauses occur in a wide range of functions, as complements, modifiers, and supplements. One function that is worth drawing attention to here is that of **catenative** complement in clause structure:

[2]	i	a. <i>Max seemed <u>to like them</u>.</i>	b. <i>Jill intended <u>to join the army</u>.</i>
	ii	a. <i>Everyone believed Kim <u>to be guilty</u>.</i>	b. <i>She asked me <u>to second her motion</u>.</i>

The term 'catenative' reflects the fact that this construction is recursive (repeatable), so that we can have a chain, or concatenation, of verbs followed by non-finite complements, as in *She intends to try to persuade him to help her redecorate her flat*. The term 'catenative' is applied to the non-finite complement, and also to the verb that licenses it (*seem*, *intend*, *believe*, and *ask* in [2]) and the construction containing the verb + its complement. We take the view that these non-finite clauses represent a distinct type of complement: they cannot be subsumed under the functions of object or predicative complement that apply to complements in VP structure with the form of NPs. Auxiliary verbs that take non-finite complements are special cases of catenative verbs: in *You may be right*, *She is writing a novel*, and *They have left the country*, for example, the underlined clauses are catenative complements.

In [2i] the non-finite complement immediately follows the catenative verbs, whereas in [ii] there is an intervening NP: we refer to [i] and [ii] as respectively the simple and complex catenative constructions. In [ii] (but not in all cases of the complex construction) the intervening NP (*Kim* in [iia], *me* in [iib]) is object of the matrix clause. Cutting across this distinction is an important semantic one, such that *Max* in [ia] and *Kim* in [iia] are **raised** complements, whereas the corresponding elements in the [b] examples (*Jill* in [ib], *me* in [iib]) are not. A raised complement is one which belongs semantically in a lower clause than that in which it functions syntactically. Thus in [ia] *Max*

is syntactically subject of *seem*, but there is no direct semantic relation between *Max* and *seem*: note, for example, that [ia] can be paraphrased as *It seemed that Max liked them*, where *Max* belongs both syntactically and semantically in the subordinate clause. Similarly, in [iia] *Kim* is syntactically object of *believe*, but there is no direct semantic relation between *believe* and *Kim*. Again, this is evident when we compare [iia] with the paraphrase *Everyone believed that Kim was guilty*, where *Kim* is located syntactically as well as semantically in the *be* clause.

## 15 Coordination and supplementation

Ch. 15 deals with two kinds of construction that differ from those covered above in that they do not involve a relation between a head and one or more dependents.

### ■ Coordination

Coordination is a relation between two or more elements of syntactically equal status. These are called the coordinates, and are usually linked by a coordinator, such as *and*, or *but*:

- [1] i [*She wants to go with them, but she can't afford it.*] [clause-coordination]  
 ii *I've invited* [*the manager and her husband*]. [NP-coordination]  
 iii *She'll be arriving* [*tomorrow or on Friday*]. [NP/PP-coordination]

We take the bracketed sequences in [i–ii] as respectively a clause-coordination (not a clause) and an NP-coordination (not an NP). Coordinates must be syntactically alike, but the syntactic likeness that is required is in general a matter of function rather than of category. Thus in the clauses *She'll be arriving tomorrow* and *She'll be arriving on Friday*, the underlined phrases have the same function (adjunct of temporal location), and this makes it possible to coordinate them, as in [iii], even though the first is an NP and the second a PP. This adjunct clearly cannot be either an NP or a PP: we analyse it as an NP/PP-coordination.

Coordinations can occur at practically any place in structure. In *Kim bought two houses*, for example, we can replace each of the constituents by a coordination: *Kim and Pat bought two houses*, *Kim bought and sold two houses*, and so on. This means that when we are describing constructions we do not need to say for each function that if it can be filled by an *X* it can also be filled by an *X*-coordination: this can be taken for granted, with exceptions dealt with specifically in Ch. 15.

One important distinctive property of coordination is that there is no grammatical limit to the number of coordinates that may combine in a single construction. Instead of the two coordinates in [iii], for example, we could have *the manager, her husband, the secretary, your uncle Tom, and Alice* or a coordination with any other number of coordinates.

### ■ Supplementation

We use the term supplementation for a construction containing an **anchor** and a **supplement**, an element related semantically to the anchor but not integrated into the syntactic structure as a dependent. Supplements are detached prosodically from the

anchor, typically having the character of an interpolation or an appendage (an element added loosely at the beginning or end of a clause). Examples are the underlined expressions in:

- [2] i *Her father – he's the guy talking to the Mayor – has agreed to finance the deal.*  
 ii *I finally volunteered to go first, a decision I quickly came to regret.*

As mentioned in §12, we include under this heading what are traditionally called non-restrictive relative clauses.

## 16 Information packaging

We noted in §2 above that there are a number of non-canonical constructions which characteristically differ from their more basic counterparts not in truth conditions or illocutionary meaning but in the way the informational content is presented: we call these **information-packaging** constructions. Some examples are given in [1], with their more basic counterparts listed in the right-hand column:

[1] i	PREPOSING	<i>This one I'm giving to Jill.</i>	<i>I'm giving this one to Jill.</i>
ii	POSTPOSING	<i>He gave to charity all the money she had left him.</i>	<i>He gave all the money she had left him to charity.</i>
iii	INVERSION	<i>In the bag were two knives.</i>	<i>Two knives were in the bag.</i>
iv	EXISTENTIAL	<i>There is one guard outside.</i>	<i>One guard is outside.</i>
v	EXTRAPOSITION	<i>It's clear that it's a forgery.</i>	<i>That it's a forgery is clear.</i>
vi	CLEFT	<i>It was a bee that stung me.</i>	<i>A bee stung me.</i>
vii	PASSIVE	<i>I was attacked by their dog.</i>	<i>Their dog attacked me.</i>

'Inversion' in [iii] is short for 'subject-dependent inversion', as opposed to subject-auxiliary inversion. In the particular example given here, there is inversion of the subject *two knives* and the locative complement *in the bag*. In *Soon afterwards came the second package* we have inversion of the subject and a temporal adjunct.

In [ii–iii] the only syntactic difference between the two versions is in the linear order of the elements, whereas in [iv–vii] there are differences in syntactic function. In the existential example, the dummy (semantically empty) pronoun *there* is subject, while *one guard* is **displaced subject**, and similarly in the extraposition example the dummy pronoun *it* is subject and *that it's a forgery* is **extraposed subject**. The terms 'displaced subject' and 'extraposed subject' denote elements which are not themselves subject but which are interpreted semantically as though they were, and characteristically correspond to the subject of the more basic construction. Extrapositional *it* can also appear in object function, as in *I find it strange that no one noticed the error*; in this case the embedded content clause functions as extraposed object.

A cleft clause contains the elements of the more basic counterpart divided into two: one (here *a bee*) is foregrounded and functions as complement of the verb *be*; the other (*stung me*) is backgrounded and placed in a subordinate (relative) clause. The example in [1vi] is, more specifically, an *it*-cleft (having the dummy pronoun *it* as subject of *be*), contrasting with the 'pseudo-cleft' *What stung me was a bee*, where the backgrounded component is located in a fused relative construction.

A passive clause like that in [1vii] differs from its active counterpart in the way the semantic roles are aligned with syntactic functions. The object of the active appears as subject of the passive, and the subject of the active appears as the complement of the preposition *by*; in addition, the passive contains the auxiliary verb *be*, taking a past-participial complement. We refer to the *by* phrase as the internalised complement: it is an internal complement of the passive VP, whereas the element in the active to which it corresponds, namely the subject, is an external complement. The internalised complement is generally optional: clauses in which it is present we call long passives, as opposed to short passives like *I was attacked*.

### ■ Pragmatic constraints

Use of the information-packaging constructions in discourse tends to be more constrained than that of the syntactically more basic constructions. Two important factors involved in these constraints are the familiarity status of the information expressed and the weight of syntactic constituents.

Information that is familiar, or **old**, is information that the speaker assumes to be shared by speaker and addressee. If it is derivable from the preceding discourse, it is discourse-old information; addressee-old information covers this together with other information that the addressee is assumed to be familiar with. Information that is not old is **new**.

Weight has to do with the length or complexity of constituents. Thus *the book she was reading* is heavier than *the book*, but the latter is heavier than *it*. Postposing, as in [1ii], generally depends on the constituent concerned being relatively heavy: replacement of *all the money she had left him* by, say, *ten dollars*, would very strongly favour the version where the object occupies its default position immediately after the verb.

## 17 Deixis and anaphora

The last of the chapters on syntax deals with deixis and anaphora, phenomena which cut across the division between the parts of speech and which are found in both canonical and non-canonical clause constructions.

Deictic expressions include temporal *now*, *yesterday*, *today*, *tomorrow*, locative *here* and *there*, demonstrative **this** and **that**, the personal pronouns **I**, **we**, and **you**, and primary tense. The property common to such expressions is that their reference is determined in relation to certain features of the utterance-act: essentially, when and where it takes place, who is speaking to whom, the relative proximity of entities to the speaker.

Anaphora is the relation between an anaphor and an antecedent, as in *Jill has left her car in the road*, in the interpretation where the reference is to Jill's car. *Jill* is here the antecedent and *her* the anaphor: the interpretation of the anaphor derives from that of the antecedent. We will often represent the anaphoric relation by co-indexing antecedent and anaphor: *Jill<sub>i</sub> has left her<sub>i</sub> car in the road*. In this example, the anaphor is a personal pronoun; we call such anaphors 'pro-forms', a term which also covers various forms which are not pronouns, such as *so* (*Grapes are expensive<sub>i</sub> and likely to remain so<sub>i</sub> for*

some time), *do so* (I haven't told them<sub>i</sub>; yet, but I'll do so<sub>i</sub> tomorrow), and **one** (This banana<sub>i</sub> is green: have you got a riper one<sub>i</sub>?). Anaphors may also be gaps, as in the elliptical *I'd like to help you<sub>i</sub>; but I can't \_\_\_<sub>i</sub>*.

An anaphor generally follows its antecedent, but under restricted conditions it may precede, as in *If you can \_\_\_<sub>i</sub>, please come a little earlier next week<sub>i</sub>*.

## 1 Inflectional categories of the verb

This section is concerned with the question of what inflectional distinctions apply in the English verbal system: how many different forms of a lexeme need to be recognised, and how are they to be named? The question of how the forms of a lexeme are derived from its lexical base is a morphological one, and is dealt with in Ch. 18.

### 1.1 Summary presentation of the categories

We begin with a brief listing of the inflectional categories of verbs. Each inflectional category will be taken up in turn in §§1.3–9, after an explanation of the concept of syncretism.

#### ■ Lexical vs auxiliary verbs

The two main types of verbs in English are the **auxiliary** verbs, comprising a small list of verbs with very specific syntactic properties, and the non-auxiliary verbs, i.e. all the rest of the verbs in the dictionary, which we will call the **lexical** verbs. The two types of verb differ in inflectional morphology as well as syntax.

#### ■ Lexical verbs: the six-term paradigm

The set of inflectional forms of a variable lexeme is called a **paradigm**, and virtually all lexical verbs have a paradigm with six forms, as illustrated in [1].

[1]		<i>take</i>	<i>want</i>	<i>hit</i>	
Primary	{ preterite { present tense	{ 3rd sg { plain	<i>took</i> <i>takes</i> <i>take</i>	<i>wanted</i> <i>wants</i> <i>want</i>	<i>hit</i> <i>hits</i> <i>hit</i>
Secondary	{ plain form { gerund-participle { past participle		<i>take</i> <i>taking</i> <i>taken</i>	<i>want</i> <i>wanting</i> <i>wanted</i>	<i>hit</i> <i>hitting</i> <i>hit</i>

#### ■ Auxiliary verbs

The auxiliary verbs depart from the above system in three main ways.

## (a) Negative forms

Auxiliaries, unlike lexical verbs, have an extra set of primary forms: the **negative** forms. Thus **can** has the preterite form *couldn't*, and the auxiliary verb **have** has the 3rd person singular present tense form *hasn't*, but we do not have *\*tookn't* in the paradigm of **take**, or *\*wantsn't* for **want**.

## (b) Modal auxiliaries

The **modal** auxiliaries, **can**, **may**, **must**, etc., are **defective**, i.e. they lack certain inflectional forms and hence cannot occur in constructions requiring these forms. All of them lack all of the secondary forms and hence are excluded from such constructions as *\*I'd like to can swim* (no plain form), *\*I regret not canning swim* (no gerund-participle), *\*I have could swim since I was three* (no past participle). In addition, **must** and one or two others lack preterite forms (*\*I must see the Dean yesterday*). A further special property of the modal auxiliaries is that they have a single present tense form that occurs with all subjects (there is no 3rd person singular present tense form with a suffixed *-s*).

(c) Additional forms for **be**

**Be** shows more person–number agreement than other verbs, and also has an irrealis mood form *were*.

In [2] we show the paradigms for **have** and **can**, the latter having only primary forms. Notice the complete lack of secondary forms with the latter.

[2]

		<b>have</b>		<b>can</b>			
		neutral	negative	neutral	negative		
Primary	{	preterite	<i>had</i>	<i>hadn't</i>	<i>could</i>	<i>couldn't</i>	
	{	present tense	3rd sg	<i>has</i>	<i>hasn't</i>	<i>can</i>	<i>can't</i>
			plain	<i>have</i>	<i>haven't</i>		
Secondary	{	plain form	<i>have</i>	–	–	–	
	{	gerund-participle	<i>having</i>	–	–	–	
	{	past participle	<i>had</i>	–	–	–	

In [3] we give the paradigm of the primary forms of **be**; the secondary forms are *be* (plain form), *being* (gerund-participle), and *been* (past participle).

[3]

		Neutral			Negative			
		1st sg	3rd sg	Other	1st sg	3rd sg	Other	
Primary	{	Present tense	<i>am</i>	<i>is</i>	<i>are</i>	<i>aren't</i>	<i>isn't</i>	<i>aren't</i>
	{	Preterite	<i>was</i>	<i>were</i>	<i>wasn't</i>	<i>weren't</i>		
	{	Irrealis	<i>were</i>	–	<i>weren't</i>	–		

## 1.2 Syncretism

When two or more forms of a lexeme are identical we say that there is **syncretism** between them, or that they are **syncretised**. For example, there is syncretism between the preterite and past participle of *want*: both are **realised** as *wanted*.

### ■ The justification for recognising syncretism

We recognise two forms with the spelling *wanted* (the preterite and the past participle), instead of just one (labelled ‘*ed*-form’, perhaps), because allowing syncretism permits the grammar to be stated in more general terms than if we dealt directly with the realisations. Consider, for example:

- [4] i a. She wanted the car.                      b. She took/\*taken the car.                      [preterite]  
 ii a. She had wanted the car.                      b. She had taken/\*took the car.                      [past participle]

*Take* has *took* and *taken* as overtly distinct forms, with preterite *took* occurring, for example, in construction [i], as the first (or only) verb of a canonical clause, and past participle *taken* in [ii], the perfect construction. If we extend the distinction from *take* to *want* (and other such verbs) the *wanted* of [ia] will be analysed as a preterite form and that of [ib] as a past participle, and this enables us to say that the first (or only) verb of a canonical clause can appear in the preterite form but not the past participle, and conversely that a verb in construction with the perfect auxiliary *have* must be in the past participle form.

### ■ Principles for deciding how much syncretism to allow

Traditional grammar postulates a great deal more syncretism than we have in [1]: instead of the six forms we propose there are no less than thirty in the traditional analysis.<sup>1</sup> This gives a very misleading account of the contemporary language, one that fails to recognise that during the course of its historical development English has lost much of its earlier inflectional system. We have based the analysis of [1–3] on the following principles:

- [5] i An inflectional distinction is accepted between two forms only if there is at least one lexeme with a stable contrast in realisation between those two forms.  
 ii Inflectional distinctions involving agreement properties are not generalised from one lexeme to another.

Principle [i] requires that a proposed inflectional distinction be morphologically marked – signalled by some actual prefix or suffix or some other overt distinction – in at least one lexeme. Inflection is **morphosyntactic**: an inflectional difference is a difference in morphological form that reflects a difference in syntactic properties. For example,

<sup>1</sup>Leaving aside the forms consisting of more than one word (*will take*, *has taken*, etc.), the traditional paradigm is as follows:

FINITE	Indicative		Subjunctive		Imperative Pres	NON-FINITE	
	Past	Pres	Past	Pres			
1st sg	<i>took</i>	<i>take</i>	<i>took</i>	<i>take</i>		Infinitive	<i>take</i>
2nd sg	<i>took</i>	<i>take</i>	<i>took</i>	<i>take</i>	<i>take</i>	Gerund	<i>taking</i>
3rd sg	<i>took</i>	<i>takes</i>	<i>took</i>	<i>take</i>		Present participle	<i>taking</i>
1st pl	<i>took</i>	<i>take</i>	<i>took</i>	<i>take</i>		Past participle	<i>taken</i>
2nd pl	<i>took</i>	<i>take</i>	<i>took</i>	<i>take</i>	<i>take</i>		
3rd pl	<i>took</i>	<i>take</i>	<i>took</i>	<i>take</i>			

the difference in form between *took* and *taken* reflects the syntactic difference between preterite and past participle, so this difference is not just syntactic but morphosyntactic. But if a syntactic distinction is never marked by a difference in morphological form there is no reason for saying that it is morphosyntactic, hence no reason for saying that it is inflectional. Consider, for example:

- [6] i *I'm warning you, [take careful note of what they say].* [imperative]  
 ii *It is essential [that he take careful note of what they say].* [subjunctive]

The bracketed clauses represent two syntactically distinct constructions: imperative and subjunctive. But no matter what lexeme we might select in such clauses, the form of the verb is always the same. This is true even with the verb *be*, which has more distinctions of form than any other verb: compare *Be patient* and *It is essential [that he be patient]*. It follows that we have no reason to say that the constructions contain different inflectional forms of the verb: imperative and subjunctive are different syntactic types of clause, but those terms do not pick out different inflectional forms of the verb.

Principle [5ii] distinguishes agreement features from others involved in inflection. To say that *X* agrees with *Y* is to say that if *Y* changes then *X* must change too. In the preterite such agreement is found between the verb and the subject with *be* but not with other verbs:

- [7] i a. *She was ill.* b. *They were ill.* [verb agrees with subject]  
 ii a. *She looked ill.* b. *They looked ill.* [no agreement]

When we change the subject from *she* to *they* in [i] we must change the preterite from *was* to *were*: there are two preterite forms whose person–number properties match those of the subject. But in [ii] *looked* remains constant, so that there is no basis for saying that the preterite of *look* agrees with the subject. Here, then, there is just one preterite form and it has no person–number properties at all. And the same of course applies to all verbs other than *be*.

We will now return to the analysis presented in §1.1, comparing it with traditional grammar in the light of these principles, and explaining the terminology adopted.

## 1.3 The past participle

### ■ Perfect and passive

The past participle is used in two constructions, the perfect and the passive, where it prototypically follows the auxiliaries *have* and *be* respectively:

- [8] i *I have written him a long letter.* [perfect]  
 ii *The letter was written by her secretary.* [passive]

Virtually all verbs appear in the perfect construction, whereas the passive is largely restricted to transitive verbs like *write* in [ii] or ‘prepositional’ verbs such as *refer* or *rely* (i.e. verbs which take a complement with a specified preposition: *refer* + *to* . . . , *rely* + *on* . . . ), as in *This matter was referred to in my earlier letter*. The verbs *be*, *die*, *seem*, for example, do not occur in the passive. But there are no verbs where the form used in

the passive is different from that used in the perfect. For this reason we take the perfect and passive constructions to involve different uses of the same inflectional form, not different forms.

### ■ Clause-head and attributive uses

The past participle is also found without the perfect and passive auxiliaries, as in:

- [9] i *I came across a letter written ten years ago.* [head of clause]  
 ii *He showed me a hurriedly written first draft.* [attributive]

Such constructions almost always involve the passive use of the past participle: [i] and [ii], for example, are comparable to *The letter was written ten years ago* and *The first draft was written hurriedly*, which contain the passive auxiliary **be**. Construction [9i] allows the past participle to be followed by the same range of dependents as it can have in [8ii]: compare *I came across a letter written by her secretary*. For this reason we analyse *written ten years ago* as a clause with the verb *written* as its head. But *written* in [9ii] cannot be followed by dependents in this way (*\*a hurriedly written by her secretary first draft*), and *hurriedly written* does not have the structure of a clause: we will refer to it as an attributive VP.

### ■ The concept of participle

The central idea in the traditional concept of participle is that it is a word formed from a verb base which functions as or like an adjective. A second general property of participles is that these words are also used in combination with an auxiliary to form a compound tense, aspect, mood, or voice.

The adjective-like character of *written* is seen in [9]. The most elementary type of noun-modifier is an adjective (as in *a long letter*, *a careless draft*), so *written* is like an adjective in that it heads an expression with the same noun-modifying function as an adjective. The secondary feature of forming compound tenses is illustrated in [8] – note that here, certainly in the perfect use in *have written*, there is nothing adjective-like about the form. It is its use in the perfect construction that provides the basis for the ‘past’ component of the name, for the perfect is a kind of past tense. No element of pastness applies to the passive use, but it is predominantly the passive that is involved in noun-modifying constructions like [9], which fit the central part of the definition of participle. ‘Past participle’ is therefore a reasonably good name for a form with the above spread of uses. It should be emphasised, however, that the inclusion of ‘past’ in the name does not imply that the past participle is itself a tensed form: it is a participle which occurs in construction with the past tense auxiliary **have**.

### ■ Participle as verb-form vs participial adjective

The formulation we used above – ‘a word formed from a verb base which functions as or like an adjective’ – is non-committal as to whether the word is in fact a verb or an adjective. Dictionary definitions commonly use the expression ‘verbal adjective’, implying a subtype of adjective. That certainly won’t do for the examples above, where the words concerned are verbs, but there are other constructions where words of this kind are indeed to be classified as adjectives. In such cases we talk of a **participial adjective**, reserving ‘participle’ itself for verbs. Compare:

- [10] i *It was broken deliberately, out of spite.* [past participle form of verb]  
 ii *It didn't look broken to me.* [past-participial adjective]  
 iii *It was broken.* [ambiguous]

The verb *broken* in [i] denotes an event, while the adjective *broken* in [ii] denotes a state – and the ambiguity of [iii] lies precisely in the fact that it can be interpreted in either of these ways. We take the verb to be more basic, with the adjective formed from it (cf. Ch. 19, §3.4).

We will look more fully at this distinction in Ch. 16, §10.1.3; here we draw attention to certain grammatical differences which justify drawing a distinction between verbs and adjectives with words of this kind.

#### (a) Complementation

Certain types of complement are found with verbs but not with adjectives – notably objects and predicative complements. The following are therefore unambiguously verbs:

- [11] i *He quickly spent the money given him by his uncle.* [verb + indirect object]  
 ii *They sacked those considered guilty of bias.* [verb + predicative comp]

#### (b) Occurrence with *seem*

Verbs such as *seem*, *appear*, *look*, *remain* take AdjPs as complement, but not participial clauses. This is why *broken* in [10ii] is unambiguously an adjective, and why the ambiguity of [10iii] is resolved in favour of the adjective (state) reading if we replace *be* by *seem*: *It seemed broken*. Compare, similarly:

- [12] i *The picture seemed excellent/distorted.* [*seem* + adjective]  
 ii *\*The boss seemed considered guilty of bias.* [*seem* + verb]

#### (c) Modification by *very* or *too*

The degree adverbs *very* and *too* can modify adjectives but not verbs: *It was very/too dangerous* (adjective), not *\*It very/too frightened me* (verb).

- [13] i *He was [very frightened] / [too frightened to move].* [adjective]  
 ii *\*The plants were [very/too watered] by the gardener.* [verb]

Note, however, that not all adjectives take this modification – we can hardly have *?It didn't look very/too broken to me*, for example. Criterion (c) therefore works in only one direction: if the word in question can be modified by *very* or *too* it must be an adjective, not a verb, but if it can't be so modified it could be either.

In the light of this distinction between participial adjectives and participle forms of verbs we can clarify the nature of the functional resemblance between participle and adjective that forms the basis for the general definition. In examples like [9] it is not a matter of the word *written* itself having a function like that of an adjective, but of *written* being head of an expression whose function is like that of an expression headed by an adjective, i.e. of an AdjP. The functional resemblance is at the level not of words but of larger constituents, such as those underlined in *a letter written ten years ago* and *a very old letter*. At the level of words, verbs and adjectives differ significantly with respect to the dependents they take.

## 1.4 The gerund-participle

This form covers the gerund and present participle of traditional grammar, which are always identical in form.

### ■ The traditional present participle

This has uses comparable to those of the past participle:

- [14] i *The train to Bath is now approaching Platform 3.* [with progressive auxiliary]  
 ii *The train approaching Platform 3 is the 11.10 to Bath.* [head of clause]  
 iii *He threw it in the path of an approaching train.* [attributive]

Constructions [ii–iii] are those where the present participle is functionally comparable to an adjective in that it is head of an expression modifying a noun, and in [i] it combines with an auxiliary to form the progressive aspect. It is called the ‘present’ participle because the time associated with it is characteristically the same as that expressed or implied in the larger construction containing it (but see also §7). In [i] and [ii] the time of approaching is simultaneous with the time of speaking, but that is because the larger construction has present tense *is*. There would be no change in the form or meaning of *approaching* if we changed *is* to *was* to give *The train to Bath was approaching Platform 3*. ‘Present’, therefore, is to be understood in a relative rather than absolute sense: the approaching is present relative to the time given in the larger construction. Again, however, it must be emphasised that the traditional present participle is not a tensed form of the verb.

### ■ Verb-form vs participial adjective

As with the past participle, we need to distinguish cases where the word in question is a verb from those where it is an adjective. Compare:

- [15] i *They are entertaining the prime minister and her husband.* [form of verb]  
 ii *The show was entertaining.* [participial adjective]  
 iii *Her parents are entertaining.* [ambiguous]

The verbal interpretation of [iii] is “Her parents are entertaining some guests”, the adjectival one roughly “Her parents have entertaining qualities”. The constructions can be distinguished grammatically by the same criteria as we used for past participles in §1.3.

#### (a) Complementation

Verbs can take NP objects, whereas adjectives normally do not. Compare, for example, *Kim loves Pat* with the ungrammatical *\*Kim is fond Pat*. The ungrammaticality of the latter results from a requirement of the adjective *fond*: it requires a PP complement with *of* (*Kim is fond of Pat*). Consider, then:

- [16] i *You’re frightening me.* [form of verb]  
 ii *Such a prospect is frightening indeed.* [participial adjective]

The object *me* in [i] is a clear indication that *frightening* must here be a verb, and since the verb **frighten** (in the relevant sense of “cause fright”) is more or less impossible without an object, *frightening* in [ii] will be interpreted as an adjective. Note that **frighten** differs in this respect from **entertain**, which does occur quite readily without an object

(cf. *They like to entertain*): this is why [15iii] can have a verbal as well as an adjectival interpretation.

#### (b) Occurrence with *seem*

We have noted that verbs like *seem* take AdjPs as complement, but not participial clauses. They can therefore substitute for *be* in [15ii] but not in [i]:<sup>2</sup>

- [17] i *They are/\*seem entertaining the prime minister and her husband.* [verb]  
 ii *The show was/seemed entertaining.* [adjective]

#### (c) Modification by *very* or *too*

As these degree adverbs can modify adjectives but not verbs they can be inserted in [15ii] but not [15i]:

- [18] i *\*They are very entertaining the prime minister and her husband.*  
 ii *The show was very entertaining.*

Ambiguities between verb and adjective, as in [15iii] (*Her parents are entertaining*) are possible, but they are not common.

### ■ The traditional gerund

A gerund is traditionally understood as a word derived from a verb base which functions as or like a noun, as in:

- [19] i *Destroying the files was a serious mistake.*  
 ii *I regret destroying the files.*

*Destroying the files* could be replaced by *the destruction of the files*, where *destruction* is clearly a noun. The primary difference between a gerund and a participle, therefore, is that while a participle is functionally comparable to an adjective, a gerund is functionally comparable to a noun. There is also a secondary difference: that gerunds do not combine with auxiliaries in the way that participles do.

### ■ Verb vs noun

As with the participle, we have used the formulation ‘as or like’ in talking of the functional resemblance between a gerund and a noun, leaving open the issue of whether the word is verb or noun. Dictionaries tend to define the gerund as a verbal noun, but there are strong grounds for analysing *destroying* in [19] as a verb, and for drawing a distinction between such words and others ending in *·ing* which genuinely are nouns and which we refer to therefore as **gerundial nouns**:

- [20] i *He was expelled for killing the birds.* [form of verb]  
 ii *She had witnessed the killing of the birds.* [gerundial noun]

The main grammatical differences are as follows:

#### (a) Complementation

Verbs and nouns differ in the kinds of complement they take. Most notably, transitive verbs can take NP objects whereas the corresponding nouns take an *of* PP: compare *the*

<sup>2</sup>Participial clauses were found with *seem* in the nineteenth century (and even occasionally in the twentieth), as in *The storms seemed clearing away from his path*: the loss of this construction has strengthened the category distinction between verb and adjective.

*birds* in [20i] with *of the birds* in [ii]. Note also that we find predicative complements with verbs but not with nouns: *He has a fear of seeming unintelligent*, but not *\*He has a fear of the seeming unintelligent*.

#### (b) Modification by adjective or adverb

Nouns are characteristically modified by adjectives, but the corresponding modifiers of verbs are adverbs:

- [21] i *He was expelled for wantonly killing the birds.* [adverb + verb]  
 ii *She had witnessed the wanton killing of the birds.* [adjective + noun]

#### (c) Determiners

*The* and comparable determiners combine with nouns, not verbs. Thus we cannot have *\*the killing the birds* – only the NP *the killing of the birds* or the VP *killing the birds*.

#### (d) Plural inflection

Gerundial nouns can very often inflect for plural, as in *These killings must stop*. This is never possible with the verbs: *\*Killings the birds must stop*.

Note again, then, that the functional resemblance between *destroying* in [19] and the noun *destruction* is not at the level of words but at the level of the larger constituents that they head – between the clause *destroying the files* and the NP *the destruction of the files* rather than between the verb *destroying* and the noun *destruction*. At the level of the word, verb and noun are quite sharply distinct by virtue of the different dependents they take. Where no such dependents are present, ambiguities can arise:

- [22] i *Kim hates writing thank-you letters.* [verb]  
 ii *Kim hadn't been involved in the writing of the letter.* [noun]  
 iii *Kim had been talking about writing.* [ambiguous]

In [i] the presence of a following object shows *writing* to be a verb; in [ii] *the* and *the of* phrase show it to be a noun; and in [iii], where it occurs alone, it could be either. In the verb interpretation of [iii] *writing* will have an understood object (very likely a letter) and also an understood subject (very likely it is a matter of Kim writing); in the noun interpretation *writing* denotes the phenomenon and is comparable to *speech*, which is unambiguously a noun.<sup>3</sup>

### ■ A distinction between gerund and present participle can't be sustained

Historically the gerund and present participle of traditional grammar have different sources, but in Modern English the forms are identical. No verb shows any difference in form in the constructions of [14] and [19], not even *be*. The historical difference is of no relevance to the analysis of the current inflectional system, and in accordance with principle [51] we reject an analysis that has gerund and present participle as different forms syncretised throughout the class of verbs. We have therefore just one inflectional form of the verb marked by the *-ing* suffix; we label it with the compound term 'gerund-participle' for the verb-form, as there is no reason to give priority to one or other of

<sup>3</sup> Both noun and verb can take genitives as dependent, as in *I can't read his writing* (noun) and *There would be no point in his writing another letter at this stage* (verb); we discuss this issue in Ch. 14, §1.6.

the traditional terms. The compound term serves also to bring out the relationship between this form and the past participle: the gerund-participle has a considerably wider distribution than the past participle (which doesn't, for example, occur in constructions like [19i]), and yet the two forms have it in common that they head expressions modifying nouns, as in [9] and [14ii–iii].<sup>4</sup> This grammar also takes the view that even from the point of view of syntax (as opposed to inflection) the distinction between gerund and present participle is not viable, and we will therefore also not talk of gerund and present participle constructions: we argue the case for this position in Ch. 14, §4.3.

In summary, words with a verb base and the *-ing* suffix fall into the following three classes:

- |        |   |                                    |
|--------|---|------------------------------------|
| [23] i | <i>She had witnessed the <u>killing</u> of the birds.</i>   | [gerundial noun]                   |
| ii     | a. <i>He was expelled for <u>killing</u> the birds.</i><br>b. <i>They are <u>entertaining</u> the prime minister.</i> | } [gerund-participle form of verb] |
| iii    | <i>The show was <u>entertaining</u>.</i>  |                                    |

## 1.5 The plain form

The last of the secondary forms, the plain form, is used in the following three constructions:

- |        |   |               |
|--------|---|---------------|
| [24] i | <i><u>Be</u> on your guard.</i>                             | [imperative]  |
| ii     | <i>It is essential [that she <u>be</u> on her guard].</i>   | [subjunctive] |
| iii    | <i>It is important [to <u>be</u> always on your guard].</i> | [infinitival] |

We pointed out in §1.2 that there is never any morphological difference between the form a verb has in the imperative construction and the form it has in the subjunctive construction, and we can now add that the form concerned is also identical with that used in the infinitival construction.

Given that the three constructions in [24] always select identical verb-forms, it is inappropriate to take imperative, subjunctive, and infinitival as inflectional categories. That, however, is what traditional grammar does, again retaining distinctions that were valid at an earlier stage of the language but have since been lost: they have no place in the inflectional system of Present-day English.

As far as terminology is concerned, there is no reason to pick out one of the three constructions as more basic than the others. This time, however, a compound term, 'imperative-subjunctive-infinitive', would be far too unwieldy, and we have therefore chosen the term 'plain form', which is oriented towards morphology rather than meaning or syntax. The form consists simply of the lexical base, the plain base without any suffix or other modification.

Precisely because it is the morphologically most elementary form, this is the one we use as the **citation form** for verbs, i.e. the one we put in bold face to represent the lexeme as a whole.

<sup>4</sup>Some modern grammars use '-ing form' for gerund-participle and '-en form' for past participle (the *-en* suffix of *taken*, *eaten*, etc., being one that is never used to form preterites). These labels have mnemonic value but are unsuitable as general terms: they do not relate the categories concerned to comparable ones in other languages.

### ■ Infinitival *to* is not part of the verb

The traditional practice for citation of verbs is to cite them with the infinitival marker *to*, as in ‘*to be*’, ‘*to take*’, and so on. That is an unsatisfactory convention, because the *to* is not part of the verb itself. It is not a (morphological) prefix but a quite separate (syntactic) word. This is evident from the fact that it can stand on its own in elliptical constructions as in [25i], need not be repeated in coordination as seen in [25ii], and can be separated from the verb by an adverb as seen in [25iii] (the so-called ‘split infinitive construction’, discussed in Ch. 6, §7.1):

- [25] i *I haven’t read it yet but I hope to shortly.*  
 ii *I want to [go out and get some exercise].*  
 iii *I’m trying to gradually improve my game.*

## 1.6 The present tense forms

Most verbs have two present tense forms, with the choice between them normally determined by agreement with the subject. The 3rd person singular form *takes* is so called, therefore, because it occurs with 3rd person singular subjects. The other form, *take*, occurs with 1st and 2nd person singular and all plural subjects. It might be called the ‘non-3rd-person-singular present tense’; we have preferred ‘plain present tense’ partly because it is simpler, partly to draw attention to the fact that with verbs other than *be* this form is syncretised with the plain form.

### ■ Syncretism between the plain present tense and the plain form

This syncretism is the most problematic feature of our analysis. An alternative would be to say that lexical verbs have only five inflectional forms, that the *take* of *They take no notice of her* is not a different inflectional form from the plain form but merely a further use of it, beyond the three illustrated in [24]. There are nevertheless several points that can be made in support of an analysis where the plain present tense is recognised as a distinct inflectional form.

#### (a) Overt morphological contrast with *be*

The main point is that with the verb *be* we do not have syncretism between the plain form and a present tense form. The examples in [24] contrast with:

- [26] *You are on your guard.* [present tense]

This is a very sharp distinction. The imperative, subjunctive, and infinitival in [24] are morphologically identical, but the present tense is morphologically distinct from them. This is sufficient to establish an inflectional contrast, in accordance with principle [5i]. There are other respects in which the plain present tense differs from the plain form.

#### (b) Tense contrast

The two forms occupy very different positions within the verbal system: the present contrasts in tense with the preterite, while the plain form is tenseless. The difference is brought out by such examples as these:

- [27] i a. *I think they take their son to school by car.* [present tense]  
 b. *I thought they took their son to school by car.* [preterite]  
 ii a. *We demand that they be reinstated.* } [plain form]  
 b. *We demanded that they be reinstated.* }

The tense contrast in [i] is not matched in [ii]; traditional grammar takes the *be* of [ii] to be a present subjunctive, but there is no justification for assigning tense to it (or for regarding *I be* and *I were* as contrasting in tense: see §1.7 below).

### (c) Person–number contrast

The plain present contrasts with the 3rd person singular present: it is normally restricted to plural or 1st/2nd person subjects, whereas in the imperative, subjunctive, and infinitival constructions the form of the verb is unaffected by the subject. If we replace *they* by *she* in [27ia], *take* changes to *takes*, but the same replacement in [iia] has no effect on the verb.

### (d) Defective morphology of the modal auxiliaries

The modals have only tensed forms. They lack a plain form, just as they lack a past participle and gerund-participle. Compare:

- [28] i *They can recite it by heart.* [present tense]  
 ii *\*Can recite it by heart by the end of the week.* [imperative]  
 iii *\*It is important for them to can recite it by heart.* [infinitival]

Instead of [ii] and [iii] we would have to use *be able*: *Be able to recite it by heart by the end of the week*, *It is important for them to be able to recite it by heart*. Similarly in the subjunctive: *It is essential that they be able to recite it by heart*; *can* is not impossible here, but that is because the subjunctive alternates with a tensed construction: *It is essential that they are able to / can recite it by heart* (cf. Ch. 11, §7.1.1).

## 1.7 The preterite and irrealis were

### ■ Three uses of the preterite

The preterite has three distinct uses illustrated in [29]:

- [29] i *She always took her dog with her.* [past time]  
 ii *If he took the later plane tonight he wouldn't have to rush.* [modal remoteness]  
 iii *Kim said I took things too seriously.* [backshift]

The difference between these is most easily seen by comparing them with the corresponding present tense forms:

- [30] i *She always takes her dog with her.*  
 ii *If he takes the later plane tonight he won't have to rush.*  
 iii *Kim said I take things too seriously.*

With [29i] and [30i] the difference is straightforwardly a matter of time: *took* indicates that I am talking about a time in the past. The difference between [29ii] and [30ii], however, is not one of time: in both cases I'm talking about future time. They belong to two different kinds of conditional construction which we call **remote** and **open**: [30ii] presents his taking the later plane tonight as an open possibility, whereas [29ii] presents it as a more remote one. Such a difference belongs to the area of meaning called modality, so that we speak of the preterite here as expressing modal remoteness (as explained in §6.1). The modal remoteness use is also found in the complement of the verb *wish*, as in *I wish I had my umbrella with me*. The time here is present, but the clause has a counterfactual interpretation, i.e. you understand that I don't have

my umbrella with me. Finally, [29iii] and [30iii] could both be used to report Kim's saying to me: *You take things too seriously*. The present tense of the original utterance is retained in [30iii] but replaced in [29iii] with a preterite; we will keep the traditional term **backshift** here, saying that preterite *took* is a backshifted counterpart of present *take*.

Of the three uses illustrated in [29] the past time one is clearly the most basic. The modal remoteness use is found (with lexical verbs) only in a few subordinate constructions, and backshift is restricted to cases of explicit or implicit reported speech, or comparable kinds of subordination. By virtue of its past time use, therefore, we say that *took* is a past tense, and since we also regard the perfect as a past tense we refer to *took* more specifically as the preterite.<sup>5</sup> This term is applicable to past tenses that are expressed inflectionally, rather than by means of an auxiliary, like the perfect.

### ■ The mood contrast between *was* and *were*

With 2nd person and plural subjects, *were* is the form of **be** used for past time, modal remoteness, and backshift, but with 1st and 3rd person singular subjects, there are two forms to account for, *was* and *were*:

- [31] i *I was very busy.* [preterite]  
 ii *If I were less busy I would go with you.* [irrealis]

There are three issues to consider here. First, we take up the descriptive issue of where the two forms are found, i.e. of their 'distribution'. The main use of irrealis *were* is to express modal remoteness, but for some speakers it extends to certain related constructions, where it has something of the character of a hypercorrection. The second issue concerns the relation between what we are calling 'irrealis' *were* and the subjunctive construction of *It is essential [that she be on her guard]* ([24ii]), since traditional grammar analyses both as subjunctive. Third, we explain why we do not extend the irrealis category beyond the 1st and 3rd person singular of **be**.

### The modal remoteness use of irrealis *were* and preterite *was*

The main use of irrealis *were* is in subordinate constructions where the preterite of other verbs has the modal remoteness meaning – remote conditionals (with *if*, *as if*, *as though*, etc.), and the complement of *wish*, *would rather*, etc.:<sup>6</sup>

- [32] i *He talks to me as if I were a child.*  
 ii *I wish I were going with you.* } [modal remoteness]

Preterite *was*, however, is very widely used instead of irrealis *were* in these constructions, especially in informal style: *He talks to me as if I was a child*, *I wish I was going with you*.<sup>7</sup>

<sup>5</sup> An alternative, AmE, spelling is 'preterit'.

<sup>6</sup> Occasional examples are found of irrealis *were* in main clauses: % *Such a move were ill-advised* ("would be"). This is archaic, reflecting a stage of the language before a modal auxiliary was required in the main clause of an explicit or implicit remote conditional.

<sup>7</sup> *Was* has been in competition with *were* for 300–400 years, and in general the usage manuals regard it as acceptable, though less formal than *were*. Two places where *were* cannot be replaced by *was* are inverted conditionals (*I would certainly join them, were I not working on a project of my own*) and the fixed phrase *as it were*; *if I were you* bears some resemblance to a fixed phrase and *was* is less usual here than in conditionals generally.

### Extended uses of irrealis *were*

For some speakers, irrealis *were* is not restricted to the modal remoteness constructions, but is found also in certain backshift and past time uses that bear some resemblance to them:

- [33] i % *She phoned to ascertain whether he were dining at the Club.* } [backshift]  
 ii % *He looked at me as if he suspected I were cheating on him.* }  
 iii % *If he were surprised, he didn't show it.* [past time]

In [i] we have backshift in a closed interrogative (the ‘original question’ was “Is he dining at the Club?”). This construction allows *if* in place of *whether* (*to ascertain if he were dining* . . .), and this can be seen as providing a link to the central uses of irrealis *were*. In [ii] the backshift is in the complement of *suspect*, which in turn is within a conditional construction (though not, in this case, a modally remote one). Example [iii] is a conditional, but of the open type, not the remote (for a past time remote conditional requires a preterite perfect: *If he had been surprised, he would have shown it*). *Was* is much more usual than *were* in the constructions of [33], and for most speakers probably the only possibility. *Were* here clearly has something of the character of a ‘hypercorrection’: prescriptive grammar used to insist on *were* rather than *was* in modal remoteness constructions, and this may have led to the avoidance of *was* in certain neighbouring constructions.<sup>8</sup>

### Irrealis and subjunctive

One striking weakness of the traditional analysis is that it treats the verbs of *I be* and *I were* as present and past tenses of a single mood, the subjunctive: this is quite unjustified in terms of the contemporary language. In general they appear in different constructions and are not in direct contrast, but in the one place where it is marginally possible to have a contrast the meaning difference is clearly not one of time but of modality:

- [34] i *If that be so, the plan will have to be revised.* [subjunctive use of plain form]  
 ii *If that were so, the plan would have to be revised.* [irrealis]

Both are concerned with present time, but [ii] suggests much more than [i] that ‘that’ is not so. In its normal use, i.e. in modal remoteness constructions, irrealis *were* does not refer to past time, and there is no synchronic reason to analyse it as a past tense form. Similarly, *be* is not a present tense form because it has no tense at all, as we argued above on the basis of its failure to undergo backshift in constructions like [27iib] (*We demanded that they be reinstated*). Moreover, we have seen that there is no inflectional distinction between this *be* and the ones that occur in the imperative and infinitival constructions. The plain form *be*, therefore, has no inflectional property of either tense or mood; 1st/3rd person singular *were* is likewise a non-tensed form, but it does have mood.

<sup>8</sup>Examples like [i] and [iii] are mentioned in some usage manuals, and generally treated as incorrect; but they are found in the writings of highly prestigious authors. Another type of example we have encountered is: *The two theoretical extremes of such a scale of formal explicitness would be (a) the case where no information at all were expressed formally, and (b) the case where no information were expressed pragmatically.* *Were* is here in a relative construction embedded within a main clause containing a modal remoteness use of *would*.

The general term **subjunctive** is primarily used for a verbal mood that is characteristically associated with subordinate clauses with a non-factual interpretation. We are extending the term so that it applies to a syntactic construction rather than a verb-form, but our subjunctive clauses are still characteristically subordinate and non-factual. We need a different term for 1st/3rd person singular *were*: we call it **irrealis**, a general term applying to verb moods associated with unreality (i.e. where the proposition expressed is, or may well be, false).

#### Irrealis category applies only to *be* with a 1st/3rd person singular subject

The distinction between *was* and *were* in [31] is not sufficient to justify generalising a mood system to all verbs. As we have noted, *was* is a variant of *were* in the modal remoteness constructions, so that if we said that *took*, for example, could be the realisation of either a preterite or an irrealis, there would be no way of telling in cases like [29ii] (*If he took the later plane tonight he wouldn't have to rush*) whether it corresponded to *was* or to *were*, and hence no way of deciding whether it was preterite or irrealis. The encroachment of *were* into territory normally occupied by *was* exemplified in [33] is further evidence that we are not dealing here with a clear case of semantic or syntactic contrast. If we were to say that all verbs had a preterite–irrealis distinction we would be claiming that the massive coalescence of realisational forms that has taken place in the development of English has not produced a change in the system of verb inflection itself, but merely large-scale syncretism. It is much more plausible to say that irrealis *were* is an unstable remnant of an earlier system – a system which has otherwise been replaced by one in which the preterite has expanded its use in such a way that it now serves to express modal remoteness as well as past time.

## 1.8 Primary and secondary forms and the category of finiteness

### ■ Primary forms: forms with tense or mood inflection

The first division we have made within the verbal paradigm is between the primary and secondary forms: leaving aside the verb *be*, the primary forms are the tensed ones, i.e. the preterite and present tense forms. These can be regarded as primary in that they are the ones that are found in canonical clauses: the secondary forms appear in various kinds of non-canonical clause, especially subordinate ones. Irrealis *were* is not used in canonical clauses, but is best classified with the tensed forms as it is normally in alternation with preterite *was* and occurs in constructions (such as those in [32–33]) which select tensed forms of other verbs. The primary forms can therefore be defined as the ones that are inflected for tense or mood, and the secondary forms as the remainder.

### 1.8.1 Finiteness as a syntactic rather than inflectional category in English

In the traditional analysis of English verb inflection the first division is between the finite and non-finite forms, but the revision we have made means that the finite/non-finite distinction is no longer definable simply in terms of inflection. We will see that there are grounds for not discarding it altogether, however, and we therefore reinterpret it as a syntactic category of the clause, rather than as an inflectional category of the verb. Clauses whose verb is a primary form are finite, those whose verb is a past participle or gerund-participle are non-finite, but those with a plain form verb can be either, depending on the construction:

[35]	VERB INFLECTION	CONSTRUCTION	CLAUSE FINITENESS
	primary form		
	plain form	{ imperative subjunctive infinitival }	finite
	gerund-participle past participle		}

### ■ Finite and non-finite as general categories

Non-finite clauses are characteristically subordinate, and non-finiteness can be seen as an instance of the phenomenon known as ‘desentialisation’, the loss of properties that are associated with a clause standing alone as a full sentence. The general term ‘finite’ is related to its everyday sense of “limited”. More specifically, a finite verb is characteristically limited with respect to person and number. In its traditional application to English, for example, *takes* is finite in that it is limited to occurrence with a 3rd person singular subject. Being limited is thus a matter of being marked for the relevant categories. Generalising beyond person–number, we can think of finite verbs or clauses as marked for more categories than non-finite ones. This accounts for the connection between non-finiteness and subordination: a subordinate clause occurs within the structure of some larger clause and is commonly less explicit than a main clause because information which in a main clause has to be encoded in the grammatical structure can be simply inferred from the larger context.

Compare, for example:

- [36] i *The boy was seen by the guard.* [finite, main]  
 ii *The boy who was seen by the guard was her son.* [finite, subordinate]  
 iii *The boy seen by the guard was her son.* [non-finite, subordinate]

The underlined clause in [ii] differs from [i] by virtue of having as subject not *the boy* but the relative pronoun *who*, whose interpretation is derivable from the main clause, but in other respects it is just the same. In [iii], however, the structural accompaniment of subordination is much greater: the subject is missing altogether and so is the passive auxiliary *be* and the preterite inflection.

## 1.8.2 Constructions with a plain form verb: imperative, subjunctive, and infinitival

The prototypical finite clause contains a tensed verb (or irrealis *were*), but there are grounds for extending the boundaries of the category to include the imperative and subjunctive constructions too. These differ from infinitivals in significant ways, being much closer to the prototypical finite construction.

### (a) Imperatives

These differ from non-finites in that they are virtually always main clauses.<sup>9</sup> They are like finite clauses, moreover, in that they take auxiliary *do* in the negative – compare:

<sup>9</sup>Note that although *You told me to be on my guard* can be used to report your saying *Be on your guard*, the subordinate clause *to be on my guard* is infinitival, not imperative (cf. Ch. 10, §9.8).

- [37] i *They don't leave until tomorrow.* [tensed]  
 ii *Don't leave until tomorrow.* [imperative]  
 iii *I advise you not to leave / \*to don't leave until tomorrow.* [non-finite]

The subject can even occur in post-auxiliary position (*Don't you talk to me like that!*), a position which is otherwise quite impossible in clauses with secondary verbs. It is true that they usually have no subject, but the understood subject is recovered from the nature of the construction itself (as *you*) rather than from an element in the larger construction, as it most often is with non-finites.

### (b) Subjunctives

These exclude auxiliary **do**, and are usually subordinate: subjunctive main clauses are restricted to fixed phrases (*So be it!*, *Be that as it may*, etc.) or frames (*Long live . . . !*, *Far be it from me to . . .*, etc.). In other respects, however, they are more like tensed clauses than non-finites. In the first place the subject is an obligatory element. Secondly, the most productive use of the subjunctive construction takes the same subordinator as is found with tensed declaratives, *that*, as in the earlier *We demand that he be reinstated*, etc. And, thirdly, except in more or less fixed expressions, the subjunctive alternates with a tensed construction:

- [38] i *It is important [that she be reinstated immediately].* [subjunctive]  
 ii *It is important [that she is / should be reinstated immediately].* [tensed]

### (c) Infinitivals

These are almost invariably subordinate, and the range of functions is closely comparable to that of gerund-participials and past-participials, which are clear cases of the non-finite construction. Like gerund-participials and past-participials, infinitivals usually have no overt subject. Those that do contain a subject are introduced by a different subordinator from that used in tensed declaratives, *for* rather than *that*, and personal pronouns appear in accusative case, not nominative as in tensed clauses. Compare:

- [39] i *It is unusual [for him to be so late].* [infinitival]  
 ii *It is annoying [that he is so late].* [finite]

It is clear, then, that although infinitivals have the same verb-form as imperatives and subjunctives, they belong more closely with gerund-participials and past-participials in terms of their distribution and structure. Infinitivals, gerund-participials, and past-participials constitute the non-finites of traditional grammar: we have retained the membership of the class while changing the interpretation and definition.

## 1.9 Negative forms

The primary forms of auxiliaries can normally be either **neutral** or **negative**. The neutral ones are so called because they can occur in both positive and negative clauses:

- [40] i *She will read it.* } [neutral form]  
 ii *She will not read it.* }  
 iii *She won't read it.* [negative form]

The clause is positive in [i], negative in [ii–iii], but only in [iii] is the negation marked inflectionally on the verb. In [ii] the negation is **analytic**, marked by a separate word (*not*), with the form of the verb, *will*, being the same as in the positive clause. The full set of negative forms is given in Ch. 18, §5.5.

### ■ Negative inflection vs contraction

Forms like *won't* are commonly regarded as ‘contractions’ of *will* + *not*, and so on, but there are compelling reasons for analysing them differently from cases like *she'll* (from *she* + *will*), *they've* (*they* + *have*), etc. *Won't* is, by every criterion, a single grammatical word, an inflectional form of **will**. *She'll* is not a single grammatical word, hence not an inflectional form. Rather, 'll (pronounced /l/) is a **clitic** form of *will*, i.e. a reduced form that is joined phonologically (and orthographically) to an independent word called its **host**. The host in the case of *she'll* is the pronoun *she*. The written forms *she'll*, *they've*, etc., are pronounced as single monosyllabic words phonologically but correspond to two-word sequences syntactically.

Evidence for this analysis is seen in:

- |        |  |                                       |
|--------|--|---------------------------------------|
| [41] i | <i>Won't</i> / * <i>Will not</i> she be glad?                          | [not replaceable by <i>will not</i> ] |
| ii     | <i>He says she'll read it, but she <u>WON'T</u> / <u>will NOT</u>.</i> | [contrastive negation]                |

Example [i] shows that *won't* is not always replaceable by *will not* (as *she'll* always is by *she will*), and in such cases a contraction analysis is not viable. In [ii] the small capitals indicate contrastive negation marked by stress. A clitic cannot bear stress (cliticisation is an extreme case of the phonological reduction that is available only for words that are unstressed). Note, for example, that in *He says she won't read it, but she WILL*, the stress prevents the reduction of *she WILL* to *SHE'LL*: if *won't* involved cliticisation like *she'll*, therefore, it would not occur with emphatic negation.

A further point is that the phonological form of *won't* is not predictable by general rule from *will* + *not* (as the form of *she'll* is a predictable reduction of *she* + *will*). The irregularity of the negative form *won't* is comparable to that of the preterite form *would*: such irregularity is a common phenomenon in inflectional morphology, but is not explicable in terms of cliticisation. Not all the negative auxiliary forms are irregular, of course, but the fact that some are is an indication that we are dealing with inflection.

The historical **origin** of the negative forms as contractions of the word *not* in casual styles of speech is nonetheless transparent. In writing this is reflected in the use of the apostrophe, which once indicated a vowel omitted. And in consequence the negative forms are therefore like genuine synchronic contractions (e.g. clitic 'll) in one respect: they are felt to be informal, and are generally avoided in the most formal styles, especially in writing (see Ch. 9, §2.1).

Notice that this book is **not** written in strictly formal style, and we make considerable use of negative auxiliaries.

### ■ Negative of plain form

**Do** is exceptional in that it has a negative of the plain form, used solely in the imperative: *Don't eat it*. *Don't* can of course also be a plain present tense form, as in *They don't eat it*: we have syncretism, just as we do with neutral *do*.

The plain form *don't* differs from the present tense in that it doesn't agree with the subject, and hence can combine with a 3rd person singular, such as *anybody*.

- [42] i *Don't anybody eat it!* [imperative: no agreement – plain form]  
 ii *Doesn't anybody eat it?* [interrogative: agreement – present tense]

## 2 Auxiliary verbs

The auxiliary verbs of English are the following:

- [1] i *can, may, will, shall, must, ought, need, dare* [modals]  
 ii *be, have, do, %use* [non-modals]

Some of them appear in idioms – *be going, have got, had better/best, would rather/sooner* (as in *It is going to rain, I've got a headache*, etc.) – and in such cases it is just the first verb (*be, have, had, would*) that is an auxiliary, not the whole idiom.

*Need, dare, have, do*, and *use* are dually categorised: they belong to both auxiliary and lexical verb classes. Compare:

- | [2]    | AUXILIARIES                                   | LEXICAL VERBS  |
|--------|---|--|
| i a.   | <i>Need I bother?</i>                         | b. <i>Do I <u>need</u> to bother?</i>                |
| ii a.  | <i>I <u>daren't</u> tell you any more.</i>    | b. <i>No one had <u>dared</u> to contradict him.</i> |
| iii a. | <i>They <u>had</u> finished.</i>              | b. <i>They <u>had</u> a fight.</i>                   |
| iv a.  | <i>She <u>doesn't</u> agree with you.</i>     | b. <i>She <u>does</u> her best.</i>                  |
| v a.   | <i>%You <u>usedn't</u> to worry about it.</i> | b. <i>You didn't <u>use</u> to worry about it.</i>   |

These matters are taken up in the discussion of the individual auxiliary verbs in §2.5; *use* differs from the others in that [va] and [vb] belong to different varieties, and for many speakers only [vb] is possible, with *use* for them belonging exclusively to the class of lexical verbs.

The syntactic properties which distinguish auxiliaries from the open class of lexical verbs are discussed in §2.1, while §2.4 presents the further properties which distinguish, within the auxiliaries, between the modals and the rest. We have listed the auxiliaries in [1] as lexemes, subsuming *could, would, should, might*, as preterite forms, under *can, will, shall, may*, respectively. For the last two, however, this raises certain problems that we take up in §9.8.4.

### 2.1 Distinctive syntactic properties of auxiliary verbs

#### ■ The NICE constructions: Negation, Inversion, Code, and Emphasis

Auxiliaries differ very strikingly from lexical verbs in their syntactic behaviour. In the first place, there are four non-canonical constructions that are found with auxiliary verbs, but not with lexical verbs. This is illustrated by the contrast between auxiliary *have* and lexical *see* in [3], where [i] represents the canonical structure in which both are allowed, and [ii–v] the special constructions that are restricted to auxiliaries:

[3]	AUXILIARY VERB	LEXICAL VERB	
i	a. <i>He <u>has</u> seen it.</i>	b. <i>He <u>saw</u> it.</i>	
ii	a. <i>He <u>has</u> not seen it.</i>	b. <i>*He <u>saw</u> not it.</i>	[Negation]
iii	a. <i><u>Has</u> he seen it?</i>	b. <i>*<u>Saw</u> he it?</i>	[Inversion]
iv	a. <i>He <u>has</u> seen it and I <u>have</u> too.</i>	b. <i>*He <u>saw</u> it and I <u>saw</u> too.</i>	[Code]
v	a. <i>They don't think he's seen it but he <u>HAS</u> seen it.</i>	b. <i>*They don't think he <u>saw</u> it but he <u>SAW</u> it.</i>	[Emphasis]

### ■ The acronym 'NICE'

The short labels for the constructions illustrated here are 'Negation', 'Inversion', 'Code', and 'Emphasis', and the initial letters of these give rise to the acronym 'NICE'. We will need to refer to them frequently in what follows, so it will be convenient to call them the **NICE constructions**.

'Negation' is clear; 'Inversion' means subject–auxiliary inversion; 'Emphasis' means emphasis on an auxiliary realised by heavy stress. 'Code' is the least transparent of the four terms. The idea is that when someone says *He has seen it* and I reply by saying *I have too*, I am speaking in a kind of code: such clauses can't be understood without a key. The key is provided by the preceding context, which in this example enables us to interpret *I have too* as "I have seen it too".

The ungrammatical examples [3iib–vb] can be corrected by inserting the verb **do** (and changing *saw* to the plain form *see*), but performing this operation on [3iia–va] leads to ungrammaticality:

[4]	AUXILIARY VERB	LEXICAL VERB	
i	a. <i>*He <u>does</u> not <u>have</u> seen it.</i>	b. <i>He <u>did</u> not <u>see</u> it.</i>	[Negation]
ii	a. <i>*<u>Does</u> he <u>have</u> seen it?</i>	b. <i><u>Did</u> he <u>see</u> it?</i>	[Inversion]
iii	a. <i>*He <u>has</u> seen it and I <u>do</u> too.</i>	b. <i>He <u>saw</u> it and I <u>did</u> too.</i>	[Code]
iv	a. <i>*They don't think he's seen it but he <u>DOES</u> <u>have</u> seen it.</i>	b. <i>They don't think he <u>saw</u> it but he <u>DID</u> <u>see</u> it.</i>	[Emphasis]

The **do** in [4ib/iiib/ivb] is a semantically empty, or **dummy** auxiliary verb introduced to permit the formation of negative, inverted, and emphatic constructions whose canonical counterpart contains no semantically contentful auxiliary verb. These constructions are commonly called **do-support** constructions: in the absence of an ordinary auxiliary they require the support of dummy **do**. We will refer to this **do**, therefore, as **supportive do**. The status of **do** in the code construction [4iii] is more problematic and subject to dialect variation; this issue will be taken up in §2.1.4 after an outline account of the three central **do-support** constructions in §§2.1.1–2.1.3.

### ■ Other distinctive properties of auxiliary verbs

There are other differences between auxiliary verbs and lexical verbs besides those where we have the interaction with **do** illustrated in [3–4]. Auxiliary verbs characteristically occupy a different position from lexical verbs relative to various adjuncts, and it is only auxiliary verbs that inflect for negation and have reduced forms. We deal with these matters in §2.1.5.

### 2.1.1 Primary verb negation

The first **do**-support construction we will call, more precisely, **primary verb negation**:

- | [5] | POSITIVE                         | PRIMARY VERB NEGATION  |
|-----|----------------------------------|--|
| i   | a. <i>That is reasonable.</i>    | b. <i>That isn't / is not reasonable.</i>                        |
| ii  | a. <i>That seems reasonable.</i> | b. <i>That <u>doesn't</u> / <u>does not seem</u> reasonable.</i> |

The [b] examples illustrate the most elementary kind of negative clause, that where the negative marker is associated with a primary verb-form – preterite or present tense (or irrealis *were*). The negation can be marked inflectionally, by means of a negative form of the verb such as *isn't* or *doesn't*, or analytically, by means of *not* modifying the verb. In either case, the verb must be an auxiliary. Where the corresponding positive contains no auxiliary, **do** must therefore be added, as in [ii].

#### ■ Primary verb negation compared with other kinds of negation

Primary verb negation is to be distinguished from non-verbal negation and non-imperative secondary negation, which do not take supportive **do**:

- |     |    |  |                                     |
|-----|----|--|-------------------------------------|
| [6] | i  | a. <i>They <u>didn't</u> go to Paris.</i>              | [primary verb negation]             |
|     |    | b. <i>No <u>one</u> went to Paris.</i>                 | } [non-verbal negation]             |
|     |    | c. <i>They went <u>not to Paris</u> but to Berlin.</i> |                                     |
|     | ii | a. <i>He <u>didn't</u> promise to help them.</i>       | [primary verb negation]             |
|     |    | b. <i>He promised <u>not</u> to <u>help</u> them.</i>  | [non-imperative secondary negation] |

Non-verbal negation commonly involves some negative word other than *not*, as in [ib], and when it is marked by *not* the *not* belongs within some larger constituent, such as the PP-coordination *not to Paris but to Berlin* in [ic] (cf. Ch. 9, §3.1). In [ii] we have a clear syntactic and semantic distinction between [a] and [b]. In [iia] it is the finite matrix clause that is negated – it is the negation of *He promised to help them*, and says that no promise was made. In [iib], by contrast, *not* belongs in the non-finite subordinate clause, which has the secondary verb-form *help* as its head: this time he did make a promise, but it was a promise to refrain from doing something.

We have labelled [6iib] 'non-imperative secondary negation' because imperatives take **do**-support even though the verb is in a secondary form, the plain form. But imperatives also differ from clauses with a primary verb-form in that verbal negation always requires **do**, even when there is another auxiliary, such as **be**; compare, then:

- |     |    |   |                         |
|-----|----|---|-------------------------|
| [7] | i  | <i>You <u>aren't</u> put off by his manner.</i> | [primary verb negation] |
|     | ii | <i><u>Don't be</u> put off by his manner.</i>   | [imperative negation]   |

It is therefore only primary verb negation that follows the general rules for **do**-support constructions: the imperative represents an exceptional extension of the use of supportive **do**.

### 2.1.2 Subject–auxiliary inversion

The second **do**-support construction is subject–auxiliary inversion, where the subject occurs after an auxiliary verb instead of in its default pre-verbal position:

- | [8] | DEFAULT ORDER                          | SUBJECT–AUXILIARY INVERSION             |
|-----|--|---|
| i   | a. <i><u>She can</u> speak French.</i> | b. <i><u>Can she</u> speak French?</i>  |
| ii  | a. <i><u>She speaks</u> French.</i>    | b. <i><u>Does she</u> speak French?</i> |

In this type of inversion the verb preceding the subject is always a primary form (again, preterite or present tense, or irrealis *were*); the verb in question must be an auxiliary, with *do* added if this requirement would not otherwise be met, as in [ii].

## ■ Constructions involving subject–auxiliary inversion

### (a) Closed interrogatives

This is the construction illustrated in [8]. Inversion is generally restricted to main clauses – compare the subordinate interrogative [*I wonder*] *whether he has got it* (but see Ch. 11, §5.3.1).

### (b) Open interrogatives

Here inversion accompanies the placement in prenuclear position of a non-subject interrogative phrase. As with closed interrogatives, inversion is normally limited to main clauses:

[9]	SUBJECT + VERB ORDER	SUBJECT–AUXILIARY INVERSION
i	a. <i>Who told you that?</i>	b. <i>What did she tell you?</i>
ii	a. <i>And after that you went where?</i>	b. <i>And where did you go after that?</i>
iii	a. <i>I wonder what she is doing.</i>	b. <i>What is she doing?</i>

In [ia] the interrogative phrase is itself subject: inversion occurs only after non-subjects, as in [ib]. In [ii] the inverted construction with the interrogative phrase in prenuclear position contrasts with the uninverted one where it appears in the same position as in corresponding non-interrogatives (cf. *I went to the station*). In [iii] the uninverted [a] is subordinate, while [b] is a main clause.

### (c) Exclamatives

Here inversion is optional after a non-subject exclamative phrase in prenuclear position:

[10] i	a. <i>What a fool I have been!</i>	b. <i>What a fool have I been!</i>
ii	a. <i>How hard she tried!</i>	b. <i>How hard did she try!</i>

The uninverted construction is much the more common (see Ch. 10, §8.1.3).

### (d) Initial negative constituents

Inversion occurs with a negative non-subject element in prenuclear position:

[11] i	a. <i>He found not one of them useful.</i>	b. <i>Not one of them did he find useful.</i>
ii	a. <i>Somewhere he mentions my book.</i>	b. <i>Nowhere does he mention my book.</i>

In [ia] we have the default subject + verb order when the negative is within the VP; inversion applies when it precedes the subject, as in [ib]. In [ii] we see the contrast between having the positive *somewhere* and the negative counterpart *nowhere* at the beginning of the clause: only *nowhere* demands inversion.

Inversion with negatives is not limited to main clauses: we get *He pointed out that not once had she complained*. But it only applies with clausal negation – compare uninverted *Not long afterwards, he moved to Bonn*, which has subclausal negation (*not* applies only to modify *long* within the temporal adjunct *not long afterwards*), the clause itself being positive (see Ch. 9, §1.2).

### (e) Initial only

*Only* is not a marker of negation: *He has only seen her once* (unlike *He hasn't seen her once*) is a positive clause. But it has a close connection with negation, for such an

example entails that he has not seen her more than once. And this connection with negation is reflected in the fact that as far as inversion is concerned it behaves just like a negative:

- [12] i a. *He found only two of them useful.*      b. *Only two of them did he find useful.*  
 ii a. *She had complained only once.*      b. *Only once had she complained.*

As with negatives, inversion does not apply unless *only* has scope over the clause: compare *Only a few days later, he moved to Bonn*, where *only* applies just to *a few days* within the initial AdvP.

#### (f) Initial *so/such*

These behave like *only*, though they do not have any similar connection with negation:

- [13] i a. *We had so little time that we had to cut corners.*      b. *So little time did we have that we had to cut corners.*  
 ii a. *He would make such a fuss that we'd all agree.*      b. *Such a fuss would he make that we'd all agree.*

We also have inversion after initial *so* when it is functioning as a connective adjunct, as in *You got it wrong and so did I* (see Ch. 17, §7.7.3).

#### (g) Other fronted elements

In relatively formal style inversion may occur following the preposing of a wide variety of elements. A few attested examples are as follows:

- [14] i *Thus had they parted the previous evening.*  
 ii *They were bound by time. . . yet were they simultaneously timeless.*  
 iii *Tourism will continue to grow. . . Particularly is this the case in Queensland. . .*  
 iv *Many another poem could I speak of which sang itself into my heart.*  
 v *The more wives he had, the more children could he beget.*  
 vi *Well did I remember the crisis of emotion into which he was plunged that night.*

#### (h) Conditional inversion

In conditional constructions an inverted subordinate clause may be used instead of *if*+ clause with default order (see Ch. 8, §14.2, and Ch. 11, §4.7):

- [15] a. *If he had seen the incident he'd have reported it to the police.*      b. *Had he seen the incident he'd have reported it to the police.*

#### (i) Optative *may*

- [16] *May you both enjoy the long and happy retirement that you so richly deserve.*

Optative clauses express hopes and wishes (Ch. 10, §10). This inverted construction with *may* generally belongs to formal style, though it is also found in various fixed phrases such as *May the best man win!* or *May you be forgiven!*

### ■ Classification of subject–auxiliary inversion constructions

The above constructions fall into two main classes: those where inversion is ‘triggered’ by the presence of some special kind of non-subject phrase in initial position, and those without any such triggering phrase. The triggered inversion constructions may be subclassified as optional or obligatory according as there is or is not alternation with

subject + verb order:

[17]	UNTRIGGERED	TRIGGERED	
		<b>obligatory</b>	<b>optional</b>
	Closed interrogatives	Open interrogatives	Exclamatives
	Conditional inversion	Initial negative	Other fronted elements
	Optative <i>may</i>	Initial <i>only</i>	
		Initial <i>so/such</i>	

### ■ Subject–auxiliary inversion vs subject postposing

Subject–auxiliary inversion is to be distinguished from subject postposing, as in *In the bottom right-hand corner could be seen a small arrow* or *Good morning, said Kim*. Auxiliaries are not significantly involved in this construction, as is evident from these examples, where the subject appears after the lexical verbs *seen* and *said*. The structures resulting from subject–auxiliary inversion and subject postposing may, however, sometimes appear superficially the same:

- [18] i *Where is the auditor's report?* [subject–auxiliary inversion]  
 ii *More damaging is the auditor's report.* [subject postposing]

The difference can be brought out by noting that a postposed subject can be moved over a sequence of verbs, freely including secondary forms: *More damaging had been the auditor's report*. Subject–auxiliary inversion, by contrast, places the subject after a single auxiliary, so we have, say, *Where had the auditor's report been?*, not \**Where had been the auditor's report?*

Exclamative and *so/such* phrases, however, can trigger either subject–auxiliary inversion or subject postposing:

- [19] i a. *How often had he regretted his impetuosity!* } [subject–auxiliary  
 b. *So cold had it been that they had called off the match.* } inversion]  
 ii a. *How ungracious had been their response!* } [subject postposing]  
 b. *So wet had been the pitch that they'd abandoned play.* }

### ■ Structure

We suggested in Ch. 2, §2, that clauses with subject–auxiliary inversion have the auxiliary verb in prenuclear position, with a gap occupying the basic position of the predicator in the nucleus – see the tree diagram given there for interrogative *Is he ill?* According to this analysis the part of the clause following the auxiliary forms a constituent (a clause realising the nucleus function), and some support for this analysis is provided by the possibility of having a coordination after the auxiliary (cf. Ch. 15, §4.6):

- [20] i *Is [he the president and his daughter the secretary]?*  
 ii *Have [you loved me and I been so inconsiderate as to make myself unworthy of your love]?*

## 2.1.3 Emphatic polarity

In the third *do*-support construction, stress is placed on the primary verb to emphasise the positive or negative polarity of the clause. Again, the verb must be an auxiliary, so

that **do** must be added if the unemphatic counterpart doesn't contain one:

- |      |                                   |   |
|------|-----------------------------------|---|
| [21] | UNEMPHATIC POLARITY               | EMPHATIC POLARITY                                     |
| i    | a. <i>I will / I'll be there.</i> | b. <i>That's not true: I <u>WILL</u> be there.</i>    |
| ii   | a. <i>She moved the picture.</i>  | b. <i>She <u>DID</u> move the picture: I saw her.</i> |

### ■ Emphatic polarity to be distinguished from emphatic lexical content

The construction illustrated in [21b/iib] is to be distinguished from that where stress is used to emphasise the lexical content of the verb, not its polarity: *He WROTE it, though he wouldn't RECITE it.* Compare:

- |      |    |  |                                 |
|------|----|--|---------------------------------|
| [22] | i  | <i>You <u>DID</u> promise – I heard you.</i> | [emphasis on positive polarity] |
|      | ii | <i>You <u>PROMISED</u> – I heard you.</i>    | [emphasis on lexical content]   |

A likely context for [i] is where you have denied promising: the issue is whether or not you promised. A context for [ii] is where you have indicated that you won't do something I want you to do: I'm reminding you that you promised in order to get you to do it after all, the important thing being that you committed yourself to doing it by making a promise. It is only when the stress emphasises the polarity that an auxiliary verb is required.

### ■ Emphatic positives

Very often an emphatic positive serves to contrast the positive with a corresponding negative proposition that has been expressed or implicated in the preceding discourse, and in this case it will often involve ellipsis: *You don't think I'm serious, but I AM!* Other uses of the emphatic positive are illustrated in:

- |      |     |   |
|------|-----|---|
| [23] | i   | <i>Kim's the one who <u>DID</u> make a donation.</i>                                      |
|      | ii  | <i>He didn't win, but he <u>DID</u> come in the first half dozen.</i>                     |
|      | iii | <i>I <u>DO</u> think you could be more tolerant. I <u>AM</u> pleased you can join us.</i> |

In [i] there is a contrast with an implicit negative, but not the negative of this clause itself: the contrast is with the people who didn't make a donation. In [ii] the contrast is not with the negative of the proposition being asserted but with something stronger – winning. In other cases an emphatic positive may be used just to indicate the strength of one's beliefs or feelings, as in [iii].

### ■ Emphatic polarity in negatives

Emphatic negatives are seen in:

- |      |     |  |
|------|-----|--|
| [24] | i   | <i>He thinks they are cheating, but they are <u>NOT</u> / <u>AREN'T</u>.</i> |
|      | ii  | <i>You're wrong: I <u>did NOT</u> / <u>DIDN'T</u> move it.</i>               |
|      | iii | <i>He never <u>DID</u> understand how she felt.</i>                          |

Examples [i–ii] have primary verb negation, and hence require an auxiliary verb for this reason as well as because of the emphatic polarity. The stress falls on the negative element: the verb itself if it is a negative form or else the *not*. The negation in [iii] is non-verbal (marked by *never*): the unemphatic version is *He never understood how she felt*. Supportive **do** is therefore added to [iii] just to carry the stress that marks emphatic polarity.<sup>10</sup>

<sup>10</sup>Auxiliary **do** was used more widely in earlier stages of the language, and in certain genres one comes across archaic uses that go beyond our **do**-support constructions – e.g. in legal language (*The person before the court is charged that at Newborough, on or about the 14th day of June, 1997, he did murder one James Robinson*).

### 2.1.4 Code: elliptical stranding and the pro-verb *do*

In the code construction the VP of a clause is reduced, with the remainder of its semantic content being recoverable from the context. In the simplest case we have ellipsis of the complement of an auxiliary verb:

- | [25] | FULL VERSION                        | REDUCED VERSION                                |
|------|-------------------------------------|--|
| i    | a. <i>Pat [can help him too].</i>   | b. <i>I can help him and Pat [can __ too].</i> |
| ii   | a. <i>Pat [is in debt as well].</i> | b. <i>I'm in debt and Pat [is __ as well].</i> |

In [ib] we understand “Pat can help him too” but the “help him” is left unexpressed, recoverable from the preceding clause. Similarly in [iib] there is ellipsis of *in debt*. The **site** of the ellipsis is shown by the gap symbol ‘\_\_’, and we say that the verbs *can* and *is* are **stranded**, i.e. left on their own before the site of ellipsis. While auxiliary verbs can be stranded in this way, lexical verbs cannot: **want**, for example cannot be stranded to give *\*I want to go and Pat wants \_\_ as well*.

#### ■ Old-verb stranding vs new-verb stranding

The stranded auxiliary verb may have the informational status of **discourse-old** or **discourse-new** (cf. Ch. 16, §2):

- |      |    |  |                      |
|------|----|--|----------------------|
| [26] | i  | <i>Kim <u>has</u> seen the report and I think Pat <u>has</u> __ too.</i> | [old-verb stranding] |
|      | ii | <i>I'll help you if I <u>can</u> __.</i>                                 | [new-verb stranding] |

In [i] the stranded *has* is discourse-old in the sense that it, as well as the missing material (*seen the report*), occurs in the preceding context. But in [ii] stranded *can* is new to the discourse. The distinction is of significance because new-verb stranding allows a slightly narrower range of possibilities – compare:

- |      |    |   |       |
|------|----|---|-------|
| [27] | i  | <i>He <u>is</u> to present a paper in the morning session and I <u>am</u> __ too.</i> | [old] |
|      | ii | <i>*I didn't bother to phone the results to her because I knew Kim <u>was</u> __.</i> | [new] |

In [i] **be** can be stranded because it, along with its understood infinitival complement *to present a paper in the morning session*, occurs in the first clause. In [ii], however, *Kim was to phone the results to her* can't be reduced to *Kim was* because this time the **be** is not found in the preceding context (we need *Kim was to \_\_* or else *Kim was to do so*).

#### Stranding with idioms

With the idioms beginning with an auxiliary we find the following contrasts:

- |      |    |   |                               |       |
|------|----|---|-------------------------------|-------|
| [28] | i  | a. A: <i><u>Would</u> you <u>rather</u> stay at home?</i> | B: <i>Yes, I would __.</i>    | [old] |
|      |    | b. A: <i>Do you want to stay at home?</i>                 | B: <i>Yes, I'd rather __.</i> | [new] |
|      | ii | a. A: <i><u>Have</u> you <u>got</u> a pen?</i>            | B: <i>Yes, I have __.</i>     | [old] |
|      |    | b. A: <i>Do you need a pen?</i>                           | B: <i>*No, I've got __.</i>   | [new] |

In [ia] *would rather* in B's response is discourse-old and hence only the auxiliary need be retained (though it is still possible to repeat *rather*); in [ib] it is discourse-new, so *rather* can't be left out. *Have got* is different, however, because *got* is a verb, and more specifically a lexical one, and hence can't be stranded. In [ii], therefore, only [a], with stranding of auxiliary *have*, is possible (instead of *\*I've got* in [ib] we need *I've got one*).

## ■ Differences between stranding and the central *do*-support constructions

### (a) Stranding not restricted to primary forms

One difference between stranding and the *do*-support constructions covered in §§2.1.1–3 is that while the auxiliaries in the latter are always primary forms, this is not so with stranding:

- [29] i *I don't think she has seen it, but she may have \_\_\_.* [plain form]  
 ii *This one needs to be repaired; the other already has been \_\_\_.* [past participle]  
 iii *%He said I was being unfair, but I don't think I was being \_\_\_.* [gerund-participle]

This construction is subject to some regional variation: AmE doesn't allow [iii], but it does have [i–ii], even if they are less usual than versions in which the second auxiliary is omitted.

### (b) The infinitival marker *to* may be stranded under restricted conditions

A second important difference between stranding and the *do*-support constructions is that stranding is not completely restricted to auxiliary verbs. It is also found with the infinitival subordinator *to* under certain conditions (see Ch. 17, §7.3):<sup>11</sup>

- [30] i *I want to go and Pat wants to \_\_\_ as well.*  
 ii *\*I advise you not to go; to \_\_\_ would be very dangerous.*

## ■ The use of the verb *do* in code

We have noted that auxiliary verbs can be stranded but lexical verbs cannot. If the full version contains a lexical verb the reduced version is formed by means of *do*; but if the full version contains an auxiliary verb (other than supportive *do*), then a primary form of *do* is excluded:

- |      |  |  |
|------|--|--|
| [31] | VERSION WITHOUT <i>DO</i>                                | VERSION WITH <i>DO</i>                               |
|      | i a. <i>*I <u>hated</u> it and Pat <u>hated</u> too.</i> | b. <i>I <u>hated</u> it and Pat <u>did</u> too.</i>  |
|      | ii a. <i>I <u>am</u> well and Pat <u>is</u> too.</i>     | b. <i>*I <u>am</u> well and Pat <u>does</u> too.</i> |

This is the same pattern as applies with primary verb negation, inversion, and emphasis. There is, however, an important difference – in code *do* is not limited to primary forms, and where secondary forms are involved versions with and without *do* are in alternation, not mutually exclusive:

- |      |  |   |
|------|--|---|
| [32] | VERSION WITHOUT <i>DO</i>                              | VERSION WITH <i>DO</i>                                  |
|      | i a. <i>I've seen it; Pat may <u>have</u> too.</i>     | b. <i>%I've seen it; Pat may <u>have done</u> too.</i>  |
|      | ii a. <i>I haven't read it but I <u>will</u> soon.</i> | b. <i>%I haven't read it but I <u>will do</u> soon.</i> |

As indicated by the % annotation, the [b] versions are not admissible to all speakers: BrE speakers accept such forms while AmE speakers mainly reject them. It is plausible to suggest that correlating with the difference in admissibility of these [b] versions is a difference in the grammatical status of *do* in code. In BrE the *do* of code constructions is a pro-form: in [31b] and [32b/ii] reduction is achieved not by ellipsis but by the substitution of a verb that stands for the whole antecedent VP. The verbal pro-form *do* bears some resemblance to the nominal pro-form *one*, so that the alternation between

<sup>11</sup>We also find a few lexical verbs appearing with ellipsis in constructions like *I tried to help him and Pat tried \_\_\_ as well*. We take the view, however, that this is not the same elliptical construction as is found with auxiliaries, and hence is not a case of a NICE construction: we take up this issue too in Ch. 17, §7.4.

the different kinds of reduction seen in [32] is similar to that found in NP reduction in pairs like:

- [33] i *The second version was no better than [the first].* [no pro-form]  
 ii *The second version was no better than [the first one].* [one as pro-form]

In both of these we understand “the first version”: in [ii] but not [i] there is a head noun *one* that substitutes for the antecedent *version*, just as in [32] the [b] versions but not the [a] ones have a head verb **do** that substitutes for the antecedents *seen it* and *read it*.<sup>12</sup>

In the dialect where examples like [32] are inadmissible, the **do** used in code is restricted to primary forms and can therefore be assimilated to the supportive **do** used in primary verbal negation, inversion, and emphasis. Here, then, [31ib] will be elliptical, like [31iia]. It differs in that reinstatement of the ellipsed material requires that **do** be dropped: the full form is *I hated it and Pat hated it too*, not *\*I hated it and Pat did hate it too*. But this is a general property of the **do**-support constructions: if we change interrogative *Did he hate it?* into its declarative counterpart we likewise drop **do** (*He hated it*). For this dialect, then, the code construction always involves ellipsis. Leaving aside the case where we have stranding of the infinitival marker *to*, it is a matter of ellipsis of the complement of an auxiliary verb, and if the full form contains no auxiliary then **do** must be inserted to permit complement ellipsis to apply.

### ■ Code in combination with negation, inversion, and emphasis

The code construction can combine with any of the other NICE constructions:

- [34] i a. A: *Was he ill?* B: *No, he was not / wasn't* \_\_. } [primary verb negation]  
 b. A: *Did he go?* B: *No, he did not / didn't* \_\_. }  
 ii a. *Kim can't help her; neither can I* \_\_. } [subject–auxiliary inversion]  
 b. *No one else complained, so why did you* \_\_? }  
 iii a. *They say I can't read it, but I CAN* \_\_. } [emphatic polarity]  
 b. *He won't believe I wrote it, but I DID* \_\_ }  
 c. %*He won't believe I wrote it, but I DID do*. }

Note that in [ii] and the versions of [i] with analytic negation the auxiliary is not situated immediately before the site of ellipsis because the subject or *not* intervenes (as *rather* likewise intervenes in [28ib]): stranding is not to be understood as implying adjacency to the site of the missing dependents.

The **do** in the [b] examples of [34] is required quite independently of code: this is therefore the supportive **do** in BrE as well as in AmE. In [iiic] *did* is a form of supportive **do** combining with the pro-form **do** in BrE: this pro-form **do** is thus a lexical verb, not an auxiliary.

## 2.1.5 Position and form

The four NICE constructions have all involved some kind of interaction between auxiliaries and **do**; in this section we turn to some further properties distinguishing auxiliaries from lexical verbs, but here there is no special relationship with **do**.

<sup>12</sup>For reasons given in Ch. 5, §9.5, however, we analyse examples like [33i] in terms of a fusion of modifier and head rather than ellipsis of the head.

### ■ Position of adverbs

Auxiliaries differ from lexical verbs in their position relative to various adverbs, notably frequency adverbs (such as *always*, *usually*, *often*, *sometimes*, *never*) and modal adverbs (such as *possibly*, *probably*, *certainly*). Such adverbs tend to precede lexical verbs but to follow auxiliaries:

[35]	LEXICAL VERB	AUXILIARY VERB
i	a. <i>He <u>always</u> looks miserable.</i>	b. <i>He <u>is</u> <u>always</u> miserable.</i>
ii	a. <i>They <u>probably</u> go by bus.</i>	b. <i>They <u>have</u> <u>probably</u> gone by bus.</i>

With lexical verbs the opposite ordering (with the adverb following the verb and preceding its complement) is excluded: \**He looks always miserable*; \**They go probably by bus*.<sup>13</sup> With auxiliaries the verb + adverb order shown above is the usual one, but the reverse order of adverb + verb is also possible: compare *He always is miserable*; *They probably have gone by bus*. One special case where the latter order might be found is with emphatic polarity, with stress on the auxiliary.

### ■ Quantificational adjuncts

A comparable difference in position between auxiliaries and lexical verbs is found with certain determinatives, such as *all*, *both*, *each* (Ch. 5, §9.2), that are semantically associated with the subject:

[36]	LEXICAL VERB	AUXILIARY VERB
i	a. <i><u>All</u> the players <u>took</u> a card.</i>	b. <i><u>All</u> the players <u>had</u> taken a card.</i>
ii	a. <i>The players <u>all</u> <u>took</u> a card.</i>	b. <i>The players <u>all</u> <u>had</u> taken a card.</i>
iii	a. * <i>The players <u>took</u> <u>all</u> a card.</i>	b. <i>The players <u>had</u> <u>all</u> taken a card.</i>

In the [i] versions *all* belongs syntactically and semantically in the subject: it functions within the NP *all the players* and it quantifies over players. Such items can be positioned outside the NP, and the [ii] versions show *all* in pre-verbal position. If the verb is an auxiliary, it can follow the verb, as in [iiib] – which is preferred over [iib]. But it cannot follow a lexical verb, as is evident from the ungrammaticality of [iiia].

### ■ Negative inflection and reduced forms

Auxiliaries differ from lexical verbs in that they have an inflectional contrast between negative and neutral forms: see §1.9. And finally, most of them have phonologically reduced forms when unstressed – weak forms such as /həv/ or /əv/ for *have*, or clitics such as /v/ (as in *I've seen it*): see Ch. 18, §§6.1–2.

## 2.2 Issues of definition and analysis

### ■ Auxiliary verb as a general term

A general definition of auxiliary verb is that it denotes a closed class of verbs that are characteristically used as markers of tense, aspect, mood, and voice. These categories are also commonly expressed by verb inflections (as primary tense is in English, for

<sup>13</sup>These examples must be distinguished from examples like *He looks, always, quite miserable* and *They go – probably – by bus*, where the adverb is set off by commas or dashes in writing and by intonation and phrasing in speech. These involve what we call supplements, which interrupt the clause rather than forming an integrated part of its structure (see Ch. 15, §5).

example): auxiliaries tend to express the same kinds of meaning as inflections, but are syntactically separate words.

In English, auxiliary verbs are defined at the language-particular level by the NICE properties – their ability to appear in the constructions described above involving negation, inversion, code, and emphasis. The class of verbs with these properties clearly satisfies the above general definition. The modals express mood, perfect **have** we analyse as a marker of tense, progressive **be** and **use** are aspect markers, and passive **be** marks voice. **Do** has no independent meaning, appearing as the default auxiliary in the **do**-support constructions, but these constructions themselves have a significant association with modality, the area of meaning expressed by the category of mood.

### ■ Core and non-core uses of auxiliaries

All the auxiliaries are used in construction with a verb bearing one of the secondary inflections: the modals and **use** with a plain form, progressive **be** with a gerund-participle, **have** and passive **be** with a past participle. We refer to this as the **core** use of the auxiliaries: it is by virtue of this use that these verbs in English satisfy the general definition of auxiliary verb, as explained above. **Be** and **have**, and the *would* of the idiom *would rather*, however, also occur without a following verb of this kind: we refer to this, by contrast, as the **non-core** use. The distinction between these two uses is illustrated in:

[37]	CORE USES	NON-CORE USES
i	a. <i>He <u>isn't</u> telling the truth.</i>	b. <i>He <u>isn't</u> honest.</i>
ii	a. <i>I <u>haven't</u> bought it.</i>	b. % <i>I <u>haven't</u> any money.</i>
iii	a. <i><u>Would</u> you rather go alone?</i>	b. <i><u>Would</u> you rather I didn't tell her?</i>
iv	a. <i>They <u>can't</u> resist it.</i>	b. [no non-core use]

In [ia] we have the progressive **be**, in construction with the gerund-participle *telling*, while [ib] illustrates the copula **be** with the AdjP *honest* as predicative complement, a non-core use of **be**. In [iia], perfect **have** is in construction with the past participle *bought*, but in [iib] **have** has the “possess” sense and takes the NP *any money* as object. This construction is subject to variation: many speakers would say *I don't have any money*, with **have** here a lexical verb: see §2.5.6. In [iiia] we have a core use of *would*: the idiom *would rather* is here in construction with the plain form *go*, whereas in the non-core use shown in [iiib] it has a finite clause as complement.

These three are the only auxiliaries with non-core uses in modern English.<sup>14</sup> All the other auxiliaries are like **can**, which has only the core use, as shown in [iv]. Examples like *They can't resist it* and *I can't either* illustrate code, and are covered by the core category.

It is in their core uses that the auxiliaries are markers of tense, aspect, mood, and voice. As observed above, this is what makes the general term ‘auxiliary verb’ applicable to this class. But the non-core uses are consistent with our applying the term ‘auxiliary’ to the non-core cases too, given the distinction we have drawn between general and language-particular definitions (Ch. 1, §4.4). The non-core **be** of [ib], **have** in [iib] (subject to the variation noted), and *would* as used in [iiib] belong to the same subclass of English verbs as those in the [a] examples because they too have the NICE properties. The subclass defined by the NICE properties

<sup>14</sup>Here we are setting aside certain thoroughly archaic uses involving the omission of understood verbs of motion after modals, e.g. *I must away* “I must go away”.

satisfies the general definition of auxiliary verb because its members are characteristically used as markers of tense, aspect, mood, and voice.<sup>15</sup>

### ■ Analysis

The main analytic issue concerns the status of the core auxiliaries. A widely adopted view is that they are dependents of the following lexical verb. We call this the **dependent-auxiliary analysis**. The view adopted in this book, however, is that they are verbs taking non-finite complements. For reasons explained below, we refer to this as the **catenative-auxiliary analysis**. We will illustrate the two contrasting analyses by reference to example [38]:

[38] *She is writing a novel.*

#### (a) The dependent-auxiliary analysis

Under the dependent-auxiliary analysis, [38] is a simple clause. Core auxiliaries are contrasted with **main verbs**, so that *is writing* forms a syntactic unit in which the main verb *writing* is head and the core auxiliary *is* is a dependent. As indicated by the term, core auxiliaries are never heads in the dependent-auxiliary analysis.

#### (b) The catenative-auxiliary analysis

The catenative-auxiliary analysis says that *writing a novel* in [38] is a non-finite complement of *is*. The tree-structure of [38] is therefore the same as that of, say, *She began writing a novel*, where *began* is a lexical verb, not an auxiliary. On this view, there is no contrast between auxiliary verbs and main verbs. *Is* in [38] is just as much a main verb as *writing*: both are heads of their respective clauses. We call this the catenative-auxiliary analysis because it treats the core auxiliaries as belonging to the larger class of **catenative** verbs. These are verbs which take non-finite complements:

[39] *She promised [not to forget [to arrange [to collect the key]]].*

*To collect the key* is complement of the catenative verb *arrange*, *to arrange to collect the key* is complement of *forget*, and *not to forget to arrange to collect the key* is complement of *promise*. As the example shows, the construction is recursive: it can be repeated, yielding a chain or ‘concatenation’ of such verbs. Hence the name ‘catenative’.

The syntactic evidence strongly favours the catenative analysis of the English core auxiliaries. We will not give the supporting arguments here, but will postpone further discussion to Ch. 14, §4.2, so that the arguments can be presented in the context of a detailed study of the catenative construction in which lexical verbs like *begin*, *promise*, *forget*, *arrange*, and all of the auxiliaries participate.

## 2.3 Combinations of auxiliary verbs

### ■ Combinatorial restrictions

Like the lexical catenative verbs seen in [39], the core auxiliaries can be chained together in sequence. The restrictions on their combination are as follows:

<sup>15</sup> Many grammars restrict the term ‘auxiliary’ to the core uses; ‘operator’ is then sometimes used for the larger class containing the NICE verbs in all their uses. The view taken here, however, is that it is this larger class that is of importance in the syntax of English (by virtue of their role in the NICE constructions), and this therefore is the one to which we apply the familiar term ‘auxiliary’.

- [40] i Auxiliary **do** cannot combine with any other auxiliary (including the non-core ones): \**He doesn't have read it*, \**Did she be working?* The only exception is the imperative, as in *Don't be making so much noise when your father comes home*.
- ii The modals are mutually exclusive. Except in coordination, they cannot combine: \**He will can swim soon*, \**She may will help you*.
- iii Aspectual **use** is likewise mutually exclusive with the modals: \**He wouldn't use to go by bus*, \**He used to can speak French*.

### ■ Order restrictions

In addition to the above restrictions about which auxiliaries may be co-members of a sequence of auxiliaries, there are also rigid restrictions on the order in which auxiliaries can appear in any such sequence; for example:

- [41] i a. *She could have won first prize.*                      b. \**She had could win first prize.*  
 ii a. *He has been reading my mail.*                              b. \**He is having read my mail.*

We need to allow for combinations of up to four auxiliaries,<sup>16</sup> appearing in the order shown in the following display:

[42] I	II	III	IV
modal <b>can/will</b> / . . .	perfect <b>have</b>	progressive <b>be</b>	passive <b>be</b>
aspectual <b>use</b>			

Given that the auxiliaries are optional but have a fixed position in the sequence, there are sixteen possibilities provided for in [42], ignoring the choice between different items from column I, but including the case where no auxiliary at all is selected. They are illustrated in [43], where *will* is used as a representative choice from column I and **take** is used as the lexical verb heading the complement to the last auxiliary.

[43]	MODAL	PERFECT	PROGRESSIVE	PASSIVE	LEXICAL VERB
i					<i>takes</i>
ii				<i>is</i>	<i>taken</i>
iii			<i>is</i>		<i>taking</i>
iv			<i>is</i>	<i>being</i>	<i>taken</i>
v		<i>has</i>			<i>taken</i>
vi		<i>has</i>		<i>been</i>	<i>taken</i>
vii		<i>has</i>	<i>been</i>		<i>taking</i>
viii		<i>has</i>	<i>been</i>	<i>being</i>	<i>taken</i>
ix	<i>will</i>				<i>take</i>
x	<i>will</i>			<i>be</i>	<i>taken</i>
xi	<i>will</i>		<i>be</i>		<i>taking</i>
xii	<i>will</i>		<i>be</i>	<i>being</i>	<i>taken</i>
xiii	<i>will</i>	<i>have</i>			<i>taken</i>
xiv	<i>will</i>	<i>have</i>		<i>been</i>	<i>taken</i>
xv	<i>will</i>	<i>have</i>	<i>been</i>		<i>taking</i>
xvi	<i>will</i>	<i>have</i>	<i>been</i>	<i>being</i>	<i>taken</i>

<sup>16</sup>We ignore here the verb **have** in its obligation or necessity sense (*I have to leave now*), which is an auxiliary for some speakers but not others: see §2.5.6 below.

Structures containing two secondary forms of **be** (progressive and passive), such as *They may be being overlooked* or *They may have been being overlooked*, are avoided by some speakers, but they do occasionally occur.<sup>17</sup>

### ■ Determination of inflectional form

Each core auxiliary fully determines the inflectional form of the next verb in the sequence, whether it be a lexical verb or another auxiliary of one kind or another. The forms required are as shown in [44], where double underlining in the examples marks the auxiliary in question, single underlining the verb whose form it determines:

[44]	AUXILIARY	NEXT VERB	EXAMPLES
i	modal	plain form	<u>will</u> <u>sing</u> <u>may</u> <u>be</u> <u>seen</u> <u>must</u> <u>have</u> <u>eaten</u>
ii	perfect	past participle	<u>has</u> <u>sung</u> <u>had</u> <u>been</u> <u>seen</u> <u>must</u> <u>have</u> <u>eaten</u>
iii	progressive	gerund-participle	<u>is</u> <u>singing</u> <u>was</u> <u>being</u> <u>seen</u> <u>has</u> <u>been</u> <u>eating</u>
iv	passive	past participle	<u>was</u> <u>sung</u> <u>was</u> <u>being</u> <u>seen</u> <u>has</u> <u>been</u> <u>eaten</u>

It is on this basis that we distinguish instances of auxiliary **be** as progressive or passive: the **be** of *was eating* is recognisable as the progressive auxiliary because it is followed by a gerund-participle, and that of *was eaten* as the passive auxiliary because it is followed by a past participle. And similarly these rules show why the progressive and passive auxiliaries are placed in that order in [42]: in *was being seen* it is the first **be** that is followed by a gerund-participle, the second by a past participle (contrast \**was been eating*).

## 2.4 Distinctive properties of modal auxiliaries

The central modal auxiliaries have five distinctive properties: they have only primary forms, they don't show any agreement with the subject, they take bare infinitival complements, they are required in remote conditionals, and the use of their preterites with the modal remoteness meaning is much less restricted than is the case with other verbs.

### (a) Only primary forms

The modal auxiliaries have no secondary inflectional forms and hence cannot occur in constructions which require one. Compare, then, the following examples with **can** and the semantically similar **be able**, where the differences in grammaticality show that **can** is a modal while **be** is not:

[45] i	a. *I'd like to <u>can</u> swim.	b. I'd like to <u>be</u> able to swim.
ii	a. *I will <u>can</u> swim soon.	b. I will <u>be</u> able to swim soon.
iii	a. * <u>Can</u> swim by June!	b. <u>Be</u> able to swim by June!
iv	a. *I regret not <u>canning</u> swim.	b. I regret not <u>being</u> able to swim.
v	a. *I have <u>could</u> swim for six years.	b. I have <u>been</u> able to swim for six years.

Constructions [i–iii] require the plain form (the *to*-infinitival, bare infinitival, and imperative constructions respectively), [iv] the gerund-participle, [v] the past participle. As evident from the acceptability of the [b] examples, this is a grammatical restriction, not a restriction attributable to the meaning. We noted above that, leaving aside coordination,

<sup>17</sup>These constructions did not enter the language until the twentieth century – and even simpler progressives like *is/was being taken* were not fully established until the second half of the nineteenth century.

the modals cannot combine (*\*He may must work tomorrow; \*They must will help you*).<sup>18</sup> This can now be seen to be a consequence of their morphological defectiveness: the verb following a modal must be in the plain form, and modals do not have plain forms, so the verb following a modal can never be another modal.

#### (b) No agreement

The modal auxiliaries do not display the usual person–number agreement with the subject in the present tense: *can, may, must*, etc., occur with any kind of subject. The normal distinction between a 3rd person singular and a plain present tense is therefore missing. Again, this is a morphological oddity.

#### (c) Bare infinitival complement

The central modal auxiliaries take bare infinitival complements – and no other kind of complement. Most verbs with infinitival complements take *to*; the few others that take bare infinitivals generally differ from the modals in their complementation by taking an NP before the plain form verb: compare non-modal *They make us work* with modal *They must work*.

#### (d) Remote conditionals

The first verb of the apodosis of a remote conditional must be a modal auxiliary:

- [46] i *If you came tomorrow, [you could help with the flowers].*  
 ii *\*If you came tomorrow, [you were able to help with the flowers].*

The apodosis is the part enclosed in brackets: the matrix clause minus the conditional adjunct. We can correct [ii] by changing *were* to *would be*, but this change involves adding modal *would*.

#### (e) Modally remote preterite

The preterites of the modal auxiliaries – *could, might, would, should* – can be used with the modal remoteness meaning without the grammatical restrictions that apply in the case of other verbs, where it is found only in a small set of subordinate constructions. Compare:

- [47] i a. *I wish [you could move it].*      b. *I wish [you were able to move it].*  
 ii a. *Could you move it?*                      b. *Were you able to move it?*

In [i] the preterites are in the complement of *wish*, where all verbs have the modal remoteness meaning. But [ii] is a main clause: the preterite *were* of [b] can therefore only indicate past time, whereas *could* in [a] is ambiguous between a past time meaning (“were able”) and a modally remote non-past time meaning (“would be able”).<sup>19</sup> The modal remoteness meaning of the preterite is much more common with the modal auxiliaries than the past time meaning: *should*, indeed, is no longer used with the past time meaning, and for many speakers the same applies to *might*.

<sup>18</sup> Some non-standard dialects allow combinations of modals, but even here they are restricted to a few specific sequences. For example, there are dialects with <sup>1</sup>*It might could break* but none with *\*It could might break*.

<sup>19</sup> This point is related to (d) in that the preterite *could* of [46i] is a special case of the use we are concerned with here. We have given them as separate properties, however, because the use in (d) is not restricted to preterite forms: see §§2.5.2–5.

## 2.5 The auxiliaries considered in turn

In this section we look at the individual auxiliaries with respect to the properties of §2.1 and §2.4; they are listed here with short labels, and exemplified with **will**:

[48]	AUXILIARY PROPERTIES	
	[A] Primary verb negation	<i>It <u>will</u> not work.</i>
	[B] Subject–auxiliary inversion	<i><u>Will</u> it rain?</i>
	[C] Emphatic polarity	<i>I <u>WILL</u> help you.</i>
	[D] Stranding	<i>He won't attend, but I <u>will</u> __.</i>
	[E] Exclusion of <b>do</b> in code	<i>*Ed <u>will</u> go and I <u>do</u> too. (“I will go”)</i>
	[F] Precede adverb/quantifier	<i>They <u>will</u> probably/all accept.</i>
	[G] Negative forms	<i>It <u>won't</u> help.</i>
	[H] Reduced forms	<i>She'<u>ll</u> be here soon.</i>
[49]	MODAL AUXILIARY PROPERTIES	
	[I] Only primary forms	<i>*It's expected to <u>will</u> finish soon.</i>
	[J] No agreement	<i>She <u>will</u>/*<u>wills</u> win.</i>
	[K] Only bare infinitival complement	<i>It <u>will</u> be / *to be over.</i>
	[L] Can occur in remote apodosis	<i>If it weren't for her I <u>would</u> give up.</i>
	[M] Modally remote preterite in main clause	<i>I <u>would</u> ask you to treat it seriously.</i>

### 2.5.1 Can and will; would rather

**Can** and **will** are the most straightforward of the modal auxiliaries: they have all the above properties.

A special use of *would* is in the idioms *would rather*, *would sooner*, *would as soon*. These expressions take not only bare infinitivals but also finite clause complements, as in *I would rather she did it alone*. In this use, therefore, *would* differs from normal modals in property [K]. With a bare infinitival it has the negation property [A] only under restricted conditions. Compare:

- [50] i *She would rather [not go first].*  
 ii *She would NOT / WOULD<sup>N</sup>T rather [go first].*  
 iii *Wouldn't she / Would she not rather [go first]?*

In [i] the *not* belongs in the non-finite complement: it negates secondary *go*, not primary *would*. It is [ii–iii] therefore which illustrate primary verb negation, but this construction is possible only under the conditions shown here. In [ii] it serves as the denial of the corresponding positive: it implies a context where someone has said or suggested that she would rather go first. In [iii] it appears in a negative question with positive bias.

*Would* in these idioms clearly exhibits property [M], the ability of the preterite to occur in main clauses with the modal remoteness meaning: *I'd rather do it myself* indicates a present time preference, but is weaker, more tentative, than *I will do it myself*. For past time we need *have*, as in *I would rather have done it myself*.

### 2.5.2 Must

**Must** is a very clear member of the modal auxiliary class, with properties [A–K] applying unproblematically. It differs from **can** and **will**, however, in that it has no preterite, and

therefore property [M] is not applicable. For some speakers it still has property [L], occurring in a remote apodosis, as in *°If he had stayed in the army he must surely have become a colonel*. However, such examples are rare and of marginal status; the remote conditional normally requires a preterite modal.

### 2.5.3 *Shall and may*

These are the last two central members of the modal auxiliary class. *Shall* has all of properties [A–M]. *May* has all except [H] and, for many speakers, [G]: it has no reduced forms and the negative form *°mayn't* is rare – the normal or only present tense negation is the analytic *may not*.

With both verbs, however, the relation between the preterite and present tense forms raises certain problems. In the case of *shall*, some major uses of the preterite *should* – as in *You should be more careful* – have no close analogues in the present tense: the meaning is thus not systematically derivable from the meanings of *shall* and the preterite, so that in these uses *should* is idiomatic, requiring independent description.

The case of *may* is somewhat different: here there is evidence that for some speakers *may* and *might* have diverged to the extent that they are no longer inflectional forms of a single lexeme, but belong to distinct lexemes, *may* and *might*, each of which – like *must* – lacks a preterite; we take up this point in §9.8.4.

### 2.5.4 *Ought*

*Ought* behaves very largely like a modal auxiliary. It differs most notably in respect of property [K]: it takes a *to*-infinitival complement, *He ought to take more care*. There is a growing tendency, however, for it to be constructed with a bare infinitival in non-affirmative contexts (particularly negatives), bringing it closer to the central modals: *°You ought not/oughtn't take any notice*, *°Ought we invite them both?* and the like are found, especially in AmE, as well as the more usual forms with *to*. The negative form *oughtn't* has declined in frequency over the last century, and is now somewhat marginal for some speakers.

In stranding constructions, it occurs much more readily when old than when new:

- [51] i A. *Ought we to invite them both?*    B. *Yes, I think we ought \_.*    [old]  
 ii *°He's considering telling the police, but I don't think he ought \_.*    [new]

It would be normal in [ii] to use the *to* stranding construction instead: *I don't think he ought to*. *Ought* has no reduced forms [H], and it also lacks a preterite counterpart, so that property [M] is again not applicable.<sup>20</sup> The absence of a preterite makes it ill-adapted to the remote apodosis construction: examples like *°If he had stayed in the army he ought to have become a colonel* are of very questionable acceptability.

### 2.5.5 *Need and dare*

#### ■ Both modal auxiliaries and lexical verbs

We have noted that these verbs can behave as modal auxiliaries or as lexical verbs, though the auxiliary use is rare in AmE:

<sup>20</sup> *Ought* derives historically (as indeed does *must*) from a preterite – and this is synchronically reflected in certain non-standard dialects where it behaves as a lexical verb taking *do* in the *do*-support constructions, for it is the preterite of *do* that appears: *°You didn't ought to speak like that*.

- | [52] | MODAL AUXILIARY                                 | LEXICAL VERB   |
|------|---|--|
| i    | a. <i>He <u>needn't/daren't</u> tell her.</i>   | b. <i>He doesn't <u>need/dare</u> to tell her.</i>   |
| ii   | a. <i><u>Need/Dare</u> he tell her?</i>         | b. <i>Does he <u>need/dare</u> to tell her?</i>      |
| iii  | a. <i>No one <u>need/dare</u> go out alone.</i> | b. <i>No one <u>needs/dares</u> to go out alone.</i> |

As lexical verbs they take **do**-support in primary verb negation and subject–auxiliary inversion, and have a distinct 3rd person singular present tense form. Because of this difference in inflectional form shown in [iii], we will distinguish separate lexemes for auxiliary and lexical **need** and **dare**. As lexical verbs they take a wider range of complementation than the auxiliaries (e.g. an NP as object: *He needs a haircut* or *I dare you to say that to his face*), but in this section we will confine our attention to the simple catenative construction of [52], where they have just an infinitival complement, like the auxiliaries.

### ■ **Need and dare as modal auxiliaries**

The auxiliaries, unlike the lexical verbs, are restricted to non-affirmative contexts (negatives, interrogatives, and related constructions):

- |      |    |   |                   |
|------|----|---|-------------------|
| [53] | i  | <i>*I regret that the Senate <u>need/dare</u> take such action.</i>     | [modal auxiliary] |
|      | ii | <i>I regret that the Senate <u>needs/dares</u> to take such action.</i> | [lexical verb]    |

Within these limitations, modal auxiliary **need** and **dare** have virtually all the auxiliary and modal properties. The main exception is [H]: they have no reduced forms. In addition **need** has no preterite form, so that [M] (modal remoteness use of the preterite) is not applicable. As for [L], occurrence in a remote apodosis, they are quite acceptable in a past time conditional marked by *have*: *If you'd told me they were going to be late, I needn't have cancelled my violin class; Even if my life had depended on it, I daren't have jumped*. Otherwise they are somewhat marginal: *If you were more efficient you needn't work such long hours; <sup>3</sup>Even if my life depended on it, I daren't jump*.

### ■ **Blurring of auxiliary–lexical distinction with dare**

The auxiliary and lexical constructions are not always as sharply distinct as they are in [52]. In the first place, lexical **dare** commonly occurs in non-affirmative contexts without *to*: *She wouldn't dare ask her father*. Secondly, it – like modal **dare** – can be stranded: *The sensible thing would be to ask my father, but I wouldn't dare*. And thirdly, while other modals have highly irregular preterites, the regular form *dared* is found in both constructions:

- |      |    |  |             |
|------|----|--|-------------|
| [54] | i  | <i>With a bold arm he <u>dared</u> once more to obstruct them.</i> | [lexical]   |
|      | ii | <i>He <u>dared</u> not obstruct them.</i>                          | [auxiliary] |

In [i] *dared* can be seen to be lexical from the *to* and the fact that the clause is affirmative; [ii], however, has primary verb negation, so lexical **dare** would require **do**-support: *He didn't dare obstruct them*. As a result of these factors there are places where it is impossible to determine whether **dare** is modal or lexical: there is nothing in *Few of them dare/dared stand up to him*, for example, to force one analysis over the other.<sup>21</sup>

<sup>21</sup>It is typical in text for about half the occurrences of lexical **dare** in non-affirmative contexts to be without *to*, but for almost all affirmative tokens to have *to*. A much rarer type of blend is seen in *The professor in turn dares not tolerate the influence in his classes of such an organisation*, with a 3rd person singular present form taking primary negation. *Dared* has replaced the now archaic *durst* as preterite of the modal, but the forms *dare* and

■ The auxiliary–lexical distinction is maintained with *need*

The blurring of the distinction noted for *dare* is not found with *need*: lexical *need* can't be stranded, *needed* is invariably lexical (it is not used in the NICE constructions), and *to* is only exceptionally omitted with lexical *need*. One difference between *dare* and *need* is that with *dare* even the lexical verb occurs predominantly in non-affirmative contexts (as the modal obligatorily does), whereas lexical *need* very commonly occurs in affirmative contexts (*We need to consider both options*), reinforcing the contrast with the modal verb.

### 2.5.6 *Have, have got, had better*

We need to consider three uses of *have* on its own, and two uses where it is part of an idiom.

#### (a) Perfect *have*

This is a clear auxiliary, with all of properties [A–H]. The canonical, primary verb negation and subject–auxiliary constructions are seen in:

[55] *She has eaten it.      She hasn't eaten it.      Has she eaten it?*

As well as the primary forms shown here, it has a plain form (*She may have eaten it*) and a gerund-participle (*She regrets having eaten it*), but not a past participle.

#### (b) Dynamic *have*

This is a lexical verb in all varieties of English:

[56] i *He had a swim.      He didn't have a swim.      Did he have a swim?*  
 ii *He had it painted.      He didn't have it painted.      Did he have it painted?*

It has none of the auxiliary properties [A–H] – cf. *\*He hadn't a swim, \*Had he a swim?*, etc. As the label 'dynamic' indicates, it expresses an event rather than a state. In [i] it is used as a 'light verb' (Ch. 4, §7): the main semantic content is in the following noun. Similar is its use with the meaning "experience": *I didn't have any difficulty in persuading her*. In [ii] it is a catenative verb taking an object and a past-participial complement; it can also take a bare infinitival: *Did she have you retype it?*

#### (c) Stative *have* and the idiom *have got*

Where *have* expresses a state rather than an event it is replaceable by the idiom *have got* (subject to conditions outlined below):

[57] i a. *She has a swim every day.*      b. *\*She has got a swim every day.*      [dynamic]  
 ii a. *She has a swimming-pool.*      b. *She has got a swimming-pool.* }  
 iii a. *She has to swim each day.*      b. *She has got to swim each day.* }      [stative]

Stative *have* occurs either with an NP object, as in [ii], expressing possession and similar relations (cf. *She has many virtues / two sons*), or as a catenative verb with a *to*-infinitival complement, as in [iii], where the meaning is of obligation or necessity, much like that of *must* (see §9.11). Note that in spite of its semantic similarity

*daren't* are commonly used where normally a backshifted preterite would be found (*He knew she dare not tell her father*), and even occasionally in ordinary past time contexts (*Kim daren't tell them so I had to do it myself*).

to **must** this **have** has none of the modal properties [I–M]. For example, it has secondary forms and hence can appear in the progressive (*I'm having to work late tonight*), the perfect (*I've had to do it all myself*), and with a modal (*We may have to cancel it*). There is therefore no case at all for including it in the syntactic class of modal auxiliaries.

The idiom **have got** derives historically from a perfect construction. This is transparent in BrE, where *got* is the past participle of **get**, so that there is homophony between the idiom of [iib]/[iiib] and the perfect with **get**, as in *She has got arrested*, *She has got him a tie for Christmas*. In AmE the past participle of **get** is generally *gotten*, making the constructions overtly distinct. In both varieties, however, the perfect origin of **have got** is reflected in the fact that the **have** component of it is an auxiliary, absolutely incompatible with **do** (*\*We don't have got enough tea*).

While dynamic **have** is invariably a lexical verb, stative **have** can behave as either a lexical verb or, in some varieties, an auxiliary. This means that for the negative we have either *don't have* or *haven't* (or the analytic forms with *not*), and analogously with inversion. If we include **have got** too, we find therefore the following possibilities:

- |           |                                      |   |  |   |   |
|-----------|--------------------------------------|---|--|---|---|
| [58] i a. | <i>I <u>have</u> enough tea.</i>     | { | <i>I <u>don't have</u> enough tea.</i>     | <i>Do I <u>have</u> enough tea?</i>         |   |
|           |                                      |   | <i>%I <u>haven't</u> enough tea.</i>       | <i>%<u>Have</u> I enough tea?</i>           |   |
|           | b.                                   |   | <i>I <u>have got</u> enough tea.</i>       | <i>I <u>haven't got</u> enough tea.</i>     | <i><u>Have</u> I <u>got</u> enough tea?</i>     |
| ii a.     | <i>I <u>have</u> to read it all.</i> | { | <i>I <u>don't have</u> to read it all.</i> | <i>Do I <u>have</u> to read it all?</i>     |   |
|           |                                      |   | <i>%I <u>haven't</u> to read it all.</i>   | <i>%<u>Have</u> I to read it all?</i>       |   |
|           | b.                                   |   | <i>I <u>have got</u> to read it all.</i>   | <i>I <u>haven't got</u> to read it all.</i> | <i><u>Have</u> I <u>got</u> to read it all?</i> |

### Have got vs have

There are several respects in which **have got** is more restricted in its use than **have**:

- |      |                                      |                                       |
|------|--------------------------------------|---------------------------------------|
| [59] | <b>have got</b>                      | <b>have</b>                           |
| i    | Informal                             | Stylistically neutral                 |
| ii   | Characteristically BrE               |                                       |
| iii  | Usually present tense of <b>have</b> | All inflectional forms of <b>have</b> |
| iv   | Excludes habitual reading            | Non-habitual or habitual              |

**Have got** is restricted to informal style, but is otherwise very common, especially in BrE. The **have** of **have got** has no past participle form (*\*She had had got a Ph.D.*): in this respect it is like the ordinary perfect auxiliary. Unlike the perfect **have**, however, the idiomatic **have** also has no gerund-participle: *%She almost regrets having got a Ph.D.* has only the non-idiomatic meaning “having obtained”, and hence requires *gotten* in AmE. The plain form is very marginal: *?She may have got plenty of money but that doesn't mean she can push us around*. The preterite is certainly possible (*She had got too much work to do*), but it is fairly uncommon: **have got** occurs predominantly in the present tense. To the extent that the plain form is excluded, the **have** here has property [I] (only primary forms), but it has none of the other modal properties and cannot be regarded as a member of the modal auxiliary class.

The meaning difference [59iv] is seen most clearly in the catenative construction:

- |        |   |                                 |
|--------|---|---------------------------------|
| [60] i | <i>I <u>ve got</u> to mow the lawn.</i> | [single obligation]             |
| ii     | <i>I <u>have</u> to mow the lawn.</i>   | [single or habitual obligation] |

While [ii] can have a habitual interpretation (“It is my regular job to mow the lawn”) or a non-habitual one (a matter of some single future act of mowing), [i] has only the latter.

**Stative *have*: lexical or auxiliary (*doesn't have* vs *hasn't*)**

In AmE stative *have* always behaves as a lexical verb (and is preferred over *have got*). In BrE the lexical use has become common too, and the auxiliary use is tending to sound relatively formal or old-fashioned (with *have got* or lexical *have* preferred). The auxiliary use is hardly possible with a habitual interpretation: *Have you to mow the lawn?*, for example, shows the same restriction as *have got* in [60i].

**(d) *Had better/best***

These are idioms containing auxiliary *had*:

[61] *I had better tell them.*    *I hadn't better tell them.*    *Had I better tell them?*

*Had* has the reduced form *'d*, but the reduction can here go one stage further, with *had* dropping altogether, and only the *better* remaining: *You better go now.*<sup>22</sup> The *had* does not have a past time meaning: in [61], for example, we are concerned with what is the best course of action now, not at some time in the past. This weakens the relationship of the *had* to non-idiomatic *have*, and it is questionable whether it should be regarded synchronically as a form of *have* or as a distinct lexeme.

If we take *had* as a form of *have*, it will have property [M], preterite with modal remoteness rather than past time meaning. If we take it as a distinct lexeme, we will say that it has been reanalysed as a present tense form (like *must* and *ought*), and it will have property [J], no agreement. In either case, it has only primary forms, [I], and takes only a bare infinitival complement, [K]. On these grounds it undoubtedly should be included among the non-central members of the modal auxiliary class. Like *must* and *ought*, it is questionable in a remote apodosis, [L]: *?If tomorrow's vote went against the proposal, you'd better let me know at once.*<sup>23</sup>

**2.5.7 *Be***

We distinguish the following uses of *be*:

- |        |   |                          |
|--------|---|--------------------------|
| [62] i | <i>She <u>was</u> a lawyer.</i>                     | [copula <i>be</i> ]      |
| ii     | <i>She <u>was</u> sleeping peacefully.</i>          | [progressive <i>be</i> ] |
| iii    | <i>They <u>were</u> seen by the security guard.</i> | [passive <i>be</i> ]     |
| iv     | <i>You <u>are</u> not to tell anyone.</i>           | [quasi-modal <i>be</i> ] |
| v      | <i>She has <u>been</u> to Paris twice already.</i>  | [motional <i>be</i> ]    |
| vi     | <i>Why don't you <u>be</u> more tolerant?</i>       | [lexical <i>be</i> ]     |

The *be* of [i–iii] has all of properties [A–H], and needs no further commentary.

■ **Quasi-modal *be***

This has clear semantic affinities with the central modal auxiliaries, and syntactically it resembles them in having property [I] (as well as [A–H]). That is, it can't appear in a

<sup>22</sup>This is so common that in non-standard speech (especially that of children) one sometimes hears examples like *!We better go in, bettern't we?*, with *better* reanalysed as itself an auxiliary verb.

<sup>23</sup>*Had* also occurs in the idiom *had rather*, a variant of the *would rather* dealt with in §2.5.1; in BrE the *had rather* variant is somewhat archaic.

secondary form: \**I resent being not to tell anyone*, \**The meeting had been to be chaired by the premier*.<sup>24</sup> It lacks all the other modal auxiliary properties, however: it has agreement forms, it takes an infinitival with *to*, it can't occur in a remote apodosis, and its preterites do not occur with the modal remoteness meaning. The label 'quasi-modal' indicates that in spite of its one modal property (and its modal meaning) this **be** doesn't in fact qualify grammatically for inclusion in that class.

### ■ Motional *be*

This occurs only in the past participle form after perfect **have**, and hence most of the auxiliary properties don't apply. It does, however, exhibit auxiliary property [D], stranding: *She's not coming to the Exhibition tonight because she has been \_\_ already*.

### ■ Lexical *be*

This is found with *why* + **do** and with *if*:

- [63] i a. *Why don't you be more tolerant?*      b. *Why doesn't he be more tolerant?*  
 ii a. *If you don't be quick you'll lose.*      b. *If he doesn't be quick he'll lose.*  
 iii a. *%If you be quick you'll win.*      b. *\*If he be/bes quick he'll win.*

The *why* construction [i] is virtually restricted to the negative: <sup>2</sup>*Why do you be so intolerant?* is at best very marginal. Pragmatically [i] conveys "You/He should be more tolerant" and thus bears some resemblance to the imperative, but syntactically it is quite distinct from the imperative construction by virtue of having a present tense form, not a plain form. This is evident from the person–number contrast between *don't* in [ia] and *doesn't* in [ib], for imperatives with a 3rd person singular subject do not differ in verb-form from those with a 2nd person subject (cf. *Somebody open the door, please*). The same person–number contrast is seen in the conditional construction [ii/iii], which again conveys that you/he should be quick (in order to win / avoid losing). This time, however, some speakers allow *be* in the positive, but with no corresponding 3rd person singular form.

Two points about **be** follow from the data of [63]. The first is that in these constructions it behaves as a lexical verb, taking **do**-support in present tense negatives. The second is that for speakers who use construction [iiia] the lexical and auxiliary uses correspond to different lexemes, for the inflectional forms are different. Lexical **be** has only the one realisational form *be*, but it realises either the plain form (when taking **do**-support) or (in positive conditionals) a present tense form, distinct from the *are* that we have with auxiliary **be**.

## 2.5.8 Do

Like several of the items considered above, **do** belongs to both the auxiliary and lexical verb classes:

- [64] i *Do you like it? I don't understand. She DOES love him.* [auxiliary **do**]  
 ii *I did my best. He's doing the washing. What can we do?* [lexical **do**]

Auxiliary **do** is virtually restricted to the **do**-support constructions discussed in §§2.1.1–4 (where it is mutually exclusive with other auxiliaries), and to negative and emphatic imperatives. Elsewhere it is archaic, as in *I do hereby bequeath. . .*, and the like. Lexical

<sup>24</sup>This represents a historical change: constructions of this kind were used until the early nineteenth century, as in *You will be to visit me in prison with a basket of provisions*.

**do** of course combines with auxiliary **do** when the latter is required: *I didn't do very well.*

### 2.5.9 Use

This is the most marginal of the auxiliaries. For many speakers, especially younger ones, it does not belong in the class at all; many others have it as both auxiliary and lexical verb (with the former belonging to somewhat more formal style). We therefore find both:

- [65] i a. %*He usedn't to like it.*                      b. %*Used he to live alone?*                      [auxiliary]  
 ii a. *He didn't use to like it.*                      b. *Did he use to live alone?*                      [lexical verb]

Choice between the negative variants is sometimes avoided in informal style by using *never*: *He never used to like it.* The version with analytic negation, *He used not to like it*, could be construed either as an auxiliary with primary verb negation, or else as a lexical verb with negation of the non-finite complement. *Usedn't* is pronounced without an internal /t/ and sometimes written *usen't*; similarly *used to* is pronounced with a single /t/ and hence is homophonous with the *use to* of [ii], and the spelling *used* is sometimes found instead of *use* in these negative and inverted constructions.

**Use** does not normally appear as an auxiliary in the emphatic polarity or stranding constructions:

- [66] i \**He claims neither of us used to reply but we USED to.*                      [emphatic polarity]  
 ii \**Kim used to like it and I used \_\_\_ as well.*                      [verb stranding]

Contrastive stress on **use** can only emphasise the past aspectual meaning, not the polarity, so the only possibility in [i] is *but we DID*. In [ii] the only possibilities are *to*-stranding (*and I used to as well*) or **do** (*and I did, as well*).

Morphologically, **use** is highly defective: it has no present tense, no gerund-participle, and no past participle.<sup>25</sup> The plain form is found only in construction with auxiliary **do**, as in [65ii]. We have seen that it is mutually exclusive with the modal auxiliaries, but it is clearly not itself a member of the modal auxiliary class. It lacks properties [I] and [K–M], while [J] is irrelevant because *used* is a preterite form so the issue of agreement doesn't arise. It is also semantically quite distinct from the modal auxiliaries: the meaning it expresses is aspectual, not modal.

## 3 Tense, aspect, and mood: preliminaries

### 3.1 Categories of form and categories of meaning

The remainder of this chapter is concerned with the verbal systems of tense, aspect, and mood, which are marked inflectionally on the verb in just one case (the distinction between present and preterite tense) and otherwise analytically by auxiliaries. We will not, however, be dealing with the voice system in this chapter: although the passive is characteristically marked by auxiliary **be**, the voice system involves contrasts in the structure of the clause as a whole and a somewhat different kind of meaning contrast, so that it is more appropriately dealt with in Ch. 16. Some attention will be given also

<sup>25</sup>Except that the preterite perfect *had used* is occasionally found: *When Arthur had been a boy at school, he had used to play football.*

to various semantically related expressions which are not members of the syntactic class of auxiliary verbs, but the main focus will be on the auxiliaries themselves. Items such as **begin** or **finish**, for example, are lexical verbs expressing aspectual meaning, whereas progressive **be** is an aspectual auxiliary requiring fuller discussion.

### ■ The four systems and their marking

There are four systems to be considered, two of tense, and one each of aspect and mood:

[1]	SYSTEM	TERMS	MARKING	EXAMPLE
i	Primary tense	Preterite	preterite inflection	<i>went</i>
		Present	present tense inflection	<i>goes</i>
ii	Secondary tense	Perfect	<b>have</b> (+ past participle)	<i>has gone</i>
		Non-perfect	[unmarked]	<i>goes</i>
iii	Aspect	Progressive	<b>be</b> (+ gerund-participle)	<i>is going</i>
		Non-progressive	[unmarked]	<i>goes</i>
iv	Mood	Modal	modal aux (+ plain form)	<i>can go</i>
		Non-modal	[unmarked]	<i>goes</i>

We will also use the terms **simple preterite** and **simple present** for examples like *went* and *goes* which are unmarked in respect of all three analytic systems. In discussing the meanings we will use the term **situation** to cover actions, processes, events, states, relations, etc. – i.e. for whatever is expressed by a clause.

### ■ Tense

The general term **tense** applies to a system where the basic or characteristic meaning of the terms is to locate the situation, or part of it, at some point or period of time. English has two tense systems, illustrated in:

- [2] i a. *She went to school.*                      b. *She goes to school.*                      [preterite vs present]  
 ii a. *He may have known her.*                      b. *He may know her.*                      [perfect vs non-perfect]

In [i] the verb-forms refer respectively to past and present time, so that this is a very obvious example of a contrast of tense. We saw in §1.7 that the same inflectional contrast can convey other meanings too. In *If she went with us tomorrow she'd have plenty of time* vs *If she goes with us tomorrow she'll have plenty of time*, for example, the time is the same (future) in both, the difference being that the first presents her going with us as a more remote possibility than the second. But this meaning difference is found only in a restricted range of constructions, such as conditionals: it is examples like [i] that illustrate the basic meanings of the forms.

In [2ii] the perfect auxiliary **have** (in combination with the following past participle) serves to locate the knowing in past time and given that this can again be regarded as the basic meaning we analyse **have** as a tense auxiliary. We shall see that the inflectional preterite and the analytic perfect have a great deal in common, and we shall use the term **past tense** to cover them both: for reasons explained in §6.3, we take the inflectional preterite to be the primary past tense and the perfect the secondary past tense.<sup>26</sup>

<sup>26</sup>The perfect is often regarded as an aspect rather than a tense; the term 'phase' (distinct from both tense and aspect) is also used.

### ■ Aspect

The term **aspect** applies to a system where the basic meanings have to do with the internal temporal constituency of the situation. Compare:

[3]		PRESENT	PRETERITE
	NON-PROGRESSIVE	<i>She goes to school.</i>	<i>She went to school.</i>
	PROGRESSIVE	<i>She is going to school.</i>	<i>She was going to school.</i>

If we change present tense *She goes to school* to preterite *She went to school* we change from present to past time, but if we change it to *She is going to school* the time (and the tense) remains the same. The difference is a matter of how the speaker views the situation. The progressive takes an internal view, looking at it from the inside, as it were, as something ongoing, in progress. The unmarked, non-progressive, version takes an external view: there is no explicit reference to any internal phase or to any feature of the temporal flow (such as whether the situation is conceived of as instantaneous or having duration through time).

There are a considerable number of verbs which express aspectual meaning. **Begin** and **finish**, for example, are semantically similar to progressive **be** in that they too take an internal view, focusing on the initial or final phase of the situation. They do not belong to the grammatical class of auxiliary verbs, however, and we will refer to them therefore as lexical aspectual verbs.

### ■ Mood

It is not so easy to give a succinct account of the kind of meaning characteristically associated with **mood**. The unmarked mood is associated with factual assertions, whereas the marked terms involve various kinds of non-factuality or non-actuality, indicating that the situation is merely possible, is predicted or inferred rather than known, and so on. Compare:

[4]	i	<i>She goes to school.</i>	[non-modal (unmarked)]
	ii	<i>She may/must go to school.</i>	[modal]

As a main clause, [i] is characteristically used as an unqualified assertion. *She may go*, by contrast, indicates that the situation possibly obtains or is permitted, while *She must go to school* typically conveys that I deduce from evidence that she goes to school or that I am imposing a requirement that she go to school.

The mood system differs from the aspect and analytic tense system in that there are a handful of modal auxiliaries, not just one. Note in particular that we depart from traditional grammar in analysing **will** and **shall** as modal auxiliaries, not future tense markers: this issue is taken up in §10.1. And again the same kind of meaning as is expressed by the auxiliaries of mood can also be conveyed by other means, e.g. adverbs like *perhaps*, adjectives like *possible*, the imperative construction (*Go to school*), and so on.

### ■ Distinct terms for form and meaning

It will be clear from the above preliminary survey that a single form does not always convey the same meaning (the preterite being a striking example) and that the same kind of meaning can be expressed by very different formal means. This makes it important to distinguish carefully between categories of form and categories of meaning, so that the complex relation between them can be described. To facilitate this we will use different

terms for the formal systems and the associated areas of meaning:

[5]	FORM	CHARACTERISTIC MEANING
	Tense	Time
	Aspect	Aspectuality
	Mood	Modality

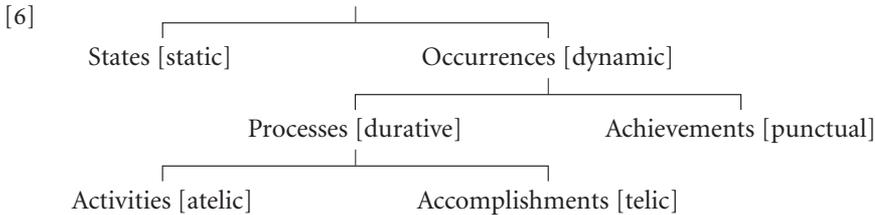

The adjectives ‘aspectual’ and ‘modal’ can apply to form or meaning depending on the noun they modify.

### 3.2 Kinds of situation and aspectuality

#### 3.2.1 A broad classification of situations

##### ■ States, activities, accomplishments, and achievements

The interpretation and use of tense, aspect, and (to a lesser extent) mood depends on the kind of situation expressed in the clause. A broad classification is given in [6], with examples in [7]:

- [7]
- i *The flag is red. He likes her. They believed in God.* [states]
  - ii *He's playing golf. He read to them. I had walked in the park.* [activities]
  - iii *He's writing a note. He read the note. I had walked home.* [accomplishments]
  - iv *I declare the meeting closed. I found the key. He had died.* [achievements]

The categories apply in the first instance to meanings and then derivatively to the forms that express them – but it must be emphasised that a single expression can often be interpreted as applying to situations of different types. Except where otherwise noted, we will be concerned with situations in abstraction from the features contributed by tense, aspect, and mood, so that, for example, *He is playing tennis, He was playing tennis, He played tennis* all involve the same situation of his playing tennis.

##### ■ Singularity vs multiple situations

Before outlining the differences between these various kinds of situation, we need to introduce a further distinction, between **singular** and **multiple** situations:

- [8]
- i *I was born on Good Friday. The President has resigned.* [singular]
  - ii *He went with her a few times. She usually cycles to work.* }
  - iii *She cycles to work. He was winking at me.* } [multiple]

A multiple situation comprises more than one instance of the same subsituation, as in [ii–iii], where we have multiple occurrences of his going with her, her cycling to work, and his winking at me. In [ii] the multiplicity is overtly expressed by adjuncts, but it does not have to be, as is evident from [iii]. Often the same form can be used for a

singularly or a multiple situation: *She cycled to work* allows both single occasion and habitual interpretations, *She immediately knocked at the door* may involve a single knock or repeated knocks, and so on.<sup>27</sup>

We will consider multiple situations in §3.2.4; in the meantime we will confine our attention to singularly ones.

### 3.2.2 States vs occurrences

The first contrast is between static and dynamic situations – between states and occurrences. States exist or obtain, while occurrences happen, take place. Occurrences involve change, while states do not. States have no internal temporal structure: they are the same throughout their duration, having no distinguishable phases.

#### ■ State-occurrences

The transitions into and out of a state are therefore not part of the state itself; where we are concerned with a state together with these transitions we will speak of a ‘state-occurrence’. Thus *She reigned for thirty years*, for example, is dynamic by virtue of covering the transitions: it denotes a situation that happened.

#### ■ Linguistic differences between states and occurrences

The distinction between the two main types of situation is reflected linguistically in a number of ways; the major ones are listed here summarily.

##### (a) Progressive aspect

This does not normally occur with expressions denoting states:

- |     |    |                                |              |
|-----|----|--------------------------------|--------------|
| [9] | i  | <i>*The flag is being red.</i> | [state]      |
|     | ii | <i>He is playing tennis.</i>   | [occurrence] |

##### (b) Simple present

This combines freely with states but not with occurrences.

- |      |    |                             |                            |              |
|------|----|-----------------------------|----------------------------|--------------|
| [10] | i  | a. <i>The flag was red.</i> | b. <i>The flag is red.</i> | [state]      |
|      | ii | a. <i>She married Tom.</i>  | b. <i>She marries Tom.</i> | [occurrence] |

While [ib] is the present time counterpart of [ia], [iib] resists a comparable interpretation – it can hardly be used for an event actually taking place at the time of speaking.

##### (c) Adjuncts of temporal location

These can refer to a point within the duration of a state but not, in the non-progressive, of an occurrence:

- |      |     |   |                |
|------|-----|---|----------------|
| [11] | i   | <i>At midnight / When he left she was still at her desk.</i>          | [state]        |
|      | ii  | <i>At midnight / When he left she made herself an omelette.</i>       | } [occurrence] |
|      | iii | <i>At midnight / When he left she was making herself an omelette.</i> |                |

In [i] midnight or the time of his leaving are internal to the static situation of her being at her desk, whereas in [ii] they are presented as giving the time of occurrence of her making herself an omelette: the progressive is needed if they are to be interpreted as internal to the situation, as in [iii].

<sup>27</sup>A singularly situation interpretation of the examples in [8iii] is in fact also possible, though it is much less salient than the multiple.

(d) Pseudo-clefts with *do*

Various constructions such as the pseudo-cleft can relate to occurrences but not to states:

- [12] i \**What she did next was know German.* [state]  
 ii *What she did next was learn German.* [occurrence]

## 3.2.3 Achievements, accomplishments, and activities

The labels for the three kinds of occurrences initially suggest situations with human agents, but they are to be understood as applying quite generally. *The fire destroyed the building*, for example, is just as much an accomplishment as *Tom destroyed the building*.

## ■ Achievements and processes distinguished as punctual vs durative

Achievements are conceived of as **punctual**, i.e. as being instantaneous, as occurring at a point in time, whereas processes – like states – are conceived of as **durative**, as having duration.

## ■ Accomplishments and activities distinguished as telic vs atelic

The two kinds of process, accomplishments and activities, are distinguished by the fact that the former are **telic**: they have an inherent terminal point beyond which they cannot continue. Activities (and states) are **atelic**. Writing or reading some particular letter or note, walking some specific distance (*We walked six kilometres*) or to some specific destination (*We walked to the post office*) are accomplishments. Once we have covered six kilometres, the situation of our walking six kilometres is necessarily terminated: we can carry on walking (for that is an activity), but not walking six kilometres. Accomplishment expressions are often essentially composite, as in this example. The verb *walk* on its own is an activity verb in that it does not itself imply any necessary conclusion: the telic property comes from adding a complement of distance or destination, which converts an atelic expression into a telic one. Similarly *read* and *write* are atelic, but adding an object that is ‘bounded’ yields a telic expression. Compare here:

- [13] i *She’s writing a note.* [telic: accomplishment]  
 ii *She’s writing notes.* [atelic: activity]

Here [i] is telic because the object is bounded: the situation must necessarily come to an end when that particular note is written. But in [ii] no bounds, limits, are set and the situation can go on indefinitely. There are some verbs, however, which incorporate the telic property within their own meaning. *Melt* and *evaporate*, for example, are telic in themselves: they denote a change from one state to another, and the occurrence is necessarily complete when the second state is reached.

## ■ Complex structure of accomplishments

Accomplishments have a complex structure involving two conceptually distinguishable phases: a pre-terminal phase, which has duration, and a terminal phase, which is punctual. Activities and achievements have a simple structure. By virtue of its pre-terminal phase an accomplishment is like an activity in that both are durative, both are processes. By virtue of its punctual terminal phase an accomplishment is like an achievement; some

grammars apply the term telic to both, but since the question of whether the situation can in principle **continue** indefinitely doesn't arise with achievements, we will regard them rather as 'quasi-telic'.

### ■ Linguistic differences

The distinction between accomplishments, activities, and achievements is reflected in the following ways:

#### (a) Lexical aspectual verbs

Achievement expressions do not normally occur as complement to the lexical aspectual verbs, whereas process expressions do:

- [14] i *He began to work / write a letter.* *He stopped snoring / reading it.* [processes]  
 ii *\*He began to reach the summit.* *\*He stopped finding the key.* [achievements]

(Recall that we are concerned at this stage only with singulary situations: *He kept reaching the summit before me* is quite normal but involves repeated achievements.) There are also more specific differences, the most important of which concerns the contrast between *finish* and *stop*; compare:

- [15] i *He stopped/finished painting the house.* [accomplishment]  
 ii *He stopped/finished talking.* [activity]

With accomplishments, *finish* necessarily encompasses the terminal phase, whereas *stop* does not: thus *He finished painting the house* entails that he had painted it, whereas *He stopped painting the house* does not – it strongly implicates that he had not. (That this is only an implicature follows from the possibility of saying *I won't stop until I've finished*, which shows that stopping can coincide with finishing.) With activities, the difference is less sharp, for both versions of [ii] entail that he had talked. *Finish*, however, lends a quasi-telic quality to the situation expressed in its complement (his talking): it suggests reaching some independently established endpoint. *He finished talking* conveys that he said all he had or wanted to say, whereas *He stopped talking* does not.

#### (b) Occurrence with progressive aspect

Similarly, processes occur freely with progressive aspect, whereas achievements tend to resist it:

- [16] i *I was working.* [activity]  
 ii *I was writing a novel.* [accomplishment]  
 iii *?I was recognising her.* [achievement]

A complication arises, however, with verbs like *die*. In the non-progressive these behave clearly as achievement expressions: they have a punctual interpretation and do not occur with the lexical aspectual verbs. Compare *He finished painting the house last week* (accomplishment) and *\*He finished dying last week* (achievement). Nevertheless, such verbs occur quite freely in the progressive: *He was dying*. This of course has a durative rather than a punctual interpretation, and we will therefore refer to situations expressed by *die* and the like as 'extendable achievements', in contrast to 'strict achievements' like [iii].

## (c) Entailments and implicatures from the progressive

- [17] i *I was working* entails that I worked. [activity]  
 ii *I was writing a novel* does not entail that I wrote a novel, but strongly implicates that I had not (yet) written the novel. [accomplishment]  
 iii *He was dying* implicates that he would subsequently die and entails that he had not (yet) died. [extendable achievement]

Accomplishments have separable pre-terminal and terminal phases, such that occurrence of the former does not guarantee occurrence of the latter. In [ii] the progressive normally picks out a segment from the pre-terminal phase, and hence *I was writing a novel* does not say whether or not I subsequently completed it – but it does implicate that at the time in question I had not done so. (Note that the negative implicature must be formulated in terms of ‘the’, i.e. ‘the same’, novel: [ii] does not of course convey that I had not written some other novel at some previous time.) Activities do not have separable phases, and hence the fact that an activity was in progress at some time is sufficient to ensure that it took place, happened: hence the entailment in [i]. The issue of such entailments does not generally arise with strict achievements because of their resistance to the progressive; extendable achievements, however, are in this respect rather similar to accomplishments. The negative implicature “he had not (yet) died” in [iii] is like that of the accomplishment in [ii] (but stronger: see §8.1): there is a necessary terminal point not yet reached at the time referred to in the progressive. An extendable achievement differs from an accomplishment, however, by virtue of the strong implicature that the terminal point was or will be reached. Thus whereas *He is writing a novel but I suspect he’ll soon give up* is perfectly natural, *He is dying but I suspect he’ll recover soon* is not. We have spoken here of an implicature because of the possibility of cancellation, as in *When I last saw him he was dying, but now you would hardly know he had been ill*; such examples are quite acceptable to many speakers at least: others might insist on *he seemed to be dying* or the like, and for them subsequent reaching of the terminal point has the strength of an entailment.

## (d) Expressions of duration

The admissibility and interpretation of such expressions also differentiates between the three kinds of dynamic situation:

- [18] i a. \**He reached the summit for an hour.* [achievement]  
 b. \**He was dying for an hour.* [extendable achievement]  
 c. *He played tennis for an hour / \*in an hour.* [activity]  
 d. *He walked a mile in an hour / \*for an hour.* [accomplishment]  
 ii a. *It took him an hour to reach the summit / die.* [achievements]  
 b. \**It took him an hour to play tennis.* [activity]  
 c. *It took him an hour to walk a mile.* [accomplishment]  
 iii a. *He reached the summit in an hour.* [duration of preceding activity]  
 b. *He arrived home / went to Ed’s for two days.* [duration of ensuing state]

Duration adjuncts like *for an hour*, interpreted as giving the duration of the situation, are inadmissible with expressions denoting achievements (usually including extendable ones, but see §8.1(d)) and accomplishments, as shown in [i]. Activities freely allow such

adjuncts, but not those like *in an hour*. These latter give the time taken to reach the intrinsic terminal point, and hence occur readily with accomplishments. *For* phrases are often possible with expressions that **can** denote accomplishments, but they induce an activity interpretation. Compare:

- [19] i *He read the book in an hour.* [accomplishment]  
 ii *He read the book for an hour.* [activity]

Example [ii] strongly implicates that he didn't finish the book (on the occasion in question).

Constructions involving *take* + duration complement measure the time of the situation through to the terminal point, and hence do not occur with activities (or states). Since the terminal phase is a point, the duration complement gives the time spent on the pre-terminal phase in the case of accomplishments. With achievements, which don't have a pre-terminal phase, it gives the time of some preliminary activity not explicitly expressed (e.g. moving towards the summit in [18iia] or looking for the key in *It took him an hour to find the key*).

Similarly an *in* phrase with an achievement is interpreted as giving the duration of such a preceding activity situation, as in [18iia]. The mirror image of this is where a *for* phrase gives the duration not of the situation (achievement or accomplishment) actually expressed but of the implied resultant state, as in [iiib].

### 3.2.4 Multiple situations

#### ■ Iterative, repeated, and serial multiplicity

There are three main ways in which a situation can be multiple rather than singular:

- [20] i *She knocked at the door* [sc. more than once]. [iterative]  
 ii *She saw him twice / several times last week.* [repeated]  
 iii *She usually mows the lawn herself.* [serial]

Verbs like *knock*, *nod*, *wink*, etc., can denote a singular punctual situation (an achievement) or a multiplicity of such subsituations: *She knocked at the door* can involve a single knock or more than one. We will use the term **iterative** for this kind of multiplicity, which is a matter of the inherent meaning of the verbs. **Repeated** is used for the case illustrated in [ii], where there is an indication of how many subsituations are involved; nothing further need be said about this type. **Serial** multiplicity is that where the recurrence of the subsituations is unbounded; there may be an indication of frequency, such as *usually* in [iii], but this is not necessary. Thus in its salient interpretation *She mows the lawn herself* is no less serial than [iii]: we take it to describe her habitual behaviour.

#### ■ Classification of subsituations and of overall situation

The analysis of multiple situations is more complex than that of singular ones, since we need to distinguish between the classification of the subsituations and that of the overall situation.

##### (a) Iterative multiplicity

With iterative multiplicity, the subsituations (as noted above) are achievements, but the overall situation is an activity. Hence the possibility of the progressive, or a *for* phrase: *She was knocking at the door*; *She knocked at the door for a moment or two*.

## (b) Serial multiplicity

Here the individual subsituations can belong to any of the categories:

- [21] i *She usually knows the answer to his questions.* [states]  
 ii *She usually gets up at six.* [achievements]  
 iii *She usually mows the lawn herself.* [accomplishments]  
 iv *She usually plays tennis at the week-end.* [activities]

But the overall situation itself is best regarded as a state. Although the subsituations may be dynamic, the overall situation is not: it is a state of affairs characterised by the serial occurrence of the subsituations. Serial situations do not have all the properties of states given in §3.2.2 (and hence are not prototypical states), but they are state-like with respect to properties (b) and (c). That is, they occur freely in the simple present, as in the examples just given, and a time adjunct can refer to an interval within the duration of the overall situation: *At the time I went to stay with them she usually mowed the lawn herself.* Moreover, as we shall note in the next subsection, serial states, like ordinary ones, have imperfective interpretations.

## 3.2.5 Perfective and imperfective aspectuality

The two most general categories of aspectuality are illustrated in:

- [22] i *He died last week. I'll write again soon. He reigned for a year.* [perfective]  
 ii *He lives in Bonn. He often cycles to work. He is working.* [imperfective]

With perfective aspectuality, the situation is presented in its totality, as a complete whole; it is viewed, as it were, from the outside, without reference to any internal temporal structure or segmentation. The concept of complete whole is independent of time, so that perfective aspectuality is compatible with any time-sphere: past in *He declared it a fake*, present in *I declare this meeting open*, future in *It is essential [that he declare everything he's bought]*. With imperfective aspectuality, the situation is not presented in its totality; it is viewed from within, with focus on some feature of the internal temporal structure or on some subinterval of time within the whole.

In languages such as Russian there are distinct verb-forms whose basic meanings correspond closely to these two aspectualities, and these languages are therefore said to have perfective and imperfective aspect. English, of course, is not such a language: the simple present and preterite can both be used either perfectly or imperfectly. With reference to English, therefore, the terms will be used wholly for categories of meaning and interpretation.<sup>28</sup> A special case of imperfectivity, however, is that where a dynamic situation is presented as ongoing, in progress: this we refer to as **progressive** aspectuality, and since it is the basic function of the **be** + gerund-participle construction to express it, this construction is called progressive aspect.

The interpretation of the non-progressive depends on the kind of situation involved. Normally (but see also §5.2) it is perfective with occurrences, i.e. dynamic situations, but imperfective with states, whether ordinary or serial. Compare:

- [23] i *He played golf on Wednesday.* [perfective]  
 ii *Even in those days he played golf every Wednesday.* [imperfective]

<sup>28</sup>It will be clear, then, that 'perfective' has a quite different sense from 'perfect'; in some works on English, however, 'perfective' is used with the meaning that (following the most usual practice) we give to 'perfect'.

Example [i] expresses a single activity; it is considered as a whole and located as a whole (by the preterite) in past time. By contrast, [ii] expresses a serial state; it is not considered as a whole, as is evident from the fact that in spite of the preterite the situation may still obtain at the time of speaking (the *even* is likely to suggest that it does). That is, the preterite locates in past time not the situation as a whole, but that part of it that I am talking about (the part that coincides with ‘those days’) – this makes clear that I am taking an internal view. Further evidence for this internal orientation comes from the fact that a time adjunct can refer to an interval of time within the duration of a state, just as it can with progressive aspect for an occurrence: see [11] above, where the adjunct has an internal interpretation in imperfective [i] and [iii], but not in perfective [ii].

## 4 Primary tense

English has two primary tense categories, preterite and present, marked by verb inflection. We examine them in this section, for the most part, with reference to the simple preterite and present, i.e. to examples without any auxiliaries of mood, secondary tense, or aspect – *She worked/works hard*; *It started/starts on Tuesday*; *He expected/expects to lose*.

### 4.1 Past, present, and future as relational categories

#### ■ Relation between time referred to and time of orientation

The semantic categories past, present, and future are inherently relational: one time is defined by its relation to another. Consider such examples as:

- [1] i *He died of lung cancer.* [past time]  
 ii *I promise to let you have it back tomorrow.* [present time]  
 iii *If you see her tomorrow give her my best regards.* [future time]

When we say of [i], for example, that the time of dying is past, this is understood as a time earlier than now, than the time at which I utter the sentence. We will speak of the two terms in the relation as **the time referred to**, symbolised  $T_r$ , and **the time of orientation**, symbolised  $T_o$ . In [i],  $T_r$  is the time of dying,  $T_o$  is the time of utterance, and the relation is “earlier than”, or to use a more technical term “anterior to”. In [ii],  $T_r$  is the time of promising,  $T_o$  again the time of utterance, and the relation is “simultaneous with”. In [iii],  $T_r$  is the time of your seeing her,  $T_o$  the time of utterance, and the relation is “later than”, or “posterior to”. These three relations may be symbolised as shown in:

- [2] i Past time             $T_r$  anterior to  $T_o$              $T_r < T_o$   
 ii Present time         $T_r$  simultaneous with  $T_o$          $T_r = T_o$   
 iii Future time         $T_r$  posterior to  $T_o$              $T_r > T_o$

In addition to  $T_r$  and  $T_o$  we need two other temporal concepts:  $T_{sit}$ , **the time of the situation**, and  $T_d$ , **deictic time**.

#### ■ Time referred to and time of situation

Where the aspectuality is perfective, the  $T_r$  for the primary tenses is simply the time of the whole situation,  $T_{sit}$  – this is so in all the examples in [1]. Where the aspectuality is imperfective, however,  $T_r$  will normally be just some point or interval within  $T_{sit}$ .

Compare:

- [3] i *He died of lung cancer.* (= [1i]) [T<sub>r</sub> coextensive with T<sub>sit</sub>]  
 ii *I already knew how to do it.* [T<sub>r</sub> included within T<sub>sit</sub>]

In [ii] the preterite in *knew* refers to some contextually given time included within the situation of my knowing how to do it, a situation which may well still obtain in the present (cf. also the above comments on *Even in those days he played golf every Wednesday* ([23ii] of §3)): this is why we need to distinguish between T<sub>r</sub> and T<sub>sit</sub> – and why our general definition of a tense system stipulated that the basic meaning of the terms was to locate in time the situation **or some part of it**.

### ■ Time of orientation and deictic time

For primary tense T<sub>o</sub> is normally the time of speaking or writing. We use the term **deictic time** to allow for the fact that in special circumstances it can be the time of **decoding** rather than that of **encoding**. Compare:

- [4] i *I am writing this letter while the boys are at school.* [T<sub>o</sub> is time of encoding]  
 ii *You are now leaving West Berlin.* [a written notice] [T<sub>o</sub> is time of decoding]

In ordinary speech the time of encoding and the time of decoding are identical, but in writing they can be different. Where this is so, the default identification of T<sub>o</sub>, as in [i], is with the time of encoding, the writer's time, but in notices like [ii] it is identified as the time of decoding, the addressee's time.<sup>29</sup> The difference between these is not marked linguistically in any way and the term deictic time covers both cases: it is defined by the linguistic event itself.

T<sub>o</sub>, we have said, is normally identified as T<sub>d</sub>; in this case, illustrated in [1], we say that the tense is **interpreted deictically**. But it is not invariably interpreted in this way. Consider:

- [5] i *If she beats him he'll claim she cheated.* [non-deictic past]  
 ii *If you eat any more you'll say you don't want any tea.* [non-deictic present]

The preterite and present tense inflections on *cheat* and *do* indicate that T<sub>r</sub> is respectively anterior to and simultaneous with T<sub>o</sub>, but here T<sub>o</sub> is clearly not T<sub>d</sub>. The time of the (possible) cheating is not anterior to the time of my uttering [5i], but to the time of his (possibly) making a claim of cheating. Similarly in [5ii] the time of your not wanting any tea is not simultaneous with my utterance but with your future utterance. This is why we need to distinguish the concepts of T<sub>o</sub> and T<sub>d</sub>: they do not necessarily coincide, even though they usually do.

### ■ The four temporal categories: summary

The four times we have distinguished are repeated for convenience in:

- [6] i T<sub>sit</sub> time of situation  
 ii T<sub>r</sub> time referred to identified with T<sub>sit</sub> when aspectuality is perfective  
 iii T<sub>d</sub> deictic time normally the time of utterance  
 iv T<sub>o</sub> time of orientation identified as T<sub>d</sub> in the default case

<sup>29</sup>The same applies to recorded speech, as for example in radio broadcasts – *You have been listening to 'The Goon Show'*.

Using ‘/’ to indicate the identification of one time with another, we can represent the temporal interpretation of [1i], *He died of lung cancer*, as  $T_r/T_{sit} < T_o/T_d$ .

The main use of the tenses is to express the relation between  $T_r$  and  $T_o$ . Whether  $T_r$  is identified with  $T_{sit}$  or just part of it is a matter of aspectuality and is not encoded by tense. As far as the identification of  $T_o$  is concerned, tense does not distinguish between a deictic  $T_o$  and a future  $T_o$ ; the former is the default identification but it can be overridden to yield a non-deictic interpretation in cases like [5]. However, the distinction between a past and a non-past  $T_o$  is relevant to the meaning of the tenses: we will take this up in §5.2, confining our attention in this section to cases involving a non-past  $T_o$ .<sup>30</sup>

## 4.2 The present tense

### 4.2.1 Present time reference

#### ■ Contrast between occurrences and states in basic use

The basic use of the present tense, we have said, is to indicate that  $T_r = T_o$ , where  $T_o$  is non-past; in the absence of indications to the contrary,  $T_o$  is identified more specifically as  $T_d$ . To see more clearly what this involves, we need to invoke the distinction between occurrences and states:

- [7] i *I promise to let you have it back tomorrow.* (= [1ii]) [occurrence]  
 ii *I live in Berlin.* [state]

Occurrences are interpreted perfectly, so that  $T_r$  is identified as  $T_{sit}$ . For [i], therefore, we have  $T_r/T_{sit} = T_o/T_d$ : the time of promising coincides with the time of speaking. The verb *promise* is here being used ‘performatively’ (Ch. 10, §3.1). I perform the act of promising by virtue of saying *I promise*, and hence the time taken to promise is precisely the same as the time taken to utter the sentence. States, by contrast, are interpreted imperfectly, with  $T_r$  included within  $T_{sit}$ . In [ii]  $T_r = T_o/T_d$ , but clearly  $T_{sit}$  is not coextensive with  $T_r$ : it extends without specified limits on either side. I am simply referring to the present time and saying that the situation of my living in Berlin obtains at that time. I say nothing about when it began or how long it will continue.

There is therefore a major difference between occurrences and states with respect to the interpretation of the simple present: dynamic situations are **coextensive with**  $T_r$ , whereas static situations **include**  $T_r$ .

#### ■ States: no distinction between limited and unlimited situations

In English, the same grammatical construction is used for states applying over an (implicitly) limited period, as in [8i], and those which hold for all time or are outside time altogether, as in [ii]:

- [8] i *She has a headache. She is Austrian. France is a republic.* [limited]  
 ii *The sun rises in the east. Two plus two is four. God is omnipotent.* [unlimited]

<sup>30</sup>Some writers use ‘zero-point’ for our  $T_d$ , while others talk of the time of utterance/speech. Alternative terms for deictic and non-deictic uses of the tenses are ‘absolute’ and ‘relative’ respectively – unfortunate terms given that in either case  $T_r$  is located relative to  $T_o$ .

### ■ Occurrences: constraints on basic use of simple present

The requirement that a dynamic situation be temporally coextensive with the utterance imposes severe constraints on what dynamic situations can be expressed in the simple present. Consider:

[9] *I do 'The Times' crossword.*

This cannot naturally be interpreted as describing a single situation because it takes longer to do 'The Times' crossword than it does to utter [9]. Only some small internal phase of the accomplishment of doing the crossword could be coextensive with the utterance, and hence if I were concerned with a single such phase I would need to use the progressive aspect: *I am doing 'The Times' crossword*. As it stands, however, [9] receives a serial state interpretation: "I habitually do 'The Times' crossword". This state interpretation is imperfective, so that  $T_{\text{sit}}$  simply includes  $T_r$ : the period of time over which my habitually doing the crossword obtains includes  $T_r$  and extends without specified limits on either side.

The use of the simple present for dynamic situations is thus very restricted. The main cases (leaving aside fiction) are the following:

#### (a) The performative use of verbs

[10] *I beg you not to tell anyone. I advise you to accept. I object strongly to that proposal. Passengers on Flight QF312 are requested to proceed to Gate 4.*

#### (b) Running commentaries and demonstrations

[11] i *Adams steps forward, tries to drive, he's bowled!*  
 ii *I add two cups of flour and fold in gently.*  
 iii *We begin by calculating the correction factor, CF: [calculation given] and continue by calculating the various sums of squares: [calculations given] . . .*

The coextensiveness between  $T_{\text{sit}}$  and  $T_d$  is subjective rather than objective: I present the happenings as simultaneous with my utterance even if strictly speaking they are not. Commentaries are generally restricted to a range of conventional contexts where the speaker is specifically assigned the role of commentator, as in the radio cricket commentary example [i]. A demonstration, as in [ii], can be thought of as a commentary on one's own actions. Example [iii], from a statistics textbook, illustrates the written analogue of a demonstration (with *we* involving the addressee in the calculations).

#### (c) Informal commentaries with preposed locatives

[12] *There it goes. Here comes the bus. Up he goes. Down she falls.*

These are semi-formulaic, with a limited range of locatives and verbs. Non-pronominal subjects are normally postposed, as in the bus example. This case might be extended to cover such examples as *Pop goes the weasel*, found in children's rhymes and stories.

### ■ Further restrictions with non-assertives

Cases (b) and (c) are restricted to declaratives – or, more generally, to assertive utterances. There is, for example, no question corresponding to *Here comes the bus*: *\*Does here come the bus?* is ungrammatical and *Does the bus come here?* corresponds to *The bus comes here*, whose natural interpretation is as a serial state. It is possible, however, to have questions corresponding to the performative category: *Do you promise not to tell anyone?*; *Do you, John,*

*take Mary to be your lawful wedded wife?* The tense here anticipates, as it were, the answer: the time of your promising (or declining to promise) is that of your answer, not my question. In speech the answer is expected to be given immediately, so there is effectively no difference in the time; in writing, of course, there is likely to be a significant time difference between question and answer, and it is clearly the time of answering that is relevant (cf. *Do you consent to the terms and conditions outlined above?*).

#### 4.2.2 The ‘timeless’ use of the present tense

The present tense can be regarded as the default term in the primary tense system: in some cases it is used without any specific reference to present time, or to any time at all, but simply because the conditions for the preterite do not obtain.

##### (a) Synopses and stage directions

One such case is in synopses of TV programmes, films, novels, operas, etc., as in [13i], and in stage directions, as in the bracketed part of [13ii]:

- [13] i *Hugo walks out on Darcy, Harry defies government orders and operates on Jenny Pope, and Tom goes on a wild goose chase to rescue Valmai Winters.*
- ii DOOLITTLE. *Afternoon, gentlemen. Afternoon, maam. [He touches his hat to Mrs Pearce, who disdains the salutation and goes out. He winks at Higgins, thinking him probably a fellow sufferer from Mrs Pearce’s difficult disposition, and follows her.]*

This use of the present tense differs from that considered above in that dynamic situations do not have to be short enough to be coextensive with the utterance. *Harry operates on Jenny Pope*, for example, cannot be used for a single present time accomplishment because an operation cannot be performed in the time taken to utter a sentence and hence cannot be viewed perfectly as occurring at  $T_d$ . But [i] is not concerned with a real situation occurring at  $T_d$ , and hence there is no obstacle to presenting the situation perfectly. If I had seen the TV programme or whatever, I would report its content using the preterite (unless making use of the ‘historic present’, §4.2.3). The perspective for a synopsis, however, is not that of a past performance (so that the preterite would be inappropriate) but of a work that can be performed (or read) at any time, and is in that sense timeless.

##### (b) Focus on present existence of works created in the past

A similar use of the ‘timeless’ present tense is seen in:

- [14] i *Describing individuals coping with ordinary life and social pressures, she [Jane Austen] uses a sharp satiric wit to expose follies, hypocrisies and false truths.*
- ii *That’s not exactly what the Bible says.*
- iii *Rubens is a master of those parts of his art which act immediately on the senses, especially in the portrayal of the tumult and energy of human action in full power and emotion.*

Writing has a permanence lacking in speech, and where past writings have been preserved they can be read now, and we can talk about them from the perspective of their present

and potentially permanent existence rather than that of their past creation. And what holds of writing applies of course to other kinds of creation, as illustrated in [iii].<sup>31</sup>

By contrast, when the concern is with the act of creation itself, then a preterite is required: *Jane Austen wrote 'Emma' in 1815.*

### (c) Captions

Similarly, photographs and drawings can give a permanence to what would otherwise be a transient historical occurrence, and captions then use the present tense, as in the following newspaper examples:

- [15] i *David Boon (above) is startled into belated action after Indian wicket-keeper Chandra Pandit threw down his stumps at the non-striker's end.*  
 ii *Aboriginal protesters occupy part of the old Parliament House in Canberra yesterday.*

Note the contrast between the tense and the time adjunct in [ii]. The tense reflects the permanence of the photographic record while the adjunct *yesterday* (like the dates in [16]) gives the time when the occupation actually took place.<sup>32</sup>

### (d) Chronicles of history

Past events can also be expressed in this timeless present tense when they are seen as part of a chronicle forming a permanent record of history:

- [16] 1434 *Cosimo dei Medici begins his family's control of Florence.*  
 1435 *Congress of Arras: Burgundians withdraw support from England, in favour of France.*  
 1438 *Albert I becomes Emperor – the first Habsburg Emperor.*

## 4.2.3 Extension of the present tense into past time territory

In [14–15] the present tense is used to give a timeless, permanent perspective to what could also have been conceptualised as past occurrences. There are a number of other places, too, where the present tense encroaches into past time territory:

### (a) The historic present in narrative

The present tense is used for past time situations in informal conversational narration or in fiction:

- [17] *There was I playing so well even I couldn't believe it and along comes this kid and keeps me off the table for three frames!*

This can be regarded as a metaphorical use of the present tense, a device conventionally used (in English and a very wide range of languages) to make the narrative appear more vivid by assimilating it to the here-and-now of the speech act. Note that in the example cited the speaker switches from preterite in the first two verbs to the present in the last two.

<sup>31</sup> Present tense cross-references to other parts of a single work may perhaps be regarded as a special case of this category: *This matter is discussed in Chapter 2; The results of the experiment are shown in Figure 3.* It is also possible to write *was discussed* or *will be discussed*, taking the perspective of the writer or reader progressing through time from beginning to end of the work. Forward references like *We take this matter up in the final chapter* can be construed indifferently as comparable to [14] or as 'futures' like [20ii] below.

<sup>32</sup> Captions to illustrations in books often use the timeless present tense too (*Dick Purfoy seeks his fortune; Mr Meekin administers consolation*), but a preterite is equally possible, to match the narrative text (*D'Artagnan began to renew the acquaintance with Groslow*).

## (b) ‘Hot news’

The present tense is widely used in news headlines (spoken, as in [18i], or written, as in [ii]) for dynamic situations in the recent past:

- [18] i *UN aid reaches the stricken Bosnian town of Srebrenica.*  
 ii *Probe clears Speaker over bike payout. Ailing pensioner gets Govt death notice.*

The texts beneath the headlines in [ii] use past tenses, preterite (*An independent inquiry yesterday cleared former Speaker Leo McLeay of any favourable treatment in his \$65,000 bicycle accident compensation claim*) or present perfect (*An 84-year-old Bathurst man recovering from a stroke has received a letter. . .*), but in headlines the simple present is shorter and more vivid. This might be regarded as a metaphorical extension of the use of the present tense in commentaries.

## (c) The past evidential use with verbs of communication

- [19] i *Your mother tells me you're off to Paris tomorrow.*  
 ii *I hear we're getting some new neighbours.*

Your mother's telling me about your departure and my hearing about our neighbours are past time occurrences, and yet the present tense is used. It serves to background the communication occurrences themselves and to foreground their content, expressed in the subordinate clause. The main clause provides, as it were, the evidence for believing or entertaining this content. The primary purpose is therefore normally to impart this content – or to seek confirmation of it. The verbs most commonly used in this way are: *say, tell, inform* (these latter two typically with a 1st person indirect object, or else in the passive with a 1st person subject, as in *I'm told you're off to Paris tomorrow*), and *hear, gather, understand* (these typically have a 1st person subject, with the communicator optionally expressed in a *from* phrase: *I gather from Angela that you're short of money again*). Because the main clause is backgrounded, it generally does not contain elaboration by adjuncts, and in particular will not include temporal specification. In [19i], for example, it would be unacceptable to add *just before she left this morning* or the like. And similarly it would be inconsistent with the backgrounding of the main clause to add that the original communicator no longer believed what they had said – e.g. to add to [19i] *but she now realises you're not going till next week*.

## 4.2.4 Future time reference in main clauses: the present futurate

The simple present tense can also be used for future time situations: we look first at main clauses and turn to subordinate clauses in the following two subsections. The main clause case we refer to as the **future**:

- [20] i *The next high tide is around 4 this afternoon. There is a solar eclipse on Tuesday. When is the next full moon?*  
 ii *The new Kevin Costner film opens at the Eldorado on Saturday. When do lectures end this year? She is president until next May.*  
 iii *If he doesn't help me, I 'm finished. If you don't do better next month you are fired. Either he plays according to the rules or he doesn't play at all. If I get it for less, do I keep the change?*

As evident from the last example in [ii], the time can be a period extending from the present into the future.

### ■ Main uses of the futurate

The futurate construction is subject to severe pragmatic constraints: the clause must involve something that can be assumed to be known already in the present. The three most common uses involve cyclic events in nature, scheduled events, and conditionals.

#### (a) Cyclic events in nature

The present tense is used for recurrent events whose time of occurrence can be scientifically calculated, as in [20i]. Here the scientific evidence for the future occurrence of the situation is clearly such as to warrant including it under what is currently known. We do not, by contrast, use the simple present for future weather. We say *It's going to rain soon* or *It will rain soon*, not *It rains soon*: such events are not conceived of as being within the domain of what is known.

#### (b) Scheduled events

The examples in [20ii] express future situations that have already been arranged, scheduled by human agency. The evidence for treating these as falling within the domain of what is known might not satisfy the demands of a philosopher concerned with the theory of knowledge, but it is sufficient in the ordinary use of language. The element of current schedule/arrangement is seen in such a contrast as we find in

- [21] i *Australia meets Sweden in the Davis Cup final in December.*  
 ii *Australia beats Sweden in the Davis Cup final in December.*

The present tense is quite natural in [i] (in a context where Australia and Sweden have already qualified for the final), but not in [ii], since this conveys that not only the finalists but also the result has already been arranged. Note that subjective certainty is not enough: I might feel quite certain, on the basis of the skills, experience, and past performance of the teams, that Australia will win, but that does not sanction the simple present *beats*.

#### (c) Conditionals

We can have a futurate to indicate that the consequence of the condition being fulfilled is inevitable or already decided, as in [20iii]. The first example conveys that if he doesn't help me nothing can prevent my being finished. The second would normally be said by someone with the power to fire you and hence would serve as a threat. The third is only indirectly a conditional (Ch. 15, §2.2.4) but, as spoken by one with the authority to stop him playing, its natural interpretation is "If he doesn't play according to the rules, he doesn't play at all". With a question, as in the fourth example, control switches to the addressee: it is (prototypically) you who decide whether I keep the change. Not all future conditionals with simple present main clauses belong in this category. *What happens if there is a power failure?*, for example, belongs under (b): it is asking what arrangements have been made to deal with this contingency.<sup>33</sup>

### ■ Reinforcement by temporal expressions

The cyclic and scheduled event cases are characteristically accompanied by a temporal expression specifying (or questioning) the future time, as in [20i–ii]. Very often, the significant information to be conveyed (or obtained) is precisely the time of the future situation.

<sup>33</sup>It can also have a serial state interpretation, with *if* equivalent to *when* or *whenever*; in this case, the time reference is present.

### ■ Progressive futurate

The present progressive is also used in main clauses with a futurate interpretation. It is found in case (b), scheduled events, and to a limited extent case (c), conditionals:

- [22] i *The new Kevin Costner film is opening at the Eldorado on Saturday.*  
 ii *Either he plays according to the rules or he is not playing at all.*

### ■ Futurate vs modal *will*

In all the above examples modal *will* could be used instead of the futurate construction. In [20i–ii] substituting *will* wouldn't make much difference: *will* does not indicate that the situations are conceived of as falling within the domain of what is known, but the scientific calculability of the first set and current scheduling of the second could be inferred from the nature of the situations involved. But the contrast is clear in [21]: adding *will* makes [ii] no less acceptable than [i]. Compare also such a pair as *When do we meet again?* and *When will we meet again?* The first is asking about current arrangements, the second is not. In [20iii] the simple present is more forceful, more dramatic than *will*, emphasising the inevitability of the consequence. We will take up the relation between these structures when considering the semantic/pragmatic status of ***will*** in §9.5.

### ■ Present futurate involves a present time component

Although the futurate locates the situation in future time, there are grounds for saying that it involves a component of present time as well: the future situation is determinable from the state of the world now. The present time element is reflected linguistically in two related ways.

#### (a) Contrast between present and preterite futurate

- [23] i *My mother is arriving tomorrow / the following day.*  
 ii *My mother was arriving tomorrow / the following day.*

The future time of arriving is the same in both: what differs is the time of the scheduling, present in [i], past in [ii]. Such contrasts are more readily found in the progressive, but they are not entirely excluded from the simple forms, as seen in [24] below.

#### (b) Possibility of separate time specification

- [24] i *The match now starts next Monday, not Tuesday, as I said in my last letter.*  
 ii *At that stage the match didn't start till next Tuesday.*

Here the adjuncts *next Monday* and *till next Tuesday* specify the time of the future situation, whereas *now* and *at that stage* give the time of the arrangement or schedule. The temporal interpretation is therefore complex – we understand [i] not as simply “future” but as “future in present”, contrasting with the “future in past” of [ii].

Examples [23–24] involve the scheduled event use of the futurate, but it is arguable that such an analysis applies to the futurate construction generally: that it involves a future component associated with the situation itself and a present (or past) component associated with the state of affairs in which the occurrence of the future situation is determined. Performative *I object* and futurate *I leave tomorrow* contrast not as “present” vs “future”, but as “simple present” vs “future in present”.

### ■ Is the tense contrasting with the preterite a present tense or a non-past?

Given that English has no future tense, some modern grammars contrast the two primary tenses as past (preterite) vs non-past. The view taken here, however, is that ‘present’ is a more appropriate term than ‘non-past’. It is true that in subordinate clauses this tense is readily used for both present and future situations, but this is certainly not so in main clauses – and it is fitting to select the general term for the category on the basis of main clause usage. The discussion of the futurate has shown that in main clauses the use of the present tense for future situations is extremely restricted and, moreover, involves an element of present time too.

#### 4.2.5 Deictic future time in subordinate clauses

##### ■ Contrast in temporal interpretation of subordinate and main clauses

In certain kinds of subordinate clause the present tense can be used for future situations without the pragmatic constraints that we have observed for main clauses, i.e. for the futurate. Consider first such pairs of subordinate and main clause as:

[25]	SUBORDINATE	MAIN
	i a. <i>Don't go until I am feeling better.</i>	b. <i>I am feeling better.</i>
	ii a. <i>I'll be disappointed if we have wet weather.</i>	b. <i>We have wet weather.</i>
	iii a. <i>Keep a record of how much you spend.</i>	b. <i>How much do you spend?</i>

In each pair the interpretation of the subordinate clause is quite different from that of the corresponding main clause. The subordinate clauses all have a future interpretation. They do not belong to the futurate construction, however: there is no present time element in their meaning and they are not subject to the pragmatic conditions applying to the futurate – we will refer to them as **pragmatically unrestricted futures**. The main clauses [ib] and [iib] have present time state interpretations: the pragmatic conditions for a natural futurate interpretation are not met in these examples. The salient interpretation of [iiib] is likewise a present time state (a serial state, concerned with recurrent spending); it also allows a futurate interpretation implying a current arrangement for future spending (cf. “How much has been allotted to you to spend?”), but there is no such meaning in subordinate [iiia].

The three subordinate examples differ slightly from one another, but they have in common that the simple present is not used to make a future time **assertion**. Take [25i] first. In a normal utterance of main clause [ib] I assert the proposition that it expresses (essentially, “I am feeling better now”) – and thus commit myself to its being true. But in subordinate [ia] I am not asserting that I am / shall be feeling better at some future time: there is no reference to any specific time. In [iia] there may be reference to a specific time, that of a forthcoming holiday perhaps, but clearly the proposition that we have wet weather at this future time is not asserted to be true: it is merely entertained as a possibility. Since there is no assertion in [ia] and [iia], they are not subject to the pragmatic conditions which apply to the future time use of the simple present tense in main clauses, clauses which **are** characteristically used for assertions.

In [25iii] we have interrogative clauses expressing questions, and hence an extra step is needed in the explanation, for the main clause [iiib] will not itself be used to make an assertion. The prototypical use of a main clause interrogative is to ask the addressee

to answer the question it expresses. And the answer will prototypically be given as an assertion (e.g. *I spend \$200 per week*). But in the subordinate [iia] you are not being asked to answer the question now, hence not to make an assertion – so again the pragmatic conditions applying to the assertive use of the simple present do not apply.

### ■ Subordinate constructions allowing pragmatically unrestricted futures

The major kinds of subordinate clause where a simple present can be used for a pragmatically unrestricted future are found in the following constructions:

#### (a) Temporal constructions

The present tense may be used in a clausal complement of *after*, *before*, *as soon as*, *once*, etc., or in a fused relative with *when*:

- [26] *I'm drinking it now, before it goes off. We'll leave as soon as it stops raining.  
Clean up before you leave. Will you be seeing Kim when you are in Bonn?*

#### (b) Conditional constructions

A future interpretation of the present tense is found in the complement of *if*, *unless*, *provided*, *supposing*, *on condition*, the verbs *assume* and *suppose*, and in the exhaustive conditional construction:

- [27] *She's mad if she goes tomorrow. We'll be staying until Friday unless the weather changes. It should last till next pay-day provided you're careful. Let's assume we are returned with a good majority. Suppose he lets you in. I'm leaving next week whether the job is finished or not.*

#### (c) Integrated relative clauses

- [28] *Anyone who misses tomorrow's meeting is irresponsible. A prize will be given to everyone who gets the right answer. Keep any letters he sends you.*

#### (d) Embedded interrogative clauses

- [29] *I don't mind what you do. Let me know who wins.*

The context has to be such that the answer only becomes available in the future. This is not the case in a context such as *I know / Do you know . . .*, and hence only a futurate interpretation is possible in *I know / Do you know when they arrive* and the like.

#### (e) Comparative clauses

- [30] *I'll be able to do it in less time than it takes them. Next time do as he says.*

These in fact are temporally ambiguous between present time (“than it takes them now”, “as he says now”) and future time.

#### (f) Complement of *bet*, *wager*, and *hope*

- [31] *I bet it rains again tomorrow. He's hoping she doesn't find out.*

*Will* is equally possible here. The construction generalises to the deverbal nouns *bet*, *wager*, *hope* (*My hope is that she changes her mind*), but not to the adjective *hopeful*.

#### (g) The covert mandative construction

- [32] *It is essential that he finishes the job tomorrow. I insist that she goes too.*

The covert mandative alternates with the more common subjunctive mandative (*that he finish*) and *should*-mandative (*that he should finish*): cf. Ch. 11, §7.1.1.

#### 4.2.6 Future interpretation of a non-deictic present tense

A third construction where a present tense is used with a future time situation was illustrated earlier:

[33] *If you eat any more you'll say you don't want any tea.* (= [5ii])

We interpret the time referred to by present tense *don't* as future, not present. This construction differs from those dealt with in the last subsection, in that here the present tense does express simultaneity. The simultaneity, however, is not with  $T_d$ , but with the time referred to in the matrix *say* clause. The temporal relation is  $T_r = T_o$ , but  $T_o$  is identified non-deictically, as future.

#### Two sources for a future interpretation of a subordinate clause

It follows from what we have said that a future interpretation of a subordinate clause may arise in one or other of the following ways:

[34] i  $T_r > T_o/T_d$  as in [26–32] [posterior to present  $T_o$ ]  
 ii  $T_r = \text{future } T_o$  as in [33] [simultaneous with future  $T_o$ ]

We need to allow for these two ways of arriving at the same end result because neither on its own will cover all the data. Case [i] will not account for [33], because it doesn't cater for the contrast in this environment between a present tense and a preterite – recall [5i] above, *If she beats him he'll claim she cheated*. Here the cheating is clearly interpreted as anterior to the claim, so that we have " $T_r < \text{future } T_o$ ", i.e. the preterite counterpart of [34ii]. But nor can [34ii] be generalised to cover [26–32]. Although most of the latter have a matrix clause with a future time, not all of them do: there can be no question of the matrix clause providing a future  $T_o$  in [31–32] or the first example in each of [26–29] (*I'm drinking it now, before it goes off; She's mad if she goes tomorrow*, etc.).

No less important is the fact that where the matrix clause does have future time reference it often need not be simultaneous with the future time of the subordinate clause:

[35] i *I'll finish it before you return.*  
 ii *If you miss her tomorrow, you'll have another chance of seeing her next week.*  
 iii *Those who pass the test tomorrow will be notified in writing next week.*  
 iv *I'm quitting at the end of the year whether I pass tomorrow's test or not.*  
 v *My time for the marathon next year will certainly be worse than it is tomorrow.*

Since the subordinate  $T_r$  here cannot be simultaneous with a  $T_o$  identified with the matrix  $T_r$ , the interpretation again cannot be given by [34ii]. All of the constructions in §4.2.5 allow for a future in the subordinate clause that is not simultaneous with a future referred to elsewhere in the sentence and hence require analysis [34i]. We will therefore restrict [34ii] to constructions where there is a potential tense contrast, with the preterite interpreted as " $T_r < \text{future } T_o$ " and the present tense as " $T_r = \text{future } T_o$ ". The clearest cases involve content clause complements of verbs of saying, thinking, feeling, etc., as in [33].

### 4.3 The preterite, as used to express anteriority

In this section we examine the use of the preterite to indicate that  $T_r$  is earlier than  $T_o$ ; its use for modal remoteness and in backshift will be taken up in §6, after consideration of the secondary past tense, the perfect.

### 4.3.1 Past time reference

The basic use of the preterite is to locate  $T_r$  as anterior to  $T_o$ , where  $T_o$  is identified as  $T_d$ :

- [36] i *I promised to let you have it back tomorrow.* [occurrence]  
 ii *I lived in Berlin.* [state]

#### ■ Occurrences

Here, as in the present tense, the aspectuality is perfective. With a past time occurrence, therefore,  $T_r$  coincides with  $T_{sit}$ , and since  $T_r$  is in the past,  $T_{sit}$  must be wholly in the past. However, there is no requirement that it be of short duration, as a dynamic present time situation must normally be: in the present,  $T_r = T_o/T_d$  and hence has to be of the same duration as  $T_d$ , whereas in the past,  $T_r < T_o/T_d$  and hence is not subject to any such constraint. In [36i]  $T_r/T_{sit}$  is short, but in *The glacier moved only about 50 metres during the next century* it is 100 years long.

#### No analogue of pragmatic constraints on dynamic use of present tense

It follows that the severe constraints on the use of the simple present for occurrences (noted in §4.2.1) do not apply in the preterite. Compare, for example:

- [37] i *I do 'The Times' crossword.* (= [9]) [present: serial state]  
 ii *I did 'The Times' crossword.* [past: occurrence or serial state]

We have seen that an interpretation of [i] as a singularly dynamic situation is generally ruled out, but such an interpretation is perfectly natural for [ii], which can refer to a single doing of the crossword as readily as to habitual doing of the crossword. With the preterite, therefore, greater importance attaches to adjuncts and context in selecting between occurrences and serial states: compare the effect of adding on the one hand *yesterday* (inducing a dynamic interpretation), and on the other *regularly* or *whenever I could find the time* (which yield interpretations as serial states).

#### ■ States

Here the aspectuality is imperfective, so that  $T_r$  does not coincide with  $T_{sit}$ : with the preterite, therefore, the state does not have to be wholly in past time (cf. [3ii], *I already knew how to do it*). Very often there will be an implicature that the state no longer obtains, but it is not an entailment. If we add *in those days* to [36ii] this encourages an interpretation where I no longer live in Berlin, but if we expand it instead to *I already lived here in Berlin at that time* we get an interpretation where I still live in Berlin. Compare also such examples as *I liked her as soon as I met her and we've been good friends ever since*. If the state still obtains in the present the question arises: Why is a preterite used, rather than a present tense? And the answer of course is that we use a preterite because we are **talking about** some time in the past –  $T_r$  is in the past. The state obtained at  $T_r$  but (unlike an occurrence) is not co-extensive with it. In this respect, the preterite is precisely parallel to the present tense.

We noted in connection with [37] that the distinction between occurrences and serial states is less clearly drawn in the preterite than in the present tense, and the same applies with ordinary (non-serial) states. Thus whereas present tense *I live in Berlin* is quite

obviously a state, preterite *I lived in Berlin* can be construed in either way:

- [38] i *At that time I lived in Berlin.*  
 ii *After the War I moved to Germany; I lived in Berlin for three years and then spent a few months in Cologne.*

In [i] it is a state, but in [ii] it is presented as one of a sequence of occurrences. In [i] it is seen as obtaining at  $T_r$  but extending without specified limits before and after  $T_r$ ; in [ii] it is viewed in its totality, and its time simply is  $T_r$ . The perfective aspectuality in [ii] embraces the transition into and out of the state, resulting in what we have called a state-occurrence.

#### 4.3.2 Past time reference in combination with politeness/diffidence

The preterite is commonly used in preference to the present in examples like the following, where it is considered somewhat more polite:

- [39] i *I wanted to ask your advice.*  
 ii *I wondered whether I could see you for a few minutes.*

The politeness/diffidence feature is also found with the past progressive: *I was hoping to see the Manager*. The prototypical case (for either aspect) is that illustrated in [39], a declarative with 1st person subject, but 3rd person subjects can be used when I am talking on someone else's behalf: *My daughter was hoping to speak to the Manager*. And the same usage carries over into interrogatives, with a switch to 2nd person subject: *Did you want to see me?*

#### ■ Politeness/diffidence feature as an implicature

This conventional use of the preterite is quite consistent with its basic past time meaning. It would not be correct to say that [39i], for example, is an ambiguous sentence, interpretable in one sense as describing my wants at some time in the past and in another as a more polite, more diffident version of *I want to ask your advice*. Rather, the first of these interpretations corresponds to what the sentence means, and the second is a context-dependent implicature deriving from that basic, literal meaning. In the absence of any contextual indication that I am referring to some definite time in the non-immediate past,  $T_r$  will here be interpreted as immediate past time. As the situations are states, not occurrences, use of the preterite does not entail that the state no longer obtains. And since there is nothing to suggest that the state has ended, the interpretation will be that the state also obtains at  $T_d$ , so that [39] conveys “I want to ask your advice”, “I wonder whether I can see you for a few minutes”. The added politeness associated with the preterite comes from avoiding explicit reference to the immediate present: I distance myself slightly and thus avoid the risk of appearing too direct, possibly brusque.

#### 4.3.3 The past futurate

The preterite can be used for arranged or scheduled situations located posterior to some time in the past, in what we are calling the futurate construction (§4.2.4):

- [40] i *Originally entries closed tomorrow, but they've decided to allow another week.*  
 ii *I was leaving for Sydney the next day so couldn't spend much time with them.*

The progressive, [ii], is used for the futurate as readily as in the present tense but

the simple preterite is very rare and generally of somewhat marginal acceptability: normally one would use a more explicit formulation such as *Originally, entries were due/scheduled/going to close tomorrow*.

A major reason why the simple preterite is so much less readily used in the futurate than the simple present is that the pragmatic constraints on the basic use of the simple present with dynamic situations do not apply with the simple preterite, as noted above. *The match starts on Tuesday*, for example, can't be used for a present time occurrence: it can only be a futurate (leaving aside the barely possible serial state interpretation). With *The match started on Tuesday*, however, there is nothing to block the basic meaning of the preterite, with the match starting in past time: if the past time applies to the arrangement rather than the starting, therefore, one will not normally associate the preterite with the verb *start* itself.<sup>34</sup> The past progressive futurate *The match was starting on Tuesday* does dissociate the preterite from *start* (so that the structure is more like that of *The match was due to start on Tuesday*, etc.), and the futurate interpretation is further facilitated by the fact that the basic meaning of progressive aspect is pragmatically very unlikely here.

#### 4.3.4 Non-deictic anteriority

The preterite expresses the relation  $T_r < T_o$ , with  $T_o$  non-past; normally  $T_o$  is identified as  $T_d$ , but it can also be some future time identified in a matrix clause. This has already been illustrated in [5i]; further examples are:

- [41] i *If you don't buy it you will soon regret that you missed such a bargain.*  
 ii *If you don't buy it you will soon envy the one who did.*

The missing in [i] and the buying in [ii] are here anterior to the (potential) future regret and envy, not to  $T_d$ . This is similar to the non-deictic use of the present tense to express simultaneity with a future  $T_o$ , as discussed in §4.2.6. The two cases are not completely parallel, however, in that the preterite is used in this way in a somewhat wider range of constructions than the present tense – notably in relative clauses, as in [41iii].

Note that we can replace *did* in [41ii] by *does*, but this does not change the temporal location of the situation. While preterite *did* indicates that the buying is anterior to the future envying, present tense *does* does not indicate that the buying is simultaneous with it; the present tense here conveys posteriority of  $T_r$  relative to  $T_o/T_d$ , so that the interpretation is to be accounted for by [34i] rather than [34ii].

## 5 Perfect tense

The secondary tense system contrasts the perfect, marked by **have** + past participle, and the non-perfect, which is unmarked. The perfect, marked analytically, and the preterite, marked inflectionally, constitute the two past tenses: they have it in common that in their basic meanings they both express the temporal relation of anteriority. This is seen most clearly in such examples as:

- [1] i *He wrote it last week.* [preterite]  
 ii *He is believed [to have written it last week].* [perfect tense]

<sup>34</sup>It nevertheless is quite possible if the context does exclude the basic past time meaning, as in *We had to get up very early because the train left at six*: what necessitated our getting up early can't have been the subsequent event itself but the fact that it was scheduled.

### 5.1 The perfect as a non-deictic past tense

In its basic use the preterite is usually interpreted deictically, locating  $T_r$  as anterior to  $T_o/T_d$ , i.e. as anterior to now. The perfect tense, by contrast, is normally non-deictic. Consider:

- [2] i *He was believed [to have written it the previous week].* [ $T_r < \text{past } T_o$ ]  
 ii *He is believed [to have written it last week]. (= [42ii])* [ $T_r < \text{present } T_o$ ]  
 iii *He hopes [to have written it by next week].* [ $T_r < \text{future } T_o$ ]

Here the past  $T_o$  in [i] is established by the preterite in the matrix clause, the present  $T_o$  in [ii] by the present tense in the matrix clause, and the future  $T_o$  in [iii] by the lexical properties of the verb *hope* (in combination with the adjunct *by next week*). The perfect tense itself expresses “ $T_r < T_o$ ”, and the temporal identification of  $T_o$  is given by the larger context; this latter aspect of the interpretation is discussed further in §7.

#### ■ Compound tenses

In order to bring out the contrast between preterite and perfect tenses most clearly, examples have been chosen where the perfect occurs in a clause lacking primary tense. When we combine the perfect with a primary tense, marked by the inflection on *have*, we have a compound tense expressing two temporal relations. We will use superscripts to distinguish the  $T_r$ - $T_o$  pairs related by primary and secondary tense:

- [3] i *At that time I had written two chapters.* [preterite:  $T_r^1 < T_o^1$ ; perfect:  $T_r^2 < T_o^2$ ]  
 ii *Now I have written four chapters.* [present:  $T_r^1 = T_o^1$ ; perfect:  $T_r^2 < T_o^2$ ]

The preterite perfect [i] locates the writing anterior to an intermediate time which is anterior to the time of speaking – it is doubly anterior. This interpretation derives from the combination of the meanings of the two past tenses as follows. The preterite (the primary past tense) indicates that  $T_r^1$ , the time specified more precisely by the adjunct *at that time*, is anterior to  $T_o^1$ , which is identified deictically as the moment of speaking. And the perfect (the secondary past tense) indicates that  $T_r^2$ , the time of writing, is anterior to  $T_o^2$ , which is identified non-deictically as  $T_r^1$ . ( $T_r^2$  is interpreted as the time of writing as a whole because the situation is dynamic, hence perfective.) Notice that there is no essential difference between this and an example like [2i], which is likewise doubly anterior. In both, the perfect locates the writing as anterior to some  $T_o$  which is identified via other features of the sentence as anterior to  $T_d$ ; the difference is that in [2i] the relevant other feature is the preterite marked on *was believed*, whereas in [3i] it is the preterite carried by *have* itself.

The present perfect [3ii] locates the writing anterior to the time of speaking – there is only one past tense here. But it is still non-deictic. The perfect again locates  $T_r^2$ , the time of writing, anterior to  $T_o^2$ ; this is not identified deictically as the time of speaking, but rather non-deictically as  $T_r^1$ , which the present tense locates as simultaneous with  $T_o^1/T_d$ . This is the major difference between the present perfect and the simple preterite, as in *I wrote four chapters*, which locates the writing anterior to  $T_o/T_d$  in a single step. The different temporal relations expressed in the preterite perfect, present perfect and simple preterite (assuming deictic primary tense in all cases) are shown schematically in [4]; the implications of the difference between present perfect and simple preterite are taken up in §5.3 below.

[4] i preterite perfect: <i>had written</i>	$T_r^2$	<	$T_o^2/T_r^1$	<	$T_o^1/T_d$	→
	writing		intermediate time		now	
ii present perfect: <i>has written</i>	$T_r^2$	<	$T_o^2/T_r^1 = T_o^1/T_d$			→
	writing		now			
iii simple preterite: <i>wrote</i>	$T_r$	<	$T_o/T_d$			→
	writing		now			

## 5.2 Complex anteriority: continuative and non-continuative perfects

An important difference between the two past tenses is that the perfect can locate  $T_r$  either wholly before  $T_o$  or as beginning before but extending forward to include  $T_o$ . Only the former possibility is available with the preterite. Compare:

[5]	NON-CONTINUATIVE ( $T_r$ wholly before $T_o$ )	CONTINUATIVE ( $T_r$ before and up to $T_o$ )
i	a. <i>He may <u>have told</u> her last week.</i>	b. <i>He may <u>have been</u> here ever since.</i>
ii	a. <i>He <u>told</u> her last week.</i>	b. <i>*He <u>was</u> here ever since.</i>

The case where  $T_r$  begins before but extends forward to  $T_o$  is called the **continuative** reading: the situation continues throughout that period. This is illustrated in [ib], where his being here covers a period beginning in the past and extending up to now. The deviance of [iib] shows that the preterite cannot be used for this meaning – only for the **non-continuative** reading where  $T_r$  is wholly before  $T_o$ , as in the [a] examples.

The temporal relation “ $T_r$  wholly before or before and up to  $T_o$ ” we will call **complex anteriority**; **simple anteriority** is the relation “ $T_r$  wholly before  $T_o$ ”. We can then say that the basic use of the perfect is to express complex anteriority with non-deictic  $T_o$ , while that of the preterite is to express simple anteriority with deictic  $T_o$ .

### ■ Non-continuative as default reading

The non-continuative reading of the perfect is much the more frequent, and can be regarded as the default one. The continuative reading virtually requires reinforcement by time adjuncts, such as *since* or *for* phrases (cf. *He has been ill for the last four days*):<sup>35</sup>

[6] i	<i>She <u>has lived</u> in Berlin ever since she married.</i>	[continuative]
ii	<i>She <u>has lived</u> in Berlin.</i>	[non-continuative]

In [i] the situation lasts from her marriage up to now (and in the absence of contrary indications will presumably continue into the future). In [ii] the absence of the duration adjunct (unless it is clearly recoverable from the context, as in response to the question *Where has she lived since she married?*) forces the non-continuative reading: her living in Berlin is said to have taken place at some indefinite time in the past. Notice, then, that

<sup>35</sup> The requirement is not absolute: *It's been very hot, hasn't it?* could be used in a context where it is still very hot, emphasising the duration of the heat. In many languages the perfect has only a non-continuative reading and translations of examples like [6i] will have simple present tenses.

a continuative reading has imperfective aspectuality, while a non-continuative one has perfective aspectuality.

### ■ Continuative restricted to atelic situations

A further restriction on the continuative perfect is that in the non-progressive it allows only atelic situations (ones without an inherent terminal point: §3.2.3):

- [7] i *He has lived here / visited her regularly ever since they met.*  
 ii *\*He has written another poem / found his keys again ever since he came home.*

In [i] we have two states, ordinary (living here) and serial (visiting her regularly); in [ii] an accomplishment (writing another poem) and an achievement (finding his keys again). Activities are possible (*He has talked non-stop ever since he arrived*), though the progressive would be somewhat more likely (especially without the *non-stop*: *He has been talking ever since he arrived*). Dropping the *ever* makes [ii] grammatical: an ordinary *since* phrase is compatible with a non-continuative reading, giving the period within which the occurrence is located. Examples like *She has lived in Berlin since then* are therefore ambiguous; the continuative reading is more salient, but the other is possible too (cf. *Since then she has lived in Berlin and Paris, as well as London*).

## 5.3 Present perfect vs the simple preterite

### 5.3.1 Present perfect as a compound tense

When primary tense combines with the perfect it gives the temporal location not of the situation itself but of the  $T_o$  that the situation (or the part of it referred to) is anterior to. With the preterite, this yields double anteriority, as noted above. Compare:

- [8] i *She went to work.* [preterite non-perfect]  
 ii *When he got up she had gone to work.* [preterite perfect]

In [i] her going to work is anterior to now, while in [ii] it is anterior to a time (the time when he got up) that is itself anterior to now. The motivation for the compound tense here is to relate the time of one situation to that of another. Consider now the present tense:

- [9] i *I promise to do it tomorrow.* [present non-perfect]  
 ii *I have promised to do it tomorrow.* [present perfect]  
 iii *I promised to do it tomorrow.* [preterite non-perfect]

Example [i] locates my promise as simultaneous with now, while [ii] locates it as anterior to now. But [iii] too locates it as anterior to now. The difference is that [iii] does so directly, whereas [ii] does so indirectly: the promise is anterior to a time which is simultaneous with now. Nevertheless, the end result, in terms of the temporal location of the promise, is the same (cf. diagram [4]). So what is the point of using a compound tense rather than the simple preterite?

The difference in meaning and use between the present perfect and the simple preterite reflects the fact that the former is a compound tense combining past and present, whereas the latter is a simple tense, just past. In the simple preterite  $T_d$  is involved only **passively**, as  $T_o$  in the anteriority relation  $T_r < T_o$ : here  $T_d$  is not here referred to, talked about. In the present perfect, however,  $T_d$  is **actively** involved: the primary tense is present, expressing the relation  $T_r^1 = T_o^1$ , so that  $T_d$  doesn't just identify  $T_o$  but is equated with

$T_r$ , and hence  $T_d$  is referred to, talked about, just as in the basic use of the simple present. With the simple preterite the focus is on the past situation (or, in the case of states, the past segment of it being talked about); with the present perfect the primary focus is on the present.

### ■ Past time adjuncts normally excluded from present perfect

The present perfect involves reference to both past and present time: it is concerned with a time-span beginning in the past and extending up to now. It is not used in contexts where the ‘now’ component of this is explicitly or implicitly excluded:

- [10] i *I saw her last week / two minutes ago.* [explicit exclusion of now]  
 ii *Who wrote ‘Moby Dick’?* [implicit exclusion of now]

Except under conditions outlined below, time adjuncts like *last week*, *two minutes ago*, etc., which refer to times wholly before now, are incompatible with the present perfect: we cannot replace *saw* by *have seen* in [i]. Example [ii] illustrates the case of past situation focus: the existence of ‘Moby Dick’, and hence the writing of it, is taken for granted, and the issue concerns a particular feature of the past situation, the identity of the writer. Compare *Who has written this note?*, which might be said in a context where the note has just been discovered, with the focus on its present existence.<sup>36</sup>

## 5.3.2 The experiential perfect

Grammars commonly distinguish four major uses of the present perfect: the **continuative**, the **experiential** (or ‘existential’) perfect, the **resultative** perfect, and the perfect of **recent past**. These can be thought of as a classification of the main ways in which the concept of a time-span up to now can be involved in the use and interpretation of the present perfect – or as different ways in which the past situation may have ‘current relevance’. The continuative has been dealt with already, and can be distinguished reasonably sharply from the non-continuative: compatibility with such expressions as *ever since* provides a criterion. The three categories within the non-continuative are not mutually exclusive, but they are useful nevertheless.

The experiential/existential perfect is seen in:

- [11] i *I’ve finally finished. We’ve now walked ten miles.*  
 ii *This is / That was the best meal I’ve had all week.*  
 iii *His sister has been up Mont Blanc twice.*

This use of the present perfect is concerned with the occurrence of situations within the time-span up to now. The connection with now is clearest and most direct when the completion of an accomplishment takes place at (or virtually at)  $T_d$ , as in [i]. The possibility of having present time adjuncts like *now* or *at present* shows clearly that we have present time meaning as well as present tense form. These bear some resemblance to continuatives – the walking ten miles, for example, has occupied a period up to now. However, they cannot take continuative adjuncts like *ever since* (\**We’ve*

<sup>36</sup>A special case of implicit exclusion is found in the use of the simple preterite for politeness/diffidence, as in *I wondered if I could see you for a moment* (§4.3.2). *Have wondered* could not be substituted here because it conveys (by virtue of the perfective aspectuality) that the wondering situation is over, which is the reverse of what I want to convey. (Progressive *have been wondering* is possible, however, because it has imperfective meaning.)

now walked ten miles ever since we started), and they are interpreted perfectly, not imperfectly.

The connection with now is also apparent in [11ii], illustrative of a common type involving superlatives or ordinal numerals (cf. *It's the first/third time you've said that today*). There is an actual or potential series of occurrences within the time-span up to now (with *first* only one is actualised, but there could have been more). In the *this* version of [ii] the meal is presumably still taking place, but it is nevertheless presented perfectly (progressive *I've been having* would be out of place), for the issue is its ranking in a series, which applies to it as a whole.

The connection with now is less direct in [11iii]: the ascents could be quite a long time in the past. The focus, however, is not on their occurrence at some particular time in the past but on the existence of the situation within the time-span. The connection with now is the potential for occurrence, or recurrence, of the situation at any time within the time-span up to now. Thus [iii] implicates that his sister is still alive, while *I haven't been to the market yet* implicates that the possibility of my going to the market still exists (it hasn't closed down).<sup>37</sup>

### ■ Experiential perfects vs simple preterites

Compare now the following pairs:

- [12] i a. *It is better than it has ever been.*                      b. *It's better than it was.*  
       ii a. *Have you seen Jim?*    b. *Did you see Jim?*

In [ia] the comparison is between its quality now and its quality at any time within the time-span – clearly the potential for it to be of such and such a quality still exists. In [ib] the comparison is between now and then; the past is contrasted with the present, the ‘then’ situation is over and excludes now.

Example [12iia] brings out the point that there may be limits to the time-span beyond those inherent in the situation itself. The inherent limit is that Jim (and you) must be alive, but in the salient interpretation I will have in mind a much shorter span than this: the time of his current visit to our vicinity, today, the period since we were last together, or whatever it might be. It would not be acceptable for you to answer *yes* on the strength of having seen him before this time-span. Whatever the limits on its beginning, however, the time-span stretches up to now. But [iib] is very different. Assuming again that you know Jim and have seen him perhaps many times, you need to determine more specifically what I am asking. This time, however, it is not a matter of placing limits on the start of the time-span up to now, but of finding which particular, definite past time I am asking about – your visit to Jim's sister last month, or whatever it might be, but a time that is over, exclusive of now.

### ■ Past time adjuncts in experiential perfects

This use of the present perfect allows for the inclusion, under restrictive conditions, of a past time adjunct:

- [13] i a. *He has got up at five o'clock.*                                      b. *He got up at five o'clock.*  
       ii a. *We 've already discussed it yesterday.*                              b. *We discussed it yesterday.*

<sup>37</sup>The implicature may be weaker: that the same **kind** of situation is still possible. *Nixon has been impeached*, for example, can still be acceptable even though Nixon has since died, given a context where the issue is the occurrence within the time-span of situations of the kind ‘impeachment of a president’.

In [ia] “at five o’clock” is a crucial part of the potentially recurrent situation: the issue is that of his getting up at this early hour; there is no reference to any specific occasion, as there is in the simple preterite [ib]. In [iia] the *already* indicates that I’m concerned with the occurrence of the situation of our discussing it within a time-span up to now and cancels the normally excluding effect of *yesterday* evident in [iib].

### 5.3.3 The resultative perfect

- [14] i *She has broken her leg. He has closed the door. They’ve gone away.*  
 ii *She’s been to the bank. She has run ten kilometres.*  
 iii *I’ve tried to phone her, but she’s not answering.*

The clearest cases of the resultative perfect are illustrated in [i], where the situation is one that inherently involves a specific change of state: breaking a leg yields a resultant state where the leg is broken, closing the door leads to the door’s being closed, going away (from place *x*) results in a state where one is no longer at place *x*, and so on. The connection with the present in this resultative use is that the resultant state still obtains now. *She has broken her leg* does not **mean** “Her leg is broken”, but this is the likely implicature unless the context selects an experiential interpretation. Cases like [i] are known more specifically as the perfect of **continuing result**: the resultant state begins at the time of occurrence of the past situation itself and continues through into the present.

Examples like [14ii] may be interpreted resultatively in a much vaguer sense. *Be*, as used here, means “go and return” and hence does not yield a resultant state “not at place *x*” as *go* does. A resultative interpretation of *She’s been to the bank* is thus not derivable directly from the meaning but is heavily dependent on pragmatics – it might be, for example, “She has some money”, but it could equally be “The cheques are deposited”, or whatever. Similarly there is no state resulting inherently from running ten kilometres, so an implicature like “She is tired” or “She is hot” is heavily dependent on context.

Example [14iii] illustrates the phenomenon of ‘nil results’, the failure to obtain the expected or intended result – in this example, that of making contact with her. In the broader sense that goes beyond case [i], the resultative is clearly not mutually exclusive with the experiential: [ii] and [iii] have both components in their interpretation – and similarly [13iia] is likely to have the resultative implicature “We don’t need to discuss it again”.

### 5.3.4 The perfect of recent past

- [15] i *It has been a bad start to the year, with two fatal road accidents overnight.*  
 ii *I’ve discovered how to mend the fuse.*  
 iii *She has recently/just been to Paris.*

One respect in which a past situation may be connected with now is that it is close in time to now. It is clear from examples like [11iii] (*His sister has been up Mont Blanc twice*) that it does not have to be recent, but there is nevertheless a significant correlation between the present perfect and recency, whereas the simple preterite is quite indifferent as to the distance between  $T_r$  and  $T_o$ . The present perfect is therefore the one most frequently used in news announcements, as in the radio bulletin example [15i]. It is arguable that the experiential and resultative categories are broad enough to cover all non-continuative uses, but recency adds an important component to the account. For example, [15ii] has a continuing result interpretation: the discovery resulted in my knowing how to mend the fuse and this knowledge persists. Such knowledge can persist for a long time, so there

is nothing in the idea of continuing result itself to exclude my having made the discovery years ago. But in fact the normal interpretation involves a recent discovery. We have noted that experiential perfects like [12iia] (*Have you seen Jim?*) impose limitations on the time-span up to now beyond those inherent to the situation, and these additional limitations also involve recency.

### ■ Adjuncts of recency

As illustrated in [15iii], the present perfect admits the adjuncts *recently* and *just*, which of course signal a perfect of recent past (when they are used deictically, in contrast to the non-deictic use in *She had recently/just been to Paris*). But recency as such is not sufficient to sanction a time adjunct: *\*I have seen him a minute ago* is no better than *\*I have seen him a year ago*. *Recently* and *just* do not refer to definite times in the past, but indicate an indefinite time within a short interval stretching back from their  $T_o$  (which in their deictic use is identified as  $T_d$ ). They are comparable, therefore, to expressions like *within the last few years*, where recency is not an issue, but which combine quite freely with the present perfect.<sup>38</sup>

## 5.4 Non-present perfects

The distinction between the present perfect and the simple preterite is neutralised elsewhere in the verbal system, so that when **have** carries any other inflection than the present tense the perfect may correspond to either a present perfect or a simple preterite. Compare, for example:

- [16] i a. *He has lost his key so he can't get in his room.* [present perfect]  
 b. *He had lost his key so he couldn't get in his room.* [preterite perfect]  
 c. *He seems to have lost his key so he can't get in his room.* [non-finite perfect]  
 ii a. *He lost his key while he was running home.* [simple preterite]  
 b. *He had lost his key while he was running home.* [preterite perfect]  
 c. *He seems to have lost his key while he was running home.* [non-finite perfect]

In [i] the non-present perfects *had lost* and *have lost* correspond to present perfect *has lost*, while in [ii] they correspond to the simple preterite *lost*. It does not follow, however, that the non-present perfects are ambiguous: it is rather that they are not subject to the restrictions and specialisation that apply to the present perfect (and which are attributable to the fact that it is in contrast with the simple preterite). In the case of the preterite perfect, for example, we have the temporal relations  $T_r^2 < T_o^2 / T_r^1 < T_o^1$ ; in [ib] the context suggests that the focus is on  $T_r^1$ , the intermediate point (when he was unable to get in his room because of the earlier loss of his key), whereas in [iib] the focus is on  $T_r^2$ , the time of losing the key, but both are special cases of a single more general meaning which is neutral as to focus on  $T_r^1$  or  $T_r^2$ .

<sup>38</sup>There are some relatively small-scale differences between AmE and BrE with respect to the choice between the present perfect and the simple preterite – cases where AmE may prefer a simple preterite where BrE prefers or requires a present perfect. One case concerns situations in the recent past, where *I just saw them*, for example, might be preferred in AmE, *I've just seen them* in BrE. Another case concerns the aspectual adjuncts *already* and *yet*: for discussion, see Ch. 8, §8.

## 5.5 Omissibility of the perfect

Under certain conditions the perfect may be omitted with little or no effect on the temporal interpretation. The construction to be considered here has the perfect in a subordinate clause following such prepositions as *after*, *as soon as*, or *before*:

- [17] i *She left after / as soon as / before he had spoken to her.* [perfect]  
 ii *She left after / as soon as / before he spoke to her.* [non-perfect]

The temporal relation between her leaving and his speaking to her is effectively the same in [ii] as in [i], being indicated by the preposition. In [ii] we have a single  $T_r$  in the subordinate clause, identified perfectly as the time of his speaking. In [i] there is reference to two times, with  $T_r^2$  the time of his speaking and  $T_r^1$  an intermediate point to which  $T_r^2$  is anterior. But there is no significant gap between  $T_r^2$  and  $T_r^1$ , so that it doesn't make any appreciable temporal difference whether the time of her leaving is specified in relation to one or the other.

The contrast between the perfect and non-perfect takes on more significance when  $T_{sit}$  is of relatively long duration, especially with *as soon as* and (to a lesser extent) *before*. Thus while the perfect is omissible in *She left the country as soon as she had completed her thesis* (with punctual  $T_{sit}$ ), it is not omissible in *She left the country as soon as she had written her thesis* (where the thesis-writing situation is too long to be compared with the country-leaving one). Similarly *She left the country before she had written her thesis* allows (and indeed suggests) that she had started writing when she left and is thus not equivalent to *She left the country before she wrote her thesis*, which indicates that the leaving preceded the whole of the thesis writing.

The perfect is also omissible in the gerund-participial complement of certain catenative verbs such as *regret*: see §7 below.

## 5.6 Scope of the perfect

There are three issues relating to the semantic scope of the anteriority expressed by the perfect that merit brief mention; two are discussed here, one in §9.8.

### (a) Multiple situations

- [18] i *Every time I've seen them, they've been drinking.* [ambiguous]  
 ii *Every time I see them, they've been drinking.* [unambiguous]

Example [i] has two interpretations: one where I've always seen them **after** they've been drinking, and one where I've always seen them **as** they were drinking. Example [ii] has only the first type of reading: I always see them after they've been drinking.

The ambiguity of [18i] can be seen as a matter of the scope of the anteriority relation expressed by the main clause perfect. In the first interpretation each drinking subsituation is anterior to the corresponding subsituation of my seeing them: we refer to this as a narrow scope reading since the anteriority applies just to the simple subsituation of their drinking. In the second, wide scope, reading, the anteriority applies to the complex subsituation of my seeing them as they are drinking. The wide scope reading is excluded in [ii] because the *see* clause is in the simple present tense.

(b) *Should/would like + perfect*

- |        |   |                           |
|--------|---|---------------------------|
| [19] i | <i>I should/would have liked to meet her.</i>     | [default version]         |
| ii     | <i>I should/would like to have met her.</i>       | [lowered <i>have</i> ]    |
| iii    | <i>I should/would have liked to have met her.</i> | [pleonastic <i>have</i> ] |

Constructions [ii] and [iii] are often used to convey the same meaning as [i]. We refer to [i] as the default version in that there is a single anteriority relation applying to the liking situation: **have** has scope over the following past participle, as usual. In [ii] **have** is syntactically in construction with **meet** while related semantically to **like**: **meet** is lower in the constituent structure than **like**, so we can think of **have** as having been ‘lowered’ into the complement of **like**. In [iii] the second **have** is pleonastic in that it does not express a second anteriority relation. Strictly speaking, [ii] and [iii] are ambiguous: they also have interpretations in which anteriority applies to the meeting. These interpretations are pragmatically somewhat unlikely in the examples chosen, but become more salient if we change *met her* to *finished it*: *I should like to have finished it* can mean “I should like to be in the situation of having finished it” (and such a normal scope interpretation is the only one available in *I should like to have finished it by the end of the week*).

## 6 Further uses of the past tenses

### 6.1 Modal remoteness

#### ■ Modal contrasts between preterite and present tense

In some constructions the preterite expresses modal rather than temporal meaning. Compare the preterite and present tenses in the following pairs of subordinate clauses:

- |     |  |   |
|-----|--|---|
| [1] | PRETERITE: PRESENT TIME                              | PRESENT TENSE: PRESENT TIME                         |
| i   | a. <i>I wish <u>he was here</u>.</i>                 | b. <i>I’m glad <u>he is here</u>.</i>               |
| ii  | a. <i><u>If he was here</u>, he’d be upstairs.</i>   | b. <i><u>If he is here</u>, he’ll be upstairs.</i>  |
| [2] | PRETERITE: FUTURE TIME                               | PRESENT TENSE: FUTURE TIME                          |
| i   | a. <i>I’d rather <u>you went tomorrow</u>.</i>       | b. <i>I bet <u>you go tomorrow</u>.</i>             |
| ii  | a. <i><u>If you went tomorrow</u>, you’d see Ed.</i> | b. <i><u>If you go tomorrow</u>, you’ll see Ed.</i> |

In each pair the time of the situation expressed in the subordinate clause is the same: present in [1], future in [2]. The difference is a matter of modality, of how the subordinate clause is presented with respect to its factuality, likelihood, and so on. We refer to clauses with a preterite tense expressing such modal meaning as **modal preterite clauses**. Normally, as in [1ia/1iia], preterite tense *was* is replaceable by irrealis mood *were*.

The interpretation of modal preterite clauses depends on the type of matrix construction containing them. The subordinate clause in [1ia] has a counterfactual interpretation: because of the meaning of *wish* we understand that he is not here. Example [1ib], with matrix *glad*, conveys that he is here, but *I think/hope he is here* leaves it open: the present tense is the default one, and covers both factual and various kinds of non-factual cases. In the conditionals in [1ii] we have a more direct contrast, since *if* can be used with either preterite or present tense. The difference is that [1iib] presents his being here as an open possibility, whereas [1iia] presents it as a remote possibility. Very often the preterite

is used when the subordinate proposition is known to be false, but it is not restricted to such cases. It is perfectly possible to say, for example, *I don't know whether he's here, but I doubt it: if he was here, he'd be upstairs.*

Where the time of the situation is future, as in [2], the difference between preterite and present tense is not quite so sharp. In [ia] the preterite can be seen as acknowledging the possibility that you won't go tomorrow: I'm expressing a mere preference, not an expectation, demand, or the like. In the conditional [2ii], the preterite version again presents the possibility of the condition being satisfied, of your going tomorrow, as more remote than the present tense version.

### ■ Remote and open conditional constructions

The most common use of modal preterite clauses is in conditional constructions. We refer to examples like [1ia] and [2ia] as **remote conditionals** and [1ib] or [2ib] as **open conditionals** – and we use **modal remoteness** as a label for the meaning of the preterite in all the above examples, a label general enough to cover all the more specific interpretations that we have illustrated. See Ch. 8, §14.2, for a fuller discussion of the difference in meaning between the two types of conditional construction.

The open conditional is the default type, while remote conditionals have the following properties:

- [3] i Subordinate clause: must contain a preterite (or irrealis *were*) expressing modal remoteness.  
 ii Matrix clause: must contain a modal auxiliary, in the preterite if possible.<sup>39</sup>

Open conditionals of course do not require a modal auxiliary in the matrix, but only those that do contain one have a remote counterpart. Consider, for example:

- [4] i *If you see Jill, tell her I'm waiting to hear from her.*  
 ii *If it rains, we're going to take a taxi.*  
 iii *If they are here, they're in the kitchen.*

In [i] the matrix clause is imperative, hence tenseless: very obviously, then, there is no possibility of changing to preterite tense to mark remoteness. In [ii–iii] the matrix clause has present tense, but does not contain a modal auxiliary: it is possible to switch tenses (*If it rained we were going to take a taxi; If they were here, they were in the kitchen*), but the result is not a remote conditional but an open one with changed time reference. We will develop this point further when we examine the meaning and use of **will**.

### ■ Modal remoteness in combination with past time reference

In the modal preterite clauses considered so far, the time of the situation has been present or future; when it is past, we need a preterite perfect:

- |     |   |   |
|-----|---|---|
| [5] | PRETERITE PERFECT: PAST TIME  | SIMPLE PRETERITE: PAST TIME   |
|     | i a. <i>I wish <u>I had accepted her offer.</u></i>                         | b. <i>I'm glad <u>I accepted her offer.</u></i>                     |
|     | ii a. <i><u>If it had come yesterday</u> he would surely have told her.</i> | b. <i><u>If it came yesterday</u> he will surely have told her.</i> |

<sup>39</sup>'If possible' in [ii] allows for the occurrence in the present tense of those modals like **must** which have no preterite form (cf. §6.2.1).

Again *wish* yields a counterfactual interpretation: I didn't accept the offer. Usually, past-time remote conditionals are also interpreted counterfactually: you are likely to infer from [iia] that it didn't come yesterday. But that cannot be part of the meaning actually expressed since, as in the present time case, it would be perfectly possible to say: *I don't know whether it came yesterday, but I doubt it: if it had come yesterday he would surely have told her.*

In the [b] examples in [5] the primary past tense, the preterite, has its basic use of expressing past time, but in [ia/iia] it serves to express modal remoteness and is therefore not available to locate the situation in past time. As a result, the secondary past tense, the perfect, has to be brought into service to fulfil this latter function. This is the one place where the perfect is interpreted deictically: it locates the accepting her offer and the coming as anterior to  $T_o$ , and  $T_o$  can only be identified as  $T_d$ .

### ■ Preterite perfects with a doubly remote interpretation

In [5ia/iia], we have noted, the preterite expresses modal remoteness and the perfect expresses temporal anteriority. With present and future time, it is possible for both past tenses to function modally yielding a (fairly rare) **doubly remote** construction. For conditionals we therefore have the following three-way contrasts:

- [6] i a. *If they are still alive they will be horrified.* [open: present time]  
 b. *If they were alive now they would be horrified.* [remote]  
 c. *If they had been alive now they would have been horrified.* [doubly remote]  
 ii a. *If they go tomorrow they will meet her son.* [open: future time]  
 b. *If they went tomorrow they would meet her son.* [remote]  
 c. *If they had gone tomorrow they would have met her son.* [doubly remote]

In [i] the difference between [b] and [c] is not very tangible: [ic] adds an extra dose of modal remoteness, as it were, but it still does not encode counterfactuality (cf. again, *I don't know whether they are still alive, but I doubt it: certainly, if they had been . . .*). In [ii] there is a sharper difference. Here [iic] is presented as counterfactual, in the sense that it conveys that they will not be going tomorrow. It suggests that the issue of their going tomorrow has already been decided negatively – for example, by virtue of their having gone already or of it having been arranged that they will go at some other time.<sup>40</sup>

The doubly remote preterite perfect is also found with other cases of the modal preterite:

- [7] i a. *I wish they were here now.* [remote: present time]  
 b. *I wish they had been here now.* [doubly remote]  
 ii a. *I'd rather you went tomorrow.* [remote: future time]  
 b. *I'd rather you had gone tomorrow.* [doubly remote]

<sup>40</sup>The doubly remote construction is not available for past time because the perfect construction is not recursive. The formal resources don't allow for more than two past tenses, and in [5ia/iia] the perfect is serving its basic function of expressing anteriority and hence cannot contribute to the expression of modal remoteness. Analogously, it is not possible to express double anteriority in the remote construction. The remote counterpart of open *If it had already died when she phoned, he will have told her* is *If it had already died when she phoned he would have told her*, where there is no difference in the form of the subordinate clause: since the preterite is being used modally we have only one anteriority relation expressed, the other being inferred from the *already*. Without the *already*, the example does not specify whether the death preceded or coincided with the phoning.

As with the conditionals, there is little discernible difference in the present time case, but a clear one with future time. Thus [iib] again conveys that it has already been settled that you won't be going tomorrow.

### ■ Formal marking of modal remoteness

We have been concerned so far with cases where modal remoteness is expressed by the same formal means, preterite tense, as the temporal relation of anteriority. There are three ways, however, in which the meanings may be differentiated.

#### (a) Irrealis *were*

With a 1st or 3rd person singular subject, irrealis *were* is often used instead of preterite *was*, especially in more formal style: *If he were/was less dogmatic we could solve the problem in no time*. This issue has been discussed in §1.7.

#### (b) *Be* + infinitival

There is one use of quasi-modal *be* that serves as a marker of the remote conditional construction, with *be* appearing in either preterite or irrealis form:

[8] *If she was/were to return now, we would be in real trouble.*

This is equivalent to *If she returned now, . . .*; quasi-modal *be* cannot occur in the open construction except with a quite different sense, so the only open conditional corresponding to [8] is *If she returns now, we will be in real trouble*.

#### (c) *Had* + *have*

Instead of an ordinary preterite perfect, a non-standard 'double perfect' is often found:

- [9] i <sup>1</sup>*If it had've come yesterday he would surely have told her.*  
 ii <sup>1</sup>*I wish he hadn't've left.*

This is largely restricted to speech (or the written representation of speech). It appears to be increasing in frequency, and though it is not as yet established as a standard form, it is used by many who in general speak standard English. From a grammatical point of view it is a curious construction in that *had* is followed by a plain form, not a past participle; it is normally reduced to /əv/, and in writing is sometimes spelled *of*, indicating that it is not perceived as a form of *have*.<sup>41</sup>

## 6.2 The backshifted preterite

### 6.2.1 Backshifted preterite vs ordinary preterite

The third major use of the preterite is in backshifting:

- [10] i *I have too many commitments.* [original utterance: present tense]  
 ii *Jill said she had too many commitments.* [backshifted report: preterite]

We are concerned with [ii] in the interpretation where it reports Jill's prior utterance of [i] – or of any other sentence expressing that proposition, for this kind of report purports to give the content of what was said, not the actual wording used. In [i] *have* is in the present tense, whereas in [ii] it is in the preterite: the term **backshifted**

<sup>41</sup>A further non-standard variant has *would have*: <sup>1</sup>*If it would have come yesterday he would surely have told her*. Very often, however, the first verb is reduced to 'd and it is then unclear whether this is to be taken as a reduced form of *would* or of *had*: *if she'd have done it is ambiguous*.

**preterite** is intended to suggest this change from an original present to a preterite. We retain the traditional terminology for its mnemonic value, but emphasise that backshift is not conceived of here as a syntactic process: we are not proposing that *had* is syntactically derived by changing the present tense of an underlying *have* into a preterite. The issue to be considered is simply what the preterite means in this construction.

### ■ Why backshift involves a special use of the preterite

The first question we need to ask is why backshift cannot be subsumed under the basic use of the preterite. After all, no one says that *she* has some special use or meaning in [10ii]: it is used in the same way as in the main clause *She had too many commitments*, namely in definite reference to some contextually identifiable female. Why can't we say, similarly, that the preterite in *had* is used in its ordinary way, again as in *She had too many commitments*, to locate  $T_r$  as anterior to  $T_o/T_d$ ? Given its context, this  $T_r$  would be identifiable, more specifically, as the time when Jill said [i].

There are two reasons why such an account would not work, why we need to recognise a backshifted preterite as distinct from an ordinary one.

#### (a) Backshifting within the scope of a modally remote preterite

- [11] i *If he knew she had too many commitments, he would do something about it.*  
 ii *I wish he realised that she had too many commitments.*

Example [i] is a remote conditional, with the preterite in *knew* expressing modal remoteness, not past time: the time of knowing is present. So too (certainly in the salient interpretation, the one we are concerned with here) is the time of her having too many commitments: it is a matter of knowing in the present about a situation obtaining in the present. And the same applies to the *wish* construction [ii]. In both, therefore, we have the preterite form *had* even though there is no reference at all to past time: this cannot represent the ordinary use of the preterite. Nor would it be valid to subsume the preterite in *had* in these examples under the modal remoteness use which applies to the matrix clause preterite verbs *knew* and *realised*. For clearly the unlikelihood in [i] and the counterfactuality in [ii] apply to his knowing/realising but not to her having too many commitments. There is no modal remoteness meaning attaching to *had*, for, certainly in [ii], you will in fact infer that she does have too many commitments. From a semantic point of view, therefore, the preterite carried by *have* must be distinguished from that carried by *know* or *realise*, and this distinction is reflected in the grammar in that irrealis *were* is not substitutable for *was* in this construction: *If he knew she was<sup>#</sup>were too busy, he would do something about it; I wish he realised that she was<sup>#</sup>were too busy.*

#### (b) Acceptability of present tense forms of modal auxiliaries

- [12] i *We knew we must leave by noon yesterday to have any chance of catching her.*  
 ii *She said I ought to invite them both, but I didn't take her advice.*

The modals *must* and *ought* have no preterite forms, and hence cannot occur with the past time meaning associated with the preterite: examples like <sup>#</sup>*We must leave by noon yesterday, so we did* and <sup>#</sup>*I ought to invite them both but I didn't* are nonsensical. They can appear in the present tense in examples like [12], however, which would require a preterite if one were available: compare *We knew we had<sup>#</sup>have to leave by noon yesterday;*

*She said I was<sup>#</sup>am morally obliged to invite them both, but I didn't.* We can account for the acceptability of [12] by allowing that with verbs having only present tense forms these forms can occur where otherwise a backshifted preterite would be needed. But this of course requires that we draw a distinction between a backshifted preterite and an ordinary one.

### ■ Conditions for backshift

A backshifted preterite can occur when either of the following conditions obtains:

- [13] i The **tense** of the matrix clause is past.  
 ii The **time** of the matrix clause situation is past.

The reference to past tense in [i] allows for backshifting after a perfect as well as after a preterite:

- [14] *I have never said she had too many commitments.*

In the great majority of cases, the two conditions in [13] are satisfied jointly, as in [10ii], but either alone is sufficient:

- [15] i *I wish he realised that she had too many commitments.* [satisfies [13i]]  
 ii *I remember telling him that she had too many commitments.* [satisfies [13ii]]

In [15i] (repeated from [11]) the matrix clause has a past tense (*realised*), but the time is present; in [15ii] the matrix clause, with *telling* as its verb, has no tense (it is non-finite) but the time of the telling is understood as past by virtue of properties of *remember*, and this is sufficient to sanction backshift in the *have* clause.<sup>42</sup>

### ■ Backshifting of an 'original' preterite

In the examples so far, the 'original utterance' has been in the present tense; when it is in the preterite, the backshifted construction has a preterite perfect:

- [16] i *I had too many commitments.* [original utterance: simple preterite]  
 ii *Jill said she had had too many commitments.* [backshifted: preterite perfect]

### ■ Meaning of the backshifted preterite

The backshifted preterite represents a distinct use of the preterite that differs in meaning from a preterite in its primary use. Compare, for example:

- [17] i *She had too many commitments.* [ordinary preterite]  
 ii *Jill said she had too many commitments.* (= [10ii]) [backshifted preterite]

Ordinary preterites are normally deictic: [i] locates  $T_r$  as anterior to a  $T_o$  that is identified with  $T_d$ , here the time of speaking. But a backshifted preterite is non-deictic: it indicates that  $T_o$  is identified by the matrix clause. In [ii], therefore, the  $T_r$  for the *have* clause is simultaneous with a  $T_o$  identified as the time of Jill's utterance. Given that the latter is in the past, we end up with the same result as for [i], namely that  $T_r$  is anterior to the time of my utterance. However, we end up with this result via a different and more complex route than in [i]. And examples like [15i] show that the end result is not always the same

<sup>42</sup> Again, the possibility of having *must* here shows that the *had* of [15ii] is a backshifted preterite, not an ordinary one: *I remember telling him that we must leave by noon yesterday.*

as with an ordinary preterite, because in [15i] the time referred to in the matrix clause is present, not past.

Let us examine the difference more precisely. We have seen that two factors are involved in locating  $T_r$ : (i) the relation between  $T_r$  and  $T_o$ ; (ii) the identification of  $T_o$ . The values of these variables are different for the two kinds of preterite in [17]:

[18] i Ordinary preterite ([17i])	(i) $T_r < T_o$	(ii) $T_o$ is non-past
ii Backshifted preterite ([17ii])	(i) $T_r = T_o$	(ii) $T_o$ is past

In the ordinary use, the anteriority expressed by the preterite is a matter of relation (i); there is no anteriority in (ii), where the more specific interpretation, applying in [17i], identifies  $T_o$  with  $T_d$ . In a backshifted case like [17ii], by contrast, the anteriority expressed by the preterite is a matter of (ii), with the past  $T_o$  identified by the past  $T_r$  of the matrix *say* clause. In the backshifted use the relation between the subordinate  $T_r$  and its  $T_o$  is not directly expressed by the preterite. Thus (i) in [18ii],  $T_r = T_o$ , is not part of the meaning of the preterite here: it is a default value arising from the **absence** of any expression of anteriority.<sup>43</sup> When anteriority **is** expressed, by the perfect, as in [16ii], we have:

[19] Backshifted preterite + perfect ([16ii])	(i) $T_r < T_o$	(ii) $T_o$ is past
---	-----------------	--------------------

The perfect is required here for the same reason as in past time remote conditionals (§6.1): the primary past tense is not being used to express the anteriority relation  $T_r < T_o$ , and hence the secondary past tense has to be introduced for that purpose. And for [15i] we have:

[20] Backshifted preterite ([15i])	(i) $T_r = T_o$	(ii) $T_o$ is present
------------------------------------	-----------------	-----------------------

(i) again has the default value  $T_r = T_o$ , and  $T_o$  is again identified by the  $T_r$  of the matrix *realise* clause, but since the latter is present, the combination of factors (i) and (ii) here yields a present time situation. The fact that backshift applies even when the matrix clause identifying the  $T_o$  has preterite form without past time reference shows that backshift is a grammatical phenomenon, akin to agreement: the *had* here agrees in tense with the verb of the matrix clause without there being any strictly semantic motivation for its preterite form.

### ■ Backshift not confined to indirect reported speech

We introduced the concept of a backshifted preterite with an example involving indirect reported speech, [10]. It is important to emphasise, however, that the backshifted preterite is used much more generally than in reported speech. Compare:

- [21] i *This meant that Jill had too many commitments.*  
 ii *That Jill had too many commitments was undeniable.*

### ■ Conversion to indirect reported speech not a matter of grammatical rule

There is a second respect in which we must beware of being misled by the traditional account associating backshift with indirect reported speech. The term ‘backshift’ may suggest an operation performed on the ‘original’ utterance to convert it into indirect reported speech – with, for example, Jill’s original *have* becoming *had* when I report her utterance. Converting into indirect reported speech, however, is not a matter of applying

<sup>43</sup>The relation can equally be that of posteriority when the corresponding present tense of the ‘original utterance’ has a future interpretation: compare *I’ll stay until you are better* with *I said I’d stay until you were better*, where *were* is interpreted as posterior to the past  $T_o$  defined by the  $T_r$  of *said*.

**rules of grammar** that are specific to this purpose. When I make an indirect report of Jill's speech, I purport to give the content of what she said – as opposed to quoting the actual wording, which is direct reported speech. In [10], the content of Jill's utterance [i] is the proposition “I [sc. Jill] have too many commitments”, and hence my report must also express this proposition. But leaving aside the issue of the tense, the way I express this proposition is just the same as if I were expressing it quite independently of her utterance. The subject could be *Jill, she, you* (if I am talking to Jill), *I* (if it is Jill who is talking), and so on: as remarked above, there is nothing special about the use of *she* in [10i]. What is special about the tense is that it is non-deictic:  $T_o$  is identified not with the reporter's  $T_d$  but with the original speaker's, and the preterite encodes this anteriority of  $T_o$ .<sup>44</sup> We have seen that backshift extends far beyond reported speech, as illustrated in [21], where there is no ‘original speech’ to convert. What [21i–ii] have in common with our initial example [10ii] (*Jill said that she had too many commitments*) is that the preterite tense of the content clause is non-deictic, taking its  $T_o$  from the matrix clause rather than immediately from  $T_d$ . This is how backshift is to be interpreted, not as converting one tense into another.

### ■ Non-subordinate backshift

Backshift normally occurs in subordinate clauses under the conditions given in [13], but it can also be found in main clauses as a literary device for representing thoughts or interior monologue:

- [22] i *Would she be home before he left, she wondered.*  
 ii *Max was getting more and more anxious. What could have happened to her? Would she be home before he left? Ought he to contact her mother?*

Example [i] illustrates the case where the reporting verb is parenthetical: *would she be home before he left* is therefore syntactically a main clause, not a complement of *wonder*. Example [ii] illustrates what is often called ‘free indirect speech’, an essentially literary device for representing thoughts or interior monologue without any overt reporting verb at all (cf. Ch. 17, §10.2). The backshift itself (alone or in combination with other features) signals the adoption of a non-deictic  $T_o$ ; note that the appearance of present tense *ought* in [ii] shows this to be just like the ordinary, subordinate, type of backshift construction.

## 6.2.2 Obligatory vs optional backshifting

### ■ A backshifted preterite may be pragmatically equivalent to a present tense

Very often, the use of a backshifted preterite is optional. Jill's *I have too many commitments* may be given in indirect reported speech in two ways:

- [23] i *Jill said she had too many commitments.* [backshifted: preterite]  
 ii *Jill said she has too many commitments.* [non-backshifted: present tense]

Corresponding to the original present tense we have a preterite in [i] but a present tense in [ii]. The two reports do not have the same meaning, but in many contexts the difference

<sup>44</sup>With the modals *must, ought*, etc., in examples like [12], the anteriority of  $T_o$  cannot be formally expressed, but is pragmatically inferred.

between them will be of no pragmatic significance. The difference is that in [i] the  $T_r$  for the *have* clause is simultaneous with the  $T_o$  identified as the time of Jill's utterance, whereas in [ii] it is simultaneous with a  $T_o$  identified as the time of my utterance. But suppose Jill's utterance took place quite recently and there has been no change in her circumstances between then and now: in this context, if she had too many commitments then, she will still have too many commitments now, and the change in  $T_o$  will not affect the validity of the report in any way.

#### ■ Four types of 'original utterance'

The options for reporting the two simple primary tenses and the two compound tenses are as follows:

[24]	ORIGINAL	BACKSHIFTED	NON-BACKSHIFTED
i	<i>I <u>am</u> ill.</i>	<i>She said that she <u>was</u> ill.</i>	<i>She said that she <u>is</u> ill.</i>
ii	<i>I <u>broke</u> it.</i>	<i>She said that she <u>had broken</u> it.</i>	<i>She said that she <u>broke</u> it.</i>
iii	<i>I <u>have seen</u> it.</i>	<i>She said that she <u>had seen</u> it.</i>	<i>She said that she <u>has seen</u> it.</i>
iv	<i>I <u>had left</u>.</i>		<i>She said that she <u>had left</u>.</i>

With an original preterite perfect (case [iv]), there is no possibility of a backshifted version: it would require a combination of three past tenses, which is beyond the formal resources available. In the other three cases, however, backshifting is always possible, and constitutes the default option; it provides, strictly speaking, a more faithful report in that it uses the same  $T_o$  as the original speaker.

#### ■ Backshift with a complex original utterance

When the original utterance is complex, with a primary subordinate clause embedded in a main clause, the options are as shown in:

[25]	i	<i>I <u>am</u> leaving before he <u>returns</u>.</i>	[original utterance]
	ii	<i>She said she <u>was</u> leaving before he <u>returned</u>.</i>	[backshifted + backshifted]
	iii	<i>She said she <u>was</u> leaving before he <u>returns</u>.</i>	[backshifted + non-backshifted]
	iv	<i>She said she <u>is</u> leaving before he <u>returns</u>.</i>	[non-backshifted + non-backshifted]

It is not possible, however, to have non-backshifted + backshifted (\**She said she is leaving before he returned*): once one has exercised the option of selecting a deictic tense, the option of selecting a non-deictic, backshifted, one is no longer available. Thus if there is more than one level of embedding, as when the original utterance is *I'm sorry I'm leaving before he returns*, we can have a backshifted preterite corresponding to all three present tenses, the first two or just the first one, but these are the only possibilities.

#### ■ Condition on use of deictic rather than backshifted tense

In the non-backshifted type of report, I use a deictic tense, taking  $T_o$  from my own utterance rather than the original one. This is subject to the following pragmatic condition:

[26]	It must be reasonable to assume that the temporal relation between the situation and the reporter's $T_d$ is the same as that between the situation and the original $T_d$ .
------	--

A deictic, non-backshifted, report indicates that the original utterance (or belief, etc.) is still applicable and relevant.

Consider the following examples with respect to condition [26]:

- [27] i a. *Jill said she had/has a weak heart.*  
       b. *Jill said she had/has a headache.*  
       ii a. *Jill said the payment was/is due next week.*  
        b. *Jill said the payment was/is due on Tuesday.*

Deictic *has* will be much more widely appropriate in [ia] than in [ib] because having a weak heart can be assumed to last much longer than having a headache. Jill's utterance needs to have been quite recent for *has* to be appropriate in [ib], whereas it could be quite distant in [ia] – provided she hasn't died. The 'original' present tense in [ii] had future time reference. In [iia] the condition for the use of deictic *is* is satisfied because the (alleged) payment date is future relative to my utterance as well as to Jill's. Whether *is* is appropriate in [iib] depends on the time reference of *Tuesday*: *is* is appropriate if the reference is to the Tuesday following my report, but not if it is to a Tuesday falling between Jill's utterance and mine – compare *Jill said the payment was due yesterday*, where a backshifted preterite is obligatory.

### ■ Factors affecting choice between backshifted and non-backshifted versions

Where condition [26] is satisfied, both backshifted and non-backshifted versions are in principle possible. A number of factors are relevant to the choice between them:

#### (a) Reporter's attitude to the content

If I endorse or accept the original, this will somewhat favour the deictic present version, and conversely if I reject it this will favour backshift:

- [28] i *She said she doesn't need it, so I'll let Bill have it.* [accepted: non-backshifted]  
       ii *She said there was plenty left, but there's hardly any.* [rejected: backshifted]

But the opposite combinations certainly cannot be excluded: *She said it's illegal, but I'm sure it's not* (rejected, but non-backshifted), *She said it was excellent, so why don't we go?* (accepted, but backshifted).

#### (b) Indication of deictic future

Consider the following reports of *I'm leaving at the weekend*, where the situation is in future time:

- [29] i *She said she was leaving at the weekend.* [backshifted]  
       ii *She said she's leaving at the weekend.* [deictic]

If there has been a week-end between the original utterance and the report, [ii] is excluded because it does not satisfy condition [26]: the week-end referred to is posterior to the original but anterior to the report. But if no week-end has intervened, [ii] will be more informative than [i] precisely because it indicates that the time of leaving is still in the future. If this information is not readily retrievable from elsewhere, [ii] is likely to be favoured.

#### (c) Focus on original

If the focus is on the original utterance or belief, with a contrast between 'then' and 'now', this will favour the backshifted version:

- [30] *I thought it was mine.* [backshifted]

One context for this is where it has just been established that it **is** mine: *thought* would here be strongly stressed, indicating a contrast between past thinking and present knowing (of the same proposition). Another context is where it has just been established (or claimed) that it is not mine: here the contrast is between what I thought in the past and what is known/claimed in the present. In either case the past time location of the thinking is foregrounded, focused, and this favours the backshifted version, preserving the original  $T_0$ : deictic *is* would hardly be possible here.

#### (d) Present perfect reporting clause

The present perfect focuses on the present rather than the past (§4.3), and tends therefore to favour the non-backshifted version, using a present  $T_0$ . Compare the following reports of *I can't afford it*:

- [31] i *She said she couldn't afford it.* [simple preterite report: backshifted]  
 ii *She has said she can't afford it.* [present perfect report: non-backshifted]

The reverse pairings are of course possible, but those shown in [31] are the most frequent.

#### (e) Simplification

Where the original utterance or belief is in the present tense, the backshifted and non-backshifted versions differ merely in primary tense, preterite vs present. But where the original is in the simple preterite they differ as preterite perfect vs simple preterite, i.e. as compound vs simple tense. In this case the non-backshifted version may be preferred precisely for its greater simplicity. Note that condition [26] will always be satisfied with an original simple preterite: if the situation was anterior to the original utterance, it will also be anterior to the report. Both backshifted and non-backshifted versions will therefore always be available. It is doubtful whether either of them can in general be regarded as the default version: it depends on the nature of the situation. Consider:

- [32] i *She asked me where I was / had been born.*  
 ii *She said she wrote / had written it herself.*  
 iii *She said she loved / had loved him when she was at college.*  
 iv *She said she loved / had loved him.*

In [i] *was* cannot be interpreted as a backshifted preterite: it can be assumed that she did not ask, *\*Where are you born?* In [ii], assuming that the *write* situation is a single occurrence, not a serial state, *wrote* will again not be interpretable as backshifted: non-serial (perfective) *I write it myself* is too unlikely. Similarly in [iii], assuming that the *when* adjunct modifies *love*, not *say*: *I loved him when I was at college* is very much more likely as the original than is *I love him when I am at college* (with the implicature of “then, but not at other times”). In none of these cases, then, is the preterite perfect necessary in order to ensure the intended temporal interpretation – and the principle of simplification is likely to favour the non-backshifted version with the simple preterite. In [iv], however, the subordinate situation is a state, and there is no temporal adjunct: in the absence of any counter-indications from the context the version with *loved* will be interpreted as a report of *I love him*. If it is intended to report *I loved him*, it will therefore be necessary to use the backshifted preterite perfect *had loved*.

### 6.3 Primary vs secondary past tense

We have been referring to the preterite and the perfect as respectively primary and secondary past tenses; there are three reasons for distinguishing them in this way.

#### (a) Relation to $T_d$

In languages in general, tense systems prototypically locate  $T_r$  relative to  $T_o/T_d$ , i.e. they are deictic, and we have seen that the English preterite is most often interpreted in this way, whereas the perfect is generally non-deictic. The preterite is thus a clearer instance of a tense than is the perfect. Moreover, when they combine in the preterite perfect to express double anteriority, it is the preterite that encodes the first move back from  $T_d$ , while the perfect encodes a further move back beyond that: the primary/secondary contrast has been shown in our notation by the superscript numerals, as in [44–45] of §5.

#### (b) Degree of grammaticalisation

The primary tense system is more highly grammaticalised than the secondary one. One obvious reflection of this is that it is marked inflectionally rather than analytically. The perfect marker *have* is a member of the small closed class of auxiliary verbs, so that the perfect can properly be regarded as a grammatical category, but analytic marking of this kind represents a lesser degree of grammaticalisation than inflection. No less important, however, is the fact that the preterite is in contrast with another tense, the present, whereas the perfect merely contrasts with its absence. The present perfect and the preterite perfect are compound tenses (involving two  $T_r-T_o$  relations), whereas the present non-perfect and the preterite non-perfect are simple tenses (involving a single  $T_r-T_o$  relation): non-perfect is not a tense. The present tense is distinct from the absence of primary tense (*She is / They are ill vs She is / They are believed to be ill*), but there is no such distinction with secondary tense. A third factor commonly involved in grammaticalisation is discrepancy between form and meaning: highly grammaticalised elements tend to develop uses which depart from their core meaning. The preterite is used for modal remoteness and to indicate backshift as well as with its core meaning of locating  $T_r$  anterior to  $T_o$ , whereas the perfect is almost restricted to this latter use.

#### (c) Anteriority expressed by the perfect when the preterite not available

We have noted that when the preterite is used for modal remoteness or in backshift (to locate  $T_o$ ), the perfect takes over the role of expressing the anteriority of  $T_r$  relative to  $T_o$ : see [16]. It similarly has this role in non-finite clauses, which lack primary tense altogether: compare finite *He died in 1806* with non-finite *He is believed to have died in 1806*.

## 7 Temporal interpretation of constructions without primary tense

In general, the concept of  $T_r$  is relevant to the interpretation of tenseless constructions as well as tensed ones. Suppose I say *Please open the window*, for example. This is an imperative clause with *open* a tenseless form of the verb – a plain form. The (potential) opening of the window, however, is not timeless: you will understand, in the absence of indications to the contrary, that my intention is for you to open the window in the immediate future, i.e. the time just following my utterance. In this case, the interpretation is linked to the imperative form of the clause.

It is not necessary to survey all kinds of constructions containing non-tensed verbs: the main issues can be seen by considering briefly just two, non-finite clauses functioning as complement to catenative verbs or as modifier in NP structure.

### ■ The catenative construction

- [1] i *I remembered* [going to Sydney at Christmas]. [ $T_r < T_m$ ]  
 ii *I enjoyed* [going to Sydney at Christmas]. [ $T_r = T_m$ ]  
 iii *I intended* [going to Sydney at Christmas]. [ $T_r > T_m$ ]

The bracketed gerund-participial is complement of the preceding verb, which belongs to the class we have called catenatives (cf. §2.2 above). In [i] we understand the time of my going to Sydney to be anterior to the time of remembering. The time of remembering is the time referred to in the matrix clause, the one in which the non-finite clause is embedded. We call this **matrix time**, symbolised  $T_m$ , while  $T_r$  is the time referred to in the clause under consideration, the gerund-participial. The annotation on the right thus says that the  $T_r$  for the *go* clause is anterior to the matrix time. In [ii], the time of going and the time of enjoying are simultaneous, while in [iii] the time of going is posterior to  $T_m$ , the time referred to in the *intend* clause.

Because the *go* clause is tenseless it does not itself express any relation between its  $T_r$  and some  $T_o$ . Rather, the  $T_r$  is related directly to the matrix time, and the different interpretations of [33i–iii] are attributable to the semantic properties of the matrix verbs *remember*, *enjoy*, and *intend*. Catenative verbs may thus be classified according to the temporal interpretation that they permit for their complement. A sample of such a classification is given in [2], with examples in [3]:

- [2] i Class 1: anterior            *forget<sub>1</sub>*    *recall*    *recollect*    *remember<sub>1</sub>*  
 ii Class 2: anterior or        *admit*    *deny*        *regret*        *resent*  
    simultaneous  
 iii Class 3: simultaneous    *begin*    *believe*    *like*        *seem*  
 iv Class 4: simultaneous or    *may*        *must*        *need*        *will*  
    posterior  
 v Class 5: posterior            *aim*        *intend*    *propose*    *want*
- [3] i Class 1            *I remember* telling you about it. } [ $T_r < T_m$ ]  
 ii Class 2            a. *He resents* her taking the car while he was out. }  
    b. *He resents* not having access to his own file. }  
 iii Class 3            *She is believed* to be in hiding. } [ $T_r = T_m$ ]  
 iv Class 4            a. *She may be* his sister. }  
    b. *She may* abdicate. }  
 v Class 5            *She wants* to finish it when you return. } [ $T_r > T_m$ ]

*Forget<sub>1</sub>* and *remember<sub>1</sub>* take gerund-participial complements, and are to be distinguished from *forget<sub>2</sub>* and *remember<sub>2</sub>*, which take infinitivals and belong to Class 3 (*I forgot to turn off the oven*). With Class 2 verbs, the choice between anterior and simultaneous interpretations depends on the aspectuality of the complement clause. In [3ii], for example, the *take* clause in [a] is perfective, while the *have* clause in [b] is imperfective.

If the matrix time is present, a complement interpreted as simultaneous is generally subject to the pragmatic constraints on perfective situations that apply to the present tense:

- [4] i I do ‘The Times’ crossword. (= [9] of §4) [present habitual]  
 ii He seems to do ‘The Times’ crossword. [present habitual]  
 iii He may do ‘The Times’ crossword. [present habitual or future]

We noted in §4.2.1 that [i] normally requires a serial state (habitual) imperfective reading, resisting a singular (dynamic) perfective one, and the same applies to the infinitival clause of [ii]. *Seem* belongs to Class 3, with  $T_r = T_m$ , and since *seem* is here in the present tense the tenseless *do* of its complement is interpreted like a present tense. *May* belongs to Class 4, and in the interpretation where the complement time is simultaneous with the matrix time, the *do* will again be interpreted as habitual: “It may be that he does ‘The Times’ crossword”. In the interpretation where the complement time is posterior to the matrix time the constraint does not of course apply, and [iii] can be interpreted with a singular doing of the crossword in future time.

There is a slight blurring of the distinction between simultaneous and posterior interpretations in two cases, illustrated in:

- [5] i I can’t understand them leaving tomorrow.  
 ii I desperately want this card to be an ace.

*Understand* belongs to Class 2, but what is simultaneous with the matrix time in [i] is not the leaving itself but the schedule or arrangement for them to leave: [i] is comparable to *I can’t understand why they leave tomorrow*, where *leave* is a present tense with a futurate interpretation. (Alternatively, the finite construction could have a progressive: *why they are leaving*.) *Want* in [ii] we have assigned to Class 5, but one might argue that the time of the card being (potentially) an ace is now; what lies in the future is of course the revelation as to whether it is an ace or not.

### The perfect auxiliary *have*

Most but not all catenative verbs allow their non-finite complement to be headed by the perfect auxiliary *have*. Thus we can have *He seemed to have offended them* but not \**He began to have offended them*, or again *I expected him to have finished by six*, but not \**I made him have finished by six*. With *begin* and *make* the matrix and subordinate situations are not temporally separable, so that the latter cannot be marked as anterior to the former by means of the perfect construction.

Where the non-finite complement does have perfect *have* as its verb, the semantic properties of the catenative verb again play a role in determining the temporal interpretation. Compare:

- [6] i He resents [her having taken the car while he was out]. }  $[T_r < T_o; T_o = T_m]$   
 ii She is believed [to have been in hiding]. }  
 iii She wants [to have finished it when you return].  $[T_r < T_o; T_o > T_m]$

$T_r$  in the annotations is the time referred to in the underlined past-participial clause; the perfect, as we have seen, locates this  $T_r$  as anterior to some  $T_o$ . The properties of the catenative verb then locate this  $T_o$  with respect to the matrix time. Here there are only two possibilities, not the three of [1] or [3]: the  $T_o$  is simultaneous with  $T_m$  in [6i–ii], posterior to it in [6iii]. Note, then, that there is no temporal difference between [6i] and [3iia]: in both, the time of her taking the car is anterior to the time of the *resent* clause (which is simultaneous with  $T_d$ , the time of utterance). Catenative verbs of Class 4 or 5, however, allow the perfect to locate the past-participial time as posterior to the matrix

time, as in [6iii]. Here, in contrast to [3v], the finishing (if her want is fulfilled) will be anterior to your return.

### ■ Non-finite clauses functioning as modifier in NP structure

In the following gerund-participials the time associated with the underlined verb is interpreted relative to  $T_d$ , the time of utterance:

- [7] i *Just about anyone living in the area at that time is at risk.* [ $T_r < T_d$ ]  
 ii *The guy sitting next to your wife was on television last night.* [ $T_r = T_d$ ]  
 iii *Anyone misbehaving at tonight's meeting won't be invited next week.* [ $T_r > T_d$ ]

In [i] the adjunct *at that time* will be understood in context as referring to some time in the past, and that is the time of the living: “anyone who lived in the area at that time”. The salient interpretation of [ii] is that the guy is sitting next to your wife now, at the time of speaking. And in [iii] it is a matter of misbehaving on some future occasion, the meeting to be held tonight. Such examples bring out clearly the tenseless nature of the gerund-participial: the verb itself gives no indication of the location of  $T_r$ , which is determined by other elements in the sentence or by the context. Very often the participial  $T_r$  is simultaneous with  $T_m$  (as in *The guy sitting next to you at lunch looked very frail*; *Some of those waiting outside are showing signs of impatience*; etc.), but this is not so in any of the examples in [7]. Given that the verb leaves quite open the location of  $T_r$ , one needs to be able to retrieve it from elsewhere, and  $T_m$  is then one particularly accessible source, but this is not to say that simultaneity with  $T_m$  is a meaning expressed by the construction.

The same applies with passive past-participials. Those in [8] match [7] above:

- [8] i *Those arrested yesterday will appear in court this afternoon.* [ $T_r < T_d$ ]  
 ii *The allegations contained in this report will be strenuously denied.* [ $T_r = T_d$ ]  
 iii *Proposals submitted after today won't be considered till next month.* [ $T_r > T_d$ ]

### Infinitival modifiers in NP structure

The infinitival construction allows a narrower range of temporal interpretations than the participial, being in general restricted to simultaneity or posteriority to  $T_m$ , as in [9i–ii] respectively:

- [9] i *She was the only one to talk to him.* [ $T_r = T_m$ ]  
 ii *She was looking for someone to talk to.* [ $T_r > T_m$ ]

Temporal location is closely bound up with modality: the infinitival commonly conveys non-actuality, which tends to be associated with posteriority. The temporal difference between [i] and [ii] thus correlates with the difference in modality: in [i] the talking is actual, whereas in [ii] it is potential.

## 8 Progressive aspect

### 8.1 Progressive aspectuality

The progressive, marked by the auxiliary *be* + a following gerund-participle, has as its basic use the expression of progressive aspectuality: hence, of course, the name. There

are also some specialised uses (§8.3) which cannot be subsumed under this meaning, and this is why we are distinguishing between progressive aspect, a category of syntactic form, and progressive aspectuality, a category of meaning.<sup>45</sup>

Progressive aspectuality involves the following features, two of which are strong implicatures rather than part of the meaning proper:

- [1] i The situation is presented as in progress, ongoing, at or throughout  $T_r$ .
- ii The situation is viewed imperfectively.
- iii  $T_r$  is a mid-interval within  $T_{sit}$ . [implicature]
- iv The situation is presented as durative.
- v The situation is presented as dynamic.
- vi The situation is presented as having limited duration. [implicature]

#### (a) Situation in progress at/throughout $T_r$

- [2] i *He was reading the letter when the phone rang.*
- ii *They were talking about it over lunch.*
- iii *I am reading 'Middlemarch' at the moment.*

In [i] the  $T_r$  is specified by the adjunct *when the phone rang*, and at this point the reading was in progress, ongoing. The formulation 'at/throughout' allows for  $T_r$  to be a point, as in this example, or a period, as in [ii]. Some situations are not strictly continuous but allow for gaps, and the concept of 'in progress at  $T_r$ ' is perfectly consistent with  $T_r$  actually coinciding with such a gap, as in [iii]. One is unlikely to read 'Middlemarch' at a single sitting: there will be reading interspersed with periods when one is doing other things (such as sleeping). But this is of no linguistic significance, for the gaps are treated as part of the situation – note for example that *It took me six months to read 'Middlemarch'* gives the time between start and finish, including all these gaps. Thus in [iii] it is the situation with gaps included that is presented as ongoing, so that I needn't be engaged in actual reading at  $T_d$ . The remaining features clarify what is meant by 'in progress'.

#### (b) Imperfectivity

Progressive aspectuality is a special case of imperfectivity (§3.2.5): in presenting a situation as in progress I am necessarily taking an internal view. Compare:

- [3] i *When he arrived she phoned the police.* [perfective]
- ii *When he arrived she was phoning the police.* [imperfective]

Assuming the phoning is a single occurrence, not a serial state, the non-progressive is interpreted perfectly: the phoning is viewed as a whole, without internal temporal structure, and therefore the *when* adjunct gives the time of the phoning as a whole. (Semantically, his arrival and her phoning are said to be simultaneous, but pragmatically we interpret it as 'loose simultaneity', with the phoning immediately following his arrival.) In [ii] the progressive gives an imperfective interpretation, so the *when* adjunct specifies the time at which the phoning was in progress, with the implicature that it had started before his arrival and continued after it: see (c) below.

<sup>45</sup>The progressive may be blocked or inhibited by certain formal factors: sequences of the form *be/been + being* tend to be avoided (cf. §2.3) and progressive *be* can hardly appear in the gerund-participial form by virtue of the 'doubl-ing' constraint (Ch. 14, §5.6.1).

The perfective/imperfective contrast is particularly important in the present tense because of the constraint that a present time perfective interpretation is normally possible only when the situation is of short enough duration to be co-extensive with the utterance:

- [4] i *His daughter mows the lawn.* [salient reading: serial state]  
 ii *His daughter is mowing the lawn.* [salient reading: single occurrence]

Mowing the lawn does not satisfy that condition, so that a single occurrence reading is not normally available for [i], which we interpret as a serial state, with habitual lawn-mowing. The imperfective meaning in [ii], by contrast, allows for  $T_d$  to be **included** within  $T_{sit}$ , giving the interpretation where a single occurrence of mowing is now in progress. In the present tense, therefore, the progressive is much the more frequent aspect for dynamic situations. It would, however, be a mistake to see “habitual” vs “non-habitual” as the difference in **meaning** between [i] and [ii] (or, worse, between the present non-progressive and the present progressive generally). A single occurrence interpretation of [i] is not semantically excluded, but merely pragmatically unlikely: it could occur as a timeless or historic present or as a futurate – and if embedded, for example in a conditional construction, it could easily take a single future occurrence interpretation. Nor does [ii] exclude a serial state interpretation: compare *His daughter is mowing the lawn until he is well again*. The “habitual” vs “non-habitual” contrast is thus a difference in salient interpretations arising from the interaction between the meaning of the aspects and the pragmatic constraints on present perfectivity. Note that in the preterite the non-progressive *His daughter mowed the lawn* allows a single occurrence reading as readily as the progressive *His daughter was mowing the lawn*.

### Measure phrases

With past time, inclusion of a measure indicator tends to favour a perfective reading and hence to make the progressive less likely:

- [5] i a. *She walked five miles.* b. *She was walking five miles.*  
 ii a. *She wrote two novels.* b. *She was writing two novels.*

Progressive [ib] suggests that the distance had been determined in advance – she was on a five-mile walk; [iib] suggests that she was writing the novels simultaneously. And in a pair like *She hit him twice* vs *She was hitting him twice* it is difficult to contextualise the progressive at all.

### (c) The mid-interval implicature

The  $T_r$  of a progressive is normally interpreted as a **mid-interval** of  $T_{sit}$  – i.e. as a point or period that excludes the beginning and the end. This is very evident in [3–5]. In [4ii], for example, the mowing started in the past and will continue for at least some time into the future; in [5iib] the writing started before  $T_r$  and presumably continued afterwards; and so on. The mid-interval feature is of greatest significance with accomplishments, where the progressive implicates incompleteness:

- [6] i a. *She wrote a novel.* b. *She was writing a novel.*  
 ii a. *He has learnt to swim.* b. *He has been learning to swim.*

In [ia] the novel was finished, for  $T_r$  coincides with  $T_{sit}$  and hence includes the terminal phase. But in [ib] it was not finished at  $T_r$ , because this is interpreted as a mid-interval of  $T_{sit}$ , one which therefore excludes the punctual terminal phase (whether or not the

terminal phase was reached after  $T_r$  is not said). Similarly, on the resultative interpretation of the perfect examples with *learn*, [iia] indicates that he now knows how to swim, whereas [iib] implicates that he doesn't.

### The mid-interval feature is an implicature, not part of the meaning proper

This is evident from the fact that we can specify the time of the beginning or end or both:

- [7] i *From the moment I arrived he was trying to provoke me.*  
 ii *He was watching TV until the power went off.*  
 iii *Between 10 and 11 I was working in the library.*  
 iv *From after dinner until nearly midnight I was filling in my tax return.*

In [iii] *between 10 and 11* may or may not specify the boundaries of my working in the library. Suppose that in response to the question *What did you do yesterday?*, I say, *From 9 to 10 I was at the phonology lecture, between 10 and 11 I was working in the library, and then I had a game of squash*: here the adjunct will be taken to delimit  $T_{sit}$ . But if [6iii] is said in response to *Where were you between 10 and 11?*, it will be taken to delimit only  $T_r$ : it could be that I worked there all morning. The same applies to [iv], where filling in my tax return is an accomplishment. Possible continuations are *It took me all that time to do it* (indicating that the terminal phase is included in the  $T_r$  of [iv], thus cancelling the implicature of incompleteness) and *I'll have to finish it tonight* (preserving the incompleteness implicature).

### The interpretive/explanatory use of the progressive

The mid-interval implicature is also cancelled in what is sometimes called the 'interpretive' or 'explanatory' use of the progressive:

- [8] *When I said 'the boss' I was referring to you.*

Here the saying and referring are strictly simultaneous, coextensive, so that the  $T_r$  for *was referring* is the whole  $T_{sit}$ . The progressive is not required here but is more usual than the non-progressive; the internal (imperfective) view is appropriate to the explanatory function of the clause – in emphasising duration, the progressive metaphorically slows down or extends the situation in order to be able to focus on clarifying its nature.

### Cancellation consistent with imperfectivity

The fact that the mid-interval factor is a cancellable implicature is quite consistent with the imperfective meaning of the progressive. Imperfective meaning involves taking an internal view of the situation (which obviously applies in all the above examples) and not presenting it in its totality – but this is not the same as presenting it as incomplete. The progressive does not itself identify  $T_r$  with  $T_{sit}$ , but is not inconsistent with other features of the sentence or context making that identification. In the absence of such features, or of features including just the beginning point ([7i]) or just the endpoint ([7ii]), it will strongly implicate that  $T_r$  is a mid-interval of  $T_{sit}$ .

#### (d) Duration

For a situation to be in progress, it must have duration: there can be no progress within a punctual situation. A conflict is thus liable to arise between an achievement type situation and progressive aspectuality: examples like *I've just found my key* resist conversion to the

progressive. There are, however, ways of resolving the conflict:

- [9] i a. *She nodded.* b. *She was nodding.*  
 ii a. *The train arrived.* b. *The train was arriving.*

Here [ia] can be interpreted punctually as an achievement involving a single nod or as an activity involving a sequence of nods, whereas [ib] selects the latter reading.<sup>46</sup> Compare similarly: *She was knocking on the door*. In [iib] the effect of the progressive is precisely to change a punctual situation into a durative one, giving an extendable achievement (§3.2.3). The mid-interval factor is also important here: the train had not yet arrived at  $T_r$  (though there is a strong implicature that subsequently it would). *Die* is similar, but allows a much greater extension in time and (in the perfect) for modification by a duration adjunct: *He has been dying for several weeks now*, but not *\*The train has been arriving for two minutes now*. *They were kissing* can be interpreted in either way: as an ongoing activity of repeated kisses, or as a single extended kiss.

The feature of duration is, however, of much more general relevance. Perfective aspectuality does not exclude duration (perfectivity is not limited to achievements), but it does not express duration, hence does not focus it. The progressive, by contrast, does highlight the duration. This is so even where the clause contains a duration adjunct: *They were arguing all through the meal* emphasises the duration more than *They argued all through the meal*: it takes an internal view, with the activity ongoing throughout the period. Similarly in accomplishments where the mid-interval implicature is cancelled, as in the relevant contextualisation of [7iii–iv], highlighting of duration is effectively the only difference between progressive and non-progressive – compare *Between 10 and 11 I worked in the library* and *From after dinner until nearly midnight I filled in my tax return*.

Duration is also the major relevant factor in the frequent use of the progressive for a situation presented as a frame or background for a perfective situation:

- [10] i *The accident occurred as she was cleaning the windows.*  
 ii *I was doing some work in the garden when the police arrived.*

Where two situations are of the same duration and simultaneous, it is possible to use the progressive for either, both, or neither:

- [11] i *She was reading while he watched TV.* [progressive + non-progressive]  
 ii *She read while he was watching TV.* [non-progressive + progressive]  
 iii *She was reading while he was watching TV.* [progressive + progressive]  
 iv *She read while he watched TV.* [non-progressive + non-progressive]

### Serial states

With situations of this kind the feature of duration tends to be accompanied by an emotive overtone, usually of disapproval, when emphasised by such adjuncts as *always*, *continually*, *constantly*, *everlastingly*, *forever*, *perpetually*. Compare:

- [12] i a. *He always loses his temper.* b. *He's always losing his temper.*  
 ii a. *They always meet at the market.* b. *They're always meeting at the market.*

<sup>46</sup>A single nod interpretation is possible for [9ib] in the special context where the situation is 'frozen' in a photograph or slowed down (and thus given duration) in a slow motion film.

Notice first that *always* is interpreted differently in the two aspects: in the progressive we understand “constantly”, whereas in the non-progressive it has its basic meaning, “on all occasions” – e.g., for [ia], on all occasions of his playing table tennis, losing at cards, or whatever, for [iia] on all occasions of their meeting or going to the market. The progressive indicates continual unpredictable recurrence of the subsituation – typically, though not necessarily, an undesirable one.

### (e) Dynamicity

The major difference between progressive aspectuality and imperfectivity in general is that the former is inconsistent with a purely static situation: it conveys some measure of dynamicity. Compare the contrasting aspects in

[13] *When I left, Jill had her head buried in a book but Ed was watching TV.*

Having one’s head buried in a book is a state whereas watching TV is an occurrence (an activity), and this is why the *have* clause has non-progressive aspect, the *watch* clause progressive.  $T_r$  (specified by the *when* adjunct) is the same for both, and in both it is included in  $T_{sit}$ : the only difference is in the static vs dynamic character of the situations. Notice, moreover, that if Kim’s situation had been conceptualised, with little objective difference, as reading, the progressive aspect would have been used, since reading, like watching TV, is an activity.

Expressions denoting purely static situations do not combine felicitously with progressive aspect: *The Earth is round/flat; The solution consists of salt and vinegar; This contains lots of calcium; He has a mole on his shoulder; She is tall for her age* – and not *\*The Earth is being round/flat; \*The solution is consisting of salt and vinegar*, etc. There are, however, several ways in which the progressive can combine with a basically stative expression to yield a dynamic interpretation:

- |        |  |                     |
|--------|--|---------------------|
| [14] i | <i>He is being tactful.</i>                                  | [agentive activity] |
| ii     | <i>He’s making more and more / fewer and fewer mistakes.</i> | [waxing/waning]     |
| iii    | <i>She is cycling to work this week.</i>                     | [temporary state]   |

#### Agentive activity

Non-progressive *He is tactful* is static: we interpret *tactful* as denoting a personal quality. Progressive *He is being tactful* ([14i]), by contrast, is dynamic: we interpret it as involving agentive activity, as describing his present behaviour, “He is behaving tactfully”. (There may also be a suggestion that he is putting on an act.)

#### Waxing and waning situations

Non-progressive *He makes mistakes* expresses a serial state. The dynamicity in progressive [14ii] comes from the element of change: the subsituations are not constant, but are waxing or waning. The state in the non-progressive need not be a serial one: compare *He looks very much like his father* and *He is looking more like his father every day*.

#### Temporary state

*She cycles to work* again typically has a serial state interpretation, and this time the dynamicity in the progressive version [14iii] comes from the feature of temporariness – see (f) below. We interpret non-progressive *She cycles to work* as giving her regular mode of travel to work, whereas in the progressive it is temporary (perhaps she normally goes by car, but this week it is off the road, so she is going by bicycle). The link between

temporariness and dynamicity is that a temporary state can be thought of as moving – ‘progressing’ – towards its endpoint. Again, the examples given are of serial states, but the phenomenon applies to ordinary states too: compare *She lives with her parents* vs *She is living with her parents*. The first suggests that it is a permanent arrangement (relatively speaking, of course), the second that it is only a temporary one. It must be emphasised, however, that temporariness is not sufficient to sanction the use of the progressive. There are ‘strongly stative’ verbs, such as *belong*, *contain*, *matter*, *own*, which remain in the non-progressive even when the state is temporary: *It doesn’t matter at this stage*; *At the moment she owns both blocks, but she’s selling one next week*. The waxing/waning type of dynamicity sanctions the progressive significantly more generally: *It is mattering more and more which university you get your degree at*; *Each year more and more people are owning their own home*.

#### (f) The limited duration implicature

The progressive often implicates that the situation is of limited duration, temporary. The clearest case is the one just illustrated in [14iii], where temporariness provides the essential feature of dynamicity. It is also evident in cases like [14i], as an accompaniment to the agentive activity feature. *He is being tactful* focuses on current behaviour and hence is likely to be interpreted as applying to a situation of shorter duration than *He is tactful*, which generally suggests a personality trait and hence a relatively permanent situation. (Notice, however, that this latter suggestion can be cancelled: *He is very tactful this morning*.) We have also seen that in pairs like [4] (*His daughter mows the lawn* vs *His daughter is mowing the lawn*) the salient interpretations differ sharply with respect to the duration of the situations, again a relatively permanent (serial) state vs temporary current activity.

Attention is often drawn to the paradox that in some cases (such as these) the progressive conveys limited duration, whereas in others it conveys extended duration, most obviously in cases like [9iib] (*The train was arriving*), where it gives duration to a situation that would otherwise be punctual. The paradox arises because neither limited duration nor extended duration is a feature of the meaning of the progressive. Both are implicatures deriving from the interaction between the meaning of the progressive and other factors, which are different in the two cases. For example, limited duration can arise when dynamicity is imposed on a situation which is basically a state, and extended duration arises when the feature of duration (which is part of the meaning) is imposed on a situation which is basically punctual. That limited duration is not part of the meaning of the progressive is evident from the complete acceptability of examples like *This must have been going on ever since the beginning of time* – or those like [12] above.

## 8.2 Some verb classes

The distinction between states and occurrences is not sharply drawn in objective reality: there is scope for differences in the way a situation is conceptualised and in the properties lexicalised in particular verbs. The above difference between *have one’s head buried in a book* (static) and *read a book* (dynamic) illustrates the relevance of conceptualisation. The relevance of particular lexical properties is seen in the following contrasts:

especially when the focus is on the quality of the sense organs or the channel (*She's not hearing very well these days; I'm hearing you loud and clear*), or when the sensation is understood to be hallucinatory (*I must be seeing things; She is hearing voices*).

### ■ Verbs of hurting

There is a small set of verbs associated mainly with various kinds of pain which again fall at the boundary between stative and dynamic: *ache, hurt, itch, feel sick/well*, etc. These occur equally readily in either aspect – compare *My neck aches* (where the non-progressive indicates a state) and *My neck is aching* (where the progressive suggests an activity).

### ■ Verbs of cognition, emotion, and attitude (*believe, fear, regret, etc.*)

These constitute a large and important class of stative verbs: *agree, believe, fear, forget, hope, intend, know, like, love, realise, regret, remember, suppose, think, understand, want, wish, wonder*, etc. As such, they occur in the simple present with imperfective meaning:

- [18] *I believe it's illegal. I fear you've made a mistake. She knows where they are. He loves you. I suppose it's too late.*

(*See, hear, and feel* also belong here when used, for example, with a finite content clause as complement: *I see/hear/feel that it's not working properly*.)

None of these verbs completely excludes the progressive, however, though they differ with respect to how easily they take it. In the case of *know*, for example, it is just about restricted to the waxing/waning case (*He claims that fewer and fewer students are knowing how to write English when they come up to university*). The following illustrate ways in which a dynamic factor can be added to the basic stative meaning:

- [19] i *I'm thinking we ought to accept. She's regretting she stayed behind.*  
 ii *Don't interrupt me when I'm thinking. They're loving every minute of it.*  
 iii *You're forgetting you said you'd help. He's not realising what he's saying.*  
 iv *I'm hoping you can help me. He was wondering if he could ask your advice.*

In [i] the progressive suggests limited duration; the focus is on the present moment, suggesting that the states have not obtained for a long time (e.g. *I've just come round to thinking this*). In [ii] the progressive yields an activity reading: we interpret *think* and *love* here as equivalent to dynamic *cogitate* and *enjoy*. In [iii] I am concerned with explaining, interpreting, commenting on something you or he has just said: the progressive adds the feature of duration to enable us to focus on what is (or was) going on (cf. [8]). Finally in [iv] the progressive adds an element of tentativeness: the first example avoids any danger of apparent brusqueness that might attach to *I hope you can help me*. The effect is similar to that of the preterite for diffidence/politeness (§4.3.2), and in the *wonder* example the preterite and progressive features combine to produce this effect. It is not so clear how the politeness derives from the progressive. One factor is no doubt length/complexity: polite formulations are often more complex than ordinary ones (compare *I wonder whether you'd mind opening the door* with *Open the door*). Another may be the restricted duration feature: the temporariness of the hoping acknowledges that you may not want to help me.

### ■ Stance verbs (*stand, lie, sit*)

The class of 'stance' or 'position' verbs, the most frequently occurring members of which are *stand, lie, and sit*, falls at the boundary between states and activities. When they are

used of fixed or (relatively) permanent positions, these verbs are construed as denoting states and normally occur in the non-progressive; when they apply to temporary positions, for example with human or animate subjects, they tend to be construed rather as activities and to favour the progressive:

- [20] i *The church stands at the top of the hill. The village lay beside the gorge.*  
 ii *He is standing near the entrance. They were lying on the beach.*

Particularly in narrative, however, the progressive is found for permanent positions, as in *We reached the knoll and the peak was standing majestically above the glacier*: the limited duration feature reflects the narrator's experience of the situation, rather than the objective state itself. With temporary positions, the non-progressive is possible: *They lay on the beach, sunning themselves; We'll sit here and watch you playing*. But the non-progressive is not normally used for a present time situation (leaving aside serial states): in response to *Have you seen Kim?*, I might say *She's in the garden* or *She's sitting in the garden*, but not *She sits in the garden*.

### 8.3 Non-aspectual uses of the progressive

There are two uses of progressive aspect where the meaning cannot be accounted for in terms of progressive aspectuality. In both cases there is future time reference, one involving the futurate, the other modal *will*.

#### (a) The progressive futurate

- [21] i a. *The sun sets at five tomorrow.*                      b. *#The sun is setting at five tomorrow.*  
 ii a. *I phone her tonight.*                                      b. *I'm phoning her tonight.*  
 iii a. *She has her operation tomorrow.*                      b. *She's having her operation tomorrow.*  
 iv a. *It expires tomorrow / in five years*                      b. *It's expiring tomorrow / in five years.*

The progressive is restricted to cases where human agency or intention is involved – hence the anomaly of examples like [ib]. The difference between non-progressive and progressive is fairly clear in pairs like [ii]. The non-progressive suggests a schedule or plan: perhaps I regularly phone her on the first Sunday in the month, or perhaps the call is part of some larger plan or arrangement – it's hardly possible if I'd simply said, casually, *I'll phone you tonight*. The progressive [iib] could be used in these schedule/plan scenarios, but it is not limited to them: it could be that I have simply formed the intention to phone her (without consulting her or anyone else about the matter) and am waiting till I think she'll be in. In [iii] there is little difference – because the greater range of the progressive just illustrated is here restricted by the fact that operations normally involve formal scheduling. A further point is that the progressive tends to be used for the relatively near future. In [ivb], for example, *tomorrow* is appreciably more natural than *in five years*, whereas there is no such difference in [iva].

#### (b) Will + progressive

- [22] i *When we get there, they'll probably still be having lunch.*                      [aspectual meaning]  
 ii *Will you be going to the shops this afternoon?*                                      [special meaning]  
 iii *When the meeting ends we'll be flying to Bonn.*                                      [ambiguous]

In [i] we simply have the ordinary use of the progressive to express progressive aspectuality: the lunch will be still in progress at the time of our arrival. This is not how we interpret [ii], however. The meaning can best be seen by comparing it with the non-progressive counterpart, *Will you go to the shops this afternoon?* The salient interpretation of the latter is as a request to you to go to the shops, and the role of the progressive in [ii] is to avoid such an interpretation. The progressive indicates that the matter has already been settled rather than being subject to decision now. Compare, similarly, *We won't buy any more* (interpretable as a refusal, made here and now) vs *We won't be buying any more* (following prior decision), or *Will he help us?* ("Is he willing?"; decision still to be made) vs *Will he be helping us?* ("Has it been decided that he will?").

The distinctness between the two meanings is seen clearly in the ambiguity of [22iii]. On the progressive aspectuality reading, we will already be flying to Bonn when the meeting ends; on the 'already decided future' interpretation, the *when* adjunct says when we will leave. The first is imperfective, with reference to a mid-interval; the second is perfective, just as in the non-progressive *we'll fly*, which, however, suggests that the decision is being made now. This use is particularly common with *will*, but it is also found with, for example, the idiom *be going*, as in *Are you going to be helping them again this year?* (where the non-progressive might again be construed as a request).

## 9 Mood and modality

The distinction between mood and modality is like that between tense and time, or aspect and aspectuality: mood is a category of grammar, modality a category of meaning. Mood is the grammaticalisation of modality within the verbal system. The term 'mood' is most usually applied to inflectional systems of the verb, as in the contrast between indicative, subjunctive, and imperative in such languages as Latin, French, and German. As far as English is concerned, historical change has more or less eliminated mood from the inflectional system, with irrealis mood confined to 1st/3rd person singular *were*, which is moreover usually replaceable by the ordinary preterite form *was* (§1.7). The main mood system, therefore, is analytic rather than inflectional, marked by the presence or absence of special words, the modal auxiliaries.<sup>47</sup>

### 9.1 Modality and its expression

#### ■ The domain of modality

The area of meaning referred to as modality is rather broad and finds expression in many areas of the language besides mood; it is, moreover, not sharply delimited or subdivided, so that we shall need to make frequent reference to the concept of prototypical features and to allow for indeterminacy at the boundaries of the categories. We begin this section, therefore, with a brief account of the central area covered by modality and of its linguistic manifestations.

<sup>47</sup>This use of 'mood' is not widely adopted in works on English grammar; we take the extension of the term to analytic systems to be parallel to the use of tense and aspect for analytic systems as well as inflectional ones.

### Speaker's attitude to factuality or actualisation

Modality is centrally concerned with the speaker's attitude towards the factuality or actualisation of the situation expressed by the rest of the clause.

A declarative main clause like *He wrote it himself* we will regard as **unmodalised**: in normal use the speaker is committed, without qualification or special emphasis, to the factuality of the proposition expressed. *He must have written it himself*, by contrast, is **modalised**: although I still commit myself to the factuality of his having written it himself, my commitment is qualified in the sense that the truth of the proposition is not presented as something that is directly known but as something that is inferred. A somewhat different kind of modality is found in (the most salient interpretation of) *You must help him*, which is concerned not so much with factuality as with the actualisation of a future situation, your helping him: I impose on you the obligation to bring this situation about.

### Necessity and possibility

Although the two examples just given involve different kinds of modality, they are united by the fact that they both express the concept of necessity. This and the related concept of possibility are core concepts in modality (and it is primarily these that the branch of logic known as modal logic is concerned to explicate and formalise). Modal possibility is illustrated in examples corresponding to the above with *may* substituted for *must*. *He may have written it himself* expresses the possibility of his having written it himself: it indicates an open attitude to the truth of the proposition. Similarly *You may help her* expresses the possibility of your helping her: I give permission and thus remove a potential barrier to the actualisation of that situation.

### Extension beyond speaker's subjective attitude

Modality is in the first instance a matter of the speaker's attitude, but it applies by extension to the attitude of persons referred to in the sentence. In *Kim thinks he must have written it himself*, for example, *must* indicates Kim's attitude, not mine, but we shall of course still regard it as expressing modal necessity. Furthermore, the concept of modality also extends to cases where it is not a matter of subjective attitude on the part of the speaker (or others), but of something more objective. *If  $x$  is a prime number between 90 and 100 it must be 97*, for example, is likely to be interpreted as expressing not the speaker's subjective attitude to the truth of " $x$  is 97" but objective, mathematical necessity.

## ■ The linguistic expression of modality

Major areas of the language, other than the analytic mood system, where modality may be expressed include:

### (a) Lexical modals

We use this term for items expressing the same kind of meaning as the modal auxiliaries, but which do not belong to the syntactic class of auxiliary verbs. It covers adjectives like *possible*, *necessary*, *likely*, *probable*, *bound*, *supposed*, adverbs like *perhaps*, *possibly*, *necessarily*, *probably*, *certainly*, *surely*, verbs like *insist*, *permit*, *require*, and nouns like *possibility*, *necessity*, *permission*, and similar derivatives.

### (b) Past tense

The preterite is commonly used to express what we have called modal remoteness, and the perfect is occasionally used in this way too (§6.1). The difference in modal meaning

auxiliary in the matrix clause and has a modal use of the preterite in both subordinate and matrix clauses, and even the open conditional very often has a modalised matrix clause too.

#### (f) Parentheticals

These contain lexical modals such as *think, seem*, etc.: *He is, I think /it seems, almost bankrupt*. They are also relatable to subordinate constructions (*I think /It seems he is almost bankrupt*); see Ch. 10, §5.3.

In this section we focus on the modal auxiliaries – we shall not, for example, be dealing systematically with the lexical modals, though we shall refer to a number of them for purposes of contrast and clarification. The modal auxiliaries have a considerable range of uses: in the next subsection we consider three major dimensions along which these uses may be compared. We then deal with the individual auxiliaries, focusing first on the present tense forms (and the idiomatic uses of *should*) before taking up the preterite forms. The remaining subsections examine the relation between the modals and perfect tense, negation, and interrogative clause type.

## 9.2 Dimensions of modality

In describing the meanings and use of the modal auxiliaries we will make distinctions on three major dimensions, which we refer to as **strength**, **kind**, and **degree**.

### 9.2.1 Strength of modality

#### ■ Necessity vs possibility: strong vs weak modality

The first dimension concerns the **strength** of commitment (prototypically the speaker's commitment) to the factuality or actualisation of the situation. This is where we distinguish the core modal concepts of necessity and possibility: necessity involves a strong commitment, possibility a weak one.

#### ■ Internal negation vs external negation

In order to describe the logical relation between necessity and possibility we need to consider their interaction with negation, and here we must distinguish between **internal negation** and **external negation**:

- |     |     |  |                                |
|-----|-----|--|--------------------------------|
| [2] | i   | <i>He may <u>not</u> have read it.</i>   | [internal negation]            |
|     | ii  | <i>He can't have read it.</i>            | [external negation]            |
|     | iii | <i>He can't <u>not</u> have read it.</i> | [external + internal negation] |

In [i] the negation applies semantically to the complement of *may*: “It is possible that he didn't read it”. We say in such cases that the modal **has scope over** the negative, or that the negation falls within the scope of the modal: it is in this sense that the negation is ‘internal’. In [ii], by contrast, the negative applies to the modal itself: “It is not possible that he read it”. Here then the negative **has scope over** the modal auxiliary rather than falling within its scope, i.e. the negation is external to the scope of the modal (see Ch. 9, §1.3.1, for the concept ‘scope of negation’). The two kinds of negation can combine, as in [iii]: “It is not possible that he didn't read it”.

A second example (omitting the combination of negatives, which would be much less natural than it is in [2]) is seen in:

- [3] i *You mustn't eat it all.* [internal negation]  
 ii *You needn't eat it all.* [external negation]

In [i] the negative applies to the eating, not the modal obligation: “It is necessary that you not eat it all”; it is thus internal, within the scope of the modal. In [ii] the negative applies to the obligation: “It isn’t necessary for you to eat it all”; here then it is external, outside the scope of the modal.<sup>48</sup>

The scope of the negation is generally transparent when the modality is expressed by lexical modals in constructions where there is a clear syntactic distinction between a matrix clause containing the lexical modal and a subordinate clause, as in the glosses given for [2–3]. In such cases a *not* in the subordinate clause marks internal negation, while a *not* in the matrix clause marks external negation. When we have negation with a modal auxiliary we can therefore test whether it is internal or external negation by finding a paraphrase with a lexical modal, and seeing whether the negative is in the subordinate clause (as in *It is necessary that you not eat it all*) or the matrix one (as in *It isn't necessary for you to eat it all*). It should be borne in mind, however, that such paraphrases will often be much less idiomatic than the versions with modal auxiliaries.

#### ■ Logical relation between necessity and possibility

The following examples illustrate the equivalence between pairs of clauses expressing modal necessity and possibility:

- |     |   |                                       |                            |
|-----|---|---------------------------------------|----------------------------|
| [4] | NECESSITY   | POSSIBILITY                           |                            |
|     | i <i>He <u>must</u> be guilty.</i>                | <i>He <u>can't</u> be not guilty.</i> | [Nec P] = [not-Poss not-P] |
|     | ii <i>He <u>must</u> be not guilty.</i>           | <i>He <u>can't</u> be guilty.</i>     | [Nec not-P] = [not-Poss P] |
|     | iii <i>He <u>isn't</u> necessarily guilty.</i>    | <i>He <u>may</u> be not guilty.</i>   | [not-Nec P] = [Poss not-P] |
|     | iv <i>He <u>isn't</u> necessarily not guilty.</i> | <i>He <u>may</u> be guilty.</i>       | [not-Nec not-P] = [Poss P] |

In the annotations on the right we use ‘Nec’ for necessity and ‘Poss’ for possibility, independently of how they are expressed: *must*, *need*, *necessary*, *necessarily*, and so on, all express modal necessity, while *can*, *may*, *possible*, *possibly*, *perhaps* all express possibility. ‘P’ stands for the propositional content that is modalised or negated: in this case, “He is guilty”. ‘Not-P’ indicates internal negation, while ‘not-Nec’ and ‘not-Poss’ indicate external negation, with the negative having scope over the modal necessity or possibility.

#### ■ Semantic strength vs pragmatic strength

When considering the strength of the modality expressed in a clause it is important to bear in mind the distinction between semantics and pragmatics. Compare, for example:

- [5] i a. *You must come in immediately.* b. *You must have one of these cakes.*  
 ii a. *You may take your ties off.* b. *You may leave now.*

Example [ia] is likely to be used as an instruction to come in: it is strong in that it doesn’t countenance your not doing so. Example [ib] contains the same modal *must*, but, as used

<sup>48</sup>Alternative terms that will be found in the literature are ‘propositional negation’ for ‘internal negation’, and ‘modal negation’ for ‘external negation’.

at an afternoon tea-party or the like, the modality would be considerably less strong – it will be taken as an offer rather than an order. We will talk of this as **pragmatic weakening**: *must* is a semantically strong modal, but in this context its strength is reduced. The opposite case is illustrated in [ii]. Here [iia] has weak modality: the salient interpretation is as giving permission, allowing you a choice as to whether or not to take your tie off. But [iib], as used in the context of a boss talking to a secretary, will be construed as an instruction, not mere permission: here we have **pragmatic strengthening**.

### ■ Medium modality

There is a third category on the scale of strength which we call **medium modality**, though intuitively it is closer to the strong end than to the weak. It is expressed by *should*, *ought*, and comparable lexical modals such as *probable*, *likely*, *appear*, *seem*:

- [6] i *The meeting must be over by now.* [strong]  
 ii *The meeting should be over by now.* [medium]  
 iii *The meeting may be over by now.* [weak]

With [ii] we confine our attention at this stage to the interpretation “The meeting is probably over by now” (ignoring, for example, its use in a context where I know the meeting is still going on and am saying that this state of affairs is not right). In the “probably” interpretation, [ii] is weaker than [i] in that it allows for the possibility that the meeting is not over: with [ii], unlike [i], I could add *but it may not be*. At the same time, [ii] is stronger than [iii] in that it presents the likelihood of the meeting being over as greater. Thus [iii] is consistent with such continuations as *but it’s unlikely to be*, whereas [ii], in its “probably” interpretation, is not. Note, moreover, that the common formula *may or may not* (e.g. *You may or may not believe this*) presents “P” and “not-P” as equally likely, but we do not similarly say *should or should not*.

#### Medium modality and negation

A significant feature of medium strength modality is that there is little difference, pragmatically, between external and internal negation:

- [7] i *He isn’t likely to be ready.* [external negation]  
 ii *He is likely not to be ready.* [internal negation]

Construction [i] is the more frequent but it tends to be interpreted pragmatically as [ii] (for further discussion, see Ch. 9, §5). Semantically [i] allows that the likelihood of his being ready may be around 50% as well as low, but in the 50% case one would generally say, more simply and clearly, *He may be ready*, so that [i] tends to be used only in the low probability case, “He is unlikely to be ready”, and this is equivalent to [ii]. Note that in a simple clause construction with *probably* the negation is normally semantically as well as pragmatically internal. For example, *He is probably not ready*, with *not* following *probably* and inside its scope, is normal while *He isn’t probably ready* is very marginal. Similarly, it is internal negation that we have with *should* and *ought* (see §9.4).

## 9.2.2 Kind of modality

It is a difficult matter to decide how many different senses should be recognised for a given modal auxiliary, but certain broad categories can be motivated by clear cases of ambiguity and by differences with respect to such matters as the scope of negation. We begin here

with the distinction between **epistemic** and **deontic** modality, and then introduce a third category of **dynamic** modality; these distinctions cut across those of strength, and we will restrict the term **kind** of modality to this dimension of differentiation.

### ■ Epistemic vs deontic modality

The contrast between the two major categories is seen in the sharply different interpretations of *must* and *may* in [8i–ii] and the ambiguity of [8iii]:

[8]	STRONG	WEAK	
i	a. <i>He <u>must</u> have been delayed.</i>	b. <i>He <u>may</u> have been delayed.</i>	[epistemic]
ii	a. <i>You <u>must</u> pull your socks up.</i>	b. <i>You <u>may</u> stay if you wish.</i>	[deontic]
iii	a. <i>You <u>must</u> be very tactful.</i>	b. <i>He <u>may</u> sleep downstairs.</i>	[ambiguous]

The ambiguity in [iii] is very clear, with [iiia] interpretable as either “I am forced to conclude (from the evidence) that you are very tactful” (epistemic) or “Be very tactful” (deontic), and [iiib] as either “Perhaps he sleeps downstairs” (epistemic) or “He can sleep downstairs” (deontic). (Strictly speaking, [i–ii] are ambiguous too, but the interpretations that we have ignored here are unlikely and need fairly elaborate contextualisation.)

Prototypically, epistemic modality concerns the speaker’s attitude to the factuality of past or present time situations while deontic modality concerns the speaker’s attitude to the actualisation of future situations.

‘Epistemic’ is derived from the Greek for “knowledge”: this kind of modality involves qualifications concerning the speaker’s knowledge. The unmodalised *He has been delayed* presents the truth of the proposition as something I know, whereas [8ia] presents it as something I arrive at by inference and in [ib] I merely put it forward as a possibility. ‘Deontic’ is derived from the Greek for “binding”, so that here it is a matter of imposing obligation or prohibition, granting permission, and the like. In [iia], for example, I am telling you to pull your socks up and in [iib] I give you permission to stay. The person, authority, convention, or whatever from whom the obligation, etc., is understood to emanate we refer to as the **deontic source**.

There are numerous expressions that are used both deontically and epistemically, and the same phenomenon is found in many other languages too. In general it is plausible to regard the deontic uses as more basic, with the epistemic ones arising by extension to the domain of reasoning of concepts primarily applicable in the domain of human interaction, such as compelling and permitting.

### ■ Dynamic modality

The clearest cases of dynamic modality are concerned with properties and dispositions of persons, etc., referred to in the clause, especially by the subject NP. Again, the category can be justified by the existence of very clear cases of ambiguity:

[9]	i	<i>She <u>can</u> stay as long as she likes.</i>	[deontic]
	ii	<i>She <u>can</u> easily beat everyone else in the club.</i>	[dynamic]
	iii	<i>She <u>can</u> speak French.</i>	[ambiguous]

Example [i] gives (or reports) permission, while [ii] is concerned with her ability, and [iii] can be interpreted in either way, deontically as authorising her to speak French or dynamically as reporting her ability to do so.

The boundary between dynamic and deontic modality is, however, somewhat fuzzy. Examples like *The most we can expect is a slight cut in the sales-tax* ([21i] below) do not belong clearly with either [i] or [ii] in [9]. We put them in the dynamic category on the grounds that no person or institution is identifiable as a deontic source – they might be glossed with “permissible”, but not with “permission” (e.g. “the most it is permissible to expect”, but not “the most we have permission to expect”).

Dynamic ability is less central to modality than deontic permission in that it does not involve the speaker’s attitude to the factuality or actualisation of the situation. It does not apply as generally to the modal auxiliaries as do deontic and epistemic modality, and the clear ambiguities illustrated above for *can* are not found with the other auxiliaries.<sup>49</sup>

### 9.2.3 Degree of modality and modal harmony

**Degree** of modality has to do with the extent to which there is a clearly identifiable and separable element of modal meaning.

#### ■ Contrast between unmodalised and modalised clauses

The difference between high and low degree modality is most easily seen by comparing pairs of clauses where one member is unmodalised, the other modalised:

[10]	UNMODALISED	HIGH DEGREE MODALITY
	i a. <i>They <u>know</u> her.</i>	b. <i>They <u>may know</u> her.</i>
	ii a. <i>Your passport <u>is</u> in the drawer.</i>	b. <i>Your passport <u>should be</u> in the drawer.</i>
	iii a. <i>The letter <u>arrived</u> yesterday.</i>	b. <i>The letter <u>will have arrived</u> yesterday.</i>
[11]	UNMODALISED	LOW DEGREE MODALITY
	i a. <i>Strange as it <u>seems</u>, I believe you.</i>	b. <i>Strange as it <u>may seem</u>, I believe you.</i>
	ii a. <i>It’s odd that he <u>is</u> so late.</i>	b. <i>It’s odd that he <u>should be</u> so late.</i>
	iii a. <i>She <u>is</u> one year old tomorrow.</i>	b. <i>She <u>will be</u> one year old tomorrow.</i>

In [10] the [b] examples differ very sharply and obviously in meaning from their unmodalised counterparts: the introduction of a modal auxiliary into the structure therefore adds a high degree of modal meaning. In [11], on the other hand, it is difficult to detect any meaning difference at all between the [a] and [b] examples: here, then, we have a low degree of modality. Degree, in this sense, is quite a different matter from strength. Our examples cover the scale of strength from weak *may* through medium *should* to strong *will* – but low degree modality is most often found at the upper end of the scale of strength, especially with *will* and, in the 1st person, *shall*.

#### ■ Modal harmony

The low degree of modality in [11b] can be attributed to the fact that it repeats, or is in **harmony** with, the modality expressed in the larger construction. *Strange as it seems / may seem* functions as a concessive adjunct: the meaning of *strange as it seems* is “although it seems strange”. *May* can be used concessively on its own (as in *It may be expensive, but it’s worth every penny* – [16] below), but in [11b] it is reinforcing, not adding, concessive meaning. Compare, similarly, the optional use of *may* in the exhaustive conditional construction, *I’m going to appoint her whatever you say / may say*. Something comparable to modal harmony can be seen in [11iib] where the optional use of *should* is dependent on the presence of an emotive word such as *odd*, *surprising*, *remarkable* in the matrix clause.

<sup>49</sup>Some scholars operate with just a two-way distinction between epistemic and ‘root’ modality.

The most common and central cases of modal harmony are found with verb–adverb combinations, as in:

- [12] i *The meeting must surely be over by now.* [strong]  
 ii *The meeting should probably be over by now.* [medium]  
 iii *The meeting may possibly be over by now.* [weak]

The verb and adverb are of the same strength and combine to express a single feature of modal meaning rather than two independent ones. They are very different from examples like *It may surely have been an accident*, where *may* (weak) and *surely* (strong) express independent modal meanings. The meaning of this non-harmonic combination is “Surely it is possible that it was an accident”, with *possible* inside the scope of *surely*.

#### ■ *Will*, a special case of low degree modality

The low degree of modality in the *will* of [11iii**b**], *She will be one year old tomorrow*, is not attributable to modal harmony. There is, rather, a strong association between *will* and the temporal concept of futurity, and the degree of modal meaning is in general significantly less with future time situations than with past and present time ones. We have noted that there are severe pragmatic constraints on the use of a main clause simple present for future time, so that with examples like *It will be dark soon* the unmodalised counterpart is not normally acceptable. *Will* can therefore be regarded as the default means of indicating future time; we take up this issue in §9.5.1.

### 9.3 Necessity and possibility: *must*, *need*, *may*, and *can*

Two modal auxiliaries, *must* and *need*, express modal necessity, and two, *may* and *can*, express possibility. *Need*, however, is restricted to non-affirmative contexts, and both *must* and *need* lack preterite counterparts; they are, moreover, jointly much less frequent than the possibility ones, and they cover a narrower range of distinguishable uses than *may* and *can*.<sup>50</sup>

#### 9.3.1 Epistemic necessity and possibility

The main auxiliaries of epistemic necessity and possibility are respectively *must* and *may*, as in *He must/may have done it deliberately*. In its epistemic use *can*, like auxiliary *need* in all its uses, is restricted to non-affirmative contexts.

#### ■ Scope of negation

Epistemic *must* and *may* normally take internal negation, with *need* and *can* being used for external negation. We therefore have the following semantic equivalences corresponding to [4ii–iii]:

- [13] i a. *He mustn't have done it deliberately.* [internal negation: Nec not-*P*]  
 b. *He can't have done it deliberately.* [external negation: not-Poss *P*]  
 ii a. *He needn't have done it deliberately.* [external negation: not-Nec *P*]  
 b. *He may not have done it deliberately.* [internal negation: Poss not-*P*]

<sup>50</sup>We use ordinary italics in this section rather than bold because we are concerned only with the present tense forms; preterite *could* and *might* are taken up in §9.8.

In each pair, however, type [a] is quite rare and restricted (indeed unacceptable for many speakers):<sup>51</sup> in negative contexts, *must* and *need* are usually interpreted deontically. In the mood system, therefore, epistemic possibility can be regarded as more basic, less restricted, than epistemic necessity.

### ■ Subjective and objective uses

*Must* and *may* are most often used subjectively, to express the speaker's judgement, but objective uses are also found. Let us take them in turn.

#### *Must*

With epistemic modality, subjective *must* characteristically involves what we have described as pragmatic weakening. This accounts for the clear difference in strength in:

- [14] i A: *What has happened to Ed?* B: *He must have overslept.* [subjective]  
 ii *If I'm older than Ed and Ed is older than Jo, I must be older than Jo.* [objective]

Objective [ii] involves strict semantic necessity, but subjective [i] will be interpreted as confident inference. And [ii] doesn't differ significantly from the unmodalised version with *am*, whereas [i] is much weaker than *He has overslept*. An appropriate pragmatic gloss is "This is the only explanation I can think of", rather than "This is the only possibility there is", which holds for [ii]. It must be emphasised, however, that semantically *He must have overslept* entails that he has overslept (as "Nec-*P*" entails "*P*"), and this is why it would be anomalous, inconsistent, to say – in the context, for example, of his having failed to turn up for an early rendez-vous – \**He must have overslept, though it might alternatively be that he has had problems with his car.*

Because of the pragmatic weakening found with subjective *must*, [13ia] is not pragmatically equivalent to [ib], which is stronger, more categorical. *Can't* would be preferred when the matter is regarded as obvious and particularly in denying something that has been asserted (*He says it was Jill but it can't have been*), with *mustn't* used – by those for whom it is not restricted to deontic modality – when it's a question of arriving at a negative conclusion (*He mustn't have told her after all*).

#### *May*

This is likewise most often used subjectively: I don't know that the proposition is false and put it forward as a possibility. But it can also be used objectively, where it is a matter of public knowledge, as it were, rather than the speaker's knowledge:

- [15] i *He may have left it downstairs: I'll just go and see.* [subjective]  
 ii *He may have misled Parliament: there's going to be an inquiry.* [objective]

The distinction here, however, is less significant (and less easy to draw) than with *must*, as it does not correlate with any appreciable difference in strength. In either case the strength can be increased by adding adverbial *well*: *He may well have left it downstairs*, "It is quite likely".

<sup>51</sup>This is why we used *necessarily* rather than *need* in presenting the logical relations between necessity and possibility in [4iii–iv]: *He needn't be guilty* is less likely than *He isn't necessarily guilty*.

### ■ The ‘don’t know’ implicature and concessive *may*

Epistemic *may* usually triggers a strong implicature that I don’t know that the proposition is true. If I knew that it was true, I would normally be expected to use the unmodalised form – *He’s ill*, say, rather than the much weaker *He may be ill*.

This implicature can be cancelled, however, yielding a rather special case of pragmatic strengthening:

[16] *It may be expensive, but it’s worth every penny.* [concessive *may*]

Here *may* is interpreted concessively, ‘I concede that it is expensive’; in this use it is typically followed by *but* or the like.

### ■ Harmonic combinations

*Must* and *may* commonly occur in harmonic combination with an adverb of comparable meaning, with the modal elements simply reinforcing each other:

[17] i *It must surely be valid. It must necessarily have involved deception.*  
 ii *He may perhaps have left already. She may possibly be ill.*

They also appear harmonically in the complements of verbs, etc., of the same strength: *He insisted that there must have been a mistake*; *I suggest that he may be lying*. *May* is also used harmonically in concessive adjuncts like *strange as it may seem* ([11b]).

### ■ Time of the situation

With *must* and *need* the time is generally present or past, as with prototypical epistemic modality. If the time is future, they are most likely to be interpreted deontically – compare *He must have told her yesterday* (past and epistemic) with *He must tell her tomorrow* (future and deontic). The future + epistemic combination is not impossible, and is somewhat more likely in conjunction with harmonic *surely* (which is not used deontically): *It must surely rain soon*. Epistemic *may*, on the other hand, occurs freely with future situations – where its deontic use is much less frequent than that of *must*. Compare:

[18] i a. *He may come back tomorrow.*      b. *You may do better next time.*  
 ii a. *He must come back tomorrow.*      b. *You must do better next time.*

The salient interpretations here are epistemic for *may*, and deontic for *must*. Epistemic *can* is barely possible with a future: compare *They may not finish until tomorrow* (where the salient reading is epistemic) and *They can’t finish until tomorrow* (where it is a question of factors preventing actualisation, hence deontic or dynamic modality).

## 9.3.2 Deontic necessity and possibility

Deontic necessity, i.e. strong obligation, is expressed (in affirmative contexts) by *must*: *You must attend the lectures*. Deontic possibility, i.e. permission, is expressed by *may*, in formal style, or *can*, informal: *You may/can attend the lectures*.

### ■ Scope of negation

Deontic *must* behaves like epistemic *must* in that it normally takes internal negation. Deontic *may*, however, behaves differently from epistemic *may*: like *can*, it usually takes external negation. The semantic equivalences corresponding to [13] are as follows:

- [19] i a. *You mustn't attend the lectures.* [internal negation: Nec not-*P*]  
 b. *You may not / can't attend the lectures.* [external negation: not-Poss *P*]  
 ii a. *You needn't attend the lectures.* [external negation: not-Nec *P*]  
 b. *?You may/can not attend the lectures.* [internal negation: Poss not-*P*]

We saw in §9.3.1 that with epistemic modality possibility is less restricted than necessity, but the reverse is the case with deontic modality. This is particularly clear in [ii]: [iia] is perfectly acceptable for all speakers, whereas [iib] is at best very marginal, with a sharp prosodic boundary being required after the auxiliary to keep it out of the scope of *not*. But even in a pair like [i], assuming a subjective interpretation with the speaker imposing obligation or giving permission, deontic possibility is more restricted than necessity. Giving permission implies the power to withhold permission and hence to impose a barrier to actualisation: subjective *may/can* tacitly invokes this power. This is why, for example, it would be quite inappropriate to replace *must* by *may* in [5ib] (*You must have one of these cakes*): *You may have one of these cakes* conflicts with the social equality of host and guest. *Must*, by contrast, is commonly used when there is no question of the speaker having the power, or the wish, to require actualisation: it is often pragmatically weakened, to be interpreted in terms of advice or exhortation rather than requirement. *You mustn't take any notice of him* is thus not pragmatically equivalent to *You may not / can't take any notice of him*: the latter is inappropriate because the situation is not of the kind that needs authorisation.

### ■ Subjective and objective

Prototypical deontic modality is subjective, with the speaker as the deontic source, the one who imposes the obligation or grants permission.<sup>52</sup> But it can also be objective, most obviously in reports of rules and regulations – compare:

- [20] i a. *You must clean up this mess at once.* } [subjective]  
 b. *You may/can have one more turn.* }  
 ii a. *We must make an appointment if we want to see the Dean.* } [objective]  
 b. *We may/can borrow up to six books at a time.* }

However, with objective necessity there is a tendency to use *have*, *have got*, or *need* rather than *must*: *We have (got) / need to make an appointment*. With possibility some speakers use *may* for speaker's permission, *can* for objective permission, but the choice between these verbs is more often a matter of style, with *may* more formal than *can*. The subjectivity is particularly clear in an example like *You may join us with pleasure*, where the pleasure is mine, not yours, and only in the subjective use do we find the pragmatic weakening of obligation to an offer and strengthening of permission to obligation illustrated in [5ib/iib] (*You must have one of these cakes, You may leave now*).

The objective examples [20ii] have 1st person subjects, but this of course is not necessary (with a subject such as *you*, however, they could be interpreted subjectively or objectively according as the speaker was laying down a rule or merely reporting one). Conversely, a 1st person subject is quite consistent with subjective modality, as in *I must do something about this leak*, where I impose on myself, or voluntarily accept, an

<sup>52</sup>In questions, subjectivity involves the addressee as deontic source, as in *May/Can I attend the lectures?*, asking for your permission. The same may apply in conditionals, as in *I'll have this one, if I may*, “if you will allow me” (a fixed expression, where *may* is not replaceable by *can*).

obligation to do something (again, more likely than an objective reading reporting an obligation imposed by someone else). This is found quite commonly with illocutionary verbs, as in *I must admit it's better than I expected* – a rather special case, for the utterance itself normally effects actualisation, i.e. I make the admission by saying *I must admit* . . .<sup>53</sup>

### ■ Time of situation

Deontic modality generally applies to future situations: I can oblige or permit you to do something in the future, but I can't oblige or permit you to have done something in the past. Deontic modality can combine with past or present situations only with general requirements, conditions, options, etc., as in [20ii] (present) or *Candidates must have completed at least two years of undergraduate study* (past).

## 9.3.3 Dynamic necessity and possibility

### ■ Dynamic possibility

This covers a considerable range of uses, including the following:

#### (a) What is reasonable or acceptable

- [21] i *The most we can expect is a slight cut in the sales-tax.*  
 ii *You can always say you're too busy.*

*May* could appear as a very formal alternative to *can* in [i], but not in the intrinsically informal [ii]. The *always* in [ii] facilitates internal negation: *You can always not answer the phone*. As noted in §9.2.2, this use falls at the periphery of the dynamic category.

#### (b) What is circumstantially possible

- [22] i *It can easily be shown that the argument is fallacious.*  
 ii *Water can still get in.*

In this case, actualisation is possible because it is not prevented by factual or physical circumstances. *May* is again found in formal style, such as scientific writing, especially in combination with a passive (it is virtually excluded in [ii], partly by informal *get*, partly by the likelihood of it being interpreted epistemically rather than dynamically).

#### (c) What is sometimes the case: the 'existential' use

- [23] i *These animals can be dangerous.*  
 ii *Poinsettias can be red or yellow.*

We can gloss [i] as “These animals are sometimes dangerous” or “Some of these animals are dangerous” – by virtue of this relationship with the existential quantifier *some*, the modality here is sometimes called ‘existential’. The modal and the quantifier often combine harmonically, as in *These animals can sometimes be dangerous. He can be very tactless/helpful* shows this use with a singular subject, expressing characteristic behaviour. Example [ii] shows the existential use combined with *or*, with the interpretation “Some poinsettias are red, others yellow” (generally with the implicature that these are the only alternatives). This combination of *can* + *or* can also be regarded as harmonic, and as in the other such combinations the auxiliary could be omitted without significant

<sup>53</sup>There are two special uses of *may* that fall at the periphery of deontic modality. One is in the idiom *may as well* (e.g. *We/You/They may as well accept*), used to suggest a course of action in default of any better. The other is the optative *may* of *May you be forgiven!*, etc., mentioned in §2.1.2.

loss: *Poinsettias are red or yellow*. *May* is again possible in formal style, but it differs from *can* in that it readily allows internal negation (like epistemic *may*): *The hairs are there all the time, although they may not grow noticeably before puberty* (“sometimes they don’t”).

#### (d) Ability

- [24] i *She can run the marathon in under three hours.* [potential]  
 ii *I can hear something rattling.* [currently actualised]

Ability is a matter of internal properties on the part of the subject-referent; it represents a grammatically distinct use in that *may* is excluded even in the most formal style. Two subcases can be distinguished: potential and currently actualised. The latter is found with sense verbs and various verbs of cognition, and here there is low-degree modality: [ii] differs little from *I hear something rattling*. By contrast, [i] differs very sharply from the unmodalised *She runs the marathon in under three hours*. The latter is interpreted as a serial state, with multiple runnings, whereas [i] could be said on the basis of a single marathon under three hours – indeed she may not have run a marathon at all but merely displayed potential in training. In this potential ability case, the degree of difference from the unmodalised version will depend very much on the pragmatics of the situation concerned. There is, for example, little effective difference between *She can speak fluent French* and *She speaks fluent French*, because it is not easy to see how one could justifiably assert the former without repeated actualisations of the ability.

### ■ Dynamic necessity

Dynamic *must* is seen in:

- [25] i *Ed’s a guy who must always be poking his nose into other people’s business.*  
 ii *Now that she has lost her job she must live extremely frugally.*

Example [i] represents prototypical dynamic modality in that it is a matter of someone’s properties/disposition: the necessity arises from some internal need, rather than being imposed by some deontic source. An approximate equivalent in terms of negated possibility is *who can’t help poking his nose into other people’s business*. This use is thus comparable to the ability use of *can* – but whereas ability is a very frequent use of *can*, internal need is a fairly rare use of *must*. No equivalence is to be found here matching that shown in [19i] and [13i]: *He mustn’t swim* cannot be interpreted as equivalent to *He can’t swim* in the dynamic sense. The boundary between deontic and dynamic is somewhat blurred in explicit or implicit conditional constructions like *These plants must have plenty of water if they are to survive*: the plants need the water, but there may be an implicit obligation on relevant persons to ensure they have it.

Example [25ii] is more peripheral to the dynamic category, involving circumstantial necessity, comparable to the circumstantial possibility of [22] above. It is not a matter of obligation imposed by a deontic source, but simply force of circumstance. But *must* is less likely than *have* or *need* in such cases.<sup>54</sup>

<sup>54</sup>Dynamic *must* is sometimes found in the harmonic idiom *must needs*: *Apart from the radio and a small decca set, there are none of the modern aids to navigation on board so the skipper and his mate must needs be master of their craft*.

## 9.4 Idiomatic *should*, and *ought*

*Should* is the preterite form of *shall* but, as noted in §2.5.3, in some uses (the more frequent ones) the meaning is not derivable from that of *shall* + preterite inflection. We deal with these idiomatic uses in this section and take up the non-idiomatic ones in §9.8.

### 9.4.1 Medium strength modality

In its most frequent use, *should* expresses medium strength deontic or epistemic modality and is generally interchangeable with *ought* (+ *to*):

- [26] i You should / ought to tell your mother. [deontic]  
 ii The next road on the left should / ought to be King Street. [epistemic]  
 iii He should / ought to do better this time. [ambiguous]

In the deontic interpretation of [iii] it is a matter of what is expected of him, whereas in the epistemic interpretation it is a matter of what I expect will happen. In the former case I could add *but I don't suppose he will*, while a possible continuation for the latter is *judging by the amount of training he's done*.

#### ■ The deontic use

Deontic *should/ought* is usually subjective, indicating what the speaker considers 'right' – whether morally (*One should always tell the truth*) or as a matter of expediency (*We should buy now while the market is depressed*). They are weaker than *must* in that they allow for non-actualisation: *I should stop now but I'm not going to*. With past or present time they are commonly used when it is known that the situation was/is not actualised, in which case they convey criticism: *He shouldn't have gone to bed so late*; *You should be doing your homework instead of watching television*. One difference between *should* and *ought* is that only the former is normally used in issuing indirect directives (Ch. 10, §9.6), such as instructions: *The right-hand column should be left blank*, "Leave the right-hand column blank".

#### ■ The epistemic use

Epistemic *should/ought*, again usually subjective, has a strength comparable with *probable*, but differs from it in that it involves inference (compare the difference between epistemic *must* and *certainly*). This means that the concept of 'right' is also relevant here: in [26ii], if the next road is not King Street, then I shall have failed to make the right inference.

#### ■ Primacy of the deontic use

The deontic use of *should/ought* is more basic than the epistemic use. An epistemic reading is hardly possible with past time situations. Note, for example, the contrast between *must/may* and *should/ought* in:

- [27] i She must/may have left yesterday. [epistemic]  
 ii She should / ought to have left yesterday. [deontic<sup>55</sup>]

<sup>55</sup>In this deontic reading the past time applies to the modality: it is a matter of what was (or would have been) right, not of what is right now. Deontic *must* and *may* cannot be used in this way with *have* for past obligation or permission: see §9.8.

More generally, there are many cases where the interpretation is purely deontic, but few where it is purely epistemic. If you ask where the key is and I reply, *It should be in the desk drawer*, there is an epistemic component in the meaning (“You’ll probably find it there”), but there is likely to be a deontic component too (“If it isn’t there, it’s not in its right place”). If you are sending a manuscript to a publisher and I say, *They should accept it*, this can have a purely deontic reading (“It would be wrong of them not to accept it”, with no epistemic judgement as to whether they will) or it can have an epistemic reading (“I’m fairly confident that they will”), but this is again not wholly free of deontic meaning: my expectation that they will accept is inseparable from the judgement that that is the right thing for them to do.

The primacy of deontic *should/ought* is also reflected in the fact that an epistemic reading is much less likely with unfavourable situations than with favourable ones. Thus if we replace *accept* by *reject* in this last example the epistemic reading becomes very unlikely. The primacy of the deontic use (where the situation is characteristically in the future) may also explain why *should/ought* are used epistemically in inferring consequences from causes but not the other way round, so that they could substitute for *must* in *He’s better now: he must be able to return to work*, but not in *He’s back at work now: he must be better*.

### ■ Negation

*Should/ought* normally take internal negation: *You shouldn’t eat so much* exhorts you to refrain from eating so much. There are no equivalent items taking external negation, i.e. no items related to them as *need* is to *must* or *can* to epistemic *may*, but this is to be attributed to the fact that with medium strength modality there tends to be no pragmatic difference between external and internal negation (§9.2.1).<sup>56</sup>

## 9.4.2 Low-degree modality

There are several constructions, predominantly subordinate ones, where *should* (but not *ought*) appears with low-degree modality, i.e. with little discernible modal meaning of its own:

- |        |  |               |
|--------|--|---------------|
| [28] i | <i>It is essential/desirable that he <u>should</u> be told.</i>                      | [mandative]   |
| ii     | <i>We invited her husband too, lest he <u>should</u> feel left out.</i>              | [adversative] |
| iii    | <i>We invited her husband too, in order that he <u>should</u> not feel left out.</i> | [purposive]   |
| iv     | <i>It’s surprising that he <u>should</u> have been so late.</i>                      | [emotive]     |
| v      | <i>If you <u>should</u> experience any difficulty, please let me know.</i>           | [conditional] |

In the first two, *should* is a somewhat less formal alternative to a plain form verb (*that he be told, lest he feel*).

### ■ Mandative *should*

In the mandative construction we have something similar to a harmonic combination of modal auxiliary + matrix predicative element, for the predicative items concerned have deontic meaning. The use of *should* here, however, is grammaticalised in that

<sup>56</sup> *Should* is often used with *why* with an implicature that there is no (deontic or epistemic) reason for actualisation: *Why should we let him get away with it?*; *Why should it have been Max who told her?* (“I don’t think it was”). A further special use of *should* is in certain Yiddishisms that have gained wide currency, e.g. *I should be so lucky*, where it conveys non-actualisation (“I am not / won’t be so lucky”).

it combines as readily with items of strong modality (*necessary, essential, imperative*, etc.) as with those of medium strength (*desirable, advisable, right*, etc.) – see Ch. 11, §7.1.1.

### ■ Emotive *should*

This occurs primarily with predicative lexemes indicating surprise or evaluation: *odd, remarkable, surprising, good, bad, a pity*, etc. The *should* clause can generally be replaced by an unmodalised one: compare [28iv] with *It's surprising that he was so late*.<sup>57</sup> This emotive *should* is also found in main-clause interrogatives used with the force of rhetorical questions: *I was walking in the park and who should I meet but Angela Cooke!* (“to my surprise I met . . .”).

### ■ Conditional *should*

This expresses slightly greater doubt than the non-modal counterpart: compare [28v] with *If you experience any difficulty, . . .* This is why it cannot be used when there is no element of doubt at all, as in *If you're my father, why don't you help me?* and the like. It is usually found in open conditionals, but the remote construction is also possible: compare *If there should be any opposition, they will/would not go ahead with the plan* (where *will* indicates open, *would* remote).

## 9.5 Will

In general *will* conveys a lower degree of modal meaning than the auxiliaries considered so far; nevertheless, it has much in common with them semantically and pragmatically as well as syntactically.

### 9.5.1 Epistemic modality, including futurity

There are three uses of *will* that fall within the general area of epistemic modality:

- [29] i *They will have made the decision last week.* [central-epistemic]  
 ii *She will beat him easily.* [futurity]  
 iii *If they are here, they'll be upstairs.* [conditional consequence]

The central-epistemic use is found with past and present time situations and the futurity use, of course, with future time. The conditional consequence use, on the other hand, applies with any of the three time spheres, and for that reason provides a bridge or link between the first two uses.

### ■ The central-epistemic use

The past time case, marked by perfect *have*, is illustrated in [29i], the present in:

- [30] [Knock on door] *That will be the plumber.*

This use is normally restricted to 2nd or 3rd person subjects: we will not say, for example, *#I will/shall have offended him by what I said at yesterday's meeting* (where epistemic *may*

<sup>57</sup>Actualisation is not always conveyed: *It is unthinkable that she should give up without a fight*, for example, involves a potential future situation whose actualisation is unthinkable. An unmodalised form is not possible here, but an infinitival construction is, especially with a modalised main clause: *It would be unthinkable for her to give up without a fight*.

or *must* could occur quite readily). It therefore excludes *shall*, which always has deontic meaning with 2nd/3rd person subjects.

### Strength and degree of modality

Semantically *will* is strong, entailing the factuality of the situation. This is why we can't say *\*They will have made the decision last week though it's just possible that they have postponed it until the next meeting*: it is self-contradictory. Usually, however, there is a considerable amount of pragmatic weakening. For example, [291] is epistemically much weaker than *They made the decision last week*: the latter presents it as something I know, whereas the former presents it as a confident prediction. In such cases, therefore, we have a sharp difference between modalised and unmodalised versions, with a high degree of modality attaching to *will*. The difference from the unmodalised version is of the same general kind as we find with epistemic *must* and *may*, and it is for this reason that we refer to this as the 'central-epistemic' use: it falls very centrally within the area of epistemic modality.

The examples given have involved subjective modality, but *will* can also be used objectively. In this case, as with *must*, there is less pragmatic weakening, and hence a lower degree of modality:

[31] *Ed is Tom's father and Tom is Bill's father, so Ed will be Bill's grandfather.*

Here the evidence for the factuality of Ed's being Bill's grandfather is so strong that I could equally well have used unmodalised *is*: the effect of *will* is just to present Ed's being Bill's grandfather as something that follows from what has just been said, rather than as a matter of direct knowledge.

### Will vs must

*Will* has the same semantic strength as *must*, and in its central-epistemic use it can generally be replaced by *must* with relatively little change of meaning. *Must* conveys the idea of conclusion, and is often used in explanations: *Ed's late – he must have overslept*. With central-epistemic *will* it is more a matter of assumption or expectation, very often with a suggestion of future confirmation, as in: *I can't tell you what the word means but it will be in the dictionary*. Compare futurity *You will find it in the dictionary*. *Will* would therefore hardly substitute for *must* in *You were mad to tell her: you must have known how upset she would be*, for it is hardly a case where the issue of future confirmation would arise. *Will* seems, moreover, to allow somewhat more pragmatic weakening than *must*, which also makes it less appropriate in this context. The idea of future confirmation is similarly unlikely to be relevant in *This must be the best restaurant in town*, though *will* would also be avoided for this present time meaning because it would most likely be misinterpreted as indicating futurity.

## ■ Futurity

We have emphasised that in main clauses a simple present tense can be used for future time only under strict pragmatic conditions: *We leave for Sydney tomorrow* but not, normally, *\*You understand when you receive Kim's letter tomorrow*. The default way of locating the situation in future time is by means of *will*: *You will understand when you receive Kim's letter tomorrow*.

### Varying degree of modality

In such cases the temporal component of meaning appears pre-eminent, but futurity is accompanied by varying degrees of modal meaning. This can be seen by comparing the following contrasts between past and future:

- |      |   |   |
|------|---|---|
| [32] | PAST TIME                                   | FUTURE TIME                                   |
|      | i a. He <u>was</u> two yesterday.           | b. He <u>will be</u> two tomorrow.            |
|      | ii a. She <u>beat</u> him in under an hour. | b. She <u>will beat</u> him in under an hour. |

In [i] there is little perceptible difference between [a] and [b] other than the temporal one: *will* here comes close to being simply a marker of futurity, with the modal component reduced to a minimum. It is not quite zero, however, for the truth of [b] is contingent on his surviving until tomorrow. In this example *will be* is interchangeable with futurate *is*, but the existence of a present futurate is not a necessary condition for *will* to be perceived as having a minimal degree of modality. Compare, for example, *It was soon too dark to play any more* and *It will soon be too dark to play any more*, where *will be* is not replaceable by *is*. If the *will* sentence is uttered on the playing field as the light fades, the modal component will again be minimal. In [ii], however, the temporal difference between [a] and [b] is accompanied by a significantly greater modal difference: [iia] reports a past event while [iib] is clearly perceived as a prediction, not a factual statement about the future. However confident I may be about the match, innumerable factors could intervene to prevent the prediction coming true. The epistemic status of [iib] is thus quite sharply different from that of [iia]. Similar are examples like *It will be a long time before we have another summer like this*, *You won't recognise him*, and so on.

Variation in the degree of modal qualification associated with *will* can also be seen by comparing the *will* construction with the present futurate in cases where the latter is acceptable:

- |      |   |  |
|------|---|--|
| [33] | PRESENT FUTURATE  | FUTURITY <i>WILL</i>   |
|      | i a. He <u>is</u> two tomorrow.   | b. He <u>will be</u> two tomorrow.                                       |
|      | ii a. Australia <u>meets</u> Sweden in the Davis Cup final in December. | b. Australia <u>will meet</u> Sweden in the Davis Cup final in December. |

In [i] there is no effective difference between the two constructions, whereas in [ii] the difference is quite sharp. As we noted in §4.2.4, [iia], with unmodalised *meets*, is appropriate only in a context where the semi-finals have been played, so that the finalists have already been determined, whereas [iib], with modal *will meet*, could be used earlier in the competition, predicting the outcome of the intermediate matches. *Will meet* is thus pragmatically considerably weaker than *meets*: it requires less supporting evidence, less 'epistemic warrant'.

It is evident, therefore, that futurity *will* potentially carries a significant amount of modal meaning. The modality concerned is of the epistemic kind, since it is generally a matter of limitations to the speaker's knowledge. There is a close intrinsic connection between futurity and modality: our knowledge about the future is inevitably much more limited than our knowledge about the past and the present, and what we say about the future will typically be perceived as having the character of a prediction rather than an unqualified factual assertion.

### Non-occurrence of futurity *will* in temporal clauses

When adjuncts and the complements of temporal prepositions such as *after*, *before*, *as soon as*, etc., take the simple present, not the *will* construction, when the reference is to future time:

- [34] i *I'll buy one when the price comes / \*will come down.*  
 ii *We'll go for a walk as soon as it stops / \*will stop raining.*

Here I do not **assert** that the price will come down or that it will stop raining, but simply take the occurrence of these events for granted. The modal qualification which *will* conveys (in varying degrees) would therefore be out of place: the grammar requires the unmodalised forms.

### Futurity *will* in conditional protases

With future time conditionals the protasis (the subordinate clause) may or may not contain *will*:

- [35] i *If [the price comes down in a few months], I'll buy one [sc. then].*  
 ii *If [the price will come down in a few months], I'm not going to buy one now.*

Version [i] illustrates the usual construction: [ii] is quite rare. In [i] I again do not assert that the price will come down (but merely entertain it as a possibility) and therefore the modal qualification associated with *will* is here too out of place. In [ii], however, *will* does appear in the protasis because the modal meaning it expresses is part of the proposition that is conditionally entertained. In [i] the condition is a matter of the future occurrence of an event, whereas in [ii] it is a matter of the present predictability of an event (it might be glossed as “If it is the case that the price will come down in a few months”, a type of gloss quite inappropriate for [i]). Note that the behaviour of *will* here matches that of the other epistemic modals – compare, for example, *If the price may come down in a few months, I'm not going to buy one now.*<sup>58</sup>

## ■ Conditional consequence

*Will* is very often used in the apodosis of conditional constructions, whether the time is past, present, or future:

- [36] i a. *If it rained last night [the match will have been cancelled].* [past time]  
 b. *If it rains tonight [the match will be cancelled].* [future time]  
 ii a. *If he's still in Bath, [he'll be at his mother's].* [sc. now] [present time]  
 b. *If he's still in Bath when you arrive, [he'll be at his mother's].* [future time]

In none of the three time spheres is *will* required. We therefore have such contrasts as the following:

- [37] i *If Ed signed the petition [he was / will have been the only one of us who did].*  
 ii *If he's still in Bath [he is / will be at his mother's].*  
 iii *If you're late again tomorrow, [you are / will be fired].*

Again, the version with *will* is pragmatically somewhat weaker than the one with the simple preterite or present. This is perhaps clearest with past time. If I'm uncertain

<sup>58</sup>The epistemic modality expressed by *will* or *may* in these conditional protases is of the objective type: it is not a matter of the speaker's subjective judgement.

whether Ed signed but know that no one else among us did, then I will use the simple preterite *was*: *will have been* conveys a lesser degree of confidence in the conclusion. Compare, similarly, *If he said that, he was mistaken*: in a context where I have no doubt that “that” is false, *will have been* would be out of place. With future time, the simple present tense (the futurate construction) is rare; in [iii] it strengthens the threat by emphasising the ineluctability of the consequence.

As suggested above, the use of *will* for conditional consequence can be seen as providing a link between the central-epistemic and futurity uses. Examples [36–37] are alike in that *will* indicates the predictability of the consequence, yet the past/present time cases have clear affinities with the central-epistemic *will*, and the future cases with the *will* of futurity. Note that in all three time spheres, strong *will* contrasts with weak epistemic *may*.

## ■ Differences from the modals of necessity and possibility

### Modal adverbs

*Will* does not combine harmonically with modal adverbs as *must* does with *surely/ necessarily* or *may* with *perhaps/possibly*. Adverbs of any strength, *possibly, probably, certainly*, etc., can all be added to epistemic *will* (just as they can to corresponding clauses without a modal auxiliary): *They will surely/probably/perhaps have made the decision last week*; *She will certainly/very likely/possibly beat him easily*. The adverbs are of high-degree modality, quite different in meaning from *will*, so that when they are added they bring a distinct modal meaning rather than harmonically reinforcing that of *will*.

### Negation

A second important difference between *will* and the modals of necessity and possibility is that it does not enter into any contrast between external and internal negation such as we find between *needn't* and *mustn't* or *can't* and *may not*. *She won't have read it yet* (central epistemic) and *She won't win as easily next time* (futurity) have internal negation and there are no comparable forms in which the negation applies to the modality.

Both these differences between *will* and the modals of necessity and possibility can be related to the degree of modality involved: in contrast to *must, may*, etc., *will* is a low-degree modal.

## 9.5.2 Dynamic modality

Under this heading we consider those uses of *will* where dispositions or properties of the subject-referent are involved.

### (a) Volition

- [38] i *Jill won't sign the form.*  
 ii *They have found someone [who will stand in for you while you're away].*  
 iii *I will be back before six.*

Example [i] implies unwillingness or refusal on Jill's part; in [ii] *will* might be glossed as “is prepared/willing to”; and in [iii] the auxiliary conveys the idea of intention.

### Difference between *will* and *want, be willing, etc.*

It must be emphasised, however, that *will* does not have the same meaning as *want, be willing, be prepared, intend*, and the like. In the first place *will* expresses strong modality

(as noted above for the epistemic uses), whereas *intend* and *want* are of medium strength, with *willing* and *prepared* still weaker. For example, [38iii] entails actualisation, so that it would be inconsistent to add *but I may not be able to manage it* (whereas *I intend/want to be back before six but may not be able to manage it* is perfectly acceptable). Secondly, with *will* there is normally no contrast between external and internal negation such as we find between, say, *She isn't willing to receive any payment* and *She is willing not to receive any payment*. Example [38i] entails her future non-signing of the form, and hence is best regarded as having internal negation (like *mustn't*), but there is no way of negating just the volitional component, leaving open the issue of future actualisation – nothing comparable to *She doesn't mind whether she signs the form or not* (hence nothing comparable to *needn't*).

These points indicate that even in the volitional use *will* has a low degree of modality: the modal meaning is not sharply separable from the non-modal component. Volition and futurity are not contrasting meanings of *will*, so that one has no feeling of ambiguity between volitional and non-volitional future in examples like [38iii] (any more than one has a feeling of ambiguity between volitional and non-volitional past in the unmodalised *I was back before six*). Volition is better regarded as an implicature overlaid upon futurity – an implicature deriving from the assumption that the subject-referent is in control, e.g. in [38iii] that I have control over the time of return. With a 1st person subject, moreover, volition tends to trigger a further implicature of commitment – and you might ask *Is that a promise?* in order to get me to make the commitment explicit.

#### Heightening of volitional meaning

The separateness of the volitional component is heightened in an example like [38i] uttered in a context where she has already expressed her intentions – *I've told her how urgent it is but she won't sign the form*. This interpretation differs from that where I am simply predicting her future non-signing. But the difference is not so much between volition and mere futurity as between current, present volition and volitional future, for the presumption must be in any case that non-signing is subject to her control and hence volitional. It is the combination of volition with present time (time distinct from that of the actualisation) that makes the modal component more separable. Such heightened modality is more likely in the negative than the positive: I am more likely to report refusal by *she won't* than agreement by *she will* (in the positive the present orientation would favour *she's going to*). Other factors which similarly tend to heighten the volitional component are illustrated in:

- |        |  |                           |
|--------|--|---------------------------|
| [39] i | <i>I <u>will</u> solve this problem.</i>   | [strongly stressed modal] |
| ii     | <i><u>Will</u> you lend me your pen?</i>   | [closed interrogative]    |
| iii    | <i>I'll wash if [you <u>will</u> dry].</i> | [conditional protasis]    |

A strongly stressed *will*, especially with a 1st person subject, tends to convey determination. A closed interrogative, especially with a 2nd person subject, characteristically questions willingness and indirectly conveys a request (Ch. 10, §9.6.1). Futurity *will* rarely occurs in a conditional protasis, as noted above, but volitional *will* is quite unexceptionable, as in [iii], where your willingness is clearly part of the proposition that is conditionally entertained.<sup>59</sup>

<sup>59</sup>One special case of volitional heightening is in subordinate elliptical constructions with comparative *as* (*He receives a large allowance to spend as he will*) or relative *what* (*Do what you will*).

### Extension to inanimates

Volition implies a human or animate agent, but something akin to a metaphorical extension of volitional *will* is found with inanimates when it is a matter of satisfying human wants, as in *The lawnmower won't start* (someone is trying to start it) or *The books won't fit on one shelf*. These again appear freely in conditionals: *Give me a call if the engine won't start*.

### (b) Propensity

- [40] i *He will lie in bed all day, reading trashy novels.*  
 ii *Oil will float on water.*

Here we are concerned with characteristic or habitual behaviour of animates or general properties of inanimates. A simple present could be substituted with little effect: this use is therefore fairly sharply distinct from futurity, though in many cases there is a connection through conditional consequence – compare [ii] with *If you pour oil on water it will float*. Strong stress on the auxiliary conveys the speaker's emotive response to the situation – usually exasperation, disapproval, resignation, or the like: *He WILL pour the tea-leaves down the sink*.

## 9.5.3 Deontic modality

- [41] *You will report back for duty on Friday morning.* [speaker's requirement]

The deontic use of *will* is a matter of implicature: if I predict your agentive actions (or someone else's) in a context where I have the authority to require them, I will be understood as tacitly invoking that authority. The evidence for the prediction is that I am telling you to do something and you are required to do as I say. The same implicature is found with *be going* (in informal speech), as in the sports coach's *You're going to go out there and give them all you've got*.

## 9.6 Shall

### 9.6.1 Deontic modality

Three deontic uses of *shall* are seen in:

- [42] i *The committee shall meet at least four times per year.* [constitutive/regulative]  
 ii *You shall have your money back tomorrow.* [speaker's guarantee]  
 iii *Shall I close the window?* [direction-seeking]

#### (a) The constitutive/regulative use

This is used in constitutions, regulations, and similar legal or quasi-legal documents. The subject is normally 3rd person.

#### (b) Speaker's guarantee

In [42ii] I give an undertaking that you will get your money back: I put myself under an obligation to ensure that the situation is actualised. This use is relatively uncommon and differs from the central cases of deontic modality in that the obligation is placed on the speaker. It is found with 2nd and 3rd person subjects.

(c) *Shall* in direction questions

Example [42iii] is what we call a direction question (Ch. 10, §4.6): I'm asking you to tell me whether to close the window or not. The prototypical answer is an imperative (e.g. *Yes, please do*), not a declarative with *shall*. This use occurs mainly with 1st person subjects, and for many varieties *will* would be quite impossible here with this meaning.

9.6.2 Non-deontic uses and the choice between *shall* and *will*

With a 1st person subject, *shall* occurs as a variant of *will* as follows:

- [43] i *I shall never understand why she left.* [futurity]  
 ii *If the rules have changed as much as you suggest we shall have done most of this work for nothing.* [consequence]  
 iii *I shall do as she says.* [volition]

We have noted that conditional consequence very often involves future time (cf. *If we don't leave now we shall miss the bus*), but [ii] shows again that it does not have to. The other epistemic use of *will*, the central-epistemic one of *That will be the plumber*, is not found with a 1st person subject, and there is accordingly no corresponding use of *shall*. The *shall* of [43i–ii] occurs also in the interrogative – e.g. for futurity, *When shall I be well enough to leave hospital?* The interrogative counterpart of [iii], however, *Shall I do as she says?*, has a deontic meaning, like [42iii] above.<sup>60</sup>

There is a well-known prescriptive rule that treats *shall* and *will* as complementary:

[44]	Traditional prescriptive rule	1ST PERSON	2ND/3RD PERSON
	i Futurity (so-called future tense)	<i>shall</i>	<i>will</i>
	ii Volition/determination	<i>will</i>	<i>shall</i>

The classic illustration contrasts the drowning man's *I shall drown and no one will save me* (expressing futurity) and *I will drown and no one shall save me* (expressing a determination to drown). It is quite clear, however, that this rule is not valid.

As for [44i], we must allow *will* as well as *shall* for the 1st person – and modern usage manuals recognise this. *Will* (including the contracted variant 'll) is in fact very much more common, and indeed in AmE *shall* is quite rare. There is also a style difference, with *shall* tending to be somewhat more formal. Part [ii] of rule [44] is unsatisfactory for two reasons. Firstly, with a 1st person subject there is again variation between *will* and *shall*: *We will/shall never surrender*. *Will* is here more frequent than *shall* – even more so than is the case with futurity. Secondly, with a 2nd/3rd person subject both *will* and *shall* are possible but they have different meanings. For subject-referent's volition, *will* occurs with all three persons – e.g. *I've said I won't sign*, *You've said you won't sign*, *She's said she won't sign*. The 2nd/3rd person *shall* of *You/They shall have my answer tomorrow* we have labelled 'speaker's guarantee': it indicates the speaker's

<sup>60</sup>Non-deontic *shall* is not wholly restricted to 1st person subjects. Some speakers allow it in 2nd person interrogatives like *Shall you take a taxi?*, where *Will you take a taxi?* is likely to be taken as a request rather than a question about your intentions. This use is uncommon and for many speakers sounds old-fashioned and formal; the more usual way of avoiding the request interpretation is by use of the progressive *Will you be taking a taxi?* There is also an archaic use of *shall* in an open protasis, still found in some legal language: *If the tenant shall at any time fail to keep the demised premises as aforesaid the landlord may do all things necessary to effect or maintain such insurance. Shall fail* here is semantically indistinguishable from *fails*; this use of *shall* is comparable to that of *should* in [28iv].

determination or promise that the situation will be actualised. With a 1st person subject the distinction between volition and speaker's guarantee is not so sharp since the subject-referent is (or includes) the speaker. Nevertheless, there is good reason to treat *I shall let you have my answer tomorrow* as volition, since this *shall* can be replaced without change of meaning by the ordinary volitional *will*: *I will let you have my answer tomorrow*.

### 9.7 *Had better* and auxiliary *dare*

The idiom *had better* and the modal auxiliary *dare* have a much narrower range of use than the items discussed above, both being restricted to just one of the three kinds of modality:

- [45] i *You/I had better telephone her.* [deontic]  
 ii *I daren't tell her.* [dynamic]

#### ■ Deontic *had better*

This is generally subjective, giving the speaker's judgement as to the best course of action. Unlike *should* but like *must*, it doesn't countenance non-actualisation: *He should / \*must / \*had better tell her but I don't suppose he will*. This makes it semantically strong, but it is normally pragmatically weaker than *must*, less a matter of the speaker's will. The modality is always in present time: compare again *He should / \*must / \*had better have done it himself*. Negation is normally internal, whether marked after or before *better*: *He had better not tell her; He hadn't better tell her*.

#### ■ Dynamic *dare*

This means essentially "have the courage" – a matter of the subject-referent's disposition. In declarative main clauses auxiliary *dare* is normally negative, and the negation is external: *I daren't open the door*, "I don't have the courage to". This entails that I won't open the door, which puts *dare* with the weak modals (cf. *I can't open the door*).

### 9.8 The preterite forms *could*, *might*, *would*, *should*

We have distinguished three uses of the preterite: past time, backshift, and modal remoteness. It is a distinctive property of the modal auxiliaries that the modal remoteness use is much more frequent and less restricted than the past time use – the complete reverse of what holds for other verbs.

#### 9.8.1 Past time

*Could* and *would* are quite commonly used with past time meaning but, significantly, the majority of examples involve dynamic modality, the kind that is least different from the type of meaning expressed by lexical verbs. Past time *might* is seen in such attested examples as:

- [46] i *When my father was attached to a cavalry regiment at Brighton before we moved to Stonehurst, my parents might attend an occasional concert at the Pavillion.*  
 ii *The completion of the canal increased the ease with which the Mons coal might be sent to Nord.*

This use is, however, very rare, and somewhat formal or literary in style: for many speakers *might* is restricted to the backshifted and modal remoteness senses. And *should* is not used at all with past time meaning.

### ■ Past time *could*

Present tense *can* is matched by *could* in all the deontic and dynamic uses given in §9.3:

- [47] i *In those days we could borrow as many books as we wished.* [permission]  
 ii *The most we could expect was a slight cut in sales-tax.* [reasonable/acceptable]  
 iii *Water could still get in.* [circumstantial possibility]  
 iv *He could be very tactless at times.* [existential]  
 v *She could run the marathon in under three hours.* [potential ability]  
 vi *I could hear something rattling.* [actualised ability]

#### Restriction on use of *could* in affirmative contexts

An important restriction is that *could* does not normally appear in affirmative contexts when it is a matter of actualisation of a single situation viewed perfectly. Compare:

- [48] i *I left early but still couldn't get a seat.* [non-affirmative]  
 ii *\*I left early and could get a good seat.* [affirmative]

In [ii] we need *was able*. Similarly imperfective *rattling* in [47vi] is not replaceable by perfective *rattle* – cf. *Last night I heard / \*could hear the clock strike two*. The restriction applies also to *can*, but is less obvious because of the general restriction on the perfective present. Thus in a timeless synopsis (§4.2.2) where this general restriction doesn't apply, we find the same contrast between *able* and *can*: *She starts early and is able to / \*can finish on time*.

### ■ Past time *would*

This is used with dynamic modality (volition or propensity) and with futurity:

- [49] i *I had no money on me but he wouldn't lend me any.* [volition]  
 ii *Whenever he heard her coming he would quickly put out his pipe.* [propensity]  
 iii *Only a few months later their love would change to hate.* [futurity]

#### Volition

The restriction just noted for *could* applies also with volitional *would*. It is normally excluded from affirmative contexts with singulary dynamic situations, so that we couldn't replace *wouldn't* in [49i] by *would* – we would use unmodalised *lent me some* (or *was willing to lend me some*, etc.). This time the restriction doesn't apply to *will* (cf. *I haven't any money on me but fortunately Ed will lend me some*).<sup>61</sup>

#### Propensity

This normally involves a serial state, as in [49ii], but there is a use of *would* which can be regarded as a special case of the propensity use and where we do find singulary actualisation in an affirmative context: *He would call round just when I wanted an early*

<sup>61</sup>The contexts allowing *would* are a little broader than the ordinary non-affirmative ones: for example, *just* permits *would* but not *any*: *The text would just fit on one page*, but not *\*I just had any money*.

*night*. The modal is always stressed – with an emotive effect like that of stressed propensity *will*. But *will* differs from *would* in not allowing reference to a single actualisation – if, in response to a jocular remark, I say *He WILL have his little joke*, I am describing his typical or habitual behaviour, not a particular instance of it, as in the *would* example. The connection with the ordinary case of propensity is that the event is presented as typical. What it is typical of is not expressed, but we infer something like “typical of the inconvenient/annoying things that he does or that happen (to me)”.

### Futurity

*Would* is also used to indicate futurity in the past, futurity relative to the time referred to by the preterite, as in [49iii]. As with *will*, actualisation is entailed – and the actualisation is virtually required to have already taken place, so that a simple preterite could have been used instead: *A few months later their love changed to hate*. The difference is in the choice of  $T_0$ : *changed* is a deictic past, while *would* has a past  $T_0$ , and [49iii] therefore has some affinity to non-subordinate backshift (§6.2.1). This use of *would* is restricted to narrative and similar genres.

## 9.8.2 Backshift

*Could*, *would*, *should*, and *might* occur as backshifted preterites. Compare:

- [50] i *I can/may/will/shall see her shortly.* [original utterance: present tense]  
 ii *I knew I could/might/would/should see her shortly.* [backshifted: preterite]

In this construction the distinction between a present tense and a modally remote preterite is lost:

- [51] i a. *I can win if I really try.* b. *I could win if I really tried.*  
 ii a. *He said I could win if I really tried.* b. *He said I could win if I really tried.*

The backshifted reports of [ia], an open conditional, and [ib], a remote conditional, are identical. In open [iia] the preterite in *could* (and *tried*) indicates that  $T_0$  is in the past, whereas in remote [iib] it indicates modal remoteness and the location of  $T_0$  is not expressed. The open conditional interpretation is the more likely because the open conditional construction is the default one. It is clear, however, that the remote interpretation is grammatically possible, for we have examples like *He knew he would be in trouble if they were to check his alibi*, where this use of *be* is found only in the remote construction (cf. §6.1).

## 9.8.3 Modal remoteness

Three broad subcases of the modal remoteness use can be distinguished: in remote conditionals and the complement of *wish*, to indicate tentativeness, and a special use applying just to *could* and *might*.

### (a) Remote conditionals and the complement of *wish*

We have seen that the distinction between open and remote conditional constructions is marked syntactically by tense. One major use of the preterite modals, therefore, is in the apodosis of a remote conditional, where they contrast with the present tense forms of an open conditional:

- [52] i *If he pays the fare [I can/may/will/shall take a taxi].* [open: present]  
 ii *If he paid the fare [I could/might/would/should take a taxi].* [remote: preterite]

We also include here cases where the condition is implicit – most obviously those where a condition is inferrable from the context, as when *I wouldn't sign* is interpreted as “I wouldn't sign if I were you”.

The relation between *would* and *should* matches that between *will* and *shall* described in §9.6.2. *Might* in this construction is generally epistemic: it could not, for example, substitute for the *could* of deontic permission in *If he hadn't misbehaved he could have come with us*.

### Remote apodosis requires a modal auxiliary

In Present-day English the apodosis of a remote conditional must contain a modal auxiliary:

- |      |  |    |  |          |
|------|--|----|--|----------|
| [53] | – MODAL AUXILIARY                                    | +  | MODAL AUXILIARY                          |          |
| i    | a. <i>If he's here, he's <u>u</u>pstairs.</i>        | b. | <i>If he's here he'll be upstairs.</i>   | [open]   |
| ii   | a. <i>*If he were here, he <u>w</u>ere upstairs.</i> | b. | <i>If he were here he'd be upstairs.</i> | [remote] |

The difference between [53ia] and [ib] is quite slight, and many grammars implicitly or explicitly treat the *would* construction [iib] as the remote counterpart of [ia] (as well as of [ib]): in such an analysis *would* is regarded as simply a marker of the remote conditional construction. The view taken in this grammar, however, is the one reflected in the display [53], namely that remote *would* is to be paired with open *will* – that [iib] differs semantically from [ia] not just as remote vs open but by virtue of containing modal “will”. Evidence for this view comes from considering examples where the presence or absence of *will* in the open construction is of greater significance:

- |      |     |  |                          |
|------|-----|--|--------------------------|
| [54] | i   | <i>If Oswald didn't shoot Kennedy someone else <u>did</u>.</i>       | [open; – <b>will</b> ]   |
|      | ii  | <i>If Oswald didn't shoot Kennedy someone else <u>will have</u>.</i> | [open; + <b>will</b> ]   |
|      | iii | <i>If Oswald hadn't shot Kennedy someone else <u>would have</u>.</i> | [remote; + <b>will</b> ] |

It is common knowledge that President Kennedy was shot, and with this background knowledge one would naturally use [i] rather than [ii]. Given that someone shot Kennedy, then if Oswald didn't, necessarily someone else did: the conclusion that someone else shot him is so certain and obvious that the epistemic qualification expressed by *will* in [ii] would be out of place. *Will* is used when the conclusion is somewhat less secure, as in our earlier example [36], *If it rained last night the match will have been cancelled*: here it is (we may assume) very reasonable to draw the conclusion, but it certainly doesn't follow necessarily from the premise since it's not impossible for a match to be played in the rain. Now consider the remote conditional [54iii]. What is striking here is that although (in view of the common knowledge mentioned) we accept [i] as true, we do not have any similar reason to accept [iii] as true. Example [iii] implicates that Oswald did shoot Kennedy but envisages a different world from our own in which he didn't, and there is no common knowledge that establishes that Kennedy would have been shot in such a world – that establishes that his shooting (by Oswald or someone else) was inevitable. The conclusion in [iii] therefore does not have the absolutely secure status that it does in [i], and that is why we perceive a difference between them with respect to truth. This is important because, in general, open–remote pairs do not differ in this way: compare *If he pays the fare I can take a taxi* with *If he paid the fare I could take a taxi* – or *If it rained last night the match will have been cancelled* with *If it had rained last night the match would have been cancelled*. An analysis which takes [iii] as the remote counterpart of [i] must therefore treat the meaning difference between them as exceptional.

No such problem arises in our analysis because for us [iii] is not the remote counterpart of [i]. It is the counterpart of [ii], which would be appropriate in a context where it was not known that Kennedy was shot, and where the conclusion was therefore again less secure than it is in [i]. (For further discussion of these issues, see Ch. 8, §14.2.2.)

*Wish* (together with certain similar expressions: Ch. 11, §7.2) requires a preterite in a finite complement, so that we have such contrasts as:

- [55] i *I'm glad you can/will join us.* [be glad + present]  
 ii *I wish you could/would join us.* [wish + preterite]

We group the remote conditional and *wish* constructions together because in both the preterite is here obligatory, and the contrast illustrated in [52] and [55] reinforces the inflectional relationship between *can* and *could*, *will* and *would*, etc.: they are different forms of a common lexeme required in different grammatical constructions.<sup>62</sup>

### (b) The tentative use

- [56] i a. *He'll be about sixty.* b. *He'd be about sixty.*  
 ii a. *Can you pass the salt, please.* b. *Could you pass the salt, please.*  
 iii a. *You may be right.* b. *You might be right.*

The difference between present tense and preterite is much less tangible here than in (a) above: the preterite introduces a rather vague element of tentativeness, diffidence, extra politeness, or the like. The intended context for [i] is that of answering such a question as *How old is he?* (we are not concerned here with the interpretation of [ib] as an implicit conditional, “He’d be about sixty now if he were still alive”). In such a context the unmodalised *He is sixty* makes an unqualified assertion. Example [ia] is less assured: it involves what we have called the central-epistemic use of *will*. And [ib] is then marginally weaker still, less confident. In [ii] we have indirect speech acts: questions about your ability are conventionally used as requests. In such cases the preterite is generally regarded as slightly more diffident, more polite. Finally, in [iii] we have epistemic possibility; for some speakers at least the preterite version [iiib] suggests a slightly lower degree of possibility than [iiiia] – they would find *may* a little more encouraging than *might*. Note that with epistemic *can* only the preterite version with *could* is used.

Further cases of tentative preterites are seen in:

- [57] i *It might/could be described as an act of provocation.* [dynamic]  
 ii *Might/Could I have a little more sugar?* [deontic]  
 iii *Would you tell them we're here.* [polite request]  
 iv *... and, I would suggest, it's too expensive anyway.* [indirect performative]  
 v *I would/should like to see him tomorrow.* [tentative version of *want*]  
 vi *They would appear to have gone without us.* [redoubled qualification]

<sup>62</sup>The contrast illustrated in [55] for *can/could* and *will/would* is not found with *shall/should* because *wish* is oriented to present (or past) time: we cannot therefore have \**I wish I should/would be able to attend* matching *I'm glad I shall/will be able to attend*. The contrast is also rather marginal for the *may/might* pair: we have *I'm glad the Grade 12 boys may attend* but *I wish the Grade 12 boys might attend* is very unlikely: it would be very much more natural here to have *could*.

Example [i] corresponds to the use of *may/can* glossed in §9.3.3 as “what is reasonable or acceptable”. Example [ii] is a request for permission, slightly more diffident than the version with *may/can* – still further politeness can be achieved by extra length, as in the harmonic combination *May/Might I be permitted to have a little more sugar?* The *would* of [iii] is volitional, again more diffident/polite than *will*. *Would* is also volitional in [iv] but actualisation is immediate, so that I make the suggestion (‘perform’ the act of suggesting: see Ch. 10, §3.1) in uttering the sentence, just as I do in the non-modal *I suggest*. *I would suggest* is less direct than *I suggest*, hence again more diffident.

*Would/should like* in [57v] is more or less a fixed phrase, contrasting as a whole with *want*. While *want* assigns a future interpretation to its complement (§7), *like* assigns a present interpretation (as in *I like to see him*); if the seeing is to be future, therefore, the liking must be too, hence the need for *will*. The preterite supplies the tentative feature, accepting that I may not be able to see him. However, a present tense conveys that the situation is a serial state (*I like to see him* conveys that I periodically do) and so does *will* (cf. *When you’re older you will probably like to see him*), whereas *would/should like* + infinitival allows a singulary situation, as in [v], and is to this extent idiomatic. The expression can also be used in indirect requests as a more elaborate alternative to the *would* of [iii]: *Would you like to tell them we’re here*. Compare also [iv] with *I should like to thank you for your kind hospitality*, which is an indirect expression of thanks, with *thank* another illocutionary verb.

In [57vi] *appear* is a lexical modal of medium strength, qualifying my commitment to the truth of the modalised proposition: compare unmodalised *They have gone without us* with modalised *They appear to have gone without us*. *Would* then adds further modal qualification, so that [vi] provides a double hedge against being wrong. There is no intermediate term with *will*, for *They will appear to have gone without us* has futurity, not central-epistemic *will*. The same effect is found in *would seem*, *I would think*, etc.<sup>63</sup>

### (c) Special use of *might* and *could*

- [58] i *You were mad to drive so fast: you might/could have been killed.*  
 ii *We could/might be in Africa.* [knowingly uttered in France]  
 iii *You might/could have cleaned up instead of leaving it to me to do.*

These do not fall into either of the above major categories: there is no implicit condition, but the preterite conveys much more than a slight element of tentativeness. In [i] the (circumstantial) possibility existed but was not actualised: you weren’t killed. Example [ii] can also be regarded as unactualised circumstantial possibility, but differs from [i] in that there is no element of cause and effect (as your being killed was a possible result of your driving so fast); it can be glossed as “It is as though we were in Africa – we’re not, but judging from appearances there’s no reason why we should not be”. Example [iii] is a conventional informal expression of reproach: “You didn’t clean up but should

<sup>63</sup> Remote *would* can occur in the protasis of an open conditional: *Come on Friday if that would be more convenient* or *If you would just move your bag I’ll open the window*. In *If only 400 weapons would destroy the Soviets, what would 17,000 weapons do to the world?* we have an open conditional with *would* in both protasis and apodosis: we understand “If it is the case that 400 weapons would destroy the Soviets . . .”, not “If it were the case that . . .”.

have done”; the possibility here is probably best regarded as deontic (like *should* in this gloss), with pragmatic strengthening. A present time example (hardly permitting *could*) is *You might take your feet off the sofa*; the implicature is that your feet shouldn’t be on the sofa.

#### 9.8.4 The status of *should* and *might* as preterites

It is clear from the data presented in §§9.8.1–3 that the relation between *should* and *shall* and between *might* and *may* is significantly less systematic than that between *could* and *can* or *would* and *will*. While *could* and *would* are unquestionably the preterite counterparts of present tense *can* and *will* respectively, the status of *should* and *might* as preterite forms is far less clear-cut.

We take the view that the analysis of *should* as the preterite counterpart of *shall* is justified by the relationship between them in backshift and conditionals. Compare:

- [59] i a. *I shall easily finish before she returns.* [original utterance]  
 b. *I knew [I should/\*shall easily finish before she returned].* [backshifted report]  
 ii a. *If they offer me the job I shall certainly accept.* [open conditional]  
 b. *If they offered me the job I should/\*shall certainly accept.* [remote conditional]

*Shall* is inadmissible in the [b] constructions: it is replaced by *should* just as other present tense forms are replaced by uncontroversial preterites. Thus no general account of these constructions can be given unless *should* is analysed as a preterite form.

The uses of *should* described in §9.4 can then be said to be idiomatic, since the meaning is not derivable from the meanings of *shall* and the preterite combined. It is exceptional for inflectional forms to be idiomatic in this way: in general, inflection differs from lexical word-formation in that the meanings of inflected forms are predictable from the components whereas this is very often not so with lexical word-formation. But exceptions to this generalisation are not restricted to the preterite forms of the modals: the comparative forms *earlier* and *later* have idiomatic senses, and there are also numerous plural nouns that are idiomatic (cf. Ch. 5, §3.2.1).

With *might* matters are complicated by the existence of significant dialect variation:

- [60] i a. *It may rain before we get home.* [original utterance]  
 b. *I thought [it might/%may rain before we got home].* [report]  
 ii a. *If you come back tomorrow, you may find him in.* [open conditional]  
 b. *If you came back tomorrow, you might/%may find him in.* [remote conditional]

In Dialect A, *may* is inadmissible in [ib/iib], and for this dialect, therefore, the argument presented for *should* applies to *might* too: it has to be analysed as the preterite form of *may*. But in Dialect B *may* is found in these constructions – and also in perfect constructions that are ungrammatical in Dialect A, such as %*The whole thing may never have happened if it hadn’t been for a chance meeting.*

There can be no doubt that in Dialect B *may* has been reanalysed as lexically distinct from *might*: they are forms of different lexemes, both present tense forms. If they were different tenses of the same lexeme, only the preterite form would be able to occur in [60ib/iib]. Such a reanalysis will no doubt have been facilitated by two factors. One is the existence in the modal system of *must* and *ought*, which likewise do not have preterite forms – note that both of them occur readily in construction [60ib], if only marginally in [iib]. The other factor is

that in other constructions the meaning difference between *may* and *might* is not like that characteristically associated with tense; in particular, *might* is hardly used to indicate past time.

Conservative usage manuals tend to disapprove of the Dialect B usage, but it is becoming increasingly common, and should probably be recognised as a variant within Standard English.<sup>64</sup>

## 9.9 Modal auxiliaries and the scope of the perfect

Perfect *have*, when following a modal auxiliary, may belong semantically in the complement of the modal or may have scope over the modal:

- [61] i *She must have saved him.* [internal perfect]  
 ii *She could have saved him if she'd tried.* [external perfect]

In [i] the modality is present, with the past time expressed by the perfect applying to the saving: “I am forced to conclude that she saved him”. In [ii], by contrast, the past time applies to the modality, to the non-actualised ability: “It would have been possible for her to save him”. The scope difference is just like that found with negation, and we use parallel terminology, contrasting internal and external perfect. In [i] the syntax matches the semantics: the modal precedes *have* and is outside its scope. In [ii] the perfect has extended scope, attributable to the fact that *can* lacks the past participle form that would be needed if it were to follow *have*.

External perfects are found as follows:

- [62] i *He needn't / ought to / should / might / could have told her.* [deontic]  
 ii *We might/could have been in Africa.* [circumstantial possibility]  
 iii *If he hadn't lied she would/might have forgiven him* [remote apodosis]  
 iv *I wish I could have persuaded her.* [non-epistemic *could*]

The deontic case [i] allows *need* but not *must*; *might* and *could* here have the pragmatically strengthened interpretation of reproach (cf. [58iii]). Example [62ii] is the past time counterpart of [58ii], and [62iii] involves explicit or implicit remote conditionals, which differ in the present regard from open conditionals:

- [63] i *If he had stayed in the army he would have become a colonel.* [remote]  
 ii *If he stayed in the army he will have become a colonel.* [open]

In [ii] the possible staying in the army and the consequential becoming a colonel are in past time, whereas in [i] only the former necessarily is: the becoming a colonel is simply subsequent to staying in the army and this includes the case where it is still in the future. The difference becomes clearer if we add a time adjunct such as *before the*

<sup>64</sup>As a present-tense form the *may* of Dialect B is exceptional in that it occurs in some constructions, such as [60ib/iib], which do not normally admit present-tense forms. We would handle this in terms of an extension in the use of the present-tense form (associated with the lack of a preterite counterpart). Its distribution is very different from that of a preterite form in that it doesn't occur with past time meaning: we would not therefore want to analyse it as a preterite form, or as a tensed form which neutralises the preterite–present distinction.

*end of the decade*: in [i] but not [ii], this could refer to the current decade, hence to a time in the future. This indicates that **will** is inside the scope of the perfect in [i] but not [ii]: [i] can be thought of as a consequential future in the past, [ii] as consequential predictability about the past. Other modal auxiliaries in remote conditionals likewise fall within the scope of *have*, as in [61ii], etc. Certain cases of non-epistemic *could* are covered by [62i–ii], but it is also found in wishes, as in [62iv], or in remote protases (*It would have been better if you could have done it yourself*).

Ambiguity concerning the kind of modality may thus be accompanied by ambiguity in the scope of the perfect:

- [64] i *He needn't have told her.* [epistemic or deontic]  
 ii *He might have killed her.* [epistemic or dynamic]

In [i] the perfect is internal in the epistemic reading (“It isn’t necessarily the case that he told her”), external in the deontic (“He didn’t have to tell her”). Similarly with [ii]: “It might be that he killed her” (epistemic), “His killing her was a possible but unactualised consequence of what he did” (dynamic).

External perfects convey propositions of opposite polarity: positive *You should have told her* implicates that you didn’t, while negative *You shouldn’t have told her* implicates that you did. A positive implicature arises whether the negation is internal, as in this *shouldn’t* example, or external, as in *You needn’t have told her*, which also implicates that you did. Thus we can’t say *\*I did what I should have done* (instead we need *I did what I had to do*). Nevertheless, we can say *I don’t know whether he told her, but he certainly should have done*. With *should have*, therefore, there may be some doubt as to whether the proposition of opposite polarity is true. That is not so, however, with *might/could* in [62i]: here there is no doubt that we were not in fact in Africa. And similarly for the *wish* construction in [62iv]: the complement of *wish* is counterfactual, so it follows from [62iv] that I couldn’t persuade her, and hence that I didn’t.

## 9.10 Modal auxiliaries in negative and interrogative clauses

### ■ Negation

There is a general tendency for strong or medium modals to take internal negation, and for weak modals to take external negation:

- [65] i *He mustn't/shouldn't go with them.* [strong/medium: internal negation]  
 ii *He can't go with them.* [weak: external negation]

Negation of a weak modal entails non-actualisation, so that even in [ii] there is negation associated with the going, but indirectly rather than directly, as in [i]. Exceptions to the above pattern are of two kinds.

#### (a) Exceptions involving specific items

Strong *need* (which in declarative main clauses is always negative) takes external negation. Weak **may** takes internal negation when epistemic or existential: *He may not have seen it* contrasts with *He can't have seen it*, which follows the basic pattern. Otherwise weak **may** and **can** take internal negation only when separated from *not* by other words or a clear prosodic juncture (§9.3.2).

## (b) Exceptions involving specific constructions

Negative interrogatives, used as questions biased towards a positive answer, have external negation irrespective of the strength of the modality: *Mustn't it be wonderful to have so many admirers?* (“Is it not the case that it must be wonderful?”, not “Is it the case that it must not be wonderful?”), *Shouldn't you tell them we'll be late?* A special case of this is in tags: *We must stop soon, mustn't we?*

## ■ Interrogatives

The use of modal auxiliaries in interrogatives is in general predictable from their use in declaratives: only a few further points need be made, several of which relate to the common use of modalised questions as indirect speech acts (Ch. 10, §9.6.1). For *shall*, see §9.6.

*Must and need*

In declaratives these differ essentially as semantically positive (*must*) vs negative (*needn't*), but in interrogatives both can appear in the positive: *Must/Need we stay to the end?* For either version the positive answer is *Yes we must* and the negative is *No we needn't*. However, a lexical modal is more likely in such questions: *Do we have to stay to the end?* *Must* readily occurs in such indirect speech acts as *MUST you interrupt when I'm speaking?* This conveys that there is no necessity and that therefore you shouldn't interrupt.

*Can, may, and will*

For epistemic possibility *can* is much preferred over *may*, and in either case the tentative preterite forms *could* and *might* are more likely: *Could/Might it be a forgery?* Questions about deontic possibility are commonly used as indirect requests, for permission (*May/Can I go with him?*) or other things (*May/Can I have some sugar?*). Tentative *could* and *might* express diffidence, and would not appear in the answer (A: *Could/Might I have a try?* – B: *Yes you can/may*). Dynamic *can* (ability) and *will* (volition) similarly appear frequently in indirect requests, prototypically with a 2nd person subject: *Can/Could/Will/Would you help me*.

*Should*

This generally has a deontic interpretation in interrogatives: *Should he go by bus?* Because *should* takes internal negation, the modality is effectively outside the scope of the question, which presupposes that he should do one of two things, go by bus or not go by bus. There is a special epistemic use in open interrogatives, normally with *why*, as in *Why should he have resigned?* This is ambiguous between a deontic reading “Why was the right thing for him to do to resign?” and an epistemic one not predictable from the use of *should* in declaratives, “Why do you assume/think he resigned?”

9.11 Lexical modals, *have (got)*, and quasi-modal *be*

## (a) Strong modality

*Have and have got*

- [66] i You have (got) to come in now. [deontic]  
 ii Now that she has lost her job she has (got) to live extremely frugally. [dynamic]  
 iii This has (got) to be the worst restaurant in town. [epistemic]

*Have* and *have got* are most commonly used for deontic necessity, as in [i]. Here they characteristically differ from *must* in being objective rather than subjective: with [i] I'm likely to be relaying someone else's instruction but with *You must come in* it's more likely that I am myself telling you to. With dynamic necessity, as in [ii], they are more likely than *must*. The epistemic use of [iii] is widely found in AmE, but is still fairly rare in BrE. The differences between *have* and *have got* are dealt with in §2.5.6.<sup>65</sup>

### Quasi-modal *be*

- [67] i *You are to come in at once.* [deontic necessity]  
 ii *He is to be left alone.* [passive: strong deontic]  
 iii *These ideas are to be found throughout his later work.* [passive: weak dynamic]

*Be* is commonly used for deontic necessity, as in [i], where it is comparable to subjective *must* or (more closely) objective *have*. With a passive the interpretation can be strong deontic, “must” ([ii]), or weak dynamic, “can” ([iii]); there is no active counterpart to the latter. Negation here follows the generalisation of §9.10: internal in the strong case (*He is not to be left alone*, “must not”), external in the weak case (*They are not to be found in his later work*, “cannot”).

*Be* is also used for future situations:

- [68] i *There's to be one more meeting.* [present schedule]  
 ii *The lecture was to be followed by a buffet lunch.* [past schedule]  
 iii *Only two weeks later he was to have a severe heart attack.* [future in the past]

Examples [i–ii] involve arrangements or schedules; [ii] doesn't indicate whether the situation was actualised, but an implicature of non-actualisation can be expressed by using perfect tense: *The lecture was to have been followed by a buffet lunch*.<sup>66</sup> Example [iii], which belongs to fairly formal style, does entail that the event took place; *was to* could here be replaced by *would*.

There are special uses of *be* in conditionals:

- [69] i *If we are to get there on time we must leave immediately.* [open protasis]  
 ii *If she was/were to come home now, we'd be in real trouble.* [remote protasis]

Example [i] suggests purpose: “in order to get there on time”. In remote conditionals *be* generally serves merely to reinforce the remote modality (combining harmonically with the preterite tense or irrealis mood): [ii] is interpreted as “If she came home now, we'd be in real trouble”.

### Lexical *need*

This is very similar in meaning to auxiliary *need*, but there are some differences:

- [70] i a. *You don't need to cut the grass.* b. *You needn't cut the grass.*  
 ii a. *He didn't need to tell her.* b. *He needn't have told her. (= [62i])*

There is some tendency for lexical *need* to favour a dynamic interpretation more than auxiliary *need* or *must*. In [i], for example, I'm likely to prefer [a] if it's a matter of the grass not having grown enough to need cutting (dynamic), but [b] if I'm simply

<sup>65</sup>The deontic meaning is attenuated in examples like *A satisfactory solution to this problem has yet to emerge* (where *got* could not be added). What is primarily conveyed is that the solution has not yet emerged.

<sup>66</sup>This is an external perfect in the sense of §9.9. We have noted that quasi-modal *be* resembles the modal auxiliaries in that it has only primary forms. It cannot therefore occur after perfect *have* and takes an external perfect instead.

exempting you, perhaps because someone else will be doing it (deontic). With past time necessity there is a sharp contrast illustrated in [ii]. In its salient deontic interpretation, [iib] conveys that he did tell her, [iia] does not: we could add *so he didn't* to [a] but not [b].

*Necessary, necessarily, surely, etc.*

- [71] i *It is necessary [that they be told] / [for them to be told].* [deontic]  
 ii *It doesn't necessarily follow that he's lying.* [epistemic]

*Necessary* is used for objective deontic but not epistemic necessity; it takes a mandative or infinitival complement. *Necessarily*, by contrast, is used for epistemic necessity, especially in non-affirmative contexts like [ii]. It is normally objective and does not allow the pragmatic weakening found with *must*. It can also be used dynamically: *The democratic process is necessarily vicious in its campaign characteristics*, “by its nature”.

Consider next *surely* and *certainly*:

- [72] i *You're surely not going to accept his offer.* } [epistemic]  
 ii *I certainly enjoyed it. It certainly does belong to her.* }

*Surely* is used only epistemically, and characteristically with persuasive intent, inviting agreement. It is subjective and does not fall within the scope of a negative. Thus *It surely needn't have been an accident* (unlike *surely must* or *needn't necessarily*) is non-harmonic, with negated *need* inside the scope of positive *surely*: “It is surely the case that it needn't have been an accident”. Epistemic *certainly* belongs with the strong modals but does not suggest any reasoning from evidence. The examples in [ii] emphasise my commitment to the modalised propositions (perhaps in response to a challenge), implying direct knowledge, so that they are pragmatically stronger than counterparts that have *must* or are unmodalised.

*Bound, sure, and certain* + infinitival are used epistemically, often (unlike *must*) with a future situation: *He's bound to be here soon*. All allow internal negation (*He's bound not to like it*) whereas external negation tends to be restricted to contexts of denial or contrast (*It's not CERTAIN to be over, but it's LIKELY to be*). More rarely, *bound* is used deontically, and here external negation is quite readily permitted: *You're not bound to answer* (“needn't”). Deontic necessity is commonly glossed as “obligation”, but the noun *obligation* covers the range of *should* as well as *must* (cf. *He had a clear obligation to return it, but refused*). *Obliged* is somewhat stronger: *I was obliged to return it* entails that I did.

## (b) Medium modality

### Epistemic

Here we have such items as *probably, probable, likely*, and the verbs *appear, seem, expect*:

- [73] i *It is probably in the desk drawer. It should probably be in the desk drawer.*  
 ii *The wet weather is expected to last several days.*

*Probably* combines harmonically with *should*, so that there is little difference between the examples in [i]. With *expect* there can also be a deontic component overlaid upon the basic meaning, as in *Everyone was expected to bring their own food*, “it was assumed they would because there was an obligation to do so”.

The participial adjectives *supposed* and *meant* have developed specialised meanings expressing medium deontic modality: *You're supposed/meant to do it this way*. They differ

from *should/ought* in being objective. The normal position for *not* is in the matrix, but (except in contrastive contexts) it is interpreted as marking internal negation: *We're not supposed to tell anyone*. *Supposed* is occasionally found in an epistemic sense: *It is supposed to have been posted yesterday*, “it's alleged to have been”; compare deontic *It was supposed to be posted yesterday*, “should have been”.

#### Dynamic

This is expressed by such verbs as *intend, want*, etc. As noted earlier, negation of medium modality tends to be interpreted more specifically as internal negation, e.g. *I don't want her to go* as “I want her not to go”.

### (c) Weak modality

#### *Possible, possibly, perhaps, maybe*

These express epistemic possibility: *It is possible that I misled you; They have possibly/perhaps/maybe misunderstood*. *Possible* and *possibly* are objective, *perhaps* and *maybe* usually subjective. The subjectivity of *perhaps* is reflected in its occurrence in interrogatives outside the scope of the question: *Has he perhaps missed his train?*, where the question is “Has he missed his train?” and *perhaps* indicates that I think he may have.

#### *Able*

This is similar to **can**, but has a somewhat narrower range of meaning: it is used for objective but not subjective permission (*Undergraduates are able to borrow up to six books*) and it can't replace *can* in the ‘existential’ use (*These animals can be dangerous*, [23i]) or for present actualised ability (*I can hear something rattling*, [24ii]) – *She is able to hear extremely high notes* is a matter of potential ability.

#### Dynamic willing

This is weaker than medium strength *want*, so that *He was not willing to do it* is not pragmatically equivalent to *He was willing not to do it*. It differs from prototypical weak modals in that *He was not willing to do it* does not entail (though it strongly implicates) that he did not do it, for one could add *but he was forced to*.

#### *Allow, permit, and let*

These can express deontic possibility, permission, but (unlike the expression *give permission*) they are also used more generally in a causative sense similar to *enable*, as in *The good weather allowed us to finish the job a day early*. Because of this causative meaning the time of the complement situation is simultaneous with that of the modality – i.e. they belong to Class 3 of §7 (like *believe*), not Class 4 (like *may*). This is why they cannot normally be used performatively: we say *I will allow him to stay until tonight*, not *I allow . . .* External negation, *He didn't allow/permit/let her take it*, strongly implicates non-actualisation of the complement situation, i.e. that she didn't take it, but this can be cancelled by contrastive stress, as in *HE didn't allow her to take it: it was her MOTHER who did*.

## 10 Future time

### 10.1 The lack of a future tense in English

One of the most obvious respects in which we have departed from traditional grammar in this book is that we do not recognise a future tense for English. Traditional grammar

treats *will* (and, in the 1st person, *shall*) as a future tense auxiliary, proposing a tense system with three terms:

[1]	PAST	PRESENT	FUTURE	[traditional tense system]
	<i>took</i>	<i>takes</i>	<i>will take</i>	

The view taken here, by contrast, is that while there are numerous ways of indicating future **time**, there is no grammatical category that can properly be analysed as a future **tense**. More particularly we argue that *will* (and likewise *shall*) is an auxiliary of mood, not tense.

### ■ The case against the traditional analysis

#### (a) The three-term system does not cater for the relation between *will* and *would*

One major argument against [1] is that *would* is the preterite counterpart of *will*. The relation between *would* and *will* is just like that between *could* and *can*. We have distinguished three uses for the preterite (past time, backshift, and modal remoteness), and *would* is found in all three, as seen in §9.8. *Will take*, therefore, does not belong in a one-dimensional system with *took* and *takes* any more than *has taken* does: the contrast between preterite and present is independent of the presence or absence of **will**, just as it is independent of the presence or absence of **have**. Even if we provisionally accept that **will** is a future tense auxiliary, [1] must be modified so as to allow for two dimensions of contrast:

[2]		PAST	PRESENT
	NON-FUTURE	<i>took</i>	<i>takes</i>
	FUTURE	<i>would take</i>	<i>will take</i>

#### (b) *Will* belongs grammatically with *can*, *may*, *must*, etc.

We have seen (§2.4) that a whole cluster of grammatical properties distinguish **can**, **may**, **must**, and a few more from the other verbs of English. They constitute a syntactic class whose central members are strongly differentiated from ordinary verbs – and **will** belongs very clearly among these central members. This argument is not itself decisive: it would in principle be possible to say that the verbs in question formed a class of tense/mood auxiliaries. But it does place the onus of proof on defenders of the future tense analysis to demonstrate why **will** (and **shall**) should be differentiated from the others as tense auxiliaries vs mood auxiliaries.

#### (c) *Will* belongs semantically with *can*, *may*, *must*, etc.

The survey in §9 shows that **will** belongs in the same semantic area as the uncontroversial modal auxiliaries, and the same applies to **shall**. The difference in interpretation between a simple present tense and its counterpart with *will* is to a very large extent a matter of modality. Compare, for example:

[3]		PRESENT TIME	FUTURE TIME
	SIMPLE PRESENT	<i>That <u>is</u> the doctor.</i>	<i>They <u>meet</u> in the final in May.</i>
	WILL + PLAIN FORM	<i>That <u>will be</u> the doctor.</i>	<i>They <u>will meet</u> in the final in May.</i>

In each pair the time is the same, but the version with *will* is epistemically weaker than the simple present. Note also that all of the auxiliaries in question can be used with situations that are in past, present, or future time. Compare, then *will* and *may* in:

[4]	PAST TIME	PRESENT TIME	FUTURE TIME
i	<i>He <u>will have left</u> already.</i>	<i>He <u>will be</u> in Paris now.</i>	<i>He <u>will see</u> her tomorrow.</i>
ii	<i>He <u>may have left</u> already.</i>	<i>He <u>may be</u> in Paris now.</i>	<i>He <u>may see</u> her tomorrow.</i>

For [ii] the past time interpretation is attributable to perfect *have*, while the present and future time interpretations can be accounted for in terms of the mechanism discussed in §7: *may* allows either a present or future interpretation to be assigned to its complement. Under the analysis proposed for *will*, [i] will be handled in exactly the same way.

Notice, moreover, that *may* and *will* are themselves present tense forms. In examples like [4] this present tense encodes the time of the modal judgement, and it is possible for the present tense modal to be modified by the time adjunct *now*: *Now we will/may not be in time to see the start*. And in dynamic uses of *will* this present time meaning tends to be more salient. In *I've asked him to help us but he won't*, for example, *won't* indicates his present disposition (compare *but he can't*, indicating present inability), and in *This door won't lock* I am talking about the present properties of the door (compare *You can't lock this door*).

Data like that shown in [3] does not by itself refute a future tense analysis: there are languages (such as French) where the translation equivalents do contrast as present vs future tense. What is decisive is the combination of arguments (a)–(c), and the extent of the grammatical and semantic likeness involved in (b) and (c). If one looks at the verbal system of English without any preconception that the tripartite division between past, present, and future time will inevitably be reflected in a system of three corresponding tenses, then the evidence is overwhelming for grouping *will*, *shall*, *may*, *can*, *must*, etc., together as auxiliaries of the same kind.

### ■ Clausal constructions with a future time interpretation

Although English has no future tense it has a range of constructions which select or permit a future time interpretation. They are illustrated in:

[5]	i	<i>Give her my regards.</i>	[imperative]
	ii	<i>It is essential [that she <u>tell</u> the truth].</i>	[mandative]
	iii	<i>The match <u>starts</u> tomorrow.</i>	[main clause present futurate]
	iv	<i>If [she <u>goes</u>], I'll go too.</i>	[subordinate present]
	v	<i>I may/will [<u>see</u> her tomorrow].</i>	[bare infinitival]
	vi	<i>I intend/want [to <u>see</u> her tomorrow].</i>	[to-infinitival]
	vii	<i>I intend/am [<u>seeing</u> her tomorrow].</i>	[gerund-participial]

In [i–ii] the modality is deontic, which characteristically involves futurity of the situation. In [iii–iv] we have present tense verbs: these allow future interpretations under the conditions described in §§4.2.4–5. Constructions [v–vii] are non-finite: the temporal interpretation depends on properties of the matrix clause, as discussed in §7.

## 10.2 Idiomatic *be going*

One case of a future-time *to*-infinitival that merits attention is that found in the complement of the idiom *be going*, as in *He's going to be too hot*. Historically the idiom clearly derives from the progressive auxiliary *be* + the lexical verb *go* (compare the literal *be*

*going* of *Now he's going through the second tunnel*), but in construction with a *to*-infinitival complement the meaning of motion and progressivity has been lost. The idiom differs from ordinary *be going* in that *going* is virtually inseparable from the following *to*; in some varieties the *to* may be incorporated into a compound verb [gənə], as discussed in Ch. 18, §6.3.

### ■ Differences between *be going* and *will*

The most salient feature of the meaning of idiomatic *be going* is that it locates the complement situation in future time: we need therefore to examine how it differs from the much more frequent *will* (beyond the obvious syntactic fact that it takes a *to*-infinitival complement rather than a bare one).

#### (a) Style

*Be going* is characteristic of relatively informal style, whereas *will* is entirely neutral.

#### (b) Inflection

The *be* component of the idiom has the full set of inflectional forms except for the gerund-participle (*\*being going* is excluded in the same way as literal progressives like *\*being taking*). As a result, it occurs in a wider range of environments than *will*, as in *She had been going to tell me*, *He may be going to resign*, etc.

#### (c) *Be going* has greater focus on matrix time

We turn now to differences in interpretation. Both the *be going* and *will* constructions involve two times, one associated with the infinitival complement, the other with the matrix, i.e. *be going* and *will* themselves. The subordinate time is always future with *be going*; we have seen that *will* allows other possibilities but we confine our attention here to future cases. The matrix time depends on the matrix tense, e.g. usually present with *is going*, past with *was going*. The first meaning difference, then, is that with *be going* there is significantly greater focus on the matrix time than is normally the case with *will*. Compare:

- [6] i *The dog's going to / will take the roast.*  
 ii *The secretary is going to / will give you a timetable.*  
 iii *If you're going to / will lose your temper, I'm not going to / won't play.*

The difference is very clear in an example like [i]: in a context where there is immediate danger of the dog taking the roast one would use *is going*, which focuses on the present danger – *will* lacks the implicature of immediacy commonly found with *be going*. In [ii] *will* invites a conditional interpretation (“if you ask”) whereas *is going* suggests that instructions have already been given to the secretary. (Conditionality is implied with *is going* in [i], but it is of a negative kind: “if nothing is done to stop it”). In [iii] the present focus of *is going* is evident from the fact that the most salient contextualisation is one where you have already shown signs of, or started, losing your temper.<sup>67</sup> *Will* would be very unnatural in this example; we have noted that it occurs in conditional protases only under restrictive conditions, and these are not satisfied in [iii] since it does not lend itself to an interpretation in terms of objective predictability (“if it is predictable that you will lose your temper”).

<sup>67</sup> *Be going* also occurs as an alternative to quasi-modal *be* in goal/purpose-oriented conditionals (cf. [69i] §9.1): *If we are going to get there on time we must leave immediately; will* is quite impossible in this sense.

The futures in [6] are all relatively close ones, but this is not a necessary feature of *be going*, merely one factor that makes current focus appropriate. The future situation is clearly not close in *I'm going to retire in ten years' time*, but instead we have present intention or arrangement.<sup>68</sup> We invoked the concept of current (present) focus in contrasting the present perfect with the simple preterite (§5.3), but the difference between *be going* and *will* is only loosely comparable. There is no present focus at all in the simple preterite, while in the present perfect it is very strong (as reflected in the impossibility, generally, of having past time adjuncts like *yesterday*); with *will* and *be going* the contrast is much less extreme, for some present focus is possible with *will* (*Now we will have to wait until Friday; I won't put up with it*; etc.) and the present focus in *is going* does not exclude future time adjuncts (*I'm going to read it tomorrow*).

(d) Preterite: *be going* doesn't entail that the complement situation was actualised

[7] He *was going to* / *would* marry his tutor at the end of the year.

Here we have a future in the past (with *would* restricted to formal narrative style). *Will*, we have seen, is semantically strong, so that the *would* version entails that he did marry her. *Was going* does not have this entailment and quite often there will be an implicature of non-actualisation.<sup>69</sup> This ties in with the current focus mentioned above: *was going* focuses on the intention/arrangement obtaining at the past time referred to, rather than the marrying situation itself.

(e) Intention vs willingness or volition

[8] I have asked her to join us but she's *not going to* / *won't*.

*Won't* here conveys dynamic volition; *be going* can also carry a dynamic overtone, but it tends to be a matter of intention rather than willingness. *Won't* suggests explicit refusal more than *isn't going*. The contrast is sharper in the preterite, where one would expect *wouldn't*, not *wasn't going*; the latter would be appropriate, however, if she later changed her mind and did join us.

<sup>68</sup> Extreme closeness, immediate futurity, is explicitly encoded in *about* or the less frequent *on the point of*. *Be going* and these expressions can be modified by *already* or *just* (in its temporal sense), whereas futurity *will* cannot: *She was already going/about to tell us* (where *going* allows for a greater temporal gap than *about*); *He was just going/about to eat it*.

<sup>69</sup> Such an implicature is more pronounced in the preterite perfect: *He had been going to marry his tutor* implicates, though of course does not entail, that he didn't do so.

This is the first of two chapters on the structure of the clause. The focus of this chapter is on complements of the verb, while Ch. 8 is mainly concerned with adjuncts. We exclude from consideration here complements with the form of subordinate clauses: these are dealt with in Ch. 11 (finite clauses) and Ch. 14 (non-finites).

## 1 Elements of clause structure: an overview

The major functions in the structure of the clause are the **predicator (P)**, **complements of the predicator (C)**, and **adjuncts (A)**, as illustrated in:

- [1] *He* | *always* | *reads* | *the paper* | *before breakfast*.  
       C           A           P           C           A

The predicator is a special case of the head function. Complements are more central to the grammar than adjuncts: they are more closely related to the verb and more clearly differentiated by their syntactic properties. Those in this example are, more specifically, subject and object respectively, two sharply distinct syntactic functions. Adjuncts, on the other hand, tend to be differentiated primarily by their semantic properties – *always* is an adjunct of frequency, *before breakfast* an adjunct of temporal location, and so on. Complements are dependents of the verb (or VP), while adjuncts may be dependents (modifiers), as in this example, or supplements, elements that are more loosely attached to the clause (see Ch. 15, §5).

Many grammars restrict the term ‘complement’ to non-subject elements. The view taken here is that although subjects do have special properties, they also have important affinities with the object and other complements.

It is a common practice to use V rather than P in representing clause structure, with V therefore used for both a function and a category. Such a dual use of V is unlikely to create problems, but we nevertheless prefer to maintain here the distinction between function names and category names that we systematically draw elsewhere, and hence we follow the also quite widespread practice of using P for the function and restricting V to the category.

In clauses containing an auxiliary verb, such as *She may like it*, some grammars analyse auxiliary + lexical verb as forming a ‘verb group’ unit realising (in our terms) a single P function. Under the analysis presented in this book, *may* is the predicator of the main clause, and *like* that of a subordinate clause functioning as complement of *may*. The contrast between these two analyses is discussed in Ch. 14, §4.2. In this chapter we will for the most part avoid the issue by concentrating on examples without auxiliary verbs.

## 1.1 Types of complement and canonical clause structures

### ■ Core complements and obliques

We distinguish between **core** and **non-core** complements. Prototypically core complements have the form of NPs, non-core complements that of PPs. The core complements in [2] are underlined.

[2]	i	<u>Kim</u>		<i>gave</i>		<u>Pat</u>		<u>the key</u> .
	ii	<u>Kim</u>		<i>gave</i>		<u>the key</u>		<i>to Pat</i> .
		C		P		C		C

All three complements are core in [i], but only the first two are in [ii].

NPs functioning as core complements are related directly to the verb, while those functioning within PPs are related to the verb only indirectly, via the preposition. An NP related to the verb by a preposition in this way is referred to as an **oblique**. In [2ii], the phrase *to Pat* is a complement of *give*, but the NP *Pat* is an oblique.

The preposition characteristically makes a contribution to identifying the semantic role of the NP. In this example *Pat* is recipient, and although a recipient is inherently involved in the semantics of *give*, the preposition *to* can be regarded as identifying the NP that has this role.

### ■ External and internal complements

Among the core complements one has special status: the subject (S). The first constituent structure division in canonical clauses is between the subject and the predicate, the function realised by the VP. In such cases, therefore, S is **external** to the VP, not a constituent of it.

English is what is known typologically as a subject-prominent language, inasmuch as the subject is very sharply set apart syntactically from other clause elements: we find a whole cluster of distinctive properties associated with it. In [2] *Kim* is S, while *the key*, *Pat*, and *to Pat* are non-subject complements, **internal** to the VP.<sup>1</sup>

### ■ Transitivity

The default type of internal core complement is an object (O). Whereas all canonical clauses contain an S, they may or may not contain an O, depending on the nature of the verb. This yields the important contrast referred to as **transitivity** – a **transitive** clause contains an O, an **intransitive** one does not:

[3]	i	<i>I fainted.</i>	[intransitive: S–P]
	ii	<i>They destroyed all the evidence.</i>	[transitive: S–P–O]

The category of transitivity applies to both clauses and verbs: *I fainted* is an intransitive clause because it contains no object, and *faint* is an intransitive verb because it has no object as dependent. More precisely, transitivity applies to **uses** of verbs, for although *faint* is always intransitive many verbs can occur either with or without an object. For example, *read* is intransitive in *She read* and transitive in *She read the letter*; likewise *open*

<sup>1</sup>The terms ‘internal’ and ‘external’ are more often applied to semantic elements (‘arguments’) than to syntactic complements, but in a comparable way, so that in *Pat took the key* the subject *Pat* expresses an external argument and the object *the key* an internal one.

is intransitive in *The door opened* and transitive in *She opened the door*. We refer to such verbs as **dual-transitivity** verbs.

The transitive class of verbs and clauses can be divided into **monotransitive** and **ditransitive** subclasses according as there is just one object (a **direct** object, O<sup>d</sup>) or two (**indirect**, O<sup>i</sup>, + direct):

- |     |    |                                |   |
|-----|----|--------------------------------|---|
| [4] | i  | <i>She wrote a novel.</i>      | [monotransitive: S–P–O <sup>d</sup> ]               |
|     | ii | <i>She told him the truth.</i> | [ditransitive: S–P–O <sup>i</sup> –O <sup>d</sup> ] |

### ■ Complex-intransitives and complex-transitives

One further subtype of (internal) complement is the **predicative complement** (PC), illustrated by *quite competent* in:

- |     |    |   |  |
|-----|----|---|--|
| [5] | i  | <i>Ed seemed quite competent.</i>         | [complex-intransitive: S–P–PC <sup>s</sup> ] |
|     | ii | <i>She considered Ed quite competent.</i> | [complex-transitive: S–P–O–PC <sup>o</sup> ] |

From a semantic point of view a PC tends to be more like a predicator than an ordinary complement such as a subject or object. In [5], for example, *Ed* and *she* serve to refer to or pick out particular persons, but the PC does not: rather, it denotes a property that is predicated of the person referred to by *Ed*. This is the basis for the term ‘predicative complement’: syntactically a PC is a complement, but semantically it characteristically has a predicative function.<sup>2</sup> In these examples the PC has the form of an AdjP; it can also be realised as an NP, as in *Ed seemed a decent guy*, but even here it expresses a property rather than referring to a person.

We refer to the constructions in [5i] and [ii] (and these uses of *seem* and *consider*) as respectively **complex-intransitive** and **complex-transitive**: on the transitivity dimension [i] is intransitive and [ii] is transitive, but each contains a further predication expressed in the PC, so that the structures are more complex than the ordinary intransitives and transitives in [3]. The PC is related in both examples to *Ed*, which, however, is S in [i] and O in [ii]. The labels PC<sup>s</sup> and PC<sup>o</sup> thus indicate whether the PC is **subject-oriented** (subjective) or **object-oriented** (objective).

However, the orientation is normally predictable from the transitivity, with the PC oriented towards O in transitive clauses, and towards S in intransitives. Thus if we put *consider* in a passive clause the PC is automatically re-oriented to S: *Ed was considered quite competent*.

Notice that in the latter example the PC *quite competent* is semantically predicated of *Ed*, but *Ed* is not syntactically the subject of *quite competent*. In [i], *Ed* is subject of *seemed* (or the VP *seemed quite competent*). In [ii], *Ed* is not subject at all, but object (of *considered*). We will therefore speak of *Ed* not as the subject of the PC but as its **predicand**.

The predicative elements in [5] are core complements (extending this category now to cover AdjPs as well as NPs); they are also found as obliques in non-core complements, as in *She regarded him as quite competent / a decent guy*, where the AdjP/NP is complement of the preposition *as*, not of the verb *regarded*.<sup>3</sup>

<sup>2</sup>There is a minor clause construction in which such expressions combine directly with the subject in a verbless clause: *Ed quite competent?* (see Ch. 10, §4.8.3).

<sup>3</sup>Predicative elements can also be adjuncts, as in *He wrote most of his poetry drunk*: the contrast between predicative and ordinary (non-predicative) thus cuts across that between complements and adjuncts, though it has less grammatical significance in the case of adjuncts.

### Comparison with constructions containing finite clause complements

The verbs *seem* and *consider* in [5] allow a paraphrase involving a finite subordinate clause, as in:

- [6] i *It seemed that Ed was quite competent.*  
 ii *She considered that Ed was quite competent.*

Such paraphrases highlight the fact that two predications are expressed in [5], for now they are located in separate clauses.<sup>4</sup> Syntactically, however, the constructions are very different, precisely because [6i–ii] contain subordinate clauses while [5i–ii] do not: in [5] *Ed* and *quite competent* are complements of *seem* and *consider*, whereas in [6] they are not.<sup>5</sup> The overlap between the verbs entering into the two constructions is relatively small: there are many like *stay* and *make* appearing in [5] but not [6], or like *happen* and *know*, with the opposite distribution.

- [7] i a. *Ed stayed silent.*                      b. \**It stayed that Ed was silent.*  
 ii a. *She made Ed angry.*                      b. \**She made that Ed was angry.*  
 iii a. \**Ed happened diabetic.*                      b. *It happened that Ed was diabetic.*  
 iv a. \**I knew Ed diabetic.*                      b. *I knew that Ed was diabetic.*

### Copular clauses

The commonest complex-intransitive construction has *be* as predicator:

- [8] *Ed was quite competent.*

It is useful to have a separate term for such clauses because there are a number of distinguishable semantic and syntactic relations involved: we will therefore refer to them as **copular clauses**. This is based on the traditional idea of *be* as a copula, a syntactic link relating PC to S; in some cases (though certainly not all) *be* has little semantic content but primarily serves the syntactic function of filling the verbal predicator position, and thus carrying the tense inflection.<sup>6</sup>

### ■ Five canonical constructions

In summary, the core complements yield two dimensions of structural contrast, a ternary one involving O and a binary one involving PC:

[9]		ORDINARY	COMPLEX
	INTRANSITIVE	<i>I left.</i> (S–P)	<i>I got better.</i> (S–P–PC)
	MONOTRANSITIVE	<i>I took the car.</i> (S–P–O)	<i>I kept it hot.</i> (S–P–O–PC)
	DITRANSITIVE	<i>I gave Jo a key.</i> (S–P–O–O)	

### ■ Valency

The categories presented in [9] are defined in terms of particular kinds of complement (O and PC), but it is also useful to have a more general classification based simply on

<sup>4</sup>Notice that even with clausal subordination *quite competent* is still a predicative complement, not a predicator: the subordinate predicator is the verb *was*.

<sup>5</sup>Some modern grammars have an analysis of [5ii] in which *Ed quite competent* is a verbless clause (technically, a ‘small clause’).

<sup>6</sup>The term ‘copular’ is widely used for [5i] and the like as well as [8]; we prefer to restrict it to the latter, using ‘complex-intransitive’ for the more general construction, partly to bring out the parallel between [5i] and [5ii], partly because complex-intransitive verbs other than *be* are not mere syntactic copulas but do express semantic predication.

the number of complements, and for this we will use the term **valency**. A monovalent verb is thus a verb which combines with just one complement, like the *leave* of [9], and so on. Classifications in terms of transitivity and valency are compared in [10], where the complements are underlined:

[10]	TRANSITIVITY	VALENCY
i <i>He <u>died</u>.</i>	intransitive	monovalent
ii <i>This depends on the <u>price</u>.</i>	intransitive	bivalent
iii <i>Ed became <u>angry</u>.</i>	intransitive (complex)	bivalent
iv <i>He read the <u>paper</u>.</i>	monotransitive	bivalent
v <i>He blamed me for the <u>delay</u>.</i>	monotransitive	trivalent
vi <i>This made Ed <u>angry</u>.</i>	monotransitive (complex)	trivalent
vii <i>She gave him <u>some food</u>.</i>	ditransitive	trivalent

Note that examples like [ii], where *on the price* is a non-core complement, and [iii], where *angry* is a predicative complement, are grouped with [i] in terms of transitivity, but with [iv] in terms of valency.<sup>7</sup> There are also quadrivalent verbs, as in *I bet you \$10 that it rains* or *I'll trade you this bicycle for your binoculars*.

## 1.2 Complements vs adjuncts

Complements, we have said, are more closely related to the verb than adjuncts. Core complements are generally more sharply differentiated from adjuncts than are non-core complements, and there is some uncertainty, and disagreement among grammarians, as to how much should be subsumed under the function complement.<sup>8</sup> We review here the major factors involved in the distinction; (a)–(e) have to do with syntactic differences, while (f)–(h) deal with semantic issues.

### (a) Licensing

The most important property of complements in clause structure is that they require the presence of an appropriate verb that **licenses** them. Compare:

- [11] i a. *She mentioned the letter.*                      b. \**She alluded the letter.*  
 ii a. *She thought him unreliable.*                      b. \**She said him unreliable.*

In [i], the verb *mention* licenses an O (*the letter*), but *allude* does not. Similarly in [ii] *think* licenses O + PC<sup>o</sup>, but *say* does not. By contrast an adjunct such as *for this reason*, *at that time*, *however*, etc., is not restricted to occurrence with a particular kind of verb.

This type of dependence between complements and their head verbs is commonly referred to as **subcategorisation**: verbs are subcategorised according to the **complementation** they take, i.e. the different kinds and combinations of complement they

<sup>7</sup>We follow the most usual terminology here in spite of the mixture of Greek- and Latin-based prefixes. The term 'valency' is used in several different ways. For some, valency covers not just the number but also the kind of complements: in this sense (for which we will use the term 'complementation'), all the verbs in [10] have different valencies. For others, valency is based on the number of semantic 'arguments' rather than syntactic complements (see §1.2 for the relation between these); an alternative term for this sense is 'adicity', with [i] and [ii] being respectively 'monadic' and 'dyadic'.

<sup>8</sup>Some restrict it to core complements, taking the presence of the preposition in, say, *He alluded to her letter* as sufficient to make the post-verbal element an adjunct; this makes the boundary between complement and adjunct easier to draw, but in our view it does not draw it in a satisfactory place, as will be apparent from the following discussion.

license. Different patterns of complementation are found with different subcategories (classes) of verb: ‘intransitive’, ‘monotransitive’, etc., are names of verb subcategories in this sense: *allude* can’t occur in [i] because it doesn’t belong to the class of verbs that license O, namely monotransitive verbs; and *say* can’t occur in [ii] because it does not belong to the class of verbs that license O + PC<sup>o</sup> complementation, namely complex-transitive verbs.

We emphasise two points about names like ‘intransitive’ and ‘monotransitive’. First, the different patterns of complementation define a large number of different verb subcategories, but only a few very general ones have established names. For example, there is no name for the class of verbs like *inquire*, *wonder*, etc., which take interrogative clauses as complement (*He inquired/\*believed/\*wanted whether it was ready*). Second, most verbs allow more than one pattern of complementation. For example, *think* is not restricted to complex-transitive clauses, but is found in intransitives (in *Let me think for a moment* the PP is an adjunct), in ordinary monotransitives (*She was obviously thinking uncharitable thoughts*), with a PP headed by *of* (*I was thinking of someone else*), with a declarative clause as complement (*She thought that he was unreliable*), and so on.

Licensing of complements often involves syntactic determination of the type of complement phrase or clause that is licensed. The issues of the choice of preposition and the choice of subordinate clause construction each deserve separate discussion.

### Choice of preposition

PBs functioning as non-core complement often have the preposition specified by the verb:

- [12] i *It consists of egg and milk. He didn’t look at her. It depends on the cost.*  
 ii *He gave it to Pat. He supplied them with sufficient food. I blame it on Kim.*

The prepositions here are not replaceable without loss of grammaticality (*\*It consists with sugar and water*) or an unsystematic change in the meaning (the difference in meaning between *He didn’t look at them* and *He didn’t look for them* is not fully derivable from the difference between *at* and *for*).

In [12i] the preposition immediately follows the verb, whereas in [ii] it is separated from the verb by another complement (O), but in either case the occurrence of the PB is dependent on the occurrence of the right kind of verb (cf. *\*It contains of egg and milk; \*He bought it to Pat*, etc.). These PBs thus very clearly qualify as complements by our licensing criterion. The first two examples in [ii] may be contrasted with *He threw it to/towards/past Pat* and *He set out with/without sufficient food*, where we have a choice of preposition; here *with/without sufficient food* is an adjunct while *to/towards/past Pat* is still a complement as it is licensed by *throw*, but it is less clearly a complement (less distinct from an adjunct) than those in [12].

### Choice of subordinate clause construction

When a clause functions as complement in the structure of a larger clause, the verb of the latter determines what kind of subordinate clause is permitted – whether declarative, interrogative, or exclamative, whether finite, infinitival, gerund-participial, and so on:

- [13] i *Whether we go abroad / \*That we go abroad depends on the cost.*  
 ii *He tends to be lazy / \*being lazy / \*that he is lazy.*

Example [i] shows that *depend* licenses an interrogative clause, but not a declarative, as its external complement, [ii] that *tend* licenses an infinitival, not a gerund-participial

or a finite clause, as its internal complement. As before, the complements require an appropriate verb: we can't, for example, have \**Whether he wins counts on the weather*, \**He enjoys to be lazy*.<sup>9</sup>

Clauses, like PPs, can be either complements or adjuncts:

- [14] i *He doesn't know whether or not she likes him.* [complement]  
 ii *I'm inviting him, whether or not she likes him.* [adjunct]

The subordinate clause is a complement in [i], for it requires a verb like *know* as opposed, say, to *intend*; but it is an adjunct in [ii], where there is no such restriction. The meaning is clearly different in the two cases: "He doesn't know the answer to the question 'Does she like him or not?'" and "It doesn't matter whether she likes him or not: I'm still inviting him".

### (b) Obligatoriness

A second important property of complements is that they are sometimes obligatory, whereas adjuncts are always optional. Compare:

- [15] i a. *She perused the report.* b. \**She perused.* [obligatory complement]  
 ii a. *She read the report.* b. *She read.* [optional complement]  
 iii a. *She left because she was ill.* b. *She left.* [optional adjunct]

We understand obligatoriness in a similar way to determination of a preposition by the verb: an element is obligatory if it can't be omitted without loss of grammaticality or an unsystematic change of meaning. Loss of grammaticality is illustrated in [ib], an unsystematic change in meaning in *She ran the business* vs *She ran*, where we have different senses of *run*. Obligatory complements with the form of PPs or subordinate clauses are illustrated in *It consists of egg and milk*, *He blamed the accident on me*, *This proves that it's possible*, *He tends to be lazy*.

This criterion is stronger than that of licensing. Licensing is a matter of a verb **allowing** a certain pattern of complementation, whereas here we are talking about the verb **requiring** it.

Obligatory complements are more distinct from adjuncts than are optional ones: they are complements in the most literal sense, in that they are needed to complete the structure headed by the verb. Both allowing and requiring complements are covered by the concept of subcategorisation mentioned above: *peruse* and *read*, for example, are differentiated in that *peruse* belongs only to the monotransitive class while *read* is a dual-transitivity verb, belonging to both monotransitive and intransitive classes.

The [a] examples in [15i–ii] are both monotransitive clauses: although the complement is obligatory in one and optional in the other this is not sufficient reason for saying that we have different constructions, for in other respects they are alike. For example, both have passive counterparts, as in *The report was perused/read by her*, and the complement can be questioned in the same way, as in *What did she peruse/read?*; and so on. If an element is obligatory, and hence a complement, with some verbs, then in the absence of counter-evidence we will take it to be a complement rather than an adjunct when it is optional too.

<sup>9</sup>Where the superordinate clause is complex-intransitive it is the PC that licenses the external complement: cf. *Whether we go abroad* / \**That we go abroad is dependent on many factors*. This is one of the factors that makes a PC more like a predicator than is an ordinary complement.

Examples involving non-core complements are given in:

- [16] i *She put/deposited the money in her bank account.*  
 ii *Lunch was followed/spoilt by the President's annual speech.*

*In her bank account* and *by the President's annual speech* are obligatory with *put* and *follow*, and hence complements. With *deposit* and *spoil* they are optional, but we again want to say that the constructions with *put* and *deposit* are the same, and likewise for those with *follow* and *spoil*. In [i] *in her bank account* can in both cases be replaced by *into her bank account*, which qualifies as a complement by the licensing criterion, since it requires the presence of a verb of the appropriate kind (compare *She deposited/\*found the money into her bank account*). The *by* phrase in [ii] is more problematic. Here the primary requirement is that the clause be passive, which is not a matter of licensing by the verb. Nevertheless, the factor of licensing does arise in cases like *How successful we are will be determined by how hard we all work*. The subordinate interrogative clause within the *by* phrase here is licensed by *determine*, just as it is in subject function in the corresponding active *How hard we all work will determine how successful we are*. We will therefore take the final elements in [16] as complements, whether they are obligatory or optional, though in the latter case they are somewhat peripheral instances of that function.

There are other cases, however, where we shall not want to generalise a complement analysis from obligatory to optional occurrences. Most obviously, the verb *be* almost always requires an internal complement, but allows a great range of different kinds of expression to fill that position and many of these are certainly not always complements:

- [17] i a. *Jill is in her study.*                      b. *The meeting was on Monday.*                      [complement]  
 ii a. *Jill signed it in her study.*                      b. *We signed it on Monday.*                      [adjunct]

The place and time expressions in [i] are obligatory and hence complements, but in [ii], where they are optional, they are prototypical adjuncts. Another example is that of manner dependents: with one or two verbs such as *treat* these are obligatory, but (for reasons we will take up in (c) below) we shall not want to take them as complements in the usual case where they are optional:

- [18] i *She treated us remarkably well.*                      [obligatory: complement]  
 ii *She carried out all the duties remarkably well.*                      [optional: adjunct]

Nevertheless, obligatoriness is an important factor in the distinction between complements and adjuncts. If a dependent is obligatory, that is sufficient to make it a complement, and the clearest types of complement (such as O, PC, etc.) are obligatory with some verbs besides *be*.

### (c) Anaphora

The fact that complements are more closely related to the verb than adjuncts is reflected in the scope of certain **anaphoric expressions**, notably *do so*. Anaphoric expressions are those which derive their interpretation from an **antecedent**. Compare, for example, *Jill signed the petition and Pam did so too* with *Jill visited my mother and Pam did so too*, where the first instance of *did so* is interpreted as “signed the petition” and the second

as “visited my mother”. The relevance of *do so* to the distinction between complements and adjuncts is seen in the following examples:

- [19] i a. \**Jill keeps her car in the garage but Pam does so in the road.*  
 b. *Jill washes her car in the garage but Pam does so in the road.*  
 ii a. \**I didn't read all the reports but I did so most of them.*  
 b. *I didn't cover this topic last time but I shall do so on Tuesday.*  
 iii a. \**She rode her bicycle and she did so to school.*  
 b. *She performed all the tasks and she did so remarkably well.*

The antecedent for *do so* must embrace all internal complements of the verb: it therefore cannot itself combine with such a complement. In [ia] *in the garage* is a complement of *keep* (it is obligatory when *keep* has the sense it has here), and therefore must be included in the antecedent for *do so*. This means that *Pam does so* has to be interpreted as “Pam keeps her car in the garage”, yet the inclusion of *in the road* to contrast with *in the garage* in the first clause requires the interpretation “Pam keeps her car”: the ungrammaticality results from this conflict. But in [ib] *in the garage* is an adjunct in the *wash* clause, and hence need not be included in the antecedent of *does so*:<sup>10</sup> we interpret it as “Pam washes her car”, with *in the road* added as an adjunct contrasting with *in the garage* in the first clause. In [iia] *all the reports* is likewise a complement of *read* (optional this time, however): *did so* must therefore be interpreted as “read all the reports”, so that we can't add *most of them* as another O. In [iib], by contrast, *do so* is interpreted as “cover this topic”, showing that *last time* is an adjunct. In [iii] the final phrase does not contrast with anything in the first clause, but the rule excluding the addition of a complement to *do so* is still operative: *to school* is complement in *She rode her bicycle to school*, whereas *remarkably well* is adjunct in *She performed all the tasks remarkably well*. Note that the data in [19] lend support to the position adopted in (b) above, namely that certain kinds of element can be either complements or adjuncts: locative *in the road*, for example, is a complement in [ia] and an adjunct in [ib].

*Do so* provides a useful diagnostic: if a dependent (other than the subject) can combine with *do so* this is sufficient to show that it is an adjunct. But inability to combine is not sufficient to show that a phrase is not an adjunct: there are semantic restrictions on the kind of VP that can serve as antecedent (see Ch. 17, §7.5). For example, we cannot say \**Kim died in 1995 and Pat did so last year*, but this doesn't indicate that *in 1995* and *last year* are here complements: the deviance doesn't result from combining a complement with *do so* but from using *do so* with the wrong kind of antecedent. This is evident from the fact that the deviance remains if we drop the time expressions altogether: \**Kim died and Pat did so too*.

#### (d) Category

In the simplest cases, complements have the form of NPs, adjuncts that of adverbs (Adv) or adverb phrases (AdvP):

- [20] *Unfortunately, Kim often reads things too quickly.*  
 A:Adv C:NP A:Adv P:V C:NP A:AdvP

<sup>10</sup>We say ‘need not’ because adjuncts can be included within the antecedent, as in *Jill washes her car in the garage and Pat does so too*.

We review summarily the major categories, confining our attention to cases where they function within the structure of the clause.

### NPs

Complements are most often NPs, and conversely NPs are usually complements. Some NPs can occur with adjunct function, but they tend to belong to very restricted semantic types, mainly time or manner:

- [21] i *They saw her this morning / last week.* [time adjunct]  
 ii *You should hold them this way.* [manner adjunct]

A distinctive property of such NPs is that they cannot be replaced by personal pronouns: *They saw her then/\*it, You should hold them so/\*it. Similarly there are no corresponding interrogatives with the pronoun *what* or relatives with *which*: *When/\*What did they see her?*, *How/\*What should you hold them?*; *the time when/\*which they saw her, the way that/\*which you should hold them.**

### AdvPs

The characteristic function of AdvPs is to modify the verb. In general they are adjuncts, but we have noted that they qualify as complements with the few verbs like *treat* where they are obligatory. AdvPs also occur as complement to the verb *be* in its specifying sense (§5.5.1):

- [22] i *She writes exceptionally clearly.* [adjunct]  
 ii *They treat us quite abominably.* [complement of *treat*]  
 iii *The only way to do it is very, very slowly.* [complement of specifying *be*]

### PPs

Phrases headed by a preposition prototypically have an NP as complement; PPs of this kind occur readily either as adjunct or complement:

- [23] i a. *She did it [without difficulty].* b. *I slept [on the floor].* [adjunct]  
 ii a. *He relied [on his mother].* b. *I put it [underneath the mat].* [complement]

The most obvious complements are those where the preposition is specified by the verb, as in the *rely* + *on* example (and those in [12] above), but there are also cases where the preposition has its full lexical content, as in [23iib]. For reasons explained in Ch. 7, we interpret the category of preposition more broadly than in traditional grammar, allowing for example that a PP may consist of just a preposition. PPs of this kind are likewise found as adjunct (*We slept downstairs*) or complement (*We took the bed downstairs*). Those consisting of preposition + declarative clause, however, are predominantly adjuncts, with complement function largely limited to copular clauses of various kinds:

- [24] i *You'll catch him [if you run].* *They left [because the baby was sick].* [adjunct]  
 ii *It's [because you eat so fast] that you get indigestion.* }  
 iii *That was [long before we were married].* } [complement]

### Subordinate clauses

Finite subordinate clauses – content clauses, as we call them – are generally complements, but are occasionally found as adjuncts too:

- |  |   |              |
|--|---|--------------|
| [25] i <i>I hadn't noticed <u>that she was looking so worried.</u></i> | } | [complement] |
| ii <i>Whether or not I give my approval depends on many factors.</i>   |   |              |
| iii <i>What had happened, <u>that she was looking so worried?</u></i>  | } | [adjunct]    |
| iv <i>He'll do it, <u>whether or not I give my approval.</u></i>       |   |              |

The complements in [i–ii] meet the licensing criterion, the first requiring a verb like *notice*, the second, one like *depend*.

Non-finite clauses are distributed more evenly between the two functions:

- |   |   |              |
|---|---|--------------|
| [26] i <i>He tried <u>to please his mother.</u></i>                   | } | [complement] |
| ii <i>I regret <u>having lived here so long.</u></i>                  |   |              |
| iii <i>He did it <u>to please his mother.</u></i>                     | } | [adjunct]    |
| iv <i>I understand the problem, <u>having lived here so long.</u></i> |   |              |

### AdjPs

The characteristic function of AdjPs is predicative – but both complements and adjuncts can be predicative:

- |   |                          |
|---|--------------------------|
| [27] i <i>She was <u>disgusted at his betrayal.</u></i>             | [predicative complement] |
| ii <i><u>Disgusted at his betrayal,</u> she went back to Paris.</i> | [predicative adjunct]    |

### (e) Position

Complements are more restricted than most adjuncts as to what positions they can occupy in the clause. In general, there is a basic or default position for a given kind of complement, with its occurrence in other positions being permitted only under a limited set of conditions. Consider, for example, the position of the underlined complements in the following:

- |      |   |   |
|------|---|---|
| [28] | BASIC (DEFAULT) POSITION                            | NON-BASIC POSITION                                  |
| i    | a. <i><u>She</u> will accept the proposal.</i>      | b. <i>Will <u>she</u> accept the proposal?</i>      |
| ii   | a. <i><u>An old badger</u> lived in the garden.</i> | b. <i>In the garden lived <u>an old badger</u>.</i> |
| iii  | a. <i>He gave the beer <u>to Kim</u>.</i>           | b. <i><u>To Kim</u> he gave the beer.</i>           |

The basic position of the subject is before the predicator, as in [ia/iiia], and no other complement can come between them. In [ib] the subject follows the auxiliary verb, a construction limited largely to main clause interrogatives and to declaratives containing a restricted range of elements in initial position (*Only then / \*Because she is desperate will she accept the proposal*). Example [iiia] shows the basic position for the PP complement *to Kim*; it can occur initially, as in the preposing construction [iiib], but this is relatively unusual and restricted in discourse distribution – for example, it would not be an appropriate response to such questions as *What happened next?*, *What did Ed do with that beer?*, and so on. Adjuncts, on the other hand, generally have considerably greater mobility. With some, such as *however*, *fortunately*, and the like, the distinction between basic and non-basic positions is not applicable, and with those where it does apply, occurrence in a non-basic position tends to be less restricted than with complements.

*In the afternoon we played tennis*, for example, is a more usual kind of construction than *To Kim he gave the beer*.

#### (f) Argumenthood

In the simplest cases the propositional meaning of a clause (ignoring the component contributed by the tense) can be described in terms of a **semantic predicate** together with one or more **arguments**. The semantic predicate represents some property, relation, process, action, etc., and the arguments represent the entities involved – the bearer of the property, the terms in the relation, etc. Prototypically, the semantic predicate corresponds to the syntactic predicator, and the arguments correspond to complements.<sup>11</sup> In our initial example, *He always reads the paper before breakfast*, the complements *he* and *the paper* are arguments of *read*, but the adjuncts *always* and *before breakfast* are not: semantically, they are concerned with circumstances of the situation (frequency and temporal location respectively) rather than entities involved in the reading.

The correlation between semantic arguments and complements is complicated by two factors:

#### Dummies

Although complements usually correspond to arguments, there are some that do not. The clearest case is that of **dummies**, semantically empty NPs consisting of a pronoun and having a purely syntactic function:

- [29] a. *It upset me that she didn't write.*      b. *She finally made it to the shore.*

In [a] *me* and *that she didn't write* are arguments of *upset*, but *it* is not: it is a dummy pronoun filling the subject position. It makes no independent contribution to the meaning of the clause, which is the same as that of *That she didn't write upset me*. In [b] the object *it* is part of an idiom, again without independent meaning of its own; the clause means roughly “She finally (after some effort) reached the shore”.

#### Raised complements

In some constructions a complement expresses an argument not of the semantic predicate expressed by its syntactic head, but of one in some subordinate position:

- [30] a. *Pat seems to have misled them.*      b. *They intended Kim to see it.*

In [a] *Pat* is a syntactic complement (subject) of *seem* but not an argument of it. The meaning is the same as in *It seems that Pat misled them*, where it is clear that *Pat* is related both syntactically and semantically to *mislead*, not *seem*. Similarly [b] has *Kim* as complement (object) of *intend* but it is an argument of *see*, not of *intend* (compare again *They intended that Kim should see it*). We will refer to complements of this kind as **raised**: syntactically they are complements of an element which is superordinate to (higher in the constituent structure than) the one they are construed with semantically.<sup>12</sup>

<sup>11</sup>In syntax we have a distinction between **predicator** (the function of the verb) and **predicate** (the function of the VP); the analogous distinction in semantics is between **simple predicate** and **complex predicate**. In *Kim loves Pat*, we have a simple predicate *love* relating *Kim* and *Pat*, but we can also think of *love Pat* as a complex predicate denoting a property attributed to *Kim*: a complex predicate can thus be formed by incorporating an argument. For present purposes, however, we will understand a semantic predicate to be of the simple kind: it is in this sense that it corresponds to a syntactic predicator.

<sup>12</sup>The term ‘raised’ was originally used in an approach where there is an abstract level of analysis in which the complement is located in a subordinate clause and then raised by a syntactic transformation into the higher clause; our definition of the term carries no such implication and covers a somewhat wider range of cases, including for example *He drank himself to death*, where *himself* relates semantically to *death*, not directly to *drink*.

## (g) Selection

Semantic predicates commonly impose **selection restrictions** on their arguments. For example, the first argument of *enjoy*, and the second of *frighten*, are normally required to represent animate beings:

- | [31]      RESTRICTIONS ADHERED TO     | RESTRICTIONS VIOLATED                           |
|---------------------------------------|---|
| i a. <i>Kim enjoyed the concert.</i>  | b. # <i>The cheese enjoyed the cool breeze.</i> |
| ii a. <i>They frightened the cat.</i> | b. # <i>They frightened the ironing-board.</i>  |

Examples like [ia] and [iia] are perfectly normal, whereas [ib] and [iib], which violate selection restrictions, are anomalous.

Since these restrictions involve arguments of the semantic predicate, then it follows from what was said about arguments in (f) above that they apply to complements: *enjoy* selects an animate subject, *frighten* an animate object.<sup>13</sup>

## (h) Role

The arguments of a semantic predicate bear various **roles** in the situation, such as agent (roughly, performer of an action) and patient (undergoer of an action). Traditional school grammar defines subject and direct object in terms of these roles: the subject is said to be the performer of the action and the direct object the undergoer. But this is a massive oversimplification, implying that there is an invariant role associated with each of these complement types. There is in fact no such invariance: the roles depend on the semantic properties of the verb. Compare, for example:

- |                                      |                               |
|--------------------------------------|-------------------------------|
| [32] i <i>Kim shot the intruder.</i> | [S: agent; O: patient]        |
| ii <i>Kim wrote the letter.</i>      | [S: agent; O: factitive]      |
| iii <i>Kim heard an explosion.</i>   | [S: experiencer; O: stimulus] |

Example [i] describes a situation in which Kim did something to the intruder, and here the traditional roles do apply. But in [ii] it is not a matter of Kim doing something to the letter, for the letter did not exist prior to the writing – note that *I wrote it* would not be a coherent response to the question *What did you do to the letter?* There is thus no patient in the situation described in [ii]. We will refer to the role of the object here as ‘factitive’, indicating something that comes into existence by virtue of the process expressed in the verb. It is even clearer that [iii] does not describe an agent–patient situation: Kim did not do something to an explosion. The clause here describes not an action performed by Kim but an event of sensory perception, and the roles we will use for this type of situation are ‘experiencer’, for the one who has the perception, and ‘stimulus’, for what is perceived. We take up the issue of describing and classifying roles in §2: the point being made here is just that there is no single semantic role that is associated with a given type of complement such as subject and object. The role depends on the meaning of the verb rather than being simply determined by the meaning of the complement expression itself. This contrasts sharply with what we find with prototypical adjuncts. If, for example, we add *at that time* or *certainly* to the examples in [32] these adjuncts will have the same interpretation in each case, determined by their own content.

<sup>13</sup>We use the standard term ‘selection restriction’ here, but it should not be interpreted in too negative a way, as ruling out examples like [31b/iib] as anomalous. A selection restriction implies that the argument is of a particular type, and this often serves to further specify the interpretation of an NP; in *He ate everything we had in the house*, for example, the selection restriction imposed by *eat* on its second argument will normally lead us to interpret *everything* as “all the food”.

Where the complement has the form of a PP we again need to distinguish those where the preposition potentially has contrastive content (e.g. *They pushed it to/towards/past their house*) and those where it is specified by the verb (e.g. *This gave a big advantage to their house*). With *push* the preposition is crucial for determining the role – compare *They pushed it from their house*, where we have a ‘source’ rather than a ‘goal’. But with *give* it is the verb that plays the major part in assigning the role. This use of *to* is clearly related to that of *They pushed it to their house*, but the role is not identical: it is by virtue of the *give* that we interpret their house specifically as ‘recipient’. The choice of preposition is not arbitrary, but nor is its content sufficient to identify the role by itself.

Semantic roles need some further discussion, and the next section is devoted to that topic.

## 2 Semantic roles

We suggested in §1.2 that the arguments of a semantic predicate play various roles in the situation represented by the clause: we turn now to the issue of describing these semantic roles. In the first instance they apply to the entities involved in the situation, but we will follow the widespread practice of applying them, derivatively, to syntactic constituents of the clause. In *Pat objected*, for example, we will say that *Pat* has the semantic role of agent.

### 2.1 Some preliminary issues

#### ■ Generality

In an example like *Kim loves Pat* we can begin by distinguishing the roles of *Kim* and *Pat* as respectively ‘lover’ and ‘loved’, roles specific to this particular verb. But there is an obvious likeness between these roles and those found with other verbs of emotion, such as *adore*, *fear*, *hate*, *like*, *respect*, so that we might describe the role of *Kim* as ‘experiencer of emotion’ and that of *Pat* as ‘stimulus of emotion’. At a higher level of generality we can group together verbs of emotion and verbs of perception, such as *feel*, *hear*, *see*, *smell*, *taste*, with the roles now simply ‘experiencer’ and ‘stimulus’.

There are, however, limits to this process of generalisation. Most obviously, we cannot generalise across **all** verbs and find one semantic role invariably filled by the subject argument of canonical clauses and another by the direct object argument. This is the point made in §1.2 in criticising the traditional schoolbook definitions of subject and direct object as respectively performer and undergoer of the action expressed by the verb. These roles apply to examples like *Kim shot the intruder*, but certainly not to all, e.g. not to *Kim heard an explosion*. We will see below that there is an important insight underlying the traditional definitions, but it is not a matter of finding a constant role associated with the subject and direct object.

It is by no means clear that (as assumed in some modern work) a small number of general roles can be established (perhaps in the order of a dozen or so) such that all arguments can be assigned to one or other of these roles, with no two arguments in the same clause having the same role.

We will not therefore attempt a systematic and comprehensive description of clause structure in terms of semantic roles. But we will frequently invoke them in a less ambitious

way in describing the arguments corresponding to complements of various sorts – subjects, direct or indirect objects, or obliques governed by different prepositions. The level of generality of the roles invoked will then vary according to the needs of the case in question. In *Kim gave the key to Pat*, for example, the role of *Pat* may be described as goal or, more specifically, as recipient: the more general role is relevant to the selection of the preposition *to*, while the more specific one is needed in relating this structure to the alternant with an indirect object, *Kim gave Pat the key*, since other subtypes of goal are not permitted here (cf. *He sent the culprit to the back of the room*, but not \**He sent the back of the room the culprit*).

### ■ Semantic role vs presentational status

Although semantic role is a major determinant of syntactic function, it is not the only one. This is evident from such pairs as:

- |     |     |   |   |
|-----|-----|---|---|
| [1] | i   | a. <i>Kim shot Pat.</i>                   | b. <i>Pat was shot by Kim.</i>            |
|     | ii  | a. <i>Kim married Pat.</i>                | b. <i>Pat married Kim.</i>                |
|     | iii | a. <i>Kim's writing resembles Pat's.</i>  | b. <i>Pat's writing resembles Kim's.</i>  |
|     | iv  | a. <i>Kim's promotion preceded Pat's.</i> | b. <i>Pat's promotion followed Kim's.</i> |
|     | v   | a. <i>Kim bought the car from Pat.</i>    | b. <i>Pat sold the car to Kim.</i>        |

In [i] the [a] version is active and [b] is its passive counterpart. Both describe the same situation, so that each of *Kim* and *Pat* has a constant role, agent and patient respectively. The difference, then, is not a matter of the roles that the arguments have in the situation but of what we will call their **presentational status**. Other things being equal, [a] will be interpreted as being primarily about Kim, [b] as being primarily about Pat. The active is syntactically more elementary than the passive. We can therefore say that the default alignment of argument and syntactic function associates agent with subject and patient with object, while the passive departs from this default, aligning patient with subject and agent with the complement of the preposition *by*.

However, presentational status is not relevant only to choice between constructions of different complexity. It may also be the chief determinant of the alignment of arguments with syntactic functions in cases like [ii–v], with no syntactic complexity differences. The [a] and [b] cases again describe the same situation, and neither is more complex than the other. In [ii] *marry* (in the sense it has here) is semantically **symmetric**: *X married Y* and *Y married X* entail each other. It follows that there is no linguistically significant difference between the semantic roles of the two arguments: both are agents. Either can be aligned with the subject without any difference in syntactic construction. The choice between them depends on whether the event is presented from Kim's perspective or Pat's. In [iii] *resemble* is likewise symmetric,<sup>14</sup> so that again the choice between [a] and [b] depends on perspective, not role. The only difference is that this time the common role is not agent, but rather one that we will subsume under 'theme'.

Example [iv] differs from [ii–iii] in that [a] and [b] contain different lexical verbs, *precede* and *follow*. These verbs (as used here) are **converses** in that each of *X precedes Y* and *Y follows X* entails the other. Again the difference is not in the situation itself, but in

<sup>14</sup>The difference in perspective here is very much the same as that found in *Kim's handwriting is as bad as Pat's is* and *Pat's handwriting is as bad as Kim's is*, where the syntactic difference, however, is not a matter of which argument is realised as subject and which as object, but rather of which is realised as subject of the superordinate clause and which as subject of the subordinate one.

the way it is presented, [a] giving greater prominence to Kim's promotion, [b] to Pat's.<sup>15</sup> Differences in presentational status thus determine not simply which argument is aligned with subject and which with object, but also which lexical verb is selected. Different verbs are needed because neither *precede* nor *follow* is symmetric, like *marry*, and this implies that the arguments do not have identical roles – they might be distinguished at a very specific level as 'prior' and 'subsequent'. But the difference between these is of no significance for more general roles, and these too we will include under the concept of theme.

In [1v], *buy* and *sell* are likewise converses: [a] and [b] entail each other. Both describe the same situation, but again from different perspectives. It is worth emphasising in this connection that *buy* and *sell* do not differ according to whether it is the buyer or the seller who initiates the deal: [a] and [b] are both consistent with either party making the first move. We very often take the perspective of the one who initiates the deal, but there may be other factors which override this. In one respect, then, *Kim* and *Pat* are both agents, just as they are in the *marry* example [ii]. In another respect, however, they are obviously different since the car goes **to** *Kim* **from** *Pat* – and this time, in contrast to [iv], the difference is of significance at higher levels of generality, where we will analyse *Kim* as goal and *Pat* as source. But either goal or source can be aligned with subject in a syntactically elementary construction, depending on the lexical properties of the particular verb selected.

## 2.2 Some major semantic roles

We present here briefly the major roles that we shall have occasion to invoke. We focus on prototypical instances with no attempt to provide rigorous criteria to determine precisely when an argument bears a given role. As made clear in the discussion of [1], we allow that in certain circumstances two arguments of a single verb may have the same role (as in *Kim married Pat*, where both *Kim* and *Pat* are agents). We also allow that a single argument may have more than one role (as in *Kim bought the car from Pat*, where *Kim* is both agent and goal, *Pat* both agent and source).

### (a) Causer

The **causer** role involves direct or immediate causation of an action or event – the role of the subject argument in *Kim signed the letter*, *The dog snarled*, *The rain ruined the crop*, etc. The qualification 'direct or immediate' is introduced to clarify the analysis in cases where we have a chain of causation, as in *Pat made Kim sign the letter*, where *Kim* is the direct/immediate causer in the signing situation, and *Pat* can be regarded as indirectly causing the signing. Here *Pat* is not an argument of *sign*, and hence has no role relative to it: the causer role for *sign* is assigned to *Kim*, just as in the canonical clause *Kim signed the letter*.

### (b) Agent

This is a subtype of causer, the type found in *Kim signed the letter* and *The dog snarled* but not *The rain ruined the crop*. The prototypical agent is animate and acts consciously,

<sup>15</sup> Each of [iiva–b] has a passive counterpart (*Pat's promotion was preceded by Kim's* and *Kim's promotion was followed by Pat's*) so that the presentational difference between [a] and [b] is not identical to that in [1i]; the point being made here, however, is that it is the same kind of difference, namely one relating to presentation rather than inherent properties of the situation being described.

volitionally. Whether or not a causer is an agent depends in part on the verb, in part on other factors. Thus *murder* takes an agent, but with many verbs the subject argument may or may not be agentive. Compare, then:

- [2] i a. *My uncle returned.*      b. *I coughed to remind them I was waiting.*      [agent]  
 ii a. *My headache returned.*      b. *I coughed.* [involuntarily]      [non-agent]

As just noted, an agent is normally animate, or at least conceived of as like an animate being, so that while the subject argument will be interpreted as agent in [ia] it does not have this role in [iia] (where it is not even causer, merely theme). And it is not just the inherent properties of the subject argument that affect the issue. For example, [iib] readily allows a non-agentive interpretation (an involuntary cough), but the purpose adjunct in [ib] excludes this (requiring a deliberate, purposeful cough). Compare, similarly, *You've broken the window* with *I suggest you break the window* and imperative *Break the window*: the role of *you* (the overt or understood subject) with respect to the breaking may be that of a non-agentive causer in the first, but must be that of agent in the second and third.<sup>16</sup>

### (c) Instrument

This is the role of an entity prototypically used by an agent in performing an action:

- [3]      *I cut the lace with the knife.*      [instrument]

There is a close relation between an instrument and a causer, and some entities can fill either role. Thus in *The knife cut the lace* the subject *the knife* bears the causer role. Note that this does not entail that anyone used the knife (perhaps it was accidentally knocked off the table and fell onto the lace, cutting it as it did so): we will therefore invoke the instrument role only where there is an explicit or implicit agent using the instrument.

### (d) Patient

A prototypical patient is affected by an action performed by some causer, especially an agent – the agent (or causer) does something to the patient. Compare:

- [4] i *They hit me.*    *They kissed us.*    *They did cruel things to him.*      [patient]  
 ii *They like me.*    *They remember us.*    *They listened to him.*      [non-patient]

### (e) Experiencer and stimulus

These roles are associated with subject and internal complement respectively in:

- [5] i *He hates me.*      *We heard a bang.*      *The thought of being alone scares me.*  
 ii *They believe me.*    *We know the reason.*    *She realizes that it's impossible.*

Experiencer and stimulus prototypically appear in situations of emotional feeling or sensory perception, as in [i]. The experiencer is the one who feels or perceives, while

<sup>16</sup>In an example like *They advised the twins not to be photographed together* the agentivity conferred on *the twins* by the verb *advise* is indirect, involving an implicit chain of causation in the sense explained in (a) above: the (direct) agent of *photograph* is not expressed. The indirectness of the agentivity is more apparent in examples with an explicit chain of causation, as in *The twins wouldn't let themselves be photographed together* or *The twins had him photograph them separately*.

the stimulus is the second argument, what arouses the feeling or is perceived. We will also extend these roles to the field of cognition, as in [ii] (where the last example has the stimulus expressed by a subordinate clause). The labels are not as intuitively appropriate in the case of cognition, for while it is normal to talk of ‘experiencing’ emotion and sensory perceptions, it is much less so for cognitive states. Nevertheless, in all three fields – emotion, perception, and cognition – we are concerned with the internal state of some animate or animate-like being which is characteristically not under its immediate control. (The experiencer may exercise control, in which case the argument will also have the agent role, as with the understood subject of *hear* in *Hear what I have to say before making up your mind.*)

#### (f) Theme

This role has a rather wide application, illustrated in:

- [6] i *She* fell off the balcony. *She's* on the balcony. *She* ran home.  
 ii He gave me the key. The key is mine.  
 iii *She* went mad. It made her angry. *She* was in a happy frame of mind.

The most central case concerns movement and location in space, as in [i]: the theme is the entity that moves or is located. In *She ran home* the role of theme combines with that of agent. Many expressions, such as the *precede* and *follow* of [1iv], have senses in the field of time as well as space, and we will thus allow for temporal as well as spatial themes. Also analogous to movement and location in space are transfer and possession, and we assign the theme role to *the key* in both examples in [ii]. By further extension it applies to entities that change or have properties, as in [iii] and, we have suggested, the arguments of *resemble* in [1iii].<sup>17</sup>

#### (g) Primary and secondary theme

In a situation of transfer there may be two themes, moving in opposite directions as it were:

- [7] i *I swapped two of my records for one of Ed's compact discs.* } [theme + theme]  
 ii *Ed swapped one of his compact discs for two of my records.* }  
 iii *I bought the car from Ed for \$1,000.* [primary + secondary theme]

In [i–ii] there is no basis for differentiating between the two themes as semantic roles: the difference between them is essentially one of perspective. But in a case like [iii] there is a situational difference between the themes. *The car* is the **primary theme** and *\$1,000* is the **secondary theme**. The secondary theme (characteristically a sum of money, the price) presupposes a primary one, but not conversely: in *I obtained the car from Ed (for \$1,000)* the version without the *for* phrase does not entail that any price was paid, whereas the interpretation of, say, *He charged me \$1,000* requires that we supply a primary theme.

<sup>17</sup>The use of ‘theme’ for a semantic role has little connection with the everyday sense of the term but is now well established; an older use of the term which still has a wide currency (and is more directly related to the everyday sense) corresponds closely to what we here call ‘topic’, a concept having to do with presentational status, not a semantic role.

## (h) Factitive theme

A further special case of theme is illustrated by the role of a *hole* in:

[8] They made a hole in the roof.    A hole appeared in the roof.

A **factitive** theme comes into existence by virtue of the process expressed, and cannot be simultaneously agent or patient.

## (i) Path, source, goal, and location

These occur in situations involving the theme role:

[9] i She ran from the post office via the railway station to the bus-stop.  
 ii a. Kim gave the key to Pat.    b. The light went from red to green.  
 iii a. She is on the balcony.    b. The meeting is at noon.

In the central case where the theme moves, as in [i], the starting-point is the **source** (*the post office*), the endpoint is the **goal** (*the bus-stop*), and the intermediate point is the **path** (*the railway station*). We will then extend these roles, as we did with theme, from the central field of space to the fields of possession and the ascription of properties/states. Thus in [ii] (where the themes are *the key* and *the light*) the sources are *Kim* (also agent) and *red*, while the goals are *Pat* and *green*. The clauses in [i] and [ii] are dynamic, whereas [iii] is static, so here there is no going from source to goal, but simply location, either spatial (*on the balcony*) or temporal *at noon*.

## (j) Recipient

This is the subtype of goal applying in the field of possession. Thus in the above *Kim gave the key to Pat* the goal *Pat* is, more specifically, **recipient**.

## (k) Beneficiary

The **beneficiary** is the role of the argument, usually animate, that something is obtained for or done for, e.g. the role of *you* in *I've bought you a present* or *I'll open the door for you*. In the central case on which the term is based, the beneficiary is intended to benefit but it also covers situations where the reverse intention holds, as in *You poured me a drink laced with arsenic*, or *I'll break your neck for you*.

## 2.3 Subject and direct object selection in canonical transitive clauses

The major factor determining the alignment of arguments with syntactic functions in canonical clauses is semantic role. Here we focus on transitive clauses, asking which argument is expressed as subject, and which as direct object. The key principle is given in [10i] and illustrated in [10ii]:

[10] i In canonical clauses with one agent and one patient, the agent is aligned with S, the patient with O<sup>d</sup>.  
 ii *Kim* shot *Pat*.    [S (*Kim*) = agent, O<sup>d</sup> (*Pat*) = patient]

There are no exceptions to this principle, which underlies the schoolbook tradition mentioned above where subject and object are defined as respectively performer and undergoer of the action. We noted that these definitions are unsatisfactory because their formulation implies that all clauses are of the agent–patient type (and because they do

not cater for non-canonical clauses like passives). Nevertheless, the alignment in other canonical clauses can be seen, to a very significant extent, as derivative, as reflecting the relative likeness of the arguments to agent and patient. We consider briefly three cases.

### (a) Potential agentivity

Many verbs allow a given position to be filled by an agent or a non-agent, with other features of the role remaining constant; this argument will then be aligned with S in either case:

- |      |   |  |
|------|---|--|
| [11] | S AS AGENT                                    | S AS NON-AGENT                                   |
|      | i a. <i><u>Kim</u> destroyed the flowers.</i> | b. <i><u>The rain</u> destroyed the flowers.</i> |
|      | ii a. <i><u>Kim</u> overtook me.</i>          | b. <i><u>The rock</u> overtook me.</i>           |

In [ia/iia] the salient interpretations have *Kim* as agent; in [ib] and [iib] *the rain* and *the rock* are not agents but their roles are like that of *Kim* in other respects, *the rain* being causer in [ib], and *the rock* theme in [iib] (describing a situation, let us say, in which a dislodged rock rolls past me down a hillside).

### (b) Experiencer + stimulus clauses

Verbs of emotion or psychological state fall into two main classes according to the way these roles align with S and O:

- |      |  |   |
|------|--|---|
| [12] | EXPERIENCER:S, STIMULUS:O                              | STIMULUS:S, EXPERIENCER:O                           |
|      | i a. <i><u>We</u> enjoyed <u>the show</u>.</i>         | b. <i><u>The show</u> delighted <u>us</u>.</i>      |
|      | ii a. <i><u>We</u> deplored <u>their decision</u>.</i> | b. <i><u>Their decision</u> appalled <u>us</u>.</i> |

The existence of these two patterns of alignment reflects the fact that both experiencer and stimulus bear some resemblance to a prototypical agent. On the one hand, the experiencer is an animate, sentient being, like an agent; on the other, the stimulus has something of the character of a causer. Most of the *enjoy* class verbs can occur fairly readily in constructions that assign agentivity to the experiencer, constructions such as the imperative (especially when negative) or the complement of verbs like *try*: *Don't despise/hate/pity me; I'm trying to like / to enjoy / not to resent it*. Similarly, verbs of the *delight* class generally allow agentivity to be assigned to the stimulus, indeed in a somewhat wider range of constructions: *Don't annoy/humiliate/intimidate him; I'm trying to amuse/encourage/shock them; He deliberately frightened/offended/unnerved them*.<sup>18</sup> The *delight* verbs also tend to occur more readily than *enjoy* verbs in dynamic situations, where the similarity between stimulus and causer is closer than in states. Finally, a number of the *delight* class verbs also have senses involving physical activity with the subject expressing a causer: *agitate, crush, depress, disarm, floor, move, repel, wound*, etc.

In the field of emotion many more verbs pattern like *delight* than like *enjoy*. In the field of perception, by contrast, the predominant pattern has the experiencer expressed as S: *I saw/heard/felt/smelled/tasted them*. The other alignment is seen in *It dazzled/deafened me*, where the experiencer is much like a patient (and the literal sense of *deafen* is straightforwardly causative). In the field of cognition it is again predominantly the

<sup>18</sup> Verbs which accommodate agentivity less readily include *abhor, deplore* from the *enjoy* class, *appal, concern* ("worry") from the *delight* class. Some of the latter class also tolerate the assignment of 'indirect' agentivity to the experiencer, as in *Don't be intimidated/offended/unnerved by his behaviour*.

experiencer that is aligned with S: *I know/forget/remember the answer*; as noted above, it is questionable whether the other role is appropriately categorised as a stimulus, and certainly it tends to be very different from a causer, so that it has very little claim, as it were, to be aligned with S. The opposite alignment, of stimulus with S and experiencer with O, does occur, but with extended senses of verbs whose primary sense is physical: *The answer eludes/escapes me*; *A worrying thought struck me*.

### (c) Presentational status as deciding factor

To conclude this discussion, we return to the examples introduced in [1ii–v]. Here we find two arguments with equal claims to subject alignment in terms of [10] and its analogical extension: in [1iii] with *marry* and [iv] with *buy/sell* the two parties are equally agentive; in [iii] with *resemble* and [iv] with *precede/follow* the two arguments are themes and equally non-agentive. It is in this case, then, that the alignment is determined not by role but by what we are calling presentational status, with the subject expressing the argument from whose perspective the situation is viewed.

## 3 The subject

At the general level the subject may be defined as that functional element in the structure of the clause that prototypically expresses: (i) the semantic role of agent, and (ii) the presentational status of topic. In canonical clauses in English where there is a single agent, this is always aligned with the subject, and there is a significant tendency for the subject to refer to the topic, to what the utterance is primarily about.

Corresponding canonical and non-canonical clauses may differ with respect to the choice of subject:

- |     |                                    |   |
|-----|------------------------------------|---|
| [1] | CANONICAL                          | NON-CANONICAL                           |
|     | i a. <i>Kim</i> opened the parcel. | b. <i>The parcel</i> was opened by Kim. |
|     | ii a. <i>One nurse</i> is here.    | b. <i>There</i> is one nurse here.      |

The existence of such pairs can be seen as reflecting the fact that there are two components of meaning involved in the above definition of subject, one having to do with semantic role, the other with presentational status. The two factors may conflict rather than combine in determining the choice of subject. In [1i] the agent is *Kim*, but I might wish to present the situation as primarily about Kim or about the parcel: in the former case agent role and topic status combine and I would select alternant [a], while in the latter they conflict and I would select [b], giving precedence to presentational status over semantic role. In [ii] there is no agent, but of the two roles that are involved, the theme *one nurse* rates as more like an agent than the location *here* and is aligned with S in the canonical alternant [a] (note that *be* allows for agentivity to be conferred on the theme by other factors, as in imperative *Be here if you possibly can*: see §2 above). The situation, however, is one that does not lend itself to a topic–comment presentation, and alternant [b] allows *one nurse* to be expressed in non-subject position with non-topic status. In general, semantic role is the determining factor in the choice of subject in canonical clauses, while presentational status determines the choice between canonical and non-canonical constructions.

before the predicator, and both are completely ungrammatical. S can be separated from P by an adjunct (*You never heard their arguments*), but not by a complement. Non-canonical constructions where S follows P involve subject–auxiliary inversion or subject postposing: see (e)–(f) below and §3.2.3.

### (c) Case

In finite clauses a personal pronoun with distinct nominative and accusative forms appears in the nominative when subject, and in the accusative when object: compare *I know them* (with nominative *I* as S, accusative *them* as O) and *They know me* (nominative *they* as S, accusative *me* as O).

In many languages case plays the major role in distinguishing subject and object, and in such languages the order of elements is characteristically very free. In English, however, the loss of any inflectional distinction between nominative and accusative except in a handful of pronouns has resulted in order becoming the primary marker of clause functions, and this limits the scope for varying the order, as illustrated above. Note that O–P–S is excluded even where the NPs are pronouns with a nominative–accusative contrast: \**Them know I*. This underlines the slender role of case in English syntax: typically in a language with case-marked subject and object, such positional reversals are permitted.

### (d) Agreement

Person–number inflection in the verb is determined by agreement with the subject:

- [4] i *The minister knows the candidates.* [knows agrees with *the minister*]  
 ii *The candidates know the minister.* [know agrees with *the candidates*]

As with case, verb agreement plays a lesser role in marking the subject in Present-day English than in many languages, and again this is due to the large-scale loss of inflectional contrasts: leaving aside the verb *be*, there is no person–number inflection in the preterite, and in the present tense we have only a two-way contrast between 3rd person singular and any other person–number combination (as in the above *knows* vs *know*). Thus in *You know the candidates* the verb-form *know* provides no indication that the subject is *you*. It is worth observing, however, that although more often than not the subject is not directly identifiable by pronominal case and verbal person–number, inflection still has a significant indirect role: the subject status of *you* in *You know the candidates* is indicated by the fact that if we replace *you* by *she* the form required will be nominative *she* and *know* will have to be replaced by 3rd person singular *knows*.

### (e) Subject–auxiliary inversion

In closed interrogative main clauses and various other constructions, the subject follows the predicator instead of preceding it, as in canonical clauses: compare canonical *She can swim* and *She likes it* with closed interrogative *Can she swim?* and *Does she like it?* The predicator has to be an auxiliary verb, and these constructions are accordingly said to involve subject–auxiliary inversion.

This property provides an indirect way of identifying the subject in structures not illustrating inversion: *you* can be confirmed as subject of *You know the candidates* because it is *you* that comes to occupy the post-auxiliary position when we convert this declarative to the corresponding closed interrogative *Do you know the candidates?*

## (f) Open interrogatives

The rules forming open interrogatives likewise distinguish sharply between subject and non-subject elements:

- [5] i *Who bought it?* [interrogative element as subject: basic order]  
 ii *What did you buy?* [interrogative element as non-subject: inverted order]

If the interrogative element is subject, the order is the same as in the declarative (cf. *Someone bought it*), but if it is non-subject, then the interrogative element is usually placed in front position, triggering subject–auxiliary inversion.

## (g) Tags

Interrogative tags attached to a declarative clause contain a subject pronoun that agrees with the subject of that clause:

- [6] i *You know the others, don't you?*  
 ii *The candidates know the minister, don't they?*

The tag has the form of an elliptical closed interrogative consisting of auxiliary + personal pronoun, the choice of pronoun being determined by the subject of the declarative: *you* agrees with *you* in [i], *they* with *the candidates* in [ii] (see Ch. 10, §5.1). Note that this holds even when the declarative clause does not have the elements in the basic order, as in *The others you know, don't you?*; *Even clearer is the second point, isn't it?*

## (h) Coordination

Since its default position is external to the VP, the subject can enter straightforwardly into construction with a VP-coordination:

- [7] *Sue typed the letter and posted it herself.*

This illustrates what we call 'basic coordination', where the coordinates *typed the letter* and *posted it herself* both have the status of constituents in the clauses *Sue typed the letter* and *Sue posted it herself*. It is to be distinguished from the much less frequent non-basic coordination *Sue typed, and her father posted, the letter*: here the coordinates *Sue typed* and *her father posted* are not normal constituents in that they don't have constituent status in the clauses *Sue typed the letter* and *Her father posted the letter*. (This is reflected by the commas and the corresponding sharp prosodic breaks when spoken.) A prototypical subject has, therefore, the distinctive property that it can combine with a basic coordination where the coordinate parts consist of the verb together with other dependents.

## (i) Obligatoriness

In general, the subject is an obligatory element: subjectless clauses are found only in certain specific non-canonical constructions such as non-finites and imperatives.<sup>19</sup> Whether a clause has an object or not depends on the lexical properties of the verb (e.g. *appear* excludes one, while *use* normally requires one), but a subject is required in all canonical clauses.

One corollary of this is that English has dummy subjects, as in *It is raining* or *It is time to go home*, where *it* satisfies the syntactic need for a subject but has no identifiable

<sup>19</sup>Or in casual style, where certain pronoun subjects may be ellipted at the beginning of a main clause, as in *Had a marvellous time at the beach yesterday*, with "I" understood (see Ch. 17, §7.8.1).

meaning. The fact that the subject is obligatory is reflected in the possibilities for reducing clauses when material is recoverable from the context. *Sue has eaten them already*, say, can be reduced to *She has* (e.g. in answer to the question *Has Sue eaten them already?*), but not to *\*Has* or *\*Has eaten*. *She has* is what we will refer to as a **maximal finite reduction**, i.e. a finite clause that can't be reduced any further, and this construction must contain a subject together with an auxiliary or the pro-form *do*.

### (j) Uniqueness

There can be no more than one subject per clause. By contrast it is possible for a clause to contain two objects (though of different subtypes), as in *She gave me the key*.

Notice that in examples like *Jane and her husband are right* we have a coordination of NPs, not of subjects: *Jane and her husband* constitutes a single subject. For example, agreement and tags treat the coordination as a whole as subject, not the separate parts: the verb required with *Jane and her husband* is *are*, and the tag would be *aren't they?*

## 3.2 Subject in non-canonical clauses

In the light of the above properties we consider here whether various non-canonical constructions differ from their basic counterparts in the choice of subject or merely in its position.

### 3.2.1 The passive and preposing constructions

Passive clauses and clauses with preposing differ from canonical clauses in radically different ways. Compare:

- [8] i *She took the others.* [canonical]  
 ii *The others were taken by her.* [passive]  
 iii *The others she took.* [preposing]

We use examples with minimal lexical content in order to facilitate the manipulation needed in applying the various tests. *The others* might be interpreted in context as “the other photographs”, “the other lectures”, “the other books”, and so on. In [ii] the subject function has clearly been reassigned from *she* to *the others*, whereas in [iii] *she* remains subject and we simply have a special position for O – we may think of it as having been preposed from its basic position. The difference is shown in the following table, which indicates for each of the two NPs whether or not it has the subject properties (b)–(i) of § 3.1.

[9]	[8i]		[8ii]		[8iii]	
	<i>she</i>	<i>the others</i>	<i>her</i>	<i>the others</i>	<i>she</i>	<i>the others</i>
(b) POSITION	✓	×	×	✓	✓	×
(c) CASE	✓	×	×	✓	✓	×
(d) AGREEMENT	✓	×	×	✓	✓	×
(e) INVERSION	✓	×	×	✓	✓	×
(f) OPEN INTERROGATIVES	✓	×	×	✓		N/A
(g) TAGS	✓	×	×	✓	✓	×
(h) COORDINATION	✓	×	×	✓		N/D
(i) OBLIGATORINESS	✓	×	×	✓		N/A

## (b) Position

In [8ii] *the others* is in subject position; in [iii] *the others* is in front position but it is still *she* that occupies the basic S position, just preceding P.

## (c) Case

In [8ii] *the others* can be replaced by nominative *they*; in [iii] a personal pronoun replacing *the others* would have to be accusative: *Them, she took*.

## (d) Agreement

In [8ii] *were* agrees with *the others*; in [iii] if we replace the preterite by the present we get *The others, she takes*; replacing *she* by *you* would yield *The others, you take*. The verb agrees with *she* or *you*.

## (e) Subject–auxiliary inversion

For [8ii] the form is *Were the others taken by her?* Preposing of a complement is extremely rare in closed interrogatives (but not ungrammatical: we cannot exclude examples like *I did the first half; the second half should we leave for Pat to finish?*). However, we can apply the inversion test more clearly by taking another construction involving subject–auxiliary inversion, namely one where the preposed element is negative, as in *None of the others did she take seriously*. Again, it is *she*, not the preposed element, that behaves like a subject.

## (f) Open interrogatives

For [8ii] we have *Which ones were taken by her?* For [iii], the criterion is not applicable ('N/A'), since this kind of preposing is incompatible with the open interrogative construction.

## (g) Tags

The evidence from tags is straightforward. For [8ii], we get *weren't they?*, where *they* has *the others* as its antecedent. For [iii], we get *didn't she?*

## (h) Coordination

For [8ii] we can have the basic coordination *The others were taken by her and gave us great pleasure*. In [iii] both S and O are external to the VP, and for this reason coordination no longer distinguishes clearly between them – hence the entry 'N/D' (non-distinctive) in the table. It is possible to have a coordination of VPs, as in *The others she took and published in a magazine*, but the coordinates *took* and *published in a magazine* are not ordinary VPs, as they do not contain the object; moreover it is also possible for O to combine with a coordination, as in *The others, she took but the editor rejected*.

## (i) Obligatoriness

The maximal finite reduction for [8ii] is *They were*; but this parameter is not applicable to [iii], since if we reduce it to *She did* we no longer have a preposing construction.

The syntactic effect of preposing is thus merely to change the order of elements: it does not affect the alignment of semantic roles with grammatical functions. Non-canonical clauses of this kind, however, do not allow the full range of manipulation available in canonical clauses. Passivisation, by contrast, does affect the role–function alignment: to use the metaphor introduced above, it 'promotes' the element that is object in the active

to subject in the passive, and assigns the active subject the status of oblique within a PP headed by *by*. This PP is a non-core complement we refer to as an **internalised complement**, since it is internal to the VP but corresponds to the external complement of the active; it is almost invariably omissible (compare [8ii] with *The others were taken afterwards*).

### 3.2.2 The extraposition and existential constructions

Consider now the extraposition and existential constructions in the light of the uniqueness property (j), which says that there can be no more than one subject per clause:

- [10] i a. *That he loved her* was obvious to everyone. [canonical]  
 b. *It was obvious to everyone* *that he loved her*. [extraposition construction]  
 ii a. *Several options* are open to us. [canonical]  
 b. *There are* *several options* open to us. [existential construction]

#### ■ Evidence that subject function is uniquely filled by dummy *it* and *there*

The underlined expressions in [10ib/iib] have the same semantic role as the identical items in [10ia/iiia], which clearly are subjects. Syntactically, however, they are very different. By the criteria for subjecthood that we have presented, the subjects of [10ib/iib] are uniquely the dummy NPs *it* and *there*. This is evident from the following table showing the value of *it*, *that he loved her*, *there*, and *several options* with respect to the subject properties (b)–(i) listed in §3.1:

[11]	<i>it</i>	<i>that he loved her</i>	<i>there</i>	<i>several options</i>
(b) POSITION	✓	×	✓	×
(c) CASE	N/A	N/A	N/A	×
(d) AGREEMENT	✓	×	✓	×
(e) INVERSION	✓	×	✓	×
(f) OPEN INTERROGATIVES	N/A	N/A	N/A	×
(g) TAGS	✓	×	✓	×
(h) COORDINATION	✓	×	✓	×
(i) OBLIGATORINESS	✓	×	✓	×

#### (b) Position

*It* and *there* have the property of occupying the default subject position.

#### (c) Case

For the most part the case criterion is not applicable to these constructions: pronouns with a nominative–accusative contrast cannot substitute for dummy *it* and *there*, nor for the extraposed clause. As for the post-verbal NP in the existential construction, pronouns with a nominative–accusative contrast are rare, but where they occur they are accusative. In answer to the question *Who is there who could help her?*, one could respond with *Well, there's always me*. Nominative *I* does not occur, indicating that the post-verbal NP has lost the subject case property.<sup>20</sup>

<sup>20</sup>Matters are not so clear with NP-coordinations; some speakers might say <sup>1</sup>*He realised that there were now only his father and he remaining*, or perhaps <sup>2</sup>*He realised that there were now only his father and he himself remaining*; but this seems to be more a fact about the uncertainty of pronoun case in coordination than about subjecthood in existentials – see Ch. 5, §16.2.2.

## (d) Agreement

In extraposition the verb agrees with *it*. Clauses generally have the default 3rd person singular feature, but a clause-coordination can have a plural interpretation, as reflected in the *are* of *To promise you'll do something and to actually do it* are *two quite different things*. There can be no extraposition counterpart of this precisely because *are* does not agree with *it*. Compare also (with different positions for *both*) *To work hard and to play hard* are *both important* and *It is important both to work hard and to play hard*.

With the existential construction, however, matters are more complicated. In the first place, we find variation according to style-level in the present tense. When the copula is cliticised to the subject in informal style, many speakers use the 3rd person singular form irrespective of the number of the post-verbal NP: %*There's only two problems remaining*. This pattern suggests the verb agreement is simply with *there*, treated as a 3rd person singular pronoun like *it*.

When the copula is pronounced as a full independent word, the person–number properties of the verb match those of the post-verbal NP – compare *There is only one problem remaining* and *There are only two problems remaining*. Contrasts of this kind appear at first to indicate that the post-verbal NP is subject, but consideration of a wider range of data shows that this is not so. Compare:

- [12] i *There tends to be a single pre-eminent factor in the breakup of a marriage.*  
 ii *There tend to be several contributing factors in the breakup of a marriage.*

Ultimately, the choice between the verb-forms *tends* and *tend* is determined by the person–number of the underlined NP, but that NP cannot be the subject of **tend**, for it is not located in the **tend** clause, but in the **be** clause. The situation here is comparable to that found in relative clauses, such as those enclosed in brackets in *the copy [which was ready]* and *the copies [which were ready]*. The choice between *was* and *were* in the relative clauses depends ultimately on the number of the underlined nominal, which is the antecedent for the relative pronoun *which*. Nevertheless it is *which*, not the antecedent nominal, that is subject of the relative clause. Relative *which* has no inherent person–number properties, but ‘inherits’ them from its antecedent. Similarly, the dummy pronoun *there* does not have inherent person–number properties but inherits them from the NP that it ‘displaces’ as subject. In [10ii], *several options* is subject in the canonical version [a], and *there* displaces it as subject in the existential version [b], taking on its 3rd person plural features. In [12] *there* is subject of the **tend** clause, but it is a raised subject, and is understood as subject of the **be** clause, and it is by virtue of its understood function in that clause that it inherits the person–number features of the underlined NPs. As far as the subject–verb agreement rule is concerned, therefore, it is *there* which counts as subject: the complication is that it inherits its agreement features from the NP it displaces as subject.<sup>21</sup>

## (e) Subject–auxiliary inversion

It is the dummy pronouns *it* and *there* that appear in post-auxiliary position: *Was it (really) obvious to everyone that he loved her?*; *Are there (really) several options open to us?*

<sup>21</sup>A further complication arises in existentials when the verb is followed by an NP-coordination, as in *There was/were a bottle of wine and several glasses on the table*. *Were* tends to be unidiomatic with an NP-coordination when the coordinate that is adjacent to it is singular, even though the coordination as a whole (*a bottle of wine and several glasses*) is plural. Plural agreement, however, occurs readily in lists: *There are still Brown, Jones, Mason and Smith to interview*.

## (f) Open interrogatives

In extraposition neither *it* nor the extraposed clause can be questioned, so this test is not applicable. In the existential construction the post-verbal NP can be questioned and then clearly behaves like a non-subject: *How many options are there available to us?*

## (g) Tags

*It* and *there* are repeated in interrogative tags: compare *It is important both to work hard and to play hard, isn't it / \*aren't they?* and *There are several options open to us, aren't there/\*they?*

## (h) Coordination

Neither *it* nor *there* commonly enter into construction with a coordination of VPs, but examples like *It was obvious to everyone that he loved her and had been from the very beginning* and *There are several options open to us and have been since the start* are acceptable, indicating that the dummy pronouns behave like subjects here too.

## (i) Obligatoriness

The minimal finite reductions of our extraposition and existential examples are *It was* and *There are*, with *it* and *there* satisfying the subject requirement.

## Conclusion

It is clear that the subjects of the extraposition and existential constructions are *it* and *there* respectively. Both are dummy elements, without any inherent semantic content. The elements that correspond to the subjects of the more basic constructions, i.e. *that he loved her* in [10ib] (*It was obvious to everyone that he loved her*) and *several options* in [10iib] (*There are several options open to us*), we call respectively the **extraposed subject** and the **displaced subject**. These terms are intended to capture the fact that they are semantically like the subject of their basic counterpart, but they are not to be interpreted as kinds of subject. The subject is a syntactic function, and these elements are no more subjects than a former president is a president or than an imitation diamond is a diamond. The label 'extraposed subject' also serves to distinguish the element concerned from an extraposed object, as in *She made it clear that she disapproved of our plan*, where *it* is object.

## 3.2.3 Subject–auxiliary inversion and subject postposing

## ■ Three positions for the subject

- [13] i *The financial arguments had been equally flawed.* [basic position]  
 ii *Had the financial arguments been equally flawed?* [post-auxiliary position]  
 iii *Equally flawed had been the financial arguments.* [postposed position]

There are three main positions for the subject, as illustrated here. The **basic position**, we have noted, is before the predicator; certain adjuncts can intervene, as in *The financial arguments clearly had been equally flawed*, but complements cannot. The subject occurs in **post-auxiliary position** in the various constructions involving subject–auxiliary inversion; except in negative imperatives (e.g. *Don't anyone touch it*, where *don't* is a plain form), the auxiliary must have a primary inflection (preterite or present tense or else irrealis *were*). Finally a subject in **postposed position** follows the predicator in final position in the clause; usually there is also a preposed complement or adjunct in front position, as in [iii].

### ■ Distinguishing the two non-basic positions

In clauses containing an auxiliary verb but no lexical verb, the two non-basic positions look superficially the same:

- [14] i *Where were the children's toys?* [post-auxiliary]  
 ii *Under the bed were the children's toys.* [postposed]

They can be easily distinguished, however, by adding a non-auxiliary verb: *Where were the children's toys hidden?* reveals that [i] has the subject in post-auxiliary position, and *Under the bed were hidden the children's toys* shows that [ii] has a subject in postposed position.

### ■ Subject postposing affects order, not function

We have assumed that *the financial arguments* is subject in all three of the examples in [13], and hence that they differ only in the order of elements, not in the assignment of functions to *equally flawed* and *the financial arguments*. This is very obvious in the case of [ii], but is worth demonstrating for [iii], since this construction is sometimes found as an alternant of the existential: compare *Over her desk was a photograph of her grandparents* and *Over her desk there was a photograph of her grandparents*. Evidence that *the financial arguments* is subject of [13iii] is provided by agreement (cf. *Equally flawed is the financial objection*), the interrogative tag (*Equally flawed had been the financial arguments, hadn't they?*) and, very marginally, case (*\*Equally flawed are they*).

### ■ The order X–P–S

In spite of the importance of position in marking the subject, it interacts with other factors. The order X–P–S is excluded where X is O, but not for other values of X. A non-object X can even occasionally take the form of an NP:

- [15] i *A thorough rogue was James Bacharach.* [PC–P–S]  
 ii *The following morning came news of her father's arrest.* [A–P–S]  
 iii *\*A loud explosion heard the children.* [O–P–S]

The ban on O–P–S reflects the fact that NPs in S and O function can be of the same semantic type, so that the meaning of the NPs themselves may give no indication as to which is S and which O. In *Kim admires Pat*, for example, there is nothing but the order to tell us who is the admirer and who the admired. In [ii], by contrast, the initial NP is a time expression and can thus be interpreted as adjunct while the final NP can only be S, given that *come* is intransitive. In [i] the NPs differ in definiteness, and while the second is clearly referential the first can be interpreted as an ascriptive property term.

## 4 Direct and indirect objects

The object is a core complement contrasting with subject and predicative complement; the contrast between O (internal) and S (external) is very sharp, that between O and PC (both internal) rather less so, though the area of uncertainty is quite small. Of the two types of object, the direct object (O<sup>d</sup>) occurs in both monotransitive and ditransitive clauses, whereas the indirect object (O<sup>i</sup>) occurs in canonical clauses only in ditransitives.

At the general level, the direct object may be defined as a grammatically distinct element of clause structure which in canonical agent–patient clauses expresses the patient role. Direct object arguments are associated with a wide range of semantic roles, but in other canonical clauses than those expressing agent–patient situations, the direct object has the same grammatical properties as the NP expressing the patient in agent–patient clauses.

The general definition of indirect object is that it is a distinct element of clause structure characteristically associated with the semantic role of recipient. Again this is not the only role we find (though the range is much narrower than with the direct object), but indirect objects behave grammatically like the NP expressing the recipient with verbs like *give*, *lend*, *offer*, *sell*.

The terms **direct** and **indirect** are based on the idea that in ditransitive clauses the  $O^d$  argument is more directly affected or involved in the process than the  $O^i$  argument. In *I gave Kim the key*, for example, it is the key that is actually transferred, while Kim is involved only as an endpoint in the transfer. Characteristically the  $O^d$  in ditransitives is obligatory while the  $O^i$  is omissible, as in *He lent (them) his car*, *She offered (us) \$400 for it*, and it is plausible to see this as reflecting a more direct involvement, a greater centrality on the part of the  $O^d$  argument.

In languages with richer case systems than English, direct and indirect objects are characteristically marked by accusative and dative case respectively. English has lost its earlier dative case, so that the two types of object are somewhat more alike than in such languages. One manifestation of this is seen in the relation between active and passive clauses. In English the subject of a passive can correspond either to active  $O^d$  (*Kim was seen by Pat* ~ *Pat saw Kim*) or to active  $O^i$  (*Kim was given the key by Pat* ~ *Pat gave Kim the key*), but in languages with dative  $O^i$  a passive subject normally corresponds only to active  $O^d$ .

In the following subsections we consider the grammatical properties of objects in English, looking first at monotransitive clauses, and then at ditransitives.

#### 4.1 The object in canonical monotransitive clauses

The object has fewer distinctive properties than the other core complements: it is characterised as much by the absence of S and PC properties as by the presence of clear positive properties of its own.

##### (a) Category: normally NP

The prototypical object has the form of an NP. Thus *He entered the lounge* has *the lounge* as O, but there is no object in *He went into the lounge*, where the internal complement *into the lounge* has the form of a PP. Similarly, the Os are as underlined in the following pairs:

- [1] i a. *He climbed the mountain.*      b. *He climbed up the mountain.*  
 ii a. *He supplied eggs to them.*      b. *He supplied them with eggs.*

Again, the PPs *up the mountain*, *to them*, *with eggs* are non-core complements, not objects. NPs readily occur as S or PC, so this property serves to differentiate objects from non-core complements and adjuncts. It is not fully decisive, however, since a limited

range of NPs are found in these latter functions, as in *They went that way*, *She arrived this morning*.<sup>22</sup> Subordinate clauses show varying degrees of similarity to NP objects, but (with minor exceptions) we prefer to use the more general term complement for them in view of the absence of well-motivated criteria to determine which are objects and which are not (see Ch. 11, §8.3).

### (b) Selective obligatoriness

Although there is a great deal of overlap between the classes of transitive and intransitive verbs, we nevertheless find some which require an O, at least for a given sense of the verb (and excluding highly restricted contexts). Thus the O is non-omissible in such examples as: *He accosted her*; *We kept the old battery*; *He delineated the problem*; *This entailed a considerable delay*; *We forced a showdown*; *I used a knife*; and so on.

### (c) Correspondence to passive subject

The object of an active clause prototypically corresponds to the subject of a related passive:

- [2] a. *Pat overlooked the error*. [O]      b. *The error [S] was overlooked (by Pat)*.

The term ‘related passive’ applies to the actual passive counterpart (*The error was overlooked by Pat*) or one differing from the latter by the absence of the *by* phrase, the internalised complement (*The error was overlooked*).

It must be emphasised, however, that such a correspondence does not hold for all objects, and that the subject of a passive does not always correspond to the object of the verb in the active:

- [3] i a. *His uncle owned two yachts*.      b. *Two yachts were owned by his uncle*.  
 ii a. *His uncle had two yachts*.      b. \**Two yachts were had by his uncle*.  
 iii a. *He has drunk out of this glass*.      b. *This glass has been drunk out of*.

We see from [i–ii] that there is a related passive when the verb is *own* but not when it is *have*, and yet there is no independent syntactic evidence for assigning different functions to *two yachts*. Whether or not there is an acceptable related passive for a given active clause depends on the interaction of pragmatic, semantic, syntactic, and lexical factors: it cannot satisfactorily be reduced to a simple matter of the presence or absence of O in the active. Example [iii] illustrates the second point, that it is not only transitive clauses that have related passives. *This glass* in [a] corresponds to the subject of the passive [b], but it is functioning as complement of a preposition, not as object of *drink*.

Nevertheless, correspondence with a passive subject is an important property of objects and provides a valuable diagnostic which we will call the **passive test**: if a core complement NP of an active clause can be converted into the subject of a related passive, then it is an object. This formulation excludes *this glass* in [iii] since it is not a core complement. And it provides a sufficient but not a necessary condition: *two yachts* passes the test in

<sup>22</sup>In special cases, moreover, it is possible for an object to have the form of a PP, as in *He considered under the mat an unsafe place for the key*: note that *under* here does not serve to relate *the mat* to *consider* or *he*.

[i] and hence qualifies as an object, but the fact that it fails the test in [ii] does not mean that *two yachts* is not here an object.

#### (d) Position

The prototypical position for O is immediately after P. Non-parenthetical adjuncts cannot normally intervene between P and O: *She saw Tom often* or *She often saw Tom*, but not *\*She saw often Tom*.

The main departures from this order are illustrated in the [b] members of the following pairs, where underlining marks P and O:

- [4] i a. *He brought the clothes in.*      b. *He brought in the clothes.*  
 ii a. *I returned the books to Jo.*      b. *I returned to Jo all the books I'd borrowed.*  
 iii a. *She rejected the others.*      b. *The others she rejected.*

In [ib] O is separated from P by *in*, which we refer to as a 'particle' (cf. §6.2); this order is not permitted when O is an unstressed personal pronoun (*\*He brought in it*). In [iib] an O that is heavy is placed in end position (see Ch. 16, §4 for details) – in [iia], by contrast, the O is not heavy enough and must precede the PP (*\*I returned to Jo the books*). In [iii], the default order is as in [a], while [b] is an instance of the preposing construction, with *the others* occupying the prenuclear position; O can also occur in this position in open interrogatives (*Which ones did she reject?*) and various other unbounded dependency constructions (cf. Ch. 12, §7).

## 4.2 Object and extraposed object

Comparable to the distinction between subject and extraposed subject is that between object and extraposed object:

- [5] i *It was necessary to postpone the meeting.*      [subject + extraposed subject]  
 ii *We thought it necessary to postpone the meeting.*      [object + extraposed object]

We have seen that in examples like [i] it is the NP *it*, not the subordinate clause *to postpone the meeting*, that has the distinctive subject properties, and in [ii] it is again *it*, not the subordinate clause, that functions as object. *It* in [ii] occupies the post-verbal object position, and corresponds to the subject of a related passive: *It was thought necessary to postpone the meeting*, not *\*To postpone the meeting was thought it necessary*. We therefore refer to the subordinate clause *to postpone the meeting* in [ii] as an extraposed object, again with the understanding that this is not a kind of object. It is semantically like an object, but does not fill that position syntactically. Note that while [i] has an alternant in which the subordinate clause does function as subject (*To postpone the meeting was necessary*) the extraposed clause in [ii] cannot replace the *it* (*\*We thought to postpone the meeting necessary*).

Extraposed objects usually occur in complex-transitive clauses, as in [5ii], where *it* is object and *necessary* predicative complement. But it is not limited to this construction, as is evident from such examples as [6] (see Ch. 11, §4.3).

- [6] *I put it to you that you knew what the consequences would be.*

Speakers vary considerably in their judgements of the [b] examples, particularly of those where the corresponding prepositional construction has *to*, as in [ib/iib], rather than *for*, as in [iii/ivb]. Nevertheless, there is very widespread agreement that the [b] examples are significantly **less** acceptable than the [a] ones.

### ■ Ditransitives and their related passives

Two passive constructions need to be distinguished according to which object the passive subject corresponds to:

- |           |                                     |    |  |                  |
|-----------|-------------------------------------|----|--|------------------|
| [10] i a. | <i>I sent <u>Sue</u> a copy.</i>    | b. | <i>I ordered <u>Sue</u> a copy.</i>    |                  |
| ii a.     | <i><u>Sue</u> was sent a copy.</i>  | b. | <i>?<u>Sue</u> was ordered a copy.</i> | [first passive]  |
| iii a.    | <i>?<u>A copy</u> was sent Sue.</i> | b. | <i>*<u>A copy</u> was ordered Sue.</i> | [second passive] |

We use the term **first passive** for the one where the subject corresponds to the first object,  $O^i$ , and **second passive** for [iii], where it corresponds to the second object,  $O^d$ . These terms also reflect the order of preference: the first passive tends to be quite strongly favoured over the second. Ditransitive verbs vary considerably in how readily they occur in passive clauses. In general, where  $O^i$  corresponds to the complement of *to* in the prepositional alternant [7i], characteristically having the semantic role of recipient, the first passive is fully acceptable, as in [10iia]; judgements vary as to the acceptability of second passives like [10iia]: many find them unacceptable,<sup>24</sup> and they are textually quite rare. Where  $O^i$  corresponds to the complement of *for* in [7ii], with the semantic role of beneficiary, neither passive is completely acceptable, but many speakers find the first marginally possible.

### ■ Ditransitive $O^i$ and $O^d$ compared with monotransitive $O^d$

We have been assuming that the second object of a canonical ditransitive can be identified with the single object of a monotransitive (as  $O^d$ ) while the first is a distinct type of object ( $O^i$ ). This is not entirely unproblematic, however, as is evident from the following examination of the properties of  $O^i$  and what for convenience we will refer to as ‘monotransitive  $O^d$ ’ and ‘ditransitive  $O^d$ ’.

#### (a) Passives

We have noted that the first passive (with the subject corresponding to  $O^i$ ) is preferred over the second (where the subject corresponds to ditransitive  $O^d$ ). This makes  $O^i$  somewhat more like monotransitive  $O^d$  than is ditransitive  $O^d$ . However, the marginality of [10iib] shows that it by no means behaves like a prototypical monotransitive  $O^d$ .

#### (b) Post-verbal position

It is of course  $O^i$  rather than ditransitive  $O^d$  that characteristically occupies the position immediately following P, as in [10i]. It is, however, significantly more resistant to departures from this position than is monotransitive  $O^d$ , as we see from the next two points.<sup>25</sup>

<sup>24</sup>Acceptability is greater when we have a personal pronoun + *by* phrase: *This copy was given me by my grandfather.*

<sup>25</sup>Note also that  $O^i$  does not readily allow a particle to intervene between it and P: examples like *I gave John back his sunglasses* are more acceptable than *?I gave back John his sunglasses*, an order that many speakers find unacceptable. The issue is complicated by the fact that the presence of a particle will often favour a PP complement over an  $O^i$ . Thus while *He sent his students out a questionnaire* may be more acceptable than *?He sent out his students a questionnaire*, it is appreciably less so than *He sent out a questionnaire to his students* or *He sent a questionnaire out to his students*.

## (c) Object postposing

Unlike monotransitive O<sup>d</sup> and ditransitive O<sup>d</sup>, O<sup>i</sup> cannot be postposed when heavy:

- [11] i *He gave to charity everything he earned from the concert.* [monotransitive O<sup>d</sup>]  
 ii *He gave Sue immediately all the spare keys he had had cut.* [ditransitive O<sup>d</sup>]  
 iii *\*He gave a second chance all those who had scored 40% or more.* [O<sup>i</sup>]

The ban on S–P–O<sup>d</sup>–O<sup>i</sup> is comparable to that on O–P–S. Order is the primary factor distinguishing O<sup>i</sup> from O<sup>d</sup> as well as S from O, and the grammar excludes structures which reverse the normal O<sup>i</sup>–O<sup>d</sup> and S–P–O orders.

## (d) Prenuclear position

As we have seen in [9], clauses with preuclear O<sup>i</sup> are of low acceptability, whereas ditransitive O<sup>d</sup> occurs as readily in this position as monotransitive O<sup>d</sup> – compare the [a] examples with *The key he lost*, *The key which he tried didn't fit*, *He asked who(m) I had invited*, *What a lot of them he had offended!*

## (e) Predicand

Unlike monotransitive O<sup>d</sup> and ditransitive O<sup>d</sup>, O<sup>i</sup> cannot be the predicand for a predicative adjunct:

- [12] i *She ate the steak almost raw.* [monotransitive O<sup>d</sup> as predicand]  
 ii *He served her her steak almost raw.* [ditransitive O<sup>d</sup> as predicand]  
 iii *\*He offered her the steak fiendishly hungry.* [O<sup>i</sup> as predicand]

In [i–ii] the property expressed by the adjunct *almost raw* is predicated of the steak, expressed as O<sup>d</sup>, but [iii] illustrates the impossibility of having O<sup>i</sup> as predicand: it can't mean that she was in a state of fiendish hunger as he offered her the steak (the asterisk applies to this interpretation: it is grammatical with the subject *he* as predicand).

## (f) Control

In infinitival purpose clauses an O can be left unexpressed if it is recoverable from the superordinate clause O – which is said to 'control' the gap, or missing element. The controlling element can be monotransitive O<sup>d</sup> or ditransitive O<sup>d</sup>, but not O<sup>i</sup>:

- [13] i *He wanted it to spend    on his children.* [monotransitive O<sup>d</sup> as controller]  
 ii *She gave him it to spend    on his children.* [ditransitive O<sup>d</sup> as controller]  
 iii *\*She sent him it to prove    wrong.* [O<sup>i</sup> as controller]

In [i–ii] we understand *to spend on his children* as "to spend it on his children": there is a missing O (a gap marked by '\_\_\_') recoverable from the O<sup>d</sup> *it* of *want* or *give*. But [iii], where the intended interpretation is "She sent him it to prove him wrong", thus with O<sup>i</sup> as controller, is ungrammatical. (The infinitivals here are 'hollow clauses': see Ch. 14, §6, for further discussion.)

## Conclusion

On balance, ditransitive O<sup>d</sup> has greater syntactic affinity with monotransitive O<sup>d</sup> than does O<sup>i</sup>, justifying our analysis of the canonical double-object construction as containing O<sup>i</sup> + O<sup>d</sup>.<sup>26</sup> The most important distinctive property of O<sup>i</sup> is (d), its resistance to front

<sup>26</sup>Some modern grammars take the opposite view, regarding the first internal complement as O<sup>d</sup> and the second as not an O at all. Languages with a ditransitive construction fall broadly into two types, one where the O which characteristically has a recipient role behaves syntactically like a monotransitive O, and one where it

position, for (e)–(f) involve fairly infrequent constructions and certainly don't apply to all O<sup>d</sup>s.

### ■ O<sup>i</sup> not found in canonical clauses without O<sup>d</sup>

In canonical clauses containing just one object, that object is always a direct object, even if it corresponds semantically to the indirect object of a ditransitive clause:

- [14] i *She teaches the first-year students introductory logic.* [O<sup>i</sup> + O<sup>d</sup>]  
 ii *She teaches introductory logic.* [O<sup>d</sup>, with semantic role of ditransitive O<sup>d</sup>]  
 iii *She teaches the first-year students.* [O<sup>d</sup>, with semantic role of ditransitive O<sup>i</sup>]

Although the semantic roles of *introductory logic* in [ii] and *the first-year students* in [iii] are different, there is no syntactic basis for assigning different structures to these clauses. Except in certain non-canonical constructions (such as the passive), therefore, O<sup>i</sup> is found only in combination with O<sup>d</sup>.

Note, in support of this analysis, that the internal complement in [14iii] does not have the major O<sup>i</sup> property of resisting prenuclear position: *These students she has never taught, the students whom she taught, Who does she teach?, What a lot of first-class students she taught!* are completely acceptable, just like the equivalent constructions based on [ii], *Logic she has never taught, the subject which she taught*, and so on. The case is comparable to that involving different kinds of relation between monotransitive and intransitive constructions:

- [15] i *She rang the bell twice.* [S + O<sup>d</sup>]  
 ii *She rang twice.* [S, with semantic role of monotransitive S]  
 iii *The bell rang twice.* [S, with semantic role of monotransitive O<sup>d</sup>]

It is uncontroversial that *she* in [ii] and *the bell* in [iii] have the same syntactic function, subject, even though the semantic roles are different, and we are saying that *introductory logic* in [14ii] and *the first-year students* in [14iii] likewise have the same syntactic function, this time direct object, in spite of the semantic difference.

## 5 Predicatives and related elements

A predicative complement is oriented towards a predicand, normally S in intransitives, O in transitives. In both cases it may be classified as either **depictive** or **resultative** as in [1], where double underlining marks the predicand, single underlining the predicative.

[1]	INTRANSITIVE	TRANSITIVE
DEPICTIVE	<u>Kim</u> <u>seemed uneasy</u> .	He found <u>Kim</u> <u>intolerant</u> .
RESULTATIVE	<u>Kim</u> <u>became angry</u> .	He made <u>Kim</u> <u>happy</u> .

The resultative PC typically occurs with verbs that denote a change of state. The PC denotes the state of the predicand argument at the end of the process. A depictive PC gives a property of the predicand argument at the time of the situation under consideration, without any such factor of change.

is the other O that does; the terms O<sup>i</sup> and O<sup>d</sup> are appropriate for the second type, with 'primary object' and 'secondary object' for the first type (the primary object covering the monotransitive O and the ditransitive O with recipient role). We are treating English as belonging to the second type, but it is not a clear-cut member; in general, the clear members are those where O<sup>i</sup> is marked by a distinct case, the dative, contrasting with accusative for O<sup>d</sup>, as in such languages as German and Latin (or Old English).

The central type of predicative complement has the form of an AdjP, as in [1] above, or else of an NP used non-referentially, as in [2]:

- [2] i *Kim remained a keen supporter of the proposal.*  
 ii *The publicity made Kim a liability.*

The underlined NPs are not here used to refer to some person, as the complement NP *Kim* is, but rather denote characteristics ascribed to Kim, as the AdjPs in [1] do. The likeness between AdjP and NP in such constructions is seen in pairs like *This idea sounds promising* and *This idea sounds a promising one*.

The underlined complements in [1–2] express semantic predicates – hence the term predicative complement. At the general level, we thus define a predicative complement as a grammatically distinct complement of the verb characteristically expressing a semantic predicate. This semantic predicate applies to the predicand, generally subject or object. Syntactically predicatives are complements, but semantically they are comparable to verbs in predicator function.

The semantic similarity between predicative complements and predicators is particularly evident in pairs like:

- [3]      PREDICATIVE COMPLEMENT                  PREDICATOR  
 a. *Kim is fond of animals.*                          b. *Kim loves animals.*

The meanings of the clauses here are more or less the same, while the syntactic structures are very different. *Love* is a verb, and its two arguments *Kim* (experiencer) and *animals* (stimulus) are aligned with S and O, external and internal core complements. *Fond*, by contrast is an adjective, and has the experiencer aligned with S, a complement of the verb *be*, rather than of *fond* itself, and the stimulus aligned with the complement of *of*, thus with an oblique element within the AdjP.<sup>27</sup> The relation between semantic and syntactic structure is thus less straightforward in [a] than in [b]. This provides one reason for applying the term ‘complex’ to clauses containing PC, with [2i], for example, a complex-intransitive clause and [2ii] a complex-transitive one.

A second, related, reason is that while the PCs in [1–2] express semantic predicates, the predications concerned are themselves arguments of a superordinate semantic predicate, *seem*, *find*, etc.<sup>28</sup> We thus have two semantic predications encoded within a single syntactic subject–predicate construction. It may be that the *be* of [3i] should be regarded as semantically empty, serving the purely syntactic function of carrying the tense inflection, which has to be associated with a verb: note in this connection that translation equivalents in a good number of languages contain no verb. However, there are undoubtedly constructions where *be* does express a semantic predicate (e.g. in *The chief culprit was Kim*: see §5.5), and we will simplify by assuming that it does in all cases.

#### ■ Clauses with extraposed subject or object

- [4] i *It is unfortunate that it rained.*      [intransitive: extraposed subject as predicand]  
 ii *I find it easier to go by bus.*                  [transitive: extraposed object as predicand]

In clauses of this kind it is the extraposed element that serves as predicand for *unfortunate*

<sup>27</sup>Since *Kim* is a complement of *love* but not of *fond*, it follows that while *love* is bivalent (has two complements), *fond* is monovalent (has only one). However, as semantic predicates *love* and *fond* are both dyadic (have two arguments).

<sup>28</sup>Alternatively we might say that the predicate itself, conceptualised as a state, constitutes the argument.

and *easier*. This reflects the fact that these elements behave semantically like the subject or object even though they do not have that syntactic function.

In the following sections we begin by presenting the syntactic properties that distinguish the central type of predicative complement from an object. We turn next to the relation between predicatives and the semantic roles of location, goal, and source. §5.3 introduces a distinction (cutting across those made above) between obligatory and optional predicatives (e.g. *He looked young* vs *He died young*), and in so doing recognises that some predicatives are adjuncts rather than complements. The final section examines various semantic and syntactic distinctions within copular clauses.

## 5.1 Distinctive syntactic properties of PCs

### ■ Three syntactic differences between PCs and objects

#### (a) Category: PC function can be filled by AdjP or bare role NP

The crucial syntactic property of PC is that it can have the form either of an AdjP or of a bare role NP (a count singular with no determiner, such as *President of the Republic*, *treasurer*, etc.). Usually it can have the form of an ordinary NP too, but what distinguishes PC from O is the admissibility of an AdjP or bare role NP.

[5]	PREDICATIVE COMPLEMENT	OBJECT
i	a. <i>He seemed <u>a nice guy</u> / <u>nice</u>.</i>	b. <i>He met <u>a nice guy</u> / *<u>nice</u>.</i>
ii	a. <i>I consider it <u>bad advice</u> / <u>bad</u>.</i>	b. <i>I gave her <u>bad advice</u> / *<u>bad</u>.</i>
iii	a. <i>She remained <u>treasurer</u>.</i>	b. * <i>She questioned <u>treasurer</u>.</i>
iv	a. <i>They appointed him <u>secretary</u>.</i>	b. * <i>They promised him <u>secretary</u>.</i>

Examples [i–ii] illustrate the possibility of replacing an ordinary NP by an AdjP in the case of PC, and the impossibility of doing so with O. Examples [iii–iv] show bare role NPs functioning as PC and the ungrammaticality that results from putting them in O function: the NPs in [iiib/ivb] need determiners (e.g. *She questioned the treasurer*; *They promised him a secretary*).

The ability of AdjPs to function as PC but not O reflects the fact that a PC characteristically expresses a property, while O (like S) characteristically refers to someone or something: AdjPs denote properties but are not used referentially. Similarly, the restriction on bare role NPs reflects the fact that they too cannot be used referentially; note in this connection that they are equally excluded from subject function: \**Treasurer has resigned*.

#### (b) Passives: no correspondence with a passive subject

A negative property is that PC – unlike a prototypical O – never corresponds to the subject of a related passive clause: it always very clearly fails the passive test.

[6]	PREDICATIVE COMPLEMENT	OBJECT
i	a. <i>Ed became <u>a minister</u>.</i>	b. <i>Ed attacked <u>a minister</u>.</i>
ii	a. * <i>A minister was become by Ed.</i>	b. <i>A minister was attacked by Ed.</i>

Again, this reflects the important semantic distinction that underlies the syntactic contrast of PC and O mentioned in (a). O is semantically the same kind of element as the S of a canonical clause in that both are characteristically used referentially and express arguments, not semantic predicates: the voice system allows for different alignments

of arguments with syntactic functions. The prototypical PC, on the other hand, is non-referential and expresses a semantic predicate, so that it is quite unlike a canonical S and remains unaffected by the voice system.

We have noted that some objects fail the passive test (e.g. *His uncle had two yachts*, but not \**Two yachts were had by his uncle*; *This colour doesn't suit me*, but not \**I am not suited by this colour*; and so on). This is therefore a less decisive criterion than the first: if an NP complement of a verb can be converted into the subject of a related passive this establishes that it is an object, not a PC, but failure to pass this test is not sufficient to establish that it is a PC.

### (c) Case: nominative possible for a PC

In languages with richer case systems, PC commonly agrees in case with its predicand: PC<sup>s</sup> and O<sup>d</sup> then tend to contrast in case as nominative vs accusative. In English, however, case is of only the most marginal relevance for PC. The nominative–accusative contrast is found only among the personal pronouns and with interrogative/relative *who*, but both kinds of pronoun occur as PC only under quite restricted conditions.

The personal pronouns are mainly used referentially and, as we have noted, PC is characteristically non-referential. Their appearance in PC function is virtually limited to specifying uses of the verb *be*, where the PC differs quite significantly from the central type of PC with respect to both form and meaning. Nevertheless, formal style does here have nominative case, so that we may contrast *It was he who wrote it* (nominative: PC) and *They saw him* (accusative: O). The distinction is lost in informal style, which has accusative for both PC and O, but the possibility of a nominative personal pronoun in formal style does differentiate PC from O, at least in certain constructions.<sup>29</sup>

*Who* likewise rarely occurs as PC except with the verb *be*. Formal style distinguishes between nominative *who*, as in *I wonder who she is* (PC: *whom* impossible), and accusative *whom*, as in *I wonder whom she invited* (O). Again the distinction is lost in informal style, which in this case has the nominative *who* for both (*who she is* / *who she invited*) rather than the accusative.

## ■ The question of number in NPs

Because an NP functioning as PC is characteristically non-referential, it tends not to select independently and contrastively for number. Very often, the number matches that of the predicand:

- [7] i a. *She seems a reliable witness*.      b. *They seem reliable witnesses*.  
 ii a. *She considered him a fool*.      b. *She considered them fools*.

Note that we cannot replace the singular PCs in [a] by the plural ones of [b], or vice versa.

This is not, however, a matter of syntactic agreement. There are innumerable examples where a PC differs in number from its predicand:

- [8] i *They were a nuisance / a problem / a huge success / an example to us all*.  
 ii *That so-called work of art is simply four pieces of driftwood glued together*.

<sup>29</sup>Nominative PCs are found predominantly in the *it*-cleft construction and in more or less fixed expressions like *Those are they*; see Ch. 5, §16.2.1, for details.

What is required is semantic compatibility, not syntactic agreement (for fuller discussion of this issue, see Ch. 5, §19).

### ■ Predicative obliques

Predicative elements may occur as complement of a preposition instead of being related directly to the verb. Much the most common preposition is *as*:

- |     |                                     |  |                |
|-----|-------------------------------------|--|----------------|
| [9] | INTRANSITIVE                        | TRANSITIVE                               |                |
| i   | a. <i>That counts as excellent.</i> | b. <i>I regard her as indispensable.</i> | [AdjP]         |
| ii  | a. <i>She served as treasurer.</i>  | b. <i>They chose her as secretary.</i>   | [bare role NP] |

Again the predicand is S in the intransitive, and normally O in the transitive.<sup>30</sup> The complements of *as* we analyse as **predicative obliques**, and the *as* phrases themselves (*as excellent*, etc.) as **marked predicative complements**.

### ■ Imperfect match between syntax and semantics

A handful of verbs such as *constitute*, *provide*, *represent* include within their range of uses one where the semantic relation between subject and internal complement is similar to that found with the verb *be*. This use is illustrated in [10i], which may be contrasted with [10ii]:

- [10] i a. *Changes in the basic wage-rate constitute an argument for raising prices.*  
 b. *Sue Brown provides an excellent example of a woman who has achieved outstanding success in the world of business while bringing up a large family.*  
 c. *This proposal represents a serious threat to our standard of living.*  
 ii a. *We must constitute a new and more democratic committee of management.*  
 b. *The government provides the necessary funds.*  
 c. *Jill represents her school at tennis.*

In [i], but not in [ii], the verbs could be replaced with virtually no perceptible change of meaning by *be* (or by *count + as*, where the complement of *as* is a predicative oblique). It would be a mistake, however, to suggest that this indicates that the internal complements are predicatives in [i], but objects in [ii]. There are no syntactic grounds for assigning different structures to the two sets of examples, and we will analyse the internal complement as an object in both: what [i] shows is that with these verbs an object can be semantically similar to a predicative complement.

The first syntactic argument that the internal complements in [10i] are objects is that we cannot replace them by AdjPs or bare role NPs – cf. *\*This proposal represents intimidatory*; *\*She constituted/provided treasurer*. Secondly, the *provide* example in [10i] has a straightforward passive counterpart: *An excellent example of a woman who has achieved outstanding success in*

<sup>30</sup>The verb *strike* is exceptional in having S as predicand in a transitive construction: compare *I regard him as a liability* (normal, O as predicand) and *He strikes me as a liability* (exceptional, S as predicand). The behaviour of *strike* here correlates with its exceptional alignment of semantic roles and syntactic functions. Like *regard* it belongs to the field of cognition, yet it aligns experiencer and stimulus with O and S respectively, instead of the usual S and O (cf. §2.3), and this exceptional alignment in turn reflects the fact that the sense involved here is a secondary one relative to that of *He struck me on the chin*.

*the world of business while bringing up a large family is provided by Sue Brown.* The relevant uses of *constitute* and *represent* do not so readily occur in the passive, but the underlined part of the following attested example shows that passives are not excluded with these verbs, merely less frequent:

- [11] *It would be possible to take sport in general, or indeed one particular sport such as cricket, and explain the material and ideological conditions surrounding its production in a specific socio-cultural order such as that constituted by Australia.*

Note, moreover, that the range of complementation patterns for *provide* is the same as in other uses, so that the above bivalent constructions can be matched with trivalent *Sue Brown provides us with an excellent example . . .* and *The government provides us with the necessary funds.*

The semantic similarity between the objects in [10i] and predicative complements is reflected in the fact that the former tend to match the subject in number. Compare [ib], for example, with *Sue Brown and her sister provide excellent examples . . .* or [ic] with *These proposals both represent serious threats to our standard of living.* The fact that such number matching is found with objects that are semantically similar to predicatives provides further support for the view advanced above that it is a matter of semantic compatibility, not grammatical agreement.

#### On the construction *She made him a good wife*

Another verb that can take an object semantically resembling a predicative complement is *make*, but here matters are complicated by the fact that *make* also appears in the complex-transitive construction, where it does take a predicative complement:

- [12] i *She made him a good husband.* [PC<sup>o</sup>: complex-transitive construction]  
 ii *She made (him) a good wife.* }  
 iii *She made (him) a teddy-bear.* } [O: ordinary transitive construction]

In [i] *a good husband* is a straightforward example of a predicative complement: it can be replaced by an AdjP or bare role NP (*She made him happy/treasurer.*). In [iii] *a teddy-bear* is equally clearly a direct object: it occurs either alone or with an indirect object, and in the former case corresponds to a passive subject (*A teddy-bear was made by her.*).

What then of [12ii]? From a semantic point of view *a good wife* is like *a good husband* except that it applies to the subject *she* rather than the object *him*. And indeed *a good wife* here is commonly analysed as a predicative complement. We would again argue, however, that from a syntactic point of view [ii] belongs with [iii], not with [i] – that *a good wife* is an object, comparable to those in [10i].

As before, the first and crucial point is that *a good wife* cannot be replaced by an AdjP or bare role NP: *\*She made exemplary/treasurer.* (and *She made him grateful/secretary.* can only have *him* as predicand and hence must belong with [12i], not [ii]). The second point is that the range of complementation patterns is again the same as in [iii], with the direct object optionally preceded by an indirect object. And both ditransitive versions alternate with a prepositional construction: *She made a teddy-bear for him* and *She made a good*

wife for him (or, if the latter sounds slightly unnatural, compare *She'll make an excellent stepmother for his children*). If a good wife were predicative complement, *She made him a good wife* would belong to a construction type unique to *make*. It differs from [iii] in that there is no related passive, but many other objects fail the passive test too, and given that there is no automatic correspondence between object and passive subject it is not surprising that an object semantically resembling a predicative should fail.<sup>31</sup>

## 5.2 Location, goal, and source

### ■ Relation between locative complements and predicative complements

One common type of complement to the verb *be* is a locative expression, as in *The letter is on the table*. The structural similarity between this and, say, *The letter is highly offensive* suggests that assigning a location to something is comparable to assigning it a property. One respect in which locative complements resemble predicatives is that they too are oriented towards a particular element, subject in intransitives, object in transitives:

[13]	INTRANSITIVE: S-ORIENTATION	TRANSITIVE: O-ORIENTATION	
	i a. <i>Sue remained <u>calm</u></i> .	b. <i>I kept <u>it</u> <u>handy</u></i>	[PC]
	ii a. <i>Sue remained <u>outside</u></i> .	b. <i>I kept <u>it</u> <u>in the drawer</u></i>	[locative]

Moreover, there is a significant degree of overlap between the verbs which take the two kinds of complement. Further examples of verbs which license both include the following (those in [i] being intransitive, those in [ii] transitive):

[14]		PREDICATIVE COMPLEMENT	LOCATIVE COMPLEMENT
	i	<i>get</i> <i>They got <u>angry</u></i> .	<i>They got <u>into the car</u></i> .
		<i>go</i> <i>He went <u>mad</u></i> .	<i>He went <u>to hospital</u></i> .
		<i>stay</i> <i>She stayed <u>calm</u></i> .	<i>She stayed <u>inside</u></i> .
	ii	<i>drive</i> <i>He drove them <u>mad</u></i> .	<i>He drove them <u>to the bank</u></i> .
		<i>get</i> <i>They got me <u>angry</u></i> .	<i>They got me <u>to the shore</u></i> .
		<i>leave</i> <i>They left me <u>unmoved</u></i> .	<i>They left me <u>in the waiting-room</u></i> .

However, there are also numerous verbs which take only one or the other, and for this reason we will not assimilate the locatives to the predicatives, but will regard them as syntactically distinct kinds of complement that exhibit certain semantic resemblances.<sup>32</sup>

<sup>31</sup>A semantic relation similar to that holding between *She made a teddy-bear* and *She made a good wife* is found between *She made a table out of the remaining timber* and *She made a man (out) of him* and again we will want to say that the underlined NP is object in both. *A table* clearly qualifies as object by the passive test: *A table was made out of the remaining timber*. The corresponding example with *a man* as subject is not acceptable: \**A man was made out of him*; however, similar examples such as *I'm sure a world-class tennis player could be made out of him* are reasonably acceptable, certainly much better than the results of trying to convert a PC into a passive subject. Note, moreover, that both examples have a counterpart with *into*, which supports their analysis as belonging to the same construction: *She made the remaining timber into a table* and *She made him into a man*.

<sup>32</sup>Note, moreover, that some of the verbs that occur with both kinds of complement, such as *drive* and *turn*, have a different sense and a very restricted range of permitted complements in the PC construction.

A few examples of verbs that take predicatives but not locatives are given in:

[15]	PREDICATIVE COMPLEMENT	LOCATIVE COMPLEMENT
i	<i>become</i> <i>He became <u>anxious</u>.</i>	* <i>He became <u>in the city centre</u>.</i>
	<i>seem</i> <i>Kim seemed <u>angry</u>.</i>	* <i>Kim seemed <u>at the back of the queue</u>.</i>
	<i>sound</i> <i>They sounded <u>strange</u>.</i>	* <i>They sounded <u>in a cave</u>.</i>
ii	<i>call</i> <i>They called him <u>stupid</u>.</i>	* <i>They called him <u>in the wrong team</u>.</i>
	<i>make</i> <i>She made him <u>happy</u>.</i>	* <i>She made him <u>onto the platform</u>.</i>
	<i>render</i> <i>This rendered it <u>useless</u>.</i>	* <i>This rendered it <u>in the wastebin</u>.</i>

Nevertheless, the semantic similarities observed above make it fruitful to generalise the semantic roles of location, source, and goal beyond the field of space. We will thus look first at spatial location and then extend the application of these roles to states and possession (for further discussion of spatial location and extension of the roles to the dimension of time, see Ch. 8, §§5–6).

#### ■ Location and change of location in space

Locative complements cover expressions associated with the roles of source, goal, and location. Source and goal apply in situations involving movement, source representing the initial location, goal the final one; where there is no movement the role is simply that of location. Compare:

[16]	<i>Angela</i>	<i>went</i>	<i>[from Berlin]</i>	<i>[to Bonn]</i>	<i>but Henry</i>	<i>remained</i>	<i>[in Berlin]</i> .
	Theme		Source	Goal	Theme		Location

The prepositions *from* and *to* serve as markers of source and goal. They indicate that their complement NPs express the initial and final locations respectively: Angela started off in Berlin and ended in Bonn. *In* by contrast is part of the expression of the location itself, and as such contrasts with other prepositions – for example, *near* or *outside*.

With goal, however, a preposition may also be part of the location expression:

[17]	i	a.	<i>Ed fell</i>	<i>[<u>in</u> the pool].</i>	b.	<i>She put Ed</i>	<i>[<u>on</u> the bus].</i>	
		ii	a.	<i>Ed slipped</i>	<i>[<u>under</u> the car].</i>	b.	<i>She pushed Ed</i>	<i>[<u>behind</u> the curtain].</i>

The prepositions here are not markers of goal: they do not indicate that the NP expresses the final location. They serve, rather, to describe the final location. The goal marker *to* cannot be added before the PPs in [17] (cf. \**Ed fell to in the pool*, \**Ed slipped to under the car*, etc.), but with *in* and *on* it can form a compound preposition:

[18]	a.	<i>Ed fell</i>	<i>[<u>into</u> the pool].</i>	b.	<i>She put Ed</i>	<i>[<u>onto</u> the bus].</i>
------	----	----------------	--------------------------------	----	-------------------	-------------------------------

The meaning is the same as in [17i], the difference being simply a matter of whether the goal role is morphologically marked or not. Note that the grammatical order of components in the compounds *into* and *onto* does not match the semantic order: we understand “to [in the pool]”, “to [on the bus]”, the final locations being “in the pool” and “on the bus”, as in [17i].

Sources behave rather differently. Compare:

[19]	i	a.	<i>Ed ran</i>	<i>[<u>from</u> the scene].</i>	b.	<i>He pulled Ed</i>	<i>[<u>from</u> the wreckage].</i>	
		ii	a.	<i>Ed emerged</i>	<i>[<u>from under</u> the car].</i>	b.	<i>He pulled Ed</i>	<i>[<u>from behind</u> the curtain].</i>

*From* marks the source in all of these. In [i] the source location is expressed simply by an NP (we understand “at the scene”, “in the wreckage”), whereas in [ii] it is expressed by a PP headed by a locative preposition: the marker of source, unlike that of goal, is not omissible in such cases. Source can also be expressed by *out*, as in *Ed ran out of the house*.

### ■ States

The extension of the locational roles from the field of space to that of states (properties) is most clearly motivated by the use of the same markers for source and goal. Compare:

- [20]      SPATIAL SOURCE + GOAL                                      STATE SOURCE + GOAL
- i a. *He went [from Berlin] [to Bonn].*                      b. *It went [from bad] [to worse].*
- ii a. *I sent it [from Berlin] [to Bonn].*                      b. *I changed it [from green] [to red].*

In [a] *from* marks the initial location in space, *to* the final one; in [b] *from* marks the initial state, *to* the final one. The AdjPs *bad*, *worse*, *green*, *red* are predicative obliques and the PPs containing them marked predicative complements.

We have seen that a spatial goal often remains unmarked, and thus we can regard the PCs in *His condition got worse* and *I made it red* as similarly unmarked state goals. There is no marker of spatial location, so that the prototypical state equivalent will likewise be an unmarked PC: *It seemed satisfactory*, *He considers it worthless*. We have noted that the source marker *from* is not omissible like the goal marker *to* and this correlates with the absence of unmarked PCs associated with the source role: thus we have *It became red* (goal), but not *\*It ceased green* (source). Compare also *It turned [from green] [to red]* (two prepositions) and *It turned red* (no preposition, with PC interpreted as goal, not source).

The parallel between spatial and state location is also seen in the fact that states are often expressed by PPs headed by prepositions whose primary meaning is spatial: *in a terrible state*, *in good condition*, *in good spirits*, *in a bad temper*, *out of sorts*, *on top of the world*. Such expressions can occur with verbs like *seem* which, as noted above (cf. [15]), do not take spatial location complements: *She seemed miserable / in a terrible state / \*in the lounge*.<sup>33</sup> In addition, *to* can mark state goals with a small range of abstract NPs such as *sleep*, *death*, *distraction* – compare:

- [21] i *He went to sleep.*      *We stabbed it to death.*      *The noise drove us to distraction.*
- ii *He fell asleep.*      *We shot it dead.*      *The noise drove us mad.*<sup>34</sup>

Semantically, the underlined expressions here are state goals (marked in [i], unmarked in [ii]). Syntactically, they are locative complements in [i], predicative complements in [ii] – note that the NPs in [i] cannot be replaced by AdjPs (or bare role NPs), and that these *to* phrases do not occur with any of the verbs that license PCs but not locative complements.

<sup>33</sup> This does not apply with *become* and *make*: see Ch. 6, §2.1.

<sup>34</sup> In the depictive construction the AdjP version is required (*He remained asleep / \*in sleep*) unless appropriate dependents are added (*He remained in a deep sleep*).

### ■ Into with state goals

With some verbs a state goal is expressed as complement to *into*:

- [22] i *Enrico turned* [from a frog] [into a handsome prince].  
 ii *Enrico / The frog turned* [into a handsome prince].

Here we take the whole compound preposition as marker of the goal role, with the NP *a handsome prince* expressing the final state. Such NPs tend to have the same number as that of the NP expressing the theme: cf. *Enrico and his brother turned into handsome princes* – or, with a different verb, *He developed into a fine young man* ~ *They developed into fine young men*. We have argued that this does not mean that these NPs are syntactically predicatives, and given that neither an AdjP nor a bare role NP can occur as complement to *into* we will take *into a handsome prince* as a locative complement. Note that *turn* does also occur with a predicative (*He turned nasty*), whereas *develop* does not.

In [22i] theme, source, and goal are all expressed separately. Construction [ii], however, which contains no *from* phrase, allows two interpretations, according as the subject expresses theme alone (*Enrico*) or theme and source combined (*the frog*): *Enrico* simply picks out the one undergoing the change, while *the frog* does this but at the same time defines the source state – the prince was (presumably) still Enrico but not still a frog.

### ■ Possession

Another field where we can invoke the roles of location, source, and goal is that of possession:

- [23] i *These houses are Kim's*.  
 ii a. *These houses belong to Kim*.                      b. *Kim owns these houses*.  
 iii *The estate passed from Kim to Pat*.  
 iv a. *Kim sold the house to Pat*.                      b. *Pat bought the house from Kim*.

Example [iii] illustrates straightforward change of possessor, with *from* marking initial possessor, *to* the final one: *Kim* and *Pat* can be regarded as possessional source and goal. In [i–ii], where there is no change of ownership, we can, by extension of the analogy, take *Kim* as possessional location, with the *to* in [iia] and the genitive case in [i] as markers.<sup>35</sup> Genitive NPs of this kind are best analysed as predicative complements, as they are found only with a subset of verbs that take such complements: e.g. intransitive *be*, *become*, *remain*, *stay*, transitive *call*, *consider*, *declare*, *make*. The non-genitives, however, are very sharply different from predicative complements. In particular, possessional location, source, and goal can all be aligned with the subject, as in [iib], [iva], and [ivb] respectively. Similarly, O<sup>d</sup> expresses source in *They robbed her of all her jewellery* and goal in *They presented her with a certificate of merit*, while O<sup>i</sup> expresses source in *They fined her \$100* and goal in *They gave her \$100*.

<sup>35</sup>The preposition *to* in [iia] does not fit in with the usual pattern since it is normally associated with goal rather than location; note that *belong* is also used in the field of space but here does not take *to*: *The shirts belong in the top drawer*.

### 5.3 Obligatory and optional predicatives

Predicatives may be either **obligatory** or **optional**.

[24]		OBLIGATORY	OPTIONAL
	INTRANSITIVE	<i>Kim became <u>ill</u>.</i>	<i>They departed <u>content</u>.</i>
	TRANSITIVE	<i>He made Kim <u>angry</u>.</i>	<i>He washed it <u>clean</u>.</i>

Obligatory *ill* and *angry* here cannot be omitted without loss of grammaticality (\**Kim became*) or an unsystematic change of meaning (the sense of *make* in *He made them angry* is not the same as in *He made them*). Optional *content* and *clean*, by contrast, can be omitted without any change to the rest: *They departed content* entails *They departed*, and *He washed it clean* entails *He washed it*.

#### ■ Intransitives

Little further need be added here concerning complex-intransitives, where we have the four combinations shown in:

[25]		OBLIGATORY	OPTIONAL
	DEPICTIVE	<i>They look <u>fantastic</u>.</i>	<i>He died <u>young</u>.</i>
	RESULTATIVE	<i>The boss got <u>angry</u>.</i>	<i>The pond froze <u>solid</u>.</i>

Note that although *die* in *He died young* entails a change of state, the change does not involve his age, so that *young* has a depictive, not a resultative, interpretation – this is why we use the terms depictive and resultative for the predicative, rather than static vs dynamic, which apply to the situation as a whole. *The parcel came open* is then ambiguous between obligatory resultative (“Its state changed from closed to open”) and optional depictive (“It was already open when it arrived” – cf. the unambiguous *It arrived open*).

#### ■ Transitives

Corresponding examples of complex-transitives are as follows:

[26]		OBLIGATORY	OPTIONAL
	DEPICTIVE	<i>He kept Kim <u>warm</u>.</i>	<i>He ate the steak <u>almost raw</u>.</i>
	RESULTATIVE	<i>This got me <u>furious</u>.</i>	<i>He painted the fence <u>blue</u>.</i>

An ambiguity matching that of *The parcel came open* might be *You’ve made the tea too weak*. The obligatory resultative reading would be appropriate in a scenario where after the tea has been made you found it too strong and added water, but too much: you have produced a change of state such that it is now too weak. No such change is involved in the optional depictive reading: you merely failed to use enough tea-leaves when making the tea, so that its initial state is too weak.

#### ■ Transitives with obligatory resultatives

Within the category of transitives with obligatory resultatives there is a further distinction to be drawn:

[27]	i	<i>He made <u>himself unpopular</u>.</i>	[internal complementation obligatory]
	ii	<i>He talked <u>himself hoarse</u>.</i>	[internal complementation optional]

In neither case can we drop the PC leaving the rest unchanged: *He made himself* is somewhat unidiomatic, but in any case has a different sense of *make* and in *He talked*

*himself* the reflexive is adjunct, not object. The resultative PC is thus in both cases obligatory. But in [ii] we can drop the PC and its predicand together, giving *He talked*, whereas [i] cannot similarly be reduced to *\*He made*. *Make* requires internal complementation, but *talk* does not. Example [i] represents the default case, while [ii] illustrates a quite unusual and restricted type of construction. The meaning is “He became hoarse as a result of talking”. It is not possible to replace the reflexive by any other kind of NP – cf. *\*He talked his audience bored*, “His audience became bored as a result of his talking”. The obligatory presence of a reflexive in [ii] would seem to be related to the fact that intransitive verbs with agentive subjects do not allow optional resultative predicatives. For example, non-agentive *The water ran hot* allows a resultative interpretation (it became hot as the water from the hot tank reached the tap), but we cannot have *Kim ran hot* with the meaning “Kim became hot as a result of running.” *?He talked hoarse* is perhaps marginally acceptable in a depictive sense, but it cannot have a resultative meaning: addition of the reflexive makes *talk* an agentive transitive in which the O can serve as a predicand for the resultative predicative. It is also possible to have a PP expressing a state goal: *He cried himself to sleep*; *He drank himself into a stupor*.

#### ■ Transitives with optional depictives: O vs S as predicand

Predicatives in transitive clauses normally have O as predicand, but optional depictives can also have S:

- [28] i *They served the coffee black.* [O as predicand]  
 ii *They served the coffee blindfolded.* [S as predicand]

This second construction is not possible with resultatives: *She chopped the wood tired*, for example, cannot mean that she became tired through cutting the wood, only that she was (already) tired when she cut it.

#### ■ Optional depictive predicatives as adjuncts

Obligatory predicatives are clearly complements, dependent on the occurrence of an appropriate verb. With optional ones, however, there are grounds for saying that while the resultatives are complements, the depictives are adjuncts. Resultatives are either obligatory (as in the *He talked himself hoarse* construction) or else need to be licensed by the verb. Optional depictives, however, are less restricted in their occurrence. One manifestation of this has just been noted: they can occur in transitive clauses with either S or O as predicand. Another is that they can occur in combination with an obligatory predicative or in the ditransitive construction:

- [29] i *They look even more fantastic naked.*  
 ii *They served us our coffee black.*

We will therefore regard such predicatives as adjuncts, so that the predicative/non-predicative contrast cuts across that between complements and adjuncts.

Like numerous other kinds of adjunct, predicatives may be integrated into the structure as modifiers, or detached, as supplements:

- [30] i *They left empty-handed.* [modifier]  
 ii *Angry at this deception, Kim stormed out of the room.* [supplement]

The supplements are positionally mobile and are set apart prosodically. The modifiers are of course more like the complements, especially in cases where they occur very frequently with a particular verb, as with *leave* in [i], *die* in *He died young*, *bear* in the passive *He was born rich*, and so on.

#### As phrases as predicative adjuncts

Predicatives marked by *as*, like unmarked ones, can function as complement or adjunct. The complement use was illustrated in [9] above (*That counts as excellent*, etc.), while the adjunct use is seen in:

- [31] i *He was happy* [as a junior assistant].  
 ii [As a former member] *we can offer you the following terms*.  
 iii [As a former member] *I offer you both the following advice*.

The adjuncts can take any pragmatically appropriate NP as predicand: for example, *a former member* has *you* (O<sup>i</sup>) as predicand in [ii], but *I* (S) in [iii] – and reducing *you both to you* in [iii] results in ambiguity, with either S or O<sup>i</sup> interpretable as predicand. The adjuncts also differ from complements in that the NP cannot be replaced by an AdjP, but it can still have the form of a bare role NP: [As treasurer] *I recommend that we seek approval for a modest increase in the subscription rate*.

## 5.4 Classification of verbs taking predicative complements

### ■ Class 1 verbs: complex-intransitives with depictive PCs

- [32] *Kim felt lonely / an intruder. Her son remained ill / a danger. That seems plausible / a good idea. Pat proved reliable / a great asset.*

Aside from *be* (discussed in §5.5) the main members of this class are given in [33]:

- [33] i *feel*                            *look* INF    *smell* ADJ    *sound* INF    *taste* ADJ  
 ii *continue* ADJ INF    *keep* ADJ    *remain*        *stay*  
 iii *appear* INF            *seem* INF                            *prove* INF

Those marked ‘INF’ also take infinitival complements, so that there is alternation between, for example, *She appeared anxious* and *She appeared to be anxious*. (With *look* and *sound* the constructions are not wholly equivalent. In *She looked happy* the signs of happiness are presented as more immediately or directly visible than in *She looked to be happy*.) The annotation ‘ADJ’ indicates that the PC is restricted, or virtually restricted, to AdjPs to the exclusion of NPs. Compare *She kept calm* but not (as a complex-intransitive) \**She kept the calmest person in the group*. The verbs in [i] are sense verbs (at least in their primary meaning), those in [ii] indicate continuation of the state, while set [iii] contains the two verbs of seeming and the odd one out, *prove*. Within set [ii] *continue* is quite rare in comparison with the others. It is used quite readily in talking of the weather, as in *It continues cold* or *The weather continued sultry*. For the rest, examples like %*Finding suitable accommodation for students continued difficult* are attested, but infinitival *continued to be difficult* would be preferred by most speakers.

The sense verbs and the verbs of seeming license a *to* phrase where the oblique NP expresses the experiencer: *The proposal looks very promising to me*. These same verbs also commonly occur with a *like* phrase instead of an NP: *Kim felt like an intruder*; *It seemed like a good idea*.

There are, in addition to the verbs in [33], a number that appear with such a limited range of PCs that the combinations are more or less fixed phrases or idioms:

- [34] *go hungry/naked, hold true, lie flat, loom large, pass unnoticed, play rough / the fool, plead guilty/innocent, rest assured, run wild, stand corrected/firm*

### Class 2 verbs: complex-intransitives with resultative PCs

- [35] *He became ill / our main ally. The work got too difficult for them.*  
 [36] *become come ADJ fall get ADJ INF go ADJ*  
*grow ADJ turn ADJ*

These are all verbs of becoming. *Get* differs from *become* in three respects: it belongs to relatively informal style; it is for most speakers restricted to adjectival PCs; and it more readily accommodates an agentive subject, as in *The dog tried to get free*. In particular we find *get* rather than *become* with *ready*: *Get ready*.

The other verbs in [36] take only a very limited range of PCs. The main items permitted by each as the head of the PC are listed in [37].

- [37] i *fall asleep, ill, pregnant, prey (to NP), sick, silent, victim*  
 ii *come loose, open, right, true; ordinal adjectives (I came third)*<sup>36</sup>  
 iii *go bad, mad, wrong, colour adjectives*  
 iv *turn bad, nasty, sour, colour adjectives*  
 v *grow long, old, tall, adjectives denoting psychological states (bored, impatient, tired), comparative AdjPs (You grow more beautiful each day)*

Although we have marked *go* and *turn* as taking adjectival complements, they can also take an NP denoting a colour: *It went/turned a strange colour*.

There are other verbs that are found only with one or two items, in what are basically just fixed phrases:

- [38] *blush scarlet, break loose, burst open, drop dead, freeze solid, run hot/cold, slide open/shut, spring open, walk free, wax eloquent, wear thin, work loose*

### ■ Class 3 verbs: complex-transitives with depictive PCs

- [39] *She believed it prudent / an advantage to be out of town. We proved it genuine / a fake. They kept their marriage secret / a secret.*

There are considerably more verbs in this class, and we therefore list separately those with the 'INF' annotation indicating the possibility of an infinitival complement instead of the PC: compare the *believe* and *prove* examples in [39] with *She believed it to be prudent to stay out of town* and *We proved it to be genuine*.

<sup>36</sup> There is a different sense of *come* (roughly "act as though one were") where it does take an NP complement, as in *Don't come the concerned father with me*. Likewise *come* licenses an infinitival complement, but with a somewhat different meaning, so that *Her wish came true*, for example, is not equivalent to *\*Her wish came to be true*.

[40] i	<i>believe</i> INF	<i>certify</i> INF	<i>consider</i> INF	<i>declare</i> INF	<i>deem</i> INF
	<i>feel</i> INF	<i>find</i> INF	<i>hold</i> <sub>1</sub> ADJ INF	<i>judge</i> INF	<i>like</i> INF
	<i>prefer</i> INF	<i>presume</i> INF	<i>profess</i> INF	<i>pronounce</i> INF	<i>prove</i> INF
	<i>reckon</i> INF	<i>report</i> INF	<i>rule</i> INF	<i>think</i> INF	<i>want</i> INF
ii	<i>account</i>	<i>brand</i>	<i>call</i>	<i>designate</i> <sub>1</sub>	<i>esteem</i>
	<i>have</i> ADJ	<i>hold</i> <sub>2</sub>	<i>imagine</i>	<i>keep</i>	<i>label</i>
	<i>leave</i>	<i>rate</i>	<i>term</i>	<i>wish</i> ADJ	

*Hold*<sub>1</sub> means roughly “consider”, as in *I hold you responsible for her safety*, while *hold*<sub>2</sub> is close to “keep”, as in *She held the door open for us*; *They held us hostage* (in both cases the range of PCs is quite limited). Some verbs in [ii] do enter into the infinitival complement construction but without the semantic equivalence that obtains in [i]. For example, *He wished himself different from the sort of person he thought he was* is closer to *He wished that he were different* than to *He wished himself to be different* (which indicates wanting to change). *He imagined himself unmarried* does have an interpretation equivalent to *He imagined himself to be unmarried* (i.e. “He thought he was unmarried” – cf. *He imagined himself indispensable*) but it also has another interpretation, probably more salient, in which he knew he wasn’t unmarried but imagined what it would be like if he were.

A few verbs not included above, such as *acknowledge*, *confess*, *suppose*, appear in the complex-transitive construction, but normally only with a reflexive object: *He confessed himself puzzled by her response*, but not \**He confessed the decision indefensible*.

#### ■ Class 4 verbs: complex-transitives with obligatory resultative PCs

[41]	<i>They appointed her ambassador to Canada.</i>	<i>You drive me mad.</i>
	<i>They made him anxious/treasurer.</i>	<i>They created her a life peer.</i>

Some of these verbs take only NPs as PC: they are listed separately in [42] with the annotation ‘NP’.

[42] i	<i>drive</i> ADJ	<i>get</i>	<i>make</i>	<i>put</i> ADJ	<i>render</i>
	<i>send</i> ADJ	<i>set</i> ADJ	<i>turn</i> ADJ		
ii	<i>appoint</i> NP INF	<i>baptise</i> NP	<i>christen</i> NP	<i>create</i> NP	<i>crown</i> NP
	<i>designate</i> <sub>2</sub> NP INF	<i>elect</i> NP INF	<i>name</i> NP	<i>proclaim</i> NP INF	<i>vote</i> NP

The verbs in [i] are the transitive analogues of the intransitive verbs of becoming. *Make*, informal *get*, and relatively formal *render* are the main ones, with the others restricted to a narrow range of adjectival complements. *Turn* takes the same type as intransitive *turn* (e.g. colour terms); *drive* and *send* occur with such items as *crazy*, *mad*, *insane*; *set* generally with *alight*, *free*, *right*, *straight*; and *put* also with *right* and *straight*.

The NP complement of the verbs in [42ii] can normally be a bare role NP: *They crowned him King*; *They elected her president*. *Baptise* and *christen* (at least in its literal sense) are exceptions, but we take this to be a semantic rather than a grammatical restriction, and not a sufficient reason for excluding them from the class of complex-transitive verbs. Some allow optional *as*: *They elected her (as) president* (see §6.1.2).

The primarily semantic distinction between depictive and resultative PCs is not always easy to draw. We have distinguished two senses of *designate* with one taking a depictive (“officially classify”, as in *They have designated<sub>1</sub> it a disaster area*), and the other a

resultative (“choose, appoint”, as in *They have designated<sub>2</sub> Kim the next Attorney-General*), and it may be that some others should likewise be dually classified. Compare, for example, *We had half the children sick* (depictive) vs *We had the meal ready in half an hour* (resultative).

### ■ Class 5 verbs: complex-transitives with optional resultatives

[43] *We hammered it flat. Kim knocked him senseless. You should paint the house green. She rubbed herself dry. He pushed the door open. I'll wipe it clean.*

There are many verbs of this type, usually taking a small range of AdjPs (though again such NPs as *an unusual colour* are possible instead of colour adjectives). A small sample, with typical adjectives, is given in [44]:

[44] *boil (hard)    bore (stiff)    brush (flat)    drain (dry)    fill (full of NP)  
frighten (silly)    jerk (open)    plane (smooth)    shoot (dead)    wash (clean)*

## 5.5 Copular clauses

### 5.5.1 Ascriptive and specifying uses of *be*

Two of the most important kinds of copular clause are illustrated in:

[45] i *His daughter is very bright / a highly intelligent woman.* [ascriptive]  
ii *The chief culprit was Kim.* [specifying]

In the ascriptive use, PC denotes a property and characteristically has the form of an AdjP or a non-referential NP; the subject is most often referential and the clause ascribes the property to the subject-referent. Thus [i], for example, ascribes to his daughter the property of being very bright or being a highly intelligent woman. The specifying use defines a variable and specifies its value. We might represent [ii] therefore as “The *x* such that *x* was the chief culprit was: Kim”; it serves to specify, or identify, who the chief culprit was. We will refer to the semantic roles joined by *be* as **theme** and **property** in the ascriptive case, and as **variable** and **value** in the specifying case.

Many copular clauses can be interpreted in either way.

[46] i *His first proposal was a joke.* } [ambiguous: ascriptive or specifying]  
ii *The victim was his sister.* }

The ascriptive interpretation of [i] is “His first proposal was laughable”: *a joke* gives an evaluation of his proposal. A context for the specifying interpretation might be one, say, where the question has been raised as to what would be the best way of opening a speech: his proposal was then to open it with a joke. Here the two interpretations are sharply different, and the specifying one is highly context-dependent. In [ii], which is much more typical, this is not so. The specifying reading identifies who the victim was; the ascriptive reading doesn't do this but merely says that she was related to him as sister. In the ascriptive use he may have several sisters, while the specifying one implicates that he has only one – and in the negative *The victim was not his sister* the ascriptive reading

is perfectly consistent with his not having a sister, while the specifying one strongly implicates that he does.

### ■ Cleft clauses

There is one special copular construction, the *it*-cleft, that is restricted to the specifying use. Thus *It was Kim who was the chief culprit* conveys essentially the same as [45ii] – and *It was his sister who was the victim* corresponds unambiguously to the specifying reading of [46ii]. (Compare also for [46i]: *It was a joke that he proposed first.*) Fused relative constructions can occur in either type. The matrix *be* clause is known as a pseudo-cleft in the case where the copula has the specifying sense.

- [47] i *It was peace and quiet that he wanted most.* [specifying; *it*-cleft]  
 ii *What he wanted most was peace and quiet.* [specifying; pseudo-cleft]  
 iii *What he wanted most was unobtainable.* [ascriptive]  
 iv *What he gave her was a worthless piece of jewellery.* [ambiguous]

In [i–ii] we have a variable defined as “the *x* such that he wanted *x* most” and its value is specified as “peace and quiet”. In the *it*-cleft, the subject *it* corresponds just to the bare “*x*”, and the definition of the variable is given in the relative clause at the end; in the pseudo-cleft [ii] the syntax matches the semantics more directly, with the “*x*” and its definition given in the fused relative construction functioning as S. In [iii] we have the same fused relative with the meaning “the *x* such that he wanted *x* most”, but this time *be* + PC does not specify the value of *x*; the fused relative is here quite strongly referential, and the clause is used to say something about the referent, ascribing the property “unobtainable” to it. Example [iv] can be taken in either way: the specifying use identifies what he gave her as a worthless piece of jewellery, while the ascriptive use describes it as such. A context for the former is where you don’t know what he gave her and my purpose is to inform you, whereas a likely purpose in the ascriptive reading is to express a judgement about the thing that he gave her. This is not to say that an evaluative term like *worthless* is needed for the ascriptive use: the ambiguity remains if we drop it, being still a matter of identification vs description, but the difference is then less salient. Precisely because the fused relative can occur in both types, it can be combined with the *it*-cleft to make the specifying sense explicit: *What it was that he wanted most was peace and quiet*; *What it was that he gave her was a worthless piece of jewellery*. (For further discussion of cleft clauses, see Ch. 16, §9.)

The contrast in meaning between the two kinds of copular clause is particularly clear when the PC has the form of an AdjP:

- [48] i *The man they’ve appointed is too big for his boots.* [ascriptive]  
 ii *What you are, my boy, is too big for your boots.* [specifying]

Example [i] is a straightforward ascriptive clause with *too big for his boots* denoting a property ascribed to the subject-referent. *Too big for your boots* in [ii] clearly also denotes a property, but it is not a property ascribed to the subject-referent, for the subject does not refer to a person. Here, then, *too big for your boots* specifies the value of the variable “the *x* such that you are *x*”. If we substitute this value for *x* in “you are *x*” we obtain “you are too big for your boots”, which is an entailment of [ii]. (For further discussion of the interpretation of *be* clauses, see Ch. 5, §8.3.)

## 5.5.2 Formal differences between ascriptive and specifying copular clauses

## (a) Reversibility

The specifying construction normally allows the alignment of semantic roles with syntactic functions to be reversed, so that we can have either variable as S and value as PC or value as S and variable as PC:

- [49]      VARIABLE AS S – VALUE AS PC                      VALUE AS S – VARIABLE AS PC  
           i a. *What he wants is peace and QUIET.*            b. *Peace and QUIET is what he wants.*  
           ii a. *Is what he wants peace and QUIET?*        b. *Is peace and QUIET what he wants?*

In order to help exclude irrelevant interpretations we have marked the focal stress (by small capitals), which in the default case falls within the element with the role of value. We give both declarative and interrogative versions to demonstrate that the first NP in both [a] and [b] is indeed the subject. No such realignment of roles and functions is possible in the ascriptive construction: the property role is always aligned with PC.

- [50]      THEME AS S – PROPERTY AS PC                      \*PROPERTY AS S – THEME AS PC  
           a. *What he wants is unobtainable.*                b. \**Unobtainable is what he wants.*

Under certain conditions the ascriptive construction allows the order of S and PC to be switched:

- [51]      S – P – PC    PC – P – S  
           a. *Her third novel was even better.*                b. *Even better was her third novel.*

That the subject of [b] is *her third novel*, not *even better*, is evident from agreement (cf. *Even better were her next two novels*), the impossibility of forming a closed interrogative by inverting the first two elements (\**Was even better her third novel?*), and so on.

The difference may therefore be summarised as follows. Given a clause ‘X – *be* – Y’, then if *be* is specifying, we can normally switch to ‘Y – *be* – X’, retaining the structure ‘S – P – PC’ (as in [49]), but changing the alignment between syntactic functions and semantic roles. But if *be* is ascriptive the switch to ‘Y – *be* – X’ will result either in ungrammaticality (as in [50b]) or in a change in syntactic structure (as in [51b]), a special case of subject–dependent inversion: see Ch. 16, §5).

## Reversibility as a source of ambiguity

The reversibility of the specifying construction is a further potential source of ambiguity, for it means that either S or PC may encode the variable. In abstraction from intonation such examples as the following can be taken with either S or PC as variable:

- [52]    i *What he wanted to know was what I told her.* }            [variable as S, value as PC OR  
           ii *What I told her was what he wanted to know.* }            value as S, variable as PC]

One interpretation has the variable expressed by *what he wanted to know* (“the *x* such that he wanted to know *x*”) and the value by *what I told her*: “It was the answer to the question ‘What did I tell her?’ that he wanted to know”. The other interpretation has the variable expressed by *what I told her* (“the *x* such that I told her *x*”) and the value by *what he wanted to know*: “It was the answer to the question ‘What did he want to know?’ that I told her”. The default position for the main stress is on *told* for the first interpretation and on *know* for the second.<sup>37</sup>

<sup>37</sup>We have cited examples where the meaning difference between the S-as-variable and S-as-value readings is very clear because in one case *what he wanted to know* is a fused relative and *what I told her* a subordinate interrogative whereas in the other case it is the other way round. It should be emphasised, however, that the

### Restrictions on reversibility

We will assume that the variable-as-S version represents the canonical alignment and that the value-as-S version is the ‘reversed’ one. The variable-as-S version is in general significantly more frequent and it is the only one allowed in the *it*-cleft construction (compare [47i] with *\*Peace and quiet was it that he wanted most*). Moreover, the variable-as-S version characteristically has the main stress at the end, which represents the default place for it in general – compare [49i–ii].

Nevertheless, there are certain conditions under which the reversed version is required:

- [53] i *Look over there!* [*THAT’S the guy you should ask.*]  
 ii *She took down some books but* [*THOSE weren’t the ones I needed*].  
 iii *THAT / <sup>3</sup>His FATHER is who you should ask.*  
 iv *THAT / <sup>3</sup>Ill HEALTH was why he resigned.*

In [i] the value is expressed by demonstrative *that* used deictically and with human reference: it can only occur as S (*\*The guy you should ask is THAT*). Example [ii] illustrates the case where the value is a demonstrative used anaphorically with a preceding antecedent (here *some books*). Examples [iii–iv] represent a somewhat problematic case of the specifying construction, with the variable expressed by an open interrogative clause (cf. Ch. 12, §5.4).

### (b) Connectedness of value and variable

- [54] i *What I asked you was whether she had seen him / \*that she had seen him.*  
 ii *What I regretted was that she had seen him / \*whether she had seen him.*

In [i] the value can be a closed interrogative but not a declarative clause, but in [ii] it is the other way round. This is because of the way the variables are defined. In [i] we have “the *x* such that I asked you *x*”, and *ask* (in the relevant sense) can take a closed interrogative but not a declarative clause as complement – *I asked you whether she had seen it / \*that she had seen it*. Conversely for the variable “the *x* such that I regretted *x*” in [ii]. Similarly in [48ii] above the value can take the form of an AdjP (*too big for your boots*) because the definition of the variable (“the *x* such that you are *x*”) allows a property term.

The form and interpretation of the value element are thus closely connected with the way the variable is defined. Some of the manifestations of this connectedness are as follows.

### Reflexives and reciprocals

- [55] i *My long-term goal is to get myself / \*me elected to Council.* } [specifying]  
 ii *All we did was give each other / \*us a little encouragement.* }  
 iii *My long-term goal is of great importance to me / <sup>2</sup>myself.* } [ascriptive]  
 iv *All we did was of great importance to us / \*each other.* }

We have a reflexive pronoun in [i] because the understood subject of *get* is *I*. Although unexpressed, it can be recovered on the basis that if I have a goal that constitutes an action then, other things being equal, I can be assumed to have the agent role. Similarly in [ii] the subject of *give* is recoverable from within the variable as *we*, which sanctions reciprocal *each other* and excludes *us*. Such reflexives and reciprocals are not

difference is not dependent on the presence of an extra factor like this. Thus *The one who got the job was the one who won the prize* and *The one who won the prize was the one who got the job* are likewise ambiguous according to which NP encodes the variable. They can be used, normally with stress on *prize*, to specify, identify who got the job (“It was the one who won the prize who got the job”) or, with stress on *job*, to specify who won the prize (“It was the one who got the job who won the prize”).

confined to clauses where the value has the form of a non-finite clause: the same principle applies to examples like *What you are, my boy, is rather too sure of yourself* (cf. [48ii]), which entails *You are rather too sure of yourself*. In the ascriptive construction, by contrast, there is no such connectedness between PC and S, so the accusative forms are now permitted. The reciprocal is straightforwardly excluded, as shown in [iv], whereas in [iii] a reflexive is marginally acceptable as an alternant to the more usual accusative – it is an example of what we call an ‘override reflexive’ (see Ch. 17, §3.1.4).

### Aspectual agreement

- [56] i *What she did next was correct/\*correcting the proofs.*  
 ii *What she was doing was correcting/\*correct the proofs.*

When the clause specifies a value for a variable involving “do *x*” there must be agreement in the aspectual system progressive vs non-progressive. Thus non-progressive *did* in [i] requires non-progressive *correct*, while progressive *was doing* in [ii] selects *correcting*.

### Non-affirmative items

- [57] i *What he never did was show some/any sign of remorse.* [specifying]  
 ii *The part he didn't read had been interesting to some/any of us.* [ascriptive]

A non-affirmative item in the value element may be sanctioned by a negative within the variable. Example [i] entails *He never showed any sign of remorse*, where *any* is straightforwardly within the scope of *never*, and this then allows non-affirmative *any* in the specifying construction. In ascriptive [ii], however, the negative embedded within the subject does not have scope over the PC.

### (c) Category

In the specifying construction the variable element normally has the form of an NP,<sup>38</sup> whereas the value can be expressed by a phrase of any category or a subordinate clause. Thus the value has the form of an AdvP in *It was only very reluctantly that she agreed*, an AdjP in [48ii], a PP in *The best place for it is under the bed*, and so on. In the ascriptive construction a subordinate clause can function as S but not in general as PC: it expresses not a property but the bearer of a property.<sup>39</sup> Compare, then, the role of the *whether* clause in:

- [58] i *Whether he'll survive is uncertain.* [ascriptive: S only]  
 ii *The question occupying us all is whether he'll survive.* [specifying: PC as value]  
 iii *Whether he'll survive is the question occupying us all.* [specifying: S as value]

### (d) Interrogative and relative *who*

*Who* cannot be used to question properties, hence can't be an ascriptive PC. *Who is he?*, for example, can only be specifying. To question properties we need *what... like*,

<sup>38</sup>The one exception is an open interrogative, as illustrated in [53iii–iv].

<sup>39</sup>Infinitival clauses can function as PC under certain conditions. The most productive case involves purpose infinitivals, as in *This is to clean the lens with*: the property is that of serving a particular purpose. Other cases like *He is to blame*, *The house is to let*, are lexically very restricted.

*what*, or *how* (Ch. 10, §7.7). Similarly for the relative: *He's not the man who I thought he was* is concerned with identity. And where the issue concerns properties, not identity, we have *He's not the man that he used to be*, where *that* cannot be replaced by *who*.

### (e) Referentiality and definiteness

NPs in ascriptive PC function are non-referential and cannot have the form of a personal pronoun; they are characteristically indefinite, as in *Kim is a successful lawyer*. Such examples illustrate the common use of ascriptive copular clauses to indicate class membership: *This is a weed*, “This belongs to the class of weeds”. Very often they involve gradable terms: *What a hopeless cook he is!*; *He's such a bore*. Definite NPs are not excluded; among the clearest examples we find superlatives, kin or similar relations, offices or roles and the like: *She's the nicest person you could hope to meet* / *the headmistress's daughter* / *the secretary of the bushwalking club*. These could also be specifying, but if we drop *the* from the last the ambiguity dissolves: *She is secretary of the bushwalking club* can only be ascriptive, for bare role NPs are always non-referential. In the specifying construction the variable NP is characteristically definite, as in *The ones he invited were Kim and Max* (where the value is definite too) or *What he wanted was an umbrella* (where the value is indefinite). Such cases carry an implicature of exhaustiveness and contrast: he didn't invite anyone besides Kim and Max, and there are others whom he might have invited but didn't. It is possible for the variable NP to be indefinite, in which case there is no such implicature: *An example of what I mean was his behaviour at dinner last night*.<sup>40</sup> The variable NP is always interpreted descriptively, never purely referentially (in the sense of Ch. 5, §8). Compare:

- [59] i *The man next to Tom* / *That guy with the beard* is a scoundrel. [ascriptive]  
 ii *The one who got the job* / *The one who set up the deal* was Max. [specifying]

In [i] it may be that I am simply wanting to tell you that a certain person is a scoundrel and indifferently choose either *the man next to Tom* or *that guy with the beard* as a means of getting you to see who I am talking about: in this case the NPs are used referentially. But the subject NPs in [ii] can't be freely interchanged in this way: their content is essential to what I am saying, for in the one case I am telling you who got the job and in the other I am telling you who set up the deal, so that the two versions cannot be different ways of making the same point. In some cases the variable NP has a form which doesn't permit a purely referential use: e.g. NPs with a fused or restrictive relative containing an *about* phrase, as in *What / The thing I like about Ed is his hair* (hence the deviance of ascriptive *\*What / \*The thing I like about Ed is black*).

### (f) Predicative complements with verbs other than *be*

Ascriptive PCs occur freely with other verbs, whereas the specifying construction is almost wholly restricted to *be* clauses:

- [60] i *It was/\*seemed/\*became John who took responsibility for the accounts*.  
 ii *\*He considered what she needed a complete rest*.

<sup>40</sup>The implicature of exhaustiveness is also lost if we add such adverbs as *primarily*, *chiefly*, *mainly*: *It was primarily the cost that put me off*.

These can be remedied by replacing *seemed* by *seemed to be* and *became* by *came to be* in [i] and adding *to be* before *a complete rest* in [ii]. Note that in [ii] it is the relationship between the complements that is inadmissible, not their form: compare *He considered what she had done a complete disaster*, with ascriptive PC. Because the PCs governed by these other verbs are ascriptive, the constructions are not reversible: *Pat became Kim's lover* is not equivalent to *\*Kim's lover became Pat* (which suggests a fantasy world where the lover turned into Pat).<sup>41</sup>

## 6 Special verb + preposition combinations and related types of complementation

Our major focus in this section is on prepositional complements of verbs where the combination of verb and preposition is distinctive in one or more of the following ways:

- [1] i The preposition is specifically selected by the verb rather than being in potential contrast with other prepositions – e.g. *Kim referred to your book*.  
 ii The preposition can be positioned between the verb and a simple NP object – e.g. *She put in her application*.  
 iii The verb + preposition combination forms an idiom, or is part of one – e.g. *I gave up the struggle* (“abandoned”), *This gave the lie to her critics* (“showed to be wrong”).

### ■ Transitive and intransitive prepositions

We include in the category of prepositions not only words like *to* in [i/i/iii], but also *in* in [iii] and *up* in [iii]. As used here, *in* and *up* are traditionally analysed as adverbs: explanation and justification for their treatment as prepositions is given in Ch. 7, §2.4. Prepositions, like verbs, head a range of different construction types, and one major distinction is between transitive and intransitive constructions. In *He put it [in the box]*, the NP *the box* is object of *in*, and we apply the term transitive to the PP or to *in* itself (as used here), just as in *He [opened the door]*, where *the door* is object of *opened*, we say that *opened the door* is a transitive VP and that *open* (as used here) is a transitive verb. Similarly, in *He brought the chairs in* the preposition has no object and we apply the term intransitive to the PP consisting of *in* alone or to the preposition *in* itself (as used here). On this basis we take the *to* of [i/iii] as a transitive preposition (with *your book* and *her critics* as object), and the *in* of [ii] and the *up* of [iii] as intransitive prepositions. Strictly speaking, an intransitive preposition may have a complement other than an object NP – e.g. *owing* in *owing to the rain* has a PP complement. In this section, however, we will be concerned only with intransitive prepositions that have either no complement at all or else a predicative, as in *That counts [as satisfactory]*.

<sup>41</sup>A specifying use of *become* cannot be excluded altogether, however, as can be seen from such an example as *The genuinely interesting question, then, becomes: what factors determine the degree of realism or distortion in conventional images of Jews*. The PC here identifies the genuinely interesting question, and subject and predicative complement could be switched. *Remain* allows a specifying PC somewhat more readily, as in *His weight remained 60 kgs* (contrast *\*His weight became 60 kgs*), with the marginal possibility of reversal to *60 kgs remained his weight*; cf. also *What I like best about Bill remains his sense of humour*, where the S can't be purely referential.

### ■ Selection of preposition by the verb

The preposition *to* of *Kim referred to your book* in [1i] is to be distinguished from that of *Kim flew to Boston* in that the latter may contrast systematically with such other prepositions as *towards*, *round*, *from*, *over*, and so on, whereas the former permits no such replacement. The dictionary entry for *refer* must specifically mention *to*, whereas that for *fly* need say only that the verb takes complements of goal, source, and path. For purposes of comparison we will refer to the *to* of *Kim referred to your book* as a **specified** preposition, and that of *Kim flew to Boston* as an **unspecified** preposition.

#### Prepositional verbs

Verbs like *refer* which select a specified preposition we call **prepositional verbs**. This category covers not only verbs where the PP is the sole complement but also those where it combines with one or more other complements, like *congratulate* in *He congratulated her on her promotion*. It also covers those where the specified preposition takes a predicative complement, like *count* in the above *That counts [as satisfactory]*. We examine constructions containing prepositional verbs in §6.1.

### ■ Positioning between verb and object: particles

The usual position for an object is immediately after the verb unless it is internally complex or heavy, in which case it may occur in postposed position, as in *She found in the woods a large number of exotic toadstools*. Clauses like *She put in her application* in [1ii] depart from the usual pattern by virtue of having a complement positioned between the verb and a simple object, i.e. one that is not heavy. Words which can occur as complement in this position we call **particles**; they are mainly intransitive prepositions like the *in* of this example, but there are also a few other types, such as the adjective *short* in *We cut short the debate*. The particle + object construction is dealt with in §6.2.

### ■ Idioms and verbal idioms

An idiom is an expression larger than a word whose meaning cannot be systematically derived from meanings that the parts have when used independently of each other. We apply the term **verbal idiom** to idioms whose major element is a verb.

A large number of verbal idioms contain intransitive prepositions, as in the *give up* of [1iii]: we survey the various constructions containing idioms of this kind in §6.3. In §6.4 we look at verbal idioms consisting of verb + NP object + transitive preposition, such as *give the lie to* in [1iii]; and in §6.5 we introduce briefly various other types of verbal idiom.

The following further examples of verbal idioms illustrate two general points that should be borne in mind:

- [2] i a. *He took me to task for wearing jeans.*      b. *She made up her mind to resign.*  
 ii a. *You're pulling my leg.* (“teasing me”)      b. *He had no idea how ill I was.*

#### (a) Idioms need not be syntactic constituents

An idiom is a lexical unit, and there is no requirement that lexical units coincide with syntactic ones. In [2i], for example, the PP *to task* is part of the idiom, but is separated from the verb by the object and hence doesn't form a syntactic constituent with the verb. In [ib/iiia] the genitive inflection in *her* and *my* is part of the idiom, while the lexeme component (*she, I*) is not, though in [ib] the pronoun must be anaphorically linked to

the subject (cf. \**We made up Jill's mind to resign*). In [iia], moreover, there is compelling evidence that the syntactic structure is the same in the idiomatic interpretation as in the literal one, for in either case we can have a related passive, as in *I don't like having my leg pulled*. It is clear, then, that *my leg* in [iia] is syntactically the object of *pull*. Similarly in [ib] *her mind* is object – cf. the adjectival passive *Her mind is made up*. In [iib] *idea* is head of the NP object: the determiner *no* isn't strictly part of the idiom for we can have other dependents here (*He hadn't the faintest idea . . . / Did he have any idea . . .*), though there are severe restrictions on what they can be (cf. \**He had a rather novel idea how ill I was*).

#### (b) Idioms can license complements

*Make up one's mind* has essentially the same meaning as *decide*, and like the latter it licenses an infinitival complement, such as *to resign* in [2ib]. Similarly in [iib], *have . . . idea* is comparable to *know* and takes the same range of clausal complements, in this example the exclamative *how ill I was*. Note that the complement here is not licensed by the noun *idea* alone, for we cannot have, say, \**The idea how ill I was hadn't entered his mind*.

It follows that when we list items taking a particular type of complement, we need to allow for the inclusion of verbal idioms.

### ■ The term 'phrasal verb'

Sequences like those underlined in the [a] examples of [3] are commonly classified as 'phrasal verbs':

- |     |     |    |  |    |                                      |
|-----|-----|----|--|----|--------------------------------------|
| [3] | i   | a. | <i>Kim referred to your book.</i>      | b. | <i>He flew to the capital.</i>       |
|     | ii  | a. | <i>He put in his application.</i>      | b. | <i>He carried in the chairs.</i>     |
|     | iii | a. | <i>I look forward to seeing you.</i>   | b. | <i>I ran forward to the desk.</i>    |
|     | iv  | a. | <i>He paid tribute to his parents.</i> | b. | <i>He sent money to his parents.</i> |

The term 'phrasal verb' implies that the combinations concerned form syntactic constituents belonging to the category verb. The view taken here, however, is that the underlined expressions in the [a] examples in [3], despite their idiomatic interpretations, do not form syntactic constituents, any more than the underlined word sequences in the [b] examples form constituents. It is for this reason that we do not use the term 'phrasal verb' in this grammar.<sup>42</sup>

## 6.1 Prepositional verbs

Prepositional verbs, we have said, are those which select a PP complement containing a specified preposition together with its own complement.<sup>43</sup> In §6.1.1 we compare the syntax of clauses containing prepositional verbs with that of clauses containing verbs taking transitive PP complements headed by unspecified prepositions; then in §6.1.2 we survey the major clause constructions containing prepositional verbs.

<sup>42</sup>For some writers the phrasal verb category is defined more narrowly to include only combinations of verb + intransitive preposition, as in [3iia], and perhaps also the non-idiomatic type of [iib].

<sup>43</sup>As usually employed, the term 'prepositional verb' applies to the sequence of verb + preposition, thus to *refer to* in [3ia]: since we don't analyse that as a single constituent, we apply the term just to the verb, i.e. in this case to *refer* itself.

### 6.1.1 Comparison between constructions with specified and unspecified prepositions

The comparison we are concerned with here is between clauses like those in the [a] and [b] members of such pairs as:

- | [4] SPECIFIED PREPOSITION                           | UNSPECIFIED PREPOSITION                         |
|---|---|
| i a. <i>I referred <u>to</u> her book.</i>          | b. <i>I flew <u>to</u> Boston.</i>              |
| ii a. <i>I came <u>across</u> some old letters.</i> | b. <i>I swam <u>across</u> the river.</i>       |
| iii a. <i>I skated <u>over</u> the problem.</i>     | b. <i>I skated <u>over</u> the frozen pond.</i> |
| iv a. <i>I waded <u>through</u> my ironing.</i>     | b. <i>I waded <u>through</u> the mud.</i>       |

The [a] examples, in contrast to the [b] ones, contain prepositional verbs. As illustrated in [iii–iv] there are numerous verb + preposition combinations where the preposition can be either specified or unspecified: in the specified case the combination forms a verbal idiom.

We will compare the two types with respect to four parameters: fronting of the preposition along with its complement, coordination of PPs, positioning of adjuncts before the preposition, formation of prepositional passives. The comparison shows that it is necessary to distinguish two types of specified preposition, **mobile** ones like the *to* of [4ia], and **fixed** ones like the *across* of [4iia]. The mobile ones behave in essentially the same way as unspecified prepositions, while the fixed ones do not permit variation in their position relative to the verb.

#### (a) Fronting of the preposition + NP

The main constructions at issue here are relatives and open interrogatives. Also relevant are *it*-clefts where the foregrounded element (the complement of *be*) is a PP. We illustrate first with cases that have an unspecified preposition:

- |       |   |                      |
|-------|---|----------------------|
| [5] i | <i>the city <u>to which</u> I flew</i>      | [relative]           |
| ii    | <i><u>To which city</u> did you fly?</i>    | [open interrogative] |
| iii   | <i>It was <u>to Boston</u> that I flew.</i> | [it-cleft]           |

There are alternants with a stranded preposition (*the city which I flew to*, etc.), but it is the version cited in [5] that is of interest for present purposes, for it shows that *to* and the following NP form a constituent.

Consider now the behaviour of specified prepositions in these constructions, the mobile *to* selected by *refer* and the fixed *across* selected by *come*:

- | [6] MOBILE PREPOSITION                                   | FIXED PREPOSITION   |
|--|---|
| i a. <i>the book <u>to which</u> I referred</i>          | b. * <i>the letters <u>across which</u> I came</i>          |
| ii a. <i><u>To which book</u> did you refer?</i>         | b. * <i><u>Across which letters</u> did you come?</i>       |
| iii a. <i>It was <u>to her book</u> that I referred.</i> | b. * <i>It was <u>across these letters</u> that I came.</i> |

The mobile preposition behaves just like the unspecified one in [5], whereas the fixed one does not. *Across* cannot be moved to the left of *come*, so only the versions with stranded prepositions are admissible: *the letters which I came across*; *Which letters did you come across?*; *It was these letters that I came across*.

#### (b) Coordination of PPs

Unspecified prepositions can be readily repeated in coordination:

- [7] *I flew to Boston and to New York.*

With specified prepositions we again find the mobile and fixed types behaving differently:

- [8] a. *I referred to her book and to several others.*                      b. *\*I came across these letters and across some family photographs.*

### (c) Position of adjuncts

An adjunct can be readily inserted between the verb and an unspecified preposition:

- [9] *I flew regularly to Boston.*

The same applies to mobile specified prepositions, but not to fixed ones:

- [10] a. *I referred repeatedly to her book.*                      b. *\*I came eventually across these letters.*

### (d) Prepositional passives

In the prepositional passive construction the preposition remains next to the verb, and this time we don't have a systematic difference in behaviour between mobile and fixed specified prepositions. With unspecified prepositions the prepositional passive is not generally admissible, but it is not wholly excluded. Passives are much more widely available with specified prepositions, but they are not admissible in all cases. Compare, for example:

- [11] i a. *\*Boston was flown to next.*                      b. *This bed has been slept in.*  
       ii a. *\*Such principles were stood for.*                      b. *Her book was referred to.*  
       iii a. *\*Some old letters were come across.*                      b. *These matters must be seen to.*

In [i] we have unspecified prepositions, in [ii] mobile specified ones (cf. *the principles for which we stand*), and in [iii] fixed specified ones (cf. *\*the matters to which we must see*).

## ■ Distinction between mobile and fixed specified prepositions applies in transitive clauses

The mobile vs fixed distinction applies also to prepositions following an object NP:

- | [12] | MOBILE PREPOSITION  | FIXED PREPOSITION  |
|------|---|--|
| i    | a. <i>He <u>referred</u> me <u>to</u> a specialist.</i>   | b. <i>He <u>got</u> me <u>through</u> the biology test.</i>  |
| ii   | a. <i>the specialist <u>to</u> whom he <u>referred</u> me</i>                                   | b. <i>*the test <u>through</u> which he <u>got</u> me</i>  |
| iii  | a. <i><u>To</u> whom did he <u>refer</u> you?</i>   | b. <i>*<u>Through</u> which test did he get you?</i>   |
| iv   | a. <i>It was <u>to</u> an ophthalmologist that he <u>referred</u> me.</i>                       | b. <i>*It wasn't <u>through</u> the biology test that he <u>got</u> me.</i>                          |
| v    | a. <i>He <u>referred</u> me <u>to</u> an optometrist, but not <u>to</u> an ophthalmologist.</i> | b. <i>*He <u>got</u> me <u>through</u> the biology test, but not <u>through</u> the anatomy one.</i> |

In the [a] examples we have the transitive use of *refer*, and as with the intransitive use considered above the specified preposition *to* can be fronted along with its complement in relatives and open interrogatives, extracted with its complement in the *it*-cleft, and repeated in coordination. The [b] examples contain the transitive idiom *get through*, "help pass", and here the specified preposition *through* cannot be moved or repeated.

## ■ Constituent structure

The constituent structure of clauses containing specified prepositions is best regarded as identical to that of matching clauses with unspecified prepositions. This means that in

all the above examples where the preposition immediately precedes an NP it combines with the latter to form a transitive PP. The bracketing for our model examples with *refer to* and *come across* is thus as follows:

- [13] a. *I [referred] [to her book].*                      b. *I [came] [across some old letters].*

Where the position of the preposition is fixed we take the verb + preposition combination to be **fossilised**, i.e. it blocks the application of the syntactic processes that can normally apply to such combinations.

There is no support for the common view according to which specified prepositions form a constituent with the verb, giving bracketings like those in [14].

- [14] a. *I [referred to] [her book].*                      b. *I [came across] [some old letters].*

These structures imply that there has been a reanalysis such that the preposition has come to be incorporated into the verb instead of heading a PP. Structure [14a], however, is inconsistent with the data presented in [6], [8], and [10], which show that syntactically the preposition belongs with the NP, its complement, not with its governing verb. If the structure were as shown in [14a], we have no account of why the preposition can be fronted along with the NP, of why the preposition can be repeated in coordination, of why an adjunct can be inserted before *to*.

The analysis of clauses with fixed specified prepositions is less clear. The data of [6], [8], and [10] are this time not inconsistent with the bracketing shown in [14b]. But nor are they inconsistent with that shown in [13b]: we can simply say that the sequence is fixed rather than variable. This indeed is the only plausible solution in the case of fixed prepositions in transitive clauses like *He got me through the biology test*, [12ib]: here the preposition is separated from *get* by the object, and hence cannot form a syntactic constituent with it.

The reanalysis account [14b] would be required if there were positive evidence that the VP behaved like a verb + object construction – for example, if an adjunct could occur immediately before a heavy NP. We have no attested examples of this type, however, and constructed ones appear to be unacceptable:

- [15] i. \**He came across later that morning a letter she wrote just before her marriage.*  
 ii. \**We must see to immediately the various matters that your father raised.*

The fossilisation account avoids the need to assign different structures to the *refer to* and *come across* examples, and is in any case needed for the transitive case illustrated with *get NP through*.

## 6.1.2 Constructions containing prepositional verbs

In this section we survey the patterns of complementation found with prepositional verbs. We distinguish the following six structures:

- |        |                                 |  |
|--------|---------------------------------|--|
| [16] I | verb – [prep + O]               | <i>I referred [to her book].</i>           |
| II     | verb – O – [prep + O]           | <i>I intended it [for Kim].</i>            |
| III    | verb – [prep + O] – [prep + O]  | <i>He looked [to her] [for guidance].</i>  |
| IV     | verb – [prep + PC]              | <i>It counts [as too short].</i>           |
| V      | verb – O – [prep + PC]          | <i>They regard it [as successful].</i>     |
| VI     | verb – [prep + O] – [prep + PC] | <i>I think [of it] [as indispensable].</i> |

In I–III the final NP is object of its governing preposition, while in IV–VI it is a predicative complement. The distinction we have drawn among complements of the verb between objects and predicatives applies also to the complements of prepositions, though the preposition governing a PC is almost always *as* – in the lists below we will include the preposition taking a PC only when it is not *as*.

■ **Structure I: verb – [prep + O], as in *refer [to her book]***

This is the type focused on in §6.1.1, where the preposition + NP forms the only complement of the verb. There are a great many prepositional verbs of this kind; a small sample are given in [17], where ‘–P’ indicates that prepositional passives like [11] are unacceptable, and ‘F’ that the combination is fossilised, with the preposition more or less fixed in position, as illustrated for *come across* in [6], [8], and [10].<sup>44</sup>

[17]	<i>abide by</i>	<i>account for</i>	<i>ask after</i> F	<i>ask for</i>
	<i>bank on</i>	<i>believe in</i>	<i>break into</i>	<i>break with</i> –P F
	<i>call for</i>	<i>call on</i>	<i>come across</i> –P F	<i>come between</i> –P F
	<i>come by</i> F	<i>come into</i> –P F	<i>come under</i> –P	<i>consist of</i> –P
	<i>count on</i>	<i>dawn on</i> –P	<i>decide on</i>	<i>dispose of</i>
	<i>draw on</i>	<i> dwell on</i>	<i>fall for</i> –P	<i>feel for</i> –P
	<i>fuss over</i> F	<i>get at</i> F	<i>get over</i> –P F	<i>get round</i> F
	<i>go off</i> –P F	<i>grow on</i> –P F	<i>hit on</i> F	<i>hold with</i> –P
	<i>hope for</i>	<i>keep to</i>	<i>lay into</i> F	<i>look after</i> F
	<i>look for</i>	<i>make for</i> –P F	<i>part with</i>	<i>pick on</i>
	<i>pore over</i> F	<i>run into</i> F	<i>see about</i> F	<i>see to</i> F
	<i>stand by</i> –P F	<i>stand for</i> –P	<i>stem from</i> –P	<i>take after</i> –P F
	<i>tamper with</i>	<i>tell on</i> F	<i>testify to</i>	<i>wait on</i>

We also include under the present heading such combinations as *blossom into* and *turn into*, where the complement of the preposition is semantically like a predicative but doesn’t qualify syntactically as a predicative complement as it cannot have the form of an AdjP or bare role NP (see §5.2).

■ **Structure II: verb – O – [prep + O], as in *intend it [for Kim]***

In this construction the verb has two complements, an object and a PP. The subject of related passives always corresponds to the object of the verb, not that of the preposition: *It was intended for Kim*, not \**Kim was intended it for*. The preposition can almost always be fronted or extracted along with its complement and repeated in coordination, as illustrated for *refer . . . to* in [12], but there are a few informal expressions like the *get . . . through of* [12] where this is not possible; such fossilised combinations are again

<sup>44</sup>In fact the three constructions in [6] differ somewhat in this regard: *the goods of which he had disposed*, for example, is much more acceptable than *Of which items did he dispose first?* or *It was of his own car that he disposed first*. We have marked with ‘F’ only those which resist occurrence in all three. Note also that a verb + preposition combination may be more fossilised in one meaning than in another: the position of *at*, for example, is fixed in *I must get a plumber to look at this tap* (“examine with a view to repairing”), but not in *Everyone was looking at the organist*.

marked 'F' below:

[18]	<i>accuse... of</i>	<i>address... to</i>	<i>assure... of</i>	<i>charge... with</i>
	<i>confine... to</i>	<i>convince... of</i>	<i>deprive... of</i>	<i>draw... into</i>
	<i>entitle... to</i>	<i>explain... to</i>	<i>get... through F</i>	<i>help... with</i>
	<i>hold... against</i>	<i>incite... to</i>	<i>interest... in</i>	<i>introduce... to</i>
	<i>let... into F</i>	<i>let... off F</i>	<i>persuade... of</i>	<i>protect... from</i>
	<i>read... into</i>	<i>refer... to</i>	<i>rob... of</i>	<i>see... through F</i>
	<i>subject... to</i>	<i>suspect... of</i>	<i>treat... to</i>	<i>warn... of/about</i>

Two special cases of Structure II are shown in:

- [19] i a. *He supplied weapons to them.*      b. *He supplied them with weapons.*  
 ii a. *She gave the key to Pat.*              b. *She gave Pat the key.*

In both there is alternation between [a] and [b]. With *supply* both alternants belong to the prepositional construction, selecting different NPs as object and different prepositions. With *give* the prepositional construction [a] alternates with the ditransitive (double-object) construction [b]. These alternations are dealt with in §8.

#### ■ Structure III: verb – [prep + O] – [prep + O], as in *look [to her] [for guidance]*

Here the verb selects two prepositions:

[20]	<i>agree with... about</i>	<i>appeal to... for</i>	<i>argue with... about/over</i>
	<i>arrange with... for</i>	<i>boast to... about</i>	<i>complain to... about</i>

#### ■ Structure IV: verb – [prep + PC], as in *count [as too short]*

[21]	<i>act</i>	<i>count</i>	<i>do "serve"</i>	<i>double</i>	<i>emerge</i>
	<i>function</i>	<i>masquerade</i>	<i>pass as/for</i>	<i>pose</i>	<i>rate</i>
	<i>resign</i>	<i>retire</i>	<i>serve</i>	<i>stand</i>	

This is the prepositional equivalent of the complex-intransitive construction. *Pass* allows *for* as the preposition, as in *He had passed for dead*.

#### ■ Structure V: verb – O – [prep + PC], as in *regard it [as successful]*

[22]	i	<i>accept</i>	<i>acknowledge</i>	<i>adopt</i>	<i>bill</i>	<i>brand</i>
		<i>cast</i>	<i>categorise</i>	<i>characterise</i>	<i>choose</i>	<i>class(ify)</i>
		<i>condemn</i>	<i>confirm</i>	<i>construe</i>	<i>count</i>	<i>define</i>
		<i>denounce</i>	<i>depict</i>	<i>describe</i>	<i>diagnose</i>	<i>disguise</i>
		<i>dismiss</i>	<i>enlist</i>	<i>establish</i>	<i>give</i>	<i>hail</i>
		<i>have</i>	<i>identify</i>	<i>instal</i>	<i>intend</i>	<i>interpret</i>
		<i>know</i>	<i>mean</i>	<i>perceive</i>	<i>portray</i>	<i>present</i>
		<i>recognise</i>	<i>regard</i>	<i>represent</i>	<i>scorn</i>	<i>see</i>
		<i>suggest</i>	<i>take as/for</i>	<i>treat</i>	<i>use</i>	<i>view</i>
	ii	<i>appoint</i>	<i>consider</i>	<i>designate</i>	<i>elect</i>	<i>imagine</i>
		<i>nominate</i>	<i>ordain</i>	<i>proclaim</i>	<i>rate</i>	<i>report</i>

This is the prepositional equivalent of the complex-transitive construction. Again we have an exceptional case where *for* is allowed as well as *as*: *He took it as obvious* and *He took them for dead*. With the verbs in [ii] the *as* is optional: *They appointed Kim (as) treasurer*; the version without *as* belongs to the complex-transitive construction discussed in §5.4.

■ Structure vi: verb – [prep + O] – [prep + PC], as in *think [of it] [as indispensable]*

[23] *agree on*                      *conceive of*                      *look (up) on*                      *refer to*                      *think of*

In this relatively unusual construction the predicand for the predicative is complement of the first preposition – i.e. the predicative *indispensable* applies to *it*. Note that there is no construction where the predicand is complement of a preposition but the predicative is not.<sup>45</sup>

## 6.2 The ‘verb – particle – object’ construction

### Particle exemplified and defined

We use the term **particle** for words like *down* in [24i], as opposed to *downstairs* in [ii]:

- [24] i a. *She brought down the bed.*                      b. *She brought the bed down.*  
 ii a. *\*She brought downstairs the bed.*                      b. *She brought the bed downstairs.*

*Down* is a one-word phrase functioning as complement of the verb, and the term ‘particle’ can be applied to the word or the phrase it constitutes. The distinctive property of particles is that they can be positioned between the verb and an NP object with the form of a proper noun or determiner + common noun. This is what distinguishes *down* from *downstairs* in [24]: both can follow the object, but only *down* can precede it. In general, object NPs of the above form follow the verb immediately, without intervening adjuncts or complements, and particles constitute the major exception to this ordering. It is necessary to refer to the internal structure of the object NP because there are no relevant restrictions on what can come between the verb and an NP that is heavy: *She brought downstairs the bed that she had recently inherited from her grandmother*. Since particles are here defined by reference to structure [ia], we will not invoke the category in intransitive clauses: there is no equivalent difference between *down* and *downstairs* in *She came down* and *She came downstairs*.

The most central particles are prepositions – intransitive prepositions, of course, since they are one-word phrases.<sup>46</sup> The class of particles also contains some adjectives and verbs, but these are restricted to a fairly small number of verbal idioms (*He made clear his intentions*; *They cut short their holiday*; *She let go his hand*), whereas prepositional particles are found readily in both idioms like *She brought down the price* and in non-idiomatic, or **free**, combinations like [24i]. A sample of these prepositional particles is

<sup>45</sup>The construction ‘verb – [preposition + NP] – PC (unmarked)’ is possible only where the predicand is subject, as in *He looks to me somewhat insecure*, with *somewhat insecure* applying to *he*, not *me*.

<sup>46</sup>The term particle is used in a variety of ways, but normally for a class of uninflected words. Our use of the term reflects the way it is most commonly applied in English.

given in [25]:<sup>47</sup>

[25]	<i>aboard</i> <sub>T</sub>	<i>about</i> <sub>T</sub>	<i>across</i> <sub>T</sub>	<i>ahead</i>	<i>along</i> <sub>T</sub>
	<i>apart</i>	<i>around</i> <sub>T</sub>	<i>aside</i>	<i>away</i>	<i>back</i>
	<i>by</i> <sub>T</sub>	<i>down</i> <sub>T</sub>	<i>forth</i>	<i>forward</i>	<i>home</i>
	<i>in</i> <sub>T</sub>	<i>off</i> <sub>T</sub>	<i>on</i> <sub>T</sub>	<i>out</i> <sup>%</sup> <sub>T</sub>	<i>over</i> <sub>T</sub>
	<i>round</i> <sub>T</sub>	<i>through</i> <sub>T</sub>	<i>together</i>	<i>under</i> <sub>T</sub>	<i>up</i> <sub>T</sub>

The annotation ‘<sub>T</sub>’ indicates that the preposition can also be transitive, i.e. can take an object NP, as in *She brought me down the mountain* (*out* is marked ‘<sup>%</sup><sub>T</sub>’ because the transitive use seen in *He jumped out the window* is normal in AmE, but not in BrE).

### Contrast between the constructions ‘V – particle – NP’ and ‘V – [preposition + NP]’

In view of the large overlap between the particle and transitive preposition categories, we will examine the difference between them in such constructions as:

[26]	V – PARTICLE – NP	V – [PREPOSITION + NP]
	a. <i>She took <u>off</u> the label.</i>	b. <i>She jumped [<u>off</u> the wall].</i>

In [a] *off* is a particle, an intransitive preposition functioning as complement of the verb, with *the label* a separate complement of the verb – more specifically, *the label* is object. In [b], by contrast, *off* is a transitive preposition with *the wall* as its object, so that *off the wall* is a PP forming a single complement of the verb. The constructions differ syntactically in the following ways:

#### (a) The ‘particle + NP’ order can usually be reversed, ‘preposition + NP’ cannot

[27]	i a. <i>She took off the label.</i>	b. <i>She jumped off the wall.</i>
	ii a. <i>She took the label off.</i>	b. <i>*She jumped the wall off.</i>

The distinctive property of particles is that they **can** precede the object, but in general they don’t have to, so that we have alternation between the two clause structures illustrated in [ia] and [iia]. In [ib], however, *off the wall* forms a single clause element, and the order within this phrase is fixed.

Important though it is, this test is not as straightforward as (b) below: there are a small number of alternations between transitive PPs and sequences of NP + intransitive preposition (illustrated in [33] below), and also cases where a particle cannot be shifted around the object (§6.3.1).

#### (b) Only a transitive preposition can be followed by an unstressed personal pronoun

The NP following a transitive preposition (its object) can have the form of an unstressed personal pronoun, but the NP following a particle can’t: objects of this kind must immediately follow the governing verb.

[28]	a. <i>*She took off it.</i>	b. <i>She jumped off it.</i>
------	-----------------------------	------------------------------

This provides the simplest test for determining which structure we have in a given instance: if the NP can be replaced by an unstressed personal pronoun, it must be the transitive prepositional construction.<sup>48</sup>

<sup>47</sup>The list could be expanded by adding various nautical terms such as *aft*, *aloft*, *ashore*, *astern*. There are others largely restricted to one or two verbs: *leave behind*.

<sup>48</sup>The qualification ‘unstressed’ allows for a particle to precede a pronoun bearing contrastive stress. In the context of removing people from a list, for example, with Jill mentioned as a possibility for removal, I might conceivably say: *I’m certainly not going to take off HER.*

(c) Transitive PPs can normally be fronted/foregrounded,  
particle + NP sequences cannot

In fairly formal style a transitive preposition can be fronted along with its complement in such constructions as relatives and open interrogatives, and similarly transitive preposition + NP can be the foregrounded element in the *it*-cleft construction; a particle + NP sequence, by contrast, does not form a constituent and cannot be fronted or foregrounded in this way:

- [29] i a. \**the label* [off which she took]      b. *the wall* [off which she jumped]  
 ii a. \**Off which label* did she take?      b. *Off which wall* did she jump?  
 iii a. \**It was off this label* that she took.      b. *It was off this wall* that she jumped.

This test provides a sufficient but not a necessary condition for the transitive PP construction: we noted in §6.1.1 that some prepositional verbs select transitive prepositions that are fixed in position (see [12] above).

(d) A transitive preposition can normally be repeated  
in coordination of phrases

- [30] a. \**Did she take off the red label* or      b. *Did she jump off the wall* or  
           *off the yellow one?*                              *off the balcony?*

Example [b] is well formed because the underlined sequences in *Did she jump off the wall?* and *Did she jump off the balcony?* are constituents. Conversely, [a] is deviant because in *Did she take off the red label?* and *Did she take off the yellow one?* the sequences *off* + NP are not constituents.

(e) A manner adverb can generally be inserted between  
verb and transitive preposition

- [31] a. \**She took carefully off the label.*      b. *She jumped fearlessly off the wall.*

In [b] the complement of the verb is a PP and complements of this kind can be separated from the verb by such adjuncts as manner adverbs (except with the fixed specified prepositions). In [a], however, *the label* is object of the verb and cannot be separated from the verb in this way: [a] is comparable to \**She removed carefully the label.*

### ■ Homonymous sequences

Given the large degree of overlap between particles and transitive prepositions, it is not surprising that the same item can often be found with the same verb, interpreted now as particle, now as transitive preposition:

- [32]      PARTICLE    TRANSITIVE PREPOSITION  
 i a. *He shouted down his opponent.*      b. *He shouted [down the phone].*  
 ii a. *They turned in the fugitives.*      b. *They turned [in the wrong direction].*  
 iii a. *She ran off another copy.*      b. *She ran [off the road].*  
 iv a. *He got over his message clearly.*      b. *He got [over his disappointment] quickly.*

These are easily differentiated by the criteria given above (the only complication being that the *get* + *over* in [ivb] is fossilised). The structural difference between the [a] and [b] members correlates with a very sharp difference in meaning, with all four of the particle

examples and the last of the transitive preposition ones involving a rather high degree of idiomatisation.

### ■ Alternation between transitive PPs and sequences of NP + intransitive preposition

The distinction between transitive prepositions and particles is slightly complicated by the existence of a few pairs like:

- |      |   |   |
|------|---|---|
| [33] | TRANSITIVE PP   | NP + INTRANSITIVE PREPOSITION                       |
|      | i a. <i>She read [<u>through</u> the prospectus].</i> | b. <i>She read [the prospectus] <u>through</u>.</i> |
|      | ii a. <i>She looked [<u>over</u> the letters].</i>    | b. <i>She looked [the letters] <u>over</u>.</i>     |

Initially these pairs look like [27ia/iiia] (*She took off the label* ~ *She took the label off*), but on closer examination we can see that they are not, that *through* and *over* are not particles here, but transitive prepositions in [a] and (non-particle) intransitive prepositions in [b]. This is evident from the fact that in [a] we can substitute unstressed personal pronouns: *She read through it*, *She looked over them*. We can also have an intervening adverb, as in *She read carefully through the prospectus*. There is a fair amount of fossilisation in the prepositional construction, so that <sup>?</sup>*the prospectus through which she was reading*, for example, is somewhat awkward and unlikely, but its status is nevertheless clearly different from the sharply ungrammatical <sup>\*</sup>*the label off which she took*. The alternation shown in [33] is restricted to certain combinations involving *through* and *over*. *Over* occurs readily as a particle elsewhere: *He knocked over the vase* / <sup>\*</sup>*it* ~ *He knocked the vase / it over*. *Through*, however, is a somewhat marginal member of the particle class: as an intransitive preposition it generally follows the object, but it is found as a particle in *She was determined to see through the project* (“see it through to completion”), which contrasts with the transitive preposition use in *She quickly saw through his little game* (“perceived the true nature of it”).

## 6.3 Verbal idioms containing intransitive prepositions

### 6.3.1 Lexicalisation and fossilisation

The intransitive prepositions that are found in verbal idioms are ones which in free combinations have locative meanings: *in*, *out*, *up*, *down*, etc. In free combinations it is usually possible to add further locative specification:

- |      |  |
|------|--|
| [34] | i <i>I jumped off (the wall). I fell in (the dam). I climbed down (the tree).</i>      |
|      | ii <i>I ran ahead (of him). I got out (of the box). I jumped down (from the wall).</i> |

In [i] the optional elements are NPs (so that *off*, *in*, and *down* will be transitive prepositions when the NPs are present). In [ii] they are PPs.

Such specification may be omitted because it is recoverable anaphorically, from previous mention: *She climbed onto the wall and immediately jumped off* (understood as “jumped off the wall”); *She walked with us most of the way, and then suddenly ran ahead* (understood as “ran ahead of us”). Often, however, it is simply implicit in the context. The examples in [35] will be understood in suitable contexts as if they included the parenthesised words:

- [35] i a. *I didn't put sugar in (your tea).*      b. *I'll take the tablecloth off (the table).*  
 ii a. *Don't go away (from me/here).*      b. *I must put the cat out (of the house).*  
 iii a. *Come back (to me / this place).*      b. *He put his coat on (himself / his body).*

There is considerable variation in the naturalness or likelihood of including such contextually derivable specification. In [35], for example, the filled out versions in the [b] cases are less likely than those in [a]. Including the parenthesised parts of the [b] examples, especially [iiib], would normally be regarded as involving an unnecessary specification of the obvious.

We find a great range of meanings with prepositional verbs, from those where there is still a transparently clear connection with the literal locative relation to others which are much more opaque. Consider, for example, the seven different senses of *take in* illustrated in [36], where [i] is clear from the sense of *take* and the contextual interpretation of *in*, while [vii] is idiomatic and completely unpredictable from the meanings of *take* and *in*.

- [36] i *We'd better take in the children's toys.*      [“move into the house”]  
 ii *They supplement their income by taking in students.*      [“renting to”]  
 iii *I've taken in your trousers, because they were too loose.*      [“tighten”]  
 iv *Grammar takes in syntax and morphology but not phonology.*      [“includes”]  
 v *I thought we might take in a show after dinner.*      [“see”]  
 vi *I was too tired to take in what she was saying.*      [“grasp”]  
 vii *I'm not surprised he was taken in: he's as gullible as a child.*      [“deceived”]

One type of extended meaning commonly found involves what we have called aspectuality (Ch. 3, §3.2), especially that of completion or perfectivity. This is illustrated in [37i], while the examples in [ii] have such other aspectual meanings as repetition and duration:

- [37] i *break up, catch up, come up (to someone), cut down, drink up/down, eat up, fill up, fizzle out, give up, lace up, round up, sell out, shrivel up, wear out, write up*  
 ii *beaver away, fire away, work away; carry on, go on, keep on, push on*

Verb + intransitive preposition idioms are an important feature of the English vocabulary; there are great numbers of them, and they are very frequent indeed, especially in informal speech. They tend to involve simple everyday verbs rather than more learned ones, and common verbs like *bring, come, give, go, have, let, make, put, take*, etc., are found in large numbers of such idioms, often with a considerable range of meanings, as illustrated above for *take in*.

Lexicalisation may be accompanied in varying degrees by what we are calling **fossilisation**, the loss of the ability to undergo the range of manipulation found with comparable free combinations. Three areas where such loss is found are:

(a) **Preposing** (*Down it went* ~ \**Down it broke*)

In free combinations, intransitive locative prepositions can generally appear in front position, with postposing of the subject if it is not a personal pronoun: *Up went the balloon; Down they glided; In came Kim; Away we ran*. A relatively small number of verbal idioms are found in this construction, as in [38i], where the concept of movement in a given direction, physical or metaphorical, remains fairly strong, but with the majority such preposing is excluded, as illustrated in [ii]:

Just as numerous ordinary verbs have dual transitivity, so there are verb + intransitive preposition idioms that occur with or without an object: *I gave up the attempt* or *I gave up*.

■ **Structure iii: verb – O<sup>i</sup> – prep – O<sup>d</sup>, as in *run [him] off [another copy]***

[47]	<i>bring up</i>	<i>get in</i>	<i>give back</i>	<i>order in</i>	<i>pack up</i>
	<i>pass down</i>	<i>pay back</i>	<i>send over</i>	<i>serve out</i>	<i>write out</i>

The meanings of such combinations are at the more transparent end of the spectrum, and indeed *bring up* and *pass down* can be regarded as free combinations. In all of them there is alternation with a prepositional construction with *to* or *for*: *I'll give you back your money* ~ *I'll give your money back to you*; *I'll get you in some food* ~ *I'll get some food in for you*. With two objects, there are in principle three positions for the intransitive PP:

[48]	i	<i>I still have to pay <u>back</u> [my father] [that loan].</i>	[PP – O <sup>i</sup> – O <sup>d</sup> ]
	ii	<i>I still have to pay [my father] <u>back</u> [that loan].</i>	[O <sup>i</sup> – PP – O <sup>d</sup> ]
	iii	<i>I still have to pay [my father] [that loan] <u>back</u>.</i>	[O <sup>i</sup> – O <sup>d</sup> – PP]

But [ii], with the PP between the two objects, is much the most usual; [i] is not possible if the indirect object is an unstressed personal pronoun (as it is very likely to be in this relatively complex structure), and [iii] requires that both objects be quite short.

■ **Structure iv: verb – prep – transitive PP, as in *look forward [to your visit]***

The idiom here contains verb + intransitive preposition + transitive preposition. As with prepositional verbs, we take the transitive preposition to belong syntactically with the following NP, so that *look* has two PP complements, one consisting of the intransitive preposition alone, the other of the transitive preposition together with its object. In this example, the second PP can be separated from the first by an adjunct (*I was looking forward eagerly to her return*) or by fronting in a relative clause (*It's not the sort of event to which you'd expect him to be looking forward so eagerly*). Others show varying degrees of fossilisation: those marked 'F' in the list below are unlikely to be found with fronting of the transitive preposition (compare *the difficulty which we had run up against*, where the preposition is stranded, with the barely possible fronted version <sup>?</sup>*the difficulty against which we had run up*). Again as with prepositional verbs, there is often a related passive whose subject corresponds to the object of the preposition: *Her return had been eagerly looked forward to*; '–P' indicates that such passives are of low acceptability.

[49]	<i>cash in on</i>	<i>come down on</i> <sub>F</sub>	<i>come up with</i> <sub>–P F</sub>	<i>cry out for</i> <sub>–P</sub>
	<i>cut down on</i> <sub>F</sub>	<i>face up to</i>	<i>fall back on</i> <sub>–P</sub>	<i>fit in with</i> <sub>–P</sub>
	<i>get along with</i> <sub>–P</sub>	<i>get by on</i> <sub>–P</sub>	<i>get on without</i> <sub>–P F</sub>	<i>go off with</i> <sub>–P</sub>
	<i>hold out for</i> <sub>–P</sub>	<i>keep up with</i> <sub>–P F</sub>	<i>lash out at</i>	<i>lead up to</i> <sub>F</sub>
	<i>look out for</i> <sub>F</sub>	<i>make up for</i> <sub>F</sub>	<i>own up to</i>	<i>put up with</i> <sub>F</sub>
	<i>run up against</i> <sub>F</sub>	<i>settle up with</i>	<i>stand up to</i>	<i>tie in with</i> <sub>–P</sub>

■ **Structure v: verb – O – prep – transitive PP, as in *let [her] in [on a little secret]***

This is the transitive counterpart of Structure iv. For the most part the object precedes the PPs: *She put [his bad temper] down [to stress]*, not *\*She put down [his bad temper]*

[to stress], but there are a few items which allow the object to follow the intransitive PP: *He played off [one] [against the other]*. Passive subjects always correspond to the object of the verb, never that of the preposition: *His bad temper was put down to stress*, not \**Stress was put his bad temper down to*. ‘F’ again indicates that the transitive preposition resists movement to front position or foregrounding: \**the shock for which he intended to let me in*.

[50]	<i>bring in on</i> <sub>F</sub>	<i>fob off on</i> (to)	<i>fob off with</i>	<i>give up to</i>
	<i>help on with</i> <sub>F</sub>	<i>let in for</i> <sub>F</sub>	<i>let in on</i> <sub>F</sub>	<i>play off against</i>
	<i>put down to</i> <sub>F</sub>	<i>put up to</i> <sub>F</sub>	<i>take out on</i>	<i>take up on</i> <sub>F</sub>

#### ■ Structure vi: verb – prep – (as) PC, as in *end up [(as) captain]*

There are relatively few idioms of this kind, and we therefore group together those where the final element is an ordinary PC (*It turned out [better than we had expected]*) and those where it is marked by *as* (*He came across/over [as rather indecisive]*).

[51]	<i>come across as</i>	<i>come over as</i>	<i>end up (as)</i>	<i>finish up (as)</i>
	<i>step down as</i>	<i>take over as</i>	<i>turn out</i>	<i>wind up (as)</i>

The annotation ‘(as)’ here indicates *as* may occur when the predicative is an NP, but not when it is an AdjP: *She ended up broken-hearted / captain / as captain*.

#### Structure vii: verb – O – prep – [as + PC], as in *show [him] up [as spineless]*

This is the transitive counterpart of Structure vi, with the object now the predicand of the predicative. Again, there are few idioms of this kind and with the somewhat marginal exception of *make out* (*They made it out worse than it was*) the predicative is oblique, complement to *as* or *for*:

[52]	<i>give up for</i>	<i>lay down as</i>	<i>pass off as</i>	<i>put down as</i>
	<i>rule out as</i>	<i>set up as</i>	<i>write off as</i>	

## 6.4 Verbal idioms containing NP + transitive preposition

We are concerned here with idioms like the underlined sequences in:

- [53] i *She lost patience [with the secretary].*  
 ii *They cast doubt [on his motives].*  
 iii *We lost sight [of our goal].*  
 iv *They made good use [of the extra time].*

The main point of syntactic interest in idioms of this form concerns the passive. The four idioms cited are all different in that [i] takes no passive, [ii] an ordinary passive, [iii] a prepositional passive, and [iv] a passive of either kind:

[54]	ORDINARY PASSIVE	PREPOSITIONAL PASSIVE
	i * <i>Patience was lost with the secretary.</i>	* <i>The secretary was lost patience with.</i>
	ii <i>Doubt was cast on his motives.</i>	* <i>His motives were cast doubt on.</i>
	iii * <i>Sight was lost of our goal.</i>	<i>Our goal was lost sight of.</i>
	iv <i>Good use was made of the extra time.</i>	<i>The extra time was made good use of.</i>

The following idioms are classified according to which of these four types they belong to:

[55]	NO PASSIVE	ORDINARY	PREPOSITIONAL	EITHER TYPE
	<i>cross swords with</i>	<i>cast doubt on</i>	<i>catch sight of<sup>F</sup></i>	<i>make a fuss of</i>
	<i>curry favour with</i>	<i>do justice to</i>	<i>give the lie to</i>	<i>make an example of</i>
	<i>find favour with</i>	<i>give credence to</i>	<i>give way to</i>	<i>make use of</i>
	<i>get the better of<sup>F</sup></i>	<i>keep tabs on</i>	<i>lay claim to</i>	<i>pay attention to</i>
	<i>give birth to</i>	<i>make an attempt on</i>	<i>lay hold of<sup>F</sup></i>	<i>pay tribute to</i>
	<i>give the lie to</i>	<i>make mention of</i>	<i>lose sight of</i>	<i>put a stop to</i>
	<i>lose patience with</i>	<i>raise an objection to</i>	<i>lose touch with<sup>F</sup></i>	<i>see much/little of</i>
	<i>make friends with</i>	<i>shed tears over<sup>F</sup></i>	<i>make fun of<sup>F</sup></i>	<i>take advantage of</i>
			<i>make love to</i>	<i>take exception to</i>
			<i>pay court to</i>	<i>take note of</i>
			<i>set eyes on</i>	

As before, ‘F’ indicates that the idiom is fossilised to the extent that the preposition resists fronting or foregrounding: *those with whom he had crossed swords*, but hardly <sup>?</sup>*those of whom he had got the better*. The prepositional passive here is exceptional, for elsewhere it is found only when the preposition immediately follows the verb: compare *Her article was referred to*, but not <sup>\*</sup>*Her article was referred the students to* (matching active *They referred the students to her article*).

On a separate dimension we find differences in the extent to which it is possible to add dependents to the post-verbal noun. Some virtually exclude all additions: *cross swords with*, *give birth to*, *catch sight of*, *set eyes on*, *put a stop to*. Others allow limited adjectival modification: *cast serious doubt on*, *keep close tabs on*, *make passionate love to*, *take careful note of*. Others again allow determiners and post-head dependents: *lose all patience with*, *pay more attention than ever to*. Note that while the prepositional passive disfavors modification of the noun, it certainly does not exclude it:

- [56] *The report highlighted the poor underground conditions and warned they had to be taken particular note of during the tunnel’s design phase.*

## 6.5 Other types of verbal idiom

### ■ Verb + adjective

Idioms including adjectives are illustrated in:

- [57] i *break even*, *come true*, *hold good/true*, *lie low*, *stand tall*, *work loose*  
 ii *He cut short the debate.* ~ *He cut the debate short.*  
 iii *She didn’t see/think fit to respond.*    *I’ll make sure it’s ready.*

The items in [i] belong in the complex-intransitive construction: *We broke even* has the structure S–P–PC<sup>s</sup>. There are also, as noted in §5.4, numerous combinations like *blush scarlet*, *lie flat* which are not strictly idioms in that the meanings are derivable from the parts, but which allow very little choice in the adjective position. *Short* in [ii] is a particle; a few other adjectival particles are found in non-idiomatic *cut open*, *make clear*, *put right/straight*. The items in [iii] are syntactically exceptional, for normally extrapositional *it* would be required (cf. *She didn’t think it necessary to respond*; *I’ll make*

*it obvious that I'm dissatisfied*); with *make clear*, the *it* is optional: *He made (it) clear that he meant business*.

### ■ Verb + verb

- [58] i *give NP to understand*; *let NP be*, *make NP do*; *knock/send NP flying*  
 ii *make do with*; *have done with*, *put paid to*

The idioms in [i] fit into what we call the complex catenative construction (Ch. 14, §3): the verb has two complements, an object and a non-finite clause. The idioms in [ii] cannot be matched with free combinations of words of the same kind, and it is best to treat the two verbs as forming a verb complex functioning as a single predicator. Similarly with *He let slip that he hadn't read it*; *I let go of the rope*. Some speakers have the alternations *He let slip the opportunity* ~ *He let the opportunity slip* and *He let go the rope* ~ *He let the rope go*; here *slip* and *go* are particles.

### ■ Verb + noun, verb + PP

Innumerable idioms contain nouns (or NPs) or PPs: *He bought a pup*; *I'll put it on the back burner*; and so on. Some of these license complements that the verb on its own can't take, such as the subordinate clauses in: *I've half a mind to accept your offer*; *He had in mind to change his will*; *It brought to light how devious he had been*.<sup>50</sup>

## 7 Light verbs

### 7.1 General issues

**Light** verbs – or, more properly, light uses of verbs – are illustrated in the right-hand column of:

- |     |                                    |  |
|-----|------------------------------------|--|
| [1] | ASSOCIATED VERB ALTERNANT          | LIGHT VERB ALTERNANT                                 |
| i   | a. <i>She kissed him</i> .         | b. <i>She <u>gave</u> him a kiss</i> .               |
| ii  | a. <i>I calculated the costs</i> . | b. <i>I <u>made</u> a calculation of the costs</i> . |
| iii | a. <i>He looked at my draft</i> .  | b. <i>He <u>had</u> a look at my draft</i> .         |
| iv  | a. <i>We rested</i> .              | b. <i>We <u>took</u> a rest</i> .                    |
| v   | a. <i>She danced</i> .             | b. <i>She <u>did</u> a dance</i> .                   |

As used here, the underlined verbs are semantically 'light' in the sense that their contribution to the meaning of the predication is relatively small in comparison with that of their complements. This is evident from the fact that the [b] examples have syntactically simpler alternants, [a], which do not contain the light verbs. The main semantic content is located not in the light verb, but in the noun functioning as head of the direct object. In the central cases, this noun is related to a verb: the lexical bases are often identical, as with *kiss*, *look*, and *rest*, or the noun may be derived from the verb by affixation, as with *calculation*. Generally, the verb is morphologically more basic than the noun, but it is not invariably so: in the pair *I showered* and *I had a shower*, for example, it would be implausible to take *shower* as primarily a verb. For this reason we refer to the verbs in

<sup>50</sup>There are also a large number of idioms containing non-referential *it* as object of a verb or preposition, as in *They don't hit it off* or *We'll have to make the best of it*: see Ch. 17, §2.5.

the [a] examples as the **associated verb**, a term which leaves open the issue of whether the verb or noun is more basic.

The light use of the above verbs contrasts with their ordinary use, where they have their full semantic content, as in *She gave him an orange*; *I made a paper-hat*; *He had a Rolls-Royce*; *We took all we could find*. In some cases there is ambiguity between the two uses. An obvious example is *I had a bath*: the light verb interpretation is “I bathed (in a bath)”, while the ordinary verb interpretation is “I owned a bath”. Less obvious is *I had a shave*: the light interpretation is “I shaved (myself)”, the ordinary one “I had someone shave me”. Or again, for *He gave me a lick* the light interpretation is “He (a dog, perhaps) licked me”, the ordinary one: “He allowed me to have a lick (of his ice-cream, perhaps)”. Some of the verb + NP + preposition sequences covered in §6.4 involve light verbs: *make mention of* (compare *She made mention of an earlier draft* ~ *She mentioned an earlier draft*), *raise an objection to*, *make use of*, *pay attention to*, *take note of*. But the combination of light verb and noun is fairly productive, and by no means all such combinations can be regarded as lexical units.

### ■ Syntactic and semantic differences between the constructions

The use of a light verb and noun tends to yield a significant increase in syntactic versatility over that of the associated verb construction. Most importantly, it generally allows for dependents to be added to the noun, allowing a considerably greater range of elaboration by modifiers and determiners. Consider, for example:

- [2] i *She gave him an unusually passionate kiss.*  
 ii *We took a well-earned rest. She had an enduring influence on him.*

Example [i] is less awkward than *She kissed him unusually passionately*, while *well-earned* and *enduring* in [ii] have no close adverbial counterparts that could be used with the associated verbs. A special case of such dependents involves quantification:

- [3] i *I've already had two showers today.*  
 ii *She made three very astute comments on his suggestion.*  
 iii *He gave a scream.*

Here [i] is equivalent to *I've already showered twice today*, but [ii] is not equivalent to *She commented three times very astutely on his suggestion*: the latter quantifies the event (three acts of commenting), whereas [3ii] quantifies the product of the event – light *make* here is like the ordinary *make* of *She made a model car* in that the object has a factitive role, with the comments, like the car, being produced by the action.<sup>51</sup> The most usual determiner with light verbs is the indefinite article, and this too introduces quantification, which may make the meaning somewhat different from that of the associated verb construction. Thus [3iii], for example, is not fully equivalent to *He screamed*, for it involves a necessarily quite short and continuous event, while *He screamed* is not so restricted, covering also cases where the screaming is prolonged and intermittent. Similarly, [1ib] specifies a single kiss whereas [1a] does not, and hence could apply to a situation where she covered him with kisses.

<sup>51</sup>Note that the light verb could appear in a relative clause modifying the noun: *The comments which she made on his plan infuriated him.*

There is, however, a little more to it than this. In the first place, properties of the light verb in its ordinary use may affect the complementation. In particular, *give*, *make*, and *do* are ditransitive verbs, and under certain conditions take an indirect object in their light use too, whereas nouns of course do not take any objects as complement: *He gave me a description of the thief*; *He made the staff a new offer*; *He did us a report on the accident*.

Secondly we sometimes find PPs which could not occur with the noun independently of the light verb:

- [8] i a. \**His blame for it on Kim is unfair.*      b. *He put/laid the blame for it on Kim.*  
 ii    *He blamed it on Kim.*  
 iii a. \**I enjoy a good read of his books.*      b. *I had a read of his book.*  
 iv    *I read his book.*

In [ib] *on Kim* can only be a complement of *put/lay*, not of *blame*, and the preposition *on* reflects that of the associated verb, as seen in [ii]. With *read*, the *of* in [iiib] is the default preposition found when its complement corresponds to the direct object of an associated verb, matching that in [7v] above, but elsewhere the noun *read* does not normally take a complement corresponding to the object of the verb, as we see from [8iiia].

## 7.2 Survey of the main light verbs

### ■ Give

Some examples of light *give* are:

- [9] i a. *She sighed.*      b. *She gave a sigh.*  
 ii a. *She kissed him.*      b. *She gave him a kiss.*  
 iii a. *She advised him.*      b. *She gave him advice.*  
 iv a. *She described him (to me).*      b. *She gave (me) a description of him.*

#### *She gave a sigh*

In [9ib] light *give* has just one complement other than the subject, and it is normally impossible to add a second as indirect object: \**She gave me a sigh*. The complementation here is therefore quite different from that of ordinary *give*, and reflects the properties of the associated verb *sigh*, and the noun derived from it, which do not license an additional complement. In [10] we give a sample of items that behave in essentially the same way; they denote bodily actions, and many – like *sigh* – involve the ingress or egress of air:<sup>52</sup>

- [10] *cough*      *fart*      *gasp*      *grunt*      *hiss*      *laugh*  
          *lurch*      *moan*      *scowl*      *shrug*      *shudder*      *squeak*

#### *She gave him a kiss*

In [9iib] the direct object of the associated verb appears as indirect object of *give*. The latter still differs from ordinary *give*, however, in that there is no alternation with a *to* phrase: \**She gave a kiss to him*. Some further items like *kiss* are:

- [11] *bath*      *clout*      *cuddle*      *hit*      *hug*      *kick*  
          *punch*      *push*      *shower*      *squeeze*      *wash*      *wipe*

<sup>52</sup> *Scowl* differs from the others in that the associated verb optionally takes *at* + NP, and this NP appears as indirect object of the light verb: *He gave me a scowl*.

This is a homogeneous set: semantically, they involve physical action in which the direct object of the associated verb has a patient role; syntactically, the nouns do not normally take PP complements (\**Her kiss of him was passionate*).

#### *She gave him advice*

Example [9iib] also has an indirect object corresponding to the direct object of [a], but this time there is alternation with a *to* phrase: *She gave advice to him*. A few items following this pattern are given in [12]:

[12] *answer consideration encouragement help reply*

Except for the first and last these are non-count nouns (like *advice*). Some take PP complements in other constructions: *consideration* and *encouragement* indeed allow *of* (*Further consideration of the matter is clearly called for*), but *of* is not possible here with light *give*.

#### *She gave (me) a description of him*

Finally, in [9ivb] the direct object of the associated verb appears as complement to *of*, not as indirect object – because that function is reserved for the NP which in the associated verb construction appears in the optional *to* phrase, *She described him (to me)*. We also have the prepositional alternant *She gave a description of him to me*. Other nouns following this pattern include:

[13] *definition demonstration explanation illustration imitation*  
*impersonation indication performance portrayal presentation*

### ■ *Make*

Ordinary *make* takes a subject, direct object, and optionally either an indirect object or a *for* phrase. Light *make* is seen in:

[14] i a. *He leapt from the balcony.*      b. *He made a leap from the balcony.*  
 ii a. *He inspected the wreckage.*      b. *He made an inspection of the wreckage.*  
 iii a. *He offered us \$100.*      b. *He made us an offer of \$100.*  
 iv a. \**He donated them \$100.*      b. *He made them a donation of \$100.*

#### *He made a leap from the balcony*

Example [14i] illustrates the case where the complementation matches that of the noun and of the associated verb. There are many examples of this kind; in the following sample the parentheses show the kind of complements found, with ‘inf’ indicating a *to*-infinitival clause, as in *He made a promise to donate \$100*, and ‘that’ a declarative content clause, as in *He made a recommendation that the offer be rejected*:

[15] *appeal (to) attempt (inf) boast (that) call (on)*  
*comment (about/on) dash (for) decision (that/inf) discovery (that)*  
*escape (from) fuss (about) grab (at) guess (at)*  
*improvement (on) inquiry (about/into) objection (to) observation (that)*  
*reference (to) remark (about) retreat (from . . . to) start (on)*

*He made an inspection of the wreckage*

In [14iib] the NP corresponding to the direct object of the associated verb is governed by a preposition, the one that the noun takes when it appears without *make*.<sup>53</sup> With the following nouns the preposition is *of* unless otherwise indicated:

[16]	<i>analysis</i>	<i>attack (on)</i>	<i>calculation</i>	<i>choice</i>	<i>contribution</i>
	<i>copy</i>	<i>disclosure</i>	<i>investment</i>	<i>note</i>	<i>payment</i>
	<i>reduction (in)</i>	<i>request (for)</i>	<i>search</i>	<i>study</i>	<i>survey</i>

*He made us an offer of \$100*

Example [14iib] has an indirect object – but its semantic role is that of recipient, like that of the indirect object of the verb *offer* in [14iia], not beneficiary, the role found with ordinary *make* (as in *He made me a cake*). This construction is then generalised to certain cases where the associated verb does not take an indirect object, as in [14iv], where *donate* takes a *to* phrase (*He donated \$100 to them*). Example [14ivb] is perhaps slightly marginal in acceptability (*He made a donation to them of \$100* is more likely), but it is much more acceptable than [14iva]. Similar items are marked with ‘?’ in the following list:

[17]	? <i>confession</i>	? <i>consignment</i>	<i>gift</i>	<i>payment</i>
	<i>proposal (that/inf)</i>	? <i>protest (about)</i>	? <i>suggestion (that)</i>	

■ *Have and take*

We consider these two verbs together as there is a considerable overlap in the nouns they take. Sample sets of nouns are as follows:

[18]	HAVE OR TAKE				
	<i>bath</i>	<i>break</i> <sup>54</sup>	<i>drink</i>	<i>guess</i>	<i>lick (of)</i>
	<i>look (at)</i>	<i>pity (on)</i>	<i>rest</i>	<i>shave</i>	<i>shower</i>
	<i>sip</i>	<i>sleep</i>	<i>swim</i>	<i>walk</i>	<i>wash</i>
[19]	HAVE ONLY				
	<i>chat (with)</i>	<i>cry</i>	<i>dream (about)</i>	<i>fight (with)</i>	<i>grumble</i>
	<i>influence (on)</i>	<i>kiss</i>	<i>laugh</i>	<i>look (for)</i>	<i>meeting (with)</i>
	<i>need (inf/for)</i>	<i>quarrel (with)</i>	<i>talk (with)</i>	<i>think (about)</i>	<i>try (at)</i>
[20]	TAKE ONLY				
	<i>decision (inf)</i>	<i>dive</i>	<i>leap</i>	<i>photograph (of)</i>	<i>step</i>

Light *take* is dynamic and normally agentive, whereas *have* has a somewhat wider range of use: compare, for example, *He took a decision to assert himself* (dynamic) and *He has a need to assert himself* (stative). Where both verbs are possible, there is a tendency for *take* to be favoured in AmE, *have* in BrE and AusE.

A number of the nouns combining with *have* are also found with (ordinary) *give* with a causative sense, ‘cause to have, let have’: *He gave me a shave / a read of his newspaper*.

<sup>53</sup>The expression *make an impression on* is exceptional in that the *on* (and indeed the noun *impression* with this sense) is restricted to the *make* construction: *He made a favourable impression on them*, but not \**His impression (on them) was favourable*.

<sup>54</sup>Here the associated verb requires complementation: *Let’s have/take a break*, but *Let’s break (off) for lunch*.

Some of them hardly appear elsewhere (as nouns) and are found in very informal style, especially in AusE: *Can I have a borrow/lend of your pen / a carry of the baby?* or *He gave me a borrow/lend of his pen / a carry of the baby*, but not *\*I was grateful for the borrow/lend of his pen*, etc.<sup>55</sup>

### ■ Do

Light *do* is seen in *She did a somersault / an imitation of her teacher*. Some other nouns:

[21]	<i>cleaning</i> <sub>N</sub>	<i>dance</i>	<i>dive</i>	<i>drawing</i>	<i>knitting</i> <sub>N</sub>
	<i>report</i> (on)	<i>sewing</i> <sub>N</sub>	<i>sketch</i> (of)	<i>sprint</i>	<i>tango</i>
	<i>thinking</i> <sub>N</sub>	<i>translation</i> (of)	<i>turn</i>	<i>work</i> <sub>N</sub>	<i>writing</i> <sub>N</sub>

Those marked 'N' are non-count nouns, and often occur with *some*: *She did some work*.

### ■ Other light verbs

There are various other verbs appearing with a much narrower range of nouns: *offer an apology / a suggestion*; *pay attention (to) / a call (on) / a visit (to)*; *put the blame on / an end/stop to*; *raise an objection (to)*.

## 8 Verbs with multiple patterns of complementation

Most verbs allow more than one complementation, i.e. they occur in two or more constructions differing in respect of the complements. For example, *make* occurs with just a direct object in *They made some cakes*, with indirect and direct object in *They made me a filing-cabinet*, with object + predicative in *They made me impatient*, and so on. This section examines a selection of such cases of multiple complementation where the verb meaning remains constant or exhibits a systematic change, and where the same contrast applies to a number of verbs. We exclude from consideration at this point alternations between canonical clause constructions and various non-canonical ones such as the passive and the existential, as these are dealt with in Ch. 16; we also continue to exclude cases involving complements with the form of finite or non-finite clauses.

The majority of these patterns of contrasting complementation will be dealt with under three headings: transitive vs intransitive (§8.1), ditransitive vs monotransitive (§8.2), and further core vs non-core contrasts (§8.3). Each covers four main types, as illustrated summarily below.

### Transitive/intransitive contrasts

[1]	$S_{\text{intr}} = S_{\text{trans}}$	$S_{\text{intr}} = O_{\text{trans}}$	
	I <i>They shot <u>him</u>.</i>	II <i>The sun radiates <u>heat</u>.</i>	} [O vs PP comp]
	<i>They shot <u>at him</u>.</i>	<i>Heat radiates <u>from the sun</u>.</i>	
	III <i>She drank <u>some water</u>.</i>	IV <i>He broke <u>the vase</u>.</i>	} [+O vs -O]
	<i>She drank.</i>	<i>The vase broke.</i>	

The four transitive/intransitive pairs here differ on two cross-cutting dimensions. In I–II the contrast is between an object (*him*, *heat*) and a non-core complement with the

<sup>55</sup> *Think* appears only with *have*: *I had a think about it*, but not *\*He gave me a think about it* or *\*That was a good think* (cf. *That's good thinking*; *That's an interesting thought*).

form of a PP, while in III–IV it is simply between the presence and the absence of an object (*some water, the vase*). On another dimension, I and III have it in common that the subject is unaffected, i.e. the intransitive subject (*they, she*) is the same, and has the same semantic role, as the transitive subject:  $S_{\text{intr}} = S_{\text{trans}}$ . In II and IV, however, the intransitive subject (*heat, the vase*) corresponds to the object of the transitive:  $S_{\text{intr}} = O_{\text{trans}}$ .

### ■ Ditransitive/monotransitive contrasts

[2]	$O_{\text{mono}}^{\text{d}} = O_{\text{ditrans}}^{\text{d}}$	$O_{\text{mono}}^{\text{d}} = O_{\text{ditrans}}^{\text{i}}$	
	I <i>I gave <u>her</u> <u>the key</u>.</i>	II <i>I envied <u>him</u> <u>his freedom</u>.</i>	} [O vs PP comp]
	<i>I gave <u>the key</u> <u>to her</u>.</i>	<i>I envied <u>him</u> <u>for his freedom</u>.</i>	
	III <i>They offered <u>us</u> <u>\$100</u>.</i>	IV <i>They fined <u>us</u> <u>\$100</u>.</i>	} [+O <sup>i</sup> vs -O <sup>i</sup> ]
	<i>They offered <u>\$100</u>.</i>	<i>They fined <u>us</u>.</i>	

The four types here differ on two cross-cutting dimensions that are similar to those in [1]. In I–II the contrast is between a ditransitive construction containing two internal core complements,  $O^i + O^{\text{d}}$ , and a monotransitive one containing  $O^{\text{d}}$  + a non-core complement with the form of a PP, while in III–IV it is between a ditransitive construction and a monotransitive containing just one internal complement ( $O^{\text{d}}$ ). And in I and III the single object,  $O^{\text{d}}$ , of the monotransitive construction (*the key, \$100*) corresponds to the direct object of the ditransitive, whereas in II and IV the single object of the monotransitive (*him, us*) corresponds to the indirect object of the ditransitive. Only a small number of verbs are found in constructions II and IV.

### ■ Further core/non-core contrasts

[3]	OBJECT VS NON-CORE COMP	SUBJECT VS NON-CORE COMP	
	I <i>He supplies <u>arms</u> <u>to the rebels</u>.</i>	II <i><u>Bees</u> are swarming <u>in the garden</u>.</i>	} [constant valency]
	<i>He supplies <u>the rebels</u> <u>with arms</u>.</i>	<i><u>The garden</u> is swarming <u>with bees</u>.</i>	
	III <i>I wiped <u>the marks</u> <u>off the wall</u>.</i>	IV <i><u>We</u> covered <u>the grave</u> <u>with leaves</u>.</i>	} [different valency]
	<i>I wiped <u>the wall</u>.</i>	<i><u>Leaves</u> covered <u>the grave</u>.</i>	

Again the pairs of clauses fit into a two-dimensional pattern. In I–II the matched clauses have the same valency, the same number of complements, but differ in the way they are aligned with the semantic roles, whereas in III–IV one member has one more complement (non-core) than the other. On the other dimension, I and III are alike in that the core complement whose content and semantic role varies is object (*arms vs the rebels, the marks vs the wall*), whereas in II and IV it is subject (*bees vs the garden, we vs leaves*).

### ■ Separate complements vs combined complement

In addition to the major kind of contrast seen in [1–3] we need to recognise the following relatively minor type:

[4]	i <i>She kissed <u>him</u> <u>on the cheek</u>.</i>	[separate complements]
	ii <i>She kissed <u>his cheek</u>.</i>	[combined complement]

## (b) Directional movement

- [8] i a. *She climbed the tree.*                      b. *She climbed up the tree.*  
 ii a. *We swam the river.*                              b. *We swam across the river.*  
 iii a. *They fled the building.*                        b. *They fled from the building.*

There is generally less objective difference between transitive and prepositional constructions here. In some cases the transitive conveys a completeness lacking in the prepositional version: [ia], for example, entails that she reached the top of the tree, whereas [ib] does not. Similarly, *They roamed the woods* suggests a fuller coverage of the area than *They roamed in the woods*. The transitive may also suggest a somewhat more significant achievement: if, for example, I use a small stepladder to reach something from a high shelf, I'm more likely to use the prepositional construction *I climbed up the stepladder* than transitive *I climbed the stepladder*. Again, compare *She jumped over the fence/pebble*: with *fence* the transitive version (*She jumped the fence*) is equally natural, but with *pebble* it is not.

In general, the prepositional construction allows a range of prepositions in addition to those where the meaning is close to that of the transitive construction: *She climbed down the tree*; *We swam along the river*; *They fled towards the building*.

## (c) Consultation and contest

- [9] i a. *Kim met the Dean.*                              b. *Kim met with the Dean.*  
 ii a. *Kim will be playing Pat.*                        b. *Kim will be playing against Pat.*

This pattern is found with a fairly small number of verbs including:

- [10] *battle*                      *box*                      *consult*                      *fight*                      *visit*

Version [9ia] applies to a wider range of situations than [ib]: the latter suggests a meeting arranged for purposes of consultation, whereas the former could also be used of a chance and inconsequential meeting on a bus. In general, such clauses are semantically symmetrical: [ia/ib] entail that the Dean met (with) Pat, and [iia/iib] that Pat will be playing (against) Kim. But there are also some metaphorical uses where the NPs could not be felicitously reversed: *He was battling (with/against) cancer*.

## (d) Emission

- [11] i a. *He was dripping blood.*                      b. *He was dripping with blood.*  
 ii a. *Her voice oozed charm.*                              b. *Her voice oozed with charm.*

The verbs here denote the emission of a physical substance or, by figurative extension, of an abstract quality. They are a relatively small subset of those found in the Type II contrast dealt with in §8.1.2 below. The transitive construction, unlike the intransitive, allows the addition of a goal, at least with physical emission: *He was dripping blood all over the carpet*.

## (e) Others

- [12] i a. *They were speaking French.*                      b. *They were speaking in French.*  
 ii a. *He always talks politics.*                              b. *He always talks about politics.*  
 iii a. *We're flying Qantas.*                                      b. *We're flying by/with Qantas.*

- |  |                                 |
|--|---------------------------------|
| g. <i>She doesn't drink.</i> (“alcohol”)               | [specific category indefinites] |
| h. <i>He read for a while.</i> (“some reading matter”) | [normal category indefinites]   |
| ii a. <i>They were talking nonsense.</i>               | [extension of intransitive]     |
| b. <i>He died a long and agonising death.</i>          | [extension by cognate object]   |
| c. <i>She smiled her assent.</i>                       | [object of conveyed reaction]   |

The first case is different in kind from the others in that it is a matter of a particular register (a variety of language associated with a limited range of social situations or functions – such as the register of newspaper editorials, sermons, parliamentary debates, etc.). The others all involve lexical properties of particular verbs, and for these we list a sample of verbs that are found in the pattern concerned and, for contrastive purposes, a few that aren't (marked with an asterisk).

(a) **Omission of object in instructional register: *Apply liberally***

Intransitives of this kind are characteristic of the register of giving instructions, as in directions for use, recipes, etc. The understood object is identifiable from the context. Very often a written instruction physically accompanies the item in question: [15ia], for example, is taken from the label on a bottle of sunscreen lotion. Alternatively, there may be prior mention of the item: *Trace design on to tracing paper, then transfer \_\_\_ on to table mat with dressmakers' carbon paper* (“transfer the design”).<sup>56</sup> Such intransitives usually occur in imperative clauses, but are also found in non-finite subordinate clauses: *Cook for 15–20 minutes, turning \_\_\_ once during cooking; To open \_\_\_, pull lever.* As noted above, occurrence in these intransitives need not be specified lexically for individual verbs: it is, rather, a property of this particular register.

(b) **Unexpressed definite object: *They won***

The unexpressed object is here recoverable from the context and has a definite interpretation, as in (a); the difference is that this time the omission of the object is not restricted to a given register, but is instead restricted to particular verbs. Intransitive *win* is interpreted as “win a contest”, and which contest it was can be determined from the context. In *They played the club champions and won*, for example, it is identifiable as the match they played against the club champions, but equally *They won* could be used in a situation where a match has just been played and it could then be interpreted as implicitly referring to this match even if there had been no overt reference to the match. But the verb *enjoy* cannot similarly be used intransitively, with the object of enjoyment identified in these ways. Thus we cannot have *\*They played the club champions and enjoyed* (“enjoyed the match”), and if I meet you as you come out of the movies I cannot say *\*Did you enjoy?* (“enjoy the movie”). Further verbs and examples:

- |              |                |                  |                  |                  |                       |
|--------------|----------------|------------------|------------------|------------------|-----------------------|
| [16] i       | <i>answer</i>  | <i>ask</i>       | <i>attend</i>    | <i>drive</i>     | <i>fail</i> (test)    |
|              | <i>fit</i>     | <i>follow</i>    | <i>interrupt</i> | <i>lead</i>      | <i>lose</i> (contest) |
|              | <i>obey</i>    | <i>prosecute</i> | <i>pull</i>      | <i>telephone</i> | <i>watch</i>          |
| ii Excluded: | <i>*punish</i> | <i>*teach</i>    | <i>*write</i>    |                  |                       |

<sup>56</sup>As can be seen from this example the instructional register often uses other reduction strategies besides the omission of the object – notably the omission of determiners. Indeed we also find omission of the subject: *Must be diluted before use.* The phenomenon here bears some similarity to the omission of subject + *be* in notices, e.g. *Not for drinking* placed beside a tap.

- [17] i *I asked her where it was but she didn't answer. There's a meeting tonight but I can't attend. They've charged him but I don't who's going to prosecute.*  
 ii \**He wants to learn but I shan't teach.*

In [17i] we understand “answer me / my question”, “attend the meeting”, “prosecute him”; [ii] is ungrammatical in the interpretation “teach him”. Some verbs appear in such intransitives only under restricted conditions. For example, I might throw you a ball and say *Catch!* but we don't have prior mention cases like \**I threw him the ball but he failed to catch*. Similarly, *Shall I dry?* (“the dishes”) is quite acceptable in, say, a context of washing-up, but we would not say \**The dishes were still wet so I dried* (“them”).

(c) Unexpressed reflexive object: *I must shave*

- |        |                             |                 |                        |                |              |
|--------|-----------------------------|-----------------|------------------------|----------------|--------------|
| [18] i | <i>bathe</i>                | <i>shave</i>    | <i>shower</i>          | <i>wash</i>    |              |
| ii     | <i>disrobe</i>              | <i>dress</i>    | ? <i>strip</i>         | <i>undress</i> |              |
| iii    | <i>cram</i>                 | <i>launch</i>   | <i>load</i>            | <i>pack</i>    | [+ goal]     |
| iv     | <i>jerk</i>                 | <i>pull</i>     | <i>yank</i>            |                | [+ free]     |
| v      | <i>behave</i> <sup>57</sup> | <i>hide</i>     | <i>identify (with)</i> | <i>prepare</i> | <i>worry</i> |
| vi     | Excluded:                   | * <i>clothe</i> | * <i>perjure</i>       |                |              |
- [19] i a. *We crammed (ourselves) into the back seat.*      b. *He pulled (himself) free.*  
 ii a. *They clothed themselves in black.*                      b. \**They clothed in black.*

The salient interpretation of *I must shave* is “I must shave myself”. The verbs in [18iii] take a complement with the role of goal (like *into the back seat*) and those in [18iv] take *free* as resultative predicative complement. The intransitive versions are in most cases much more frequent than the overt reflexives; although one can shave or wash others, and so on, the default object is reflexive and there is a strong tendency to leave it unexpressed. This makes it difficult to identify the verbs concerned very precisely. Thus we can have *I must go and wash/bathe/shower*, but a reflexive object is unlikely with *bathe* or *shower* (a possible context might be one where a nurse asks: *Are you able to shower yourself?*); similarly in [ii] an overt reflexive is somewhat marginal with *strip*. We do not include here cases where the presence or absence of a reflexive affects the agentivity of the clause, as in *He got himself arrested* vs *He got arrested*, or *She proved herself reliable* (“showed herself to be”) vs *She proved reliable* (“turned out to be”).

(d) Unexpressed reciprocal object: *We had met before*

- |        |                |                |                |                   |              |
|--------|----------------|----------------|----------------|-------------------|--------------|
| [20] i | <i>court</i>   | <i>divorce</i> | <i>embrace</i> | <i>kiss</i>       | <i>marry</i> |
| ii     | <i>cross</i>   | <i>hit</i>     | <i>miss</i>    | <i>touch</i>      |              |
| iii    | <i>consult</i> | <i>fight</i>   | <i>meet</i>    |                   |              |
| iv     | Excluded:      | * <i>help</i>  | * <i>love</i>  | * <i>resemble</i> |              |
- [21] i a. *They kissed (each other) passionately.*      b. *The lines cross (each other) here.*  
 ii b. *They resemble each other closely.*                      b. \**They resemble closely.*

<sup>57</sup> With *behave* the overt reflexive is normally restricted to cases of good behaviour: it could be inserted into *They behaved well*, but not *They behaved appallingly*; “well” or the like is understood in examples like *Behave!*, where no manner adjunct is expressed.

Intransitive *drink* is ambiguous according as the unexpressed object is understood specifically as alcoholic drink or more generally, as in case (h) below. *Expect* has a special sense (found only in the progressive) where *baby* can be either present or left understood: “She’s pregnant again”. *Eat* in [27] is likely to be interpreted with some contextually determined meal as implicit argument, though in cases like *He was eating* the interpretation is more general. There are innumerable things one can wash but *I was washing* (ignoring the reflexive interpretation) will generally be interpreted as involving clothes/sheets/towels, items covered by the noun *washing* (as in *I must hang out the washing*). Likewise with *bake*, where the intransitive use applies to cakes, pies, and the like, as opposed, say, to various other kinds of food that can be baked, such as potatoes or apples.

(h) Normal category indefinites: *He read for a while*

- |              |                |             |                |              |              |              |
|--------------|----------------|-------------|----------------|--------------|--------------|--------------|
| [28] i       | <i>cook</i>    | <i>darn</i> | <i>draw</i>    | <i>drink</i> | <i>drive</i> | <i>dust</i>  |
|              | <i>eat</i>     | <i>fly</i>  | <i>hunt</i>    | <i>iron</i>  | <i>knit</i>  | <i>marry</i> |
|              | <i>paint</i>   | <i>read</i> | <i>sew</i>     | <i>study</i> | <i>teach</i> | <i>type</i>  |
| ii Excluded: | <i>*devour</i> | <i>*fix</i> | <i>*peruse</i> |              |              |              |
- [29] *They were eating/drinking/\*devouring.*      *I want to read/\*peruse.*

The unexpressed object here is interpreted as an indefinite member of the typical, unexceptional category for the verb in question – reading matter for *read*, food for *eat*, and so on. Thus *He read for a while* wouldn’t normally be used of a situation where he was reading short-answer examination questions: this is not the usual kind of reading. Nor would I say *I had been eating* if it had been grass, say: that is too exceptional to be subsumed under the ordinary activity of eating. Similarly, *She spent the afternoon writing* suggests some kind of composition: one would hardly use this if she had been writing labels or addressing envelopes. Because of this kind of restriction, no sharp line can be drawn between the present case and (g) above.

A great many verbs enter into this contrast: the lexical process of extending the use of a basically transitive verb by omission of an indefinite object is very productive. There are differences, however, in how readily a verb occurs in the intransitive construction. As with case (f) above – which is indeed very similar to the present one – the most accommodating contexts tend to be those involving generalisations rather than particular events. Thus *It is better to love than to hate* and *He loves/hates with great passion* are more acceptable than *He’s going to love/hate* or *At that time he loved/hated*. Compare similarly *He likes to organise* with <sup>?</sup>*This morning he organised* or *He would never steal* with <sup>?</sup>*He had lunch at the castle yesterday and stole when he was left alone*.

With a considerable number of verbs the intransitive construction is characteristically used for an activity and the transitive one for an accomplishment. This is so, for example, with *I ironed* vs *I ironed your shirt*, *We read* vs *We read the report*, and so on. This is one reason why adding *something* often fails to provide a satisfactory paraphrase of the intransitive: *We read* (activity) does not mean quite the same as *We read something* (accomplishment).<sup>59</sup> Notice in this connection the contrast between *eat/drink* and *eat/drink up*: the preposition *up* gives an accomplishment meaning and is

<sup>59</sup>Note that while *We were reading* entails *We read*, *We were reading something* does not entail *We read something* (assuming that *something* has constant reference).

inconsistent with the intransitive use being considered here – \**When I left they were still eating up*.<sup>60</sup>

(i) **Extension of intransitive: *They were talking nonsense***

Intransitive *talk* denotes an activity which does not inherently involve an object-argument, but it is possible to include one, such as *nonsense* (with the semantic role of factitive). Other examples:

- [30] *hum run sing speak walk weep*  
 [31] *She hummed a familiar tune. She ran a marathon. I sang the wrong words. He speaks Greek. I walked the last two miles. She wept tears of joy.*

The objects tend to be selected from a quite narrow range of types – in the case of *weep* the head can only be *tear*. We might also include here *push, shove*, etc., which allow a *way* object before a goal complement: *They pushed (their way) to the front* (cf. Ch. 8, §4.4). Two special cases are given in (j)–(k) below.

(j) **Extension by cognate object: *He died a long and agonising death***

A cognate object is one where the head noun is a nominalisation of the verb, as *death* is of *die*, and so on. In some cases the selection of a cognate object is of no syntactic significance: *They built a hideous building* and *I can smell an appalling smell* belong to the same construction as *They built a mansion* and *I can smell rotting meat*. *Sing* is arguably basically intransitive, but it allows many objects besides the cognate *song* and hence was included under (i) above. But there are also verbs where the cognate object is not freely replaceable by a non-cognate one:

- [32] i *cough grin laugh sigh snore yawn*  
 ii *die dream live sleep think*  
 [33] *He grinned a wicked grin. She always dreams the same dream. He lives a life of drudgery. She slept the sleep of the just. He was thinking lewd thoughts.*

The semantic role might again be said to be factitive. Modification of the noun is just about obligatory:<sup>61</sup> *He died a death*; *He grinned a grin*. It is semantically comparable to modification of the verb (cf. *He died slowly and agonisingly*; *He grinned wickedly*).

(k) **Object of conveyed reaction: *She smiled her assent***

- [34] i *grin laugh nod sigh smile wave*  
 ii *mumble roar scream whisper*  
 [35] *He grinned his appreciation. I nodded my agreement. He roared his thanks.*

The verbs in [34i] involve non-verbal communication; the meaning of *She smiled her assent* is approximately “She signalled her assent by smiling”: the object thus hardly expresses an argument of *smile* – and cannot be made into a passive subject: \**Her assent was smiled*. The verbs in [34ii] are manner-of-speaking verbs and allow a wider range of objects (e.g. *He roared the command*) and passives are not in principle excluded (*On the parade ground commands must be roared, not whispered*).

<sup>60</sup> *Eat/drink up* have intransitive uses of type (b), as in *You haven't finished your milk: drink up*, but these have accomplishment interpretations.

<sup>61</sup> In canonical clauses, that is: a construction without modification is found in relative clauses, as in [*the dream*] *I dreamt last night, [the life] she led then*, etc.

8.1.4 Type IV: *He broke the vase vs The vase broke*

Pairs of this type differ from those considered above in that the subject of the intransitive corresponds not to the subject of the transitive but to its object:  $S_{\text{intrans}} = O_{\text{trans}}$ , i.e. the semantic role of the intransitive subject is the same as that of the transitive object. In the *break* pair, for example, *the vase* is subject of the intransitive and object of the transitive, having the same semantic role in both cases, that of theme, the entity that undergoes the change of state. A great many dual-transitivity verbs enter into this type of contrast. We will consider here four cases of it, classified by properties of the intransitive.

- [36] i *The vase broke.* [non-agentive dynamic intransitive]  
 ii *The ladder leant against the wall.* [non-agentive static intransitive]  
 iii *The dog walked round the block.* [agentive intransitive]  
 iv *She doesn't frighten easily.* ['middle' intransitive]

(a) Non-agentive dynamic intransitives: *The vase broke*

This is much the most usual case: the subject, *the vase*, is non-agentive, and the clause expresses a dynamic situation, as does the transitive *He broke the vase*. The transitive differs from the intransitive in including an extra argument with the role of causer, potentially agent, which is expressed as subject in accordance with the general rule that a single actual or potential agent is aligned with the subject in canonical clauses (§2.3).

Very often there is also a copular counterpart containing an adjective morphologically related to the verb:

- |      |                           |                         |                             |
|------|---------------------------|-------------------------|-----------------------------|
| [37] | TRANSITIVE                | INTRANSITIVE            | COPULAR                     |
| i    | <i>I opened the door.</i> | <i>The door opened.</i> | <i>The door was open.</i>   |
| ii   | <i>I widened the gap.</i> | <i>The gap widened.</i> | <i>The gap was wide(r).</i> |
| iii  | <i>I tore my shirt.</i>   | <i>My shirt tore.</i>   | <i>My shirt was torn.</i>   |

The copular version describes the state resulting from the dynamic situation expressed in the transitive–intransitive pair. (In [ii] the verb is derived from the adjective, and conversely in [iii], which is also interpretable as a passive clause – see Ch. 16, §10.1.3.)

A sample of verbs found in contrasts of the type *He broke the vase ~ The vase broke* is given in [38], together with a few which are excluded (those lacking the intransitive use marked ‘\*<sub>I</sub>’, and those lacking the transitive use marked ‘\*<sub>T</sub>’):

- |              |   |   |  |                                       |  |              |
|--------------|---|---|--|---------------------------------------|--|--------------|
| [38] i       | <i>bend</i>                               | <i>blacken</i>                          | <i>bounce</i>                            | <i>change</i>                         | <i>collapse</i>                        | <i>crack</i> |
|              | <i>crease</i>                             | <i>divide</i>                           | <i>drop</i>                              | <i>drown</i>                          | <i>explode</i>                         | <i>float</i> |
|              | <i>freeze</i>                             | <i>grow</i>                             | <i>improve</i>                           | <i>melt</i>                           | <i>move</i>                            | <i>roll</i>  |
|              | <i>sink</i>                               | <i>slow</i>                             | <i>smash</i>                             | <i>turn</i>                           | <i>vary</i>                            | <i>wake</i>  |
| ii Excluded: | <i>construct</i> <sup>*<sub>I</sub></sup> | <i>destroy</i> <sup>*<sub>I</sub></sup> | <i>endanger</i> <sup>*<sub>I</sub></sup> | <i>hit</i> <sup>*<sub>I</sub></sup>   | <i>touch</i> <sup>*<sub>I</sub></sup>  |              |
|              | <i>die</i> <sup>*<sub>T</sub></sup>       | <i>emerge</i> <sup>*<sub>T</sub></sup>  | <i>fall</i> <sup>*<sub>T</sub></sup>     | <i>occur</i> <sup>*<sub>T</sub></sup> | <i>perish</i> <sup>*<sub>T</sub></sup> |              |

- [39] i a. *This changed the situation.* b. *The situation changed.*  
 ii a. *The<sub>I</sub> destroyed the farm.* b. *\*The<sub>I</sub> farm destroyed.*  
 iii a. *\*The<sub>I</sub> frost perished the fruit.* b. *The<sub>I</sub> fruit perished.*

It must be emphasised that we are concerned here with a lexical relationship which is subject to a fair amount of idiosyncratic variation for particular items. Thus *break*

occurs only transitively in the context of records or laws/rules (*He broke the 100m record*, but not *\*The 100m record broke*), and with a body-part object a matching subject will generally be interpreted as experiencer rather than causer (*I've broken my arm*). *Grow* appears in both constructions when applied to plants but is used only intransitively of people or animals (*They grew lots of tomatoes/\*children*). Intransitive *move* with animates (*He moved*) has a sense involving movement of part of the body which doesn't apply in the transitive (*They moved him*), and conversely the transitive has a sense in *It moved me to tears* that is not found in the intransitive (*\*I moved to tears*). With *change*, the transitive use (*I changed my views*) and the intransitive use (*My views changed*) have virtually the same meaning. With *bounce*, *drop*, *roll* we hardly have an adjectival copular counterpart: *The ball was bounced* is a passive clause.

(b) **Non-agentive static intransitive: *The ladder leant against the wall***

With a relatively small number of verbs the intransitive denotes a state and the transitive the bringing about of that state: *I leant the ladder against the wall*. This is found with verbs of position, such as *hang*, *rest*, *sit*, *stand*, and a few others such as *hurt* (*My arm is hurting* ~ *You are hurting my arm*).

(c) **Agentive intransitives: *The dog walked round the block***

With a few primarily intransitive verbs the intransitive subject has an agent role (combined with that of theme), and the transitive then involves getting the person or whatever to act in the given way: *We walked the dog round the block*.<sup>62</sup> Compare similarly: *The prisoners marched to the guardroom* ~ *He marched the prisoners to the guardroom*. In the transitive, the agentivity of the dog/prisoners is much reduced: the primary agent is the one expressed as subject. The clear cases of pairs of this kind involve movement in some direction (in *She jumped the horse* it cannot be a matter of jumping on the spot). Other verbs include *canter*, *gallop*, *run*, *walk* – but hardly *jog*, *meander*, *saunter*, and the like.

(d) **'Middle' intransitives: *She doesn't frighten easily***

In this case the transitive use is primary and the intransitive is interpreted as having an unexpressed causer. Cross-linguistically, the primary use of the general term **middle** is for a term in a system of voice – it applies to a voice that is in some sense intermediate between active and passive. The term is certainly not applicable to English in this sense: there are just two categories in the syntactic system of voice in English, active and passive. *She doesn't frighten easily* is active in form, but it has some semantic affinity with the passive, and it is in this semantic sense that it can be thought of as intermediate between ordinary actives and passives: we put scare quotes around the term to signal that it is being used in an extended sense and is not to be interpreted as denoting a formal category in the voice system.

Intransitives like *She doesn't frighten easily* characteristically have the following properties:

[40] i A causer (normally human) is implied but can't be expressed in a *by* phrase.

<sup>62</sup>The meaning of transitive *walk* in *I'll walk you home* is more specialised: "escort on foot".

- ii The clause is concerned with whether and how (especially how readily) the subject-referent undergoes the process expressed in the verb.
- iii The clause is negative, or is headed by a modal auxiliary (especially *will*), or contains an adjunct of manner (such as *well* or *easily*).
- iv The clause expresses a general state, not a particular event.

The implication of a causer ([40i]) is what makes such clauses semantically similar to passives: compare *She isn't easily frightened*. But the causer cannot be expressed: *\*She doesn't frighten easily by noises in the dark*.<sup>63</sup> Property [ii] shows that these intransitive actives are by no means identical in meaning to passives. Compare *The shirt irons well*, which says something about the quality of the shirt, with *The shirt was ironed well*, which tells of the skill of the ironer. Properties [iii] and [iv] exclude such examples as *\*She frightens* and *\*There was a sudden noise outside and she frightened immediately*.

A sample of verbs occurring in 'middle' intransitives is given in:

[41] i	<i>alarm</i>	<i>amuse</i>	<i>demoralise</i>	<i>embarrass</i>	<i>flatter</i>	<i>frighten</i>
	<i>intimidate</i>	<i>offend</i>	<i>pacify</i>	<i>please</i>	<i>shock</i>	<i>unnerve</i>
ii	<i>clean</i>	<i>cut</i>	<i>hammer</i>	<i>iron</i>	<i>read</i>	<i>wash</i>

The restrictions given in [40] normally apply in full to the verbs in [41i], but those in [ii] allow single event interpretations, contrary to [40iv]: *The meat cut surprisingly easily*; *The milk kept for ten days*; *The tin hammered flat*; *The shirt washed cleaner than I'd expected*.<sup>64</sup> *Sell* is less restricted again, allowing unmodified structures like *The house sold*.

In addition, numerous verbs subsumed under case (a) above can appear in clauses with an interpretation like those we have been considering: *The door won't open*; *These rods bend quite easily*; *The handle doesn't turn*. These could be used of situations where someone is trying to open the door, bend the rods, or turn the handle. However, these are not the only possible contextualisations, and there is no justification for analysing them as structurally ambiguous. As observed above, the 'middle' intransitive is not a syntactically distinct construction in English, and there is also no sharp semantic distinction between such clauses and the intransitives covered under (a); it is sufficient to note that the central instances are those involving verbs like *frighten*, *read*, *cut*, etc., which are subject (in varying degrees) to the restrictions outlined in [40].

## 8.2 Ditransitive/monotransitive contrasts

### 8.2.1 Type I: *I gave her the key vs I gave the key to her*

The indirect object generally expresses arguments with the semantic role of recipient or beneficiary, and these arguments are also commonly expressed by PPs headed by *to*

<sup>63</sup>A further structural difference from the passive is that the subject always corresponds to an object in a transitive construction. There are therefore no analogues of prepositional passives like *The house can be easily broken into*: *\*The house breaks into easily*.

<sup>64</sup>The last three examples illustrate alternatives to the more usual manner adjunct mentioned in [40iii]: an adjunct of duration and a resultative PC. Note that *\*The tin won't/doesn't hammer* is not acceptable: there is no issue of whether the tin can undergo the process of hammering, only of whether it has a certain result. Similarly *read* has to do with readability, not legibility, so that *\*Your paper won't/doesn't read* is not acceptable: there can't be an issue as to whether it can be read, only as to how it sounds or is evaluated when read (*It reads well / like a confession*).

and *for* respectively. We distinguish five verb classes according to which of the following constructions they license: ditransitive, monotransitive with *to* phrase, monotransitive with *for* phrase.

[42]	O <sup>i</sup> + O <sup>d</sup>		O <sup>d</sup> + NON-CORE COMP	
i	a. <i>I gave <u>her</u> <u>the key</u>.</i>		b. <i>I gave <u>the key</u> <u>to her</u>.</i>	[O <sup>i</sup> or <i>to</i> ]
ii	a. <i>*I explained <u>her</u> <u>the problem</u>.</i>		b. <i>I explained <u>the problem</u> <u>to her</u>.</i>	[ <i>to</i> only]
iii	a. <i>I bought <u>her</u> <u>a hat</u>.</i>		b. <i>I bought <u>a hat</u> <u>for her</u>.</i>	[O <sup>i</sup> or <i>for</i> ]
iv	a. <i>*I borrowed <u>her</u> <u>the money</u>.</i>		b. <i>I borrowed <u>the money</u> <u>for her</u>.</i>	[ <i>for</i> only]
v	a. <i>I spared <u>her</u> <u>the trouble</u>.</i>		b. <i>*I spared <u>the trouble</u> <u>to/for her</u>.</i>	[O <sup>i</sup> only]

The [a] examples are ditransitive, whereas the [b] ones are monotransitives containing a non-core complement after the direct object. Examples of verbs belonging to the five classes are given in:

[43]	i O <sup>i</sup> OR <i>TO</i>	<i>award</i>	<i>bequeath</i>	<i>bring</i>	<i>cabl</i>	<i>deny</i>
		<i>feed</i>	<i>give</i>	<i>hand</i>	<i>kick</i>	<i>leave<sub>1</sub></i>
		<i>lend</i>	<i>offer</i>	<i>owe</i>	<i>pass</i>	<i>post</i>
		<i>promise</i>	<i>read</i>	<i>sell</i>	<i>send</i>	<i>show</i>
		<i>take</i>	<i>teach</i>	<i>tell</i>	<i>throw</i>	<i>write</i>
	ii <i>TO</i> ONLY	<i>announce</i>	<i>confess</i>	<i>contribute</i>	<i>convey</i>	<i>declare</i>
		<i>deliver</i>	<i>donate</i>	<i>exhibit</i>	<i>explain</i>	<i>mention</i>
		<i>narrate</i>	<i>refer</i>	<i>return</i>	<i>reveal</i>	<i>say</i>
		<i>submit</i>	<i>transfer</i>			
	iii O <sup>i</sup> OR <i>FOR</i>	<i>bake</i>	<i>build</i>	<i>buy</i>	<i>cook</i>	<i>design</i>
		<i>fetch</i>	<i>find</i>	<i>get</i>	<i>hire</i>	<i>leave<sub>2</sub></i>
		<i>make</i>	<i>order</i>	<i>reach</i>	<i>rent</i>	<i>reserve</i>
		<i>save<sub>1</sub></i>	<i>sing</i>	<i>spare<sub>1</sub></i>	<i>write</i>	
	iv <i>FOR</i> ONLY	<i>acquire</i>	<i>borrow</i>	<i>collect</i>	<i>compose</i>	<i>fabricate</i>
		<i>obtain</i>	<i>recover</i>	<i>retrieve</i>	<i>withdraw</i>	
	v O <sup>i</sup> ONLY	<i>allow</i>	<i>begrudge</i>	<i>bet</i>	<i>charge</i>	<i>cost</i>
		<i>envy</i>	<i>excuse</i>	<i>fine</i>	<i>forgive</i>	<i>permit</i>
		<i>refuse</i>	<i>save<sub>2</sub></i>	<i>spare<sub>2</sub></i>	<i>strike</i>	<i>tax</i>
		<i>tip</i>	<i>wish</i>			

The subscripts indicate different senses. For *leave* we have *He left<sub>1</sub> everything to his wife* (“bequeathed”), Class [i], and *I’ve left<sub>2</sub> some spaghetti for you*, Class [iii]. For *save* and *spare* we have *I’ll save<sub>1</sub> you some porridge* (“keep”), *I can’t spare<sub>1</sub> you any more* (“let you have”), Class [iii], and *This will save<sub>2</sub>/spare<sub>2</sub> you the bother*, Class [v]. The *for* construction is possible only with the first sense: *I’ll save some porridge for you* and *I can’t spare any more for you* but not *\*This will save/spare the bother for you*.

It will be noted that items of very similar meaning may belong to different classes, especially [i] and [ii]. Compare, for example, *She gave/\*donated her old school \$500*; *He gave me back / \*returned me the books I’d lent him*; *They showed/\*revealed/\*exhibited us the jewellery recovered from the wreckage*. In such cases there is a tendency for it to be the Latinate and/or more formal words that exclude O<sup>i</sup>.

With verbs allowing an alternation between ditransitive and prepositional constructions, the difference between them is very largely a matter of information packaging. Thus in accordance with the general tendencies described in Ch. 16, §2, *He gave his son*

a couple of CDs is likely to be preferred over the prepositional counterpart *He gave a couple of CDs to his son*, and conversely *He gave the spare copy to one of his colleagues* is likely to be preferred over the ditransitive counterpart *He gave one of his colleagues the spare copy*. If  $O^d$  is a personal pronoun, the prepositional construction is favoured, especially if the other NP is not a pronoun – examples like  $\%I\text{ gave Kim it}$  are inadmissible for most speakers, especially in AmE.

In addition, however, there are certain points to be made concerning the semantic role of  $O^i$  and the oblique NP.

### ■ Recipients

In the most central ditransitive construction  $O^i$  has the semantic role of recipient. With such verbs as *give*, *hand*, *throw* there is actual transfer of the theme (expressed as  $O^d$ ) to the recipient; with *bequeath*, *offer*, *owe*, *promise* there is an arrangement or commitment for the recipient to receive the theme later.<sup>65</sup> With such verbs as *tell*, *read*, *show*, *teach*,  $O^i$  and  $O^d$  are aligned with less central cases of recipient and theme: the  $O^i$ -referent comes to hear, see, or learn what is expressed by  $O^d$ , rather than to have it. Verbs of verbal communication, of saying, characteristically belong to the *to*-only class: *He said something offensive to us*, not *\*He said us something offensive*. *Tell* is the main exception, but there is also a productive set expressing the means of communication (*cable*, *fax*, *phone*, etc.: *I'll fax you a copy*).

#### Recipient vs locative goal

The preposition *to* can mark a recipient or a locative goal – compare: *She offered the manuscript to the university library* (recipient) and *She took her son to the university library* (locative goal). It is only in the recipient case, however, that there is alternation with a ditransitive:<sup>66</sup>

- [44] i a. *I gave/sent some cash to him.*                      b. *I gave/sent him some cash*                      [recipient]  
       ii a. *I moved/sent Kim to the back.*                      b. *\*I moved/sent the back Kim*                      [locative]

### ■ Beneficiaries – of goods or services

*For* marks the oblique as having a beneficiary role, and we can then distinguish (not always sharply) between beneficiaries of goods and beneficiaries of services. In *I'll get another glass for you* we have a beneficiary of goods (the glass is for you), in *Let me open the door for you* we have a beneficiary of services (it is the deed that is for you, not the door). The  $O^i$  alternant tends to be restricted to cases where it is a matter of goods rather than services:

- [45] i a. *I'll do a quiche for you.*                                      b. *I'll do you a quiche.*                                      [goods]  
       ii a. *I'll do the washing-up for you.*                                      b. *\*I'll do you the washing-up.*                                      [service]

<sup>65</sup> In the extended sense of *owe* seen in *She owes her immense success to sheer hard work* the oblique NP does not have a recipient role, and here the  $O^i$  alternant is not possible: *\*She owes sheer hard work her immense success*.

<sup>66</sup> For some speakers there may be a further difference in some cases between the ditransitive and prepositional alternants, with the latter more consistent with a failure of the transfer, thus more likely than the  $O^i$ -alternant in examples like *He teaches logic to Grade 10 students, but they don't seem to learn anything* or *I sent my report to the boss but she never received it*.

there will still be a recipient understood (recoverable from the context), but if we drop *them* from the *make* clause to give *He made some cakes* there is no understood beneficiary, no suggestion that the cakes were for some third party. Similarly if we drop the  $O^i$  from *I bought her a hat* to give *I bought a hat* there is again no implicit beneficiary: *buy* inherently involves transfer to the buyer (expressed as the subject) but not to a beneficiary.

With verbs whose  $O^i$  is associated with the recipient role, omission of the  $O^i$  usually leaves the recipient understood but there are a few where this is not so, where the recipient is not an inherent part of the meaning. Compare:

- [51] i a. *We haven't awarded anyone a prize.*      b. *We haven't awarded a prize.*  
 ii a. *He read them a story.*      b. *He read a story.*

There is an implicit recipient in [ib], but not in [iib].

### 8.2.4 Type IV: *They fined us \$100 vs They fined us*

Considerably less usual is the case where the single object of the monotransitive corresponds to the indirect object of the ditransitive: the role of *us* in *They fined us \$100* is the same as in *They fined us*.

With *fine*, this is the only possibility, but there are other verbs such as *charge* that allow both types of omission:

- [52] i a. *They fined us \$100.*      b. *They charged us \$100.*  
 ii a. *\*They fined \$100.*      b. *They charged \$100.*  
 iii a. *They fined us.*      b. *They charged us.*

*Tip* follows the pattern of *fine* while the verbs in [53] follow that of *charge*:

- [53] *bet*                      *cost*                      *envy*                      *excuse*                      *forgive*  
*refuse*                      *show*                      *teach*                      *tell*

Again there is a distinction to be drawn between understood elements that are definite and those that are indefinite. Compare, for example, *I asked him the price but he wouldn't tell me* (sc. "the price": definite) and *He tells lies / dirty jokes* (addressee indefinite). *Cost* appears in examples like [52iii] only in informal style (*That'll cost you*, with "a lot" understood) or in the idiom *It cost us dear* (where the syntactic analysis of *dear* is unclear).

## 8.3 Further core/non-core contrasts

### 8.3.1 Type I: *He supplies arms to the rebels vs He supplies the rebels with arms*

In this type we have two internal complements, with the object of one corresponding to the oblique of the other. Several different cases can be distinguished.

#### (a) *Present/blame*

- [54] i a. *He presented a prize to Kim.*      b. *He presented Kim with a prize.*  
 ii a. *He blamed the accident on Kim.*      b. *He blamed Kim for the accident.*

With *present* the roles are theme (*a prize*) and recipient (*Kim*), and when they are not aligned with the object they take the prepositions *with* and *to* respectively. There are a number of verbs that follow this pattern, and some that occur only with *with* (*They*

armed us with knives, but not \*They armed knives to us):

[55]	i	TO OR WITH	credit	entrust	furnish	issue	present
			provide	serve	supply	trust	
	ii	WITH ONLY	arm	equip	regale	reward	saddle

This contrast is similar to that between *He gave the prize to Kim* and *He gave Kim the prize*, except that in the second construction the NP expressing the theme is oblique (complement of *with*) instead of being a core complement (direct object). A few verbs, as noted in §8.2.2 above, are found in all three constructions. In addition, *supply* allows a beneficiary with *for* instead of a recipient with *to*: *He supplies arms for the rebels*.

In some cases the range of NPs found as oblique is somewhat greater than that allowed as object. For example, if we replace *a prize* in [54i] by *a dilemma* only [b] is acceptable. Conversely with *entrust*: we have *He entrusted his children to her* and *He entrusted her with his children*, but if we replace *her* by *her care* only the *to* construction is permitted. There are also differences among the verbs as to whether the non-core complement can be omitted: *serve* allows omission of either (*They served the guests*; *They served the wine*), *present* allows omission of the recipient (*He presented the prizes*), *entrust* requires two internal complements (\**He entrusted me / his savings*).

The contrast with *on* and *for* seen in [54ii] is unique to *blame*. We can omit the *for* phrase (*He blamed Kim*) but not the *on* phrase (\**He blamed the accident*).

#### (b) *Spray/load*

[56]		THEME AS OBJECT		LOCATIVE AS OBJECT
	i	a. <i>She sprayed <u>paint onto the wall</u>.</i>		b. <i>She sprayed <u>the wall with paint</u>.</i>
	ii	a. <i>She loaded <u>hay onto the cart</u>.</i>		b. <i>She loaded <u>the cart with hay</u>.</i>

Here one argument has the role of theme, the other that of locative. In [a] the object is aligned with the theme and in [b] with the locative. When the theme is expressed as oblique the preposition is always *with*, whereas in the [a] version a range of locative prepositions is found – e.g. *over* in [ia] or *into* in [iia]. If only one internal complement is included it will normally be the object, and while both kinds of object are possible in this case the locative is somewhat more likely (*She loaded the cart*).

The meanings of the [a] and [b] versions in [56] are not quite the same. Where the locative is expressed as object, it characteristically has what has been called a **holistic** interpretation. The [a] examples could be used of a situation in which only a small portion of the wall had paint sprayed on it or where the hay occupied only a small part of the cart, whereas the [b] versions indicate a fuller coverage of the wall, a fuller loading of the cart. It is, however, difficult to capture the difference precisely. *She sprayed me with water*, for example, certainly does not require that she sprayed me all over. And in *She sprayed the wall with paint all over* the *all over* undoubtedly adds new meaning instead of merely reinforcing what is already expressed in [ib]. The best way to get at the difference in meaning is to take NPs of the same kind (more precisely, both definite) and introduce an explicit indication of completeness, such as the verb *finish*:

- [57] i *She finished spraying the paint on the wall.*  
 ii *She finished spraying the wall with the paint.*

What emerges from such a comparison is that it is the object-argument that determines when the situation is complete/finished. In [i] the spraying was finished when the paint was used up, regardless of how much of the wall was covered; conversely, in [ii] it was finished when the wall was covered.

While *spray* and *load* appear in both constructions there are other verbs limited to one or the other:

- [58] i a. *She put the tea in the cupboard.*      b. \**She put the cupboard with the tea.*  
 ii a. \**She filled cordial into the glass.*      b. *She filled the glass with cordial.*

The asterisk in [ib] applies to the interpretation where *the tea* expresses the theme, here the entity moved: the sentence is perfectly acceptable with *the cupboard* expressing the theme and *with* a locative preposition, i.e. when the structure is the same as in [ia]. In [59] we give a sample of verbs from the three classes: those in [i] follow the pattern of *spray* and *load* in allowing either theme or locative as object, those in [ii] are like *put* in licensing only the theme-as-object construction, and those in [iii] are like *fill* in that they appear only in the locative-as-object version.

[59] i	THEME OR LOC	<i>brush</i>	<i>cram</i>	<i>hang</i>	<i>inject</i>	<i>pack</i>
		<i>plant</i>	<i>shower</i>	<i>smear</i>	<i>spread</i>	<i>sprinkle</i>
ii	THEME ONLY	<i>immerse</i>	<i>lean</i>	<i>place</i>	<i>push</i>	<i>stand</i>
iii	LOC ONLY	<i>cover</i>	<i>decorate</i>	<i>drench</i>	<i>litter</i>	<i>surround</i>

### (c) Drain

- |      |   |  |   |
|------|---|--|---|
| [60] | THEME AS OBJECT   |  | LOCATIVE AS OBJECT                                      |
| i    | a. <i>I drained <u>water</u> <u>from the pool</u>.</i>  |  | b. <i>I drained <u>the pool</u> <u>of water</u>.</i>    |
| ii   | a. <i>I removed <u>leaves</u> <u>from the pool</u>.</i> |  | b. * <i>I removed <u>the pool</u> <u>of leaves</u>.</i> |
| iii  | a. * <i>He deprived <u>food</u> <u>from us</u>.</i>     |  | b. <i>He deprived <u>us</u> <u>of food</u>.</i>         |

This case is like that found with the *spray/load* verbs, except that this time the locative is source rather than goal and the preposition used with the theme NP in [b] is *of* rather than *with*. In the [a] version other prepositions than *from* are often available, such as *off* or *out* + *of*. Sample verbs following the complementation patterns of *drain*, *remove*, and *deprive* respectively are shown in:

[61] i	THEME OR LOC	<i>bleed</i>	<i>clean</i>	<i>clear</i>	<i>empty</i>	<i>strip</i>
ii	THEME ONLY	<i>eject</i>	<i>eradicate</i>	<i>extract</i>	<i>omit</i>	<i>withdraw</i>
iii	LOC ONLY	<i>acquit</i>	<i>cheat</i>	<i>divest</i>	<i>purge</i>	<i>rob</i>

There are few clear members of class [i]; for some speakers, verbs such as *cleanse*, *cull*, *leech*, *plunder* belong in the class too, while for others they belong in [ii] or [iii].

### (d) Engrave

- |      |   |  |  |
|------|---|--|--|
| [62] | THEME AS OBJECT   |  | LOCATIVE AS OBJECT   |
| i    | a. <i>I engraved <u>my initials</u> <u>on the ring</u>.</i>   |  | b. <i>I engraved <u>the ring</u> <u>with my initials</u>.</i>    |
| ii   | a. <i>I scratched <u>my initials</u> <u>on the ring</u>.</i>  |  | b. * <i>I scratched <u>the ring</u> <u>with my initials</u>.</i> |
| iii  | a. * <i>I labelled <u>my initials</u> <u>on the ring</u>.</i> |  | b. <i>I labelled <u>the ring</u> <u>with my initials</u>.</i>    |

This again is very much the same contrast as we have with *spray* and *load*. This time the theme is a factitive theme: the (representation of) my initials is created by the act

of engraving. There is no difference here comparable to that illustrated in [57]. Sample verbs:

[63]	i	THEME OR LOC	<i>embroider</i>	<i>inscribe</i>	<i>mark</i>	<i>stamp</i>	<i>tattoo</i>
	ii	THEME ONLY	<i>carve</i>	<i>copy</i>	<i>draw</i>	<i>print</i>	<i>write</i>
	iii	LOC ONLY	<i>adorn</i>	<i>brand</i>	<i>decorate</i>	<i>illustrate</i>	<i>tag</i>

(e) *Hunt*

[64]		QUEST AS OBJECT		LOCATIVE AS OBJECT	
	i	a.	<i>They hunted <u>deer</u> <u>in the woods</u>.</i>	b.	<i>They hunted <u>the woods</u> <u>for deer</u>.</i>
	ii	a.	<i>*She searched <u>her key</u> <u>in her bag</u>.</i>	b.	<i>She searched <u>her bag</u> <u>for her key</u>.</i>

The verbs we are concerned with here take as internal arguments a locative and what may be called a quest – the entity being looked for or sought. Quest is a quite specific semantic role, and it remains unclear whether it could be satisfactorily subsumed under one of the more general roles we have postulated. The object expresses the quest in [a] and the location in [b], where the quest is aligned with the complement of *for*. The verbs below are classified according as they allow both kinds of object in this way, or only a locative, as in [64ii]:

[65]	i	QUEST OR LOC	<i>fish</i> I	<i>hunt</i> I	<i>mine</i> I	<i>poach</i> I	<i>stalk</i>
	ii	LOC ONLY	<i>check</i> I	<i>dredge</i> I	<i>examine</i>	<i>inspect</i>	<i>investigate</i>
			<i>ransack</i>	<i>scour</i>	<i>search</i> I	<i>survey</i>	<i>watch</i> I

The annotation ‘I’ indicates that the verb also appears in an intransitive construction with two PPs, *for* again marking the quest: *They hunted for deer in the woods*; *She searched for her key in her bag*. We haven’t given any verbs appearing in construction [64ia], but not [64ib]; *They discovered deer in the woods* has the syntactic structure of [ia] but the object is not associated with the quest role, and hence the inadmissibility of *\*They discovered the woods for deer* needs no special noting.<sup>70</sup>

(f) *Hit*

[66]	i	a.	<i>He hit <u>the stick</u> <u>against the fence</u>.</i>	b.	<i>He hit <u>the fence</u> <u>with the stick</u>.</i>
	ii	a.	<i>He stabbed <u>his knife</u> <u>into me</u>.</i>	b.	<i>He stabbed <u>me</u> <u>with his knife</u>.</i>
	iii	a.	<i>He pierced <u>the pin</u> <u>through my hat</u>.</i>	b.	<i>He pierced <u>my hat</u> <u>with the pin</u>.</i>

Here the [a] and [b] examples are equivalent. In [b] the *with* phrase is instrument and the object has the role of patient. In [a] the PP is a locative, and an important feature of this construction is that the locative is obligatory: it cannot be omitted without changing the way in which the object is interpreted. The [a] examples, that is, do not entail that he hit the stick, that he stabbed his knife, that he pierced the pin – but they do entail that he hit the fence, stabbed me, and pierced my hat. In the construction with a locative PP, [a], the object has the role of theme, which it does not otherwise have with these verbs (and given the equivalence with [b] it might be said to combine this with the instrument role).

<sup>70</sup>A candidate for a verb taking only the structure with quest as object is *ferret*: *She ferreted the secret out of him* but not *\*She ferreted him for the secret*. However, the locative here is source, not location, as in [64].

### 8.3.2 Type II: *Bees are swarming in the garden vs The garden is swarming with bees*

This contrast is like the last except that the core complement involved is subject rather than object. Again we distinguish various cases, but as they are effectively intransitive analogues of some of the transitive cases covered under Type I, we can deal with them quite briefly.

#### (a) *Swarm/abound*

[71]	THEME AS SUBJECT	LOCATIVE AS SUBJECT
i	a. <i>Fish abound in the lake.</i>	b. <i>The lake abounds with fish.</i>
ii	a. <i>Vermin were crawling over him.</i>	b. <i>He was crawling with vermin.</i>
iii	a. <i>Sweat dripped down his face.</i>	b. <i>His face dripped with sweat.</i>
iv	a. <i>Wild music resounded in the hall.</i>	b. <i>The hall resounded with wild music.</i>

This is analogous to the *spray/load* contrast. Again we have a theme and a locative, such that either can be aligned with a core complement (here subject) and the other with a non-core element. The locative subject version characteristically has *with* in the non-core complement, but some verbs allow other prepositions, as in *The lake abounds in fish*. *In* is the most usual preposition in the version with the theme as subject, but others occur here more readily, as seen in the above examples – and in case [iiia] we could have a whole range: *from*, *off*, *over*, and so on.

A considerable number of verbs exhibit this contrast; further examples are given in [72], grouped into broad semantic classes:

[72]	i	<i>blaze</i>	<i>flicker</i>	<i>glimmer</i>	<i>glitter</i>	<i>shimmer</i>	<i>shine</i>
	ii	<i>buzz</i>	<i>clatter</i>	<i>echo</i>	<i>resonate</i>	<i>ring</i>	<i>whir</i>
	iii	<i>abound</i>	<i>bloom</i>	<i>blossom</i>	<i>bristle</i>	<i>crawl</i>	<i>creep</i>
		<i>quiver</i>	<i>sprout</i>	<i>swarm</i>	<i>teem</i>	<i>throng</i>	<i>writhe</i>

The verbs in [i] have to do with light, those in [ii] with sound, and those in [iii] with concrete objects, generally in large numbers. Abstract qualities are also found in figurative language: *Anger blazed in his eyes* ~ *His eyes blazed with anger*.

In some cases there is a difference in meaning between the two versions of a kind analogous to that discussed for *spray/load*. The locative subject version, *The garden was swarming with bees*, has a holistic interpretation: we understand that more or less the whole garden was occupied by the swarming bees. But there is no such implicature in the theme subject version *Bees were swarming in the garden*: here they could all have been in just one corner of the garden. It must be emphasised, however, that this semantic difference is found only under quite limited conditions: even with verbs like *swarm* it can be lost with a change in the location (*The night air swarmed with midges* ~ *Midges swarmed in the night air*) or a change in the preposition (*The bush was swarming with bees* ~ *Bees were swarming over the bush*).<sup>71</sup>

<sup>71</sup>Since *swarm* doesn't lend itself to the expression of an achievement, as opposed to an activity, we cannot here bring out the difference in meaning between the two constructions by using examples with *finish*, analogous to [57] above.

The interesting point to note about these examples is that when we drop the subject NP from the trivalent construction the obligatory subject function is taken over not by the object, but by the complement of the preposition. Only [i] and [iv] allow a third construction where the subject of the bivalent corresponds to the object of the trivalent (*The door opened with the master-key*; *The clothes dried in the sun*) – the contrast between the [a] examples and these is a transitive/intransitive contrast of the kind covered in §8.1.4.

The non-core complements in the [a] examples of [76] have a range of roles. *With the master-key* in [ia] is an instrument. The bivalent version [ib] is available only with a limited range of instruments: compare, for example, *We ate it with a spoon* vs \**A spoon ate it*. The *with* phrases in [iia] and [iiia] have some similarity to an instrument, but are nevertheless distinct. The salient interpretation of [iia], in contrast to [ia], is non-agentive: we didn't use our complaints to offend her, as we used the master-key to open the door in [i]. And in [iiia] the distinction between the *with* phrase and an instrument is evident from the possibility of combining them: *We covered the grave with leaves with a garden-fork*. The PP in [iiia] can be identified with the non-core complement used in the *spray/load* construction of §8.3.1, and the NP *leaves* can be regarded as having the theme role. The [a] and [b] versions of [iii] differ in terms of the kind of situation involved: [iiia] is dynamic, expressing an occurrence, while [iiib] has not only a dynamic interpretation but also (and more saliently) one where it describes a state. A considerable number of verbs enter into the contrasts illustrated here for *offend* and *cover*; further examples are given in:

[77]	i	LIKE OFFEND	<i>affect</i>	<i>amuse</i>	<i>appall</i>	<i>bewilder</i>	<i>depress</i>
			<i>discourage</i>	<i>enthrall</i>	<i>humiliate</i>	<i>hurt</i>	<i>worry</i>
	ii	LIKE COVER	<i>adorn</i>	<i>bathe</i>	<i>clutter</i>	<i>fill</i>	<i>flood</i>
			<i>line</i>	<i>litter</i>	<i>stain</i>	<i>surround</i>	<i>wreathe</i>

The PPs in [76iv–vii] are various kinds of locatives. Only a few verbs, closely related semantically to those used in [76], enter into these contrasts: for example, *heat* and *scorch* are found in [iv], *feed* and *house* in [v], *incorporate* and *omit* in [vi], *bake* and *weave* (both rather unlikely in the bivalent version, however) in [vii]. In [viii] (where it is hard to find a convincing replacement for *see*) the PP is a temporal. Finally, the *for* phrase in [ix] expresses the price role and the trivalent–bivalent contrast is found with a few related verbs such as *obtain*, *reserve*, etc.<sup>72</sup>

## 8.4 Contrasts between separate complements and a single combined complement

### (a) Oblique of trivalent incorporated into object of bivalent

- [78] i a. *She kissed him on the cheek.*      b. *She kissed his cheek.*  
 ii a. *She praised him for his sincerity.*      b. *She praised his sincerity.*

Here [a] has two internal complements while [b] has only one, but the content of that one complement covers that of the two complements of [a]. The object of [a], *him*,

<sup>72</sup>Note that *sell* differs from *buy* in entering into the transitive–intransitive contrast instead: *We sold the house for \$200,000* or *The house sold for \$200,000* but not \**\$200,000 sold the house*.

corresponds to the genitive *his* functioning as subject-determiner within the object NP of [b]. An alternative pattern is for it to correspond to the complement in an *of* phrase (*She praised the auditors for their diligence* ~ *She praised the diligence of the auditors*). In [ia] the PP expresses a body-part location (and allows a variety of locative prepositions), while in [iia] the oblique expresses a property and the normal preposition is *for*. Verbs following the patterns of *kiss* and *praise* are illustrated in [79i–ii] respectively:

[79]	i	<i>bang</i>	<i>bump</i>	<i>hammer</i>	<i>hit</i>	<i>kick</i>	<i>poke</i>
		<i>prick</i>	<i>punch</i>	<i>scrap</i>	<i>smack</i>	<i>tap</i>	<i>touch</i>
	ii	<i>admire</i>	<i>appreciate</i>	<i>censure</i>	<i>commend</i>	<i>denounce</i>	<i>despise</i>
		<i>envy</i>	<i>fear</i>	<i>like</i>	<i>need</i>	<i>respect</i>	<i>value</i>

These may be contrasted with such verbs as *break* and *discern*, which allow only the bivalent construction: *She broke his arm* (not \**She broke him in/on the arm*); *She discerned his anxiety* (not \**She discerned him for his anxiety*).

(b) Oblique of bivalent incorporated into subject of monovalent

[80] a. *The shares increased in value.*      b. *The value of the shares increased.*

This contrast is like those considered in (a) except that the core complement involved is subject rather than object. Again we can have either a genitive, as in *The shares' value increased* or an *of* phrase, as in the example cited. This intransitive contrast is found in clauses expressing a change of state involving the increase or decrease of some measurable property such as price, length, weight, etc. Other verbs found here include:

[81] *appreciate decline decrease drop fluctuate soar*

- 20.3 Embellishments 519
- 20.4 Secondary uses of proper names 520
- 20.5 NPs in vocative function 522

This chapter is concerned with the structure of noun phrases (NPs) and with the syntax of two lexical categories that function primarily within that structure: **nouns** and **determinatives**.

## 1 Distinctive properties of nouns and NPs

### ■ Summary of defining properties of NPs

- [1] i NP FUNCTION NPs are prototypically capable, when placed in an appropriate case-form, of functioning as a complement in clause structure, i.e. as subject (*The doctor arrived*), object (*We need a doctor*), or predicative complement (*Kim is a doctor*).
- ii NP STRUCTURE Except in what we refer to as the fused-head construction (*Two of them were broken*; *Many would disagree*; *It benefits the rich*), NPs consist of a noun as head, alone or accompanied by one or more dependents.

### ■ Summary of defining properties of nouns

- [2] i INFLECTION Nouns prototypically inflect for number (singular vs plural) and for case (plain vs genitive).
- ii FUNCTION Nouns characteristically function as head in NP structure.
- iii DEPENDENTS Various dependents occur exclusively or almost exclusively with nouns as head: certain determinatives (*a book, every day*), pre-head AdjPs (*good news*), relative clauses (*people who work*). Conversely, nouns differ from verbs and prepositions in that they do not take objects: *I dislike it* but not *\*my dislike it*.

### ■ Inflection of nouns

The four inflectional forms of prototypical nouns are illustrated in [3] for regular **dog** and irregular **child**:

[3]		PLAIN	GENITIVE	PLAIN	GENITIVE
	SINGULAR	<i>dog</i>	<i>dog's</i>	<i>child</i>	<i>child's</i>
	PLURAL	<i>dogs</i>	<i>dogs'</i>	<i>children</i>	<i>children's</i>

Not all nouns have contrasting singular and plural forms: *equipment*, for example, has no plural counterpart, and *outskirts* no singular; we take up these matters in §3.2.

Personal pronouns have a different set of inflectional forms, as illustrated in:

[4]			DEPENDENT	INDEPENDENT	
	NOMINATIVE	ACCUSATIVE	GENITIVE	GENITIVE	REFLEXIVE
	<i>I</i>	<i>me</i>	<i>my</i>	<i>mine</i>	<i>myself</i>
	<i>he</i>	<i>him</i>	<i>his</i>	<i>his</i>	<i>himself</i>
	<i>she</i>	<i>her</i>	<i>her</i>	<i>hers</i>	<i>herself</i>

### ■ Pronouns included in the category of nouns

Traditionally pronouns are regarded as a separate part of speech, but there are strong grounds for treating them as a subcategory of noun. They differ inflectionally from prototypical nouns and permit a narrower range of dependents, but they qualify as nouns by virtue of heading phrases which occur in the same functions as phrases headed by nouns in the traditional sense, i.e. common and proper nouns. This functional likeness between common nouns, proper nouns, and pronouns is illustrated for the three main clause-structure complement functions in:

[5]	COMMON/PROPER NOUN	PRONOUN	
i	a. [ <i>The boss</i> ] / [ <i>Liz</i> ] <i>was late</i> .	b. [ <i>She</i> ] <i>was late</i> .	[subject]
ii	a. <i>I'll tell</i> [ <i>the boss</i> ] / [ <i>Liz</i> ].	b. <i>I'll tell</i> [ <i>her</i> ].	[object]
iii	a. <i>It was</i> [ <i>the boss</i> ] / [ <i>Liz</i> ] <i>who left</i> .	b. <i>It was</i> [ <i>she/her</i> ] <i>who left</i> .	[predicative]

### ■ Other functions of NPs

In addition to their prototypical function as complements in clause structure, NPs may appear with a number of other functions, including the following:

[6]	i	<i>I was talking</i> [ <i>to the doctor</i> ].	[complement in PP]
	ii	<i>I like</i> [ <i>Sue's analysis of the passive construction</i> ].	[subject-determiner in NP]
	iii	<i>Fred arrived</i> [ <i>the day before yesterday</i> ].	[adjunct in clause]
	iv	<i>The nail was</i> [ <i>three inches long</i> ].	[modifier in AdjP]
	v	<i>Fred arrived</i> [ <i>a whole day late</i> ].	[modifier in AdvP]
	vi	<i>The wreck was discovered</i> [ <i>a mile under the sea</i> ].	[modifier in PP]
	vii	<i>She was writing a treatise on</i> [ <i>the opera 'Carmen'</i> ].	[modifier in NP]
	viii	<i>I finally met his wife, a distinguished anthropologist</i> .	[supplement]
	ix	<i>Elizabeth, your taxi is here</i> .	[vocative]

In [ii] the relation of the NP *Sue's* to the larger (bracketed) NP bears significant resemblance to that between a subject NP and the verb in clause structure, and for this reason we analyse *Sue's* as **subject-determiner**, i.e. as combining the functions of subject and determiner. The functions in [iii–ix] allow only a quite restricted range of NPs.<sup>1</sup>

### ■ Inclusion of dummies in the category of NP

We naturally include in the category of NP any noun-headed unit which, while not functioning in all of the clausal complement positions (subject, object, predicative complement), nevertheless occurs in at least one. This covers the dummy *there* of:

[7]	<i>There are several options open to us</i> .	[subject]
-----	---	-----------

<sup>1</sup>There are one or two NPs that are specialised to the modifying functions [iv–vi]: *It's* [*a damn sight better than last time*]; *It's* [*a tad small*]. These NPs do not occur as complement in clause structure.

We argued in Ch. 4, §3.2.2, that the subject here is *there*, not *several options*, and this is sufficient to establish that this semantically empty *there* qualifies as an NP, even though it occurs only as a subject in clauses like [7] or, derivatively, as object in the related raised object construction *I believe there to be several options open to us*.

### ■ Inclusion of bare role NPs in the category of NP

Also included in the category of NP are **bare role NPs** such as *president*, *deputy leader of the party* – bare in the sense that they do not contain a determiner. These qualify as NPs by virtue of occurring as the predicative complements of verbs like *be*, *become*, *appoint*, *elect*, but singular NPs of this kind are exceptional in that they cannot occur as subjects or objects, where a determiner such as the definite article *the* is required:

- [8] i *I'd like to be president.* [predicative complement]  
 ii *I'd like to meet \*president / the president.* [object]

## 2 Overview of noun classes and NP structure

### ■ Common nouns, proper nouns, and pronouns

Nouns can be divided in the first instance into three major classes: common nouns, proper nouns, and pronouns.

- [1] i *The manager has just arrived.* [common noun]  
 ii *Sue has just arrived.* [proper noun]  
 iii *She has just arrived.* [pronoun]

The main use of proper nouns is as head of an NP that serves as a **proper name**. They also have various other uses: in *He thinks he's [another Einstein]*, for example, the bracketed NP has a proper noun as head, but is not itself a proper name. It should also be borne in mind that not all proper names have proper nouns as head: the heads (underlined) of such names as *The Open University* and *Rhode Island*, for example, are common nouns. Pronouns fall into various more specific classes such as personal pronouns, interrogative pronouns, relative pronouns, etc.: they differ from ordinary nouns in that they allow a much narrower range of dependents, and in particular they do not combine with determiners. Pronouns and proper nouns are discussed in §§10 and 20 respectively; no separate section is needed for common nouns, which constitute the default category, lacking the special properties of the others.

### ■ Count and non-count nouns

A second important distinction is between count and non-count nouns:

- [2] i a. *She was reading [a book].* b. *May I have [another cake]?* [count]  
 ii a. *She was reading [poetry].* b. *May I have [some more cake]?* [non-count]

Count nouns can combine with low numerals: *three books*, *ten cakes*. Many nouns allow both count and non-count interpretations, as illustrated here for *cake*. As a count noun *cake* denotes an individuated, separate entity, while as a non-count noun it denotes a substance.

### Head and ultimate head

We have seen that the head position can be filled by a noun, as in *the man*, or a nominal, as in *the old man*. In the latter example, the nominal itself has the noun *man* as head, and we will refer to this as the **ultimate head** of the NP, i.e. the final head element in a line running from the NP through any intermediate heads until we reach the level of the word. Except in most cases of the fused-head construction, therefore, the ultimate head in NP structure is a noun.

### Determiner

From a grammatical point of view, the most important dependent is the determiner: in many cases this element is obligatory. The determiner position can be filled by a determinative (or a phrase headed by a determinative, i.e. a DP) or else by an NP, almost always in genitive case:

- [6] i *He broke [the glass].* [determinative]  
 ii *He broke [the teacher's glass].* [genitive NP]

Note then that we distinguish between **determiner**, a function in the structure of the NP, and **determinative**, a word-category. As the examples show, the determiner position is not always filled by a determinative (or DP): *the teacher's* in [ii] has the same relation to the head *glass* as *the* in [i], but it has itself a structure where *the* is determiner and *teacher* is head, and hence is an NP. Conversely, while determinatives function most distinctively as determiner in NP structure, most of them are not restricted to that function. For example, determinative *all* is determiner in *all children* but modifier in *all the children* (an NP, with *the* as determiner) or *I was all confused* (an AdjP).

### Internal dependents: modifiers and complements

Dependents which are immediate constituents of a nominal rather than of an NP we refer to as **internal dependents**. The determiner by contrast is an **external dependent**: see the structures represented in [5].

Further examples of internal dependents in pre-head position are given in:

- [7] i *the two mistakes I made* [determinative]  
 ii *an extremely old manuscript* [AdjP]  
 iii *Ministry of Defence officials* [nominal]  
 iv *some wonderfully warm woollen blankets* [AdjP + adj]

Determinatives like *two* function as internal dependent when they follow a determiner, as in [i], but otherwise function as determiner, as in *I found [two mistakes]*. Other types of pre-head internal dependent do not presuppose the presence of a determiner, as is evident from [iii]. The construction is recursive, so that in [iv], for example, *woollen* modifies *blankets* to form the nominal *woollen blankets*, and then *wonderfully warm* modifies this to form the larger nominal *wonderfully warm woollen blankets*, which enters into construction with the determiner *some* to form the whole NP.

Internal dependents in post-head position are illustrated in:

- [8] i *a house as big as I have ever seen* [AdjP]  
 ii *the nightlife in Paris* [PP]  
 iii *the proposal which she made* [relative clause]  
 iv *the photographs of Paris which her father had taken* [PP + relative clause]

Like those in pre-head position, these dependents form a nominal with the head, and again the construction is recursive. In [iv], for example, the PP *of Paris* combines with the noun *photographs* to form the nominal *photographs of Paris*, and this in turn is postmodified by the relative clause yielding a larger nominal which is determined by *the*. *Photographs of Paris which her father had taken* is thus the immediate head of the NP, while the noun *photographs* is the ultimate head.

Within the category of internal dependents we will draw a distinction between modifiers and complements. The pre-head dependents in [7] are modifiers, while complements are seen in *the finance minister*, *our legal advisor*, and the like. Of the post-head dependents in [8], *of Paris* is a complement and the rest modifiers.

### External modifier: predeterminer and peripheral

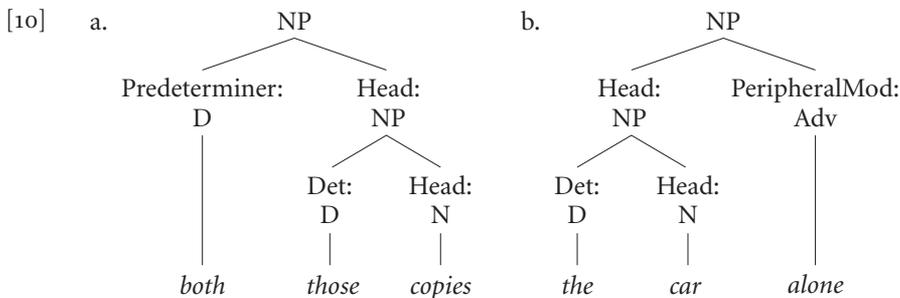

External dependents are immediate constituents of an NP, not a nominal. The determiner, which we have already covered, is external in this sense. In addition there are external modifiers, which modify an NP. These are of two kinds, **predeterminer modifiers** (or simply **predeterminers**) and **peripheral modifiers**.

- [9] i a. *He destroyed [both those copies].*  
       b. *It's [two thirds the price of the other one].*  
       c. *She had [such a brilliant idea].*  
    ii a. *[Even this house] is too expensive.*  
       b. *We couldn't manage with [the car alone].*  
       c. *He took [by far the most difficult path].*
- [predeterminer (modifier)]
- [peripheral modifier]

Predeterminer modifiers have a variety of forms, including the determinatives *all* and *both*, fractions, multipliers (*twice*, *three times*, etc.), and a small range of adjectives (e.g. *such* in [ic]) or AdjPs (*[How large a piece] do you need?*). A predeterminer modifier normally precedes a determiner: in *both copies*, for example, *both* is determiner, not predeterminer as in [ia], and in *such brilliant ideas* the *such* is an internal modifier.

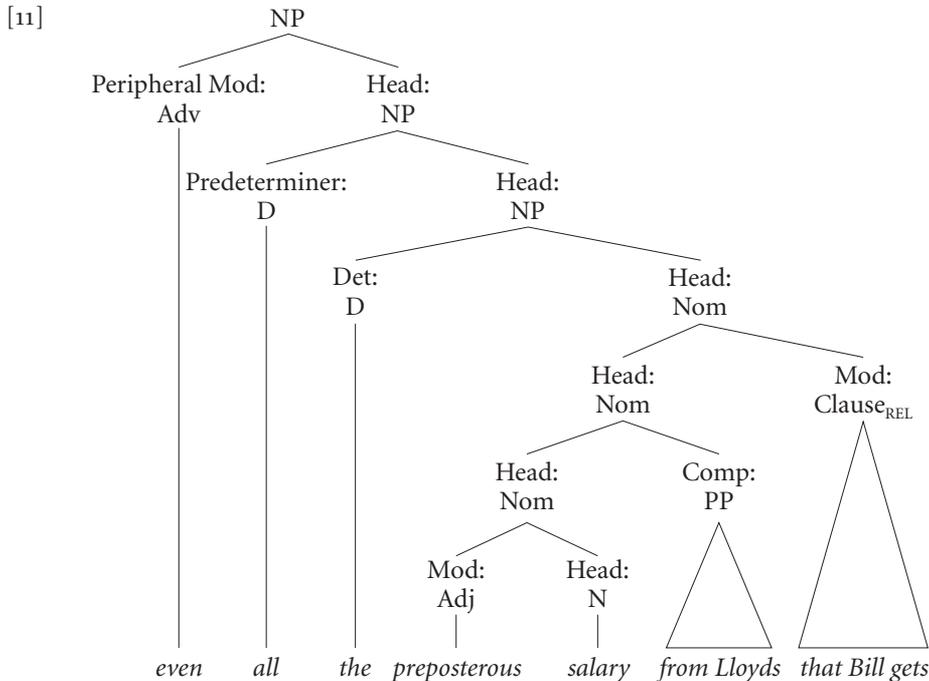

Peripheral modifiers have the form of adverbs, PPs, or reflexive pronouns (*Jill herself*). They occur either initially or finally, and in the former case precede any predeterminer: *[Even such a pessimist as your father] admits the prospects are improving*.

Tree structures for [9ia/iib] are as in [10].

### Sample structure for NP containing multiple dependents

To conclude this overview of the structure of NPs (with non-fused heads), we give the structure for an example containing multiple dependents in [11], where the triangle notation is used for elements whose internal structure is not analysed.

### ■ Fused-head constructions

Fused-head NPs are those where the head is realised jointly with a dependent function. The major case is where the head is fused with a dependent in NP structure – an internal modifier, a determiner, or (occasionally) a predeterminer:<sup>2</sup>

- [12] i a. *He ignored [the most important of her criticisms].* } [modifier-head]  
       b. *This proposal would benefit [the rich].* }  
       ii a. *Four boys played croquet and [two]played tennis.* } [determiner-head]  
        b. [Many]would agree with you on that point. }  
       iii *Jo earns three times that amount, and I earn [double].* } [predeterminer-head]

The bracketed expressions here are NPs, and the underlined expressions combine the function of head with that of a dependent. In [i] *most important* is understood in part in the same way as in the non-fused construction *the most important criticisms*, but in [i] it is also occupying the head position, with *of her criticisms* as complement. In some cases it would be possible to simply add a separate head without changing the meaning: for example, we could replace *many* in [iib] by *many people* and *double* in [iii] by *double that amount*. This is not possible in cases like [i], however, and it is for this reason that we analyse the construction in terms of fusion of the head with a dependent function rather than in terms of ellipsis of the head.<sup>3</sup> Tree-diagrams for NPs with fused heads are given in §9 (p. 412).

<sup>2</sup> A more complex case of fusion is between the head and the initial element of a relative clause, as in *He quickly devoured [what was left of the shepherd's pie]*. This fused relative construction is discussed in Ch. 12, §6.3.

<sup>3</sup> There is one other construction, a minor one, where we recognise an NP that does not have a noun as head. This is what we call a hybrid NP, with a gerund-participial VP as head: *There was [no stopping her]*. For discussion, see Ch. 14, §1.6.

On one dimension, we can distinguish different types of fused-head according to the syntactic category of the head. On another, we can distinguish among them on the basis of their structure and interpretation. Here we have the following three types.

#### (a) Simple fused-head NPs

This type is illustrated in the *two* of [12iia] and *double* of [iii]. Here a head can be added that is recoverable from an antecedent: *two boys* and *double that amount*.

#### (b) Partitive fused-head NPs

*The most important of her criticisms* ([12ia]) is a **partitive NP**; other examples are *most of the boys*, *two of these chairs*, and so on. The NP contains an *of* PP and denotes a subset of the set denoted by the complement of *of*, i.e. by the **partitive oblique**. The examples given are explicitly partitive, but we also have implicit partitives, where the *of* phrase is missing but recoverable, as in *He made ten mistakes but most were fairly trivial*: we understand “most of them”.

#### (c) Special fused-head NPs

The remaining two examples in [12], *the rich* and *many*, fall into neither of the above relatively straightforward categories and have what we call special interpretations. *The rich* is here understood as “rich people”, and *many* as “many people”, but special interpretations do not always incorporate “people”. In *They are striving for [the unobtainable]*, for example, we understand “that which is unobtainable”.

### ■ Subordinate clauses excluded from the NP category

Certain kinds of subordinate clause – those commonly called ‘noun clauses’ in traditional grammar – bear some resemblance to NPs, but do not qualify for inclusion in that category. Compare:

- |        |                                  |                                 |                                |
|--------|----------------------------------|---------------------------------|--------------------------------|
| [13] i | <i>That he was guilty</i>        | <i>was obvious to everyone.</i> | [declarative content clause]   |
| ii     | <i>Whether it will work</i>      | <i>remains unclear.</i>         | [interrogative content clause] |
| iii    | <i>For her to be so late</i>     | <i>is most unusual.</i>         | [infinitival clause]           |
| iv     | <i>Finding suitable lodgings</i> | <i>proved to be difficult.</i>  | [gerund-participial clause]    |

Such clauses are like NPs in that they function as subject or internal complement of a verb. But their distribution is by no means the same as that of NPs. For example, such clauses occur as extraposed subject, as in *It was obvious to everyone that he was guilty*, etc., whereas all but a very narrow range of NPs are excluded from this position. Most importantly, subordinate clauses differ markedly from NPs in their internal structure. In [i–iii] we have a subordinator and a clearly verbal head. The gerund-participial construction in [iv] does not allow a subordinator and has a closer relation to an NP than the other types of subordinate clause, but here too there are good reasons for treating it as a clause rather than an NP, as argued in Ch. 14, §1.6.

## 3 Number and countability

The grammatical term **number** is the name of the system contrasting singular and plural. Some languages have more than two terms in the number system: it is not uncommon, for example, for there to be a dual category, indicating “two” (with plural then characteristically expressing the meaning “more than two”). There are a few places

in English where a feature dual is relevant (e.g. in *both* and *either*), but the number system itself simply contrasts singular and plural (“more than one”).

The number system applies primarily to nouns and NPs – with the number of an NP generally but not invariably matching that of its head noun. The system is relevant in four main areas of the grammar:

- [1] i Noun inflection: characteristically, plural nouns are morphologically marked (*dog·s*) while singular nouns are unmarked, identical with the lexical base (*dog*).
- ii Agreement and selection within the NP: *this dog* vs *these dogs* (agreement), *a dog* but *several dogs* (selection).
- iii Pronoun–antecedent agreement: *My dog hid its bone* vs *My dogs hid their bones*.
- iv Subject–verb agreement: *The dog likes her* vs *The dogs like her*.

We deal with these issues in §§3.2, 3.4, 17, and 18, but first we need to examine the distinction between count and non-count nouns, since this interacts in important ways with the number system.

### 3.1 Count and non-count nouns

As the terms indicate, **count** nouns denote entities that can be counted, while **non-count** nouns denote entities that cannot be counted:

- [2] i *We need another plate*. [count]
- ii *We need some more crockery*. [non-count]

#### ■ Test for countability: occurrence with cardinal numerals

A simple test for count nouns is the ability to combine with the cardinal numerals *one*, *two*, *three*, etc.:

- [3] i *one plate* ~ *two plates* ~ *three plates* [count]
- ii *\*one crocker*y ~ *\*two crocker*ies ~ *\*three crocker*ies [non-count]

#### ■ The count vs non-count distinction applies to senses or uses of nouns

Many nouns can be used with either a count or a non-count interpretation:

- [4] i *Would you like [another chocolate]*? [count]
- ii *Would you like [some more chocolate]*? [non-count]

*Chocolate* in [ii] denotes a food substance, whereas in [i] it denotes an individual unit consisting of that substance (in either case there may be additional matter beside the pure chocolate substance: filling, nuts, etc.). We regard this as a case of **polysemy**, not **homonymy**. Homonymy is the phenomenon where distinct lexical items happen to be pronounced and spelled alike. A standard example is *bank*, where we distinguish two homonymous lexical items, one denoting a financial institution, the other the sloping margin of a river. These happen to derive ultimately from the same etymological source, but they have come into English via different routes and, more importantly, they are not perceived as being semantically related. But in the case of [4] there is a clear relation between the two meanings, and we therefore take them to be senses of a single lexical item. *Chocolate* accordingly exhibits polysemy: it has more than one sense.

It follows that when we speak of count nouns and non-count nouns it is to be understood that we are concerned with nouns as used with a count and non-count interpretation respectively. There are, certainly, some nouns, such as *piece*, which have no established non-count use, and others, such as *crockery* above, which have no established count use. These are simply the limiting cases; the dual use of *chocolate* is not remotely exceptional but is representative of an extremely widespread phenomenon. The following sample should give some idea of how pervasive it is:

- | [5]      COUNT  | NON-COUNT  |
|---|--|
| i a. <i>This proposal has three <u>advantages</u>.</i>      | b. <i>They took <u>advantage</u> of us.</i>            |
| ii a. <i>He's promoting a new <u>slimming aid</u>.</i>      | b. <i>Foreign <u>aid</u> has been reduced again.</i>   |
| iii a. <i>I quoted two <u>authorities</u> in support.</i>   | b. <i>They don't have much <u>authority</u>.</i>       |
| iv a. <i>It is certainly a fine <u>building</u>.</i>        | b. <i>There's plenty of <u>building</u> going on.</i>  |
| v a. <i>Both <u>covers</u> were torn.</i>                   | b. <i>The trees provided useful <u>cover</u>.</i>      |
| vi a. <i>There are three <u>details</u> I would add.</i>    | b. <i>They didn't go into much <u>detail</u>.</i>      |
| vii a. <i>Change over to another <u>discipline</u>.</i>     | b. <i>We need rather more <u>discipline</u>.</i>       |
| viii a. <i>My three main <u>duties</u> are as follows.</i>  | b. <i>She has a strong sense of <u>duty</u>.</i>       |
| ix a. <i>She wants a <u>football</u> for Christmas.</i>     | b. <i>Let's play <u>football</u>.</i>                  |
| x a. <i>Australia won more <u>golds</u> than ever.</i>      | b. <i>It isn't really made of <u>gold</u>.</i>         |
| xi a. <i>That's one of my two pet <u>hates</u>.</i>         | b. <i>He still seems full of <u>hate</u>.</i>          |
| xii a. <i>I can't see a single white <u>hair</u>.</i>       | b. <i>He has blond <u>hair</u>.</i>                    |
| xiii a. <i>Several <u>improvements</u> were made.</i>       | b. <i>There's been little <u>improvement</u>.</i>      |
| xiv a. <i>These are our two major <u>necessities</u>.</i>   | b. <i>I see little <u>necessity</u> for change.</i>    |
| xv a. <i>She's written five <u>papers</u> already.</i>      | b. <i>We haven't got much <u>paper</u> left.</i>       |
| xvi a. <i>I have several <u>reasons</u> for concern.</i>    | b. <i>He's little <u>reason</u> to doubt her word.</i> |
| xvii a. <i>We've three <u>sausages</u> left.</i>            | b. <i>I don't like <u>sausage</u>.</i>                 |
| xviii a. <i>I've just had another good <u>sleep</u>.</i>    | b. <i>I've not had much <u>sleep</u>.</i>              |
| xix a. <i>The word has two different <u>spellings</u>.</i>  | b. <i>They should be taught <u>spelling</u>.</i>       |
| xx a. <i>These animals have two <u>stomachs</u>.</i>        | b. <i>I haven't much <u>stomach</u> for it.</i>        |
| xxi a. <i>All previous <u>studies</u> are flawed.</i>       | b. <i>The question needs more <u>study</u>.</i>        |
| xxii a. <i>Bear these <u>truths</u> constantly in mind.</i> | b. <i>There's some <u>truth</u> in what he says.</i>   |
| xxiii a. <i>The gadget has several <u>uses</u>.</i>         | b. <i>It's not much <u>use</u> complaining now.</i>    |
| xxiv a. <i>I've read her most important <u>works</u>.</i>   | b. <i>They haven't put in enough <u>work</u>.</i>      |
| xxv a. <i>These are my two main <u>worries</u>.</i>         | b. <i>It's a source of great <u>worry</u> to me.</i>   |

### ■ Count and non-count conceptualisations

A count noun denotes a class of individuated entities of the same kind. *Boy*, for example, denotes the class of boys. The individual entities are atomic in the sense that they cannot be divided into smaller parts of the same kind as the whole. A boy consists of parts – head, arms, legs, etc. – but these parts are not themselves boys. The entities denoted by non-count nouns may be uncountable for a variety of reasons, of which we will consider just two at this point. One very salient case is that of nouns denoting physical substances: *water*, *milk*, *soil*, *silver*, *hydrogen*, and so on. The substances denoted by such words are not inherently bounded: particular amounts can be separated out and put in individual containers, but (in their primary senses) such nouns do not apply to separate amounts. Water, milk, soil, silver, and hydrogen are not atomic. An amount of water can be divided

arbitrarily into parts which are themselves (amounts of) water. There is no individuation by non-count nouns of this type, hence no basis for counting.

A second type of non-count noun is illustrated by our original example, *crockery*. This covers a variety of objects – plates, dishes, cups, saucers, etc. – united by their shared function with respect to food and drink. The subdivisibility feature applies here only to a limited extent. Given a reasonably large amount of crockery, it could be divided into two parts each of which would itself constitute crockery, but such subdivision cannot be carried out arbitrarily, as it can with substances. Thus the handle of a cup, or indeed a whole cup, does not constitute crockery. What distinguishes crockery from water is that it is heterogeneous while water is homogeneous. Any subamount of water is still water, but crockery is made up of entities of different kinds. *Crockery* denotes a heterogeneous **aggregate** of parts. Nevertheless, that aggregate, like a substance, is not inherently bounded, so that we can add or subtract pieces, and still be left with crockery. This is what makes it uncountable. We can count the individual plates, dishes, cups, saucers, etc., that make up crockery, but not the aggregate itself. A sample of other non-count nouns denoting heterogeneous aggregates of this type is given in:

- [6]    *baggage*    *bedlinen*    *clothing*    *cutlery*    *equipment*    *footwear*  
          *furniture*    *jewellery*    *luggage*    *machinery*    *tableware*    *underwear*

### ■ Count/non-count polysemy

In some cases, the existence of paired count and non-count senses is entirely predictable, so that it is not necessary for a dictionary to list both: one can be inferred from the other. But very often we find pairings that are restricted to particular items, so that both senses have to be specified for the lexical items concerned. Consider the following pairs.

#### (a) Drink/food substances and servings

- [7]    i *I don't like beer.* [non-count]  
          ii *She offered me another beer.* [count]

Names of drinks are primarily non-count, but systematically allow count interpretations where the noun denotes a serving of the drink – a glass, bottle, cup, or whatever. The paired senses illustrated in [7] are found also with *coffee*, *tea*, *lemonade*, *orange-juice*, *brandy*, and so on – including drinks known by proprietary names, such as *Ovaltine*, *Milo*, and the like. This is one of the regular cases where the secondary sense, here “serving of . . .”, is predictable and need not be listed. With foods we have a contextually much more restricted count sense applicable to ordering in restaurants, cafés, etc.:

- [8]    i *I'm going to have pork.* [non-count]  
          ii *That makes five porks and two turkeys, please.* [count]

#### (b) Foods and varieties

- [9]    i *We're having cheese for lunch.* [non-count]  
          ii *These are two of my favourite cheeses.* [count]

Example [i] represents the primary sense, while [ii] has the secondary sense “kind/variety of cheese”. This too is a case where the count sense is predictable and does not need individual listing: compare *an excellent brandy*, *a slightly bitter coffee*, *a very popular bread*, *a mild mustard*, and so on.

## (c) Animals and food

- [10] i *I was lucky enough to catch a salmon today.* [count]  
 ii *We're having salmon for dinner.* [non-count]

The primary sense here is the count one, with *salmon* denoting a fish of a particular species; in the secondary non-count sense it denotes a food substance. This extension of meaning applies very generally with fish. It is also found with poultry: *chicken, turkey*, etc. Similarly with *lamb*, but for *cow, pig, sheep, deer* there are separate terms for the meat: *beef, pork, mutton, venison*. Note also that the food sense can be further reinterpreted as count with the restaurant order sense mentioned in (a) above: *One roast beef and two lambs, please.*

## (d) Abstracts and event instantiations

- [11] i a. *Considerable injustice was revealed during the enquiry.* } [abstract,  
 b. *Serious harm was done to the project's prospects.* } non-count  
 ii a. *Two fundamental injustices were revealed during the enquiry.* } [event, count]  
 b. *\*Two serious harms were done to the project's prospects.* }

There are a large number of nouns denoting abstract concepts which are non-count in their primary sense. With some there is a secondary count sense denoting an event which constitutes an instance of the abstract concept, as with *injustice* in [ii]. But this extension is not regular and predictable. Although events in which injustice is instantiated are countable, events in which harm is instantiated are not. The same variability is found with abstract nouns derived from verbs. Compare, for example, *discussion* and *permission*, abstract nouns derived from *discuss* and *permit* respectively:

- [12] i a. *Full discussion of the land question is vital.* } [abstract, non-count]  
 b. *Permission is required.* }  
 ii a. *Two discussions of the land question took place.* } [event, count]  
 b. *?Two separate permissions are required.* }

Events which instantiate discussion are clearly countable, but those which instantiate permission are at best only marginally countable.

## (e) Abstracts and results

- [13] i *Necessity is the mother of invention.* [abstract, non-count]  
 ii *?There were two separate inventions of the light-bulb.* [event, count]  
 iii *Edison was honoured for three separate inventions.* [result, count]

Nouns which denote results, however, are more generally countable than those denoting events: the count result sense of *invention* in [iii], for example, is fully acceptable, whereas the event sense in [ii] is again at best very marginal.

## (f) Nonce substance interpretations of primarily count nouns

Concrete nouns whose primary sense is count may be 'coerced' into a non-count use, where the entities are reinterpreted as substance rather than individuals:

- [14] i *The termite was living on a diet of book.*  
 ii *There was cat all over the driveway.*

These involve a somewhat contrived extension of the sense of *book* and *cat* – one that is in principle applicable quite generally, and that clearly does not need to be listed in dictionary entries.

### ■ The count vs non-count contrast and the system of number

Count nouns can be either singular or plural, whereas non-count nouns are generally singular. The singular non-count nouns in [6], for example, have no plural counterparts: \**bedlinens*, \**clothings*, \**cutleries*, and so on. And where a noun has distinct count and non-count senses, occurrence of the plural form will normally force the count interpretation, as in *a box of chocolates*, *its advantages*, *these aids*, etc. We do, nevertheless, find some non-count plurals, so that the two systems of count vs non-count and singular vs plural cut across each other:

[15]	COUNT	NON-COUNT
SINGULAR	<i>I'd like <u>an</u> apple.</i>	<i>I'd like <u>some</u> cheese.</i>
PLURAL	<i>I'd like <u>some</u> biscuits.</i>	<i>I'd like <u>some</u> oats.</i>

*Oats*, unlike the ordinary plural *biscuits*, has no established singular counterpart and does not take numeral dependents: \**an oat*, \**two oats*.

### ■ Cross-linguistic differences in lexicalisation and conceptualisation

Whereas the count/non-count distinction appears to play a role in most if not all languages, the ways in which particular entities are conceptualised and lexicalised may vary considerably. One area in which there is variability is the treatment of more-or-less identical small entities (particles) which can be gathered together into a substance: if the particles are very small and non-significant, then the conceptualisation is likely to focus on the substance. Languages may differ, however, in how small an entity has to be to be treated as insignificant. In English for instance, the basic noun for “dust”, “sand”, “wheat”, and “grass” is a non-count noun denoting the substance, just like *water*: cf. \**one dust*, \**one sand*, etc. If we want to talk about the individual particles, we have to use a syntactic construction headed by a separate particle-denoting count noun: *particle of dust*, *grain of sand*, *ear of wheat*, *blade of grass*. On the other hand, larger entities such as peas, strawberries, and potatoes are individuated in English and lexicalised as count nouns: *one pea*, *one strawberry*, *one potato* (we can also have *some mashed potato*, but this is a homogeneous substance prepared from potatoes). When peas, strawberries, and potatoes are gathered together, we simply pluralise the count noun: *peas*, *strawberries*, or *potatoes*. In Russian, by contrast, peas, strawberries, and potatoes are basically conceptualised as gathered, like grass, into substances denoted by non-count nouns, e.g. *trava* “quantity of grass”, *gorox* “quantity of peas”, *klubnika* “quantity of strawberries”, *kartoška* “quantity of potatoes”. Non-basic count forms, often referred to as ‘singulative’, are then required to denote individual units: blades of grass, separate peas, etc.

Similar, but less systematic, differences in lexicalisation can also be found with concrete nouns denoting aggregates, and with abstract nouns. In English, for example, *furniture* is a non-count singular noun and *contents* is a non-count plural. In French, the treatment is the reverse: *meubles* “furniture” is plural and *contenu* “contents” is singular. In English, information is conceptualised as a substance (*plenty of information* / \**one information*) and for individual ‘particles’ we use a composite nominal *item/piece of information*; in French, on the other hand, the basic term is count (*une information* “an item of information”).

### ■ Determiners in combination with count and non-count singular nouns

Some determiners combine with both count and non-count singular nouns:

[16] i	COUNT	<i>the house</i>	<i>this piece</i>	<i>my father</i>	<i>no pianist</i>
ii	NON-COUNT	<i>the equipment</i>	<i>this crockery</i>	<i>my clothing</i>	<i>no milk</i>

Similarly for *that*, other genitives, *some* and *any*, *which* and *what*. There are others, however, that are wholly or predominantly restricted to one or other class of noun.

#### (a) Incompatible with count singular nouns

[17] *a little enough little much sufficient*

[18] COUNT

NON-COUNT

- |  |   |
|--|---|
| i a. * <i>Why has he so <u>much/little</u> priest?</i>   | b. <i>Why was there so <u>much/little</u> damage?</i>   |
| ii a. * <i>He damaged <u>a little</u> knee.</i>          | b. <i>She drank <u>a little</u> water.</i>              |
| iii a. * <i>He has got <u>enough/sufficient</u> son.</i> | b. <i>He has got <u>enough/sufficient</u> strength.</i> |

Example [iia] is of course grammatical with *little* an adjective and *a* the indefinite article (“He damaged a small knee”): we are concerned here with *a little* as determinative. With nouns having both count and non-count senses, the occurrence of one of these items selects a non-count interpretation: *There isn’t much chocolate left*; *We need a little discipline*; *Does it provide enough cover?*

#### (b) Incompatible with non-count singular nouns

[19] *another each either every neither one*

[20] COUNT

NON-COUNT

- |  |  |
|--|--|
| i a. <i><u>Each/Every</u> boy won a prize.</i>           | b. * <i>He broke <u>each/every</u> crockery.</i>       |
| ii a. <i>I’ll accept <u>either/neither</u> proposal.</i> | b. * <i>I can repair <u>either/neither</u> damage.</i> |
| iii a. <i>Choose <u>one/another</u> leader.</i>          | b. * <i>Choose <u>one/another</u> clothing.</i>        |

Occurrence of such a determiner with a noun that has both count and non-count senses selects the former: *He examined every chocolate in the box*; *Neither discipline appeals to her very much*; *One cover was torn*.

#### (c) The indefinite article *a*

In general, *a* selects a count singular noun: *a cup*, but not \**a crockery*. *Would you like a chocolate?* therefore yields a count interpretation of *chocolate*. Under restricted conditions, however, *a* can combine with a non-count singular:

- [21] i a. *A number of problems remain.*      b. *He wastes a great deal of time.*  
 ii a. *I have a high regard for them.*      b. *Jill has a good knowledge of Greek.*

*Number* and *deal* in [i] are quantificational nouns: they serve here to quantify (imprecisely) problems and time. *Deal* is restricted to the singular; **number** can inflect for plural (*Huge numbers of bees were swarming in the garden*), but in this imprecise quantificational sense it doesn’t allow cardinal numerals (\**Two numbers of problems remain*). *Regard* in the sense it has in [iia] has no plural (\**We both have high regards for them*). *Knowledge* in [iib] is a clear case of a non-count noun: it has no established plural and combines with the determinatives *much*, *little*, *enough* (*They have little knowledge of the matter*). The effect of the *a* is to individuate a subamount of knowledge, her knowledge of Greek, but this individuation does not yield an entity conceptualised as belonging to a class of entities of the same kind: \**Jill has an excellent knowledge of Greek and Liz has another*; \**They both have excellent knowledges of Greek*.

#### (d) *All* as determiner

As determiner (as opposed to predeterminer), *all* in a singular NP is normally restricted to non-count nouns:

- [22] a. \**All cup had been broken.*      b. *All fear had evaporated.*

It can, however, combine with count singulars denoting periods of time: *She spent all week marking exam papers; We were at home all morning.*

### (e) Absence of determiner

Singular NPs with no determiner cannot normally have a count common noun as head:

- [23] i a. \**She married Englishman.*                      b. *She always drinks water.*  
 ii a. \**There had been a lot of vandal.*                b. *There had been a lot of vandalism.*

*Chocolate is bad for your teeth* or *I bought a bar of chocolate* therefore involve the non-count sense of *chocolate*.<sup>4</sup>

## 3.2 Singular and plural nouns

Most nouns have both singular and plural forms:

- [24] i SINGULAR    *dog*    *fox*    *child*    *mouse*    *sheep*  
 ii PLURAL        *dogs*   *foxes*   *children*   *mice*    *sheep*

The singular is identical with the lexical base and the plural is formed from the base by suffixation or some other morphological process: this is a matter of inflection, and the formation of plural nouns is described in detail in Ch. 18, §4.1. The only point we need to make here is that with a small number of irregular nouns the plural form is identical with the singular, as with *sheep* in [24]; we refer to plurals that are identical with the lexical base as **base plurals**. This case is clearly distinct from that where a noun has a singular form but no plural, for base plurals can occur in the same positions as ordinary plurals. Compare, then:

- [25]            NO PLURAL FORM                                      BASE PLURAL  
 i a. \**these equipment*                                      b. *these sheep*  
 ii a. \**The equipment are ready.*                        b. *The sheep are ready.*

In examples like those in [24] the plural form applies to a set containing two or more of the entities to which the singular applies; nothing further need be said about such cases in this section. Our main focus will be on **plural-only nouns**, nouns which have either no singular form at all (as with *cattle* or *clothes*) or no singular form with a matching meaning (as with *glasses* in the sense ‘spectacles’ or *greens* ‘green vegetables’).<sup>5</sup> We will also consider, by way of contrast, singular nouns whose form resembles that of a plural noun (e.g. *mumps*, *mathematics*, and the like).

### 3.2.1 Plural-only nouns with the *-s* ending

#### ■ Bipartites

One quite large class of plural-only nouns consists of words denoting objects made up of two like parts: we refer to these as **bipartites**.<sup>6</sup> They include names of articles of clothing, tools, and optical aids, as in [26i–iii] respectively.

<sup>4</sup>Non-count nouns are often called ‘mass’ nouns. We have preferred ‘non-count,’ in part because it reflects clearly the test we use for determining whether a noun is count or non-count, in part because ‘mass’ is not suitable for the full range of non-count nouns. The term ‘mass’ is readily applicable with nouns like *water* or *coal* that denote substances but it is less evident that it applies transparently to abstract non-count nouns such as *knowledge*, *spelling*, *work*.

<sup>5</sup>Plural-only nouns are often referred to by the equivalent Latin term, ‘pluralia tantum.’ Some grammars, however, use this term for only a subset of plural-only nouns.

<sup>6</sup>They are sometimes called ‘summation plurals,’ though some writers use this term for other kinds of plural-only nouns too.

[26] i	<i>bloomers</i>	<i>breeches</i>	<i>briefs</i>	<i>britches</i> AmE	<i>corduroys</i>
	<i>drawers</i>	<i>flannels</i>	<i>jeans</i>	<i>knickerbockers</i>	<i>knickers</i>
	<i>overalls</i> BrE	<i>pajamas</i> AmE	<i>panties</i>	<i>pants</i>	<i>pyjamas</i> BrE
	<i>shorts</i>	<i>slacks</i>	<i>tights</i>	<i>trousers</i>	<i>trunks</i>
ii	<i>bellows</i>	<i>clippers</i>	<i>cutters</i>	<i>forceps</i>	<i>nutcrackers</i>
	<i>pincers</i>	<i>pliers</i>	<i>scales</i>	<i>scissors</i>	<i>secateurs</i>
	<i>shears</i>	<i>snippers</i>	<i>tongs</i>	<i>tweezers</i>	
iii	<i>binoculars</i>	<i>clip-ons</i>	<i>glasses</i>	<i>goggles</i>	<i>spectacles</i>

The bipartite nature of the objects is reflected in the common occurrence of these nouns in construction with *pair*: *a pair of trousers/shears/spectacles*.

The garment terms in [26i] denote clothes that are worn over the lower part of the body and cover the legs to varying degrees (or at least provide holes for them to pass through): it is of course the duality of the legs that is the source of the bipartite form of the garments. There are many words of this kind, some of them (such as *drawers*) now somewhat dated, others (such as *bloomers*) denoting garments worn in earlier times. Clothes for the upper body are not treated as bipartite even where they cover the arms; note in connection with this contrast between the upper and lower parts of the body that English has the word *sleeve* for the part of a garment covering an arm, but no comparable word for the part covering a leg. BrE *overalls*, however, denotes a garment covering both parts of the body; AmE here has singular *overall*, a term which in BrE denotes only a non-bipartite garment shaped like a coat. Several of the words in [i] have singular forms denoting a type of cloth, with the bipartite plural having a sense incorporating the meaning “trousers”: corduroys, for example, are trousers made of corduroy. Two other words that might be included as peripheral members of this group denote straps for holding up trousers: *braces* in BrE and *suspenders* in AmE.

Bipartite tools typically have two mobile parts which come together and move apart. In the original type of scales, the two parts were trays at the end of a pivoted bar; changes in design have resulted in an object that is no longer physically bipartite, and while the plural form *scales* is applied to such objects in BrE, AmE has a singular: cf. (*a pair of*) *kitchen scales* vs *a kitchen scale*. There is similarly variation (though not regional) between (*a pair of*) *nutcrackers* and *a nutcracker*.

The bipartite nature of the optical words in [26iii] comes from their containing two pieces of glass (or glass substitute) for the eyes. *Glasses* itself is also found in various compounds: *field-glasses*, *sunglasses*, etc.

The bipartite structure of the three kinds of object motivates the construction with *pair*, and the plural form of the noun. But the two parts are essentially joined and do not have independent functions, and there is no singular form denoting just one of them: *He had \*torn his left slack / \*damaged the lower shear / \*cracked the right spectacle*.<sup>7</sup> Thus while *He has a pair of shoes* entails *He has two shoes*, no such relation holds between *He has a pair of slacks/scissors/glasses* and *He has \*two slacks / ?two scissors / two glasses*.

Outside the *pair* construction, bipartite plurals characteristically apply to single garments, tools, or optical devices: *I've torn my trousers*; *These scissors need sharpening*; *Where are the binoculars*? There is some uncertainty and variation among speakers as to

<sup>7</sup> Singular *trouser* is occasionally found (<sup>0</sup>*He had snagged his left trouser on the wire*), but for most speakers such examples are quite unacceptable.

how readily they can also be applied to a plurality of such objects. Compare:

- [27] i a. *Corduroys are still fashionable.* b. *%I'll get both these trousers cleaned.*  
 ii a. *All the scissors need sharpening.* b. *?Have you got two tweezers I can borrow?*

Example [ia] illustrates the generic use and is completely acceptable: it would be quite inappropriate to say *Pairs of corduroys are no longer fashionable* because the *pair* construction focuses on the individual objects. In [iia] we have reference to all members of some definite set of bipartite objects; this too has a high degree of acceptability, but this time the version with *pairs of scissors* would be acceptable too, though probably somewhat disfavoured relative to [iia] itself. Example [ib] is subject to variation between speakers: some find it acceptable, while others would require *both (these) pairs of trousers*. Example [iib] is significantly worse: there can be few speakers who find this as acceptable as *Have you got two pairs of tweezers I can borrow?* There may also be differences between the various bipartite nouns, with *?I've only got two jeans* being perhaps worse than [iib]. Overall, however, bipartite plurals cannot be said to satisfy the test for count nouns.

It should be noted, finally, that there is a restricted use of bipartite nouns as singulars:

- [28] i *This scissor reportedly never needs sharpening.*  
 ii *Ever wondered why someone can't design a flannel-lined jean?*  
 iii *Venetians were a wide-topped breeches narrowing to button or tie below the knee.*

Note that in [iii] (where *Venetians* denotes a garment) *breeches* retains the *-s* ending: we take it to have been reanalysed as a non-inflectional suffix, like that in *mumps*, etc. discussed in §3.2.3 below. Examples like [28] are most likely to be encountered in the language of commerce or in non-fictional writing such as a historical survey of clothing, tools, and so on. The crucial feature of this usage is that the reference is to types, not individual specimens. For the latter the plural form is required (*These scissors* / *\*This scissor will have to be sharpened*), and it is for this reason that bipartites fall within our definition of plural-only nouns.<sup>8</sup>

### ■ Plurals denoting substances consisting of particles

- [29] *dregs Epsom salts grits AmE oats*

The plurality of the particles accounts for the plural form of the nouns, but the individual particles are themselves of no significance, and this correlates with the lack of a singular form and the non-occurrence with cardinal numerals and comparable quantifiers: *\*one oat, \*two oats, \*several oats, \*how many oats*. (*?How much oats* is better, but of marginal status because of the conflict between *much* and plurality.) *Chives* might be included here, though the components would be described as blades, rather than particles. There are of course non-count singulars denoting substances consisting of particles: *sand, gravel, rice, sugar, salt* (as for use in cooking, for example, in contrast to *Epsom salts*), but the particles tend to be relatively larger in the case of the plural nouns (i.e. relative to the total amount of substance under consideration). In the case of such foods as peas and noodles the particles are large enough to be counted, so that *pea* and *noodle* are count nouns, even though they most often occur in the plural in contexts where one would be unlikely to be concerned with the number.

<sup>8</sup>The uninflected base is also found in compounds or as an attributive modifier: *a trouser-press, changes in forcep design*.

### ■ Plurals denoting aggregates of entities

[30]	<i>arms</i>	<i>clothes</i>	<i>contents</i>	<i>covers</i>	<i>dishes</i>
	<i>goods</i>	<i>groceries</i>	<i>leftovers</i>	<i>munitions</i>	<i>odds-and-ends</i>
	<i>refreshments</i>	<i>remains</i>	<i>spoils</i>	<i>supplies</i>	<i>valuables</i>

These are cover-terms for sets of entities of unlike kind: the plurality of the entities again matches the plural form, while their heterogeneity prevents counting. The aggregate nature of the denotation is comparable to that of the non-count singulars given in [6] above, and the difference in number between the singular and plural forms is difficult to explain in general terms. One grammatical difference is that the singulars but not the plurals occur in *of* complements to nouns like *item* and *piece*:

[31]	i	a. <i>an item of clothing</i>	b. * <i>an item of clothes</i>
	ii	a. <i>a piece of jewellery</i>	b. * <i>a piece of valuables</i>

*Contents* (as in *the contents of the drawer*) contrasts with singular *content* (*the content of the essay*); the latter is virtually restricted to the singular. Non-count *covers* denotes bedcovers, subsuming sheets, blankets, quilt, or whatever, and contrasts with count **cover** as used, for example, for a bookcover. Non-count *dishes*, as in *I must do/wash the dishes*, subsumes plates, cups, saucers, etc., in contrast to count **dish**, denoting a shallow bowl.

### ■ Plurals denoting areas containing a plurality of entities without clear boundaries

[32]	<i>bushes</i>	<i>mountains</i>	<i>plains</i>	<i>steppes</i>	<i>woods</i>
------	---------------	------------------	---------------	----------------	--------------

These can be ordinary count plurals (*We should plant a few bushes*; *She climbed two mountains in one day*), but they have non-count interpretations in examples like [33]:

[33]	a. <i>He threw it in the bushes.</i>	b. <i>She lives in the mountains.</i>
------	--------------------------------------	---------------------------------------

Here we understand an area containing bushes or mountains that are not perceived as discrete enough to be countable. Note the sharp contrast between [a] and *He threw it in two bushes* and the absurdity of asking, in connection with [b], *How many mountains does she live in?* *Catacombs* and *ruins* have affinities with this type of plural.

### ■ Other plural-only nouns

[34]	i	<i>beginnings</i>	<i>belongings</i>	<i>furnishings</i>	<i>goings-on</i>	<i>lodgings</i>
		<i>makings</i>	<i>proceedings</i>	<i>savings</i>	<i>surroundings</i>	<i>writings</i>
	ii	<i>amends</i>	<i>damages</i>	<i>deserts</i>	<i>dues</i>	<i>earnings</i>
		<i>proceeds</i>	<i>reparations</i>	<i>reprisals</i>	<i>returns</i>	<i>wages</i>
	iii	<i>apologies</i>	<i>compliments</i>	<i>condolences</i>	<i>regards</i>	<i>remembrances</i>
	iv	<i>alms</i>	<i>arrears</i>	<i>ashes</i>	<i>auspices</i>	<i>brains</i>
		<i>credentials</i>	<i>customs</i>	<i>elders</i>	<i>eye-drops</i>	<i>folks</i>
		<i>genitals</i>	<i>grassroots</i>	<i>greens</i>	<i>grounds</i>	<i>guts</i>
		<i>heads</i>	<i>heavens</i>	<i>holidays</i>	<i>humanities</i>	<i>letters</i>
		<i>looks</i>	<i>mains</i>	<i>minutes</i>	<i>odds</i>	<i>particulars</i>
		<i>reams</i>	<i>spirits</i>	<i>tails</i>	<i>troops</i>	<i>wits</i>

The nouns in [34i] contain the suffix *-ing* attached to a verb base. For most there is also a singular form, but the meaning relation is not that of a normal singular–plural pair. For example, *The movement had its beginnings in the seventeenth century* does not

imply that it had more than one beginning. *Lodgings* can denote a single rented place of accommodation (*My lodgings are next to the post office*) or a plurality of such places (*Their lodgings are several miles apart*). *Makings* means roughly “potential”: *Kim has the makings of a fine writer*. Plural-only *savings* denotes money that one has saved out of income or whatever (*We may have to draw on our savings*), whereas *saving*, with both singular and plural forms, denotes a reduction in time or money (*You can make a big saving / big savings by buying at the hypermarket*). Singular *writing* has a variety of senses, but none quite matches that of plural *writings*, which applies to literary output. *Belongings* and *furnishings* denote aggregates, like those in [30].

The nouns in [34ii] have to do with compensation and reward for what has been done; *earnings* could also have been included in [i]. For most, the singular form exists, but not with the standard sense relation to the plural. *Wages* simply means “pay”; compare *I haven’t received this week’s wages yet* and *There has been little increase in the average weekly wage this year*. *Returns* differs little from one sense of *return*: *I’m not satisfied with the return/returns on my investment*.

The nouns in [34iii] are used in relatively formal expressions of feelings: *Please accept my condolences*; *My father sends his regards*. *Thanks* and *congratulations* might be added here or in [ii].

Finally, [34iv] contains a set of miscellaneous plural-only nouns. *Heads* and *tails* apply in the tossing of coins. *Elders* means “those who are older”: *Show more respect for your elders*. *Eye-drops* can be a straightforward plural of *eye-drop* (*He put two eye-drops in each eye*), but in *a bottle of eye-drops* it denotes a quantity of liquid. Plural-only non-count *brains* is seen in examples like *Use your brains* or *She has brains* (which is close in meaning to *She has a good brain*); contrast the ordinary count *brains* of *She examined the brains of the victims*. Others that can also be ordinary plurals with a count sense are: *customs* (as in *customs and excise*); *grounds* (*the palace grounds*); *looks* (*Kim has good looks*); *spirits* (*They are in good spirits*). *Folks* is used with genitive determiners in the same meaning as *family*, and is informal in style: *My folks are pretty dumb*. It can also be used as a form of address, and is not restricted in this case to family members: *goodbye, folks!* (For *folk* as a plural form, see §3.2.2 below.)

Most of the nouns in [34] not only lack a singular form but also exclude cardinal numerals with the plural: \**seven amends*; \**three folks of mine*. However, *minutes* “written record of a meeting” is marginally countable: *Three separate minutes were kept of the meeting*. Similarly with *arrears*: *There are three separate arrears on this account*.

### ■ Functionally restricted plural-only nouns

- [35] i *at loggerheads with*    *at odds with*    *for keeps*  
           *in cahoots with*        *in the doldrums*    *on friendly terms with*  
 ii *I’m no longer friends with him.*

There are a good number of more or less fixed phrases containing non-count plurals, as in [i]. In [ii] the plurality of *friends* derives from the fact that two people are involved in the relation (cf. *We are no longer friends*), but the plural appears in predicative complement function with a singular subject. This plural-only non-count use is to be distinguished from the ordinary use seen in *They are friends of mine* (cf. *He’s a friend of mine*; *They are two old friends of mine*); the *friends with* construction focuses on the relationship, while the *friend of* construction gives a descriptive property of the predicand.

### 3.2.2 Other plural-only nouns

#### (a) Foreign plurals with no singular counterpart

[36] *genitalia*            *minutiae*            *regalia*

See also §3.2.4 for some foreign plurals that have been partially reanalysed as singular.

#### (b) Uninflected plural-only nouns

There are a few plural-only nouns that are not morphologically marked as plural:

[37] i *cattle*            *livestock*            *police*            *poultry*<sub>1</sub>            *vermin*  
 ii *folk*                *people*<sub>1</sub>

The lack of a singular–plural contrast is seen in such pairs as:

[38] a. *These cattle belong to my uncle.*      b. *\*This cattle belongs to my uncle.*

The items in [37i] cannot be used with low numerals, but are found with high round numerals (and hence might be classified as ‘quasi-count nouns’). Their denotation is thought of en masse, with none of the individuation into atomic entities that the use of a low numeral implies. Genuine count nouns (usually of somewhat more specific meaning) must be substituted in order for this individuation to take place. Compare:

[39] i *a thousand cattle*            *\*seven cattle*            *seven cows*  
 ii *two hundred police*            *\*four police*            *four policemen / police officers*

An alternative, in the case of *cattle*, is to use a quantificational noun construction: *seven head of cattle*. *Poultry*<sub>1</sub> denotes hens and other fowl; it is distinguished from the non-count singular-only *poultry*<sub>2</sub>, which denotes the meat of these birds (*Poultry is cheaper than beef*).

*Folk* and *people*<sub>1</sub>, by contrast, do occur with low numerals: *these three city folk*, *two people*;<sup>9</sup> they can therefore be regarded as exceptional count nouns, differing from normal ones only in the absence of a singular. *People*<sub>1</sub> is distinguished from *people*<sub>2</sub>, a noun with regular singular and plural forms: compare *They are a very family-oriented people*<sub>2</sub> and *Similar customs are found among many peoples*<sub>2</sub> of the world. Instead of *\*one people*<sub>1</sub> we have *one person*, *person* being an ordinary noun with singular and plural forms. *Persons* is then in competition with *people*<sub>2</sub>; the latter is considerably more common, *persons* often (though not invariably) being associated with legal or quasi-legal contexts (cf. *Persons using the footbridge do so at their own risk*). *Folk* has a similar meaning to *people*<sub>1</sub>, but its use is mostly restricted to a few standard collocations: *country folk*, *city folk*, *island folk*, *the folk around here*. It can also be used with proper name modifiers, with the same connotations of group identity: *Virginia folk*, *East Anglia folk*. (For plural-only *folks*, containing the regular plural suffix, see [34iv] above.)

### 3.2.3 Singular nouns with the -s ending

There are a number of nouns in English which appear to have the same ending as plural nouns but which are in fact singular. One clear example is the disease name *shingles*. There is a singular noun *shingle* but it is not related semantically (or etymologically) to

<sup>9</sup>There is, however, a slightly old-fashioned use with the sense ‘family’ which is non-count: *My people have lived in these parts for several generations*.

*shingles*. The existence of the singular form *shingle* helps give *shingles* the appearance of a plural form, but this appearance is misleading: it is singular. Evidence for saying that it is grammatically singular is provided by examples like:

[40] *Shingles is/are often excruciatingly painful; I hope I never get it/\*them.*

This case is to be distinguished from that illustrated in:

[41] i *A very pleasant three days was spent with Kim's aunt in Brighton.*

ii *Three ounces of sugar is rather too much.*

Here *days* and *ounces* are plural nouns even though the NPs containing them are construed as singular, as shown by the 3rd person singular verb-forms *was* and *is*. These involve semantically motivated recategorisation: in [i] the nominal *three days* is recategorised as singular by virtue of denoting a continuous stretch of time, while in [ii] the NP *three ounces of sugar* is recategorised as singular by virtue of denoting a quantity. There is a clear distinction between these constructions (discussed in §3.4 below) and the *shingles* case, but we will see that there are some examples whose assignment to one or other type is more problematic.

An isolated example of the *shingles* type is the non-count noun *news*, as in *This news is encouraging*. *News* is morphologically analysable into *new* + *s*, but *new* is not a noun, nor *-s* here an inflectional suffix. Other cases we discuss in groups.

#### (a) Diseases and ailments

[42] i *bends*                    *hives*                    *mumps*                    *rabies*                    *ricketts*                    *shingles*  
 ii *haemorrhoids*            *hiccups*                    *measles*

The terms in [i] are singular nouns, behaving like our model example *shingles*. Some, such as *bends* (which occurs with the article *the*), are etymologically plurals, but as disease names they are not systematically related to the forms without *-s*. The words in [ii] are different. *Hiccup* is a singular noun denoting an involuntary spasm of the respiratory organs producing a characteristic sound, and *hiccups* can be a straightforward plural counterpart: *I heard two further hiccups and then there was silence*. *Hiccups* can also denote the condition where one is producing such spasms, and in this case it can be construed as singular or plural for purposes of subject–verb agreement: *Hiccups is/are unpleasant, I concede, but it/they are hardly life-threatening*. *Hiccups* is thus best treated as a plural noun, with the NP it heads optionally recategorised as singular by virtue of being interpreted as denoting a condition rather than the spasms themselves: this is to handle it like [41]. The same applies to *haemorrhoids*. And probably also to *measles*, except that here the use of *measle* and *measles* for the spots that characterise the disease is relatively uncommon; many speakers will have only the form *measles* denoting the disease and for them it is likely to belong with the singular nouns in [42i].

#### (b) Nouns with the *-s* ending in both singular and plural

[43] *barracks*                    *crossroads*                    *gallows*                    *headquarters*                    *innings*                    *kennels*  
*links*                            *means*                            *mews*                            *rapids*                            *waterworks*

*Waterworks* is illustrative of a handful of compounds in *-works*: *gasworks*, *ironworks*, etc. *Innings* is used in connection with such games as cricket: for baseball the term is *inning*, with *innings* a regular plural. *Kennels* here denotes an establishment where dogs are bred

or looked after while their owners are away; *kennels* can also be the ordinary plural of *kennel*, “small hut for a dog”. *Links* denotes a golf-course (and is often compounded with *golf*).

The words in [43] are count nouns with identical singular and plural forms:

- [44] i *This barracks is in urgent need of repair.*  
 ii *These two barracks have been used to accommodate refugees.*

In several cases at least, the *·s* transparently has its source in the ordinary plural suffix, but it is not serving to mark these words themselves as plural. *Crossroads* applies to a place where roads cross but it denotes the intersection, a singular concept, not the roads as such. The *·s* is part of the lexical base of these words, not an inflectional suffix added to it. BrE *licensed premises* (“pub”) belongs here too, and so for many people does *splits* as used in gymnastics, etc.: *a licensed premises, a finely executed splits*. *Series* and *species* might also be included, though it is doubtful if these are perceived as containing a morphological ending *·s* at all.

### (c) Nouns in *·ics*

- [45] i *acoustics*    *classics*    *economics*    *ethics*    *linguistics*    *mathematics*  
           *mechanics*    *phonetics*    *physics*    *politics*    *semantics*    *statistics*  
 ii *athletics*    *gymnastics*

The nouns in [i] denote fields of study (with some having other meanings too); those in [ii] various sporting activities. For some of them there is a related singular noun without the *·s* (*acoustic, classic, ethic, statistic*), and these have regular count plurals:

- [46] i *The new concert hall has two distinct acoustics.*  
 ii *Two distinct ethics are in conflict in this school.*  
 iii *Two newly published statistics reveal that alcohol is good for you.*

Where there is no form without *·s* we still find plural agreement for some uses:

- [47] i *His politics are somewhat to the left of my own.*  
 ii *I recall the mental gymnastics that were required to keep up with him.*  
 iii *I'm afraid the mechanics of the market are beyond me.*

There can be no doubt that the *·ics* words in [46–47] are plurals. But in the case of *phonetics*, for example, there is no noun *phonetic*, and *phonetics* itself behaves as a non-count singular, as evident from the *much* and *it* in:

- [48] *There is unfortunately not much phonetics in the course: it's my best subject.*

It would be quite implausible to analyse *phonetics* as a plural noun that is merely recategorised as singular: it is simply a singular noun. Historically, *·ics* consists of *·ic* + the plural suffix, but it is arguable that they have undergone reanalysis, combining into a single suffix indicating a field of study. But as is often the case with reanalysis, there is variation in the present-day system – between singular and plural agreement with such words as *athletics* and *mathematics*, for example. With such words, and those that have both a field of study sense and some other sense, it is difficult to decide whether singular behaviour in the field of study sense should be handled by saying that the form is morphologically singular (like *shingles*) or in terms of recategorisation of a plural NP (like our *two ounces of sugar* example).

## (d) Games

- |      |    |                  |                     |                     |                 |                 |
|------|----|------------------|---------------------|---------------------|-----------------|-----------------|
| [49] | i  | <i>billiards</i> | <i>checkers</i> AmE | <i>draughts</i> BrE | <i>fives</i>    | <i>ninepins</i> |
|      | ii | <i>cards</i>     | <i>darts</i>        | <i>dominoes</i>     | <i>skittles</i> |                 |

As names of games these normally take singular agreement, but those in [ii] can also be ordinary plurals applied to the entities used in the game:

- [50] i *Billiards/Dominoes is one of my favourite games.*  
 ii *I've only three dominoes left.*

The natural solution for [49ii] is to say that these are plural nouns, with the NP they head being recategorised as singular when interpreted as denoting the game (a singular concept) rather than the pieces. But the nouns in [49i] apply only to the game (ignoring irrelevant senses), and are therefore better treated as simply singular nouns, with the *-s* part of the lexical base.<sup>10</sup>

## 3.2.4 Variation between singular and plural construals

There are a number of nouns with Latin plural endings where English usage is divided as to whether they are construed as singular or plural:

- |      |    |                 |                  |                 |                      |                 |
|------|----|-----------------|------------------|-----------------|----------------------|-----------------|
| [51] | i  | <i>algae</i>    | <i>bacteria</i>  | <i>criteria</i> | <i>data</i>          | <i>insignia</i> |
|      |    | <i>media</i>    | <i>phenomena</i> |                 |                      |                 |
|      | ii | <i>ephemera</i> | <i>erotica</i>   | <i>exotica</i>  | <i>paraphernalia</i> | <i>trivia</i>   |

We thus find <sup>0</sup>*this algae* and <sup>0</sup>*these algae*, <sup>0</sup>*the data that is relevant* and <sup>0</sup>*the data that are relevant*, <sup>0</sup>*too much trivia* and <sup>0</sup>*too many trivia*, and so on. Those in [i] are historically plurals of the unequivocally singular forms:

- |      |               |                   |                  |              |                |
|------|---------------|-------------------|------------------|--------------|----------------|
| [52] | <i>alga</i>   | <i>bacterium</i>  | <i>criterion</i> | <i>datum</i> | <i>insigne</i> |
|      | <i>medium</i> | <i>phenomenon</i> |                  |              |                |

These singulars, however, are – in varying degrees – uncommon in comparison with their plural counterparts, and this has led to some speakers reanalysing the forms in [51i] as singulars, inflectionally unrelated to the forms in [52]. *Alga*, *bacterium*, and *insigne* are particularly rare outside specialised registers, and many speakers will be familiar only with their counterparts in [51]. Some of the items in [51i] are treated as count singulars with regular plural counterparts: <sup>1</sup>*bacterias*, <sup>1</sup>*criteria*, <sup>0</sup>*insignias*, <sup>1</sup>*medias*, <sup>1</sup>*phenomenas*. Of these, however, only *insignias* has gained any significant degree of acceptance, and that in AmE rather than BrE: the others are still regarded as clearly non-standard, as indicated by the annotation. It should be noted, however, that this reanalysis has taken place in the history of *agenda* and *candelabra*, former plurals which are now uncontroversial singulars with the regular plurals *agendas* and *candelabras*.<sup>11</sup>

As for the singular use of the forms in [51], all except *criteria* and *phenomena* are well enough established to be regarded as standard. With *data* the singular construal is particularly common in the field of computing and data-processing, where *datum* is hardly applicable. The most frequent use of *media* is in the phrase *the media*, applied to

<sup>10</sup>For some speakers *draughts* belongs in [ii], being applicable to the pieces as well as the game. The coordination *cowboys and indians* also belongs in [ii], but with the singular forms denoting participants.

<sup>11</sup>*Candelabra*, however, is still encountered as a plural of a rare *candelabrum*.

the means of mass communication, the press, radio, and television, where both singular agreement and plural agreement are well established.

### 3.3 Non-count quantificational nouns

The most straightforward type of quantification involves a quantifier in determiner or modifier function: *many books*, *these three houses*. But quantification can also be expressed by means of a noun as head with an *of* PP as complement. We are concerned in this section with the case where the quantificational noun is non-count, as in *a lot of people*.

There are three versions of this non-count quantificational noun construction to be considered, as illustrated in [53], where double underlining marks the quantificational noun and single underlining marks what we shall call the **oblique**, the NP complement of *of*:

- |      |  |  |
|------|--|--|
| [53] | SINGULAR   | PLURAL   |
| i    | a. [ <u>A lot of <u>work</u></u> ] was done.               | b. [ <u>A lot of <u>errors</u></u> ] were made.                    |
| ii   | a. [ <u>A great <u>deal</u> of <u>work</u></u> ] was done. | b. *[ <u>A great <u>deal</u> of <u>errors</u></u> ] were/was made. |
| iii  | a. *[ <u><u>Dozens</u> of <u>work</u></u> ] was/were done. | b. [ <u><u>Dozens</u> of <u>errors</u></u> ] were made.            |

In [i] the number of the whole NP depends on the oblique: we will say that *lot* is **number-transparent** in that it allows the number of the oblique to percolate up to determine the number of the whole NP. In [ii], singular *deal* selects a singular oblique, while in [iii] plural *dozens* selects a plural oblique. (We include both *was* and *were* in [iib] and [iiia] to show that the ungrammaticality is not a matter of subject–verb agreement but lies within the NP.)

The obliques may be either **partitive** or **non-partitive**:

- |      |    |  |                 |
|------|----|--|-----------------|
| [54] | i  | [A lot of <u>the delegates</u> ] complained. | [partitive]     |
|      | ii | [A lot of <u>people</u> ] complained.        | [non-partitive] |

In [i] the whole NP picks out a subset of the set referred to by *the delegates*, whereas there is no such subset relation involved in [ii]. The partitive obliques are normally definite and are distinguished from the non-partitives in that they occur in the fused-head construction:

- |      |    |   |                 |
|------|----|---|-----------------|
| [55] | i  | [Many of <u>the delegates</u> ] complained. | [partitive]     |
|      | ii | *[Many of <u>delegates</u> ] complained.    | [non-partitive] |

Instead of [55 ii] we have simply [*Many delegates*] complained, where there is no embedding of one NP within another.

#### (a) Number-transparent quantificational nouns

The *lot* in [53i] is to be distinguished from that of *We have two lots of visitors coming this afternoon, one at 2.30 and the other at 4*, where *lot* is a count noun meaning “group”. In the use illustrated in [53i] it has been bleached of its original meaning and is a non-count noun, with the bracketed NPs meaning respectively “much work” and “many errors”. The *of* complement can be omitted in ellipsis, but it remains understood and continues to determine the number of the NP headed by *lot*, as is evident from the verb-forms in:

- |      |    |   |                                      |
|------|----|---|--------------------------------------|
| [56] | i  | A: Where did <u>all the money</u> go?       | B: <u>A lot was</u> spent on travel. |
|      | ii | A: What happened to <u>the protesters</u> ? | B: <u>A lot were</u> arrested.       |

In [i] *a lot* is understood as “a lot of the money” and hence is singular, in [ii] as “a lot of the protesters”, and hence plural.

The main number-transparent nouns are as follows:

- |        |                  |               |              |              |               |               |
|--------|------------------|---------------|--------------|--------------|---------------|---------------|
| [57] i | <i>lot</i>       | <i>plenty</i> |              |              |               |               |
| ii     | <i>lots</i>      | <i>bags</i>   | <i>heaps</i> | <i>loads</i> | <i>oodles</i> | <i>stacks</i> |
| iii    | <i>remainder</i> | <i>rest</i>   |              |              |               |               |
| iv     | <i>number</i>    | <i>couple</i> |              |              |               |               |

Singular *lot* takes *a* as determiner, and allows a very limited amount of premodification, as in *A whole/huge lot of time has been wasted*.<sup>12</sup> *Plenty* is singular in form but does not permit any determiner or modifier: *plenty of butter/friends*, not *\*a remarkable plenty of butter/friends*. The plural forms in [ii] occur without determiners; *lots* is informal and the others very colloquial. These latter hardly allow partitive obliques: compare, for example, *They have oodles of money* but hardly *?Oodles of the money had already been spent*. *Remainder* and *rest* take the definite article *the* and allow only a partitive oblique: *the remainder/rest of the time/errors*, not *\*the remainder/rest of time/errors*.

*Number* and *couple* permit only plural obliques, partitive or non-partitive: *a number of the protesters/\*money*, *a couple of days/\*hope*. Both occur in singular form with an obligatory determiner (usually *a*, but others are possible as shown in [58]), and in addition **number** can occur in the plural, and take a limited range of adjectival modifiers:

- |        |   |
|--------|---|
| [58] i | <i>We found [huge <u>numbers</u> of ants] swarming all over the place.</i>                    |
| ii     | <i>If [this <u>number</u> of people] come next time we'll bring in professional caterers.</i> |
| iii    | <i>[Any <u>number</u> of people] could have done a better job than that.</i>                  |
| iv     | <i>[The <u>couple</u> of mistakes she had made] were easily corrected.</i>                    |
| v      | <i>[An unusually large <u>number</u> of people] have applied this year.</i>                   |
| vi     | <i>[How large a <u>number</u> of students] have enrolled, did you say?</i>                    |

The definite article *the* does not occur with *number* in the sense we are concerned with here. In the number-transparent sense it indicates an imprecise number, but elsewhere it indicates a precise number, and in that case it can take *the*, as in *The number of protesters arrested has not been revealed*, where the subject NP is singular by virtue of having singular non-transparent *number* as head.

#### (b) Non-count quantificational nouns selecting a singular oblique

One clear case here is *deal*, as in [53ii] (*a great deal of work*, but not *\*a great deal of errors*). Non-partitive obliques are construed as non-count. In Standard English *deal* requires an adjectival modifier, normally *great* or *good*, as well as the indefinite article. Informal *smidgen* and *bit* are also of this type: *a smidgen/bit of improvement*, but not *\*a smidgen/bit of improvements*. The sense of *bit* here is different from that of non-quantificational *bit*, “piece”, as in *two bits of cheese*. *Amount* and *quantity* are for many speakers likewise restricted to singular obliques, but here we find divided usage with respect to examples like *\*a large amount/quantity of stamps*. Conservative usage manuals tend to condemn such examples, while more liberal ones recognise that they are quite common – especially when there would be no question of specifying a precise number, as in *a large amount of pebbles*. Compare also the non-count plural oblique in *a huge amount/quantity of stolen goods*. But in any case *amount* and *quantity* differ from *deal* in that they are count nouns: *Two small quantities of silver had been discovered*.

<sup>12</sup> *Lot* can occur in the complement of *hell/heck*, and in *A hell of a lot of people are going to be disappointed* the plural feature percolates up from *people* to the topmost NP. See §14.1 for more on this construction.

## (c) Non-count quantificational nouns selecting a plural oblique

*Dozens* in [53iii] (*dozens of errors*, but not *\*dozens of work*) is representative of the following class:

[59] *dozens scores tens hundreds thousands millions billions zillions*

We distinguish these plural nouns from the singular forms that appear in cardinal numerals and comparable quantifiers:

[60] i a. *dozens of spiders*      b. *hundreds of voters*      [head noun + complement]  
 ii a. *a dozen spiders*      b. *three hundred voters*      [determiner + head noun]

The head in [i] is *dozens/hundreds*, whereas in [ii] it is *spiders/voters*. The crucial difference is that the plural nouns in [i] cannot be related directly to the noun whose denotation is quantified: they require *of* (cf. *\*dozens spiders*, *\*hundreds voters*). The quantifiers can occur with a definite *of* phrase in the partitive fused-head construction (*a dozen of the spiders*, *three hundred of these voters*), but in the simplest construction they occur as dependents of a following head, as in [ii].

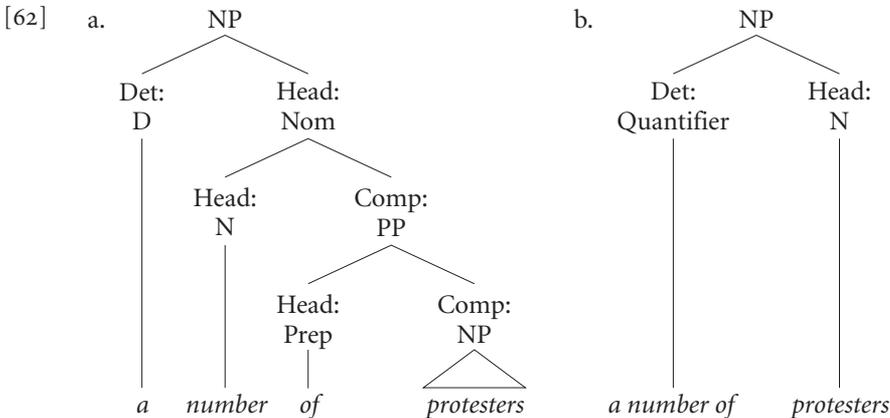

The plural nouns in [59] are non-count in that they cannot take numerals as dependent; instead we have iteration of the head noun + complement construction:

[61] i a. *\*ten thousands of stars*      b. *tens of thousands of stars*  
 ii a. *\*seven thousand millions of stars*      b. *thousands of millions of stars*

*Tens* is largely restricted to this iterated construction: *?tens of mistakes*. The construction does, however, allow *many* or certain definite determiners (*many thousands of stars*, *the thousands of stars you can see*, *those millions of people living in poverty*).

■ Syntactic structure of NPs like *a number of protesters*

The analysis we have assumed for *a number of protesters* takes *number* as head and *of protesters* as complement – and analogously for the other quantificational noun constructions covered above. An alternative analysis found in many works takes *protesters* as head and *a number of* as a complex quantifier. Simplified tree structures will be as follows:

The main motivation for analysis [b] is that the grammatical number of the whole NP is plural. In [b] this follows from the general rule that the number of an NP derives from

its head, whereas in [a] special provision has to be made, with the grammatical number percolating upwards from the oblique rather than being determined by the head.

We believe, however, that there are compelling arguments in favour of analysis [a] which far outweigh this point.

(a) Evidence that *of* forms a constituent with the oblique, not with (a) *number*

[63] i *Most students like continuous assessment but [a number \_\_ prefer the old examination system].*

ii *We called a meeting of the first-year students, [of whom a number \_\_ had complained about the assessment system].*

Example [i] shows that if the oblique is omitted in ellipsis the *of* drops too, as is the case with PPs generally. In [ii] the oblique is not dropped but relativised, and *of whom* is clearly a PP occupying prenuclear position in the relative clause. There is no plausible way of reconciling these constructions with analysis [b].

(b) Pre-head dependents of *number*

Analysis [62b] effectively treats *a number of* as a fixed phrase: it doesn't provide a structure with potential for replacements and expansion. But we have seen that *a* is replaceable by certain other determiners (e.g. *this* or *any*, as in [58ii–iii]); that **number**, although non-count, has both singular and plural forms; and that *number* can take adjectival modifiers (as in [58v–vi]) – note in particular the position of the interrogative phrase in *how large a number of students*. To cater for these constructions analysis [62b] would need to assign to complex quantifiers a structure that duplicates in many respects what we already have for the NP.

### 3.4 Number agreement and selection within the NP

Restrictions on the combination of elements within an NP that have to do with number are of two kinds, **agreement** and **selection**:

[64] i a. *this book* / \**this books*            b. *these books* / \**these book*            [agreement]  
 ii a. *one doctor* / \**one doctors*            b. *two doctors* / \**two doctor*            [selection]

We say there is agreement in [i] because *this* and *these* are inflectional forms of a single lexeme **this**: the agreement rule requires the singular form *this* when the head itself is singular, and the plural form *these* when the head is plural. But in [ii], *two* is not the plural counterpart of *one* any more than *three* is: *one* and *two* are not forms of a single lexeme differing simply with respect to an inflectional property. We talk here, then, of selection: *one* selects a singular head, *two* a plural one.

#### ■ Agreement

There are just two dependents that agree in number with the head, the demonstratives **this** and **that**:

[65] a. *this girl* ~ *these girls*            b. *that boy* ~ *those boys*

#### The *these kind of dogs* construction

Exceptionally, the nouns **kind**, **sort**, and **type** can occur in the singular with a plural demonstrative. Compare:

[66] i a. [This kind of dog] is dangerous.            b. [These kinds of dogs] are dangerous.  
 ii [These kind of dogs] are dangerous.

The examples in [i] follow the normal agreement rule, but [ii] does not. The meaning of the bracketed NP in [ii] is like that of the one in [ia] in that we have a single kind of dog, not a plurality, as in [ib]; cf. also *dogs of this kind*. Construction [ii] involves number-transparency as in the *a number of protesters* construction discussed in §3.3 above, for the plural number of the whole NP is determined by that of the oblique *dogs*, but this time the plural number carries over to the demonstrative determiner too. The construction is very well established, and can certainly be regarded as acceptable in informal style.

### ■ Selection

Determiners such as *the, which, no* are indifferent as to the number of the head, whereas others are selective.

#### (a) Dependents that select a singular head

[67]	i	<i>a</i>	<i>one</i>	<i>each</i>	<i>every</i>	<i>either</i>	<i>neither</i>
	ii	<i>much</i>	<i>little</i>	<i>a little</i>			

As noted earlier, those in [i] combine with count singulars, those in [ii] with non-count singulars.<sup>13</sup> *A* belongs in set (c) below when compounded with *other* or combined with *further* or *additional*. The quantifiers in [ii] marginally permit certain non-count plurals such as *oats*: ?*We haven't got much oats left* (§3.2.1).

#### (b) Dependents that select a plural head

[68]	i	<i>two</i>	<i>three</i>	<i>one and a half</i>	2.3 (/tu: pɔɪnt θri:/)	
	ii	<i>both</i>	<i>several</i>	<i>many</i>	<i>few</i>	<i>a few</i>
	iii	<i>numerous</i>	<i>countless</i>			
	iv	<i>we</i>	<i>you</i>			

Those in [i] are illustrative of numerals greater than one, whether integral or not: compare *half an apple* and *one and a half apples*. The items in [iii] are adjectives: *numerous objections*, *countless mistakes*. The 1st and 2nd person determinatives *we* and *you* are seen in *we veterans*, *you youngsters*.<sup>14</sup>

#### (c) Dependents or sequences that select a singular or quantified plural head

[69]	<i>another</i>	<i>an additional</i>	<i>a further</i>	<i>a good</i>
------	----------------	----------------------	------------------	---------------

- [70] i [Another *body*/\**bodies*] *had been discovered*.  
 ii [Another *three bodies*] *have been discovered*.  
 iii [A *further few*/\**many volunteers*] *were needed*.  
 iv *He ate [a good *three hefty steaks*] before leaving the table*.

A plural head is permitted only if it is quantified by a numeral or by *few*. With singular heads, *a good* is restricted to occurrence with abstract nouns like *time*, *period*, *distance*, *way*, *stretch*, *weight*, and measure nouns like *day*, *hour*, *week*: *We have a good stretch still to cover* or *It took me a good day to finish the assignment*.

<sup>13</sup> *One* selects a singular head even when it occurs in DPs headed by *more* like *more than one* or *one more*: see [6] of §11. However, it selects a plural in examples like [*one in ten*] *students*, where *one in ten* is a DP indicating proportion ("10% of"). The head is also plural when determined by the coordinations *one or two* and *one or more*.

<sup>14</sup> The requirement for a plural head with *you* does not apply in vocative NPs: *Why did you miss the train, you fool?* – nor in the exclamatory construction *You bastard!* Such NPs can never occupy a complement position in ordinary clause structure: \**You fool are late!*

### ■ Respecification of plural measure phrase nominals as singular

Certain kinds of plural nominal can be respecified as singular:

- [71] i [*That ten days we spent in Florida*] *was fantastic.* [period of time]  
 ii [*This twenty dollars isn't going to get us very far.*] [sum of money]  
 iii [*This next two miles isn't going to be difficult.*] [distance]  
 iv [*This last fifty bars clearly isn't Beethoven.*] [stretch of music]  
 v [*That two pounds of sugar you bought*] *isn't going to be enough.* [quantity]

The underlined nominals here are plural with respect to their internal form (they have plural nouns as head) but they are conceptualised as denoting single entities: a period of time, a sum of money, a distance, a stretch of music, a quantity. This singular conceptualisation overrides the plurality of form, so that they are treated as singular heads – just like *that period of ten days*, *this sum of twenty dollars*, and so on.<sup>15</sup>

Such respecification is in general optional. Besides [71], for example, we find:

- [72] i [*Those ten days we spent in Florida*] *were fantastic.*  
 ii [*These twenty dollars aren't going to get us very far.*]  
 iii [*These next two miles aren't going to be difficult.*]  
 iv [*These last fifty bars clearly aren't Beethoven.*]  
 v [*Those two pounds of sugar you bought*] *aren't going to be enough.*

However, with quantifiers that select singular heads, respecification is the only option:

- [73] i [*Every ten days we've spent on the project*] *has/\*have cost a fortune.*  
 ii [*Each fifty bars*] *was/\*were a new challenge.*

The respecification of plural nominals as singular is clearly similar to the occurrence of quantified plurals with *another* and the other items in [69]. In particular the nominal must again be quantified by a numeral or by *few*: *That few/\*many days we spent in Florida was fantastic*. Moreover, respecification of plural measure nominals as singular is found with *another*, etc., as well as with the items shown in [71] and [73]. But *another*, etc., also occur with plural nominals that are not measure phrases and that do not permit respecification. Compare:

- [74] i [*Another three days*] *are/is going to be needed.* [respecification permitted]  
 ii [*Another three bodies*] *have/\*has been discovered.* [respecification disallowed]

*Three days* in [i] is a measure phrase that can be conceptualised as denoting a single period of time, in which case we have respecification as a singular, just as we do with *this*, *every*, etc. But *three bodies* in [ii] is not a measure phrase and cannot undergo respecification, as shown by the verb-form, or by the impossibility of replacing *another* by *this* or the like: *Where did they find these!/\*this three bodies? Another and a(n) additional further/good* can thus combine with nominal heads that are both conceptually and formally plural.

## 4 The determiner function

The determiner is a key function in the structure of the NP. When a determiner is added to a nominal, a construction at the NP level is formed. In the case of nominals headed

<sup>15</sup>The respecification of a plural head as singular is also found in fused-head NPs where the head is a numeral: *Then it would be reasonable to suppose that he showed the diamonds to you, his customer. Or showed you twenty-five of them perhaps. Then he sent that twenty-five back to Antwerp by the Euro-Securo couriers.* We interpret *that twenty-five* anaphorically as “that batch of twenty-five diamonds”.

by singular count nouns, addition of a determiner is generally obligatory:

- [1] i \*[*New car*] *was stolen*. [bare count singular nominal]  
 ii [*The/One/Ally's new car*] *was stolen*. [determiner + nominal]

In [i], the nominal *new car*, headed by the singular count noun *car*, cannot by itself constitute an NP which is capable of acting as the subject of the clause. In [ii], the addition of the determiners *the*, *one*, and *Ally's* to this same nominal forms the NPs *the new car*, *one new car*, and *Ally's new car*. Each determiner has its own specialised meaning. However, one general function of all determiners is to add a specification of definiteness (as with *the* or *Ally's*) or indefiniteness (*one*). In their primary use, proper names are inherently definite: we defer consideration of them until §20.

### ■ Determined and bare NPs

NPs containing a determiner we call **determined NPs**. Under certain circumstances, nominals can themselves form NPs in the absence of a determiner, and we speak here of **bare NPs**. Nominals headed by plural count nouns or by non-count nouns can freely be admitted as indefinite by default, forming bare indefinite NPs such as *new cars* in *We used to buy new cars*, or *Danish cheese* in *We used to prefer Danish cheese*. Compare then [1] with the plural [2]:

- [2] i [*New cars*] *were stolen*. [bare NP]  
 ii [*The/Two/Ally's new cars*] *were stolen*. [determined NP]

In [i] the nominal *new cars* forms a bare indefinite NP, while in [ii] the addition of determiners forms NPs in the same way as in [1], with *the new cars* and *Ally's new cars* definite, *two new cars* indefinite. There are, however, various exceptional cases where bare count singular nominals are admitted as NPs – compare *Henry became treasurer*; *Ed went to school*; *What time did you have breakfast?*; *We are monitoring the situation day by day*: these constructions are discussed in §8.5.

### ■ Types of determiner

We distinguish the following types of determiner:

- |     |     |                     |   |                |                         |                           |
|-----|-----|---------------------|---|----------------|-------------------------|---------------------------|
| [3] | i   | BASIC DETERMINERS   | { | determinatives | <i>the tie</i>          | <i>those shoes</i>        |
|     |     |                     |   | DPs            | <i>almost every tie</i> | <i>at least two shoes</i> |
|     | ii  | SUBJECT-DETERMINERS | { | genitive NPs   | <i>my tie</i>           | <i>the boy's shoes</i>    |
|     | iii | MINOR DETERMINERS   | { | plain NPs      | <i>what colour tie</i>  | <i>this size shoes</i>    |
|     |     |                     |   | PPs            | <i>over thirty ties</i> | <i>up to thirty shoes</i> |

#### Distinction between determiner and determinative

We distinguish, then, between the concepts of determiner, a **function** in the structure of the NP, and determinative, a **category** of words (and certain larger expressions) whose distinctive syntactic property concerns their association with the determiner function. Determinatives (or phrases headed by them) constitute the most basic kind of determiner, but not all determiners have this form, as seen in [3ii–iii]. Conversely, most determinatives can occur in one or more functions besides that of determiner, as in [4i–v], or combine the function of determiner with that of head in the fused-head

construction, as in [4vi–viii]:

- |     |      |   |                            |
|-----|------|---|----------------------------|
| [4] | i    | [ <u>All</u> the vases] are broken.                             | [predeterminer]            |
|     | ii   | [The <u>three</u> rings] were stolen.                           | [modifier in nominal]      |
|     | iii  | The problem isn't [ <u>that</u> serious].                       | [modifier in other phrase] |
|     | iv   | We are [ <u>three</u> in number].                               | [predicative complement]   |
|     | v    | The remark was [ <u>both</u> offensive] and irrelevant.         | [marker of coordination]   |
|     | vi   | He gave ten copies to me and [ <u>six</u> ] to the others.      | [simple]                   |
|     | vii  | I had taken lots of books but <u>all</u> (of them) were novels. | [partitive]                |
|     | viii | They couldn't find <u>much</u> to criticise.                    | [special]                  |

Traditionally, different uses of the determinatives are largely handled in terms of differences in part-of-speech classification. For example, *both* is traditionally an adjective in *both sides*, a pronoun in *both of them*, an adverb in *both Jill and her husband*. Within the framework adopted in this book it is generally more appropriate to handle these differences in terms of function rather than category: we deal with this issue in some detail in our discussion of the fused-head construction in §9. The syntactic distinction between determinatives and adjectives is discussed in Ch. 6, §2.4.2.

### Basic determiners

These generally have the form of determinatives alone or with a limited range of modifiers (such as *almost* and *at least* in [3i]). We include in the category of determinatives certain complex expressions (such as *a few*, *many a*, cardinal numerals expressing numbers greater than 100) whose internal structure is not describable in terms of general rules of syntax applying elsewhere. The main members of the determinative category are as follows:

- |     |      |  |   |
|-----|------|--|---|
| [5] | i    | <i>the, a</i>                                | articles  |
|     | ii   | <b><i>this, that</i></b>                     | demonstrative determinatives                            |
|     | iii  | <b><i>we, you</i></b>                        | personal determinatives                                 |
|     | iv   | <i>all, both</i>                             | universal determinatives                                |
|     | v    | <i>each, every</i>                           | distributive determinatives                             |
|     | vi   | <i>some, any</i>                             | existential determinatives                              |
|     | vii  | <i>one, two, three, . . .</i>                | cardinal numerals                                       |
|     | viii | <i>either, neither</i>                       | disjunctive determinatives                              |
|     | ix   | <b><i>no</i></b>                             | negative determinative                                  |
|     | x    | <i>another</i>                               | alternative–additive determinative                      |
|     | xi   | <i>a few, a little, several, . . .</i>       | positive paucal determinatives                          |
|     | xii  | <b><i>many, much, few, little, . . .</i></b> | degree determinatives                                   |
|     | xiii | <i>enough, sufficient</i>                    | sufficiency determinatives                              |
|     | xiv  | <i>which, what, whichever, whatever</i>      | interrogative and relative determinatives <sup>16</sup> |

Those in bold face exhibit inflectional variation: ***this*** and ***that*** inflect for number; ***we*** inflects for case (nominative *we*, accusative *us*); ***no*** has distinct dependent and independent forms (*no* and *none*); and the degree determinatives inflect for grade (*much, more, most*, etc.).

<sup>16</sup>The relative series also contains the archaic forms *whichever* and *whatsoever*. There is also a minor use of *such* that belongs with the determinatives: see §12. We might also include *last* and *next* as used in temporal deictic expressions such as *last week, next year*, etc., where they contrast with the central determinative *this*.

As determiners, the definite article *the* and those in [5ii–iv] mark the NP as definite, while the indefinite article and [v–xiii] mark it as indefinite; the items in [xiv] are indefinite as interrogatives, definite as relatives. Basic determiners are dealt with in §§6–7.

### Subject-determiners

Genitive NPs like those in [3ii] combine the function of determiner with that of subject of the NP: hence the term **subject-determiner**. As determiners, they specify an NP as definite: *Ally's new cars* is in this respect like *the new cars belonging to Ally*, where definiteness is instead specified by the basic determiner *the*. Genitive NPs function not only as determiner but also as fused determiner-head (*This car isn't as big as Ally's*), predicative complement (*Everything here is Ally's*), oblique genitive (*a friend of Ally's*), and as subject of a gerund-participial clause (*I object to [Ally's being given extra privileges]*). Most personal pronouns have two genitive forms, dependent (*my*) and independent (*mine*). The syntax and semantics of genitive NPs are described in §§16.3–6.

### Minor determiners

The determiner function can also be filled by a narrow range of plain-case NPs and PPs. The NPs are of two kinds. Firstly, there are those headed by nouns denoting elementary properties, such as *size*, *shape*, and *colour*. These occur most readily in interrogatives: [*What size hat*] *do you take?* They are also possible with a demonstrative, as in *They don't stock [that size shoes]*, but here there is a strongly preferred alternant in which the embedded NP functions as post-head modifier rather than determiner: *They don't stock [shoes that size]*.

The second kind of plain NP found in determiner function is a weekday name, or one of the temporal pronouns *yesterday* and *tomorrow*, as in *Sunday morning*, *tomorrow evening*, etc. We take the second noun as head since this is the one which marks the number of the whole NP: compare *Sunday morning* and *Sunday mornings*. Note also the contrast with *this morning*, where *this* is a basic determiner.

PP determiners normally have a cardinal numeral as complement of the preposition:

- [6] *around ten thousand copies, between fifty and sixty tanks, close to a hundred tickets, from ten to fifteen judges, in excess of ninety delegates, over a million people, under ten new drugs, up to twenty minutes*

These PPs are semantically comparable to DPs like *more than ten thousand*, etc., and we will return to them briefly in our discussion of the latter (§11).

## ■ Determiner as a dependent function, not a type of head

The analysis presented in this chapter differs from that adopted in much work in recent formal grammar in that we take elementary NPs like *the book* to be headed by the noun *book*, not the determinative *the*. This is of course implied by our retention of the term 'noun phrase'.

There are two main reasons for our decision to retain the traditional conception of such expressions as headed by the noun. Firstly, it is the noun (or nominal) which defines the selectional properties of the phrase. For example, a verb like *assassinate* selects a human NP as object (one can assassinate a president, but not a dog), whereas there is no verb in English which selects an object phrase determined by *the* as opposed to *no*. This is because the basic semantic function of the determiner is to indicate whether the phrase is definite or indefinite (whether it denotes something assumed to be identifiable), and this is independent of the role

The following table shows the classification of the simple quantifiers introduced so far:

[9]		UNIVERSAL		EXISTENTIAL	
			<b>basic</b>	<b>non-affirmative</b>	<b>negative</b>
	NEUTRAL	<i>all</i>	<i>some</i>	<i>any</i>	<i>no</i>
	DUAL	<i>both</i>		<i>either</i>	<i>neither</i>

*All*, we have noted, is not normally used in a context where it is known that the set has just two members: compare *Cars were parked on both/all sides of the road*. However, the “more than two” component in examples like *He had eaten all of the pies* is an implicature not an entailment. The right answer to the question *Have all (the) mistakes been corrected?* in a situation where there were exactly two mistakes and both have been corrected is “Yes”, not “No”. And of course no such “more than two” implicature can arise in non-count cases like *all of the meat*. It is for these reasons that we have labelled *all* ‘neutral’: there is no explicit indication of the size of the set or quantity.

In the dual series the “two” meaning is more prominent in universal *both* than in existential *either* and *neither*. Compare, for example, the interrogatives:

- [10] a. *Did he eat both of the pies?*                      b. *Did he eat either of the pies?*

A “yes” answer to [a] entails that he ate two pies, while a “yes” answer to [b] does not: it is merely that there are two pies under consideration. The greater prominence of “two” in *both* is reflected in the syntax of coordination. *Both*, *either*, and *neither* are the three words that can function to mark the first member of a coordination construction, and while *both* is limited to binary coordinations, *either* and *neither* are not. Thus we have *both Kim and Pat* but not *\*both Kim, Pat, and Alex*, whereas *either Kim, Pat, or Alex* and *neither Kim, Pat, nor Alex* are admissible.

### ■ Free choice *any* and *either*

Besides their use as an existential quantifier in non-affirmative contexts, *any* and *either* can be used with what is called a **free choice** sense:

- [11] a. *Any of these computers will do.*                      b. *Either of these computers will do.*

Again, *any* here implicates a set of three or more computers while *either* presupposes a set of just two. The interpretation is that if you choose arbitrarily from among the set of computers – i.e. make a free choice – the one you choose will have the predication property, i.e. in this case it will do (“satisfy the requirements”). In the free choice case, the quantifier is always stressed. Where relevant, we will distinguish the two senses with subscripts: *any<sub>n</sub>* and *either<sub>n</sub>* represent occurrence of these items with the non-affirmative existential sense, while *any<sub>f</sub>* and *either<sub>f</sub>* represent occurrences of them with the free choice sense.

*Any<sub>f</sub>* and *either<sub>f</sub>* are not excluded from non-affirmative contexts, so that there may be ambiguity between the two senses, as in:

- [12] *Were [any/either of the students] allowed to take part?*

In the non-affirmative existential sense, this asks if there was at least one of the students who was allowed to take part. In the free choice sense (with stressed quantifier) it asks whether permission to take part was available generally, i.e. whether a student chosen

arbitrarily from the set could take part. What is at issue in this second interpretation is whether or not restrictions applied as to which or how many students were allowed to take part.

Free choice *any* and *either* often implicate universal quantification. This is so in the examples cited: [11] implicates that all or both of the computers will do and a “yes” answer to the free choice reading of [12] implicates that all or both students had permission to take part. This component of the meaning is not an entailment. Imperative *Take any<sub>i</sub>/either<sub>i</sub> of the computers*, for example, is not an instruction to take all or both of them; indeed in such contexts there will tend to be an implicature limiting the number to one: “Take any/either one of the computers”.

The free choice quantifiers are admissible only in a certain range of contexts. *We haven’t had any rain for two months*, for example, admits only the non-affirmative reading, while *\*I had been for a long walk and was feeling hungry, so I ate any/either of the pies* excludes not only the non-affirmative reading (by virtue of being a positive declarative main clause) but also the free choice one.

### ■ Distributivity and the universal quantifiers *each* and *every*

The concept of **distributive** quantification can best be explained by means of the contrast illustrated in:

- [13] i *Five students* voted against the proposal. [distributive]  
 ii *Five students* lifted the piano onto the stage. [non-distributive: joint]

In [i] the predication property (“*x* voted against the proposal”) applies to the five students individually: there were five votes against the proposal. We say in such cases that the predication is interpreted distributively. The salient interpretation of [ii] by contrast is that the predication property (“*x* lifted the piano onto the stage”) applies to the five students jointly, collectively: they lifted it together. Here then the predication is interpreted non-distributively.

In this example there is no syntactic marking of the difference between the two interpretations. Thus [ii] could in principle be interpreted distributively, with the students individually lifting the piano onto the stage in turn: this is merely pragmatically unlikely. There are, however, two universal quantifiers, *each* and *every*, which explicitly indicate that the predication property applies distributively. Compare:

- [14] i *Every student* voted against the proposal. } [distributive]  
 ii *Each student* lifted the piano onto the stage. }

Here [ii] has the pragmatically unlikely interpretation where the students individually lifted the piano, so that there were as many acts of lifting the piano onto the stage as there were students: perhaps it was a toy or miniature piano, perhaps they had some mechanical aid.

### ■ Existential presupposition of universal quantification

It is normally presupposed, taken for granted, that a universally quantified set is not empty. *All left-handed philosophers* presupposes that there exist left-handed philosophers, *all/both Kim’s children* presupposes that Kim has children, *each/every pie* and *all the pies* presuppose the existence of pies belonging to a set that will be identifiable in the context, and so on. There are certainly cases where such existence is not entailed, but we still find

a distinction between universal *all* and free choice *any*:

[15] *All/Any candidates who score 100% on the test will receive a \$100 prize.*

This does not entail that there will actually be candidates who score 100%. The use of *all* nevertheless suggests a disposition to believe that some candidates will do so, whereas free choice *any* is more neutral. The distributive universal quantifiers *each* and *every* behave like *all* in such cases.

## 5.2 Scalar entailments and implicatures

### ■ Cardinal numerals

Numeral determinatives are generally interpreted as giving the exact **cardinality** of a set, i.e. the exact number of members that it contains. An elementary example like [16i] will then be understood as conveying the propositions [ii–iii]:

[16] i *Max has [four children].*  
 ii “Max has no less than four children” [lower bound]  
 iii “Max has no more than four children” [upper bound]

Proposition [ii] gives the **lower bound** to the cardinality of the set, the minimum number: “at least four”; [iii] gives the **upper bound**, the maximum number: “not exceeding four”. If, for example, I say [i] in response to the question *How many children has Max got?*, you would clearly infer that Max has exactly four children. But the two components [ii–iii] differ in status. Proposition [ii] is an entailment: if it is false, then necessarily [i] itself is false. But [iii] is only an implicature, albeit a strong one: it is possible for [i] to be true while [iii] is false. Suppose, for example, that in order to qualify for extra child benefit one has to have at least four children: in the context of talking to the benefits clerk I could truthfully say that I have four children even if I have five, because the only thing that is relevant here is whether the lower bound condition is satisfied. Or take the case where we are expecting an unusually large number of guests to dinner, say fourteen. I could then ask *Have we got fourteen dining chairs?* and the answer *Yes* would again convey only that the lower bound condition was satisfied – you could add, without contradiction, *in fact we’ve got sixteen*.

The relation between a pair of numerals such as *five* and *four* is thus as illustrated in:

[17] i *Max has five children* **entails** *Max has four children*  
 ii *Max has four children* **implicates** *Max doesn’t have five children*

Adding *at least* cancels the implicature: *Max has at least four children* allows that there may well be more than four. Adding *at most* converts the upper bound implicature into an entailment: *Max has at most four children* entails *Max doesn’t have five children*. But at the same time it removes the lower bound entailment: *Max has at most four children* does not entail that he has (no less than) four children, or indeed that he has three.

The implicature [17ii] is standardly called a **scalar implicature**. It is an obvious property of the cardinal numerals (and of the numbers that they express) that they are ordered: *five* comes between *six* and *four*, and so on. We talk of this ordered arrangement as a **scale**. Other things being equal, the expectation is that a speaker will make the strongest statement that is consistent with what they know to be true. If I know that Max has five children, I will normally be expected to say so, rather than making the weaker

statement that he has four. The most obvious reason for saying *four* rather than *five* is that it would not be true to say *five*, so [16i] will generally convey [16iii]. But since there could be other reasons for choosing the weaker statement, [16iii] is an implicature, not an entailment. More generally, the selection of a particular term on some scale implicates the negation of stronger ones.

### ■ All and some

There is likewise a scalar relation between *all* and *some*: *all* is stronger than *some*. This gives rise to essentially the same pattern of entailments and implicatures:

[18] a. *All of her children have emigrated.*      b. *Some of her children have emigrated.*

Here [a] entails [b], and [b] implicates the negation of [a], i.e. *Not all her children have emigrated.*<sup>17</sup> Again the implicature is a strong one, but it is easy to demonstrate that it is not an entailment. Suppose she has five children. One plausible context for [b] is where I know that three of them have emigrated and simply don't know about the other two; here I choose [b] over [a] not because [a] is false but because I don't know whether it is true or false. (Notice that replacing *her* in [b] by *my* strengthens the implicature: I would normally be expected to know whether all my own children have emigrated.) A second point is that if [b] entailed the negation of [a] it would be logically impossible for [a] to entail [b]. But clearly [a] does entail [b]: if all of them have emigrated, then necessarily some of them have.

### ■ Proportional and non-proportional quantification

The “not all” implicature is not found with all uses of *some*:

[19] i *There were some children in the park.* }  
       ii *I saw some children climb over the fence.* }      [non-proportional use of *some*]

In construction [i], with dummy *there* as subject, substitution of *not all* for *some* is not permitted: \**There were not all children in the park.* The latter is not pragmatically intelligible, and cannot express an implicature of [i]. As for [ii], we are concerned with the reading where *some* is unstressed, reduced to /səm/ (or /sm/). In this case there is no particular larger set of children that I have in mind of whom it would not be true that I saw them all climb over the fence. Again, then, I'm not implicating that I didn't see all of a certain set of children climb over the fence. *Some* conveys “not all” only when it is interpreted **proportionally**, i.e. when there is a certain set involved such that the issue arises as to whether all members of that set have the predication property. The partitive construction is one which forces such a proportional interpretation, for the set concerned is expressed in the partitive oblique. In [18b], we are concerned with the set of her children, and *some* is interpreted relative to this set: by virtue of this it contrasts with *all* and implicates “not all”. But it isn't only in partitives that *some* has a proportional interpretation. Consider:

[20] i *Some people misunderstood the question.* }  
       ii *Some people don't know how to say 'No'.* }      [proportional use of *some*]

<sup>17</sup>Strictly speaking, the entailment relation holds only if the universally quantified set is not empty: see the discussion of [15] above. *All candidates who score 100% will win a prize* does not itself entail *Some candidates who score 100% will win a prize* – but it and *Some candidates will score 100%* taken together do have this entailment.

In [i] there is an implicit set of people who were asked the question (perhaps the candidates in an examination, perhaps the voters in a referendum, and so on), so *some* is interpreted proportionally: it contrasts with *all* and implicates “not all”. In [ii] I am talking about people in general, but people in general constitute a set, so again we have the “not all” implicature.

### ■ Proportional *most*

*Most* likewise has proportional and non-proportional uses, though in this case they are somewhat more clearly distinguished, with the non-proportional use being the superlative of *many* and *much*. We distinguish the uses by means of subscripts, with  $most_p$  representing the proportional sense,  $most_s$  the non-proportional, superlative sense:

- [21] i  $Most_p$  students would regard that as unreasonable. [proportional]  
 ii *It's the Psychology Department that attracts (the)  $most_s$  students.* [superlative]

In [i] the predication property applies to a high proportion of students, while in [ii] it is a matter of the Psychology Department attracting the largest number of students, i.e. a larger number than the other departments. Again, proportional *most* is weaker than *all* and hence triggers a “not all” implicature: “Not all students would regard that as unreasonable”.

### ■ Scalar relation between *all*, $most_p$ , and *some*

$Most_p$  is weaker than *all* but stronger than proportional *some*, so that they can be arranged on a scale as shown in [22], where ‘>’ means “is stronger than”:

- [22] *all* >  $most_p$  > *some*

Each of these quantifiers entails any to its right and implicates the negation of any to its left:

- [23] i *I knew all of the delegates.* [entails [ii–iii]]  
 ii *I knew most of the delegates.* [entails [iii], implicates negation of [i]]  
 iii *I knew some of the delegates.* [implicates negation of [i–ii]]

### ■ Multal quantification

**Multal** quantification is the name given to the quantification expressed by such items as *many*, *much*, *a lot*, *a great deal*, and so on. In most (but not all) of its uses *some* enters into a scalar relationship with the multal quantifiers as illustrated in:

- |      |   |  |
|------|---|--|
| [24] | PROPORTIONAL                                      | NON-PROPORTIONAL                               |
|      | i a. <i>Many people think it's a conspiracy.</i>  | b. <i>We're having a lot of friends round.</i> |
|      | ii a. <i>Some people think it's a conspiracy.</i> | b. <i>We're having some friends round.</i>     |

In both the proportional and non-proportional cases [i] entails [ii], while [ii] has a “not multal” implicature, i.e. [iia] implicates that the proportion of people who think this is less than high, and [iib] implicates that the number of friends we're having round is less than large. We specify the implicature here as “not multal”, rather than as “not many” because *not many* is interpreted not as “less than many” but as “few” (cf. Ch. 9, §5 and footnote 18 below.).

The proportional uses of the multal quantifiers cannot, however, be simply added to the scale in [22] because *all*, *most*, and *some* do not presuppose that the set in question is large. Suppose, for example, that Ed makes six mistakes. If four were trivial,

I could say *Most of them were trivial*, but *Many of them were trivial* would not be appropriate. *All* and *most<sub>p</sub>* do not therefore entail *many/much*. *Many* and *much* implicate “not all”, but whether they implicate “not most<sub>p</sub>” will be very much context-dependent.

### ■ Paucal quantification

**Paucal** quantification is expressed by such quantifiers as *a few*, *a little*, *several*, *a bit*, etc. These enter into a scalar relation with the multal quantifiers. Compare:

- [25] i a. *I disagreed with many of his points.*                      b. *I made a lot of mistakes.*  
       ii a. *I disagreed with a few of his points.*                      b. *I made a few mistakes.*

The examples in [i] entail those in [ii] and the latter have a strong “not multal” implicature.

There is no such relation between *some* and the paucal quantifiers. The paucal quantifiers entail *some* (for example, [25iib] entails *I made some mistakes*), but *some* clearly does not implicate “less than paucal”. *Some* is applicable to an area of the quantificational scale that includes the paucal area. The lower bound for *a few* is three, but two qualifies as ‘some’, and *some* can readily be used without any suggestion that the upper bound is low.

### ■ Negative quantifiers

The scale in [22] cannot be expanded by adding anything to the right of *some*. In particular, we cannot continue with **no**. Compare the following pair with [18] above:

- [26] a. *Some of her friends voted for him.*                      b. *None of her friends voted for him.*

Example [b] doesn’t implicate the negation of [a] (*It is not the case that some of her friends voted for him*): it entails it. **No** is thus not a weaker quantifier than existential *some*: it combines negation with existential quantification, and for this reason it does not belong on the scale of positive quantifiers given in [22].

*Few* is likewise to be excluded by virtue of being negative. The relation between *many* and *few* is comparable to that between *some* and **no**:

- [27] a. *Many of her friends voted for him.*                      b. *Few of her friends voted for him.*

Again, [b] entails the falsity of [a] rather than merely implicating it. Note, then, the difference in the following:

- [28] i *Some if not all / indeed all of her friends voted for him.*  
       ii *\*Few if not many / indeed many of her friends voted for him.*

*If not all* in [i] cancels the “not all” **implicature** of *some* by admitting the possibility that all voted for him, while *indeed all* cancels it by asserting that all did. But these devices cannot cancel the “not multal” **entailment** of *few*.

*Few*, however, does not mean “less than many”: it means “the opposite of many”. *Many* and *few* are antonyms, like *good* and *bad*, *big* and *small*, *old* and *young*, etc. We noted above that negating *many* tends to yield a paucal interpretation. Compare, then:

- [29] a. *He didn’t obtain many votes.*                      b. *He obtained few votes.*

Example [a] conveys that he obtained a small number of votes. But this is an implicature: it could be that he received a fair number of votes but nevertheless somewhat fewer

than would merit the description *many*. *Few*, however, could not be used in this latter scenario: [b] entails, rather than merely implicating, that he obtained no more than a small number of votes. Thus [a] and [b] are not equivalent: [b] entails [a], while [a] implicates [b].<sup>18</sup>

As a negative, *few* enters into a scalar relation with *no*, and if we consider just proportional uses we can also include *not all* on the negative scale even though it is not a single word:

[30] *no* > *few* > *not all*

We put *no* on the left because it is the strongest of the three, in the sense of being most restrictive. Compare:

[31] i *None of her friends voted for him.* [entails [ii–iii]]  
 ii *Few of her friends voted for him.* [entails [iii], implicates negation of [i]]  
 iii *Not all of her friends voted for him.* [implicates negation of [i–ii]]

The truth conditions for [i] are narrower, more restrictive, than those for [ii], and the latter are in turn more restrictive than those for [iii].

The entailments and implicatures deriving from [30] follow the same principles as with the positive scale [22]. The stronger terms entail the weaker, while the weaker implicate the negation of the stronger, as indicated in the annotations given on the right in [31]. The implicature from *few* to “not none” is often very strong, like that from *some* to “not all”, and this is likely to be the case in the particular example we have here. But in other cases it is clearer that we are dealing with an implicature, not an entailment. Suppose, for example, we are about to mark a set of exam papers. I might say *Few will do as well as Kim Jones in last year’s exam: of that we can be quite sure*. This expresses confidence that at most a small number will equal Kim’s (outstanding) performance last year, but it doesn’t say that at least some will do so. The “not none” implicature can be cancelled in the same way as was illustrated for the “not all” implicature of *some* in [28i]:

[32] *Few if any / indeed none of them did as well as Kim.*

#### *A few and few*

These are both paucal quantifiers in that they involve a low upper bound. But they contrast as positive vs negative (cf. Ch. 9, §3.3). This results in the differences summarised in:

[33]		<i>a few</i>	<i>few</i>
i	Upper bound is low	implicated	entailed
ii	Lower bound is greater than zero	entailed	implicated

(*A few* entails, in fact, that the lower bound is greater than two.) Notice, then, that *a few* works in just the opposite way from *few* with respect to the cancellation of implicatures. Compare [28ii] and [32] with:

[34] i *A few if not many / indeed many of her friends voted for him.*  
 ii *\*A few if any / indeed none of them did as well as Kim.*

<sup>18</sup>When *not* modifies *many* within a DP, however, we have a paucal entailment: *Not many of her friends voted for him* does not allow an interpretation where a good number voted but not enough to qualify as many.

## 6 The articles and the category of definiteness

The term **article** is used for the special subcategory of determinatives that provide the most basic expression of definiteness and indefiniteness. In this section we examine in turn the two articles *the* and *a*, explaining what is meant by the contrast between definite and indefinite NPs.

### 6.1 The definite article *the*

The definite article *the* is the most basic indicator of definiteness. It is illustrated in [1], which shows that it is compatible with all types of common noun: count singular, count plural, and non-count.

[1] *Bring me [the ladder/ladders/cement]!*

Use of the definite article here indicates that I expect you to be able to identify the referent – the individual ladder, the set of ladders, the quantity of cement that I am referring to.

#### ■ Identifiability

The concept of identifiability expressed by the definite article is best understood in terms of pre-empting a question with *which?* Compare, for example:

- [2] i *Where did you park the car?*  
 ii *The father of one of my students rang me up last night.*  
 iii *The first person to run the mile in under four minutes was Roger Bannister.*

Example [i] illustrates the frequent case where the addressee can be assumed to be familiar with the referent of the definite NP: you have been driving the car and presumably know a good deal more about it than that it is a car – what colour and make of car it is, and so on. You thus don't need to ask *Which car?*: you know which one I'm referring to.<sup>19</sup>

Familiarity of this kind is not, however, a necessary condition for the felicitous use of *the*. In [2ii], for example, I don't say who the student is and so can't expect you to know who the father is. Nevertheless, I have a particular student in mind and the property of being father of that student provides distinctive, hence identifying, information about the referent. It wouldn't make sense, therefore, to ask *#Which father of one of your students?* (*Which one of your students?* would of course make sense, but the *which* question here relates to the embedded NP *one of my students*, which is indefinite.)

The kind of identifiability signalled by *the* is thus of a relatively weak kind. This is further illustrated in [2iii], where the predicate provides stronger identifying information. The head nominal of the definite NP in subject function defines a unique individual, so again the question *#Which first person to run the mile in under four minutes?* would be incoherent. But you can recognise that the description can only be met by a unique individual without knowing who the individual is: it is the predicate in [iii] that says who he is. *The* indicates, therefore, that the head gives identifying information that pre-empts

<sup>19</sup>If you did respond to my utterance of [2i] by asking *Which one?*, this would indicate that there had been a breakdown in communication, that I had been mistaken in assuming that you would be able to identify which car I was referring to.

a *which* question, but the information expressed in the head certainly need not pre-empt a *who* question.

### ■ Count singular NPs: identifiability and uniqueness

In the case of definite count singular NPs, identifiability is normally due to the recognition that there is only one relevant entity satisfying the description expressed in the head. In [2iii] there is necessarily only one person who was the first to perform the feat in question. In [2ii] there can likewise be only one person who is father of the student I have in mind. And in [2i] there is a unique car in the context that is relevant: the context will be one where we are aware that you had been driving a particular car, and this is the one I'm referring to.

Under certain circumstances, however, the definite article can be appropriate with a count singular even when the context does not strictly limit the number of entities satisfying the description given in the nominal to just one:

- [3] i *Put your cup down on the arm of your chair.*  
 ii *He married the daughter of his bank manager.*

An (arm-)chair has two arms, but the definite article in [i] is in order on the assumption that it doesn't matter which one you choose. Again, then, the definite article signals my expectation that you don't need to ask *Which arm of my chair?* In [ii] it could be that the bank manager has in fact two daughters, but *the* is again appropriate on the assumption that you don't need to ask *Which one?:* perhaps the other is already married, or too young to marry, perhaps you don't know that there are two, and perhaps it simply doesn't matter, the important point being only that his bank manager was the father of the woman he married.

### ■ Existential presupposition

In general, use of the definite article presupposes the existence of the entity, set, or quantity that the addressee is expected to be able to identify. For example, [3ii] presupposes that his bank manager has a daughter. In the example as given, the existence of the daughter is entailed, but the presupposition typically carries over to contexts in which there is no such entailment, as in *He thinks it would be to his advantage to marry the daughter of his bank manager.* This includes negative contexts, such as *He didn't, after all, marry the daughter of his bank manager:* this still takes it for granted that the bank manager has a daughter. It is possible to cancel the existential presupposition, but this would normally only be done in a context where one is denying what has been said or suggested by someone else. In such a context one could say, for example, *He can't have married the daughter of his bank manager: his bank manager doesn't have a daughter.*

### ■ Plural and non-count NPs: totality

The account of identifiability by virtue of uniqueness can be extended to plural and non-count definite NPs:

- [4] i *Where did you put the keys / the milk?*  
 ii *The parents of one of my students came round to see me last night.*

These are like the count singulars in [2i–ii], except that the uniqueness applies now to a set or quantity rather than to an individual. It is to be understood, however, that the set or quantity is maximal: we are concerned with the totality of the keys, milk, and parents.

If you had five keys, say, there will be a number of subsets containing four, three, or two keys, but these are irrelevant: it is the set as a whole that is presented as identifiable by virtue of there being in the context a unique maximal set of keys (the keys that you were recently using to open a door or safe, perhaps).

It is important to note, however, that the concept of totality implied by the definite article is somewhat weaker than that expressed by universal quantification: if the set consists of a number of essentially similar entities, then the use of the definite article does not entail that every individual entity has the predication property. Compare:

- [5] a. *The bathroom tiles are cracked.* b. *All the bathroom tiles are cracked.*

In [a] it is not necessarily the case that every individual tile is cracked: rather, the totality of the tiles gives the impression of being cracked. If I wish to indicate that every individual tile is cracked, I must make that explicit, for example by adding the universal quantifier *all* as a predeterminer, as in [b].

### ■ Types of context in which the identifiability requirement is satisfied

The following examples illustrate a range of contexts in which the use of the definite article is appropriate:

- [6] i *Could you do something about the hum?*  
 ii *The president has been assassinated.*  
 iii *They have a cat and two dogs. The cat is over fifteen years old.*  
 iv *My car won't start; I think the battery is flat.*  
 v *She grabbed me by the arm.*  
 vi *Everybody wants to be a member of the most popular team.*  
 vii *They are interviewing the man who mows her lawn.*  
 viii *The racquet dropped from Andre Agassi's hand as if his fingers had grown numb.*

In [i] the hum is identifiable from sensory features of the situation: I assume you can hear it. Similarly, I might say *Pass me the hammer* in a context where you can see it, or *Does the draught worry you?* in a context where you can feel it. Example [ii] illustrates the case where identifiability derives from non-linguistic knowledge shared by speaker and addressee. If [ii] is uttered as 'hot news', the most likely interpretation is that the definite NP refers to the person they know as the president of their country. But of course, in another exchange, for example between two journalists who report on a particular country, the reference may well be to the president of that country, identifiable through shared knowledge of the country.

In [6iii] the first sentence introduces a particular cat into the discourse, so the referent of *the cat* in the second is identifiable by virtue of this prior mention. In [iv] the battery is identifiable through its association with the car that has just been introduced into the discourse: it is interpreted as the battery of that car. Example [v] is similar, with the arm in question identified by association with the object-referent: it was my arm. An alternative formulation in this case would use the genitive pronoun: *She grabbed me by my arm*. There are, however, severe restrictions on the construction with *the*. In the first place the referent of the determined NP is prototypically a body-part (cf. *She grabbed me by the tie*). Secondly, the body-part NP and the NP with which it is associated are respectively oblique and direct complements of a single verb (this kind of interpretation is not available with *I used the arm to help me get over the fence*).

In [6vi] it is the modifier *most popular* that enables the team to be identified: it is singled out by its position at the top of the scale of popularity. The modifier can thus be said to **establish** identifiability. The same applies to the relative clause in [vii]. The definite article is not of course required, but its use indicates that *man who mows her lawn* is being presented as a description of a unique person.

A less usual case is illustrated in [6viii], the first sentence in a newspaper sports article. The sentence forces you to recognise a unique racquet even though the NP itself contains no other information about it than that it is a racquet. It is thus only from the predication property that you obtain the information necessary to understand what racquet it is, and we can say then that it is the predication that establishes identifiability. Similarly with a notice such as *Beware of the dog!* This serves to inform readers that there is a (single) dog in the vicinity, and warns them to beware of that dog.

### ■ Stress

The definite article is generally unstressed in connected speech. Stressed use of the definite article, in the form /ði:/, is highly unusual, but is found with proper names in examples like *Was it THE Bill Gates that he was talking about?* (discussed in §20.4), or with common nouns, as in *Is that THE book you're looking for?* (where I am seeking confirmation that the entity concerned is indeed the unique book that you're looking for).

### ■ Functions beside determiner

- [7] i *She ran [the fastest she had ever run].* }  
 ii *The longer we stay, [the more] chance there is we'll be caught.* } [modifier]

*The* occurs as modifier in construction with superlatives and comparatives: see Ch. 13, §§4.4.2, 6.3.4. The bracketed phrases here belong respectively to the categories AdvP and DP. Note that in [ii] *the more chance* is an NP, but *the* here modifies *more*: it is not determiner with *more chance* as head.

Unlike most determinatives, *the* is completely excluded from fused-head function:

- [8] i *\*There's a spider in the bath. Get rid of [the] immediately!* [it]  
 ii *\*Do you prefer this version or [the Kim did]?* [the one]  
 iii *\*Wine from Australia is now more popular than [the from France].* [that]

Instead of *the* we need the forms shown on the right. *It* and *the one Kim did* are not fused-head NPs, while *that from France* is (see [9] of §9).

## 6.2 The indefinite article *a*

The indefinite article *a* is the most basic indicator of indefiniteness for singular count nouns. Its incompatibility with plurals is due to its historical origin as an unstressed form of the numeral *one*. The indefinite article is then unstressed in connected speech, but has a liaison form *an* (see Ch. 18, §6.4).

With indefinite NPs the addressee is not being expected to be able to identify anything. NPs headed by singular count nouns permit a direct contrast between indefinite *a* and definite *the*:

- [9] a. *Bring me a ladder!*                      b. *Bring me the ladder!*

One possible scenario for the use of *a* is that there are two or more ladders in your field of vision, especially ones differing in significant ways, such as size. In this case *the* would

be inappropriate since you would not be able to identify a unique ladder (so that the question *Which ladder?* would not be pre-empted). Another possible scenario is one in which there are no ladders at all in the field of vision, and therefore no clues to help identify a unique ladder.

### ■ Quantitative and non-quantitative indefiniteness.

A can express two kinds of indefiniteness, quantitative and non-quantitative:

- |      |   |   |
|------|---|---|
| [10] | QUANTITATIVE  | NON-QUANTITATIVE                                  |
| i    | a. <i>She has just bought [a new car].</i>              | b. <i>Jill is [a doctor].</i>                     |
| ii   | a. [ <u>A student</u> ] <i>has complained about it.</i> | b. <i>As [a doctor], Jill should know better.</i> |
| iii  | a. <i>Jill found [a book on Greek syntax].</i>          | b. <i>Jill has [a good knowledge of Greek].</i>   |

Quantitative *a* expresses existential quantification. By virtue of selecting a singular head it indicates “one”, and we have the usual scalar implicature in the [a] examples that she bought no more than one car, and so on. But the issue of how many is backgrounded with *a*: where the distinction between one and more than one is important we use cardinal *one* rather than *a*. The quantification is generally non-proportional, as in [ia/iiia], but [iia] shows that a proportional use is possible: I could be talking here about a student belonging to a definite set of students. We then have the “not all” implicature, but again the contrast with *all* is much less salient with *a* than with *one*. *A* is found only in determiner function. It is thus not used in partitives or other fused-head NPs: this gap is filled by *one*.

The non-quantitative use of *a* is found in ascriptive predicative complements indicating simple set membership, as in [10ib/iib]. Here, what is being said is that Jill belongs to the set denoted by the noun *doctor*, i.e. that she belongs to the set of doctors. The singular NP in the predicative complement position matches the singularity of the predicand *Jill*, but is not in itself quantitative, and could not in this use be replaced by *one*. *A* is also used non-quantitatively in combination with non-count nouns, as in [10iiib]: see the discussion of [21] in §3. Generic *a*, as in *A lion is a ferocious beast* ([14iia] of §8), is likewise non-quantitative.

### ■ Constraint on occurrence of *a* in attributive modifiers

Being essentially a marker of indefiniteness, *a* occurs in determiner function and, unlike cardinal numerals, cannot itself function as modifier: compare *its one redeeming feature* and *\*its a redeeming feature*. However, *a* can occur in certain kinds of expression which can in general function as either determiner or modifier, notably cardinal numerals and genitives. We illustrate first with cardinal numerals and genitives containing *one*:

- |      |  |   |
|------|--|---|
| [11] | DETERMINER                                 | MODIFIER                                    |
| i    | a. [ <u>one hundred</u> ] <i>charges</i>   | b. <i>these [one hundred] charges</i>       |
| ii   | a. [ <u>one colleague's</u> ] <i>house</i> | b. <i>the [one dollar's] worth of coins</i> |

(We have varied the nouns in [ii] because only a narrow range of measure phrases can occur as attributive genitive NPs – see §16.3.) Now *a* can replace *one* when the numeral or genitive NP is in determiner function, but not when it is modifier: we can't have *\*these [a hundred] charges* or *\*the [a dollar's] worth of coins*. Instead, *a* is simply dropped when the numeral or genitive is in modifier function following a determiner:

- |      |    |  |   |
|------|----|--|---|
| [12] | i  | a. [ <u>a hundred</u> ] <i>charges</i>   | b. <i>these [hundred] charges</i>       |
|      | ii | a. [ <u>a colleague's</u> ] <i>house</i> | b. <i>the [dollar's] worth of coins</i> |

This rule applies only when *a* would be in initial position in the modifier. *A* is thus retained in such examples as the following:

- [13] i *the [more than a hundred] charges that had been laid against them*  
 ii *the [almost a dollar's] worth of coins that he had in his pocket*

## 7 Other determinatives

In this section we examine in turn the groups of determinatives given in [5] of §4 other than the two articles. Our major focus will be on their use in determiner function, with other uses being dealt with more summarily.

### 7.1 The demonstrative determinatives *this* and *that*

There are two demonstrative determinatives, proximal **this** and distal **that**. Both inflect for number, and when in determiner function agree with the head: compare singular *this book* with plural *these books*, or singular *that book* with plural *those books*.

Demonstratives, like the definite article, mark the NP as definite. In saying *this book* or *that book*, for example, I assume you are able to identify which book I am referring to. In the plural the demonstratives indicate in the same way as *the* that the totality of the set has the predication property. Compare, then, the following with [5] of §6:

- [1] a. *Those bathroom tiles are cracked.*      b. *All those bathroom tiles are cracked.*

What the demonstratives add to basic definiteness is, in the central cases, the notion of spatial deixis:

- [2] a. *Read me this book!*                                      b. *Fetch me that book!*

Proximal *this* indicates that the book is relatively close to the speaker, distal *that* that it is less close – though the notion of closeness is partially subjective.

The demonstratives are also used anaphorically:

- [3] i *Jones was playing chess. This new hobby that he had just discovered was taking up all of his time.*  
 ii *I suggested we call the police, but he didn't like that idea.*

Here the interpretation of the underlined NPs derives in part from their antecedents: in [i] the new hobby is understood to be chess, and in [ii] the idea he didn't like is that of calling the police. In both cases we could have *the* instead of the demonstrative, but *this* and *that* mark the anaphoric relationship more clearly or explicitly. The deictic and anaphoric uses of demonstratives are discussed in detail in Ch. 17, §5.

#### ■ Functions besides determiner

- [4] i *Those cards are Kim's; [these] are yours.*                                      [simple fused-head]  
 ii *[All those of them that were contaminated] we destroyed.*                      [partitive fused-head]  
 iii *It's a little late, but [that] doesn't matter.*                                      [special fused-head]  
 iv *We don't need [this much] sugar.*    [modifier]

The fused-head constructions are discussed in §9.2. The modifier use is found with the singular forms in construction with gradable adjectives (*The food wasn't [that bad]*),

adverbs (*I hadn't expected to finish [this quickly]*), and the core degree determinatives, as in [iv].

## 7.2 The personal determinatives *we<sub>d</sub>* and *you<sub>d</sub>*

- [5] i [We<sub>d</sub> supporters of a federal Europe] will eventually win the argument.  
 ii [You<sub>d</sub> students] should form a society.

*We<sub>d</sub>* and *you<sub>d</sub>* here are the determinative counterparts of the 1st and 2nd person plural pronouns *we<sub>p</sub>* and *you<sub>p</sub>* that we have in *We<sub>p</sub>* *will eventually win the argument* and *You<sub>p</sub>* *should form a society*. Like the demonstratives, *we<sub>d</sub>* and *you<sub>d</sub>* mark the NP as definite, but this time what is expressed in addition to definiteness is person deixis: *we* denotes a set containing the speaker, *you* a set containing at least one addressee but not the speaker. *We<sub>d</sub>*, like the pronoun, inflects for case, with nominative *we* contrasting with accusative *us*; the distribution of these case-forms is described in §16.2.

It should be noted that the personal determinatives are exactly parallel to other definite determiners such as the demonstratives and the definite article *in*, for example, permitting the universal quantifier as a predeterminer. Compare:

- [6] i a. all we<sub>d</sub> supporters of a federal Europe      b. all you students  
 ii a. all those supporters of a federal Europe      b. all the students

This property distinguishes them from the personal pronouns, which permit *all* only when postmodified: *All we/you who support a federal Europe will win the argument*, but not *\*All we/you will win the argument*.

In [7], however, *we* and *you* are pronouns:

- [7] i We<sub>p</sub>, the supporters of a federal Europe, will eventually win the argument.  
 ii You<sub>p</sub>, the students, should form a society.

Here, the determiner of *supporters* and *students* is clearly the definite article, and the NPs formed with the definite article are full NPs in their own right which stand in supplementary apposition to the personal pronouns *we* and *you* (see Ch. 15, §5, for discussion of this construction). One reflection of this difference is that the personal determiners can only be the 1st person plural *we* and the 2nd person plural *you* (with the exception noted in footnote 14), while all the personal pronouns regardless of person and number occur in the appositional construction. We illustrate this with the 1st person singular *I*, the 2nd person singular *you*, and the 3rd person plural *they*:

- | [8] | DETERMINER + HEAD   | APPOSITIONAL CONSTRUCTION  |
|-----|---|--|
| i   | a. <u>*I</u> <u>president</u> declare the meeting open.                           | b. <u>I</u> , <u>the president</u> , declare the meeting open.                           |
| ii  | a. <u>*You</u> <u>proponent of a federal Europe</u> should support this proposal. | b. <u>You</u> , <u>the proponent of a federal Europe</u> , should support this proposal. |
| iii | a. <u>*They</u> <u>poets</u> are our guides.                                      | b. <u>They</u> , <u>the poets</u> , are our guides.                                      |

## 7.3 The universal determinatives *all* and *both*

*All* and *both* express universal quantification, with *both* applied only to sets with exactly two members. As noted in §5.1, *all* is neutral with respect to the size of the set but by virtue of the contrast with *both* it generally strongly implicates “more than two” when used in count plural NPs. Compare, for example:

### ■ Relation between determiner and predeterminer constructions

*All* and *both* are unique among the determinatives in that they function as either determiner or predeterminer:

- [12] i [All/Both students] failed the philosophy exam. [determiner]  
 ii [All/Both *the* students] failed the philosophy exam. [predeterminer]

With *both* such pairs are equivalent. *Both students* (in contrast to *two students*) is definite: it denotes the totality of an identifiable set. *The* expresses nothing more than definiteness, so adding it to the already definite *both students* has no effect on the meaning.

*All*, however, has a somewhat restricted use as a determiner. The universality of *all* naturally gives rise to generic interpretations, as in *All philosophers live long*; but elsewhere *all* occurs more naturally as a predeterminer than as a determiner, with the *all* version of [12i] thus considerably less likely than that of [12ii] (or the partitive fused-head construction *All of the students failed the philosophy exam*). The determiner construction, however, is certainly not excluded:

- [13] i *We will be informing the market that the business is continuing to run as a separate entity, with all key staff remaining in place.*  
 ii *All students who have failed must see their tutors tomorrow.*  
 iii *All three visitors left early.*  
 iv *We spent all day at the beach.*

In [i] the primacy adjective *key* lexico-morphologically indicates a unique set, making it unnecessary to indicate definiteness by means of *the*. Example [ii] illustrates the use of determiner *all* in signs, notices, and injunctions, [iii] before a numeral internal modifier, and [iv] with a time-period noun. Again, *all* could be replaced by weaker *the* in all these examples.<sup>20</sup> Since a unique set is indicated and *all* indeed makes a stronger statement of totality than required for definiteness, *all* must be considered as a definite determiner. Note in this connection that it is possible, though unusual, for it to appear in the oblique NP in the partitive, as in [*Over 40% of all first-year logic students go on to do a major in that field.*]

### ■ Fused-heads

- [14] i *Her friends have got their results: [all/both (of them)] have passed.* [partitive]  
 ii [All here] admire her. }  
 iii [All I want] is peace and quiet. } [special]

*All* and *both* commonly occur in explicitly or implicitly partitive fused-head NPs; a special case of this is the adjunct use in *They had both/all (of them) passed*. In addition *all* occurs in special fused-head NPs, with a human interpretation (“all people”) in [ii], a non-human one in [iii]. *All* in [ii] is more formal and less common than *everyone*. But we could not substitute *everything* in [iii] because of the distributive meaning of *every*. In this inanimate use, *all* is generally followed by a dependent, such as the relative clause modifier in [iii]. *All* on its own tends to be restricted to more or less fixed phrases such as *above all*, *All is well*, *All is not lost*.

<sup>20</sup>Such a replacement of *all* by *the* is not possible in NPs with adjunct function: *He worked at home all day / \*the day.*

*The both of us*

Fused-head NPs of this kind are used by some speakers in informal style: %*They had invited the both of us*. More widely accepted would be *the two of us* or *both of us*. Syntactically *the both of us* is exceptional in that *both* cannot follow *the* (i.e. cannot occur in internal modifier function) in NPs with a noun head: \**the both students*. The partitive oblique is restricted to personal pronouns: \**the both of the students*.

## ■ Other functions

- [15] i *She did it [all by herself]. I'm [all wet]. The coat is [all wool].* [modifier]  
 ii *They invited [both Kim] and Pat.* [marker of coordination]

*All* can modify PPs, AdjPs, AdvPs, and NPs. *All wool* in [i] has *all* as a peripheral modifier in the NP, not a determiner, as it is in [*All wool*] *is tax-free* (see [6ii] of §13). *All* is also used as an intensifying modifier of AdjPs, AdvPs, or DPs that have *the* or *that* as modifier: *I feel [all the better for it]; The exam wasn't [all that difficult]*. The plural meaning of *both* excludes it from such modifying constructions, but it is used (in correlation with *and*) as a marker of coordination. There is no corresponding use of *all* for multiple coordination: \**They invited all Kim, Pat, and Alex*.

## ■ Distributivity

*All* and *both* usually yield a distributive interpretation, i.e. one where the predication property applies individually to the members of the set:

- [16] i *All members of the committee voted in favour of the resolution.*  
 ii *Both students bought a present for the teacher.*

In [i] the vote was unanimous: the members voted individually in favour of the resolution. If it was a majority vote rather than unanimous we wouldn't use *all*, but would simply say *the members of the committee* (or, in this particular case, *the committee*). Similarly, we understand from [ii] that two presents were bought for the teacher.

*All* and *both* do not explicitly exclude a non-distributive interpretation (as *each* and *every* do), but the preference for a distributive reading is somewhat stronger with *both* than with *all*. Compare:

- [17] i *All/Both the students together had managed to lift the piano onto the stage.*  
 ii *All/Both the students had handed in only five essays.*

In [i] *together* forces a non-distributive, joint, reading, and some speakers feel that *both* is not completely felicitous here. If we drop *together*, the *all* version continues to allow the joint interpretation, whereas the acceptability of *both* becomes problematic: inherently it strongly favours a distributive interpretation, but this clashes with the usual expectation that more than one person is needed to lift a piano. The preferred interpretation of [ii] is distributive, with five essays handed in per student. The non-distributive interpretation has a total of five essays handed in, and while *all* allows this interpretation it is hardly possible with *both*. The non-distributive reading can be forced by adding *between them*, and again some speakers will find *both* somewhat less fully acceptable than *all*.

## Reciprocal properties

- [18] i *All/Both of them had been to the same school.*  
 ii *All/Both copies were identical/alike.*

In the absence of further context we will interpret [i] reciprocally, i.e. as “the same school as each other” (rather than “the same school as the person just mentioned”), and we likewise have a reciprocal interpretation in [ii]: “identical to / like each other”. Such properties are compatible with *each*, which indicates that they can be construed as distributable: *Each of them had been to the same school; Each copy was identical/alike*. Nevertheless, they are less straightforwardly distributable than others, and there are again speakers who find *both* less than fully acceptable here.<sup>21</sup>

#### 7.4 The distributive determinatives *each* and *every*

*Each* and *every* explicitly indicate a distributive interpretation of the predication property, and this is reflected in the selection of a singular head. Compare, then, [17ii] above with:

[19] *Each/Every student handed in only five essays.*

If there were ten students, fifty essays were handed in: it can't be that the students as a group handed in only five. This is the normal interpretation for *both* too, but it selects a plural head. Plural *both students* is definite in that it refers to an identifiable set of two; singular *each/every student*, however, is indefinite: our concern here is with the individual students, and they do not individually satisfy the criterion of being identifiable.

##### ■ Differences between *each* and *every*

###### (a) *Each*, unlike *every*, normally involves an identifiable set

Although an NP like *each student* is itself indefinite, we understand that there is some definite set of students to which the quantification applies. This, however, is not necessarily so with NPs determined by *every*. Compare:

- [20] i a. *Last year each student passed.*                      b. *Last year every student passed.*  
 ii a. *Each philosopher admires Aristotle.*                      b. *Every philosopher admires Aristotle.*  
 iii a. *\*We lunch together each other day.*                      b. *We lunch together every other day.*

In [i] I'm talking specifically about last year's course, so there must be an identifiable set of students involved, the ones who took that course. In contexts like this, *each* and *every* are equally appropriate. But the difference is clear in [ii]. Here [iib] is interpreted generically (like *all philosophers*, except for the explicit marking of distributivity); [iia], however, doesn't have this generic interpretation: rather, we recognise some contextually identified set of philosophers, each of whom admires Aristotle. With time (and other measure) expressions, the identifiable set requirement with *each* is not so evident, for we can have *We lunch together each day*; nevertheless, *every* occurs more freely in this kind of context, as is evident from the contrast in [iii]. Compare similarly *I see her every two or three days*, but not *\*I see her each two or three days*.

###### (b) The distributive meaning is stronger with *each* than with *every*

We have said that both items indicate distributivity, reflected syntactically in the singular head. With *each*, however, this feature is stronger in that the predication property is generally construed as applying **separately** to the individual members of the set. Compare

<sup>21</sup>There is a prescriptive tradition of condemning this use of *both*, though the more empirically based usage manuals recognise that it is well established. Curiously, manuals which condemn it invoke the concept of tautology or redundancy, but there is no more reason to say that *both* is redundant in *Both copies were alike* than there is in *Both copies were defective*.

such examples as the following, where *every* is considerably more likely or natural than *each*:

- [21] i *Each/Every city in the region was destroyed by the earthquake.*  
 ii *I enjoyed each/every minute of it.*

In [i] it is likely that the earthquake destroyed the cities more or less simultaneously, which is more consistent with *every* than with *each*: the latter suggests they were destroyed separately. In [ii] *enjoy every minute of* is a common expression: you understand that it was enjoyable throughout, from beginning to end. The version with *each*, however, focuses more literally on the sequence of individual minutes.<sup>22</sup>

(c) *Every but not each implicates a set with more than two members*

Like *all*, *every* is not normally used when it is known that the set has just two members. Only *each* is appropriate in examples like *Cars were parked on each side of the road.*

(d) *Every can be used with abstract nouns with multal rather than universal meaning*

- [22] i *There is every possibility that she will make a complete recovery.*  
 ii *I have every reason to believe that they were conspiring against us.*

This represents a secondary use of *every*, where the primary universal distributive meaning is lost: in [i] you understand that there is a very good chance of her recovery, and in [ii] that I have strong reasons for my belief (cf. Ch. 16, n. 16). The loss of the primary meaning is such that it is not clear that the NPs in [22] are construed as count rather than non-count; certainly, *every* in this sense can combine with non-count nouns, as in *He gave them every encouragement.*

(e) *Each but not every can be used as a fused determiner-head*

- [23] i a. *Each (of them) was cut in two.*                      b. \**Every (of them) was cut in two.*  
 ii a. *They sold for two dollars each.*                      b. \**They sold for two dollars every.*

*Every* has only a dependent use, requiring a following head. We can correct [ib] by inserting *one* to satisfy this requirement: *Every one (of them) was cut in two*, but this is hardly possible in [iib]. Fused-head NPs with *each* are normally explicitly or implicitly partitive; *Each to %his/their own* and its variant *To each %his/their own* are fixed phrases with the form of special fused-head NPs where *each* means “everyone”.

(f) *Every, but not each, permits modification*

- [24] a. [*Almost every student*] *passed.*                      b. \**[Almost each student] passed.*

(g) *Every, but not each, can occur as modifier following a genitive determiner*

- [25] a. *They scrutinised [her every move].*                      b. \**They scrutinised [her each move].*

The NP in [a] means “every move she made”. The construction is possible with only a narrow range of nouns as head, probably all abstract.

*Each* and *every* also differ (reflecting certain of the above contrasts) in the compounds into which they enter: *each* compounds with *other* in the reciprocal *each other*, *every* with *-body*, etc., in *everybody*, *everyone*, *everything*, *everywhere*. They can also coordinate for emphatic effect: *Each and every contestant will win a prize.*

<sup>22</sup> Compare also the idiomatic expressions *every inch* and *every bit* as used in examples like *She was every inch a philosopher* or *It was every bit as good as I'd hoped.*

objective description. *Some* is more natural than *a* with epithets: *An idiot has left the oven on* suggests that *idiot* is being used as an ordinary descriptive noun. Finally, in [iii], the indefinite article would not be possible, though *some* could here be replaced without detectable change of meaning by *one*. This case is restricted to a handful of nouns such as *day*, *time*, and *place*. NPs of this kind bear some resemblance to compounds (such as *somewhere*) but differ in that they are syntactically composite. It is possible, for instance, to insert the adjective *other* between the determiner and the noun: *some other day*.

#### (d) Exclamatory use with stressed *SOME*

[30] a. *Those are SOME elephants!*      b. *SOME hotel that was! An utter disgrace!*

With strong (but not contrastive) stress, *some* has a special interpretation indicating an emotive response to something exceptional. The speaker's attitude may be favourable, as is quite likely in [a] ("remarkable elephants"), or unfavourable, as in [b]. The examples given have plural and count singular heads; non-counts are less usual but certainly not excluded (*That was SOME crockery they were using!*).

#### (e) Basic proportional use

[31] i *Some people left early.* [plural]  
 ii *I think some candidate expressed a view on this issue* [count singular]  
 iii *Some cheese is made from goat's milk.* [non-count]

Here, in contrast most directly to use (a), we are concerned with quantity relative to some larger set, so that there is a clear "not all" (and indeed "not most") implicature: "Not everyone left early, most people didn't leave early", and so on. As with use (a), *any* would generally be used in negative declarative contexts: *I don't think any people left early*. In this use, however, *some* is stressed, and not reducible to /səm/. It can be modified by such expressions as *at least* or (less likely) *at most*: *At least some people thought it was worthwhile*. It can be the focus of *only*: *Only SOME people read the whole report*. It is mainly found with plural and non-count heads. But count singulars are also possible, as in [ii]: we don't here have the special indeterminate interpretation given under (c) above for non-proportional *some*.

### ■ *Any* in determiner function

For *any* we have a major distinction between two uses that we call non-affirmative (*any<sub>n</sub>*) and free choice (*any<sub>f</sub>*).

#### (a) Non-affirmative *any<sub>n</sub>*

*Any<sub>n</sub>* has essentially the same sense as *some* in its basic non-proportional and proportional uses, but is restricted to non-affirmative contexts – prototypically either negative declaratives or else interrogatives.

The non-proportional use is seen in:

[32] i *There aren't any letters for you.* [plural]  
 ii *We don't need any sugar.* [non-count]  
 iii *I haven't got any job lined up for you today, I'm afraid.* [count singular]

The count singular case is relatively uncommon. We noted above that the indefinite article *a* is generally preferred over *some* for count singulars, and since *a* – unlike *some* – is not

polarity-sensitive, that preference carries over to non-affirmative contexts. Thus I would normally say, for example, *I haven't got a car* rather than *I haven't got any car*. The latter cannot be ruled out, but it needs some special context, as when I make an emphatic riposte to someone who thinks I do have a car. *Any<sub>n</sub>* is found with various singular abstract nouns where the distinction between count and non-count is somewhat blurred: *They didn't make any attempt to justify their decision* (cf. *They didn't make an attempt / much attempt to justify their decision*, with count and non-count interpretations respectively). In general, the choice between singular and plural with count nouns is determined by the same factors as apply with *no*: see §7.8. Note, for example, that one would normally say *They haven't got any children* rather than *They haven't got any child*.

The proportional use of *any<sub>n</sub>* is illustrated in:

- [33] i *I don't think any people left early.* [plural]  
 ii *I don't think any candidate expressed a view on this issue.* [count singular]  
 iii *I don't think any cheese is made from goat's milk.* [non-count]

The count singular case is less restricted here than in the non-proportional use, reflecting the fact that proportional *some* is also found with count singulars.

*Any<sub>n</sub>* is usually but by no means always unstressed. It can be stressed, for example, when it is the focus of negation: *I don't think ANY people left early*. The negative orientation of *any<sub>n</sub>* can be reinforced by the polarity-sensitive *at all* or *whatever*: *We hadn't made any progress at all / whatever*.

#### (b) Free choice *any<sub>f</sub>*

- [34] i *Any computers with defective keyboards should be returned.* [plural]  
 ii *Any policeman will be able to tell you.* [count singular]  
 iii *Any remaining dirt will have to be removed.* [non-count]

*Any<sub>f</sub>* occurs with all three of the main kinds of head: plural, count singular, and non-count. It indicates that there is a free choice: an arbitrary member (or subquantity) can be selected from the set (or quantity) denoted by the head and the predication property will apply to it. In [ii], for example, there is a free choice as to which policeman can be selected, but no matter which policeman it is, that policeman will be able to tell you. *Any<sub>f</sub>* implicates that the free choice will only have to be made once, but this implicature can be cancelled. In [ii], since the first policeman selected will normally provide the required information, it will not be necessary to ask another one. However, in [i] the modal *should* imposes an obligation to apply the free choice until all defective computers are selected. Note that this obligation to return all defective computers is not related to the plurality of the nominal: *Any computer with a defective keyboard should be returned* implicates the same obligation.

For these reasons *any<sub>f</sub>* bears some resemblance to the universal quantifier *all*: compare *All computers with defective keyboards should be returned*.<sup>23</sup> It is clear, however, that *any<sub>f</sub>* does not **mean** "all". There is, for example, a clear difference between *Come on, anyone, join me up here on the stage*, which asks for one volunteer to come up on stage, and *Come on, everyone, join me up here on the stage*, which asks less prudently for everyone in the audience to come up on stage.

<sup>23</sup> *Any* is sometimes found coordinated with *all*: *He hadn't seen the indictment but asserted that he was totally innocent of any and all charges*.

Free choice *any<sub>f</sub>* is best treated as having the same sense as *some* in its basic proportional use, with a special added implicature: when I say *Any<sub>f</sub> first-year student could solve this puzzle* I assert that some first-year student could solve this puzzle and also implicate that I have no particular first-year student in mind, but rather am prepared to allow the claim to be applied to whatever arbitrary first-year student you might pick. I do not **state** that every first-year student could solve the puzzle, but very strongly implicate a belief in that proposition, because my claim risks being shown to be false unless it is in fact true that every first-year student could solve the puzzle.

#### Differences between *any<sub>f</sub>* and *any<sub>n</sub>*

There are several differences between the two *any*'s. We noted that *any<sub>n</sub>* is usually unstressed: *any<sub>f</sub>*, by contrast, is always stressed. Secondly, while *any<sub>n</sub>* is restricted to non-affirmative contexts, *any<sub>f</sub>* is not polarity-sensitive. The *any<sub>f</sub>* examples given above are all in affirmative contexts, but in a negative context we can have a contrast between the two senses:

- [35] i [We don't publish any<sub>n</sub> letters:] we only accept commissioned articles.  
 ii [We don't publish just any<sub>f</sub> letters:] we reject more than half of those submitted.

Example [i] is equivalent to *We publish no letters*. In [ii] the free choice is negated: we ourselves are making a selection, accepting some letters, rejecting others. Thirdly, *any<sub>f</sub>*, unlike *any<sub>n</sub>*, permits modification, for example by the adverb *almost*. Compare:

- [36] i *Jan will read [almost any<sub>f</sub> computer magazines].*  
 ii \**Jan couldn't find [almost any<sub>n</sub> computer magazines] in the shop.*

### ■ Restriction of *some* and *any<sub>n</sub>* to quantitative indefinites

Unlike the indefinite article and bare NPs, *some* and *any<sub>n</sub>* are excluded from non-quantitative indefinites.

#### (a) Ascriptive predicative complements

*Some* and *any<sub>n</sub>* are not used in ascriptive predicative complements indicating simple set membership. Instead we find the indefinite article for count singulars (as in [10ib/iib] above) and bare NPs for plural and non-count heads. Compare:

- [37] i a. *Jill is a doctor.* b. \**Jill is some doctor.*  
 ii a. *Jill and Ed are doctors.* b. \**Jill and Ed are some doctors.*  
 iii a. *As doctors, they should know that.* b. \**As any doctors, they should know that.*  
 iv a. *This liquid is sulphuric acid.* b. \**This liquid is some sulphuric acid.*  
 v a. *Jill wasn't a student.* b. \**Jill wasn't any<sub>n</sub> student.*

This is not to say that *some* and *any<sub>n</sub>* are wholly excluded from predicative complements:

- [38] i *Mary and Frieda are [some friends of ours that we met on holiday in Ibiza].*  
 ii *This is [some sulphuric acid we have left over from the last experiment].*  
 iii *Jill wasn't [any<sub>n</sub> student of mine].*

These, however, do not belong to the ascriptive *be* construction: the predicative does not indicate membership of a set or type, but identity. Thus [37vb] is inadmissible with the sense "It is not the case that Jill was a member of the set of students", but [38iii] can be treated as equivalent to "It is not the case that Jill was one of my students", with the second *be* used in its specifying sense.

- iii *The film is disappointing – some might put it more strongly than that.* [special]

*Any<sub>n</sub>* has no special fused-head use corresponding to the *some* of [iii], “some people”.

#### (b) Modifier

[43] i *Have you got [some/any more] milk?*

ii *Are you feeling [any better] / [any more relaxed]?*

In [i] *some* and *any* modify *more* in a DP (see §11). In [ii] *any<sub>n</sub>* functions as degree modifier of comparatives; *some* is found in this construction in AmE, but is regarded as either very colloquial or non-standard: %*I'm feeling some better*. The standard form with positive orientation is *somewhat*: *I'm feeling somewhat better*. *Some* and *any<sub>n</sub>* are also used as degree modifiers in clause structure, but primarily in informal AmE: %*She may be oversimplifying some*; %*That wouldn't help us any*.

*Some* with the sense “approximately”, as in *We had some thirty applications for the position*, we take to be a different word, belonging to the adverb category.

## 7.6 Cardinal numerals

The cardinal numerals are primarily determinatives but they have a secondary use in which they inflect for number and hence belong in the noun category: *They set off in threes / enrolled in their hundreds*. In practice, only low or round numerals are used in this way.<sup>24</sup>

### ■ The form of cardinal numerals

The cardinal numerals can express any number, and therefore themselves form an infinite subset of the determinative category. Numerals expressing whole numbers from “0” to “99” are single words (*zero/nought, three, thirteen, thirty, thirty-three*, etc.); those expressing higher numbers are syntactically complex (*three hundred, three hundred and thirty-three*, etc.), as are those involving fractions (*one and a half*).<sup>25</sup>

The rules which govern the internal structure of the syntactically complex numerals are *sui generis*, and, with one minor exception, this internal structure is unaffected by the wider syntactic context. We will therefore treat all numerals as belonging to the lexical category determinative, on a par with other unmodified determinatives, and for this reason we describe their form in Ch. 19, §5.10.1.

The one place where the form of the numeral is affected by the syntactic structure of the NP involves numerals which begin with the multiplier “1”: *one hundred, one thousand, one million*, etc. The form *one* here can be freely replaced by the indefinite article to give *a hundred, a thousand, a million*, etc. Note that this article must be considered as an integral part of the numeral, and not as an independent determiner. *A hundred days*, for example, has the structure determiner + head, not determiner + modifier + head: the whole NP is clearly plural, not singular, as it would be if *a* were the determiner.<sup>26</sup>

<sup>24</sup>Numerals are often used metalinguistically, as the names of symbols: *They added a '3' before all the Brisbane telephone numbers*.

<sup>25</sup>Fractional numbers smaller than one, however, are expressed by nouns or NPs in predeterminer modifier function: see §12.

<sup>26</sup>Contrast *a marvellous hundred days*, where *a* is determiner and quite independent of *hundred*: see §3.4 for discussion of this construction.

However, when the numeral is in modifier function, initial *a* is dropped in accordance with the rule given in §6.2, so corresponding to, say, *every one hundred days* we have not \**every a hundred days*, but *every hundred days*.

### ■ Interpretation and modification

As noted in §5.2, the numerals are usually interpreted as giving the exact cardinality of a set, but the “not more than” component has the status of an implicature. *Five people complained* implicates but does not entail that no more than five complained. They allow a significant range of modifiers such as *at least* or *at most*, and various expressions of approximation: *some fifteen mistakes*, etc.

### ■ Numerical vs singulative *one*

At the first level we distinguish three items *one*: a personal pronoun (*One should keep oneself informed of these matters*), a common noun that is generally used anaphorically and has a plural form *ones* (*a red car and three black ones*), and the determinative that is our concern in the present section.

Determinative *one* belongs in the set of cardinal numerals, but it has some uses that are not matched by the higher numerals. We therefore distinguish two uses, which we will call **numerical** ( $one_n$ ) and **singulative** ( $one_s$ ):

- |      |   |  |
|------|---|--|
| [44] | NUMERICAL ONE   | SINGULATIVE ONE  |
| i    | a. <i>We have one<sub>n</sub> son and two daughters.</i>  | b. <i>She arrived one<sub>s</sub> rainy morning.</i>                   |
| ii   | a. <i>Only / At least one<sub>n</sub> student failed.</i> | b. <i>Not one<sub>s</sub> student failed.</i>                          |
| iii  | a. <i>I need one<sub>n</sub> or more volunteers.</i>      | b. <i>For one<sub>s</sub> reason or another they didn't charge us.</i> |
| iv   | a. <i>That one<sub>n</sub> mistake cost him his job.</i>  | b. [no use of $one_s$ as modifier]                                     |
| v    | a. [no emotive use of $one_n$ ]                           | b. <i>That's ONE<sub>s</sub> big elephant.</i>                         |

$One_n$  contrasts with the higher cardinal numerals: [ia] contrasts with *We have two sons*, and so on.  $One_s$  does not enter into such contrasts: compare [ib] with \**She arrived two rainy mornings*. We observed that the indefinite article *a* arose historically by weakening of *one*:  $one_s$  behaves in many respects like a stressed counterpart of *a*. In [ii] we see that  $one_n$  takes modifiers in the same way as other cardinals: *at least*, *at most*, *more than*, etc., and can be the focus of such NP-level modifiers as *only* (§13). These constructions are incompatible with  $one_s$ , but the latter permits *not*. This *not* is not generally found with higher cardinals (\**Not five students failed the exam*),<sup>27</sup> but it is commonly found with *a*: compare *Not one<sub>s</sub>/a day passed without Fred losing his glasses*. The numerical nature of  $one_n$  is seen in the coordination with *or more* in [iiia] (cf. *three or more*); the corresponding coordination for  $one_s$  is with *another*, as in [iiib]: it's a matter of what reason, not how many reasons.<sup>28</sup> This association with *another* is seen also in examples like *One<sub>s</sub> problem followed another*.  $One_n$  can function as modifier following a determiner, as in [iva]; again, other cardinals appear here too: *Those two mistakes cost him his job*.  $One_s$ , however, is restricted to determiner function – like the indefinite article. Finally, [vb] shows  $one_s$  carrying heavy stress for emotive effect: it conveys that the elephant is exceptionally big. The construction is similar to that illustrated in [30] for *some*. Note

<sup>27</sup> Such combinations are permitted with expressions of measure, as in *I saw her not five minutes ago*.

<sup>28</sup> Here  $one_s$  is replaceable by *some* (in what we called the vague count singular use): *for some reason or another*. We find a similar interchangeability in *One<sub>s</sub>/Some day soon I'll make amends*.

that highlighting *one* here has nothing to do with a contrast between one and more than one. Somewhat similar is the use of *one<sub>s</sub>* in combination with the head noun *hell* in *We had one<sub>s</sub> hell of a week-end*; in this case, however, *one<sub>s</sub>* is not stressed and can be replaced by *a*.

### ■ Fused-head NPs

Cardinal numerals occur commonly in simple and partitive fused-head NPs, and *one<sub>n</sub>* follows this pattern. *One<sub>s</sub>* is found in the simple type, where it fills the gap resulting from the inability of *a* to function as fused-head, and in the special type with the interpretation “a person”:

- [45] i a. *Kim has written four novels, and Pat has written two/one<sub>n</sub>.* } [simple]  
       b. *Mary bought a book, and I bought \*a/one<sub>s</sub> as well.* }  
       ii *They gave us four copies but two/one<sub>n</sub> of them seemed defective.* [partitive]  
       iii *He behaved like one<sub>s</sub>, who considers himself born to rule.* [special]

### ■ Zero and nought

*Zero* and BrE *nought* are marginal members of the set of cardinal numerals. They act like cardinals in arithmetic operations (*zeronought times ten*), in percentages (*zero percent*), in decimals (*zeronought point two*), and temperature measures (*zeronought degrees Celsius*). *Zero*, but not *nought*, also functions as a determiner comparable to *no* (which is not a cardinal numeral, and does not take part in any of the rules for numeral formation):

- [46] a. *They made zero/no errors.*                      b. *They have zero/no chance of winning.*

*Zero* is quite rare in comparison with *no*; its origin as a mathematical term for the number “0” tends to give utterances with *zero* a pseudo-scientific character. *Zero* differs from *no* in that it is not a marker of negation. The difference is brought out, for example, by the reversed polarity tag test for clause polarity (Ch. 9, §1.1): contrast *They made zero errors, didn't they?* and *They made no errors, did they?*<sup>29</sup>

## 7.7 The disjunctive determinatives *either* and *neither*

### ■ *Either* as determiner: non-affirmative and free choice uses

*Either* selects a count singular head: *either parent*, but not \**either children* or \**either information*. Like *any*, it has a non-affirmative use (*either<sub>n</sub>*) and a free choice use (*either<sub>f</sub>*):

- [47] i a. *He didn't like either<sub>n</sub> teacher.*                      b. \**He liked either teacher.*  
       ii a. *Did either<sub>n</sub> boy have a key?*                      b. \**Either boy had a key.*  
       iii a. *You can take either<sub>f</sub> computer.*                      b. \**She had taken either computer.*

The inadmissible [b] examples are affirmative and also exclude a free choice interpretation.

### ■ Duality: *either* in relation to *any* and *both*

*Either* differs from *any* in that it presupposes a selection from a set of two that is assumed to be identifiable by the addressee. *Either teacher* in [47ia] is thus equivalent to *either*

<sup>29</sup>There are a number of other words expressing “0” found in specialised registers, such as giving scores in various sports – e.g. *nil* (soccer, etc.) or *love* (racquet sports).

of the two teachers. Its association with duality makes *either* like *both*. The difference is most straightforwardly seen in pairs like:

- [48] i a. Did *either* boy have a key? (= [47iia])      b. Did *both* boys have a key?  
 ii a. If *either* parent dies, Jill will inherit the business.      b. If *both* parents die, Jill will inherit the business.

In [i] the conditions under which the answer to the question is “yes” are clearly different: in [b] each of the two boys must have had a key, but in [a] only one need have had one. Similarly in [ii] the condition under which Jill will inherit the business is different: in [b] she’ll inherit if each of the parents dies, but in [a] it is sufficient that one parent dies. *Both* thus indicates the totality of the set: it is a universal quantifier. *Either*<sub>n</sub> is an existential quantifier: it indicates at least one member. This is reflected in the fact that *both* selects a plural, while *either* selects a singular. And it follows that while *both* boys is definite, *either* boy is indefinite.

The presupposition of a definite set of two distinguishes dual *either* from neutral *any*. *Either* could be replaced by *any* in [47], preserving the contrast between the admissible [a] and inadmissible [b] examples, but with the implicature now that we are concerned with more than two teachers, boys, or computers. *Any*, however, does not presuppose a definite set at all, so a closer *any* counterpart of [47ia] would have an explicit partitive phrase: *He didn’t like any of the teachers*, etc. As with *both*, restriction to a set of exactly two rules out modification: compare *He liked hardly any/\*either of the teachers* or *Almost any/\*either of the computers would do the job*.

#### ■ *Either* as a marker of coordination

Like *both*, *either* functions not only as determiner in NP structure but also as the marker of the first term in a coordinative construction:

- [49] i a. *either* parent                                      b. *both* parents  
 ii a. *either* her father or her mother              b. *both* her father and her mother

While *both* is paired with the coordinator *and*, *either* is paired with *or*; the relation between [a] and [b] in the coordinations [ii] thus matches that between the NPs [i]. *Or*-coordinations (discussed in Ch. 15, §2.2) express the semantic relation known as **disjunction**: hence our classification of *either* as a disjunctive determinative. The relation between the uses as NP-determiner and coordination-marker is not quite as close with *either* as with *both*. In the first place, the distributional restrictions on *either* in NPs illustrated in [47] do not hold for *either* in coordinations: compare [47iib], for example, with *Either* her father or her mother had a key. Secondly (as we noted in §5.1), the duality feature is weakened: while *either*-coordinations are characteristically binary, multiple ones like *either* Kim, Pat, or Alex are also possible.

#### ■ Special use: *on either side*

[50] *They planted roses on either side of the driveway.*

Here *either* is equivalent to *each*, and since a set of two is still presupposed *either side* is equivalent to *both sides*. This use of *either* is found with a very small set of nouns, such as *side*, *end*, *extreme*, and is not subject to the syntactic restrictions illustrated in [47].

### ■ *Neither*

*Neither* functions likewise as determiner (*neither parent*) or marker of an initial coordinate (*neither her father nor her mother*), and represents the lexicalisation of “not + either”. Example [47ia] is thus equivalent to *He liked neither teacher*. Similarly *Neither boy had a key* means “It is not the case that either boy had a key” and is equivalent to *Both boys didn’t have a key*. This equivalence is the same as that between *Neither Max nor Ed had a key* and *Both Max and Ed didn’t have a key*, and is discussed more fully in our account of coordination (Ch. 15, §2.4).

### ■ Fused-head NPs

*Either* and *neither* commonly occur as head in explicitly or implicitly partitive fused-head NPs:

- [51] i *Let me know if [either/neither of the students] turns up.* [explicitly partitive]  
 ii *There were two flats available, but [neither] was suitable.* [implicitly partitive]

## 7.8 The negative determinatives *no* and *none*

### ■ *No* as determiner with count and non-count heads

- [52] i a. *No juvenile was admitted.* b. *No juveniles were admitted.* [count]  
 ii *No bread was baked that day.* [non-count]

With count heads *no* indicates that not one member of the set under consideration has the predication property, and with non-count heads it indicates that there isn’t any subquantity of the quantity under consideration that has the predication property. The set/quantity under consideration is that denoted by the head subject to any implied contextual restrictions. If I say, for example, *No student had read Bloomfield’s ‘Language’*, I will normally be understood as talking not about students in general but about the students in a particular course.

### Neutralisation of the singular–plural distinction

Examples [52ia–b] are semantically equivalent: the distinction between singular and plural is here neutralised. In this example there is little pragmatic difference between the two versions, but in some cases one or other may be preferred or required:

- [53] i a. *He has no father.* b. *\*He has no fathers.*  
 ii a. *He has no child.* b. *He has no children.*

In [i] the singular is required because one doesn’t have more than one (biological) father. The singular is also more natural in *He has no job/jobs*: it is of course possible to have two or more jobs, but the normal expectation is that people have just one. In [ii], by contrast, we would normally use the plural version: it is more usual to have two or more children than just one. It is arguable, indeed, that the plural in general represents the default choice.

### ■ Relationship with *not* + *a/one/any<sub>n</sub>* and *neither*

In general, *no* is equivalent to *not* (or a negative verb inflection) + *a*, *one<sub>s</sub>*, or *any<sub>n</sub>*.

- [54] i a. *No boy(s) in the class passed.* b. *I know no boy(s) in the class.*  
 ii a. *Not a/one<sub>s</sub> boy in the class passed.* b. *I don’t know a/one<sub>s</sub> boy in the class.*  
 iii a. *?Not any<sub>n</sub> boy(s) in the class passed.* b. *I don’t know any<sub>n</sub> boy(s) in the class.*

In the case of the plurals, the lower bound is three: two doesn't qualify as a few or several.

### ■ The complex forms *a few* and *a little*

These have internal structure in that they contain the indefinite article *a*. *A few mistakes* with *a few* as determiner is structurally quite different from *the few mistakes*, where *the* is determiner and the degree determinative *few* is modifier – and of course *a little money* is structurally distinct from *a little boy*, where *little* is an adjective in modifier function. The only internal expansion permitted for *a little* is the addition of *very* (*a very little money*), while *a few* admits *very*, *good*, and *fair*; the internal structure of these forms is thus sui generis, and as with the cardinal numerals we include them among the lexical determinatives. They can also combine with the peripheral modifier *quite*. Compare then:

[61] a. [*a very few*] *mistakes*                      b. *quite* [*a few*] *mistakes*

*Very* in [a] serves to lower the upper bound: the number is not much greater than the minimum of three. *Quite* in [b] by contrast raises the upper bound, as do the adjectival modifiers in *a good/fair few*: the number is appreciably greater than three.

### ■ *A few* vs *several*

One clear syntactic difference between these is that *several* can function as modifier (following a definite determiner) or as predicative complement: *its several advantages*; *Its advantages are several*. *A few*, but not *several*, can combine with *quite*, as in [61b], and also with *not*: *not a few* implies a relatively large number. *Only* occurs readily with *a few*, but is hardly idiomatic with *several*. *At least* can occur with either, but also more readily with *a few*.

Some speakers feel that the upper bound can be somewhat greater with *several*, but that is difficult to establish. *A few* contrasts with *many* more directly than does *several* (though not so directly as does *few*), and for this reason the “not multal” implicature conveyed by *a few* seems somewhat stronger than that conveyed by *several*. Thus a salesperson would be more likely to say that their product had several advantages over a competitor than that it had a few.

### ■ Fused-head NPs

All three forms are used as head in simple or partitive fused-head NPs: *Kim made about ten mistakes* and *Pat made a few too* (simple); *She took about twenty photographs* and *a few (of them) were very good indeed*.

### ■ *Various* and *certain*

These are somewhat marginal members of the determinative category, less clearly distinct from adjectives than most. Both occur with plural heads:

[62] a. [*Various* *items*] *are missing*.            b. [*Certain* *problems*] *remain*.

In [a] *various* acts as a determiner rather similar to *several*: a relatively small number of items are missing. It differs from *several* in indicating more explicitly that the items are different; note, however, that this component of variety can also sometimes be found in the modifier use of *several* following a subject-determiner, as in *their several opinions*. *Certain* in [b] implies that the problems could be specified. In this example, *certain* is non-proportional, while in other cases it can be proportional, with a strong “not all” implicature: *Such action might be justifiable in certain circumstances*.

*Certain* occurs (in relatively formal style) as head in a partitive fused-head: *Certain of the delegates had expressed strong opposition to the proposal*. The same applies, for some speakers, primarily AmE, to *various*: <sup>96</sup>*He summoned a number of men (those who had been professional entertainers in civilian life) from various of his units*. This makes *certain* and *various* more like the clear determinatives, distinct, for example, from the adjective *numerous*. They also differ from adjectives in not allowing a generic interpretation. *Various tiger populations are dangerous*, for example, means that a small set of tiger populations are dangerous, not that any tiger populations which show variety are dangerous. *Numerous tiger populations are dangerous*, by contrast, can be given a generic interpretation: populations which consist of large numbers of tigers are dangerous.

*Certain* is also used in singular NPs in combination with *a*:

- [63] i *This gave her a certain authority.*  
 ii *To a certain extent I agree with you.*  
 iii *It's a certain bet that the price will rise again before the end of the year.*

The *certain* of [iii] is semantically distinct from that of [i–ii]; it is replaceable by *sure* and is clearly an adjective in modifier function. In [i–ii], unlike [iii], there is a strong association with *a*, and it may be best to treat *a certain* as a complex determinative. In cases like [i], indeed, we could not omit *certain* and retain *a*: <sup>#</sup>*This gave her an authority*. *A certain* here serves to individuate a kind of authority. In [ii] *a certain* is equivalent to *some* with a paucal implicature: “to a limited extent”.

## 7.11 The degree determinatives *many, much, few, little*

These form a distinct group of determinatives in that they inflect for grade. **Many** and **few** select count plural heads, **much** and **little** non-count singulars:

- | [64] | COUNT PLURAL  | NON-COUNT  |
|------|---|--|
| i    | a. <i>He made [<u>many</u> mistakes].</i>           | b. <i>Has he got [<u>much</u> money]?</i>          |
| ii   | a. <i>He made [<u>more</u> mistakes than you].</i>  | b. <i>Has he got [<u>more</u> money than you]?</i> |
| iii  | a. <i>He made [(the) <u>most</u> mistakes].</i>     | b. <i>Has he got [(the) <u>most</u> money]?</i>    |
| iv   | a. <i>He made [<u>few</u> mistakes].</i>            | b. <i>He has got [<u>little</u> money].</i>        |
| v    | a. <i>He made [<u>fewer</u> mistakes than you].</i> | b. <i>He has got [<u>less</u> money than you].</i> |
| vi   | a. <i>He made [(the) <u>fewest</u> mistakes].</i>   | b. <i>He has got [(the) <u>least</u> money].</i>   |

We have used interrogative examples for **much** because the plain form *much* is largely restricted to non-affirmative contexts (see Ch. 9, §4.1.2). The grammar of comparison is described in Ch. 13, and our discussion of the comparative and superlative forms in this section can be brief, focusing on certain issues concerning the structure of NPs.

### ■ The plain forms

The plain forms express imprecise quantification. *Many* and *much* are multal quantifiers, meaning approximately “a large number/quantity of”; their antonyms *few* and *little*, meaning “a small number/quantity of”, are paucal quantifiers. *Few* and *little* differ from *a few* and *a little* as negative vs positive; the difference in meaning was presented summarily in §5.2 above, and is treated in detail in Ch. 9, §3.3. All four plain forms accept a wide range of modifiers: *unusually many*, *amazingly few*, *this much*, *very little*, and so on. As determiners they mark the NP as indefinite.

### Use as modifiers in NP structure

Except for *much*, the plain forms can also occur as modifier following a definite determiner: *her many virtues, those few outstanding mistakes, the little money that remains*.<sup>30</sup> *A few* and *a little* cannot occur as modifiers, but the rather sharp contrast that we find in determiner function between negative *few* or *little* and positive *a few* or *a little* is largely neutralised with *few* and *little* as modifiers. In the first place, determiner *few* implicates but does not entail a number above zero, but by virtue of the existential presuppositions associated with definite NPs modifier *few* has to be interpreted as greater than zero: *The few mistakes they made were relatively trivial* entails that they made at least some mistakes. Secondly, while a determiner can mark a clause as negative, an internal modifier never can. Compare, for example, *She hadn't offered a very convincing excuse, had she?* (positive tag attached to a negative clause) and *She had offered a not very convincing excuse, hadn't she?* (negative tag attached to positive clause). Similarly with *few*:

- [65] i *Few people came to the meeting, did they?* [determiner; negative clause]  
 ii *The few people who came to the meeting all supported the proposal, didn't they?* } [modifier; positive clause]

### Many in combination with a

*Many* combines with *a* to form two kinds of complex determinative:

- [66] i [*Many a man*] *has been moved to tears by this sight.*  
 ii [*A great many complaints*] *had been received.*

*Many a* is syntactically inert: nothing can intervene between *many* and *a*, and *many* cannot even be replaced in this position by its antonym *few*. Like *a*, *many a* always functions as determiner. It is found in proverbs such as *There's many a slip twixt cup and lip*, and in the frequency adjunct *many a time*, but is elsewhere somewhat formal or archaic. The *many* component indicates a large number, but the *a* has an individuating and distributive effect requiring a count singular head.

*Great* in *a great many* can be replaced by *good*, but one or other of these adjectives is required; for the rest, these expressions are syntactically comparable to *a few*. They function as determiner or fused determiner-head (simple or partitive).

## ■ The superlative forms and proportional *most*

We have distinguished two senses of *most* (§5.2), one proportional (*most<sub>p</sub>*) and one the superlative of *many* or *much* (*most<sub>s</sub>*). Both select plural or non-count heads:

- [67] i a. [*Most<sub>p</sub> people*] *enjoyed it.* b. [*Most<sub>p</sub> cheese*] *is made from cow's milk.*  
 ii a. *Kim had scored [(the)most<sub>s</sub> runs].* b. *Kim had made [(the)most<sub>s</sub> progress].*

There is no analogous distinction for *fewest* or *least*: these cannot indicate a small proportion, but have only the superlative sense.

### Proportional *most<sub>p</sub>*

*Most<sub>p</sub>* indicates a number or subquantity that is at least greater than half of the set or quantity concerned, but in many contexts it will be interpreted as a considerably higher proportion. It marks the NP as indefinite, and can never occur as modifier.

<sup>30</sup>*Much* is marginally possible in this function if it is itself modified: *all the not very much money that he earns.*

### The and the superlatives

As illustrated in [67ii], superlative *most*, and also *fewest* and *least* occur with or without *the*; the version with *the* is considerably more frequent. We analyse this *the* as modifying the comparative quantifier, rather than as determiner in NP structure: the whole NP is indefinite, just as it is when *the* is omitted. *The* is here functioning in the same way as in *It was Jill who had spoken [the most eloquently]*. Note, then, the contrast between [67ii] and, say, *Jill had put forward [the most promising proposals]*. In the latter *the* is determiner in NP structure, marking the NP as definite; if we drop *the* here we get an indefinite NP, and *most promising* can only be interpreted as “highly promising”, rather than as a strict superlative.

### ■ The comparative forms

The determinatives *more*, *fewer*, and *less* likewise occur in determiner function, marking the NP as indefinite:

- [68] i *She drinks [more/less milk than you].*  
 ii *There's [more milk] in the fridge if you need some.*

In [i] we have a straightforward comparative, while in [ii] *more* is interpreted as “additional, further”. The comparative forms cannot occur as modifier: *\*I can't find [the more milk that you said was in the fridge]*. There is, however, a construction comparable to the superlative one in [67ii], where *the* modifies the comparative form:

- [69] i *That's [all the more reason why we should take professional advice].*  
 ii *[The more alternative occupations] there are available, [the fewer women] you will find who take in lodgers.*

The bracketed NPs here are indefinite, and the underlined sequences are DPs; again this *the* is found outside NP structure, as in *He had found that [the more afraid] a man was, the easier it was to kill him.*

### ■ Fused-head NPs

All the forms in [64] are found as fused heads. A few examples are given in:

- [70] i *He expected to get a lot of votes but ended up with [relatively few].* [simple]  
 ii a. [Much of the book] was incomprehensible.  
 b. I found about twenty mistakes, but [most<sub>p</sub>] were relatively minor. } [partitive]  
 iii a. They had found [much/little to criticise] in his thesis.  
 b. [Many/Few] would disagree with you on that point. } [special]  
 c. Kim isn't [much of an actor] / [any more of an actor than Pat]. }

### ■ Other functions

**Much** and **little** (all forms) occur as degree adjunct in clause structure: *Jill little realised what they were planning; It didn't hurt as much as last time.* The plain forms *much* and *little* modify comparative expressions: *much better, little different, much more cheese, little less intrusive.* *Very much* modifies a wider range of expressions: *very much in control, very much an intellectual.* (*More* and *less* modify adjectives, adverbs, etc., but we take these to be degree adverbs, rather than comparative forms of **much** and **little**: see Ch. 13, §4.1.1.) The degree determiners can also function directly as predicative complement: *Their enemies were many.* This, however, is a relatively uncommon and formal

construction: a formulation in which they appear as determiner to a noun would usually be preferred, as in *They had many enemies*.<sup>31</sup>

## 7.12 The sufficiency determinatives *enough*, *sufficient*

As determiners, *enough* and *sufficient* select count plural or non-count heads:

- [71] i [*Enough/sufficient people*] attended the meeting to form a quorum.  
 ii I haven't got [*enough/sufficient money*].

They express imprecise quantification, being concerned with the lower bound required to satisfy some explicit or implicit need or purpose. In [i] it is a question of how many people were needed to form a quorum; suppose that in a particular case twenty was the minimum (maybe there were thirty members and the rules stipulated a quorum of two thirds), then [i] indicates that at least twenty people attended. In [ii] no indication is given of the need or purpose, but one must be recoverable from the context – it could be quite specific (e.g. to come to the movies with you) or quite general (e.g. to satisfy my needs). *Enough* and *sufficient* do not say anything about the upper bound; in cases like [i], however, where we are concerned with a proportion of some set, we have the familiar “not all” implicature: I convey that not all members attended.

### ■ Expression of need/purpose, or result

*Enough* and *sufficient* license purpose expressions with the form of PPs with *for* (*enough money for a taxi*), or infinitival clauses (such as *to form a quorum* in [71i]). AmE allows an alternative construction in which they take a resultative content clause: <sup>o</sup>*There was enough hot water that we could all have baths*.

### ■ *Sufficient* as determinative or adjective

Unlike *enough*, *sufficient* belongs to the category of adjectives as well as being a determinative:

- [72] i *This isn't [a sufficient reason for dismissing them].* [adjective]  
 ii *Those aren't [sufficient reasons for dismissing them].* [adjective or determinative]

In [i] *sufficient* differs from the sufficiency determinatives in two respects: it is in modifier function and the head is count singular. The meaning is approximately “sufficiently good/strong”: it is quantifying not the reason itself, but a property of it. Example [ii] is then ambiguous: in the adjectival reading it is simply a plural counterpart of [i] (“Those aren't sufficiently good reasons”); in the determinative reading, *sufficient* is replaceable by *enough*, so that we are here quantifying reasons.

### ■ Fused-head NPs

The sufficiency determinatives function as head in all three types of fused-head NP, with the special ones having non-count interpretations:

- [73] i *I had some money on me, but not enough/sufficient to get a taxi.* [simple]  
 ii *I don't think enough/sufficient of us are here to form a quorum.* [partitive]  
 iii *You've already said enough/sufficient to convince me.* [special]

<sup>31</sup>A special and idiomatic case has predicative *many* in front position with a singular temporal expression as subject: *Many's the time I've found them playing computer games well after midnight*.

### ■ Modifier uses

The sufficiency determinatives are not permitted in pre-head modifier position. *Enough*, however, has the syntactic peculiarity of being able to appear as post-head modifier and it can also occur in this function with verbs, adjectives, and adverbs:

- [74] i We have time enough to complete the task. [noun]  
 ii I don't like it enough to buy it at that price. [verb]  
 iii The furniture isn't robust enough for that kind of treatment. [adjective]  
 iv They don't speak clearly enough for me to be able to hear. [adverb]

Note, however, that it doesn't modify the core degree determinatives. It contrasts rather than combines with them, so that we have *enough money* (or *money enough*), not *\*much enough money*. To a limited extent *enough* can also modify PPs, and here – as in NPs – it precedes the head (*I wasn't enough in control for that*) or follows it (*I wasn't in control enough for that*).

The determinative *sufficient* is much more limited in its distribution, occurring only as determiner in NP structure (or fused determiner-head). The gap is filled by the adverb *sufficiently*: compare *like it sufficiently*, *sufficiently robust*, *sufficiently clearly*, *sufficiently in control*. The fact that *sufficient* is paired with a *-ly* adverb in this way makes it the most adjective-like of the determinatives.

## 7.13 The interrogative determinatives *which, what, whichever, whatever*

The interrogative determinatives belong to the larger set of interrogative words that includes also *who, when, where, why*, etc. – and *what* as a pronoun. The determinatives in *-ever* are found only in the exhaustive conditional construction: [*Whichever/Whatever present you buy for him,*] *he won't be satisfied*; this construction is discussed in detail in Ch. 11, §5.3.6, and the forms will not be considered further here.

### ■ Which vs what

The interrogative words, by their very nature, mark the NP as indefinite, but *which* shares with *either* and *each* the property of involving a set that is identifiable by the addressee: answers to a *which* question make a selection from this set. Compare:

- [75] Which/What videos have been released this week?

Suppose I go into the video store and use the *which* version of question [75]: *which* indicates that I expect you to be able to identify a unique set of videos, perhaps those on display in the store; I will be understood as requesting the kind of answer that selects from this set in the most relevant way to me the ones released this week. *Which* can be used in a directive way to force the addressee to recognise a unique set in the absence of any contextual clues. Consider, for example, the question *Which video shall we watch tonight?* This might be used in a context, say, where we have hired seven videos from the video store to last the week, and you will then be already aware of the unique set from which the answer is to be selected. But it is also possible that there is no such previously established set (perhaps we are merely planning a trip to the video store), and *which* then serves itself to establish one in a way that is comparable to the establishing use of the definite article (as in [6viii] of §6.1). You are forced, as it were, to recognise a set consisting of the videos that we might choose.

### ■ Fused-head NPs

*Which* occurs freely in explicitly or implicitly partitive fused-head NPs: [*Which* of the candidates] shall we interview first?; They had hired several videos and were arguing about [*which*] to watch. Determinative *what*, however, does not function as a fused-head – cf. \*[*What* of these videos] have you already seen? The *what* that occurs as head in NP structure is a pronoun, differing sharply in meaning from the determinative. The pronoun *what* is non-personal (contrasting with personal **who**: *What/Who* did you see?), whereas the determinative is indifferent as to the gender of the head noun.

## 7.14 The relative determinatives *which, what, whichever, whatever*

### ■ Fused relatives

The relative determinatives occur in the fused relative construction (Ch. 12, §6). *Which* is restricted to the free choice subtype:

- [76] i We bought [*what/whatever/\*which/whichever* tickets were available]. [ordinary]  
 ii We can use [*what/whatever/which/whichever* edition you want]. [free choice]

Like interrogative *which*, fused relative *which* and *whichever* are selective. It follows that, unlike *what* and *whatever*, they select count nouns as head. Compare:

- [77] i We'll use [*whatever/whichever* edition is available]. [count singular]  
 ii I gave them [*whatever/\*whichever* help I could]. [non-count]

*Whichever* in [i] signals that I expect you to be able to identify a set of editions from which one will be selected. *What* (but not *whatever*) in the ordinary fused relative has a paucal interpretation: *We bought what tickets were available* conveys that few tickets were available.

The relative NPs in the fused construction can plausibly be regarded as definite: the examples in [76], for example, are comparable to *We bought the tickets that were available* and *We can use the edition you want to use* (not *some tickets* or *an edition*). The *-ever* compounds – and *what* or *which* in the free choice construction – are indeterminate (see §8.3 below). For example, [77i] can be glossed as “We’ll use the edition that is available, no matter which it is”.<sup>32</sup> For the rest NPs determined by *what* can be referential or indeterminate. *We bought what tickets were available* can be interpreted either referentially (e.g. the two tickets in the front stalls) or indeterminately (the tickets that were available, no matter which they were).

### Fused-head NPs

*Which* and *whichever* occur as fused heads: *There are several editions of the play – you can use [*which* you like]*; *We’ll borrow [*whichever of the computers* is available]*. But as with interrogatives, *what* and *whatever* in head function are pronouns, contrasting with personal **who** and **whoever**.

<sup>32</sup>There is a subtle distinction between *whichever* and the free choice quantifier *any<sub>f</sub>*. A child who is told *You can have whichever present you like for Christmas* would have to choose a unique present, for *whichever*, though indeterminate, is definite. On the other hand, a child who is told *You can have any<sub>f</sub> present you like for Christmas* might claim to be allowed to choose a multiplicity of presents: with indefinite *any<sub>f</sub>* the parent only **implicates** that no more than one present is to be chosen (see §7.5 above).

### ■ Supplementary relatives

The only relative determinative found outside the fused construction is *which*. It occurs in supplementary but not integrated relatives:

[78] *The meeting lasted until midnight, at [which stage] everyone was exhausted.*

Again the relative NP is definite – comparable, for example, to demonstrative *that stage*. Determinative *which* does not occur in fused-head NPs: in *He works at the post-office, [which is just down the road]* the head *which* is a pronoun. The pronoun is non-personal, contrasting with *who*, while the determinative occurs with personal and non-personal heads.

## 8 Referential and non-referential uses of NPs

### 8.1 Reference and denotation

In this grammar, we make a distinction between the semantic properties **reference** and **denotation**. We will say that a linguistic expression has reference if, by using it on a given occasion, a speaker intends it to pick out some **independently distinguishable** entity, or set of entities, in the real world (or in some fictional world). By ‘independently distinguishable’, we mean distinguishable by properties other than those inherent in the meaning of the expression itself. We will say that an expression used in this way is **referential**, that it is used to **refer to** the entity in question, and we call this entity the **referent** of the expression.

Consider the following elementary example:

[1] *Mary washed her car.*

The subject NP *Mary* is a proper name and as such is the most basic kind of referential expression. In an ordinary utterance of sentence [1],<sup>33</sup> the NP serves to pick out a certain individual named *Mary*, an entity distinguishable by properties other than her name (for example, her appearance, where she lives, etc.). We say, then, that the speaker refers to this entity by means of the NP or, by extension and more simply, that the NP itself refers to it. Reference is clearly **context-dependent**: the NP *Mary* can be used on different occasions to refer to indefinitely many distinct individuals, so what its referent is on any particular occasion will depend on the context. The pronoun *her* in [1] is also referential; in a salient interpretation it too refers to *Mary*, this time by virtue of the anaphoric relation between the pronoun and its antecedent, the NP *Mary*. Finally, the object *her car* is referential: it picks out a particular car, distinguishable by properties not expressed in the NP, such as colour, make, registration number, and so on.

Not all of the linguistic expressions in [1] are referential, however. The verb *washed* is not referential: rather than picking out a particular entity, it indicates the relation that obtained between *Mary* and the car. This we speak of as denotation: the verb **wash** denotes a relation between two arguments *x* and *y* such that *x* cleans *y* using some liquid (typically water). Similarly, in *Mary is very talkative* the adjective *talkative* is

<sup>33</sup>The qualification ‘ordinary’ excludes special cases where a sentence is simply used as an example, as in a linguistic discussion, a language-teaching class, or whatever. In what follows we will take it for granted that we are concerned only with ordinary uses.

non-referential and denotes a property of an argument  $x$  such that  $x$  talks a lot. Denotation is not context-dependent in the way that reference is: while [1] can be used on different occasions to refer to different people and different cars, the relation between the subject-referent and the object-referent is the same. Denotation is thus a matter of the meaning of expressions in the language system, while reference is not. An ordinary monolingual dictionary is largely concerned with describing the denotation of lexemes and idioms, but it does not and could not give the referents of referential expressions.

Referential expressions are generally NPs.<sup>34</sup> Nouns (or nominals), by contrast, are not themselves referential. Thus while the NP *her car* in [1] is referential, the noun *car* is not. Rather, it denotes the set of entities of a certain kind (prototypically four-wheeled road vehicles powered by an engine); the particular car referred to by the NP *her car* in a given utterance of [1] will then be a member of the set denoted by the noun *car*. This set is said to be the **denotation** of *car* (with the same term thus used for the semantic relation and for the set denoted). *Mary* is an NP that happens to consist of just a noun, but it is by virtue of being an NP in [1] that it is referential, not by virtue of being a noun. Considered as a noun, *Mary* is non-referential, and denotes the set of individuals named *Mary*: this is reflected in uses like *There are two Marys in my class*.

## 8.2 The contrast between referential and non-referential NPs

Referential expressions, we have said, are generally NPs – but NPs aren't always referential. Compare:

- [2] i *Did Mary telephone while I was out?* [referential]  
 ii *Did anyone telephone while I was out?* [non-referential]

In [i] I refer to a certain person and ask whether this person telephoned. In [ii], by contrast, *anyone* is not used referentially: I am not asking whether a certain person phoned.

### ■ Coreferential pronouns as test for referentiality

In straightforward cases like [2], the difference can be brought out by testing whether a coreferential personal pronoun can be added in a separate main clause:

- [3] i *Did Mary<sub>i</sub> telephone while I was out? She<sub>i</sub> promised to call today.*  
 ii *Did anyone<sub>i</sub> call while I was out? \*She<sub>i</sub>! \*He<sub>i</sub>! \*They<sub>i</sub> promised to call today.*

In [i] *she* derives its interpretation from its anaphoric link with *Mary*: the two NPs refer to the same person, and hence are **coreferential**. In [ii], however, *anyone* is non-referential and, unlike *Mary*, cannot stand as antecedent for a personal pronoun in this context. Referential 3rd person NPs can always serve as antecedent for an anaphoric personal pronoun in a following main clause, while the clearest cases of non-referential NPs cannot.

Consider some further examples:

- [4] i a. *One car in the race broke down and it had to be repaired.* [coreferential]  
 b. *\*No car in the race broke down and it had to be repaired.*  
 ii a. *Three students arrived early; they had taken a taxi.* [coreferential]  
 b. *No students arrived on time; they had all overslept.* [not coreferential]

<sup>34</sup>Under restricted conditions, PPs can also be referential. In *Under the table is the best place to hide*, for example, the PP *under the table* refers to a particular place. Titles of books, films, etc., can also be used referentially and need not have the form of NPs: *They saw 'What's up, Doc?' three times*.

Examples [ia–b] exhibit the same clear distinction as we had in [3]: *one car in the race* is referential and serves as antecedent for the pronoun *it*, while *no car in the race* is non-referential and cannot serve as antecedent for a pronoun in a separate main clause. *Three students* in [iia] is again unproblematically antecedent for the coreferential *they*. Example [iib] shows that the test must be applied with care: although *they* is perfectly acceptable here, *no students* is not its antecedent and there is no relation of coreference between the two NPs. *No students* is non-referential, but is understood here as “none of the students”, i.e. as involving a set of students of whom none arrived on time, and it is this set that *they* refers to. The difference between [iia] and [iib] is evident from the fact that [iia] entails that three students had taken a taxi, whereas [iib] does not entail that no students had overslept.

### ■ NPs that can only be used non-referentially

Negative NPs like those in [4ib/iib] are always non-referential. Other kinds of inherently non-referential NPs are illustrated in [5]:

- [5] i [Either city] might win the Olympics. [determinative *either*]  
 ii The matron interviewed [each boy] in turn. [determinative *each*]  
 iii I wonder [who] told her. [interrogative]  
 iv I was elected treasurer two years ago. [bare role NP]

Certain determinatives, such as *either* and *each* in [i–ii], mark an NP as non-referential. The pronoun test works clearly in [i]: we could not continue with *It has excellent facilities*, with *it* anaphoric to *either city*. We could have *They have excellent facilities*, but this is like [4iib]: *either city* involves a set of two cities, and *they* refers to this set. Similarly, we could not continue [5ii] with *he* used as an anaphor to *each boy*, but could use *they* to refer to the implicit set of boys. Other items of this kind include *any*, *every* – and the negative *no* and *neither*. *Who* in [5iii] is representative of the class of interrogative NPs, which are all clearly non-referential; *who told her* expresses an (embedded) question, and it is the corresponding NP in the answer (such as *Tim told her*) that is referential. *Treasurer* in [iv] is a bare role NP restricted to the function of predicative complement: by virtue of having no determiner such NPs cannot occupy characteristically referential positions such as subject (for other kinds of bare NP that are always non-referential, see §8.5 below).

### ■ NPs which can be used referentially or non-referentially

Most types of NP can be used either referentially or non-referentially. The proper name *Mary*, for example, can be used non-referentially even when it constitutes a full NP, as in *Mary is still one of the most popular girl's names*. This represents a **metalinguistic** use of *Mary*: the case where we cite a linguistic expression in order to say something about it qua linguistic expression. It is obvious that *Mary* does not here refer to a person, but it would also be a mistake to say that it refers to a name: it *is* a name. In the following section we consider various non-referential uses of NPs besides this metalinguistic case. These uses exploit the fact that even potentially referential NPs also have a denotation of the type “*x* such that . . .”; for example, even a proper name like *Mary*, which is prototypically referential, has a denotation “the individual *x* such that *x* is named *Mary*”.

### 8.3 Some special cases of non-referential NPs

#### (a) Ascriptive interpretations

- [6] i *Mary is a Manchester United supporter.*  
 ii *Kim became Pat's lover / the heir to a large fortune.*

Ascriptive NPs are those that function as predicative complements in the ascriptive as opposed to specifying construction (see Ch. 4, §5.5.1). In [i] I am not telling you that Mary is the same as some individual that I know as a Manchester United supporter: I'm simply saying that Mary is a member of the set of Manchester United supporters – I'm not specifying who she is, but ascribing a property to her. Similarly in [ii], where the ascriptive NP is definite rather than indefinite: the clause doesn't describe a change of identity, but Kim's coming to be in the lover relation to Pat, or the heir to a large fortune.

#### (b) Descriptive interpretations

Descriptive interpretations arise in constructions which contain *be* in its reference-specifying rather than ascriptive use. In these cases, we have a definite NP as predicand and another definite NP as predicative complement. We made the point in §6 that a definite NP is assumed to contain enough information to identify some entity or set of entities in the relatively weak sense of pre-empting a *which* question. However, the fact that an NP identifies some entity or set of entities in this sense does not mean that it is being used referentially. Consider, then:

- [7] i *The Vice-Chancellor is that guy over there by the piano.*  
 ii *Paul is that guy over there by the piano.*  
 iii *I'm Kim Lane.*  
 iv [*Cassius Clay*] is [*Mohammed Ali*].

In [i] *that guy over there by the piano* is referential, but *the Vice-Chancellor* is not: I'm not making two references to a certain person and saying that this person is identical to himself.<sup>35</sup> Rather, I assume you know there is some contextually relevant person who satisfies the description *the Vice-Chancellor* and am telling you who this person is: the individual referred to by the NP *that guy over there by the piano*. The same applies in [ii]: a proper name can be descriptive, just as an NP with a common noun as head can be. Thus *Paul* is here non-referential but acts as a description of some individual by virtue of his name (“the individual *x* such that *x* is named Paul”), and the referential NP *that guy over there by the piano* specifies the value of the variable *x*. In [iii] it is the subject *I* that is referential, while the predicative complement *Kim Lane* is descriptive: I'm not saying that I'm identical to myself, but giving my name. Example [iv] is naturally interpreted like [i–ii], saying that the individual named Cassius Clay is the person you already know as Mohammed Ali, but it can also be interpreted like [iii], saying that the person you already know as Cassius Clay also has the name Mohammed Ali. This interpretation emerges strongly if we add *now*: *Cassius Clay is Mohammed Ali now*. These examples are

<sup>35</sup>One place where the subject and predicative complement of *be* can both be referential is in examples like *Max was Macbeth*, “Max played the part of Macbeth”. This represents a special use of *be* that cannot be subsumed under either the specifying or ascriptive use.

reference-specifying in the sense that, following their utterance, the descriptive NP can be used referentially.<sup>36</sup>

### (c) Definiendum and definiens interpretations

A further use of specifying *be* is in definitions. In this case, both predicand and predicative complement are indefinite NPs (either a singular NP determined by the indefinite article, or a bare plural). Consider, then:

- [8] i A pentagon is a regular figure with five sides.  
 ii Pentagons are regular figures with five sides.

Here I am not telling you that a particular pentagon (or a particular set of pentagons) has the property of being a regular figure with five sides, nor indeed that a typical pentagon has this property (this would be a generic interpretation, see (i) below). Rather, I am specifying what the definition of the expression *pentagon* is. Both NPs are then non-referential: the predicand represents the definiendum (the entity whose definition is to be specified), and the predicative complement represents the definiens (the entity providing the definition). These examples are similar to the reference-specifying examples in (b), since I am telling you how a term can appropriately be used, but reference is not involved.

### (d) Indeterminate interpretations

- [9] i The boy who wrote this email must be expelled. } [referential or  
 ii I think Ed's CD player was stolen by a friend of his. } [indeterminate]

These examples are ambiguous, with the underlined NPs having either a referential or a non-referential interpretation. Take first the underlined NP in [i]. This could be used as a way of picking out a particular individual (Smith Junior, say); in this referential interpretation, then, I'm saying that Smith Junior must be expelled. A context for this interpretation might be one where an investigation has already taken place into who wrote the offending email, and the culprit has been apprehended.<sup>37</sup> Alternatively, however, it could be that no investigation has yet taken place, so that the culprit is not yet known. In this case, the underlined NP can be used non-referentially to say that the individual denoted ("the *x* such that *x* is a boy who wrote this email") must be expelled, whoever this individual might turn out to be. We term this the **indeterminate** use of the NP. The indeterminate interpretation can be expressed unequivocally by *Whichever boy wrote this email must be expelled* (fused relative), or *The boy who wrote this email must be expelled, whoever it is* (NP + exhaustive conditional adjunct). Note, then, that the indeterminate use is akin to the descriptive use outlined in (b) above, but it is not identical: following the utterance of the sentence, the indeterminate NP does not automatically have a referential use.

<sup>36</sup>Example [7iv] also has another and less likely interpretation where neither NP is referential: here I am merely saying that *Cassius Clay* and *Mohammed Ali* are names of the same person, though I don't know who it is that bears these names. The only use of such a sentence would be in a context where we are discussing examples of things which have two different names. The classic philosophers' example *The morning star is the evening star* is of the same kind: it has two reference-specifying interpretations in which either I specify the morning star as the entity you know as the evening star, or vice versa. But it can also be used to assert that there is a single celestial body which has these two names.

<sup>37</sup>It should be noted that in the referential use, the property given in the NP does not in fact have to apply to the referent. It could be that speaker and addressee are both convinced that Smith Junior is the culprit, even though he is not; in that case *the boy who wrote this email* would still successfully pick out Smith Junior and I would still be saying that Smith Junior must be expelled.

Indeterminate NPs can serve as antecedent for personal pronouns (we could continue [i], for example, with *He has brought the school into disrepute*): as is evident from the formulation in §8.2, inability to be antecedent for an anaphoric pronoun in an independent clause is a sufficient but not a necessary condition for the non-referential use of a 3rd person NP.

The referential versus indeterminate distinction also applies in the case of indefinite NPs, as in [9ii]. In the referential use I am picking out an individual whom I could distinguish by independent properties – compare *a friend of his named Jones*. On the other hand, I might have no idea who the thief is, but deduce from the fact that there has been no break-in that only a friend, someone who had access to the house, could have done it. In that case, *a friend of his* is being used indeterminately, to indicate what property the thief must have (whoever it actually is). Of course you, the addressee, cannot judge from the utterance of [9ii] alone whether I was using the NP referentially or indeterminately; a response such as *So you know who did it then?* would serve to seek confirmation that a referential use had been intended.<sup>38</sup>

#### (e) Non-specific interpretations

- |  |   |                                  |
|--|---|----------------------------------|
| <p>[10] i <i>I want to meet <u>the genius who can solve this equation.</u></i><br/>         ii <i>I'm going to marry <u>the man of my dreams.</u></i><br/>         iii <i>I intend to date <u>a Norwegian.</u></i></p> | } | [referential or<br>non-specific] |
|--|---|----------------------------------|

These examples too are ambiguous according as the underlined NP is interpreted referentially or non-referentially. In [i], for example, the NP can be used referentially to pick out the person who I know (or believe) to be the genius who can solve this equation; this is the specific interpretation and the referent will again be independently distinguishable – perhaps I know his or her name, perhaps I have merely seen the solution scribbled on the blackboard and am referring to the unknown person who wrote it. But there is also an interpretation where I don't know that there is in fact anyone who can solve the equation, and hence am not referring to anyone. This type of non-referential NP is called **non-specific**. Such interpretations arise in the scope of verbs like *want* which create hypothetical worlds: what is wanted may involve entities that do not necessarily exist.

Other verbs (or verbal idioms) that create such hypothetical contexts include *be going* and *intend*, and also *desire*, *ask for*, *look for*, *seek*, *dream*. In the referential (specific) interpretation of [10ii] there exists an actual person who satisfies the description *man of my dreams*; in the non-specific, non-referential, interpretation such a person exists so far only in my dreams, and hence is not independently distinguishable.

Non-specific interpretations are classically illustrated by indefinite examples such as [10iii]. The interpretation in question is that I haven't found anyone to date yet, but want to find someone to date who is a Norwegian: for some reason, being Norwegian is an essential property I'm looking for in my date. This contrasts with the referential specific

<sup>38</sup>The term 'attributive' is often used for what we have here called the 'indeterminate' use of NPs. We prefer the latter term in order to avoid conflict with the syntactic use of 'attributive' as applied to adjectives functioning as pre-head modifier to a noun (contrasting with their 'predicative' function). The concept of indeterminate use of an NP can be extended to pronouns, as in *I wonder which of the boys told her: he must have wanted to embarrass me*. The pronoun is equivalent to the indeterminate NP *the boy who told her*.

interpretation where there is a particular person I have in mind – compare *I intend to date a Norwegian my brother introduced me to last night*. The bare plural NP *Norwegians* could similarly be interpreted in either way.

(f) **Negative-bound interpretations**

- [11] i *My sister now has a car. She bought it with the royalties from her novel.*  
 ii *My sister doesn't have a car. \*She bought it with the royalties from her novel.*

In [i] *a car* is referential, and can be antecedent for the following pronoun *it*. But in [ii] *a car* is within the scope of the negative and non-referential. I do not pick out some particular car and say that my sister doesn't have it: she simply has no car. Such **negative-bound** interpretations typically emerge with indefinite NPs: if I say *My sister doesn't now have the car*, I am referring to a particular car and saying that she does not now have it. However, definite negative-bound NPs are found, as in *I don't have the slightest idea*, "I have no idea, not even a minimal one".

(g) **NP-bound interpretations**

- [12] i *Every first-year student has to learn two languages.*  
 ii *Some students have a boyfriend.*  
 iii *Most people got the salary they deserved.*  
 iv *Each of them wants to marry a film-star.*

**NP-bound** interpretations of NPs arise in the scope of other NPs that are quantified, such as the subjects in these examples. In [i] the quantified NP *every first-year student* is naturally interpreted as having *two languages* within its scope. This means that each student has an individual set of two languages to learn. For pragmatic reasons, there is likely to be a great deal of overlap between these sets: if there are forty students, for example, it is highly unlikely that any college would have the resources to offer eighty languages, as would be needed if there were no overlap. But this is irrelevant: what is crucial for the NP-bound interpretation is that there be three or more languages from which each student selects (or is assigned) a set of two. This contrasts with the referential interpretation where two particular languages, German and Chinese, say, have to be learnt by each student, i.e. all students learn the same two languages. In this referential interpretation *two languages* is outside the scope of the quantified NP. Note that the passive counterpart *Two languages have to be learnt by every first-year student* allows the same two interpretations but with the referential one somewhat more salient than in the active. But the construction with existential *there* – *There are two languages that every first-year student has to learn* – does not permit the NP-bound interpretation as *two languages* is in a higher clause than the quantified NP.

In [12ii] the NP-bound interpretation is the only natural one: each student has their own boyfriend (with the possibility of incidental overlap). The situation where they all had the same boyfriend would normally be considered so unusual that it would need to be expressed more explicitly, so a referential interpretation of *a boyfriend* is hardly possible. A bare plural *boyfriends* would require the NP-bound interpretation; it differs from the singular in that while *a boyfriend* implicates just one boyfriend per student, *boyfriends* leaves it quite open as to whether the students concerned have one or more boyfriends.

In [12iii] we have the less usual case where a definite NP is NP-bound: “for most people  $x$ ,  $x$  got the salary  $x$  deserved”. Here “the salary  $x$  deserved” applies separately to each person  $x$ , but in each case  $x$ 's deserts define a unique salary, so that the definite article is in order. A referential interpretation would be possible but unlikely: I would be saying that most people got a particular salary (\$40,000, say), which is what they all deserved.

Finally, [12iv] shows that NP-bound and non-specific interpretations of the same NP are not mutually exclusive. The sentence therefore has three interpretations. Firstly, *a film-star* may be referential, referring to a particular individual. Secondly, it may be NP-bound but specific: each of them has a particular film-star in mind, but not the same one in each case. Thirdly, there is the NP-bound non-specific interpretation where they don't have any particular film-star in mind.

#### (h) Multiple-situation-bound interpretations

- [13] i *The president has been assassinated three times.* [repeated multiple situation]  
 ii *The police are getting younger.* [serial multiple situation]  
 iii *I usually have lunch with a colleague.* [ambiguous]

**Multiple-situation-bound** interpretations arise when the NP is in the scope of an expression denoting a multiple situation, in the sense of Ch. 3, §3.2.4. They are very much akin to the NP-bound interpretations just discussed in that both involve quantification, but this time the quantification is over situations rather than entities. Example [i] involves a repeated multiple situation – i.e. one where a specific indication is given of the number of occurrences, in this case three. Only the non-referential interpretation makes sense in this example: there were three assassinations, each of a different president. If *the president* were referential and hence outside the scope of the multiple situation it would be a matter of a single president being assassinated three times, a physical impossibility. In [ii] the multiple situation is of the serial type, with the number of occurrences in principle unlimited. I am comparing the age of the police at different times, and at each time it is a matter of the age of those who are in the police force at that time. A non-bound, referential, interpretation would be saying that those who now make up the police force are getting younger – again a physical impossibility. Example [iii] is then ambiguous according as *a colleague* is likewise within the scope of a serial multiple situation or is referential: in the latter case it is always the same colleague I lunch with, while in the non-referential case there is variation between one occasion and another.

#### (i) Generic interpretations

**Generic** interpretations arise with NPs that are within the scope of expressions denoting the situation type we call **unlimited states**.<sup>39</sup> Unlimited states potentially hold for all time (or at least for as long as the entities which take part in them exist). Examples of clauses with referential subjects expressing unlimited states are *Leo is a lion* and *I like Hilda*. Unlimited states can be contrasted with limited states, as in *Leo is angry* or *I am in Paris*, which are understood to hold for a limited period of time unless an explicit indication is given to the contrary.

<sup>39</sup>Some works use the term ‘generic’ more broadly covering also such multiple-situation-bound interpretations as *I smoke a cigar / cigars after dinner*. We believe, however, that there is no difference in principle between this and the examples in [13], and wish to reserve the term ‘generic’ for the interpretation of NPs in the scope of unlimited states. Multiple situations are similar to unlimited states, but distinct.

Generic interpretations are illustrated in [14]:

- [14] i a. *Lions* are ferocious beasts.            b. *Italians* like *pasta*.  
 ii a. *A lion* is a ferocious beast.            b. *An Italian* likes *pasta*.  
 iii a. *The lion* is a ferocious beast.        b. *The Italians* like *pasta*.

The denotation of bare indefinite NPs is itself unlimited in the scope of unlimited states, and so examples like [ia] are naturally interpreted generically, with *lions* understood as “any lion or set of lions that exists”. The interpretation of singular indefinites in the same context, like *a lion* in [iia], is correspondingly “any lion that exists”. The generic use of a singular definite like *the lion* is also possible in the context given in [iiia], but is an example of the restricted ‘class’ use of the definite article (see §8.4 below). If instead of lions, we were talking about doctors, the definite singular would not generally be possible: compare the generic *Doctors are kind people* with *The doctor is a kind person* (which only has a non-generic, referential interpretation). In *The lions are ferocious beasts*, the plural definite *the lions* would also obligatorily be interpreted non-generically. The [b] examples illustrate the generic use of nationality nouns like *Italian* (as well as the generic use of non-count nouns like *pasta*). This time the restricted class use of the definite article has a plural rather than a singular NP. The definites in [iii] could both also have a non-generic interpretation where they refer to a particular lion and a particular set of Italians.

With predicates that can only be applied to a set, a singular indefinite generic such as *a lion* is inadmissible:

- [15] *Lions* / \**A lion* / *The lion* will soon be extinct in this part of Africa.

## 8.4 Restricted non-referential uses of the articles

In this section, we cover non-referential uses of NPs determined by the definite and indefinite articles that are permitted only with a restricted set of head nouns.

### (a) Class uses of the definite article

NPs determined by the definite article can denote the entire class denoted by the head noun, rather than individual members or subsets within that class.

- [16] i a. *The African elephant* will soon be extinct.  
 b. *The invention of the hydrogen bomb* was the next step.  
 c. *This chapter describes the English noun phrase*.  
 d. *The human brain* has fascinated me ever since I was a child. } [singular]  
 ii a. *We studied the Hittites* in the final year. }  
 b. *The Greeks* defeated *the Persians* at Issus. } [plural]

The boundaries of this usage with singular nouns are somewhat indeterminate, but it is clearly facilitated in the context of species ([ia]), inventions ([ib]), and areas of study, interest, or expertise ([ic–d]). Compare, for example, \**The hospital doctor* is overworked with *The hospital doctor* is an endangered species round here, or \**The tabloid newspaper* is a disgrace with *Hugo* has turned *the tabloid newspaper* into a research industry. With plurals, the class use is restricted to nouns that denote nations. The interpretation of [iia] is that we studied the Hittites qua nation, rather than any particular Hittites, and similarly for [iib].

## (b) Fixed expressions containing the definite article

A number of fixed expressions require the definite article. In such cases, it is largely arbitrary that the definite article is required rather than a bare noun (and often both are possible).

- [17] i Wolfgang can play the piano / the violin / the drums. [musical instruments]  
 ii Hilda can dance the waltz / the rumba. [dances]  
 iii I have (the) flu / (the) measles / (the) mumps / (the) chicken pox. [illnesses]  
 iv I listened to the radio / spoke to her on the telephone. [transfer of information]  
 v We took/caught the bus / the train / the boat. [transport]  
 vi I take my nap in the morning. [times]

Nouns denoting musical instruments take the definite article in the context of the verb *play*, when it is clear that what is important is the activity rather than the particular instrument that is played on a given occasion. When the interpretation is that of an academic subject, however, in the context of the verb *study*, either a bare NP or one with the definite article NP is possible: *Wolfgang is studying (the) piano at the Royal College*. Nouns denoting dances in the activity sense also take the definite article, as in [ii]. However, if an individual performance is indicated, the normal range of determiners is possible: *Hilda danced a frenzied rumba, followed by a sedate waltz*. Some common infectious diseases optionally take the definite article, as in [iii]; cf. also *(the) hiccups*. With *the plague*, the article is obligatory. Most diseases are non-count: *He has rubella / AIDS / Alzheimer's disease* – but note *He has a cold/headache*. In [iv] we have the definite article used in expressions concerned with devices and institutions for the transfer of information, even though it is the activity or action that is relevant rather than the device used on a particular occasion. Compare, however, *watch something on (the) television* with the article optional, and *watch (some) television*, where *television* is non-count. No article is used in *watch something on tape/video*, and the like, where the recording medium rather than the recording device is intended. For postal and similar institutions, we also have the article: *put something in the post/mail*. However, no article is used after *by*: *by post, by telephone*, etc. With transport terms, the article is used in examples like [v], where there is no reference to any particular vehicle, but again, there is no article after *by*: *by bus*. Example [vi] illustrates the article with temporal nouns following the preposition *in*: no particular morning is being singled out. With seasons the article is optional: *Hedgehogs hibernate in (the) winter*. In addition, a number of idiomatic expressions require the definite article, presumably for historical reasons. Examples include: *pass something on the nod* (“without discussion”); *be on the blink* (“out of order”); *be left in the lurch* (“in severe difficulty”).

## (c) The indefinite article in expressions of price, rate, etc.

- [18] She has a salary of [\$80,000 a year]. [How many hours a day] do you work?  
 He was going at [50 miles an hour]. It costs [\$20 a yard/person].

The underlined NP is interpreted distributively, like one with *each* (which in some contexts can be used instead of *a*: compare *How many hours do you work each day?*). A somewhat more formal alternant is a PP with *per* + bare NP, as in *\$80,000 per year* (though in cases like *The output per worker has increased dramatically* or *The cost is \$200 per person per week* only the *per* construction is acceptable).

## 8.5 Restricted non-referential interpretations of bare NPs

Here we cover cases similar to those dealt with in §8.4, i.e. cases where only a restricted range of head nouns is found. This time, however, our concern is with bare NPs. We confine our attention to singular count nouns, which normally require a determiner.

### (a) Bare role NPs

- [19] i *Henry became treasurer.*  
 ii *As treasurer, I strongly support this proposal.*  
 iii *The role of treasurer will fall to Henry.*

NPs such as *treasurer*, *deputy leader of the party*, occur as the predicative complements of verbs like *be*, *become*, *appoint*, *elect*, as oblique predicative governed by *as*, and as complement of the preposition *of* following nouns like *role*, *part*, or *position*. They cannot occur as subjects (*\*I'm told treasurer strongly supports this proposal*) or objects (*\*We dismissed treasurer*): in these positions they require a determiner. The interpretation of bare role NPs is invariably definite: in [19], for example, we are concerned with the office of treasurer in some particular organisation. They are therefore invariably replaceable by their counterparts with determiner *the*, as in *Henry became the treasurer*, and so on.

It is important to note that only NPs which genuinely allow role interpretations can function in this manner. The verb *become*, for example, also allows non-role nouns such as *miser* as head of the predicative complement, but such nouns require determiners: *Fred became \*miser / a miser when he lost his job*.

### (b) Fixed expressions or frames

- [20] i *Ed is in hospital / went to school / went off stage.* [activities linked to locations]  
 ii *They are out of place / off target / on call.* [indications of status]  
 iii *We went by bicycle / communicate by email.* [transport and media]  
 iv *We had lunch on the terrace.* [meals]  
 v *at dawn, by daybreak, before sunrise* [times]  
 vi *arm in arm, back to back, day after day, mouthful  
by mouthful, side by side, mile upon mile* [repeated nouns]  
 vii *from father to son, from beginning to end, between  
husband and wife, mother and child* [matched nouns]

The examples in [i] are illustrative of a number of restricted expressions connected with common activities of everyday life where no determiner is permitted, even when the noun involved is in other uses a singular count noun denoting a location which would require a determiner. In these cases, the noun acts as an indication of the associated activity, and does not have its standard denotation. Contrast, for example, *Ed is in bed* (resting/asleep) with referential *There are fleas in the bed*; or *Ed is in prison* (serving time) with *There was a riot in the prison*; or again *Ed is in church* (at a service) with *There is a new pulpit in the church*. The nouns which permit this use are severely restricted. We do not have for example *\*Ed is at desk* (studying), *\*Ed is at computer* (working), *\*Ed is in kitchen* (cooking). Nevertheless there are a fair number of them: others include the underlined nouns in such expressions as *on campus, in class, at college, settle out of court, at sea (as a sailor), at table (for a meal), leave town, start university*.

The examples in [20ii] relate to what we may call ‘status’: whether or not something is in its proper place, whether or not someone is available or engaged in their proper activity. These fixed expressions are comparable to those with non-count nouns such as *at work*, *at play*. The bare NPs in [iii] occur after the preposition *by*: compare the definite NPs in [17iv]. Meals are generally expressed by bare NPs, except when a particular occasion is singled out: compare [20iv] with *We had a nice lunch at the Savoy*. Note also *at/by dinner*, where the meal indicates a time of day. Bare NPs are used for times of day following the prepositions *at*, *by*, *before*, *until*, *after*, as in [20v]; note, however, that *morning*, *daytime*, *evening*, and *dark* take *in + the* instead of *at*: *in the / \*at morning*. The examples in [vi–vii] are illustrative of a number of expressions involving repetition of the same noun or contrasting nouns; for the category status of the expressions in [vi], see Ch. 7, §4.3. Similarly, in coordinate structures, bare NPs can optionally be used in repetition: *We searched endlessly for a spring or a cave to spend the night, but neither spring nor cave could be found*.

## 9 Fused-head and elliptical NPs

### 9.1 Overview of the fused-head construction

Fused-head NPs are those where the head is combined with a dependent function that in ordinary NPs is adjacent to the head, usually determiner or internal modifier:

- [1] i *Where are the sausages? Did you buy [some] yesterday?* [determiner-head]  
 ii *The first candidate performed well, but [the second] did not.* [modifier-head]

#### ■ Form of the fused head

In general, the expression in fused-head position can occur in the dependent position in NPs where it is not fused with the head. Thus *some* occurs with just the determiner function in *some sausages* and *second* with just the internal modifier function in *the second candidate*. These latter examples involve the **dependent** use of *some* and *second*, while [1] illustrates the **independent** use:

- [2] i *Did you buy [some sausages] yesterday?* [dependent use]  
 ii *Did you buy [some] yesterday? (from [1i])* [independent use]

There are two small-scale departures from this pattern.

#### Contrasting dependent and independent forms

A handful of items have distinct inflectional forms for dependent and independent uses:

- [3] i DEPENDENT      *my*      *your*      *her*      *our*      *their*      *no*  
 ii INDEPENDENT    *mine*      *yours*      *hers*      *ours*      *theirs*      *none*

The dependent forms are used in (pure) determiner function, the independent ones in head function. The independent genitive pronouns occur in fused heads and also pure heads, whereas the independent negative determinative *none* appears (in NP structure) only as a fused head:

- [4] i *Kim’s car had broken down and [mine] had too.* [determiner-head]  
 ii *Don’t touch that: it’s [mine].* [(pure) head]  
 iii *They made several mistakes, but [none] were serious.* [determiner-head]

### Compound determinatives

In some cases the syntactic fusion of determiner and head is reflected in the morphological compounding of a determinative base and a noun base, as in *something*, *nobody*, etc. These compound forms are discussed in §9.6 below.

### ■ Types of fused-head construction

There are three main types of fused-head construction: simple, partitive, and special. The partitive may be explicit, with an *of* phrase in post-head modifier position, or implicit, with ellipsis of the *of* phrase. Compare, then:

- |     |     |  |                        |
|-----|-----|--|------------------------|
| [5] | i   | <i>While Kim had lots of books, Pat had [<u>very few</u>].</i>     | [simple]               |
|     | ii  | <i>[<u>Few of her friends</u>]knew she was ill.</i>                | [explicitly partitive] |
|     | iii | <i>We made numerous suggestions but [<u>few</u>]were taken up.</i> | [implicitly partitive] |
|     | iv  | <i>[<u>Few</u>]would have expected it to turn out so well.</i>     | [special]              |

### Simple and implicitly partitive constructions

These are usually interpreted anaphorically, i.e. via an antecedent. We understand [5i], for example, as “very few books” and [5iii] as “few of the suggestions”. It is also possible for the interpretation to derive from something in the situation of utterance. Perhaps, for example, there is a packet of biscuits on the table: you take a biscuit from the packet and I say *Can I have one too?* The fused-head NP *one* is here interpreted as “a biscuit” – or “one of those biscuits”, for the distinction between the simple and implicitly partitive cases may in certain cases be neutralised. We look further into the interpretation of these two types in Ch. 17, §6.1.

### Explicitly partitive constructions

Here the head is followed by a complement consisting of *of* + a partitive oblique, an NP which can be plural, non-count, or, under restricted conditions, count singular:

- |     |     |                                      |                              |                      |
|-----|-----|--------------------------------------|------------------------------|----------------------|
| [6] | i   | a. <i>some of <u>the books</u></i>   | b. <i>all of <u>them</u></i> | [plural]             |
|     | ii  | a. <i>some of <u>the meat</u></i>    | b. <i>all of <u>it</u></i>   | [non-count singular] |
|     | iii | a. <i>some of <u>the morning</u></i> | b. <i>all of <u>it</u></i>   | [count singular]     |

In [i], the partitive oblique denotes a set and the matrix NP (the one with the fused head) denotes a subset of that set; similarly in [ii] the partitive oblique denotes a quantity and the matrix NP denotes a subquantity of that quantity. We use ‘subset’ here in the technical sense which does not require that a subset be smaller than the set concerned: this allows for [ib] as well as [ia].<sup>40</sup> Count singulars are admissible as partitive obliques only if they can be interpreted as divisible into parts in some relevant way. The clearest cases are those involving time periods, as in [iii]. We can also have, for example, *Some of the loaf had mould on it*, but not \**Some of the car was muddy*: we need a noun head, as in *Parts of the car were muddy*.

Partitive obliques are normally definite: we would not have #[*Two of some windows were broken*]. Indefinites cannot be wholly excluded, however: acceptability improves if the indefinite NP contains an information-rich internal modifier of the type that would in principle justify use of the definite article (cf. the discussion of definiteness-establishing

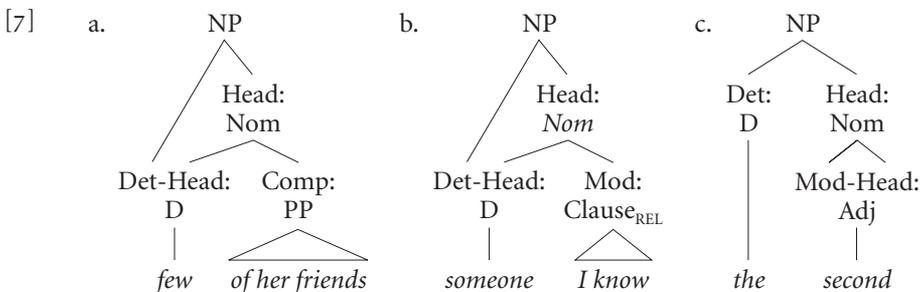

<sup>40</sup> A subset which is smaller than the set is known technically as a ‘proper subset’. In non-technical usage *subset* is interpreted as “proper subset”: this is a case therefore where an implicature of the familiar “not all” type is taken to be actually part of the meaning of the form.

modification in [6vi–vii] of §6). Such a modifier would be the relative clause in [*One of some windows which we were fitting at the Sears Tower*] was broken, and that's why I'm late.

Partitive NPs do not invariably have fused heads: there are various quantificational nouns that can occur as head, either with a separate determiner (*the majority of the books*, *a lot of the meat*) or in bare NPs (*lots/dozens of the books*).

### ■ Representation of NPs with fused heads

Simplified tree-diagrams are given in [7] for three NPs with fused heads: *few of her friends*, *someone I know* and *the second* (as used in [iii]).

## 9.2 Fusion of determiner and head

### ■ Exclusions

The great majority of determiners can fuse with the head, but there are a small number of exceptions, which fall into two groups.

#### (a) *What, we, you*

These items belong to both determinative and pronoun categories: in determiner function they are determinatives, in head function they are pronouns (see §9.5 below). Note that *what*, *we*, and *you* do not occur in constructions comparable to those involving simple or partitive fused-head constructions:

- [8] i a. *What books did he give Kim, and what did he give Pat?*  
 b. *We students will leave first, you follow as soon as you can.*  
 ii a. \**[What of these books] have you read?*  
 b. \**[You of the team] have let the rest of us down.*

The underlined NPs in [i] are not interpreted anaphorically as “what books” and “you students”, and the partitives in [ii] are ungrammatical.

#### (b) *The, a, every*

The two articles and *every* do not occur in head function at all: they require the presence of a separate head. In the case of the articles, the gap created by their inability to fuse with the head is filled by demonstrative *that* and singulative *one* respectively.

- [9] i a. *Alice's performances were better than [those/\*the of Helen].* [count plural]  
 b. *Alice's performance was better than [that/\*the of Helen].* [count singular]  
 c. *Alice's cooking was better than [that/\*the of Helen].* [non-count]  
 ii *I haven't got a pen: can you lend me [one/\*a]?* [count singular]

In the case of *every*, what we have in place of a determiner-head fusion is a construction with *every* as determiner and pro-nominal *one* as head:

- [10] i *He received over a hundred letters and replied to [every one / \*every (of them)].*  
 ii [Every one / \*Every of the apples] was rotten.

## ■ Partitives

### (a) Determinatives restricted to the partitive subtype

A number of determinatives function as fused head only in partitives:

- [11] i *I found some old letters in the attic; [certain of them] dealt with political issues.*  
 ii *They had borrowed two videos but there wasn't time to watch [either (of them)].*  
 iii *We used to have two spare keys, but [both (of them)] have disappeared.*

With *certain* the *of* phrase is hardly omissible, and the same applies to *various*. Like *either* in [ii] are *neither* and *which*: all involve choosing from some set. *Each* would also belong here, were it not for the minor special use mentioned below. *Both* indicates the whole of some definite set; as a determiner-head it is always partitive, but it can also occur as fused predeterminer-head (see §9.4 below).

### (b) Definites

Of the definite determiners only the universal quantifiers *all* and *both* occur freely as fused head in partitives. Genitives are completely excluded: \**Kim's of the shares had already been sold*. (The meaning here could be expressed as *Those of the shares that were Kim's had already been sold*.) Of the demonstratives, only *those* appears in partitives, and then only under restricted conditions:

- [12] i \**[Those of the accidents] are discussed in greater detail in Chapter 7.*  
 ii [Those of the above accidents which involve special circumstances or matters of particular medical interest] are discussed in greater detail in Chapter 7.  
 iii [Those of you with a train to catch] had better leave now.

*Those* is admissible in this construction only if the partitive PP is followed by a modifier – a relative clause in [ii], a PP in [iii]. It is this modifier which serves to establish the definiteness of the set expressed by the matrix NP.

### (c) Quantificational adjuncts

One use of fused-head partitives that merits separate mention here is that where they function as quantificational adjunct in clause structure:

- [13] i *Her parents both felt she had been exploited.*  
 ii *They had none of them intended to cause so much ill will.*

The quantificational adjuncts serve to quantify the subject. Example [i] is thus equivalent to *Both her parents felt she had been exploited* and [ii] to *None of them had intended to cause so much ill will*. Universal *all*, *both*, and *each* can occur as implicit partitives, while the set of determinatives found in explicit partitives is considerably larger: these three together with existential *some*, *any*, *none*, cardinal numerals, plural *many* and *much*, paucal *few*, *a few*, and *several*. The implicit partitives can occur in preverbal position, as in [i]; explicit partitives are somewhat questionable in this position, strongly preferring post-auxiliary position. Compare <sup>?</sup>*Her parents both of them felt she had been exploited* and *Her parents had both of them felt she had been exploited*.

### ■ Fused determiner-heads with special interpretations

We consider five cases of this construction:

#### (a) Personal: “people”

- [14] i [*Those who break the rules*] *must expect to be punished.*  
 ii [*Few*] *would quarrel with that assessment.*

Example [i] can be glossed as “(Those) people who break the rules . . .”; the construction requires a clausal modifier and the plural form *those*. There is no contrast with proximal *these*, and the deictic, demonstrative meaning of **that** is bleached away.

In [14ii], we likewise understand “few people”; postmodification is not required (but nor is it excluded). This pattern, relatively uncommon, is found with paucal *few*, multal *many*, universal *all*, and existential *some*. *All* is here equivalent to the compound determinative *everybody*, which is much more usual; *each* is found but only in more or less fixed expressions like *Each to %his/their own*. *Some* differs from *somebody* by virtue of being plural. Non-affirmative *any* is not used in this way, and negative *none* is largely restricted to constructions with *but* or *other*, as noted in §7.8. *None but a lawyer* is equivalent to *nobody but a lawyer*, but *none other than the President herself* is idiomatic and doesn't allow replacement of *none* by *nobody*.

#### (b) Non-personal

- [15] i [*Not much / Little*] *has happened while you've been away.*  
 ii *You said [enough to convince me I was wrong].*

This pattern is found mainly with quantifiers that do not form compounds with *thing*: multal *much*, paucal *little*, and the sufficiency quantifiers *enough* and *sufficient*. For universal quantification we generally have *everything*, but *all* is used in a very restricted range of cases, usually with a following modifier, as in [*All I did*] *was express an opinion*.<sup>41</sup>

#### (c) Singular demonstratives

- [16] i [*This*] *doesn't look like Jill's writing.*  
 ii *The rules allow 16-year-olds to buy alcohol, but [that] is going to change.*  
 iii *What's [all this I hear about a move to sack the chief executive]?*  
 iv *The banquet costs \$50, but you could get a decent meal for [half that].*

The singular forms of the demonstratives behave somewhat differently from the plurals. Proximal *these* is used in the simple fused-head construction, interpreted anaphorically (*Those questions are too advanced: I recommend you focus on [these]*) or directly from the context (*Can I have one of these?* – “one of these biscuits”, perhaps). *Those* is used in the same way, but also (with neutralisation of the distal vs proximal distinction) in examples like [12ii–iii] and [14i]. The singular forms can be used with a separate head recoverable anaphorically, as in:

- [17] i *That sausage has only 25 % meat, but [this] has 90%.*  
 ii *This model is more suitable than [that].*

or – in the case of *that* only – in examples like [9ib–c]. The construction of [17], however, is somewhat less likely than one with pro-nominal *one* (*this one, that one*), and

<sup>41</sup>There are places where *all* neutralises the personal vs non-personal distinction, as in partitive obliques: *best of all*. The same applies with certain fixed phrases with *none*: *second to none*.

is not normally used with human antecedents (*\*I prefer the previous candidate to this*). The singular demonstratives in head position thus fall predominantly in the special interpretation category.

(d) Quantification of predicatives: *much of a . . .*

[18] i *Ed isn't [much of a husband].*

ii *It turned out to be [more/less of a problem than we'd expected].*

Plain *much*, comparative *more* and *less*, and sufficiency *enough* are used as degree quantifiers for properties expressed in predicative NPs. *Husband* doesn't usually denote a gradable property, but in this construction we understand the quantification to apply to the degree to which Ed has the properties that are taken to characterise a good husband. Syntactically, *much* is a determiner-head taking a PP complement in which *of* is followed by an NP with the form *a* + nominal. *Much* here is strongly non-affirmative: compare *\*Ed is much of a husband*. This construction is to be distinguished from that where *very much* appears as peripheral modifier. Compare, for example, *He's [very much an actor]* and *He isn't [very much of an actor]*, where the first has *actor* as head, the second, *much*. The first is concerned with the degree to which he can be said to be an actor, the second with how good an actor he is.

(e) Genitives with a locative interpretation: *Kim's, the doctor's*

[19] i *There's a party at [Kim's] tonight.*

ii *I'd better take you to [the doctor's].*

*Kim's* in [i] is understood as “Kim's place, the place where Kim lives”. Note that, except in the informal speech of young people, personal pronouns cannot be used in this way: *%There's a party at mine tonight*. The genitive in [ii] has a more specific interpretation, “the doctor's surgery” – similarly with *the hairdresser's, the grocer's*, etc., “the hairdresser's/grocer's shop”, or with proper names referring to stores: *Sainsbury's*. In this second type there is often a strong implicature of purpose. In [19ii], for example, it will normally be a matter of taking you there to consult the doctor: I wouldn't use this construction if it were a matter of your going there to play chess with the doctor's daughter.

## 9.3 Fusion of internal modifier and head

The head does not fuse so readily with an internal modifier as with a determiner, as evident from the ungrammaticality of such examples as:

[20] i *\*Because the existing bridge is too narrow, we will have to build [a new].*

ii *\*The retreating troops were captured, but [the advancing] managed to escape.*

iii *\*Bill likes the linguistics lecturer, but I prefer [the sociology].*

The adjective *new*, the verb *advancing*, and the noun *sociology* require a following head, such as *one*. The cases where fusion is possible are as follows.

### (a) Determinatives

Those determinatives which can function as internal modifier as well as determiner can in general occur as fused modifier-head as well as determiner-head:

- [21] i *This copy is defective but [the other two] are fine.*  
 ii *I've corrected most of the mistakes but [these few here] are still to be done.*  
 iii *I didn't like it myself, but I respect the views of [the many who did].*

Much the most common case has a cardinal numeral as head, as in [i]. *Every* is again excluded, and so too this time is *various*, while the others are hardly admissible unless accompanied by a following modifier, as in [ii–iii].

### (b) Superlatives and definite comparatives

- [22] i *I went up that skyscraper in Boston, but [the tallest] is in Chicago.*  
 ii *There are two sisters, but [the elder] is already married.*  
 iii *\*Hugo has a big house, but Karl has [a bigger].*

The fact that acceptability deteriorates with indefinitely determined comparatives suggests an explanation based on definiteness. Superlatives are **ranking expressions**: they inherently pick out a unique entity as of higher rank than the rest, as do comparatives when comparison is made between two entities. They are therefore more like definite determiners than are ordinary adjectives, which serve only to constrain the denotation of the nouns they modify. This is reflected in the position of superlatives and comparative adjectives: they are typically closer to the determiner than other adjectives (§15). However, the possibility of fusion with the head must in the last resort be stated in syntactic terms, for other adjectives which have a similar ranking function, for example *main*, cannot be used in the same way: *\*There's obviously some kind of switch at the front, but [the main] is at the back.*<sup>42</sup>

Superlatives occur in the special interpretation type in a construction with a genitive personal pronoun as determiner, and special interpretations are also found with *former*, *latter*, and *same*:

- [23] i *George was at [his most obstructive].*  
 ii *They invited Watson and Gates, but as usual [the latter] was unable to come.*

Example [i] illustrates the common type where the NP is complement to *at*; it says that George was particularly obstructive, locating his obstructiveness at the maximum level. *Best* and *darmedest* also occur as complement to *do*: *He did his best/darmedest to frustrate our plan. The former/latter/same* are used as anaphors (see Ch. 17, §9.4); in [ii], for example, *the latter* is understood as “Gates”.

### (c) Ordinal adjectives

- [24] i *The first student wanted to take linguistics, but [the second] did not.*  
 ii *I wanted to catch the next train, because [the last] will be too late.*  
 iii *After having a first child, I didn't want [a second].*

The fact that ordinal adjectives are also ranking expressions links this phenomenon to (b) above. However, as is demonstrated by [iii], there appears to be no constraint against the NP being indefinitely determined. Ordinal fused heads occur with special interpretations in dates (*the second of June*, “second day”) and in proper names (*George II*, spoken as *George the Second*).

<sup>42</sup> As well as taking a partitive complement (e.g. *the biggest of them*), superlatives can, when in predicative function, take a bare plural as oblique: *He isn't the most reliable of colleagues*.

## (d) Modifiers denoting colour, provenance, and composition

- [25] i *Henrietta likes red shirts, and I like [blue].*  
 ii *Knut wanted the purple wallpaper, but I wanted [the mauve].*  
 iii *Henrietta likes Russian vodka, and I like [Polish].*  
 iv *Knut wanted the French caterers, but I wanted [the Italian].*  
 v *I prefer cotton shirts to [nylon].*  
 vi *Knut likes malt whisky, but I prefer [blended].*

The NPs here are either bare or have a definite determiner; there is significant loss of acceptability when the determiner is indefinite:

- [26] i *?Harvey bought a red shirt and I bought [a blue].*  
 ii *?I bought some Chinese food rather than [some Indian].*  
 iii *?I bought a cotton shirt rather than [a nylon].*

## (e) Adjectives denoting basic physical properties such as age and size

- [27] i *Lucie likes young dogs, but I prefer [old].*  
 ii *Lucie likes big dogs, but I prefer [small].*

The boundaries to what is admissible are hard to define, but there appears to be considerable degradation with adjectives denoting more complex physical properties or with evaluative adjectives, for example those denoting character:

- [28] i *?Lucie likes smooth-coated dogs, but I prefer [shaggy].*  
 ii *\*Lucie likes friendly dogs, but I prefer [aggressive].*

As with type (d) above, acceptability is reduced, indeed here lost altogether, when the NP is indefinitely determined: *\*Lucie bought a young dog, but I bought [an old].*

## (f) Modifier-heads with special interpretations

- [29] i *[The French] do these differently from [the Dutch].*  
 ii *[The rich] cannot enter the kingdom of Heaven.*  
 iii *How will the new system affect [the very poor]?*  
 iv *We are going to attempt [the utterly impossible].*  
 v *This is verging on [the immoral].*  
 vi *They like to swim in [the nude].*

A rather restricted range of adjectives – beyond those covered in (b) and (c) – occur in fused-head constructions with special interpretations. The NPs are determined by the definite article – we couldn't even substitute a demonstrative: *\*these very poor*. Examples [i–iii] illustrate a subtype denoting categories of human being; these NPs are characteristically used generically, as here. *The French* and *the Dutch* denote the inhabitants of France and Holland; for other nationality adjectives of this kind, see Ch. 19, §5.6.2. NPs like those in [ii–iii] can be paraphrased by means of *those* + relative clause: *those who are rich / very poor*. This subtype includes adjectives based on past participle forms or similar denominal derivatives in *-ed*: *the disadvantaged*, *the intellectually gifted*, *the unemployed*, *the hard-hearted*, and so on. Two non-generic cases are *the deceased* and *the accused*, which can be used in singular or plural reference. Note also the fused-head restrictive modifier in proper names like *Ivan [the Terrible]*.

Examples [29iv–v] illustrate a second subtype, with an abstract rather than concrete interpretation. Paraphrases here may have the form *that* + relative clause or fused relative: *that which is utterly impossible*, *what is immoral*. Neither type of paraphrase applies in [vi], where *in the nude* is an idiom meaning “naked”. See also §16.7 for the use of *own* in special fused-head constructions.

It is possible, though very rare, for the AdjP functioning as fused head to contain a post-head modifier: *the pure in heart*. In a dependent use AdjPs of this kind can only follow the head noun: *people pure in heart*, not \**pure in heart people*. We must allow, therefore, for a head to fuse with a post-head modifier, as well as for the usual case where the fusion is with a pre-head modifier.

#### ■ Fused modifier-heads contrasted with non-fused heads realised by de-adjectival nouns

The construction we have been concerned with in this section is to be distinguished from that where the head position is filled by a noun morphologically derived by conversion from an adjective:

[30] *Kim is [an intellectual].* [determiner + head]

*Intellectual* here is simply a noun that happens to be derived from an adjective, whereas *French*, *Dutch*, *rich*, *poor*, *impossible*, and *immoral* in [29] are themselves adjectives.

The difference is clearest with the *rich* and *poor* type, which differ from *intellectual* in two respects. In the first place, *intellectual* inflects for number (cf. *Kim and Pat are intellectuals*), whereas *the rich* and *the very poor* are plural NPs with no inflectional plural marking on the head. Secondly, while the adjective *intellectual* takes adverbs as modifier, as in *Kim is [remarkably intellectual]*, the noun *intellectual* does not. Instead of \**Kim is [a remarkably intellectual]*, we have *Kim is [a remarkable intellectual]*, with the noun modified by the adjective *remarkable*. *Rich* and *poor*, by contrast, take adverbs as modifier, as in *the extremely rich* and *the very poor*: this is clear evidence that they retain their category status as adjectives.

The nationality adjectives *French* and *Dutch* are non-gradable, and with these only the first difference applies: the lack of plural inflection. Conversely, *impossible* and *immoral* in [29iv–v] are obligatorily singular, so here only the second difference applies: the adverbial modification. In both cases, however, the one difference is sufficient to establish that the head word has not been converted into a noun, especially in view of the fact that *the French* and *the immoral* clearly belong with *the rich* by virtue of the obligatory definite article.

### 9.4 Fusion of predeterminer and head

To a very limited extent the head may also fuse with a predeterminer modifier. There are two cases to consider:

#### (a) Fractions and multipliers

- [31] i *I earn half the amount Bill does, and Mary earns [two thirds].*  
 ii *I earn three times the amount Bill does, and Mary earns [double/half].*  
 iii ?*I earn three times the amount Bill does, and Mary earns [twice].*

These belong to the simple fused-head construction, interpreted anaphorically as “two thirds the amount Bill does”, and so on. In [i–ii] the predeterminer is respectively a nominal and a noun, while in [iii] *twice* is an adverb, which is appreciably less acceptable. (Fractions can also occur as non-fused heads in a partitive construction: *Mary had already spent [two thirds of her allowance].*)

### (b) Universal quantifiers

- [32] i *Both/All these issues were ignored in the first draft, but [both/all] are now adequately covered.*  
 ii *Two judges had given both/all the competitors a grade of B+, but one had given [both/all] an A.*

The analysis here is rather problematic since *both* and *all* can function as determiner, and examples of this kind could be construed as implicitly partitive determiner-heads, “both/all of them”. Be that as it may, *all* occurs here less readily than *both*, the *all* version of [ii] (where the fused-head NP is non-subject) being of very questionable acceptability. Preference would generally be given, even with *both*, to one or other of two equivalent formulations: *both/all of them* or *them both/all*.

## 9.5 The fused-head analysis compared with alternatives

The constructions we have been concerned with in this section are not analysed in terms of functional fusion in traditional grammar, or indeed in modern treatments either. Traditional grammars tend not to provide wholly explicit accounts, but in general offer a combination of two kinds of analysis, one involving pronouns, the other ellipsis:

- [33] i *There are a dozen applications and [several] look quite promising.* [pronoun]  
 ii *There were two pieces left and Kim, as always, chose [the larger].* [ellipsis]

*Several* is traditionally analysed as an adjective in examples like *several applications*, but as a pronoun in examples like [i]. *Larger*, however, is treated as an adjective not only in *the larger piece*, but also in [ii]: the latter is said to be elliptical, with *piece* understood.

We believe it is fair to say that traditional grammar provides no justification for handling the examples in [33] in different ways, and this itself must count against the analysis: a unitary treatment is to be preferred on grounds of simplicity and generality.

### ■ Problems with the traditional pronoun analysis

#### (a) Lack of generality

The first point to note about the pronoun analysis is, indeed, that it clearly cannot be generalised to cover all cases. This approach says that a word belongs to different part-of-speech categories according to whether or not it is (in our terms) head of the NP, and there are several reasons why this won't do as a general solution. In the first place, fusion of dependent and head is possible with comparative and superlative adjectival expressions: to include inflected forms like *larger* and *largest* and the plain-form heads of analytic comparatives and superlatives such as *more/most important* would make the pronoun category open-ended and completely change its character. Secondly, in the construction where a genitive determiner is fused with the head, as in *Jill's proposal was an improvement on her husband's*, the head word

is a noun; to treat *husband's* and the like as pronouns would lose the distinction between pronouns and common or proper nouns. The pronoun analysis is traditionally invoked only for our determinatives (other than cardinal numerals) and it cannot be extended beyond those.

#### (b) Differences from genuine pronouns with respect to dependents

A second point is that the words concerned take different dependents from pronouns – but the same ones as they take when functioning as non-fused determiner. Compare:

[34]	DEPENDENT USE	INDEPENDENT USE
	i a. <i>not much</i> cheese	b. <i>not much</i> of the cheese
	ii a. <i>very little</i> cheese	b. <i>very little</i> of the cheese
	iii a. <i>almost enough</i> cheese	b. <i>almost enough</i> of the cheese

This argues against any part-of-speech distinction between the two uses – contrast again the case of *intellectual* in [30], which takes different dependents in the independent (noun) use from those it takes in the dependent (adjective) use.

#### (c) Genitive case

The forms we analyse as fused heads either cannot occur in the genitive at all or do so only very rarely. \**All's*, \**many's*, \**few's*, \**some's*, for example, are completely excluded, while *each's* is occasionally attested but of somewhat questionable status. A pronoun analysis provides no account of why this should be so, while the fused analysis does suggest a reason: the form is simultaneously determiner and head, and for full acceptability its case should match both functions. The genitive marking in *many people's expenses* goes on the head, not the determiner, and hence there is a conflict between case and determiner function in \**many's expenses*. (See also the discussion of case in fused relatives, Ch. 12, §5.3.)

### ■ Ellipsis

Ellipsis does not provide a general solution either. There are several cases where it is not possible to reinstate a separate head element, the two most important of which are seen in:

[35]	i	<i>many of us</i>	<i>two of the windows</i>	<i>much of it</i>	<i>all of the meat</i>
	ii	<i>the rich</i>	<i>the very poor</i>	<i>the immoral</i>	<i>the utterly impossible</i>

In [i] we have partitives, and we cannot in examples like these add a noun before *of* – cf. \**many ones of us*, \**much quantity of it*, etc. The NPs in [ii] belong to the special type of fused modifier-head construction: see [29] above. Although the first two denote sets of people, we cannot insert the noun *people* here without changing the meaning, for *the rich* and *the very poor* are interpreted generically, while *the rich people* and *the very poor people* are not. It is likewise impossible to add a separate head noun in examples like those in [23].

A less obvious problem with an ellipsis analysis arises when we consider the relationship between the present NP construction and clauses with missing heads. Compare:

[36]	i	<i>Alice performed the Schubert</i> and [ <i>Helen</i> _ <i>the Rachmaninov</i> ].	[clause]
	ii	<i>Alice's performance of the Schubert</i> and [ <i>Helen's of the Rachmaninov</i> ]	[NP]

In [i] the head of the clause, the predicator, is missing, but recoverable from the underlined antecedent in the preceding clause: this is the construction known as gapping (Ch. 15, §4.2). It is tempting to say, by analogy, that in [ii] the head of the NP is missing but recoverable as *performance* from the preceding NP. The two constructions are not, however, as similar as

this pair of examples at first suggests. Two significant differences are illustrated in:

- [37] i a. \**Alice performed the Schubert immediately after [Helen – the Rachmaninov].*  
 b. *Alice's performance of the Schubert took place immediately after [Helen's of the Rachmaninov].*  
 ii a. *Alice attempted to play the Schubert and [Helen – the Rachmaninov].*  
 b. \**Alice's attempt to play the Schubert and [Helen's the Rachmaninov]*

In the first place, gapping is in general restricted to coordinative constructions, hence the ungrammaticality of [ia]. There is, however, no such restriction on the fused-head NP construction, and [ib] is perfectly well formed. Secondly, gapping can involve the omission of a sequence of elements which do not together form a constituent: this is illustrated in [iia], where there is ellipsis of *attempted + to play*. There is nothing comparable in the NP, however, with [iib] completely ungrammatical. No viable fusion analysis could be devised to handle gapping: we have to describe this construction in terms of the omission of elements recoverable from an antecedent. But there is nothing in the NPs that requires this approach, and since it cannot be sustained for the constructions shown in [35], it cannot be accepted as providing a satisfactory alternative to the fused-head analysis.

#### ■ A third approach: change of function without change of category

A third solution that is compatible in principle with our framework is to handle such pairs as the following in the same kind of way:

- [38] i a. *The shirt is made of [nylon].* [noun as head]  
 b. *He was wearing [a nylon shirt].* [noun as modifier]  
 ii a. [Many people] *would agree with you.* [determinative as determiner]  
 b. [Many] *would agree with you.* [determinative as head]

In [i] we simply have a single category appearing in two different functions: *nylon* is head in [ia], internal modifier in [ib]. This is the kind of analysis we have adopted in numerous places in the present grammar, so the question naturally arises as to whether a solution of this kind could handle the constructions under consideration in this section. It would involve saying that in [ii] *many* belongs to the same category, determinative, in both cases, but functions as determiner in [iia], head in [iib].

The reason we have not adopted this solution is that it does not handle cases like:

- [39] i *I prefer cotton shirts to [nylon].* (= [25v])  
 ii *I earn three times the amount Bill does, and Mary earns [double].* (= [31ii])

To say that *nylon* in [i] was a noun in head position would not distinguish this construction from *I prefer cotton to nylon*. The crucial difference is that in [i] but not this latter example *nylon* is understood as having modifier function. The fused-head analysis enables us to make this distinction: *nylon* combines the functions of modifier and head in [39i], but functions simply as head in *I prefer cotton to nylon*, just as it does in [38i]. Similarly in [39] *double* is a noun, but it would not be satisfactory to say that it was functioning simply as head of the NP object of *earns*: it is understood as having a predeterminer modifier function matching that of *three times* in the object of the first clause.

#### ■ Overlap between determinative and pronoun categories

The fused-head analysis avoids the need to recognise a large amount of overlap between the pronoun and determinative categories. In the present grammar there are just four items that belong in both categories: *what*, *which*, *we*, and *you*.

- |      |  |   |
|------|--|---|
| [40] | DETERMINATIVE  | PRONOUN                                     |
|      | i a. [ <u>What</u> boy] could resist such an offer?    | b. [ <u>What</u> ] happened?                |
|      | ii a. It may be free, in [ <u>which</u> case] I'll go. | b. I need a job [ <u>which</u> ] pays well. |
|      | iii a. [ <u>We/You</u> Irish] will have his support.   | b. [ <u>We/You</u> ] will have his support. |

#### (a) *What* and *which*

With these items there is a difference of meaning between determinative and pronoun, so their assignment to separate categories is unproblematic. The interrogative and relative pronouns *what* (and *whatever*) and the relative pronoun *which* are non-personal, contrasting with personal *who*, while the determinatives are neutral as to the personal vs non-personal contrast. Note that there is no interrogative pronoun *which*: the *which* of [Which (of them)] *do you want?* is likewise neutral in gender and functions as a fused determiner-head.

#### (b) *We* and *you*

Here there is no comparable difference in meaning, but there are other grounds for recognising a category distinction. We take *we* and *you* to be primarily pronouns because they enter into systematic contrast with the 3rd person and 1st person singular personal pronouns, and have inflectional forms – genitive and reflexives – which are quite inapplicable to determinatives. There could be no question of analysing these items as uniquely determinatives, with independent occurrences, i.e. those without a following noun (which of course constitute the overwhelming majority), belonging to the fused-head construction. We regard the *we/you students* construction, therefore, as involving an extended, secondary use in which they have been reanalysed as determinatives.

#### (c) Borderline case: singular demonstratives

It is less clear how the demonstratives *this* and *that* should be treated. A case could be made for treating them too as belonging to both determinative and pronoun categories. In head function, we have seen, they cannot occur in partitives, and they do not commonly occur in simple fused-head constructions like [17]: they belong predominantly to the special subtype of fused-head construction, with little semantic motivation for saying that they have determiner as well as head function. Moreover, while they freely occur with a following personal head (*this girl, that boy*), a personal interpretation of them in head function is permitted only under restricted conditions: *This is my husband*, but not – with a personal interpretation – *\*This said he would help me*. We have nevertheless found it preferable to assign demonstratives uniquely to the determinative category, functioning in NP structure as determiner or fused determiner-head. One reason is that there is no well-motivated place to draw a boundary between determinative and pronoun uses. The plural forms fall in naturally with the fused-head analysis, and singular examples like [17] and [9ii–iii] match corresponding plural forms. A second point is that the demonstratives differ quite sharply from prototypical pronouns in the way they combine with other elements in the structure of NPs. Pronouns do not in general take quantifiers as pre-head dependents: of the personal pronouns only *we* and plural *you* allow *all*, and then only in the presence of a post-head modifier such as a relative clause. The demonstratives, however, allow *all* quite freely, and in addition take other predeterminers: *half this, double / three times that*, and so on. There is no difference with regard to such quantification between demonstratives in (determiner-)head position and those in pure determiner position. And again, post-head relative clauses and PPs are commonly found in NPs headed by demonstratives (see [16iii] for a relative clause example), but are very rare with pronouns.

## 9.6 Compound determinatives

Compound determinatives such as *somebody* occur as determiner-head with the syntactic fusion of the two functions marked by the morphological compounding of a determinative base with a nominal one. The central members are:

- |      |     |                   |                  |                 |                |
|------|-----|-------------------|------------------|-----------------|----------------|
| [41] | i   | <i>everybody</i>  | <i>somebody</i>  | <i>anybody</i>  | <i>nobody</i>  |
|      | ii  | <i>everyone</i>   | <i>someone</i>   | <i>anyone</i>   | <i>no one</i>  |
|      | iii | <i>everything</i> | <i>something</i> | <i>anything</i> | <i>nothing</i> |
|      | iv  | <i>everywhere</i> | <i>somewhere</i> | <i>anywhere</i> | <i>nowhere</i> |

The determinative bases are universal distributive *every* and three existential quantifiers: positively-oriented *some*, non-affirmative or free choice *any*, and negative *no*. The nominal bases are personal *·body* and *·one* (which are wholly equivalent), non-personal *·thing*, and locative *·where*. An informal variant of *·where* in AmE is *·place*. The analysis of the locatives as heads of NPs is motivated by their use as object in constructions like *Have you got anywhere to spend the night?*<sup>43</sup>

### ■ Special post-head dependents

Because determiner and head are fused it is not possible for these forms to take internal pre-head dependents. The counterparts of such dependents in non-fused NPs are located after the head:

- [42] i [No sensible ideas] / [Nothing sensible] will emerge from the meeting.  
 ii I don't want [a gold watch] / [anything gold] for my anniversary.

We refer to such post-head dependents as **restrictors**. There can be no more than one of this kind per NP:

- [43] i [No sensible new ideas] / \*[Nothing sensible new] will emerge from the meeting.  
 ii I don't want [an expensive gold watch] / \*[anything expensive gold] for my anniversary.

### *Else and more*

The compound determinatives share with the determiner-heads *all*, *much*, and *little* the property of taking *else* or (in the case of those expressing existential quantification) *more* as immediate post-head dependent: *everything else*, *nothing else than a few scraps of bread*, *something more*, *anything more than that*. *Else* can precede a restrictor like those in [42]: *nothing else sensible*, *anything else gold*. This is not possible, however, if there is a *than* complement, in which case *other* is required instead of *else* and follows the restrictor: compare *\*nothing else sensible than this* and *nothing sensible other than this*.

### ■ Post-head modifiers

The compound determinatives take the same range of post-head modifiers as common nouns, for example PPs and relative clauses: *everything in the collection*, *something (that) you need to know*, and so on. These ordinary modifiers must follow any restrictor: *everything fashionable in the collection*, not *\*everything in the collection fashionable*, and so on. This ordering restriction departs from the general rule that from a syntactic point of view the ordering of post-head internal dependents is completely free (see §15).

<sup>43</sup>There are one or two nouns formed by conversion from compound determinatives: *He's [a nobody]*, *Would you care for [a little something]*?

*Something of . . .*

*Something* can indicate degree in combination with an *of* phrase complement:

- [44] i *It was something of a surprise that he wasn't sacked on the spot.*  
 ii *She's something of an actor.*

The meaning is “It was to some extent a surprise”, “She can to some extent be described as an actor”.<sup>44</sup> This construction bears some resemblance to that found with *much* (cf. [18] above), but is not restricted to predicative complements: *Something of a problem has arisen*. Nor is it restricted to obliques determined by *a*: *She has something of her mother's charm and tenacity*.

### ■ Pre-head dependents

The compound determinatives take the same pre-head modifiers as the determinative bases they contain (see §11):

- [45] i a. [Not every] supervisor would agree.      b. [Not everyone] would agree.  
 ii a. They did [hardly any] work.                      b. They did [hardly anything].

### ■ Analysis as compound determinatives

These words are traditionally analysed as pronouns but are here assigned to the determinative category. They have it in common with pronouns that they always function as head in NP structure. The reason for nevertheless regarding them as determinatives at the primary level is that they take the same pre-head modifiers as ordinary determinatives, as illustrated in [45]. In the [a] examples, *not every* and *hardly any* are DPs functioning as determiner in NP structure; in the [b] examples *not everyone* and *hardly anything* are DPs functioning as determiner-head in NP structure. On this analysis *not everyone* and *hardly anything* can be handled in terms of constructions that are needed anyway for the DP rather than by setting up special NP constructions. Note also that while they share with pronouns, as we have noted, the property that they always function as head in NP structure, they differ from pronouns in that they freely take post-head modifiers, as illustrated above. Moreover, they differ semantically from the core pronouns in that they are not interpreted deictically or anaphorically.

## 9.7 Ellipsis of postmodifiers

The fused-head analysis makes it unnecessary to posit ellipsis of heads or pre-head dependents; the only cases of ellipsis in NP structure thus involve internal post-head dependents:

- [46] i *You say she's [a friend of Bill's], but I think she's [a relation \_].*  
 ii *[An article on this topic] is more likely to be accepted than [a book \_].*

We understand “a relation of Bill's”, “a book on this topic”: the post-head dependents are ellipsed to avoid repetition. The ellipsis involved here is of a quite general kind applicable to post-head constituents: compare *I sent my daughter to Paris, and Mary sent her son \_*.

<sup>44</sup>A variant of *something* in this construction is *somewhat*: *It was somewhat of a problem*. *Somewhat* must therefore be admitted as a marginal member of the category of compound determinatives, but elsewhere it is a degree adverb, as in *It was somewhat difficult to understand*. In non-standard English *something* extends into this degree adverb territory: *I loved her something rotten*, “terribly, greatly”.

In *I use [a teaspoon of garlic powder] in this recipe, and Mary uses [a tablespoon \_] \_*, we have ellipsis of *of garlic powder* in NP structure, and of *in this recipe* in clause structure.

A special case of post-head ellipsis in the NP occurs in what we have been calling implicit partitives:

- [47] i *I didn't see any of the movies, but Lucille saw [some \_].*  
 ii *A great many people saw the play and [the majority / almost all \_] enjoyed it.*

Here we have ellipsis of *of them*, with the antecedent for the partitive oblique being the underlined NP. In [i] there is a partitive PP in the preceding clause, but in [ii] there is not: the *of* is inherent in the partitive construction, and does not have to be recoverable from an antecedent. *Some* and *almost all* in these examples are fused determiner-heads, but *majority* is not: ellipsis of the *of* phrase is possible in either case.

## 10 Pronouns

Pronouns constitute a closed category of words whose most central members are characteristically used deictically or anaphorically.

- [1] i *I love you.* [deictic pronouns]  
 ii *Tell Mary; I want to see her.* [anaphoric pronoun]

In [i] *I* and *you* are deictic in that they are interpreted in relation to certain features of the utterance-act: they refer to persons with the roles of speaker and addressee respectively. In the salient reading of [ii] *her* is anaphoric in that it derives its interpretation from the expression *Mary*, its antecedent: in this simple example the pronoun is coreferential with its antecedent. Syntactically, pronouns function as head in NP structure, and for that reason belong to the larger category of nouns. What distinguishes them from other nouns (common nouns and proper nouns) is that they permit a much narrower range of dependents. Usually they form full NPs by themselves, as in [1]. Most distinctively, they do not take determiners.

Precisely because of their close association with deixis and anaphora, detailed discussion of the meaning and use of pronouns is largely deferred until Ch. 17. Here we review fairly summarily the various subcategories of pronoun, and then take up the question of the syntactic difference between pronouns and other nouns.

### 10.1 Subcategories of pronoun

The category of pronouns recognised in this book is somewhat smaller than in traditional grammar since a number of our determinatives are traditionally analysed as pronouns when they occur in what we are calling the fused-head NP construction: this issue has been discussed in §9.5. On the other hand, we include in the pronoun category certain words such as *today* which are traditionally analysed as common nouns or adverbs. This gives, then, five main categories: personal, reciprocal, interrogative, relative, and temporal.

#### 10.1.1 Personal pronouns

This is the largest category, and can usefully be subdivided into core and more peripheral members.

### ■ Core members

Personal pronouns are so called because they are the ones that are classified according to the deictic category of person. More specifically, this is the category that contains the 1st and 2nd person pronouns, associated with the speaker and addressee roles in the utterance-act. There are eight core members of the category, classified also for number and (in the 3rd person singular) gender. Each has up to five inflectional forms, as shown in [2]:

[2]

PERSON	NUMBER	GENDER	Non-reflexive				Reflexive plain
			nominative plain	accusative plain	genitive dependent	genitive independent	
1st	sg		<i>I</i>	<i>me</i>	<i>my</i>	<i>mine</i>	<i>myself</i>
2nd	sg		<i>you</i>	<i>you</i>	<i>your</i>	<i>yours</i>	<i>yourself</i>
3rd	sg	masculine	<i>he</i>	<i>him</i>	<i>his</i>	<i>his</i>	<i>himself</i>
		feminine	<i>she</i>	<i>her</i>	<i>her</i>	<i>hers</i>	<i>herself</i>
		neuter	<i>it</i>	<i>it</i>	<i>its</i>	<i>its</i>	<i>itself</i>
1st	pl		<i>we</i>	<i>us</i>	<i>our</i>	<i>ours</i>	<i>ourselves</i>
2nd	pl		<i>you</i>	<i>you</i>	<i>your</i>	<i>yours</i>	<i>yourselves</i>
3rd	pl		<i>they</i>	<i>them</i>	<i>their</i>	<i>theirs</i>	<i>themselves</i>

The inflectional forms divide first into reflexive and non-reflexive categories. Reflexives are primarily used when there is a close structural relation between the pronoun and an overt or covert antecedent: typically, the antecedent is subject of the clause containing the pronoun. Compare, then, *Ed hurt himself* (antecedent as subject) and *She had pushed Ed away but hadn't intended to hurt him* (antecedent in different clause). Reflexives have only a plain case-form. There are thus no genitive reflexives: *Ed has left his/\*himself's umbrella behind*. The non-reflexives do have a genitive vs non-genitive case distinction. In the non-genitive most distinguish nominative vs accusative (a contrast otherwise found only in interrogative/relative *who*); *you* (singular and plural) and *it*, however, have only a plain form. In the genitive all except *he* and *it* exhibit a distinction between dependent and independent forms that is found only in personal pronouns and the determinative *no*. The system of case is described in §16.

### ■ Singular *they*

*They* is commonly used with a singular antecedent, as in *Someone has left their umbrella behind*. As such, it fills a gap in the gender system of the core personal pronouns by virtue of being neutral as to sex. For some speakers singular *they* has a distinct reflexive form *themselves*: <sup>45</sup>*Someone has locked themselves in the attic*.<sup>45</sup> For discussion of singular *they*, see the section on gender, §17.2.4.

### ■ Pronoun *one*

The pronoun *one* belongs with the personal pronouns on two counts, as illustrated in:

- [3] i *One shouldn't take oneself too seriously.* [reflexive form]  
 ii *One can't be too careful in these matters, can one?* [subject of tag]

In the first place it has (in addition to plain *one* and genitive *one's*) a reflexive form *oneself*: reflexive forms are not found outside the personal pronoun system. In the second place,

<sup>45</sup>There is also a singular *we* with *ourselves* as reflexive form. This is an honorific pronoun used by monarchs, popes, and the like: it is hardly current in Present-day English.

animate: see §17.3. Examples illustrating the non-personal vs personal distinction are given in:

[10]		NON-PERSONAL	PERSONAL
	i INTERROGATIVE	<i>What did he want?</i>	<i>Who did you see?</i>
	ii FUSED RELATIVE	<i>Take [what you want].</i>	<i>Marry [who you want].</i>
	iii OTHER RELATIVE	<i>the car [which came first]</i>	<i>the boy [who came first]</i>

Fused relative **who** is virtually restricted to the free-choice construction illustrated here: compare \*[*Who said that*] was wrong.

In addition to the above forms, there are compounds in *-ever*, which are found only in fused relatives ([*Whoever said that*] was wrong) and in the exceptional interrogative construction that functions as exhaustive conditional adjunct (*I shan't be attending the meeting, [whoever takes over as chair]*). These interrogative and relative pronouns are discussed more fully in the chapters that deal with the interrogative and relative constructions in general: see Ch. 10, §7, and Ch. 12, §§3.5.1–2, 6.4.

### 10.1.4 Deictic temporal pronouns

*Yesterday, today, tonight, and tomorrow* are not traditionally analysed as pronouns, but belong in this subclass of nouns by virtue of their inability to take determiners. Compare, for example, *Today!* \**The today is my birthday*. They are also semantically like the central pronouns **I** and **you** in that they are characteristically used deictically. Unlike the temporal prepositions *now* and *then*, the pronouns have genitive forms: *today's*, etc. For further discussion of their syntactic analysis, see Ch. 6, §5.1.

## 10.2 The structure of NPs with pronouns as head

Pronouns usually constitute whole NPs by themselves, but some allow a very limited range of modifiers, such as the integrated relative clause in *you who worked on both the projects*.

### ■ Pronouns do not permit determiners

A defining property of pronouns in English is that they do not permit determiners: \**the they*, \**some you*, \**our each other*.<sup>46</sup> Items traditionally analysed as pronouns but excluded from the pronoun category because they can take determiners include echo **what** and the pro-nominals **one** and **other**:

[11]	i	A: <i>I bought a new car.</i>	B: <i>You bought a what?</i>	} [common nouns, not pronouns]
	ii	A: <i>Which operas do you like?</i>	B: <i>The ones by Mozart.</i>	
	iii	A: <i>Which books do I need?</i>	B: <i>The three others.</i>	

Echo **what** is syntactically very different from the interrogative pronoun *what*. It can replace words of more or less any category, and can take on the inflectional properties of that category – cf. *You bought three whats?* or even *They had whatted the car?* Pro-nominal **one** and **other** are likewise very different from such pronouns as **it** and **they**. As

<sup>46</sup>In examples like *Is it a he or a she?* the forms *he* and *she* are common nouns, not pronouns. The meaning and the syntax are clearly different from those of the pronouns.

the examples show, they inflect for number, and in the structure of the NP they take the same range of dependents as ordinary common nouns.

### ■ Pre-head internal dependents normally excluded too

Pronouns do not normally allow internal pre-head dependents: \**Extravagant he* bought a new car; \**I met interesting them all*. The qualification ‘normally’ caters for one minor exception, the use of a few adjectives such as *lucky*, *poor*, *silly* with the core personal pronouns:

- [12] i *Lucky you!* No one noticed you had gone home early.  
 ii They decided it would have to be done by *poor old me*.

The adjective is semantically non-restrictive, and the NP characteristically stands alone as an exclamation, as in [i]. It can be integrated into clause structure, as in [ii], but not as subject (\**Poor you have got the night shift again*). The pronoun must be in accusative or plain case (compare *Silly me!* and \**Silly I!*).

### ■ Post-head dependents

A very limited range of post-head modifiers are found.

#### (a) Interrogative and fused relative pronouns

Interrogatives take *else* and emotive modifiers such as *on earth*, *the hell*: *What else* do you need?; *Who on earth* could have done this? Interrogative and fused relative pronouns allow PPs: *Who in Paris* would wear a hat like that?; *Whatever in the report* was written by Harry was simply ignored. They can also serve as antecedent for integrated relative clauses, but these occur in delayed position and hence do not form part of the NP itself:

- [13] i *Who* do you know *who would wear a hat like that*?  
 ii *Whatever* they have *that has a Paris label* is bound to fetch a higher price.

#### (b) Personal pronouns

Personal pronouns with human denotation may be modified by integrated relative clauses:

- [14] i *I/We* who have read the report know that the allegations are quite unfounded.  
 ii *He* who controls testosterone controls the sexual universe.

The 3rd person use is archaic, characteristic of proverbs (*He who laughs last laughs longest*) or new forms modelled on the proverbial use, as in [ii]: the pronoun is used non-referentially. In Present-day English this type of meaning would usually be expressed in a construction with *those* as fused determiner-head: *Those who control testosterone control the sexual universe*.

### ■ External modifiers

Peripheral modifiers combine with NPs, and a number are largely indifferent as to the internal structure of the NP. In particular, certain focusing modifiers combine readily with personal pronouns and to a lesser extent with reciprocals: *I love* [*only you*]; *Let's invite* [*just them*]; *They criticise* [*even each other*].

Predeterminer modifiers are more sensitive to the structure of the head NP, and are virtually incompatible with pronouns. The one exception is that *all* combines with the 1st and 2nd person plural pronouns provided they are modified by a relative clause or PP, *all we who have signed up for the course*; *all you in the front*.

## 11 Determinative Phrases

Most of the determinatives that are semantically quantifiers optionally take dependents, thus forming phrase-level constituents, DPs. Some of the expressions that function as dependents in DP structure can also be peripheral modifiers in NP structure (see §13):

- |     |   |  |
|-----|---|--|
| [1] | MODIFIER IN DP                                | MODIFIER IN NP                                   |
| i   | a. [ <u>Not many</u> ]people saw her leave.   | b. [ <u>Not a single person</u> ] saw her leave. |
| ii  | a. [ <u>Almost all</u> ]copies were lost.     | b. [ <u>Almost the whole batch</u> ] was lost.   |
| iii | a. [ <u>At least ten</u> ]people were killed. | b. [ <u>At least an hour</u> ]was wasted.        |

In the [a] examples the underlined expression modifies the immediately following word, forming a phrase which is a dependent of the head noun, whereas in the [b] examples it modifies the following phrase, an NP. It is not always as easy as in these examples, however, to determine which is the appropriate structure to assign.

We review in this section the various syntactic and semantic types of dependent found in DP structure. The DPs are enclosed in brackets with the heads underlined.

### (a) The absolute negation marker *not*

*Not* occurs most readily with *many* (as in [1ia]), *much*, *all*, *every*, and *enough*. It is also permitted with *sufficient*, *a few*, and *a little*, but not (as a DP-level modifier) with *both*, *each*, *few*, *little*, *some*, and at best only marginally with *any* (cf. Ch. 9, §3.1). *Not* can occur before singulative *one* (*Not one computer was working*) and, under quite restrictive conditions, with cardinal numerals in general (*Not three miles from where they live is a most beautiful lake*), but these are cases where it may be better to treat *not* as a peripheral modifier in NP structure, as in [1ib].

### (b) Approximation and precision

- [2] i *The platoon contained [approximately twenty] soldiers.*  
 ii *[Almost no]seats were taken.*  
 iii *We have [exactly/hardly enough] fuel to get us home.*

Such adverbs as *approximately*, *roughly*, *about*, *almost*, *nearly*, *practically*, *exactly*, *just*, *precisely*, and the idioms *nigh on* (“almost”), *spot on* (“exactly”) occur with numerals, and some of them with *all*, *every*, *any<sub>i</sub>*, *no*, *enough*, *sufficient*. *All of* probably belongs here too, as used in examples like *They had recruited [all of fifty] volunteers*. The approximate negators *hardly*, *barely*, *scarcely* can modify *any<sub>n</sub>*, *enough*, *sufficient*, and numerals ([*Barely twenty] people attended the meeting*). The adverb *some* expresses approximation only with numerals, as in [*some thirty] students*.<sup>47</sup>

### (c) Degree

The degree determinatives *many*, *much*, *few*, and *little* are the ones that are most like adjectives, and in particular they take a very similar range of degree modifiers to gradable adjectives, including *very*, *so*, *too*, *how*, *this*, *that*, *amazingly*, *distressingly*, and the like (but not *slightly*, and others of this kind):

- [3] i *He hasn't [very much] patience.*  
 ii *They gave us [too little] time for discussion.*

<sup>47</sup> Approximation is also expressed by certain grammatically distinct constructions, as in [*thirty or so] students* (coordination) or [*thirty-odd] students* (affixation).

Adverbs denoting degrees of completeness such as *fully*, *totally*, *completely*, *marginally*, and *partially* can modify the sufficiency quantifiers *enough* and *sufficient*. *Fully* can also modify numerals, while *absolutely* occurs with universal *all* and *every* and negative *no*:

- [4] i *We have [marginally enough] material to finish the job.*  
 ii *There are [fully twenty] unanswered letters in your in-tray.*  
 iii *[Absolutely all] his friends had deserted him.*

#### (d) Comparison

The comparative forms of the degree determinatives, *more*, *less*, and *fewer* take PP complements with the form *than* + quantifier (usually a numeral), and pre-head modifiers realised by a quantificational determinative (numeral, *many*, *much*, *some*, *a few*, *no*, etc.), adverb (*considerably*), or NP (*a lot*, etc.):

- [5] i *[More/Less/Fewer than twenty] people came to the meeting.*<sup>48</sup>  
 ii *[Considerably/A lot more than fifty] protesters were arrested.*  
 iii *You can have [no/a little more] money.*

The *than* phrase can occur later (so that it is no longer part of the DP): *more people than twenty*. Where the complement of *than* is non-quantificational this is the only option: *more people than expected*, but not \**more than expected people*. In [iii] the salient interpretation of *more* is “further, additional”, but a *than* phrase (explicit or implicit) generally requires the strict comparative interpretation of “greater amount”. Complications arise where *one* occurs as complement of *than* or as pre-head modifier:

- [6] i *[More than one] glass was broken.*  
 ii *[One more] application has been received (than we had expected).*

The presence of *one* selects a singular head noun (*glass*, *application*), even though *one* is not head of the DP. In [i] this results in a clear discrepancy between form and meaning: *more than one glass* is syntactically singular but denotes a plurality of glasses. In [ii] we have the same discrepancy in the version with the *than* phrase: leaving aside the unlikely scenario where we had expected zero applications, the interpretation is that a plurality of applications have been received. However, without the *than* phrase and with *more* interpreted as “additional” the clause reports the receipt of a single application, but with the implicature that at least one other had been received earlier.<sup>49</sup>

#### (e) Upper and lower bound

- [7] i *We have [at least enough] fuel to get to Woking.*  
 ii *[At the very most twenty] people will agree to help.*

The PPs *at most* and *at least* (together with the fuller forms with *the very*) mark the upper and lower bounds (“no more than”, “no less than”). They occur mainly with numerals, *some*, *a few*, *a little*, *enough*, and *sufficient*. *Several* accepts *at least* but hardly *at most*.

<sup>48</sup> A variant of *more than* that is sometimes found is *greater than*, as in *It reserves the right to treat any Application in the Public Offer for greater than 20,000 Sale Shares as an Application in the Institutional Offer*. Since *greater* is an adjective, however, we need to treat *20,000* as head of the DP: this is another case where a comparative expression (*greater than*) has been reanalysed to function as an adverbial modifier (cf. Ch. 13, §4.5).

<sup>49</sup> Note that a singular is not permitted with *no*: *no more applications*, not (as a count singular) \**no more application*, even though we can have singular *no application*. This, together with the fact that in the fused-head construction we have the dependent form *no*, not independent *none* (*No!/\*None more have been received*) argues that *more* is head of the construction.

## (f) PPs: condition, exception, proportion, and addition/subtraction

- [8] i [*Few, if any,*] *guests will arrive on time.*  
 ii [*All but/except a few*] *helicopters have crashed.*  
 iii [*One in ten*] *students take drugs.*  
 iv *There's room for* [*ninety thousand minus a few hundred*] *spectators.*

Here we have PPs in post-head modifier function. There are alternants in which the PP is delayed, so that it is not a constituent of the DP: *Few guests, if any, will arrive on time*; *All helicopters but/except a few have crashed*; *One student in ten takes drugs*; *There's room for ninety thousand spectators minus a few hundred*. With numerals there is also a PP expressing totality, as in [*Thirty-five in all*] *supporters were arrested after the game*, but this is strongly disfavoured relative to the version with delayed PP (*Thirty-five supporters in all were arrested after the game*).

The conditional type serves to cancel implicatures, as described in §5.2. The exception construction is found only with *all*: with *every, no, any* the PP can only occur after the head noun, as in *Every helicopter but one has crashed*.

## ■ PPs in lieu of DPs

The same kind of meaning as we find in a number of the above DP constructions can also be expressed by the PPs given in [6] of §4, such as [*around ten thousand*] *copies*, [*between fifty and sixty*] *tanks*, [*from ten to fifteen*] *judges*, etc. It is clear that in the last two there can be no question of treating the numerals as head: *between* takes a coordination as complement, while *from* takes two complements, a numeral and a *to* PP. We need therefore to recognise that a restricted range of PPs can function as determiner – just as a restricted range can function as subject in clause structure, as in *From London to Manchester is 180 miles* or *Under the mat is a silly place to hide a key*.

## 12 Predeterminer modifiers

Predeterminer modifiers, or predeterminers, are one type of external modifier, i.e. they enter into construction with an NP, not a nominal, as explained in §2. There are four subtypes, illustrated in:

- [1] i *She had lost* [*all her money*]. [universal quantifier]  
 ii *He had eaten* [*half a bar of chocolate*]. [fraction]  
 iii *They wanted to charge us* [*twice the amount they had quoted*]. [multiplier]  
 iv [*How serious a problem*] *is it?* [adjectival]

The first three express various kinds of quantification, while the adjectival type is restricted to occurrence before the indefinite article *a*. As implied by their name, the NP they modify generally contains a determiner. There are two very restricted cases, however, where the NP has a pronoun as head: *all* can occur as external modifier to an NP headed by *we* or *you* provided there is a following modifier (*all you who were present at the meeting*), and fractions and multipliers can combine with a fused relative construction (*I sold it for halftwice what I had paid*).

## (a) Universal quantifiers

- [2] i *all the books/sugar/morning, all these books, all that work, all Kim's friends*  
 ii *both the houses, both these animals, both those cups, both my parents*

*All* and *both* occur before the definite determiners: the definite article, the demonstratives, and genitives.<sup>50</sup> For further discussion of these constructions, see §7.3.

When *all* occurs immediately before a cardinal numeral, as in *all three proposals*, we take *all* to be the determiner and the cardinal numeral an internal modifier. *All three proposals*, unlike *three proposals*, is definite (I assume you can identify them), so it is *all* that is the marker of definiteness, and we have seen that the definiteness of an NP depends on the determiner. Note, moreover, that the relation of *all three proposals* to *all the three proposals* is the same as that of *all proposals* to *all the proposals*: in each pair *all* is determiner in the version without *the* and predeterminer in the one with *the*.

### (b) Fractions

- [3] i *John had already wasted [half his share of the legacy].*  
 ii *He had to sell his shares for [exactly one half the amount he paid for them].*  
 iii *It only took [a quarter / one third / two fifths the time I thought it would].*

Predeterminers expressing fractions have the form of NPs. *Half*, *quarter*, *third*, etc., are nouns, as is evident from the fact that they take determiners (cardinal numerals or the indefinite article *a*) and inflect for number (as in *fifths* in [iii] – cf. also *three quarters*, *two thirds*). There is an alternative construction in which the fractional noun functions as head of the topmost NP, with a following partitive complement: *half of his share . . .*, *exactly one half of the amount . . .*, *a quarter of the time . . .*, etc.

*Half* behaves somewhat differently from the other fractional nouns. In the first place, it can occur without a determiner, as in [i]. Secondly, it cannot take the plural form in the predeterminer construction, though the anomaly of *#two/both halves the amount* is paralleled by that of *#three thirds the amount*.<sup>51</sup> Thirdly, it occurs with a much wider range of NP heads than the others. All can occur with abstract nouns such as *amount*, *time*, *size*, *height* with a definite determiner, but in the predeterminer construction concrete nouns accept only *half*, and then without any determiner before it: *half the cake* but not *\*a half/third the cake* (instead we have partitive *a half/third of the cake*). Similarly, only undetermined *half* can occur before indefinite *a*: *half a day*, but not *\*one half/third a day*.

### (c) Multipliers

- [4] i *She earns [two/three/four times the salary I earn].*  
 ii *Kim won \$10,000, but Pat won [twice/thrice that].*  
 iii *We've had [double/triple/quadruple the number of applications I had expected].*

Forms consisting of cardinal numeral + *times*, as in [i], are clearly NPs. *Twice* and the archaic *thrice* in [ii] are adverbs, occurring elsewhere as frequency adjuncts, like the *times* NPs: *I saw her twice / three times*. The category status of *double*, *triple*, and the quite rare *quadruple* is somewhat unclear: we take them to be nouns on the basis of their occurrence in the expressions *in doubles/triples*; they also occur as internal modifier, where they are probably to be analysed as adjectives (*double/triple glazing*). Multipliers occur only with definite NPs, and there is no corresponding partitive construction (*\*double of my salary*).

<sup>50</sup>One further, somewhat marginal, possibility is for *all* to occur before interrogative *which* in a certain very restricted type of context. Suppose I say *I've read all the books*, assuming you can identify the set concerned (all the books on some reading list, perhaps), when in fact you can't (there may be two reading lists): you could then ask *All which books?*, with the aim of eliciting identifying information about the set.

<sup>51</sup>The plural is possible, however, in the partitive construction: *both halves of the apple*. This indicates that the two constructions are not absolutely equivalent: the partitive allows *half* to be interpreted in a more physical sense as 'half-portion'.

## (d) Adjectival predeterminers

A very limited range of adjectives and AdjPs occur before the indefinite article. Three types can be distinguished.

*Such and exclamative what*

- | [5] | EXTERNAL MODIFIER                           | INTERNAL MODIFIER                               |
|-----|---|---|
| i   | a. <i>It was [<u>such</u> a disaster].</i>  | b. <i>She had shown [<u>such</u> promise].</i>  |
| ii  | a. [ <u>What</u> a disaster] <i>it was!</i> | b. [ <u>What</u> promise] <i>she had shown!</i> |

The adjectives *such* and exclamative *what* occur as external rather than internal modifier in construction with *a*: compare \**a such/what disaster*. In non-count or plural NPs, as in the [b] examples, they are in internal position: there is no determiner here and no reason to say that the adjective is in predeterminer position. *Such* differs from *what* in that it can follow certain determiners other than *a*: *one such device, all/several/many such problems* (and indeed it can follow *a* if there is another adjective intervening, as in *a further such error*). In this latter construction, however, it has only the “kind” sense (“one device of this kind”, etc.), whereas in initial position it can be a matter of either kind (*such a person, such letters*) or degree (as in the examples of [i]).<sup>52</sup>

*AdjPs introduced by the degree modifiers as, so, how, too, this, and that*

- |     |     |   |   |
|-----|-----|---|---|
| [6] | i   | a. <i>It's [<u>as fine</u> a show as I've seen].</i>                | b. * <i>They're [<u>as fine</u> shows as I've seen].</i>                  |
|     | ii  | a. <i>It's [<u>so good</u> a bargain I can't resist buying it].</i> | b. * <i>They're [<u>so good</u> bargains I can't resist buying them].</i> |
|     | iii | a. [ <u>How serious</u> a problem] <i>is it?</i>                    | b. * <i>[How serious problems] are they?</i>                              |

AdjPs of this form can function as pre-head modifier only in external position, before *a*. Their distribution is thus more restricted than that of *such* and *what* above. Note, for example, that while *such a good bargain* is equivalent to *so good a bargain*, the plural *such good bargains* has no counterpart \**so good bargains*, as seen in [iib]. For further discussion, see Ch. 6, §3.3.

The degree adverb or determinative need not be modifying the adjective itself: it may be part of an AdvP modifying the adjective, as in *It was so blatantly biased a report that no one took any notice of it*. The restriction to NPs determined by *a* does not apply to AdjPs in post-head internal modifier function: *He had a nose so long he reminded me of Pinocchio; He had hair so long that it reached down to his knees*.

*AdjPs introduced by the degree adverbs more and less*

- |     |   |   |
|-----|---|---|
| [7] | a. <i>This is [<u>more serious</u> a problem than the other].</i> | b. <i>This is [<u>a more serious</u> problem than the other].</i> |
|-----|---|---|

With AdjPs of this form, there is alternation between the external position [a] and the internal [b]. Again, the external position is available only in combination with *a* – compare the bare NP *These are [more serious problems than the others]*. Note also that inflectional comparatives are restricted to internal position: *Kim is a better player than Pat*, not \**Kim is better a player than Pat*.

<sup>52</sup>There is a minor use of *such* found primarily in legal register where it is a determinative rather than an adjective: *Completion of the transactions will take place on 21 December 1999 or [such other date as the parties may agree]*. The NP here is count singular, so *such* (meaning roughly “any”) must be in determiner function.

### ■ Combinations of predeterminers

It is possible, though rare, for a predeterminer to modify an NP which itself contains a predeterminer of a different kind:

- [8] i *Even if I had [double all the money he has],* [multiplier + univ quantifier]  
*I wouldn't be able to afford that house.*  
 ii *Give me [even three times one thousandth the amount* [multiplier + fraction]  
*you win on the lottery], and I will be very happy.*  
 iii *If I had [even half such a brain as you do], I'd be prime* [fraction + adjective]  
*minister by now.*

## 13 Peripheral modifiers

This section is concerned with those external modifiers occurring at the periphery of the NP, mainly in initial position (before any predeterminer) but in a few cases in final position.

Almost all the semantic types involved are found with the same kind of meaning in other constructions, especially clauses and AdjPs or AdvPs. Indeed, it is not always evident from the linear position of an adverb whether it is functioning in the structure of a clause or of an NP. Consider, for example:

- [1] *Possibly (,) the best actress in the world will take the role of Emma.*

Here the modal adverb *possibly* can have scope over the clause or over the subject NP. In the former case (where the adverb would most likely be followed by a comma) the interpretation is “It is possibly the case that the best actress in the world will take the role of Emma”; in the latter case (which does not admit a comma) we understand “The person who is possibly the best actress in the world will take the role of Emma”. The difference can be brought out syntactically by passivisation:

- [2] i *Possibly, the role of Emma will be taken by [the best actress in the world].*  
 ii *The role of Emma will be taken by [possibly the best actress in the world].*

The position of the clause-level adjunct remains constant when we passivise, but that of the NP-level peripheral modifier does not, for it is a constituent of the NP whose function changes from subject to complement of *by*. These examples are structurally unambiguous: in [i] *possibly* can only belong in the clause, while in [ii] it immediately follows a preposition and hence must belong in the NP.

We review briefly in turn six semantic categories of peripheral modifier.

### (a) Focusing modifiers

- [3] i [*Only the corner of the painting*] had been damaged.  
 ii [*Jill alone*] has the authority to sign cheques.  
 iii *He wasn't familiar with [even the broad outlines of the proposal].*  
 iv *We specialise in [principally the following three areas].*  
 v [*The bottom drawer too*] needs some attention.

Focusing modifiers attach to phrases of almost all categories, and are discussed further in Ch. 6, §7.3.

### (b) Scaling modifiers

- [4] i *We were faced by [easily the worst situation we had ever seen].*  
 ii *Kim had come to [almost the same conclusion as us].*  
 iii *After [hardly a moment's hesitation] he agreed to all their demands.*  
 iv [Not the least of my worries] *is that my hearing is deteriorating.*  
 v *I'd asked him not to make a fuss, but he was doing [exactly that].*

These have it in common that they are permitted with only a restricted range of NPs – compare, for example, *\*We were faced by easily a disaster* or *\*Not the problem is that my hearing is deteriorating*. The sanctioning element typically has to do with some scalar property. All of them have analogues in the structure of DPs, as described in §11 above; they have some affinity with the category of degree adjuncts in clause structure (Ch. 8, §11), but cover a rather broader range of semantic territory. Various subtypes can be recognised, as illustrated in [i–v] respectively.

**Reinforcement:** *absolutely, altogether, entirely, fully, quite, much, by far, easily*

All of these items can modify superlatives, as in [4i], but the last two are restricted to this construction, whereas the others are found also with such adjectives as *same* and *wrong*: *quite* / *\*by far the wrong job*, *entirely* / *\*easily the same conclusion*.

**Approximation:** *almost, nearly, practically, virtually, essentially, quite, much, rather*

These modify superlatives, like the reinforcement modifiers, but in addition occur more readily than the latter with indefinite NPs: *rather* / *\*absolutely a good idea*. *Quite* and *much* have both reinforcement and approximation uses: compare *quite the worst response* (reinforcement: “absolutely”) and *quite a good idea* (approximation: “fairly good”); *much the best solution* (reinforcement: “by far”) and *much the same size* (approximation: “virtually”). *Nearly* and *much* can themselves be modified by *very*: *They had chosen very nearly/much the same material*. This type also includes a number of idioms or fixed phrases: *all but, more or less, to all intents and purposes, informal as good as*.

**Negative approximation:** *hardly, barely, scarcely*

These indicate approximation to the negative end of the scale; see Ch. 9, §3.3.

**Absolute negation:** *not*

As a peripheral modifier in NP structure, *not* is found with superlatives, as in [4iv], and in various forms of quantification: *Not a single complaint had been received*; *Not a soul had noticed her plight*. It also occurs in coordinative constructions: *They had chosen [not Paris] but Rheims as the venue for the conference* (Ch. 15, §2.6).

**Precision:** *exactly, precisely*

These are found with such adjectives as *right* and *wrong* (*exactly the right answer*); with abstract nouns like *way*, *height* (*He responded in [precisely the way I expected]*); with demonstratives, as in [4v]; interrogative and relative *what*, etc. (*I did [exactly what you asked me to]*). In certain cases they can occur in post-head position: *It lasts [ten minutes exactly]*; [*What precisely*] *do you want?*

## (c) Frequency, domain, modal, and evaluative modifiers

Modifiers of these types characteristically function in clause structure (see Ch. 8, §§9, 15–17), but they are also found in NP structure, as in:

- [5] i With [*invariably* the most unconvincing explanations], he would attempt to excuse his erratic behaviour.  
 ii I'd rate this as [*architecturally* the most impressive building in the city].  
 iii After [*possibly* the worst performance of his career], he was booed off the stage.  
 iv With [*unfortunately* very limited qualifications], he has little prospect of getting a job.

Such adverbs as *invariably* in [i], and also *always*, *consistently*, *repeatedly*, *usually*, occur with heads denoting events or results. Domain modifiers are realised by adverbs such as *architecturally*, *politically*, *economically*, *socially*, or corresponding PPs of the form *from a political point of view*, etc. Modal modifiers (*possibly*, *probably*, *surely*, *definitely*, etc.) and evaluative modifiers (*unfortunately*, *happily*, *sadly*, *regrettably*, etc.) comment on properties expressed in the NP: “It is possible that this was the worst performance of his career”, “It is unfortunate that his qualifications are very limited”.

## (d) Quantifying modifiers in predicatives

- [6] i She is [*every inch* a philosopher].  
 ii The sweater is [*all* wool].

These modifiers occur in NPs functioning as predicative complement: we can't say \**The proposal was made by every inch a philosopher*, and the *all wool* of [ii] is understood quite differently from that in *All wool is imported*, where *all* is determiner. Other such modifiers include *wholly*, *exclusively*, *half*.

## (e) Reflexive pronouns

- [7] [*The manager herself*] had approved the proposal.

In this construction an NP with the form of a reflexive pronoun functions as post-head modifier within a larger NP; it is an external rather than internal modifier in that the immediate constituents of the matrix NP are *the manager + herself* (not *the + manager herself*). Where, as in this example, the matrix NP is subject, there is an alternative construction with the reflexive as a clause-level adjunct: *The manager had approved the proposal herself*. See Ch. 17, §3.2, for further discussion.

## (f) Combinations

An NP may contain more than one peripheral modifier, with multiple layers of embedding:

- [8] i Make sure you invite [*Jill herself too*].  
 ii [*Even merely* a formal apology] would be acceptable.  
 iii After [*financially certainly* the worst crisis this decade], the emerging economies will take some time to recover.

The bracketed NP in [i] has the NP *Jill herself* as head and the adverb *too* as peripheral modifier; at the next level, the NP *Jill* is head and the NP *herself* is peripheral modifier. A peripheral modifier is thus in peripheral position (initial or final) in the NP of which

it is an immediate constituent, but need not be in peripheral position in a larger NP containing it.

## 14 Internal dependents

**Internal dependents** of the head noun are dependents contained within the nominal constituent. They therefore follow the determiner (if there is one) and any other pre-head external dependents. Internal dependents can be distinguished in terms of position as **pre-head** or **post-head**. In terms of function we distinguish **complements** and **modifiers**.

- |     |                                       |                                     |              |
|-----|---------------------------------------|-------------------------------------|--------------|
| [1] | PRE-HEAD                              | POST-HEAD                           |              |
|     | i a. a [ <i>linguistics student</i> ] | b. a [ <i>report on the crash</i> ] | [complement] |
|     | ii a. a [ <i>first-year student</i> ] | b. a [ <i>report in the paper</i> ] | [modifier]   |

Adjectives in pre-head position, as in a *brilliant student*, are traditionally called **attributive**, and we will generalise this term to all pre-head internal dependents. One special case of the post-head modifier is the integrated appositive, as in *the poet Wordsworth*; we will deal with appositives separately, in §14.3.

### 14.1 Complements

#### ■ Categories of complement

Pre-head complements are usually realised by nominals, but a small number of adjectives can also function as complements:

- |     |                              |                                 |             |
|-----|------------------------------|---------------------------------|-------------|
| [2] | i a. a <i>flower seller</i>  | b. an <i>income tax adviser</i> | [nominal]   |
|     | ii a. a <i>legal adviser</i> | b. an <i>ecological expert</i>  | [adjective] |

Post-head complements have the form of PPs or clauses:

- |     |  |                                |
|-----|--|--------------------------------|
| [3] | i <i>the journey to Rome / back</i>                  | [PP]                           |
|     | ii <i>the rumour that the city had been captured</i> | [declarative content clause]   |
|     | iii <i>the question whether they were guilty</i>     | [interrogative content clause] |
|     | iv <i>the question 'Is God dead?'</i>                | [main clause]                  |
|     | v <i>the decision to abandon the project</i>         | [to-infinitival clause]        |

Clauses in complement function are usually subordinate, but main clauses are found in direct reported speech or citation, as in [iv]. Nouns, unlike verbs, do not permit objects and hence do not normally take NPs as complement – NPs occur as oblique complements, related to the head by a preposition; compare, for example, the clause *They destroyed the city* with the NP *their destruction of the city*.<sup>53</sup>

#### ■ Complements vs modifiers

The distinction between these two kinds of dependent is essentially the same as in clause structure, but in the NP they are not as clearly differentiated syntactically. Note in particular that while complements of a verb are not infrequently recognisable as such by

<sup>53</sup>A minor exception is found in examples like [*The journey this way*] *is less hazardous*. A comparable clause construction is *Let's go this way*, where the NP is a locative complement, not an object.

virtue of being obligatory, the contrast between obligatory and optional elements is of virtually no relevance to distinguishing complements from modifiers in NP structure. Compare, for example the verb *peruse* and the noun *perusal*. The former requires an object (*Jill perused the documents*, but not *\*Jill perused*), but the noun can be found quite naturally without a complement: *After a quick perusal, Jill pushed the documents to one side*. The one exception is the noun *denizen*, which requires a complement: *They are denizens of the forest* but not *\*They are denizens*.<sup>54</sup>

We consider in turn the other syntactic and semantic criteria presented in Ch. 4, §1.2.

#### (a) Complements must be licensed by the head noun

The licensing criterion is the most basic criterion for complement status of post-head dependents. In the case of subordinate clauses the choice between the types illustrated in [3] depends on the noun: compare *the fact that he was ill* with *\*the fact whether he was ill* and *\*the fact for him to be ill*, and so on. With PP complements the head noun determines the choice of preposition or the range of permitted choices. The default preposition is *of*, and this is often the only possibility, as in *the King of France*. Nouns like *report* and *injury* permit either default *of* or a more specific preposition (*a report on/of the crash*, *an injury to/of the wrist*), but subtle differences in meaning are involved. A report **on** the crash is likely to be the result of a detailed investigation into its causes, whereas a report **of** the crash can be simply an announcement that a crash has taken place. Similarly, an injury **to** the wrist is likely to be caused by an external force, whereas with an injury **of** the wrist the cause is not emphasised. *Journey* licenses prepositions denoting motion (*the journey to Rome / from here / back*) but not of (*\*the journey of the continent*).

With deverbal nouns we find the following relations between clause and NP:

[4]	CLAUSE	NP
	i a. <i>Muriel rejected <u>the plan</u>.</i>	b. <i>Muriel's rejection <u>of the plan</u></i>
	ii a. <i>The school banned <u>alcohol</u>.</i>	b. <i>the school's ban <u>on alcohol</u></i>
	iii a. <i>Fiona relies <u>on public support</u>.</i>	b. <i>Fiona's reliance <u>on public support</u></i>

In [i] we have the common case where the verb takes an object while the noun takes default *of*. Example [ii], however, shows that not all nouns corresponding to transitive verbs take *of*: *ban* takes *on*, *address* takes *to*, *entry* takes *into*, and so on. Where, as in [iii], a verb takes a PP complement rather than an object, the noun takes the same preposition.

This kind of licensing does not apply directly with pre-head complements. However, such complements typically have close paraphrases involving post-head complements where a forced choice of preposition is observable. Compare, for example, *an alcohol ban* and *a ban on alcohol*, *a wrist injury* and *an injury to the wrist*. Similarly, corresponding to a *legal adviser* ([2ii]) we have *an adviser on legal matters*.

#### (b) Scope of anaphora

In clause structure any internal dependent that can combine with anaphoric *do so* must be an adjunct because it takes as antecedent a verb together with all its internal complements.

<sup>54</sup>The complement is usually an *of* PP, but occasional examples are found with a genitive subject-determiner: *The Dock Leaf had shed one generation of low-life drinkers, and discovered another. Its denizens now were young, unemployed and living six to a three-bedroom rented flat along Shore Road*. For the alternation between *of* PPs and genitives, see §16.5.3.

To a limited extent the pro-nominal **one** behaves in the same way in NP structure:

- |     |    |  |                 |
|-----|----|--|-----------------|
| [5] | i  | a. ? <i>I prefer the poems of <u>Goethe</u> to the ones of <u>Schiller</u>.</i>        | } [complements] |
|     |    | b. ? <i>I have the key to the <u>basement</u> but not the one to the <u>attic</u>.</i> |                 |
|     |    | c. ? <i>I've told my <u>history</u> tutor, but I can't find my <u>French</u> one.</i>  |                 |
|     | ii | a. <i>I prefer the poems in <u>Part I</u> to the ones in <u>Part II</u>.</i>           | } [modifiers]   |
|     |    | b. <i>This key is identical to the one in the <u>door</u>.</i>                         |                 |
|     |    | c. <i>I don't want a <u>British</u> nanny; I want a <u>French</u> one.</i>             |                 |

The examples in [i], where **one** is in construction with an internal complement, show varying degrees of infelicity, but those in [ii], where it is in construction with a modifier, are impeccable. *French* in [ic] is a noun (denoting an academic subject), whereas in [iic] it is an adjective. This test distinguishes between the two senses of the ambiguous nominal *criminal lawyer* (with *criminal* an adjective in both). In the sense “lawyer who works in the field of criminal law”, *criminal* is a complement and resists combination with **one**: ?*I needed a civil lawyer, but he had found me a criminal one*. But in the sense “lawyer who is criminal”, *criminal* is a modifier and combines readily with **one**: *It turned out that he was an honest lawyer, not a criminal one, as I'd been led to expect*.

This test does not work, however, with nouns derived from verbs. The following, for example, are fully acceptable although the PPs are complements licensed by the head nouns *ban* and *proof*:<sup>55</sup>

- |     |    |  |
|-----|----|--|
| [6] | i  | a. <i>I support the ban on <u>smoking</u>, but not the one on <u>alcohol</u>.</i>  |
|     | ii | a. <i>The proof of <u>Pythagoras' theorem</u> is more clearly formulated than the one of <u>Parseval's equality</u>.</i> |

### (c) Correlation with syntactic category

Within NP structure we do not observe the clause-level correlation between complement and NP: as we have noted, nouns do not (with minor exceptions) take NPs as complement. Nevertheless, just as adverbs typically correspond to adjuncts in the clause, so adjectives are typically modifiers in the NP: adjectival complements like that in *legal adviser* are exceptional.

### (d) Positional mobility

Complements are generally more restricted than modifiers. With respect to the internal dependents of the NP, this is most clearly observable with pre-head complements, which must be positioned adjacent to the head noun, following any modifiers. We have for example *a brilliant legal adviser* (modifier + complement), but not \**a legal brilliant adviser*. Post-head complements by contrast only have a tendency to follow the head noun directly: see §15 below.

### (e) Complements express semantic arguments of the head noun

This criterion holds for the NP in much the same way as for the clause. Its application is particularly straightforward when the noun is a semantic predicate denoting some property, relation, process, or action (whether a nominalisation or not), and the

<sup>55</sup>The deviance of examples like \**Your reliance on me is just as bad as Kim's one on Pat* is due to the fact that pro-nominal **one** is a count noun and hence cannot have non-count *reliance* as antecedent: it has nothing to do with the complement status of the PPs.

complement represents an involved entity: the bearer of the property, a term in the relation, etc. However, we also take as complement those *of* PPs that are semantically related to the head in such ways as:

- |       |   |                              |
|-------|---|------------------------------|
| [7] i | <i>the dirtiness <u>of the water</u></i>                            | [o has non-human property h] |
| ii    | <i>the younger sister <u>of Mary</u></i>                            | [o has kin relation h]       |
| iii   | <i>the anger <u>of the older staff</u></i>                          | [o has feeling h]            |
| iv    | <i>the writing <u>of the book</u></i>                               | [o is result of h]           |
| v     | <i>the rays <u>of the sun</u></i>                                   | [o is natural source of h]   |
| vi    | <i>the spire <u>of the cathedral</u></i>                            | [o has inherent part h]      |
| vii   | <i>the most expensive car <u>of the man who lives next door</u></i> | [o is owner of h]            |
| viii  | <i>her stupid nitwit <u>of a husband</u></i>                        | [o is predicand of h]        |

In the annotations on the right, o = oblique (the NP within the underlined PP: *the water*, etc.), and h = head (the head of the matrix NP: *dirtiness*, etc.). Many NPs with *of* complements alternate with the subject-determiner construction: compare [ii], for example, with *Mary's younger sister*. We compare the two constructions in §16.5.3.

Examples [7i–iv] illustrate the straightforward cases: *dirtiness* denotes a property and the water bears that property; *sister* denotes a relationship in which Mary is one term; *anger* denotes an emotional process in which the older staff are experiencers; *writing* is an action of which the book is a result. The complement status of the PPs in [v–vii] is also relatively obvious, even though the head in each case denotes a physical object rather than a property, relation, process, or action. Rays do not exist without a source, so the sun is plausibly taken as an involved entity. Similarly, spires do not exist in isolation of the buildings of which they are a part. Most controversial is perhaps the complement status of the *of* phrase in examples like [vii], where the oblique represents the owner. However, owners are from a semantic point of view plausibly taken as entities involved in the things they possess. The grammatical evidence also points towards complement status: owners are typically expressed by the subject-determiner function, whose complement status in other cases is relatively uncontroversial; pro-nominal *one* is also infelicitous: <sup>#</sup>*my car and the one of the man who lives next door*.

Example [7viii] belongs to a distinctive syntactic construction where the oblique is constrained to be determined by the indefinite article *a*. The relation between the oblique and the head is like that between the predicand and the predicative complement in the clausal construction *Her husband is a stupid nitwit*. We can also relate [i] to *The water is dirty*, but this involves a change in the category and form of the noun *dirtiness* to the adjective *dirty*, whereas in [viii] the noun *nitwit* remains constant.<sup>56</sup>

One significant difference between clauses and NPs is the lack of any counterpart in NPs to dummy and raised complements. There are thus no NP counterparts to clauses like *It is noisy in the hall* or *Kim is certain to win* – compare <sup>\*</sup>*the noisiness of it in the hall*

<sup>56</sup>The singular nouns *hell* and *heck* occur in a frozen version of this construction: *It created a hell/heck of a problem*. The popular spelling *a helluva problem* might appear to suggest a reanalysis, making *problem* the head, but the possibility of intensificatory modification, as in *an absolute hell of a problem*, argues that *hell* remains syntactic head of the construction.

and \**the certainty of Kim to win* (or, with subject-determiners, \**its noisiness in the hall* and \**Kim's certainty to win*).

#### (f) Semantic roles of complements depend on the head noun

This property of complements is a natural consequence of their being semantic arguments, and is no less applicable to the NP than to the clause. In clause structure the roles associated with the subject and object depend on the meaning of the verb (e.g. Kim and Pat are respectively agent and patient in *Kim shot Pat*, but experiencer and stimulus in *Kim saw Pat*); in NP structure the same applies with the subject-determiner (as described in §16.5) and PP complements, especially those headed by *of*. Compare, for example, *the resignation of the secretary*, where the secretary is agent, and *the assassination of the secretary*, where the secretary is patient – and the examples in [7] provide further illustration of this point.

#### (g) Semantic selection restrictions in NPs involve complements

This property too is a natural consequence of the semantic argument status of complements. A spire is an inherent part of a building, and this imposes a semantic selection restriction on the denotation of the complement. While we can have *the spire of the cathedral*, we cannot have \**the spire of the rocket* or \**the spire of Mary*. Similarly, a speech can only be made by a person, so we have *the speech by the mayor*, but not \**the speech by coffee*.

### ■ Indirect complements

The complements considered so far have all been **direct**, in that they are licensed by the head noun itself. **Indirect** complements are those where the licenser is another dependent of the head (or part of one). In the following examples single underlining marks the indirect complement, brackets enclose the other dependent and double underlining marks the element within it that licenses the complement.

- [8] i a [larger] galaxy than initial measurements suggested [than PP]  
 ii [so great] a loss that we're likely to go bankrupt [declarative content clause]  
 iii [too dangerous] a proposal for parliament to accept [infinitival]

Indirect complements are licensed by: comparative expressions (see Ch. 13, §1.3); the degree adverbs *so* and *too* (Ch. 11, §4.6); the sufficiency determinatives *enough* and *sufficient*, and the adverb *sufficiently* (see §7.12 above); and a number of attributive adjectives, such as *easy*, in *some [very easy] people to get on with* (Ch. 14, §6.3).

The post-head position of these complements correlates with the fact that PPs and clauses are not permitted within pre-head dependents except under very restricted conditions: [8i], for example, may be contrasted with \**a larger than initial measurements suggested galaxy*, and so on. In most cases there is an alternative construction in which the licenser too occurs after the head of the NP: *a galaxy larger than initial measurements suggested*. One exception involves comparative *same*: *the same problem as you had*, but not \**the problem same as you had*. It is also usually possible for the complement to be further delayed so that it occurs later in the clause rather than within the NP: *We have suffered so great a loss this year that we're likely to go bankrupt*. The exception this time is the adjective + hollow clause construction: \**We've got some very easy people at the office to get on with*.

## 14.2 Modifiers

## ■ Attributive modifiers

Internal modifiers in pre-head position are realised by DPs, AdjPs, VPs with past participle or gerund-participle heads, and nominals in plain or genitive case:

[9]	i	a. <i>another <u>three</u> days</i>	b. <i>the <u>barely forty</u> students present</i>	[DP]
	ii	a. <i>his <u>wry</u> attitude</i>	b. <i>many <u>very angry</u> farmers</i>	[AdjP]
	iii	a. <i>the <u>defeated</u> army</i>	b. <i>her <u>recently published</u> article</i>	} [VP]
	iv	a. <i>the <u>gleaming</u> showroom</i>	b. <i>three <u>steadily melting</u> marshmallows</i>	
	v	a. <i>its <u>entertainment</u> value</i>	b. <i>those <u>Egyptian cotton</u> shirts</i>	} [nominal]
	vi	a. <i>a <u>dogs'</u> home</i>	b. <i>a <u>young children's</u> edition</i>	

A few prepositions are also found, as in *the downstairs toilet*. For determinatives and adjectives we recognise a single higher-level category, DP and AdjP, whereas for verb and noun we recognise two, VP and clause for the verb, nominal and NP for the noun, and in the latter two cases the attributive modifier position admits expressions belonging to the intermediate but not to the highest category (with the small-scale exception of measure genitives, which we take up in §16.3). The attributes in [iii–iv] are thus VPs, not clauses, and those in [v–vi] are nominals, not NPs.

The internal structure of attributive modifiers is subject to severe constraints. They can contain their own pre-head dependents, as in the [b] examples in [9], but for the most part attributive modifiers cannot contain post-head dependents: compare \**many [very angry at this betrayal] farmers*, \**her [recently published in 'Nature'] article*, \**those [Egyptian cotton of the highest quality] shirts*, and so on. VPs do not allow any relaxation of this constraint. With plain-case nominals, post-head dependents are found with institutional proper names, as in *a [Ministry of Defence] official*. AdjPs allow a narrow range of short post-head dependents, as in [*better than expected*] *results* – see Ch. 6, §3.3. DPs take few post-head dependents even in determiner function (see §11), but in general those that are permitted within determiners are admissible in attributes too, as in *the [more than twenty] complaints they received*.

There are numerous adjectives which, either absolutely or in a given sense, occur only in attributive modifier function (e.g. *a mere child*, but not \**The child is mere*), and others that are excluded from this function (*Corruption was rife*, but not \**rife corruption*); we deal with these issues in Ch. 6, §4.

## Nonce-formations

In addition to regular formations like those in [9], we also find **nonce-formations**:

- [10] i *my do-it-yourself skills, the buy-me glitter of the duty-free shop*  
 ii *a no-frills airline, a no-fuzzy-edge guarantee, an all-or-nothing approach*  
 iii *huge floor-to-ceiling windows, the custard-pie-in-your-face front cover*

The examples in [i] are constructed from VPs headed by plain-form verbs; those in [ii] contain determiners; those in [iii] are nominals with post-head dependents in the form of PPs. These attributes are nonce-formations in that forms of these types are not systematically admissible in this construction. Some of them have the status of well-established forms (e.g. *do-it-yourself*, *floor-to-ceiling*), but many – such as *custard-pie-in-your-face* in [iii] – are simply concocted on-the-hoof. One even finds word-sequences that

elsewhere do not form constituents, as in the attested example *his 'best-of' retrospective album*. (See also Ch. 19, §4.3.3.)

### ■ Post-head modifiers

The general constraints on attributive modifiers do not apply to those in post-head position: they readily take their own post-head dependents, and for expressions based on verbs and nouns we have expressions of the highest-level category, clause and NP. NPs, however, are rare because with modifiers, as with complements, dependent NPs are usually related to the head by means of a preposition, rather than directly. Modifiers with the form of PPs are extremely common in post-head position, but those containing complements do not occur attributively (leaving aside nonce-formations).

#### (a) Determinatives and DPs

The default position for these modifiers is before the head, but certain types can follow:

[11] *a/one day more two days [less than we had expected] money enough*

The comparative determinatives *more*, *less*, *fewer* can occur after the head provided there is a determiner. Thus we have a post-head alternant for *one more day* but not for *more days*: compare *One day more* / *\*Days more will be needed*. In NP structure determinative *enough* usually functions as determiner, but it is permitted as post-head modifier provided it is not modified: *I have money enough*, but not *\*I have money almost enough*.

#### (b) Adjectives and AdjPs

The basic rule for the placement of adjectives and AdjPs is that single adjectives and phrases without their own post-head dependents occur in attributive position, while others occur **postpositively**, i.e. after the head of the NP, as in *members [dissatisfied with the board's decision]*. Special rules apply with compound determinatives like *somebody*, *anything*, etc.: see §9.6. For the rest, there are certain specific adjectives that can or must occur postpositively. Representative examples are given in [12] (see also Ch. 6, §4.2):

[12] i *the only day suitable, years past, proof positive, matters financial, all things Irish*  
 ii *the people present, the cars involved, the students concerned, the city proper*  
 iii *the heir apparent, the body politic, the president elect, the devil incarnate, the poet laureate, a notary public*  
 iv *the house [currently ablaze], all people [now alive], the ones asleep*

The examples in [12i] alternate with the attributive construction: compare *the only suitable day*, etc. The postpositive use of these adjectives is subject to severe restrictions. Adjectives in *-able* or *-ible*, like *suitable* and *possible*, require an attributive superlative or *only*: compare *the best result possible* and *\*the result possible*. Postpositive *past* occurs with temporal nouns (cf. *\*approaches past*), and *positive* only with *proof*. The last two examples have general nouns as head and denote domains; the adjectives *financial* and *Irish* are like restrictors (§9.6) in that they must immediately follow the head.

The adjectives in [12ii] occur both attributively and postpositively, but with a difference in sense. Postpositive *present* (or *absent*) denotes a temporary state of affairs: compare *the present government*. The same applies to *involved* and *concerned*, though here the attributive sense differs more (cf. *deeply involved activists, concerned parents*). Postpositive *proper* means “in the strict/proper sense of the term”. With *net* and *gross*

the choice of position depends not on the meaning but on the head: they follow specific sums (*fifty dollars net*) but otherwise precede (*my net income*).

The examples in [12iii] are fixed phrases, with no attributive alternant. The adjectives in [iv] are ones which are altogether excluded from attributive position.

#### (c) NPs

- [13] i *a man my age, shoes this size, the results last year, houses this side of the lake*  
 ii *fifty miles an hour, a salary of [\$20,000 a year], ten dollars a head*

Leaving aside the appositives to be discussed in §14.3, modifiers with NP form are limited to those denoting age, size, and similar properties, or non-referential distributive indefinites like those in [ii] (discussed in §8.4 above).

#### (d) PPs

- [14] i *a woman [of great wisdom], a school [of this type], the man [with black hair], the church [near the river], friends [from Boston], Jill's career [as a journalist]*  
 ii *the temperature [outside], the floor [below], the year [before]*  
 iii *his behaviour [after his wife left him], the car [as we know it today]*

A very great range of PPs can function as post-head modifier. Those in [i] illustrate the most frequent pattern, with the preposition having an NP as complement. In the last example, with *as*, the oblique NP is interpreted predicatively: Jill was a journalist. We also find prepositions without complements, generally locative or temporal, as in [ii]; and in [iii] the prepositions have clauses as complement.

#### (e) Clauses

- [15] i *Where's [the book I lent you]?* [relative]  
 ii *Kim is [the person to do the job].* [infinitival]  
 iii *[People living near the site] will be seriously disadvantaged.* [gerund-participial]  
 iv *She came across [some letters written by her grandmother].* [past-participial]

Finite clauses in modifier function are all relatives: post-head content clauses are complements. For the three types of non-finite clause in [ii–iv], see Ch. 14, §8.2.

### ■ Multiple dependents

Nominals commonly contain more than one internal modifier:

- [16] i *some [blue cotton blankets]*  
 ii *the [star on the horizon with the reddish tint]*  
 iii *the [gleaming star on the horizon]*

We take the modifiers to modify the head successively rather than simultaneously: i.e. we recognise a layered structure with one nominal inside another. In [i], for example, the ultimate head *blankets* is modified by the noun *cotton* to give the nominal *cotton blankets*, and this in turn is modified by *blue* to give *blue cotton blankets*. This construction is known as **stacked modification**, or **stacking**; see also Ch. 6, §3.2.

Syntactic evidence for such a layered structure comes from coordination and anaphora. We can have coordination at any of the three levels: *blue cotton blankets and sheets*; *blue cotton blankets and silk sheets*; *blue cotton blankets and white silk sheets*. And any of the three heads can be the antecedent for various kinds of anaphoric expression (see Ch. 17, §6.1). In *I prefer those blue cotton blankets to these*, for example, *these* can be interpreted as “these

blankets”, “these cotton blankets,” or “these blue cotton blankets”. Examples like [iii], with a pre-head and a post-head modifier are structurally ambiguous according to which modifier is applied to the head noun first: the immediate constituents can thus be either *gleaming star + on the horizon* or *gleaming + star on the horizon*. Usually, as in this example, it will make no practical difference whether it is taken in one way or the other.

The constructions in [16] are to be distinguished from such as the following:

- [17] i *some* [*Egyptian cotton* *shirts*]  
 ii *an* [*interesting and very promising* *proposal*]  
 iii *the* [*award of the contract to the other firm*]

In [i] *Egyptian* modifies *cotton*, and the nominal *Egyptian cotton* in turn modifies *shirts*. This is **submodification**, modification of a modifier; again see Ch. 6, §3.2. In [ii] there is just one modifier, realised by an AdJP-coordination. And in [iii] the two underlined PPs are complements of *award*, and as such are related to the head at the same structural level: *award of the contract* does not here form a nominal.

### 14.3 Appositive modifiers

Appositive dependents are ones which when substituted for the matrix NP in a declarative clause systematically yield a clause which is an entailment of the original:

- [18] i a. *She sang in* [*the opera* ‘*Carmen*’].      b. *She sang in* ‘*Carmen*’.  
 ii a. *It was founded in* [*the year* 1850].      b. *It was founded in* 1850.  
 iii a. [*The verb* ‘use’] *is transitive*.      b. ‘Use’ *is transitive*.

In each of these pairs, [a] entails [b]. The appositive thus provides a formulation that can stand instead of the NP containing it.

We are concerned here with appositives as integrated dependents in NP structure, as distinct from supplementary appositives like that in *The information was given me by Kim Jones, the President of the Students’ Union*: see Ch. 15, §5, for this latter construction. Integrated appositives are usually semantically restrictive, as in [18]. Thus ‘*Carmen*’ in [i] restricts the denotation of the nominal headed by *opera*: the opera ‘*Carmen*’ contrasts with other operas. Analogously in [ii–iii], where *1850* and ‘*use*’ restrict the denotation of the nominals headed by *year* and *verb*. Typically, integrated appositives provide identifying information, so that the matrix NP is definite. However, they do not have to be semantically restrictive, as is evident from examples like:

- [19] *This is* [*my husband* *George*].      [non-restrictive integrated appositive]

As an integrated appositive *George* belongs in the same intonation unit as the head, instead of being pronounced as a separate intonation unit, as in supplementary apposition. But there is no entailment or implicature that I have more than one husband: the integrated construction simply provides a succinct way of saying that the person concerned is my husband and is named *George*.

Appositive modifiers are very often proper names, but there are other possibilities too, as illustrated in [18]. It is also possible for a proper name to occur as head with a definite NP as appositive: [*‘Carmen’ the opera*] *is performed more often than* [*‘Carmen’ the ballet*].

### ■ Appositives vs complements

We have said that substitution of an appositive for the matrix NP **systematically** yields entailments. This distinguishes appositives from complements realised by content clauses:

- [20] i [The suggestion that they cheated] was quite outrageous. }  
 ii They omitted to mention [the fact that he is insolvent]. } [complement]

Example [i] clearly does not entail *That they cheated was quite outrageous*: the latter presupposes that they cheated and says that the cheating was quite outrageous, while in [i] it is the suggestion that was outrageous, probably because they didn't in fact cheat. The content clause thus does not qualify as an appositive; it is a complement licensed by the head noun *suggestion*, just as in the clausal construction *He suggested that they cheated* it is a complement licensed by the verb *suggested*. Example [ii], however, does entail *They omitted to mention that he is insolvent*. But this is attributable to the semantic properties of the noun *fact*: it is not a systematic feature of the noun + content clause construction. We accordingly don't regard this example either as satisfying the condition for analysis as an appositional construction: syntactically, it is just like [i].

### ■ Appositive obliques

Appositives with the form of proper names may be related to the head via the preposition *of*, rather than being directly related to it, as in the above examples.

- [21] i a. She was born in [the month of May].      b. She was born in May.  
 ii a. It took place in [the city of Berlin].      b. It took place in Berlin.

Again, [a] entails [b] in each pair, and just as in the [a] examples of [18] we understand that 'Carmen' is an opera, 1850 a year, and *use* a verb, so [21ia/iiia] categorise May as a month and Berlin as a city. Following the terminology used for predicatives in Ch. 4, §5.1, we call the PPs *of Berlin* and *of May* **marked appositives**, and the NPs *Berlin* and *May* **appositive obliques**. The oblique is a proper name, and the head is *month* or a term denoting some politico-geographical entity such as *city*, *town*, *suburb*, *village*, *settlement*, *state*, *county*, *canton*, *province*. The construction is characteristically definite, since the oblique is a proper name, but it is possible for the matrix NP to be indefinite, as in *There's a city of Manchester in England, and one in New Hampshire too*, reflecting the secondary use of proper names to denote a set of bearers of the name (§20.4).

## 14.4 Composite nominals vs compound nouns

The syntactic construction consisting of an attributive dependent + head, forming a composite nominal, is to be distinguished from a morphological compound noun:

- [22] i a. some new cars                      b. two London colleges                      [composite nominals]  
 ii a. some shortbread                      b. two ice-creams                              [compound nouns]

*New* and *London* are separate words, adjective and noun respectively, functioning as attributive modifiers, while *short* and *ice* do not themselves have the status of words: they are bases, again adjective and noun respectively, forming part of a compound word.

It might be claimed that the reason why examples like *ice-cream* fail the tests is purely semantic: an ice-cream is not transparently a cream made of ice. Since there is an element of unpredictability in the way the denotation of *ice-cream* is related to the denotation of its parts, we should not then expect either *ice* or *cream* to be independently modifiable. Likewise, only elements which are semantically comparable can be coordinated: since the role of ice in making ice-creams is not the same as that of custard in making custard-creams, and since an ice-lolly is a lolly made of ice in a sense that an ice-cream is not, we could expect *ice-cream* to fail the coordination tests. There are, however, pairs of N + N combinations in which the semantic relations involved seem both transparent and equivalent, but which nevertheless fail the coordination tests:

- |        |                                     |   |
|--------|-------------------------------------|---|
| [27] i | <i>sunrise</i> ~ <i>sunset</i>      | *[ <i>The sunrise and set</i> ] were both magnificent.      |
| ii     | <i>backache</i> ~ <i>toothache</i>  | *I'm suffering from [ <i>back and toothache</i> ].          |
| iii    | <i>teardrop</i> ~ <i>raindrop</i>   | *Her face was a sea of [ <i>tear and raindrops</i> ].       |
| iv     | <i>swimwear</i> ~ <i>sportswear</i> | *This is [ <i>a swim and sportswear shop</i> ].             |
| v      | <i>blackbird</i> ~ <i>bluebird</i>  | *There are [ <i>both black and bluebirds</i> ] in the area. |

If, as we believe to be the case, these examples cannot be explained on semantic grounds, a syntactic difference must exist between the examples in [25] and those in [27]: the former are syntactic constructions and the latter are compounds.

The semantic relations involved in composite nominals and compound nouns may be exactly the same: for example, *cutlery box* denotes a box for cutlery, and *matchbox* denotes a box for matches. *Cutlery box* seems to pass the coordination test, e.g. *I collect antique [cutlery and wine-glass boxes]*, but *matchbox* does not: \**I collect antique [match and dinky-car boxes]*. As the orthography suggests, *cutlery box* is then a syntactic construction, and *matchbox* is basically a compound. Nevertheless, the fact that two superficially identical structures coexist as competing realisations of the same semantic relationship means that it is often possible to reanalyse the component elements of a compound as independent constituents. For example, *washing-machine* is basically a compound: it denotes a machine for washing, but specifically a machine for washing clothes. It must fail the first coordination test because the other devices for handling clothes are not of the same form: we have a *tumble-dryer* rather than a *drying-machine*, and a *press* rather than a *pressing-machine*. Nevertheless, *washing-machine* can be coerced into passing the coordination test in the situation where we have a new invention which carries out all three processes: this might be called a combined *washing-, drying-, and pressing-machine*.

It is commonly pointed out that tests such as those illustrated in [23] do not yield a sharp division between composite nominals and compound nouns. A good deal of the apparent blurring of the distinction, however, is attributable to reanalysis of the type just illustrated. For the rest, we take the view, here as in so many other areas of grammar, that the existence of borderline cases does not provide a reason for abandoning a distinction that can be recognised in a great range of clear cases. To abandon the distinction requires that we treat all N + N combinations as composite nominals or else treat them all as compounds. Each of these approaches raises more problems than it solves. The all-composite-nominals approach provides no explanation for data like [27], and it leaves a major and arbitrary gap in the rules for forming compound nouns: given the wide range of compound types described in Ch. 19, §4.2, why should there be none formed from N + N combinations?

The all-compounds approach, on the other hand, requires that we allow for open-ended recursive formations within morphology, resulting in a serious weakening of the distinction between syntax and morphology: we will have to allow for compounds to contain

coordinations of arbitrary length (*the [United States, New Zealand, . . . , and Soviet Union representatives]*), PPs (*a [Ministry of Agriculture and Food proposal]*), and even interpolations (*They are cancelling all [history, philosophy and even, I believe, linguistics classes]*).

Both approaches, moreover, raise the problem of the relation between N + N combinations and Adj + N combinations: the coordination and modification tests of [24] apply to both. The problems just mentioned become even more serious if the unitary approach is extended to these – as would seem necessary given that we can have N + Adj + N combinations like *London theological college* or coordinations of N + Adj combined with N, as in *brick or wooden houses*. But if, nevertheless, the unitary approach is not extended, so that a distinction between composite nominals and compounds is recognised for Adj + N combinations on the basis of the coordination and modification tests, the question arises as to why these same tests are deemed irrelevant for N + N combinations.

Various non-syntactic criteria have been proposed as differentiating between composite nominals and compound nouns, as in such pairs as composite *black bird* (“bird which is black”) and *blackbird* (“species of bird”):

- [28] i STRESS: the composite nominal has primary stress on the second element (*black-<sup>1</sup>bird*), while the compound has it on the first (<sup>1</sup>*blackbird*).
- ii ORTHOGRAPHY: the composite nominal is written as two orthographic words, the compound as one.
- iii MEANING: while the meaning of the composite nominal is straightforwardly predictable from the component parts, that of the compound is not – it is specialised, denoting a particular species.
- iv PRODUCTIVITY: in the composite nominal the dependent can be replaced by any other adjective that is semantically compatible with the head, whereas there is a quite limited number of compounds with the form Adj + *bird*.

The correlation between these criteria and the syntactic tests of coordination and modification is, however, very imperfect, and since we are concerned with the delimitation of a syntactic construction we will naturally give precedence to the syntactic tests in the many cases of divergent results.

In the first place, there are many combinations that clearly pass the tests for composite nominals that have primary stress on the first element – forms like *biology teacher*, *cooking apple*, *television screen*, *income tax*. Conversely, there are some compounds, such as *full stop* (“period”) or, for many speakers, *hotdog*, that have stress on the second element.

Orthography does not provide a decisive criterion because in many cases there are alternant forms: *daisy wheel*, *daisy-wheel*, or *daisywheel*, for example. And there are compounds, such as the above *full stop*, that are written as two orthographic words.

Thirdly, semantic specialisation may be found in composite nominals as well as compounds. The coordination *desktop and internet publishing*, for example, shows *desktop publishing* to be a composite nominal, but the meaning is specialised, since it denotes publishing by use of computer programs accessible to a desktop computer, rather than publishing using the top of a desk. Conversely, the meaning of such compounds as *backache* or *raindrop* is as transparent as that of numerous composite nominals.

Finally productivity is a gradient matter, and cannot provide a criterion for a binary distinction. Syntactic processes are overall more productive than morphological ones within the lexicon, but this is a tendency, not a matter of productive vs non-productive.

- [7] i *the two vital reports* [determinative + residual]  
 ii *the largest unsupported structure* [superlative + residual]  
 iii *the second unsuccessful attempt* [ordinal + residual]  
 iv *the key new proposal* [primacy + residual]

When compatible early modifiers combine, they may generally do so in any order (with possible scope differences):

- [8] i a. *the two largest buildings* b. *the largest two buildings*  
 ii a. *the second brightest child* b. *the brightest second child*  
 iii a. *the key second proposal* b. *the second key proposal*

Whereas the [a] and [b] examples are more or less equivalent in [i], those in [ii] are not. In its salient interpretation [iia] denotes the runner-up to the brightest child, or there may have been two groups of children ranked for brightness, giving two children who are brightest in their group, and this is the second of these two. The meaning of [iib] is quite different: it picks out the brightest from the set of second children (most plausibly, second in order of birth). The examples in [iii] can be interpreted as equivalent, with the proposal concerned being simultaneously the key proposal and the second proposal. But they are more likely to be interpreted differently, with [iiib] denoting the second in the set of key proposals, and [iiia] the key one among the second proposals.

Evidence that the ordering in [6] is labile is provided by such examples as:

- [9] i *a seemingly interminable two hours* [residual + determinative]  
 ii *their woefully spoilt youngest child* [residual + superlative]  
 iii *an unsuccessful second attempt* [residual + ordinal]  
 iv *her highly influential key address* [residual + primacy]

### Residual pre-head modifiers

Here we have the labile ordering stated in [10] and illustrated in [11]:

- [10] Evaluative > General property > Age > Colour > Provenance > Manufacture > Type  
 [11] *an [attractive tight-fitting brand-new pink Italian lycra women's] swimsuit*

Evaluative modifiers represent the speaker's evaluation, rather than an objectively definable general property. The central examples are *good* and *bad*; others include *annoying*, *attractive*, *boring*, *despicable*, *excellent*, *ghastly*, *mind-numbing*, *oppressive*, *perfect*, *revolting*, *tasty*, *valuable*, and so on.

General property modifiers include those denoting properties that can be objectively distinguished using the senses: size (*big*, *small*), dimension (*long*, *tall*, *short*, *wide*, *narrow*, *fat*, *thin*), sound (*loud*, *faint*), touch (*rough*, *smooth*), taste (*sweet*, *sour*). Less central examples include: *ear-splitting*, *enormous*, *foul-smelling*, *inaudible*, *minuscule*, *obese*, *tight-fitting*, *vast*. Also belonging under the same heading are modifiers denoting human properties, such as *cruel*, *intelligent*, *irascible*, *jealous*, *kind*, *pompous*, *rude*, *snooty*, *wise*. We note that, when a sense modifier and a human property modifier apply non-restrictively, there is no real preferred order: *her fat cruel husband* and *her cruel fat husband* are indistinguishable.

Age modifiers include *old*, *new*, and *young*, along with *ancient*, *brand-new*, *modern*, *up-to-date*, etc. Colour modifiers include the basic colour terms *black*, *white*, *red*,

*yellow, green, brown, blue, pink, orange, grey, purple*, together with a host of non-basic ones, e.g. *crimson, vermilion, carmine, blue-green, powder-blue*. Provenance modifiers are typically nationality adjectives, such as *French, Italian, Chinese, Venezuelan*, or other geographical and politico-geographical proper names, for example *Queensland in an old Queensland sofa*.

Manufacture modifiers either denote the material out of which something is composed, or the mode of its manufacture. Composition modifiers can be adjectival, for example *wooden* and *woollen*, but are typically nouns: *cotton, iron, jade, nylon, polyester, satin, wood, wool*. Mode modifiers are typically participles, e.g. *carved, enamelled*. We also include under this heading genitive proper name nominals, as in *a delicious Sainsbury's pie*. Modifiers indicating type are mainly nominals but also include a number of adjectives: *fancy-dress costume, photograph album, dessert spoon, lap-top computer, passenger aircraft, winter overcoat, digestive biscuit*. Into this class naturally fit genitive nominals such as *men's department, women's clothes, children's diseases, old people's home, summer's day, winter's day*.

The labile nature of constraint [10] can be seen in the fact that while *a new cotton shirt*, say, is normally preferred over *a cotton new shirt*, the latter is not ungrammatical. It is admissible, for example, in a context where there has been talk of new shirts, and the concern is with different kinds of new shirt.

## ■ Post-head internal dependents

### General labile constraints

Post-head internal dependents are subject to the two labile constraints [12], as illustrated in [13], where double underlining is used for complements, single underlining for modifiers:

- [12] i Light post-head complements > Post-head modifiers  
 ii Light dependents > Heavy dependents
- [13] i a. *the attack on the prime minister in the tabloid press*  
 b. *?the attack in the tabloid press on the prime minister*
- ii a. *the rumour in the tabloid press that income tax would be cut*  
 b. *?the rumour that income tax would be cut in the tabloid press*
- iii a. *the rumour that income tax would be cut which was published in 'The Times'*  
 b. *the rumour which was published in 'The Times' that income tax would be cut*

In [13i] we have a light complement and in accordance with [12i] it will normally precede the modifier: [13ia] is preferred over [13ib]. In [13iia–b] the complement is heavy, so [12i] is irrelevant. Since the modifier is light, it will normally precede the complement in accordance with constraint [12ii]: [13iia] is the preferred member of the pair. Finally, in [13iii] both dependents are heavy, so neither of the constraints is applicable, and both versions are perfectly acceptable.

### Specific rigid constraints

Although the order of post-head internal dependents is essentially labile, certain specialised types are subject to rigid ordering constraints:

- [14] i Immediate post-head dependents » Residual post-head dependents  
 ii *else* » Restrictors » Residual post-head dependents

Constraint [14i] is illustrated in:

- |      |     |    |   |    |  |
|------|-----|----|---|----|--|
| [15] | i   | a. | <i>a trip <u>abroad to Paris</u></i>      | b. | <i>*a trip to Paris <u>abroad</u></i>      |
|      | ii  | a. | <i>the opera '<u>Carmen</u>' by Bizet</i> | b. | <i>*the opera by Bizet '<u>Carmen</u>'</i> |
|      | iii | a. | <i>the body <u>politic of France</u></i>  | b. | <i>*the body of France <u>politic</u></i>  |

Dependents which immediately follow the head are appositives (*the opera 'Carmen'*), prepositions without complements (*a trip abroad*), single adjectives in fixed phrases (*the body politic*): in each case, the attempt to insert a light complement between them and the head results in ungrammaticality.

Constraint [14ii] concerns the position of the modifiers we call restrictors. These are AdjPs or nominals without any post-head dependents of their own which modify the compound determinatives: *something very nice*, *everything gold* (see §9.6). These restrictors cannot occur in pre-head position because of the fused nature of the construction, and are forced into post-head position, with only *else* allowed between them and the head:

- |      |    |    |  |    |   |
|------|----|----|--|----|---|
| [16] | i  | a. | <i>something <u>highly original by Bach</u></i>    | b. | <i>*something by Bach <u>highly original</u></i>    |
|      | ii | a. | <i>nothing <u>else significant by Schubert</u></i> | b. | <i>*nothing <u>significant else by Schubert</u></i> |

### ■ Post-head external modifiers and postposing

There is rigid ordering between the two types of post-head modifier:

- |      |                     |                                      |                    |                                       |
|------|---------------------|--------------------------------------|--------------------|---------------------------------------|
| [17] | Emphatic reflexives | »                                    | Focusing modifiers |                                       |
| [18] | a.                  | <i>the author <u>herself too</u></i> | b.                 | <i>*the author too <u>herself</u></i> |

Clausal post-head internal dependents are often **postposed** to a position following the short post-head focusing modifiers, as in:

- |      |    |  |
|------|----|--|
| [19] | i  | <i>the one man <u>alone who can help you on this</u></i>               |
|      | ii | <i>the possibility <u>too that the prisoners would be released</u></i> |

The postposed dependent occupies a special position within the NP, but outside the structure imposed by the basic order constraint in [2].

## 16 Case

### 16.1 Preliminaries

#### ■ Case as a general term

The term case applies in the first instance to a system of inflectional forms of a noun that serve to mark the function of an NP relative to the construction containing it. Compare, for example:

- |     |     |                         |                                 |
|-----|-----|-------------------------|---------------------------------|
| [1] |     | FUNCTION OF NP          | CASE OF PRONOUN                 |
|     | i   | <i>I slept soundly.</i> | subject of clause<br>nominative |
|     | ii  | <i>Please help me.</i>  | object of clause<br>accusative  |
|     | iii | <i>Where is my bag?</i> | subj-det of NP<br>genitive      |

The pronouns in [i–ii] are heads of NPs functioning in clause structure: the nominative *I* marks that NP as subject, while accusative *me* marks it as object. At the general level, the nominative is a case whose primary function is to mark the subject of both intransitive and transitive clauses, while the accusative is a case whose primary function is to mark

the direct object of a transitive clause. The genitive is somewhat different in that its primary function is to mark one NP as a dependent in the structure of a larger NP. In [iii] *my* is a dependent in the structure of the NP *my bag*. More specifically, we analyse the dependent NP as subject-determiner within the matrix NP.

### ■ Plain case: neutralisation of the nominative–accusative contrast

In Present-day English the contrast between nominative and accusative is found with only a handful of pronouns. At earlier stages of the language the contrast applied to the whole class of nouns but the inflectional distinction has been lost except for these few pronouns. We will use the term **plain case** for the form that neutralises the distinction between nominative and accusative, contrasting simply with the genitive:

[2]	FUNCTION OF NP	CASE OF NOUN
i [The <u>doctor</u> ] slept soundly.	subject of clause	plain
ii Please help [the <u>doctor</u> ].	object of clause	plain
iii [the <u>doctor's</u> ] bag	subj-det of NP	genitive

### ■ Distinction between case and syntactic function

While case characteristically serves as a marker of syntactic function, it is important not to lose sight of the distinction between the inflectional category of case and the functions that it may mark. It is a common practice in much traditional grammar, especially traditional school grammar, to say that nouns functioning as (head of the) subject are in nominative case, while those functioning as (head of the) object are in accusative case, but this is to confuse the two sets of concepts. According to this traditional account, *doctor* is nominative in [2i] and accusative in [ii], but in fact there is no inflectional distinction between these two occurrences of the noun *doctor*. *The doctor* is subject in [i], object in [ii], but the difference in function is not marked by any difference in the internal form of the NP: there is therefore no contrast of case here, and as indicated in [2] we assign both instances of *doctor* to the same case, the plain case. Case, then, is only one among a variety of possible markers of syntactic function, and as far as Present-day English is concerned the linear position of an NP relative to the verb plays a larger role in the marking of syntactic function than does inflectional case.<sup>58</sup>

### ■ Terminology: ‘nominative’ vs ‘accusative’ or ‘subjective’ vs ‘objective’

The classical terms ‘nominative’ and ‘accusative’ are quite opaque, and some modern grammars have replaced them by the more transparent ‘subjective’ and ‘objective’ respectively. The view taken here, however, is that the correlation between case and syntactic function is so complex that these new terms run the risk of creating confusion, and we have therefore preferred to retain the traditional terms – which also have the advantage that they are much more widely used in the grammars of other languages. As we will note in detail below, the nominative is not restricted to subject function (cf. *It was I who found it*,<sup>59</sup> *They’ve invited Kim and I to lunch*) and the accusative is likewise not restricted to object function, and indeed not excluded from subject function (*Kim objected to him being given such preferential treatment; For him to go alone would be very dangerous*).

<sup>58</sup>Case as an inflectional category is quite distinct from the ‘abstract case’ invoked in some modern theories of formal grammar: all overt NPs have case in this abstract sense, regardless of their surface form.

### ■ No dative case in English

The earlier case system of English distinguished not only nominative, accusative, and genitive, but also dative (a case which characteristically serves to mark indirect object function). The loss of inflectional endings has resulted in this case dropping out of the system altogether, for it is not even retained in the personal pronouns. Compare, then:

- [3] i We took him to the zoo. [direct object; accusative case]  
 ii We showed him the animals. [indirect object; accusative case]

No pronoun has different forms in these constructions, and there is thus no basis for distinguishing two inflectional cases here. Again, traditional school grammars often analyse *him* as a dative case in examples like [ii], but this is one of those places where an analysis that is valid for Latin (or Old English) has been inappropriately carried over to Present-day English.<sup>59</sup>

### ■ Inflectional and analytic case

Although case is prototypically marked inflectionally, there are languages where it is marked analytically, by special grammaticised words. Japanese is a language of this type, with subject, direct object, and indirect object marked by distinct postpositions. Some grammars of English also postulate a certain amount of analytic case: *to*, for example, has been regarded as a marker of dative case in clauses like [4a] and *of* as a marker of genitive case in NPs like [4b]:

- [4] a. I gave the money to Kim. b. the father of the bride

The view taken here, however, is that English has only inflectional case, that prepositions are not case markers. The rationale for taking *to* as a dative marker is that *to Kim* is allegedly an indirect object, but we have argued in fact that it is not – that although it has the same semantic role as the NP *Kim* of *I gave Kim the money* it does not have the same syntactic function (cf. Ch. 4, §4.3). Leaving aside the nominative–accusative contrast in pronouns, the core syntactic functions in clause structure are not marked by inflectional case, and there is no justification for treating *to* as an analytic case marker here but as an ordinary preposition in *I explained the matter to Kim*, *I spoke to Kim*, *He referred to Kim*, and so on. Similarly for *of*. Semantically, the relation of *the bride* to *father* is the same in [4b] as in *the bride's father*, but syntactically there is a major difference: in the latter *the bride's* is determiner (or subject-determiner), whereas in [4b] *of the bride* is simply a complement, and as such it is similar to the post-head PPs in *a view of the river*, *a number of animals*, *his marriage to Jennifer*, *her insistence on a recount*. There are a large number of prepositions in English and overall their role is very different from that of inflectional case markers; some of them have relatively grammaticised uses, but we do not believe it would be possible to make a principled and rigorous syntactic distinction between case-marker and other uses.

### ■ Variants of the genitive: dependent and independent

Most of the personal pronouns have two genitive forms, which we refer to as **dependent** and **independent**:

- [5] i Where shall I park my car? [dependent]  
 ii Jill's car is in the carport: where shall I park mine? [independent]

<sup>59</sup>A considerable amount of modern work applies the term 'dative' to a semantic role (essentially, the recipient role) or the corresponding syntactic function. Given that 'dative' is applicable to an inflectional case in many languages, this seems to us an unfortunate extension of the term.

*My* is required in [i], where the genitive is a dependent of the head noun *car*, but in [ii], where the genitive itself is head of the object NP, we have the independent form *mine*. We take this to be a relatively minor matter, and regard *my* and *mine* as variants of the genitive case. The distinction is not comparable to that between *I* and *me*: these are distinct primary cases, not variants of the plain case.

We have, then, three major cases: nominative, accusative, genitive. The plain case represents a neutralisation of the nominative–accusative opposition, and independent and dependent genitives are contextual variants of the genitive.

### ■ Pronouns with more than two case-forms

Most nouns, we have noted, have just two cases, plain and genitive. The following table lists those pronouns which distinguish nominative and accusative, and/or independent and dependent genitives. They constitute most of the personal pronouns together with the interrogative and relative pronoun *who*:

[6]	NOMINATIVE		ACCUSATIVE		GENITIVE	
	PLAIN				Dependent	Independent
PERSONAL						
	<i>I</i>		<i>me</i>		<i>my</i>	<i>mine</i>
	<i>we</i>		<i>us</i>		<i>our</i>	<i>ours</i>
		<i>you</i>			<i>your</i>	<i>yours</i>
	<i>he</i>		<i>him</i>			<i>his</i>
	<i>she</i>		<i>her</i>		<i>her</i>	<i>hers</i>
	<i>they</i>		<i>them</i>		<i>their</i>	<i>theirs</i>
INTERROGATIVE/RELATIVE						
	<i>who</i>		<i>whom</i>			<i>whose</i>

## 16.2 Nominative and accusative

We look first at the contrast between nominative and accusative case, where we find a considerable amount of variation and instability in the system. There are a number of constructions where the nominative is associated with formal style, the accusative being strongly preferred in informal speech and writing. Because of the tendency of older prescriptive grammar to accept only formal style as ‘grammatically correct’, there has been a tradition of criticising the accusative alternants, and the stigmatism attaching to such accusatives has given rise to a certain amount of hypercorrection, with nominatives being used in constructions where the traditional rules call for an accusative. Or at least this is the situation with the personal pronouns and determinatives: with interrogative and relative *who* the reverse situation obtains, the accusative *whom* being the case associated with formal style. We will therefore consider the personal pronouns and *who* separately, and for the former we begin with non-coordinate constructions, leaving the special problems found with coordination to §16.2.2.

### 16.2.1 Non-coordinate personal pronouns/determinatives

#### ■ Constructions where nominative case is obligatory

There is just one function where pronouns appear in the nominative case to the exclusion of the accusative, irrespective of style level: subject of a finite clause. Compare:

- |     |  |   |
|-----|--|---|
| [7] | NOMINATIVE                                   | ACCUSATIVE                                |
|     | i a. <u>I</u> made up some new curtains.     | b. * <u>Me</u> made up some new curtains. |
|     | ii a. Did <u>we</u> see that movie or not?   | b. *Did <u>us</u> see that movie or not?  |
|     | iii a. We saw that movie, didn't <u>we</u> ? | b. *We saw that movie, didn't <u>us</u> ? |
|     | iv a. I think <u>he</u> is mad.              | b. *I think <u>him</u> is mad.            |

These examples illustrate a variety of finite-clause subjects: non-inverted subject in [i], inverted subject in [ii], inverted subject in an interrogative tag in [iii], and subject of a finite subordinate clause in [iv]. In all these environments, an accusative subject is completely ungrammatical, as seen in the [b] versions.

Even in this construction, however, we find variation with the personal determinative *we*, with nominative *we* being the norm but very colloquial and dialectal varieties having accusative *us*:

- [8] i We anarchists almost toppled the militarist-industrial-financial Establishment.  
 ii Perhaps this is why we all taunted and teased him, because he was different and us kids don't like anything different.

### ■ Constructions where nominative and accusative are in alternation

There are a number of constructions where both cases are found. In most, the nominative is restricted to formal (or very formal) style, with the accusative appearing elsewhere.

#### (a) Subjective predicative complement

- [9] i a. It is I who love you. b. It's me who loves you.  
 ii a. It is I she loves. b. It's me she loves.  
 iii a. Yes, it is she! b. Yes, it's her!  
 iv a. This is he / These are they. b. This is him / These are them.  
 v a. <sup>?</sup>The only one who objected was I. b. The only one who objected was me.  
 vi a. \*This one here is I at the age of 12. b. This one here is me at the age of 12.

Probably the most frequent use of a nominative case predicative is in the *it*-cleft construction, as in [i–ii]. And here we can make a distinction according to whether the pronoun would be in nominative or accusative case in the non-cleft counterpart: compare [i] with I love you and [ii] with She loves me. In the former, the accusative version [ib] certainly has an informal flavour, whereas in the latter the nominative version [iia] seems very formal and the accusative [iib] relatively neutral in style. Nominatives are also found with *it* + *be* without a following relative clause, as in [iii]. This is considered very formal – and in response to the question *Who's there?* the nominative version *It is I* would be widely perceived as pedantic. The other main construction where a nominative is quite commonly found, again in formal style, is with a demonstrative as subject, as in [iv]. It might also be used in *if I were he* (but hardly <sup>?</sup>*if you were I*). Elsewhere, it is again likely to be perceived as somewhat pedantic. Most speakers would avoid examples like [va] – which is easily done by reversing the order (*I was the only one who objected*). The context for [vi] is one where we are looking at an old photograph; it is difficult to imagine that anyone would use a nominative in construction with the following PP that we have here.

Languages with fuller case systems than Present-day English often have case agreement between a predicative complement and its predicand; this indeed was the situation in older stages of English. With only a handful of pronouns showing a nominative–accusative contrast, however, it would be inappropriate to talk of case agreement in English. In [9], for

example, all the subjects are in plain case, so it is not a matter of whether the predicative matches the subject in case. Notice, moreover, that the issue of a contrast in case between subjective and objective predicatives doesn't arise for it is impossible to have a personal pronoun in objective predicative complement function. This is because an objective predicative can only be ascriptive, and personal pronoun predicatives can only be of the specifying type: see Ch. 4, §5.4.2.

#### (b) Subject of a gerund-participial in adjunct function

- [10] i *We were in Greville's office, I sitting in his swivel chair behind the vast expanse of desk, Annette sorting yesterday's roughly heaped higgledy-piggledy papers back into the drawers and files that had earlier contained them.*  
 ii *He could think of a few himself, I expect, him being so much in the business already.*

Here the difference is straightforwardly one of style level, nominative being the formal variant, accusative the informal.

#### (c) Complement of comparative *than* and *as*

- [11] i a. *She is older than he.* b. *She is older than him.*  
 ii a. *She went to the same school as I.* b. *She went to the same school as me.*  
 iii a. *I've not met a nicer man than he* b. *I've not met a nicer man than him.*  
 iv a. *\*It affected the others more than I.* b. *It affected the others more than me.*  
 v a. *\*She is older than we both/all.* b. *She is older than us both/all.*

If the complement of *than* or *as* can be expanded by the addition of a verb to which the pronoun is subject, then formal style has a nominative, informal style an accusative. In [i–iii], for example, we can expand the [a] versions to *older than he is*, *the same school as I went to*, *a nicer man than he is*. According to the traditional account, the pronouns in [i–iii] are subjects of elliptical clauses and therefore 'should' appear in the same case as when the verb is present. Whether the pronouns in [i–iii] are properly analysed as reduced clauses is a difficult question that we discuss (without in fact resolving) in Ch. 13, §2.2, but whatever the answer the accusatives are clearly fully acceptable in informal style. Some speakers may find the nominative less likely in [iii] than in [i–ii]: in [i–ii] the pronoun is matched against the subject of the matrix clause, but this is not so in [iii]. In [iv] expansion of the complement of *than* would put the pronoun in object position (*It affected the others more than it affected me*), and in comparative constructions of this kind the pronoun is invariably accusative. Note finally that if the pronoun is followed by *both* or *all*, as in [v], accusative case is the only possibility (see §10.1.1).

#### (d) Subject of (other) verbless clauses

- [12] i a. *He was morose, she full of life.* b. *He was morose, her full of life.*  
 ii a. *What, he a republican?* b. *What, him a republican?*

Example [i] belongs to the gapping construction (Ch. 15, §4.2); the nominative is readily used in formal style, while the accusative seems very informal or colloquial. Example [ii] belongs to the bare predication polar echo construction (Ch. 10, §4.8.3), which is itself generally a somewhat informal construction, so the accusative pronoun is more likely; nevertheless, a nominative, as in [iia], is certainly possible. There is also the verbless counterpart of the gerund-participial adjunct discussed in (b) above:

Accusatives are also the only option for the left- and right-dislocation constructions (which are themselves characteristic of informal style):

- [18] i Me, I wouldn't trust him further than I could throw him.  
 ii I don't much care for it, me.

The non-clausal construction where a pronoun is modified by an adjective is likewise restricted to accusatives: *Silly me!* And we can almost certainly include here too the displaced subject in the existential construction (see Ch. 4, §3.2.2):

- [19] i A: *Who is there who could help?* B: *Well, there's always me! I suppose.*  
 ii A: *Don't forget Liz.* B: *Yes, there's certainly her/\*she to consider.*

As we saw with the subject of a finite clause, the case-assignment rule does not apply so absolutely with determinative **we** as it does with pronouns:

- [20] i *Nobody asked us workers how we felt about it.*  
 ii <sup>0</sup>*The real work of universities . . . is now being made increasingly difficult for we workers.*  
 iii <sup>0</sup>*What a delightful invitation, for we workers to submit something to your splendid publication.*

The nominatives in [ii–iii] (both taken from a university staff newsletter) are further examples of what can be regarded as hypercorrections.

### 16.2.2 Coordinative constructions

For one variety of English, coordination has no bearing on case: the case of a coordinate pronoun is the same as that of a pronoun that could substitute for the whole coordination. Some examples conforming to this rule are as follows:

- [21] i *At 4 pm this afternoon my ministers and I formally took office.*  
 ii *He and Luckman were sentenced to life imprisonment.*  
 iii *He and I have some of our biggest arguments over Conservative social issues.*  
 iv *You know you can trust Andrea and me.*  
 v *I saw them and their children in the park.*  
 vi *There has always been pretty intense rivalry between him and me.*

Compare [i–iii] with the non-coordinate nominatives *I took office*, *They were sentenced . . .*, *We have . . .*, and [iv–vi] with the accusatives . . . *you can trust us*, *I saw them*, . . . *between us*. This is the pattern advocated by the usage manuals, but for many speakers the case-assignment rules are sensitive to the syntactic distinction between coordinate and non-coordinate pronouns.

#### ■ Coordinate accusatives corresponding to non-coordinate nominatives

- [22] i a. <sup>1</sup>*Tina and me sat by the window looking down on all the twinkling lights.*  
 b. <sup>1</sup>*She and us are going to be good friends.*  
 ii a. <sup>1</sup>*Me and Larry are going to the movies.*  
 b. <sup>1</sup>*Him and me fixed up the wagon while the others went to town.*

In the variety illustrated in [i] the accusative is used only for a coordinate following the coordinator: coordinators are treated in the same way as prepositions for case-assignment purposes. In [ii] the accusative is used irrespective of the position of the pronoun within the coordination.

The accusatives in [22] are non-standard and strongly stigmatised, especially the pattern in [ii]. They show, however, that the only completely secure territory of the nominative in Present-day English is with pronouns functioning as the whole subject in a finite clause.

#### ■ Coordinate nominatives corresponding to non-coordinate accusatives

- [23] i a. %*The present was supposed to represent Helen and I, that was the problem.*  
 b. %*Any postgrad who has any concerns about working conditions or security in shared offices is welcome to approach either Ann Brown or I with them.*  
 c. %*It would be an opportunity for you and I to spend some time together.*  
 d. %*He had intended to leave at dawn, without you or I knowing anything about it.*  
 ii a. %*They've awarded he and his brother certificates of merit.*  
 b. %*There's a tendency for he and I to clash.*

Single pronouns replacing the coordinations would have to be in accusative case: *us* in [i] and [iib], *them* in [iia]. One particularly common use of this construction is in the expression *between you and I*, and indeed usage manuals often discuss it under that heading. It must be emphasised, however, that these nominatives are found quite generally in coordinations functioning in positions where single accusative pronouns are used. The pattern shown in [i], with the nominative as final coordinate, is much more common than the one in [ii], where the nominative occurs as first (or both first and final) coordinate.

There can be little doubt that the quite common use of this construction is related to the stigmatisation attaching to accusatives in subject coordinations like those in [22]: people are taught that *Me and Kim will do it* and *Kim and me will do it* are incorrect, and many generalise their avoidance of such coordinate accusatives to other functional positions. The schoolteacher's strictures focus primarily on the 1st person singular pronoun (since this is where children most commonly depart from the standard variety), and in construction [23], with final-only nominative, *I* is overwhelmingly the most frequent form that is found. Compare [23] with the much less widely used:

- [24] i %*They've invited the Smiths and we to lunch.*  
 ii %*Liz will be back next week, so I've asked Ed to return the key to you or she.*

Because these coordinate nominatives are perceived to be associated with avoidance of stigmatised accusatives in subject coordinations they are often described as hypercorrections. This is to imply that they are 'incorrect', not established forms in the standard language. Construction [23i] with *I* as final coordinate is, however, so common in speech and used by so broad a range of speakers that it has to be recognised as a variety of Standard English, and we will reserve the term hypercorrection for examples like [23ii] and [24].

Note that the distinction between 1st person singular and other personal pronouns is also evident in such constructions as:

- [25] i *They like the same kind of music as you and we.*  
 ii *They like the same kind of music as you and I.*

Example [i] belongs to the same style level as *They like the same kind of music as we* – i.e. it is very formal. But [ii] is not felt to be stylistically restricted in the same way; many speakers who do not themselves use examples like [23i] would nevertheless feel much more comfortable with [25ii] than with [25i].

16.2.3 *Who and whom*

The situation with the interrogative or relative pronoun **who** is significantly different from that obtaining with the personal pronouns. Style differences in the personal pronouns have nominative as formal, accusative as informal, but with **who** the alternations are typically between accusative *whom* as formal and nominative *who* as informal or relatively neutral.

- |      |   |  |
|------|---|--|
| [26] | ACCUSATIVE  | NOMINATIVE   |
| i    | a. <i>Whom</i> did you meet?                        | b. <i>Who</i> did you meet?                        |
| ii   | a. <i>He</i> didn't say <i>whom</i> he had invited. | b. <i>He</i> didn't say <i>who</i> he had invited. |
| iii  | a. <i>those whom</i> we consulted                   | b. <i>those who</i> we consulted                   |

■ *Whom and style level*

In short simple constructions like those in [26] there is a rather sharp style contrast between *whom* and *who*: *whom* is strikingly more formal than *who*. It would be a mistake to say, however, that *whom* is confined, or even largely confined, to formal style. In more complex constructions than the above, *whom* is not infrequently found in combination with lexical or syntactic features which are characteristic of relatively informal style. A few attested examples are given in:

- [27] i *A pretty young co-ed named Junko gets into the game and thus meets a youngster with whom she has an affair.*  
 ii *The next musician whom I got to know well was a much younger man whom I have already mentioned, Sidney Lewis.*  
 iii *He double-crosses the five pals with whom he lives, cheats a waitress (Juliet Prowse) and cynically uses a magazine editress (Martha Hyer) to get ahead.*  
 iv *Jeffrey had grown a beard and was associating with a scruffy crowd of radicals, many of whom were not even British.*  
 v *Hugh wasn't impressed with this ingratiating barman whom Roddy had raked up.*  
 vi *These include the deros of the inner urban areas and most of the abos, most of whom haven't got a skerrick, and spend most of what little they have on the terps getting rotten.*

None of these could be described as formal in style; the last in particular, an Australian example, is strikingly informal, containing as it does the clippings *deros* ("derelicts"), *abos* ("Aborigines"), *terps* ("turpentine"), and such other features as *haven't got a skerrick* and *getting rotten*.

■ *Survey of functions*(a) *Subject and predicative complement*

Nominative is required in both these functions:

- |      |     |   |                                      |
|------|-----|---|--------------------------------------|
| [28] | i   | a. * <i>Whom</i> wrote the editorial?   | b. <i>Who</i> wrote the editorial?   |
|      | ii  | a. * <i>the man whom</i> came to dinner | b. <i>the man who</i> came to dinner |
|      | iii | a. * <i>Whom</i> could it be?           | b. <i>Who</i> could it be?           |

We are concerned here with the subject of the interrogative or relative clause itself: for the construction where **who** is subject of a clause embedded within the interrogative or relative, see (e) below. A predicative complement realised by **who** is always subjective:

the objective predicative in clauses like *He considered her the victim* cannot be questioned or relativised by *who*.

### (b) Object of verb

Here *whom* and *who* are in alternation, as illustrated in [26]. The alternation is also found in post-verbal interrogative objects:

- [29] a. *Who is going to marry whom?*      b. *Who is going to marry who?*

The formal feel of *whom* is most apparent in main clause interrogatives: examples like [26ia] are widely perceived to be very formal indeed (verging on the pedantic), with nominative *who* considered preferable in almost all contexts. *Whom* is just about impossible as a single-word question: in response to *I met a friend of yours on the bus this morning* one would say *Oh, who?*, not *Oh, whom?* With relatives the nominative is felt to be more informal than with the interrogatives, probably because it can easily be avoided in integrated relatives by means of a non-*wh* construction: *those we consulted* or *those that we consulted* (but note the accusative object in [27v] above). Supplementary relatives are normally of the *wh* type, and here *whom* is not uncommon, and not strongly formal in tone; the following, for example, appeared in a video chainstore's magazine giving synopses of new releases:

- [30] *Award-winning journalist Nelson Keece (Gary Busey) is coldly detached from his chosen subject, serial killer Stefan (Arnold Vosloo), whom he catches in the act of murder.*

### (c) Fronted object of a stranded preposition

- [31] i a. *Whom are you referring to?*      b. *Who are you referring to?*  
 ii a. *someone whom we can rely on*      b. *someone who we can rely on*

The versions with *who* have a slightly informal flavour, and again relative *who* will often be avoided in favour of the non-*wh* construction *someone (that) we can rely on*. The construction with accusative *whom* is fairly rare in comparison with *who* + stranded preposition or fronted preposition + *whom* (as in [33] below). Nevertheless, examples of *whom* + stranded preposition are certainly attested, providing further evidence that *whom* is not restricted to markedly formal style.

- [32] i *Nobody cares to guess how many votes he may get, nor whom he is most likely to take them from.*  
 ii *The first royalty whom mama ever waited on in the White House was Queen Marie of Rumania, . . .*  
 iii *And that's the man whom you've been eating your heart out over?*

### (d) Object of a preceding preposition

- [33] i a. *To whom are you referring?*      b. *\*To who are you referring?*  
 ii a. *someone on whom we can rely*      b. *\*someone on who we can rely*

This is the one place where the accusative is normally the only option: the nominative [b] versions are clearly ungrammatical. One qualification concerns constructions in which the PP stands alone or in post-verbal position:

- [34] i A: *You should give them away.*    B: *To who?*  
 ii *Who said what to who?*

*Who* here is acceptable in informal style: in terms of their grammaticality status these examples are closer to [31b/iib] than to [33b/iib].

The particular accusative examples cited as [33ia/iaa] are very formal in tone, and in most contexts would be avoided in favour of the stranded preposition construction shown in [31] above. But there are many places where the stranded construction is impossible or would be extremely awkward:

- [35] i *Her whole life centred around her six surviving daughters, one son, and nine grandchildren, of whom I was the youngest.*  
 ii *There were many in the colony for whom a resumption of the transport system meant a supply of cheap labour.*

It is where there is no stranding alternant that the accusative *whom* is most likely to be perceived as more or less neutral in style rather than as a distinctively formal marker. The most common construction where stranding is not an available alternant is with partitives, as in: *some of whom, all/both/many/few/none/two of whom*, etc.

The preposition + *whom* construction is much more common in relatives than in interrogatives. It is certainly not excluded from the latter, however; one type worth illustrating is that where we have a coordination of interrogative clauses or phrases:

- [36] *Since the earliest days of Australian sports coverage the issues have been, more subconsciously than consciously, what should be reported, by whom, for whom, to what purpose and in what form.*

#### (e) Subject of an embedded content clause

- [37] a. *%those whom he thought were guilty*      b. *those who he thought were guilty*

Here *who* is subject of the content clause functioning as complement of *thought*: it is not subject of the relative clause itself but of a finite clause embedded within the relative clause. In this construction there is variation between accusative *whom* and nominative *who*. The accusative construction is very largely restricted to relative clauses; it does not appear to occur in main clause interrogatives, and is rare and of doubtful acceptability in subordinate ones:

- [38] i a. *\*Whom do you think will win?*                      b. *Who do you think will win?*  
 ii a. *?I told her whom you think took it.*                  b. *I told her who you think took it.*

Attested examples of relative *whom* are given in [39], where [i] represents the usual type with a tensed verb (*thought*), while [ii] has a plain-form verb in the mandative construction:

- [39] i *A man with a large waxed moustache and a mop of curly damp hair, whom Hal thought might be his uncle Fred, said, 'That's a fine bird you're carving, Bert.'*  
 ii *It turns out that the woman, whom the police have asked not be identified, was a talented pianist and an unpublished writer.*

Prescriptive grammarians commonly treat this *whom* as a hypercorrection: since the pronoun is in subject function, the argument goes, it should be nominative and the accusative is therefore incorrect, attributable to a concern to avoid the common 'error' of using nominative *who* in place of accusative *whom*. This is another place, however, where we believe it is invalid to talk in terms of hypercorrection. The accusative variant has a long history and is used by a wide range of speakers; examples are quite often encountered

in quality newspapers and works by respected authors. It has to be accepted as an established variant of the standard language.<sup>62</sup> Thus there are in effect two dialects with respect to the case of embedded subjects, though they are not distinguished on any regional basis. Dialect A, which selects nominative, has more speakers and is the one recommended by the manuals, but there is no reason to say that it is inherently better or more grammatically correct than Dialect B, which selects accusative: the dialects just have different rules.

The alternation between *who* and *whom* can be attributed to the tension between the function of *who* with respect to the embedded content clause and its position in the relative clause. The two relevant factors are:

- [40] i **Who** is subject of a finite content clause.
- ii **Who** is in prenuclear position preceding the subject of the relative clause.

In Dialect A it is factor [i] that determines the case, as nominative, while in Dialect B [ii] is the determining factor, at least in formal style (and excluding the rather rare construction where *who* is in predicative complement function). In Dialect B the crucial distinction is therefore between relative clause subject and non-subject. And it is worth noting that this distinction is of importance elsewhere in relative clauses: bare relatives are normally not admissible when it is the relative clause subject that is relativised, but allow relativisation of other elements, including the subject of an embedded clause. Compare, for example, \**She's the student<sub>i</sub>; [\_\_<sub>i</sub> had made the complaint]* (where the gap is relative clause subject) with *She's the student<sub>i</sub>; [he accused \_\_<sub>i</sub>]* (object) and *She's the student<sub>i</sub>; [he said [\_\_<sub>i</sub> had made the complaint]]* (embedded subject).

### 16.3 Six types of genitive construction

We turn now to the genitive case, where we distinguish six constructions, as follows:

- [41] i [*Kim's father*] *has arrived*. [I: subject-determiner]
- ii *No one objected to* [*Kim's joining the party*]. [II: subject of gerund-participial]
- iii *Max's attempt wasn't as good as* [*Kim's*]. [III: fused subject-determiner-head]
- iv *She's* [*a friend of Kim's*]. [IV: oblique genitive]
- v *All this is* *Kim's*. [V: predicative genitive]
- vi *He lives in* [*an old people's home*]. [VI: attributive genitive]

The genitives in Types I–V are full NPs, while that in Type VI can be just a nominal.

In this section we present a short overview of all six constructions; in §16.5 we look more fully at Type I, and the ways Type VI differs from it.

#### ■ Type I: subject-determiner

In [41i] *Kim's* is a genitive NP functioning as subject-determiner within the matrix NP *Kim's father*; genitive case marks *Kim* as standing in a relation of dependence within this matrix NP. *Kim's father* itself has plain case and can occur in the full range of NP positions; it is interpreted as definite (“the father of Kim”, not “a father of Kim”).

<sup>62</sup> *Whom* is occasionally found as subject not of an embedded clause but of the relative clause itself, with a parenthetical expression after the subject: \**Mr Dawkins lashed out at the Senators, including those of his own party whom, he believed, should have shown more loyalty*. Unlike the examples in [37a] and [39], however, this does not represent an established usage, and we believe it is properly regarded as ungrammatical, a genuine hypercorrection.

As noted above, the genitive subject-determiner is itself a full NP. In *this company's computers*, for example, it is clear from the singular form that *this* is a dependent of *company*, not *computers*; we accordingly have the NP *this company's* functioning as subject-determiner within a larger NP. Where the genitive NP contains a post-head dependent, as in *the people next door's behaviour*, the case marker attaches at the end rather than on the head (*people*): we take up this issue in §16.6.

The construction is recursive, i.e. we can have one such construction within another, as in *Kim's father's business*, where the first 's suffix marks **Kim** as subject-determiner of *Kim's father*, and the second marks the latter as subject-determiner within the topmost NP *Kim's father's business*.

#### ■ Type II: subject of gerund-participial

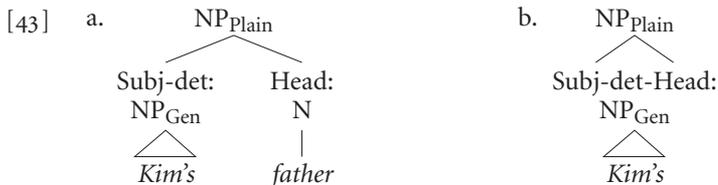

In [41ii] the genitive marks the subject of a gerund-participial clause in complement function – in this example, the clause is object of the preposition *to*. Historically, this construction is an offshoot from Type I: what was originally a noun came to be reanalysed as a verb and to behave as the head of a clause rather than an NP (see further discussion in Ch. 14, §1.5). This genitive marks the relation of *Kim* not to a matrix NP but to a clause; in this construction, then, the subject function does not combine with that of determiner. One major difference between Types I and II in Present-day English is that the genitive marking the subject of a gerund-participial alternates with plain (or accusative) case: *No one objected to Kim joining the party*.

#### ■ Type III: fused subject-determiner-head

*Kim's* in [41iii] is an instance of the fused-head construction discussed in §9.2. As in the Type I construction, the genitive marks the relation between a dependent element and a matrix NP containing it. Usually, as in this example, the two NPs are co-extensive, but they do not have to be – the matrix NP may also contain a predeterminer or a post-head dependent:

- [42] i *Only one of Ed's attempts was successful, but [both Kim's] were.*  
 ii *Ed's production of 'Hamlet' was more successful than [Kim's of 'Macbeth'].*

Thus in [41iii], no less than in [41i], we need to recognise a plain-case NP as well as the genitive one. The structures for the two examples are as follows:

#### ■ Type IV: oblique genitive

We refer to the genitive in [41iv] as oblique because it is related to the head noun *friend* obliquely, via the preposition *of*, rather than immediately, as in *Kim's friend*.<sup>63</sup> The PP *of Kim's* is post-head dependent within the matrix NP. Type I genitives fill

<sup>63</sup>The oblique genitive construction is commonly referred to as the 'double genitive'. For the reasons given in §16.1, however, we do not regard *of* as a genitive case marker, and hence there is only one genitive here, not two.

the determiner position, where they mark the NP as definite, while the oblique allows the relation between subordinate and matrix NPs to be expressed while leaving the determiner position free to be filled by other kinds of determiner.<sup>64</sup> Compare, then:

[44]	PRE-HEAD	POST-HEAD: OBLIQUE
i	a. *a <u>Kim's</u> friend	b. a friend of <u>Kim's</u>
ii	a. * <u>those Kim's</u> friends	b. <u>those friends of Kim's</u>
iii	a. <u>Kim's</u> friend	b. * <u>the friend of Kim's</u>
iv	a. ? <u>Kim's</u> friend that I met in Paris	b. <u>the friend of Kim's</u> that I met in Paris
v	a. <u>all/both Kim's</u> friends	b. <u>all/both friends of Kim's</u>
vi	a. <u>Kim's</u> every move	b. <u>every move of Kim's</u>

Examples [ib/iib] show the oblique in combination with an indefinite or demonstrative determiner; the [a] versions are inadmissible because the determiner position is doubly filled – by *a/those* and by the Type I genitive *Kim's*. In [iiia] *Kim's* marks the matrix NP as definite, and the [b] version is excluded: the meaning would not be distinct from that of [iiia], and the simpler Type I construction is required. Where there is a post-head dependent, such as the relative clause in [iv], *the* is permitted in the oblique construction, while the pre-head version tends to be somewhat marginal. In [v] *all* and *both* can be predeterminers as well as determiners, and hence both constructions are possible, though the simpler [a] version is quite strongly preferred. Both versions are possible in [vi] too, because *every* can function as modifier as well as determiner; the [a] version, however, is limited to a quite narrow range of heads, so we can have *every friend of Kim's*, but not \**Kim's every friend*.

#### ■ Type v: predicative genitive

In [41v] the genitive marks the relation between *Kim* and the predicand *all this*, a relation like that expressible by *belong + to*. *Kim's* here is thus not part of some matrix NP, as it is in Types I and III–IV: here, then, the predicative complement function is realised directly by a genitive NP. Genitive predicative complements are usually subjective, as in this example, but they can also be objective: *Let's call it Kim's; I regard it as Kim's*.

As there is no reason to exclude the fused-head construction from predicative complement position, there may be structural ambiguity between Types III and v. Consider the case where A says, *I've got my towel but I can't find Kim's*, and B replies, *This is Kim's*. The first *Kim's* is Type III and one will tend to take the second in the same way, but outside such contexts *This is Kim's* will be Type v. The two readings here amount to the same thing, but we could not dispense with Type v, treating all such cases as fused heads: there is, for example, no basis for a fused-head analysis in examples like *Everything that is mine is yours*.

#### ■ Type vi: attributive genitives

In [41vi], *an old people's home*, the genitive is an attributive modifier within a nominal. At the top level of structure we have *an* as determiner and *old people's home* as head: it is clear that *an* cannot belong within the genitive expression, which is here plural. These genitives, moreover, can be preceded by other attributes, as in *a luxurious old people's home*, where *luxurious* modifies *old people's home*.

We distinguish two subtypes of attributive genitive:

<sup>64</sup>The range of semantic relations between subordinate and matrix NPs is, however, considerably narrower in the oblique construction: see §16.5.3.

## (a) Descriptive genitives

- [45] a glorious [summer's day], a [Sainsbury's catalogue], two [bachelor's degrees],  
a [women's college], these very expensive [ladies' gloves], an [all girls' school]

The square brackets enclose the nominal containing the genitive attribute. Descriptive genitives are themselves generally nominals, not NPs, as in all these examples except the last. Here, *all girls'* has NP status by virtue of having *all* as a peripheral modifier, giving the meaning “school exclusively for girls”.

Descriptive genitives are unusual in that they are a somewhat unproductive category. For example, while it is possible to have a *summer's day* and a *winter's day*, corresponding forms for the other seasons are quite marginal: ?*a spring's day*; ?*an autumn's day*. Similarly, we have a *ship's doctor*, but not #*a school's doctor* – instead a plain-case nominal is used, a *school doctor*. The great majority of descriptive genitives denote humans (or animals); compare, for example, *fisherman's cottages* (cottages typical of those lived in by a fisherman) and \**country's cottages* – instead of the latter we again have plain-case *country cottages*.

## (b) Measure genitives

- [46] [an hour's delay], [one week's holiday], this [hour's delay], a second [one hour's delay], the [one dollar's worth of chocolates] he bought

Genitives of this kind measure just temporal length or value: we do not have, for example, \**They had [a mile's walk]* (spatial distance) or \**We bought [a pound's carrots]* (weight). Value measures take the noun *worth* as head, while the temporal ones allow any semantically appropriate noun as head. An alternative means of expressing measure is to use a compound adjective, as in a [two-hour delay], a [five-mile walk], an [eight-pound baby], etc.; this is less restricted than the genitive, though it is not admissible with *worth*.

Measure genitives commonly occupy initial position in the NP, as in the first two examples in [46], in which case they resemble subject-determiners (Type I genitives). That they are attributive modifiers, not determiners, however, is evident from the last three examples, where they follow a determiner (immediately or with an intervening adjectival attribute). When they occur in this position, i.e. after a determiner, they are subject to the constraint described in §6.2, so that the indefinite article is dropped: instead of \**this [an hour's delay]* we have *this [hour's delay]*. In this case the measure genitive (*hour's*) has the status of a nominal, but otherwise measure genitives are full NPs.

Because they are modifiers not determiners, measure genitives do not confer definiteness on the NP. While *a friend's dog*, with Type I genitive, is definite (“the dog of a friend”), *an hour's delay* is indefinite (“delay of an hour”). Nor can they occur initially with nouns that require a count interpretation: \**We played [an hour's game of squash]*; instead we need the compound adjective construction *We played a [one-hour game of squash]*.

## 16.4 Genitive pronouns

## ■ Dependent and independent forms

Five personal pronouns have two distinct contextual variants of the genitive case, dependent and independent: *my* ~ *mine*, *our* ~ *ours*, *your* ~ *yours*, *her* ~ *hers*, *their* ~ *theirs*. The dependent forms are used in constructions of Types I–II, the independent ones in

Types III–V (while Type VI excludes personal pronouns altogether):

- [47] i [*My father*] *has arrived*. [I: subject-determiner]  
 ii *No one objected to* [*my joining the party*]. [II: subject of gerund-participial]  
 iii *Max's attempt wasn't as good as* [*mine*]. [III: fused subject-determiner-head]  
 iv *She's* [*a friend of mine*]. [IV: oblique genitive]  
 v *All this is* *mine*. [V: predicative genitive]

Independent genitives can stand alone as NPs functioning in the structure of main clauses. The dependent ones can function as subject in one type of subordinate clause, the gerund-participial, but in main clauses they require the support of a following head element, as in Type I. The head can be fused with a modifier (*My second attempt was even worse than* [*my first*]), but not with the dependent genitive itself (*\*Max's attempt wasn't as good as* [*my*]): fusion with the subject-determiner is structure III and requires the independent form, as in [47iii].

### ■ Traditional grammar's contrast between 'possessive adjectives' and 'possessive pronouns'

The dependent and independent genitives are often analysed in traditional grammar as 'possessive adjectives' and 'possessive pronouns' respectively, but we find this an unsatisfactory way of handling the difference between the two sets of forms. Both are genitive forms of the personal pronouns, and *my* and *mine* are both pronouns, just as *I* and *me* are. As pronouns, they are heads of NPs: *my* and *mine* are genitive NPs, like such expressions as *Kim's* or *the doctor's*, which can replace them. It is important to note that *my* is replaceable by expressions of this kind just as much as *mine* is. Moreover, *my* can be coordinated with such NPs, as in *He did it without my or the doctor's approval*. And in constructions of Type II an adjective analysis makes no sense at all: *my* is functioning as subject of a clause, not a modifier in NP structure.

### ■ Distributional restrictions on certain genitive pronouns

For the most part, any genitive can occur in all of constructions I–V, assuming that the correct choice is made between the dependent and independent forms, where relevant. There are, however, a number of restrictions applying to a few pronouns.

#### *Its*

This form is largely restricted to the constructions where dependent forms are used, i.e. I–II. Examples are very occasionally found in III and V, but we have no attested instances of IV and constructed examples seem clearly unacceptable:

- [48] i *The Guardian seems to respect its readers more than the Sun respects* *its*. [III]  
 ii *\*The Bank is being sued by a rich client of* *its*. [IV]  
 iii *The council appears to be guilty of the illegal sale of houses that were not* *its* *to sell in the first place*. [V]

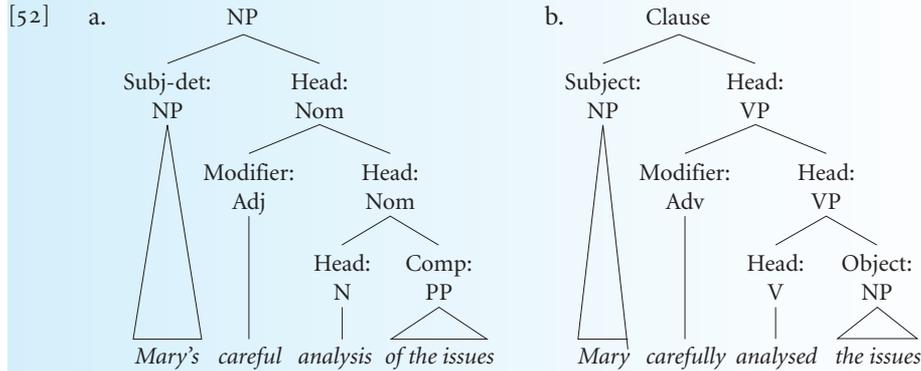

Instead of [ii] we would have *one of its rich clients* – or else we could have **they** rather than **it**: *a rich client of theirs*. (See footnote 68 for another Type III example.)

#### Interrogative *whose*

This occurs in all constructions except the gerund-participial subject (II) and the oblique (IV), though its use in the fused-head construction (III) is rare:

a direct comparison between NP and clausal structures, as in:

To bring out the parallelism, we use the label ‘head’ in [b] rather than the more specific ‘predicate’ or ‘predicator’. Just as the verb *analysed* is the ultimate head of the clause, so the noun *analysis* is the ultimate head of the NP. Nouns take oblique complements as opposed to objects, so the internal complement of *analysis* is the PP *of the issues* rather than directly *the issues*. The nominal *analysis of the issues* is directly parallel to the VP *analysed the issues*: both can be modified by a pre-head modifier, the adjective *careful* in the case of the nominal and the adverb *carefully* in the case of the VP. The subject-determiner then completes the NP as the subject completes the clause.

#### ■ Reflexives and their antecedents

The subject of a clause is the prototypical antecedent for any reflexive anaphor in the same clause, blocking any higher subject from acting as antecedent. The subject-determiner has an analogous role in NP structure. Compare:

- [53] i a. *Sue analysed herself.*      b. *Jill said [that Sue analysed herself].*      [clause]  
 ii a. *Sue's analysis of herself*      b. *Jill's note on [Sue's analysis of herself]*      [NP]

In clause [ia] *herself* has the subject *Sue* as antecedent, and in [ib] it is still anaphorically linked to *Sue*, the subject of its own clause: it cannot be linked to *Jill*, the subject of the higher clause. And the same applies in the NPs in [ii]: in [iib] it is linked to the subject of the NP in which it appears as oblique, not the subject of the higher NP. (See Ch. 17, §3.1, for fuller discussion.)

## 16.5.2 Semantic comparison with the subject in clause structure

### ■ Range of semantic relations

The range of semantic relations between the genitive NP and the head is vast, and largely parallel to that found between subject and predicate in clause structure. Some of this variety is illustrated in [54]: the semantic distinctions made are typical of those known cross-linguistically to have different structural realisations even though they are similarly expressed in English. NPs are given in the left-hand column, and can be compared to clauses in the middle column, where the semantic relation between the subject and the NP within the predicate is parallel to that between the genitive and the head nominal. The right-hand column contains a generalised schema of each semantic relation:

[54] i	<i>Mary's green eyes</i>	<i>Mary has green eyes.</i>	[d has body part h]
ii	<i>Mary's younger sister</i>	<i>Mary has a younger sister.</i>	[d has kin relation h]
iii	<i>Mary's husband</i>	<i>Mary has a husband.</i>	[d has married relation h]
iv	<i>Mary's boss</i>	<i>Mary has a boss.</i>	[d has superior h]
v	<i>Mary's secretary</i>	<i>Mary has a secretary.</i>	[d has subordinate h]
vi	<i>Mary's friend</i>	<i>Mary has a friend.</i>	[d has equal h]
vii	<i>Mary's team</i>	<i>Mary belongs to a team.</i>	[d is member of h]
viii	<i>Mary's debut</i>	<i>Mary performs her debut.</i>	[d is performer of h]
ix	<i>Mary's book</i>	<i>Mary writes a book.</i>	[d is creator of h]
x	<i>Mary's new house</i>	<i>Mary owns a new house.</i>	[d is owner of h]
xi	<i>Mary's honour</i>	<i>Mary is honourable.</i>	[d has human property h]
xii	<i>Mary's anger</i>	<i>Mary feels angry.</i>	[d has feeling h]
xiii	<i>Mary's letter</i>	<i>Mary receives a letter.</i>	[d is recipient of h]
xiv	<i>Mary's obituary</i>	<i>Mary is the topic of an obituary.</i>	[d is human topic of h]
xv	<i>Mary's surgery</i>	<i>Mary undergoes surgery.</i>	[d is undergoer of h]
xvi	<i>the room's Persian carpet</i>	<i>The room contains a Persian carpet.</i>	[d is location of h]
xvii	<i>this year's new fashions</i>	<i>This year is a time of new fashions.</i>	[d is time of h]
xviii	<i>the sun's rays</i>	<i>The sun emits rays.</i>	[d is natural source of h]
xix	<i>the cathedral's spire</i>	<i>The cathedral has a spire.</i>	[d has inherent part h]
xx	<i>the war's ancient origins</i>	<i>The war has ancient origins.</i>	[d has cause h]
xxi	<i>the flood's consequences</i>	<i>The flood has consequences.</i>	[d has result h]
xxii	<i>the lock's key</i>	<i>The lock has a key.</i>	[d has associated part h]
xxiii	<i>the summer's heat</i>	<i>The summer is hot.</i>	[d has non-human property h]

In the annotations on the right 'd' stands for dependent (i.e. the subject-determiner NP) and 'h' for head (i.e. the nominal which the genitive determines); thus in [i], for example, 'd' represents Mary and 'h' represents green eyes.

The semantic analysis given here is considerably more specific than that which underlies the semantic roles presented in Ch. 4, §2.2, with the roles listed here being special cases of those more general roles. For example, performer ([viii]) and creator ([ix]) are central types of agent, and undergoer ([xv]) is a clear case of patient. The list given in [54] is not intended to be exhaustive, and indeed could not be, since ultimately the semantic relation that holds between subject-determiner and head nominal is not predetermined. Rather the interpretation is dependent on what semantic relation the context allows.

For example, *Mary's green eyes* in [i] is in isolation most likely to be interpreted as "the eyes which Mary sees with" (i.e. "Mary has green eyes as body part"), but other contextualisations are possible. Mary might be a university ophthalmologist who is conducting research into the optical properties of differently coloured eyes ("Mary is researcher into green eyes"). Or Mary might have a phobia about green eyes ("Mary is fearer of green eyes"). Or Mary might be an avant-garde sculptor who makes sculptures of green eyes ("Mary is creator of green eyes").

Similarly, *Mary's letter* in [iii] could be interpreted as "the letter Mary received" ("Mary is recipient of the letter"); or as "the letter Mary wrote" ("Mary is creator of the letter"); or as "the letter Mary posted" ("Mary is poster of the letter"); or it might have been written by Shakespeare, and Mary does research into it ("Mary is researcher into the

letter”). The possibilities are endless, but they are all ones which can be paralleled by a clause which contains the subject-determiner as subject.

### Nominalisations

In [54] we chose NPs that do not involve nominalisations, which to some extent need separate treatment. Or rather, this is so for **event nominalisations**, where the head noun is morphologically derived from a verb and denotes an event. Compare:

[55]	i	a.	<i>Jill's departure</i>	<i>Jill departed.</i>	} [event nominalisations]
		b.	<i>Ed's destruction of the file</i>	<i>Ed destroyed the file.</i>	
	ii	a.	<i>Max's invention</i>	<i>Max invented something.</i>	} [other nominalisations]
		b.	<i>Edith's proposal</i>	<i>Edith proposed something.</i>	
		c.	<i>Nigeria's population</i>	<i>Nigeria is populated.</i>	

The nominalisations in [ii] are essentially like the examples of [54] in allowing a range of interpretations for the subject NP. The most salient ones are those that match the corresponding clause, with Max the inventor in [iia], Edith the proposer, i.e. the creator of the proposal, in [iib], and Nigeria the location in [iic] (for *population* denotes the people who populate a given place). But other construals are possible. For example, if a class of science students is asked to write essays on different nineteenth-century inventions, Max might be allocated an essay on the light bulb, and is therefore researcher. Similarly in [iib], Edith could be a recipient of the proposal. And for [iic] imagine that the United Nations passes a resolution requiring population growth in each country to be monitored by a neighbouring country: then *Nigeria's population* might be interpreted as “the population Nigeria monitors” (the generalised researcher relation again).

With event nominalisations such as we have in [55i], however, it is hardly possible to assign a semantic role to the subject-determiner different from that of the subject of the corresponding clause. This is particularly so in examples like [ib] which contain another complement besides the subject. Here Ed can only be the destroyer, the agent, and the file that which is destroyed, the patient. In event nominalisations, therefore, the role of the subject-determiner is determined by the predicate expressed in the noun head to the same extent as the role of the subject of the clause is determined by the predicate expressed in the verb head.

## 16.5.3 Alternating patterns of complementation

In the structure of NPs, as in the structure of clauses, we often find that an element with a given semantic role may be aligned with complements of different kinds:

[56]	i	a.	<i>Van Dyck's portrait of Charles I</i>	[creator as subject-determiner]
		b.	<i>the portrait of Charles I by Van Dyck</i>	[creator as <i>by</i> oblique]
	ii	a.	<i>the flood's consequences</i>	[cause as subject-determiner]
		b.	<i>the consequences of the flood</i>	[cause as <i>of</i> oblique]

We have seen that the subject-determiner characteristically allows a range of roles, so that [ia] could be construed with Van Dyck having some other role than that of creator, such as owner; the oblique construction, however, is more specific, so that [ib] allows only the creator construal.

In [56i] the NPs are bivalent, i.e. contain two complements, while in [ii] they are monovalent, i.e. have just one complement (see Ch. 4, §1.1, for the concept of valency).

We will examine the two cases in turn, confining our attention to alternations involving the subject-determiner.

### ■ Bivalent constructions

In event nominalisations corresponding to transitive clauses, we typically have three possible alignments:

- [57] i *Alexander the Great's conquest of Persia* [subject-determiner + of oblique]  
 ii *Persia's conquest by Alexander the Great* [subject-determiner + by oblique]  
 iii *the conquest of Persia by Alexander the Great* [of oblique + by oblique]

Version [iii] has two obliques, the others a subject-determiner + one oblique. In obliques it is the complement associated with the role of agent that takes *by*, while other roles take the default preposition *of*. In the mixed constructions, pattern [i] is more usual than [ii]: there is a preference for the more active role to be aligned with the subject-determiner, and for the other to be aligned with an oblique, which will therefore take the preposition *of*.

#### No system of voice in the NP

The relation between [57i] and [ii] bears some resemblance to that between active and passive clauses:

- [58] i *Alexander the Great conquered Persia.* [active]  
 ii *Persia was conquered by Alexander the Great.* [passive]

*Alexander the Great* is subject in [57i/58i] and *by* oblique in [57ii/58ii], while *Persia* is subject in [57ii/58ii], and *of* oblique in [57i], object in [58i] – nouns don't take objects, *of* obliques being the default counterpart to the object of a verb. The parallel, however, is by no means sufficient to justify analysing the NPs [57i–ii] as differing in voice: there is no system of voice in the NP. The reasons for not generalising the system of voice from the clause to the NP are as follows:

(a) The system of voice in the clause involves just one of a number of contrasts in the alignment of complement types with semantic roles (see Ch. 4, §8). It differs from others (such as that illustrated in *Kim gave the book to Pat* vs *Kim gave Pat the book*) in that the terms are marked by formal differences that concern the verb, not just the NP complements: in this example, *conquered* vs *was conquered*. There is no difference of this kind in NP structure.

(b) For the NP, we have three contrasting structures, as shown in [57], not just the two that we find for the clause, illustrated in [58]. There would be no way of determining the voice of the double-oblique construction: it is like the putative active in having the patient role aligned with the *of* oblique, but like the putative passive in having the agent role aligned with the *by* oblique.

(c) The *by* oblique in NPs is associated with a narrower range of semantic roles than the *by* oblique in clauses. In NPs it always has an agentive role, whereas in clauses it can express, for example, the experiencer. Compare, then, *These facts were known by his father* and *\*the knowledge of these facts by his father*.

### ■ Monovalent constructions: subject-determiners compared with of phrases

In bivalent constructions a subject-determiner can combine with an *of* phrase, but in monovalent ones the two kinds of complement tend to be in competition with each other:

- |      |                                 |                                      |
|------|---------------------------------|--------------------------------------|
| [59] | GENITIVE SUBJECT-DETERMINER     | OF + NON-GENITIVE                    |
| i    | a. <i>Mary's sister</i>         | b. <i>the sister of Mary</i>         |
| ii   | a. <i>the accident's result</i> | b. <i>the result of the accident</i> |

In [i] one would generally prefer the [a] version, but in [ii] the [b] version. We review here a number of factors favouring one or the other; the first involves a structure that excludes the genitive as ungrammatical, while with the others it is a matter of preferences, as in [59].

#### (a) Semantic relation between the NP and the head noun

Certain semantic relations are excluded from the subject-determiner construction but permitted in the *of* phrase one. These are illustrated in:

[60] i	* <i>Roman coins' collection</i>	<i>the collection of Roman coins</i>	[h is collection of d]
ii	* <i>shrub's two kinds</i>	<i>the two kinds of shrub</i>	[h is type of d]
iii	* <i>red wine's glass</i>	<i>the glass of red wine</i>	[h is quantity of d]
iv	* <i>gold's colour</i>	<i>the colour of gold</i>	[h is colour of d]
v	* <i>honour's men</i>	<i>the men of honour</i>	[h has human property d]
vi	* <i>despair's cry</i>	<i>the cry of despair</i>	[h has source d]
vii	* <i>unemployment's problem</i>	<i>the problem of unemployment</i>	[h has content d]
viii	* <i>washed silk's dress</i>	<i>the dress of washed silk</i>	[h has composition d]
ix	* <i>twelve years' girl</i>	<i>the girl of twelve years</i>	[h has age d]
x	* <i>purple's veil</i>	<i>the veil of purple</i>	[h has colour d]
xi	* <i>2%'s rise</i>	<i>the rise of 2%</i>	[h has size d]
xii	* <i>the cross's sign</i>	<i>the sign of the cross</i>	[h has form d]
xiii	* <i>the hay stack's painting</i>	<i>the painting of the hay stack</i>	[h is depiction of d]
xiv	* <i>all battles' battle</i>	<i>the battle of all battles</i>	[h is supreme example of d]

There is also no genitive counterpart of the predicative construction *the stupid nitwit of a husband* discussed in §14.1 (cf. *\*a husband's stupid nitwit*), or of partitives like *the youngest of the boys* (*\*the boys' youngest*).

#### (b) Semantic character of the NP

NPs denoting humans and (to a lesser extent) animals occur with much greater frequency as subject-determiners, e.g. *Mary's green eyes* and *the cat's paw* are much preferred to *the green eyes of Mary* and *the paw of the cat* (cf. also [59i]). However, there is also a (less strong) preference for NPs denoting times and geographical entities to be subject-determiners, e.g. *October's weather* is preferred to *the weather of October*, and *London's pubs* is preferred to *the pubs of London*. Least preferred as subject-determiners are NPs denoting other inanimates, e.g. *the roof of the house* is preferred to *the house's roof* (cf. [59ii]).

#### (c) Syntactic character of the NP

Most strikingly, pronouns are very strongly preferred as subject-determiners, and rarely found as the complement of *of*: compare *her money* and *your nose* with the very unnatural *the money of her* and *the nose of you*. However, pronouns are not totally excluded from the *of* construction. We have examples like *The only portrait of her can be found in the National Gallery*, where *her* as human topic is intended as relatively lower on the semantic hierarchy: *her only portrait* could also be interpreted as creator or owner. There are also almost idiomatic phrases like *That will be the death/undoing/making of him*, where again a low role (undergoer) seems to be intended.

Secondly, other things being equal, relatively short, head-final NPs will generally prefer subject-determiner position while relatively long NPs with post-head dependents will generally prefer the oblique position:

- [61] i a. *the city's usual rush-hour traffic*                      b. *the usual rush-hour traffic of the city*  
 ii a. *a relatively young designer from Italy's creations*                      b. *the creations of a relatively young designer from Italy*

Version [a] is preferred in [i], [b] in [ii]. This reflects the general linguistic tendency for heavy dependents to be positioned to the right of the head.

#### (d) Morphological character of the NP

A small tendency has been noted for the regular plural ending to be avoided in subject-determiners: in speech, *the king's horses* and *the kings' horses* are not distinguishable, whereas *the horses of the king* and *the horses of the kings* are.

### ■ Comparison with oblique genitives

The oblique genitive construction is semantically less general than the subject-determiner construction. The semantic roles available to the oblique genitive NP are those in the top half of the hierarchy given in [54], while the construction is either questionable or clearly unacceptable with those in the lower half. Compare:

- [62] i *those green eyes of Mary's*                                      *that younger sister of Mary's*  
       *that husband of Mary's*    *that boss of Mary's*  
       *that secretary of Mary's*    *that friend of Mary's*  
       *that team of Mary's*    *that debut of Mary's*  
       *that book of Mary's*    *that new house of Mary's*  
 ii <sup>?</sup>*that honour of Mary's*    <sup>?</sup>*that anger of Mary's*  
       <sup>?</sup>*that letter of Mary's*    <sup>\*</sup>*that obituary of Mary's*  
       <sup>\*</sup>*that spire of the cathedral's*    <sup>\*</sup>*that heat of the summer's*

The oblique genitive therefore does not generally contrast with the non-genitive *of* phrase construction, since this is disfavoured by animate dependents and virtually excluded in the case of personal pronouns. There is no possibility, for example, of <sup>\*</sup>*those green eyes of her* competing with *those green eyes of hers*. Nevertheless, we note two cases where there is competition. Firstly, it has been established that relatively long and heavy post-head dependents can favour the *of* phrase construction over the subject-determiner construction; this carries over to a competition between the oblique genitive and simple *of* phrases. We are more likely to have *those green eyes of Mary's* than *those green eyes of Mary*; equally, however, *those green eyes of the girl who lives next door* is considerably favoured over *those green eyes of the girl who lives next door's*. Secondly, in the special case of the equal relationship the difference between the two constructions can indicate different perspectives. We gloss *Mary's friends* (the plural of [54vi]) as “d has equal h”, indicating that the relationship is viewed from Mary's perspective, and *those friends of Mary's* is understood in the same way. In *those friends of Mary*, however, the perspective is that of the friends, so that an appropriate gloss would have the terms reversed, giving “h has equal d”.

## 16.6 Head and phrasal genitives

Genitive NPs are usually marked as such by the inflection of the head noun: we refer to these as **head genitives**. It is also possible for the marking to be located on the last word of a (final) post-head dependent, and these we call **phrasal genitives**. Compare, then, the following, where underlining marks the head and the genitive suffix:

- |      |   |  |
|------|---|--|
| [63] | HEAD GENITIVE                           | PHRASAL GENITIVE                             |
| i    | a. [ <u>Edward's</u> ] daughter         | b. [ <u>the King of England's</u> ] daughter |
| ii   | a. [ <u>everyone's</u> ] responsibility | b. [ <u>everyone else's</u> ] responsibility |
| iii  | a. [ <u>somebody's</u> ] initiative     | b. [ <u>somebody local's</u> ] initiative    |
| iv   | a. [ <u>the doctor's</u> ] house        | b. [ <u>a guy I know's</u> ] house           |

In [ib], for example, the head of the genitive NP is *King* but the suffix 's attaches to *England*, the last word of the phrase *the King of England*. The range of phrasal genitive constructions is greater in informal, especially spoken, styles than in formal and written ones. In the latter it is normally restricted to post-head dependents with the form of a PP, including *else*, as in [ib/iib]. In informal speech it is also found with relative clauses ([ivb]), and the occasional postpositive AdjP ([iib]). Acceptability decreases as the weight or complexity of the post-head dependent increases, as illustrated in the following examples:

- |      |    |   |  |
|------|----|---|--|
| [64] | i  | a. [ <u>the Head of Department's</u> ] speech   |  |
|      |    | b. ?[ <u>the Head of the newly formed Asian Studies Department's</u> ] speech           |  |
|      | ii | a. [ <u>the man she was speaking to's</u> ] reaction                                    |  |
|      |    | b. ?[ <u>the man she and her friend had been complaining to's</u> ] reaction            |  |
|      |    | c. #[ <u>the man she and her friend had been complaining to so angrily's</u> ] reaction |  |

Example [ia] is acceptable in any style, and [iia] is fully acceptable in informal speech, but the rest are marginal and would generally be avoided in favour of other constructions, notably *the* + N + PP (*the speech by the Head of the newly formed Asian Studies Department*). And in [ii] version [c] can be regarded as significantly worse than [b]: examples of this degree of complexity are certainly unacceptable.

### ■ Why we need to distinguish the head and phrasal genitive constructions

In both head and phrasal genitives the genitive marking is on the last word. It is not possible to have genitive marking on the head if there is a post-head dependent: we cannot have \*[the Head's of Department] speech or \*[the man's she was speaking to] reaction.<sup>65</sup> Why then, it might be asked, do we need to distinguish between head and phrasal genitives – can't we treat all genitives as phrasal genitives (i.e. marked on the final word), with examples like *Edward's daughter*, *the manager's departure*, etc., simply having the head as the final word? The reason why this would not do, why we need to distinguish head and phrasal genitives, is that the morphological realisation of genitive case is sensitive to the distinction. This can be seen in such pairs as:

- |      |    |                                    |   |
|------|----|------------------------------------|---|
| [65] | i  | a. [ <u>my</u> ] facial expression | b. [ <u>the man opposite me's</u> ] facial expression |
|      | ii | a. [ <u>my friend's</u> ] father   | b. [ <u>a friend of mine's</u> ] father               |

<sup>65</sup> Exceptions to this rule are occasionally found in the Type III construction (i.e. with a fused determiner-head): *I could feel the hair stand up on the back of my neck like [a dog's that is going to get into a fight]*. The relative clause is too long to accept the 's marker at the end, but one would have expected this to lead to the avoidance of the genitive: *like that of a dog that is going to get into a fight*. Examples of the kind cited are not acceptable and frequent enough to qualify as grammatical.

In [i] the genitive is marked on the pronoun **I**: in the head genitive construction [a] the pronoun is realised as *my* but in the phrasal genitive as *me's*. In [ii] we have two genitives: in [iia] one is again realised as *my* and the other as *friend's*, whereas in [iib] they combine in the single word *mine's*. Both *me's* and *mine's* thus have double case-marking, an inner case and an outer case. In *me's* the inner case is accusative, required because the pronoun is object of the preposition *opposite*, while in [iib] the inner case is genitive because the pronoun is functioning in the oblique genitive construction. The phrasal genitive is the outer case, morphologically added to the form that realises the inner case. In examples like [*the King of England's*] *daughter* the inner case of *England's* is the plain case, which has no morphological marking, but the principle is the same: the outer genitive is added to the form required by **England** within the inner NP *the King of England*. In *the man she was speaking to's* we only have an outer layer of case because the last word of the inner NP, *to*, is a preposition, not a noun, and hence does not have any inner case.

### ■ Genitive as an inflectional case, not a construction marked by a cliticised word

We have been assuming that all the examples in [63–65] have genitive **case-inflection**, but we need to show that this analysis is to be preferred over one in which the genitive marker is a **clitic**, a separate syntactic word that merges phonologically with the preceding word – as *'m* is a clitic that merges with *I* in *I'm ill* (see Ch. 18, §6.2).

An obvious difference between *'m* and the genitive marker is that the latter can never stand alone as a phonologically independent word, whereas clitic *'m* alternates with the non-clitic *am*. This is not a conclusive argument for rejecting a clitic analysis of the genitive, however. Although cliticisation happens to be always optional in English, there are languages where it is not; for example, the French subject personal pronouns *je*, *tu*, etc., are obligatorily cliticised onto the verb. The English genitive marker could in principle be a clitic of this kind.

#### Argument for inflectional status of head genitives

The status of the genitive as an inflectional case is most evident in head genitives. With the personal pronouns, no other analysis is possible. *My*, *our*, *your*, *his*, *her*, and *their* are completely irregular forms and could not be divided into two consecutive syntactic words: their relationship to **I**, **we**, **you**, **he**, **she**, and **they** is a matter of inflectional morphology. In nouns such as *cats*, *dogs*, *horses*, the genitive is marked by a suffix whose form varies according to the phonological properties of the base to which it attaches. As described in detail in Ch. 18, §2.1.1, we have /ɪz/ after sibilants (/hɔːt's-ɪz/ *horse's*), /s/ after voiceless non-sibilants (/kæt-s/ *cat's*), and /z/ after voiced non-sibilants (/dɒg-z/ *dog's*). Such alternation is not inconsistent with the second element being a clitic, but what does provide further evidence for an inflectional analysis is that genitive formation is sensitive to the internal **morphological** structure of the noun. Compare, for example:

[66]	SINGULAR	PLURAL
i	a. [ <i>the duck's</i> ] <i>plumage</i> /dʌk-s/	b. [ <i>the ducks'</i> ] <i>plumage</i> /dʌks/ */dʌks-ɪz/
ii	a. [ <i>the goose's</i> ] <i>plumage</i> /guːs-ɪz/	b. [ <i>the geese's</i> ] <i>plumage</i> */giːs/ /giːs-ɪz/

In [ia] and [iia] the genitive NPs are singular, and the forms follow the regular rule just given, with /s/ after the /k/ of *duck* and /ɪz/ after the sibilant /s/ of *goose*. The plural form *ducks*, however, also ends in sibilant /s/, but we do not form the genitive by adding the /ɪz/ ending:

In both versions of [68] and of [69] the whole coordination is genitive, and the difference is a matter of how the genitive case is realised – on each coordinate or only the last. Each coordinate is an NP, and hence for each NP there is in principle the possibility of having either a head or a phrasal genitive.

When one or more of the coordinates is a personal pronoun, the construction with marking on the final coordinate is of at best marginal acceptability:

- [70] i a. [*his and her*] views                      b. [*my and her*] views                      [multiple marking]  
 ii a. ?[*you and Kim's*] views                      b. \*[*Kim and your*] views                      [single marking]

Even the one with marking on all coordinates may sound somewhat awkward with some of the pronouns, such as *my* in [ib]. We review more comprehensively the range of possible structures in Ch. 15, §3.4, but one further point to be made here is that the single marking construction with a pronoun as the final coordinate will never have the 's suffix. Thus ?*These are Kim and yours* is the only possible form: \**These are Kim and you's* is excluded because *you* is head of the final coordinate, and hence what is needed is a head genitive, not a phrasal one.

### (b) Supplementation

A supplementation consisting of one NP as anchor and another as supplement may likewise have either multiple or single marking:

- [71] i [*the Prime Minister's, Mr Howard's*] tax package                      [multiple marking]  
 ii [*the Prime Minister, Mr Howard's*] tax package                      [single marking]

The multiple-marking version is preferred in writing, no doubt because it allows the supplement to be set off by paired commas. In speech, however, it is the single-marking version that is usually heard.

## 16.7 The adjective *own* in construction with genitives

The adjective *own* is unique in that it is virtually restricted to occurring after a genitive subject-determiner.<sup>66</sup> It occurs with a following head or as fused modifier-head.

### (a) *Own* in pre-head position

- [72] i a. *The children had to make [their own beds].* }  
           b. *Sue set up [her own marketing business].* } [restricted uses]  
 ii a. *Jill prefers [her own car].* }  
       b. [*Jill's own car*] is out of service. } [general use]

Restricted uses are those where the genitive subject-determiner must be a personal pronoun, while the general use allows other types of genitive NP too, such as *Jill's* in [iib]. The interpretation of [ia] is that the children had to make their beds themselves – no one else would do it for them. In this use the genitive pronoun must be anaphorically linked to the subject. *The children had to make my own bed*, for example, does not have this interpretation and belongs to the general construction. The restricted use illustrated in

<sup>66</sup>The only exceptions are set phrases, as in *They won by an own goal* or *Own brands are often the best value* ("Supermarkets' own brands of goods"). *Own* naturally can't occur following the subject of a gerund-participial: \**No one would object to your own giving yourself a modest pay-rise*. The underlined sequence is a VP, not a nominal, and hence cannot take an adjectival modifier.

[ib] is found with verbs of possession, acquisition, or causing to possess; *own* emphasises that the business was hers. The antecedent in this example is the subject, but there are other possibilities, as in *They gave Sue her own business*.

The adjective likewise has an emphatic role in the general construction: in [72ii] it emphasises that the reference is to Jill's car as opposed to someone else's. A natural context for [iib], for example, is one where Jill has had to go in some other car because hers is unavailable. A 3rd person pronoun in this construction will often be anaphorically linked to the subject, as in [iia], but again it is not required to be. Compare, for example:

- [73] i *Bill advised Fred to take his own car.*  
 ii *Bill offered to let Fred take his own car.*

The most likely interpretation of *his* is “Fred’s” in [i] and “Bill’s” in [ii], and while in [i] the antecedent is the understood subject of the *take* clause, in [ii] it is not.

#### (b) *Own* as fused modifier-head

- [74] i *Your proposal is no better than my own.* [simple]  
 ii a. A: *Is this your father's?* B: *No, it's my own.*  
 b. *I've got a car of my own.*  
 c. *She is living on her own.* [special]

Here, no less than in (a) above, a genitive personal pronoun appears in the dependent form: the independent form occurs only when the pronoun itself is in head function. Thus *my own*, not *\*mine own*.

*Own* occurs in two of the three types of fused-head construction we have distinguished. As it is an adjective (in plain grade) it cannot occur in the partitive type: compare *three of the books* and *\*my own of the books*. Example [74i] is of the simple type, with *my own* interpreted anaphorically as “my own proposal”; it is an emphatic version of *mine*. The others illustrate various special uses. *My own* in [iia] is predicative complement, equivalent to the predicative genitive in *It's mine*. In [iib] *a car of my own* means “a car which belongs to me”, while in [iic] *on her own* means “by herself” (cf., similarly, *She did it on her own*). In these examples [iib–c] the genitive subject-determiner must be a personal pronoun linked to an antecedent (cf. *\*I've got a car of their own*). And here there is no possibility of dropping *own* and having the genitive as fused head: [iib] is not equivalent to the unlikely *I've got a car of mine*. The same restrictions apply to various idiomatic expressions that belong to the special fused-head construction: *I want to get my own back* (“get revenge”); *It's at times like this that she really comes into her own* (“shows her real value”); *We have to look after our own* (“look after those related to or otherwise associated with us”).

#### ■ Modification

In some of its uses *own* can be modified by the adverb *very*: *This is my very own work*. This gives extra emphasis to the point that the work is mine, not someone else's. The complement of *one's own* can be modified by *all*: *a room all of my own* (“a room which is entirely mine”).

## 17 Gender and pronoun–antecedent agreement

### 17.1 Gender as a grammatical category

The grammatical category of gender applies in the first instance to a system of noun classes differentiated by the agreement patterns they enter into with associated words. In languages where gender plays a greater role in the syntax than it does in English these agreement patterns characteristically hold between a head noun and various dependents within the NP, such as articles and attributive adjectives.

Elementary examples from French and German are given in [1]:

[1]	i	a.	<i>un grand château</i>	“a big castle”	[masculine]
		b.	<i>une grande maison</i>	“a big house”	[feminine]
	ii	a.	<i>der Garten</i>	“the garden”	[masculine]
		b.	<i>die Wand</i>	“the wall”	[feminine]
		c.	<i>das Haus</i>	“the house”	[neuter]

French has just two genders, and [i] illustrates the inflectional agreement of the indefinite article and the adjective *grand* (“big”) with head nouns of masculine and feminine gender. The term gender is then applied, secondarily, to these dependents: *un* and *une* are the masculine and feminine forms of the indefinite article, *grand* and *grande* masculine and feminine (singular) forms of the adjective. German has three genders; the examples in [ii] ignore adjective agreement, but show agreement between the article and the head noun, with *der*, *die*, *das* respectively (nominative singular) masculine, feminine, and neuter forms of the definite article.

In this example, the head noun is what we call the **source** of agreement, while the dependent article or adjective is the **target**.<sup>67</sup> The head noun is source in the sense that the target derives its gender from this noun. It is for this reason that we said that gender applies in the first instance to a system of noun classes: the source in gender agreement is a noun (or NP). The names for gender categories are then based on semantic characteristics of these noun classes. The masculine and feminine gender classes are so called because these are the classes to which nouns denoting respectively males and females characteristically belong. In both French and German these classes also contain many words that denote inanimates (necessarily so in French, of course, since there is no other gender class), and for this reason it is important to distinguish carefully between the grammatical terms **masculine** and **feminine** and the semantic or extralinguistic terms **male** and **female**.

Until relatively recently it was usual to make a parallel distinction between **gender** (grammatical) and **sex** (extralinguistic) – comparable, for example, to that between tense and time. In the social sciences, however, ‘sex’ came to be used to refer to biological attributes and ‘gender’ to the social construction of sex, and this usage has been incorporated into linguistics. A book on ‘language and gender’ will therefore not be primarily concerned with gender as a grammatical category, but will cover such matters as differences between the speech of men and women. Our concern in this section, however, is

<sup>67</sup> A more usual term than ‘source’ is ‘controller’; we have preferred the former, however, because we use ‘controller’ for the element which determines the interpretation of certain ellipted elements, such as the missing subject in *Kim wants \_ to leave*: see Ch. 14, §11.

with gender in the old, strictly grammatical sense, as defined above, and because in this area, as indicated above, the relation between form and meaning is by no means one-to-one, we will not risk possible confusion by using ‘gender’ for the semantic categories as well: we will speak therefore of masculine and feminine gender, male and female sex. It is important, moreover, to bear in mind that while noun gender systems often have a significant correlation with the categories of male and female they do not necessarily do so. Etymologically, ‘gender’ derives ultimately from Latin *genus* (“kind, sort”), and the basis for differentiating between various kinds of noun is not necessarily the sex of their denotation. Some languages have gender systems based on such contrasts as animate vs inanimate, human vs non-human, strong vs weak, large vs small, and some have more specific categories correlating with insects, liquids, edibles, and so on. And indeed, in English, gender differences are reflected not only in the contrast between the personal pronouns *he*, *she*, and *it* but also in that between the relative pronouns *who* and *which*, where the difference is not based on sex.

English differs from languages like French and German in two important respects. In the first place, there is no gender agreement between dependents and head noun within NP structure, matching that seen in [1]. Gender is not an inflectional category in English. Gender classes can be differentiated only on the basis of relations with pronouns, as illustrated in [2], where the identical indices mark the anaphoric relation between the pronoun and the (head of the) antecedent:

- |     |     |   |             |
|-----|-----|---|-------------|
| [2] | i   | <i>The King<sub>i</sub></i> ; declared <i>himself<sub>i</sub></i> ; satisfied.  | [masculine] |
|     | ii  | <i>The Queen<sub>i</sub></i> ; declared <i>herself<sub>i</sub></i> ; satisfied. | [feminine]  |
|     | iii | <i>The machine<sub>i</sub></i> ; had switched <i>itself<sub>i</sub></i> ; off.  | [neuter]    |

Secondly, the choice of pronoun is determined by denotation or reference, not by purely syntactic properties of the antecedent. We have observed that in French and German, nouns denoting males and females are generally masculine and feminine respectively, but for the rest the gender of a noun is not predictable from its meaning. The dictionary entries for French *château* and *maison*, German *Garten*, *Wand*, and *Haus* must explicitly record their gender, but no lexical specification of this kind is needed in English.

Because of these differences some linguists argue that English simply has no gender system, that the category of gender is irrelevant to English. That is not the view we take here: we regard the differences between English and French or German as a difference in the degree to which gender is grammaticalised in these languages, not in whether or not they have a category of gender. In French and German, agreement between pronoun and antecedent works in a very similar way to agreement between dependent article or adjective and head noun, but not identically: it is somewhat more semantically oriented. And restrictions on pronoun–antecedent pairing in English have sufficient in common with those obtaining in French and German to justify treating them as involving agreement of gender. Note in this connection that while pronoun choice in English depends on the meaning or reference of the antecedent there are places where the linguistic form of the antecedent restricts the choice of pronoun. Compare, for example:

- [3] a. *The dog<sub>i</sub>*; has lost *his<sub>i</sub>/its<sub>i</sub>*; bone.      b. *Fido<sub>i</sub>*; has lost *his<sub>i</sub>/\*its<sub>i</sub>*; bone.

*The dog* and *Fido* could be used to refer to the same male animal, but the fact that the latter has a proper noun as head excludes the use of the neuter pronoun *it* that is found

as an alternative to **he** in [a]. Similarly with human babies:

- [4] a. *Her baby<sub>i</sub>; had lost its<sub>i</sub>; rattle.*      b. *\*Her son<sub>i</sub>; / \*Max<sub>i</sub>; had lost its<sub>i</sub>; rattle.*

Again, *her baby*, *her son*, and *Max* could all be used to refer to the same person, but only the first permits neuter *it* as pronoun.

We will say, therefore, that English does have gender, although it is only weakly grammaticalised, being based purely on pronoun agreement. There are two systems of pronoun–antecedent agreement to consider, one involving the personal pronouns (which agree with their antecedent in person and number as well as gender), the other the relative pronouns *who* and *which*. We will examine these in turn.

## 17.2 Agreement between personal pronouns and their antecedents

### 17.2.1 Nature of the agreement relation

Personal pronouns agree with their antecedent in person and number; in the 3rd person singular they also agree in gender. We illustrate here with reflexive forms of the pronouns as target:

[5]	GENDER	PERSON	NUMBER
i <i>I<sub>i</sub>; may hurt myself<sub>i</sub>.</i>		1st	} singular
ii <i>You<sub>i</sub>; may hurt yourself<sub>i</sub>.</i>		2nd	
iii <i>The King<sub>i</sub>; may hurt himself<sub>i</sub>.</i>	masculine	} 3rd	
iv <i>The Queen<sub>i</sub>; may hurt herself<sub>i</sub>.</i>	feminine		
v <i>The dog<sub>i</sub>; may hurt itself<sub>i</sub>.</i>	neuter		
vi <i>We<sub>i</sub>; may hurt ourselves<sub>i</sub>.</i>		1st	} plural
vii <i>You<sub>i</sub>; may hurt yourselves<sub>i</sub>.</i>		2nd	
viii <i>The children<sub>i</sub>; may hurt themselves<sub>i</sub>.</i>		3rd	

We assume that there are two pronouns **you**, a singular one with *yourself* as its reflexive form and a plural one with *yourselves* as reflexive form. As the distinction is marked only in the reflexive, examples like *You may have missed your chance* are ambiguous between singular and plural interpretations.

We have suggested that restrictions on the pairings of pronouns with antecedents have sufficient in common with those on pairings of articles or attributive adjectives and head noun in [1] for us to treat them as a matter of agreement. Nevertheless, there are significant differences between the two types of agreement.

#### (a) No fixed structural relation between antecedent and personal pronoun

The antecedent source and personal pronoun target do not occupy fixed positions in a syntactic construction like the noun as head and article as determiner or adjective as modifier in the French and German examples. Compare, then:

- [6] i *The King<sub>i</sub>; says he<sub>i</sub> will see you tomorrow.*  
 ii *The King<sub>i</sub>; wants you to help him<sub>i</sub>.*  
 iii *We found the King<sub>i</sub>; examining one of the recommendations of his<sub>i</sub> advisors.*  
 iv *I'm looking for the King<sub>i</sub>; . He<sub>i</sub>; sent for me this morning.*

Subject to various restrictions described in Ch. 17, §2.3, the antecedent NP and the pronoun can occupy the full range of NP functions. Note in particular that they do not

need to be in the same sentence, as seen in [iv]. The functions of pronoun and antecedent are here quite independent: in [i] they are both subjects, in [ii] the antecedent is subject, the pronoun object (of a different clause), in [iii] the antecedent is object, the pronoun subject-determiner in NP structure, and so on. The inflectional case of the pronoun depends entirely on the function of the pronoun itself: the function of the antecedent is irrelevant.

Replacement of the masculine pronouns by feminine or neuter ones in such examples does not lead to ungrammaticality – it merely excludes *the King* as a possible antecedent for the pronoun. And similarly, a masculine pronoun does not have to have *the King* as antecedent:

- [7] i *The King<sub>i</sub> says she<sub>j</sub> will see you tomorrow.*  
 ii *The King<sub>i</sub> says he<sub>j</sub> will see you tomorrow.*

The reflexive forms are more constrained in their distribution, and in examples like [5] or the earlier [2] replacement of one reflexive by another does lead to ungrammaticality:

- [8] i *\*The King<sub>i</sub> declared herself<sub>i</sub> satisfied.*  
 ii *\*The Queen<sub>i</sub> declared itself<sub>i</sub> satisfied.*  
 iii *\*The machine<sub>i</sub> had switched himself<sub>i</sub> off.*

But even reflexive forms are not restricted to a particular functional relation – the antecedent, for example, is not invariably subject: *She was telling Max<sub>i</sub> some home-truths about himself<sub>i</sub>.*

#### (b) The pronouns can be used non-anaphorically – without an antecedent

Except for the 3rd person reflexive forms, the personal pronouns do not require an antecedent for their interpretation: they can refer directly to entities that have not been mentioned (and are not subsequently mentioned). This represents much the most frequent use of the 1st and 2nd person pronouns, and is illustrated in the subject pronouns in [5i–ii] and [vi–vii]. However, the 3rd person pronouns can also be used non-anaphorically. In such cases the referent is usually present in the situation, but even that is not necessary: see Ch. 17, §2.3.1. In addition *it* has non-anaphoric uses with no referent at all – dummy uses as in *It is raining*, *We finally made it to the shore*, etc.

#### (c) Gender agreement requires consistency rather than complete identity of relevant features

Consider such a set of examples as:

- [9] i *My tutor wants to see me.*  
 ii *My tutor<sub>i</sub> wants me to go and see her<sub>j</sub>.*  
 iii *My tutor<sub>i</sub> wants me to go and see him<sub>j</sub>.*

The noun *tutor* does not encode any information about the sex of the person. Example [i] is not ambiguous as to whether the tutor is male or female: it is simply non-specific, just as it is non-specific as to whether the tutor is married or single, well-qualified or under-qualified, and so on. In [ii–iii] *tutor* is head of the NP that is the antecedent of feminine *her* and masculine *him* respectively, but because *tutor* is itself non-specific we cannot say that both antecedent and pronoun are feminine in [ii], masculine in [iii]. The pronoun encodes a property of the person that is not encoded in the antecedent. What is required for an NP to qualify as a possible antecedent for a pronoun is that

it be consistent or compatible with the meaning of the pronoun. Agreement in gender between personal pronoun and antecedent, therefore, is agreement of a somewhat looser kind than agreement in person and number (or than agreement in gender between article/adjective and head noun in French or German).

### 17.2.2 Masculine, feminine, and neuter

#### ■ Core uses of *he*, *she*, and *it*

In the most straightforward cases, *he* is used for males, *she* for females, and *it* for entities which are neither male nor female:

- [10] i *My father<sub>i</sub> has lost his<sub>i</sub> watch.*  
 ii *One woman<sub>i</sub> said she<sub>i</sub> would make a formal complaint.*  
 iii *Have you seen my diary<sub>i</sub>? I had it<sub>i</sub> a few minutes ago.*

We include here cases where *it* has a clause as antecedent or is used as a dummy element:

- [11] i *I'd like to help<sub>i</sub> but I'm afraid it<sub>i</sub> is just not possible.*  
 ii *It looks as though we're going to be late.*

#### ■ *She* with non-females

There are two cases where *she* can be used as an alternant of *it* for entities that are neither female nor male.

##### (a) Countries considered as political entities

- [12] i *This country<sub>i</sub> / England<sub>i</sub> has no sense of her<sub>i</sub> / its<sub>i</sub> place in the world.*  
 ii *From this map of England<sub>i</sub> you can see that it<sub>i</sub> / \*she<sub>i</sub> lies north of the 50th parallel.*  
 iii *England<sub>i</sub> has won its<sub>i</sub> / their<sub>i</sub> /<sup>2</sup>her<sub>i</sub> first victory over Australia for five years.*

*She* is not used when the country is considered as a geographical entity, as in [ii], and it is very marginal when the country name is used for a sporting team, as in [iii].

##### (b) Ships and the like

- [13] i *The Titanic<sub>i</sub> sank on her<sub>i</sub> / its<sub>i</sub> maiden voyage.*  
 ii *It<sub>i</sub> / She<sub>i</sub> is a beauty, this Ferrari<sub>i</sub>.*

Ships represent the classic case of this extended use of *she*, but it is found with other kinds of inanimates, such as cars. There is considerable variation among speakers as to how widely they make use of this kind of personification. It is often found with non-anaphoric uses of *she*: *Here she is at last* (referring to a ship or bus, perhaps), *Down she comes* (with *she* referring, say, to a tree that is being felled).

#### ■ *It* with animates

*It* is by no means restricted to entities that are neither male nor female: it is often in competition with *he* and *she* rather than mutually exclusive with them. We distinguish two cases:

##### (a) Non-humans

- [14] i *The bull<sub>i</sub> turned his<sub>i</sub> / its<sub>i</sub> head.*  
 ii *The cow<sub>i</sub> was lying on her<sub>i</sub> / its<sub>i</sub> back.*  
 iii *The dog<sub>i</sub> looked as if he<sub>i</sub> / she<sub>i</sub> / it<sub>i</sub> needed a good brush.*

In cases like this, the difference between *it* on the one hand and *he* or *she* on the other does not lie in the referent itself: it is a matter of whether the speaker chooses to encode the sex of the referent. As is evident from [i–ii], encoding of sex in the antecedent does not require that it also be encoded in the pronoun. Again, what is required is simply consistency: an NP headed by *dog* is consistent with all three pronouns, one headed by *bull* or *cow* with only two, as shown. There is nothing in the meaning of *it* that would make it inapplicable here: it does not mean “neither male nor female”. In many cases the neuter pronoun is used because the speaker doesn’t know what the sex is, though we may also use *he* or *she* in such contexts, making an arbitrary assumption about the sex. Use of a masculine or feminine pronoun is generally more likely with pets, domestic animals, and creatures ranked high in the kingdom of wild animals (such as lions, tigers, elephants, etc.). It indicates a somewhat greater degree of interest in or empathy with the referent than does *it*. As remarked above, *he* or *she* is obligatory if the animal is referred to by a proper name.

#### (b) Humans

[15] *The baby<sub>i</sub> lost his<sub>i</sub>/her<sub>i</sub>/its<sub>i</sub> rattle.*

With human antecedents *it* can be used for babies. Because the normal pronouns for humans are *he* and *she*, the use of *it* tends to have a dehumanising effect, and it is more likely in the context of a maternity hospital with lots of potentially undifferentiated babies than in that of a private home with just one or two: *it* in this latter context would tend to suggest resentment or antipathy. As noted above, *it* is not used when the antecedent head noun is *son* or *daughter*: there is here no motivation for failing to encode the sex of the baby.<sup>68</sup>

### 17.2.3 Common noun gender classes

It follows from the above discussion that we need to classify common nouns according to their compatibility with the 3rd person singular pronouns. In the first place, we classify them as **single-gender**, **dual-gender**, and **triple-gender** common nouns according as they are compatible with just one, with two, or with all three of the core singular pronouns *he*, *she*, and *it*.

As will be clear from the discussion above, a dual-gender noun is not to be interpreted as a noun which has two genders: it is a noun which can head the antecedent to a pronoun of either of two genders. *Tutor*, for example, is a dual-gender noun in that it can serve as antecedent to either *he* or *she*, but we are not saying that *tutor* itself can be either a masculine or a feminine noun. This would incorrectly imply that *My tutor wants to see me* ([9i]) was ambiguous according as it contained an instance of masculine or feminine *tutor* – and it would raise pointless problems with examples like *No tutor should be expected to put up with that kind of treatment*, where there is no reference to any particular tutor. Likewise *parent* is not ambiguous, synonymous in one sense with *mother* and in

<sup>68</sup> An exceptional attested example where *it* is used non-referentially in talking of humans as a whole is: *Darwin felt that a so-called lower form of life, like an amoeba, could be as adapted to its environment as a human is to its – humans in other words, are not necessarily closer to some evolutionary ideal than other animals.* What makes *it* appropriate here is that humans are being likened to other animals rather than differentiated from them: the likeness is reflected in the use of the same pronoun. In this example, moreover, the use of *it* solves the problem of finding a pronoun subsuming males and females: see §17.2.4.

another with *father*: it is a more general noun, distinct in meaning from both these more specific terms. This type of case is to be distinguished from that illustrated by *diner*, for example. *Diner* does have two meanings: in one sense, “railway restaurant carriage”, it is a single-gender noun taking *it* as pronoun, while in another, “person dining”, it is a dual-gender noun taking *he* or *she*. Similarly *fellow* as a colloquial term for “man” is a single-gender noun taking *he*, but with the meaning “member of a learned society” it is a dual-gender noun taking *he* or *she*.

Single- and dual-gender nouns are subclassified according to the particular pronoun or pronouns permitted. This gives seven classes in all:

[16]		{	masculine	<i>he</i> only
	SINGLE-GENDER		feminine	<i>she</i> only
			neuter	<i>it</i> only
	DUAL-GENDER	{	masculine/feminine	<i>he</i> or <i>she</i>
			masculine/neuter	<i>he</i> or <i>it</i>
			feminine/neuter	<i>she</i> or <i>it</i>
	TRIPLE-GENDER			<i>he, she, or it</i>

#### (a) Single-gender masculine nouns

[17]	<i>bachelor</i>	<i>boy</i>	<i>bridegroom</i>	<i>chap</i>	<i>husband</i>	<i>king</i>
	<i>man</i>	<i>monk</i>	<i>policeman</i>	<i>son-in-law</i>	<i>stepson</i>	<i>widower</i>

This class contains *man* and a number of more or less colloquial synonyms; various kinship or similar terms involving marriage relations; a good number of occupational terms compounded from *man*; and names of various social ranks such as *duke*, *count*, *squire*.

#### (b) Single-gender feminine nouns

[18]	<i>actress</i>	<i>bride</i>	<i>girl</i>	<i>heroine</i>	<i>nun</i>	<i>policewoman</i>
	<i>princess</i>	<i>queen</i>	<i>spinster</i>	<i>widow</i>	<i>wife</i>	<i>woman</i>

This class is significantly larger than the last: its members include not only feminine counterparts to the masculines in (a) above, but also a fair number derived by suffixation from dual-gender nouns, such as *actress* and *heroine* in this list. The morphological marking of gender is discussed in Ch. 19, §5.3.

#### (c) Single-gender neuter nouns

[19]	<i>arrival</i>	<i>beer</i>	<i>fact</i>	<i>finger</i>	<i>garage</i>	<i>glove</i>
	<i>idea</i>	<i>piece</i>	<i>sincerity</i>	<i>thing</i>	<i>title</i>	<i>window</i>

This is the largest class, containing abstract nouns and concrete inanimates.

#### (d) Dual-gender masculine/feminine nouns

[20]	<i>actor</i>	<i>atheist</i>	<i>dwarf</i>	<i>friend</i>	<i>hero</i>	<i>manager</i>
	<i>narrator</i>	<i>nurse</i>	<i>parent</i>	<i>person</i>	<i>poet</i>	<i>writer</i>

This class is far larger than the single-gender masculine and feminine classes put together. It contains words denoting humans without specification of sex; many of them are derived morphologically by various processes, as described in Ch. 19, §5.7.1. There are also a few words denoting non-humans, such as *god* and *angel*.

## (e) Dual-gender masculine/neuter nouns

[21]	<i>brother</i>	<i>buck</i>	<i>bull</i>	<i>cock</i>	<i>drake</i>	<i>father</i>
	<i>gander</i>	<i>gelding</i>	<i>he-goat</i>	<i>ram</i>	<i>stallion</i>	<i>tom-cat</i>

This is a quite small class. It contains the names for males of various animal species (particularly farm animals), together with male kinship terms applicable to animals as well as to humans. With the kinship terms, the masculine pronoun is more likely than the neuter.

## (f) Dual-gender feminine/neuter nouns

[22]	<i>boat</i>	<i>car</i>	<i>country</i>	<i>cow</i>	<i>earth</i>	<i>hen</i>
	<i>lioness</i>	<i>mare</i>	<i>mother</i>	<i>she-goat</i>	<i>ship</i>	<i>sister</i>

This class contains names for the female of various animals, female kinship terms matching the male ones in (e), and terms denoting boats and the like. There is no clear boundary between nouns which allow this extended use of *she* and those which do not, and hence belong in Class (c); as remarked above, there is considerable variation among speakers as to how widely they use *she* for inanimates.

## (g) Triple-gender nouns

[23]	<i>baby</i>	<i>blackbird</i>	<i>child</i>	<i>dog</i>	<i>elephant</i>	<i>frog</i>
	<i>goat</i>	<i>horse</i>	<i>infant</i>	<i>lion</i>	<i>octopus</i>	<i>snake</i>

This class contains a few words for young humans and terms denoting animals without specification of sex. As mentioned above, *he* and *she* are less likely to be used for lower animals (other than pets) than for higher ones, but it would not be feasible to assign some animal terms to Class (g) and others to Class (c).

## 17.2.4 Singular pronouns denoting humans without specification of sex

Many singular NPs with human reference or denotation include no specification of sex:

- [24] i *My tutor* wants to see me. (= [9i])  
 ii *I'm having lunch with a friend from College.*  
 iii *Someone* has borrowed my stapler.  
 iv *The successful candidate* will be required to take up duties in January.  
 v *No one in the class* had noticed the mistake.

Cases like [i] present no problem for the selection of an anaphoric personal pronoun. *My tutor* refers to a specific person, and I can use *he* or *she*, as appropriate: *My tutor<sub>i</sub> wants me to go and see her<sub>i</sub>*; or *My tutor<sub>i</sub> wants me to go and see him<sub>i</sub>*. Similarly in [ii], though it might be that I don't wish to reveal the sex of the person concerned (this could of course also be the case in [i], though it is very much less likely). In [iii] there is again a particular person involved, but since I presumably do not know who this person is I cannot select an anaphoric pronoun in the same way as in [i–ii]. In [iv] there is no reference to any particular person: the intended context is one where a number of people including at least one man and one woman have applied for a job and no one has yet been selected. Finally in [v] we are not concerned with any single individual: assuming again that the class is of mixed sex, this example illustrates the frequent case where a nominal represents a variable ranging over a set containing both males and females.

What is needed, therefore, is a pronoun that simply expresses the meaning “human”, without specification of sex.<sup>69</sup> And English, of course, does not have a personal pronoun with this as its primary meaning.<sup>70</sup>

Various strategies for dealing with this problem are illustrated in:

[25] i	}	<u><sup>%</sup>his</u>	[purportedly sex-neutral <b>he</b> ]
ii		<u><sup>%</sup>her</u>	[purportedly sex-neutral <b>she</b> ]
iii		<u>his or her</u>	[disjunctive coordination]
iv		<u>his/her</u>	[composite]
v		<u>their</u>	[singular <b>they</b> ]
vi		<i>All had cast their votes.</i>	

Versions [iii–iv] have variants with the component pronouns in the reverse order: *her or his*, *her/his*.

#### (a) Purportedly sex-neutral **he**

**He** has traditionally been regarded as the grammatically ‘correct’ choice in opposition to singular **they**; it is characteristic of relatively formal style. The issue of the choice between **he** and **they** has concerned writers on usage for some 200 years, but since this use of **he** represents one of the most obvious and central cases of sexism in language, the matter has received much more widespread attention since the early 1980s in the context of social changes in the status of women.

The fact that the primary meaning of **he** contains the component “male” makes it an unsatisfactory pronoun for use in a secondary sense that covers females as well as males. Use of the male term to subsume females is a form of linguistic inequality that can be seen as related to and tending to reinforce social inequality. The strong and persuasive criticisms that have been made of sex-neutral **he** by supporters of the feminist movement have led to a marked reduction in its use. Many people now systematically avoid it, and we have accordingly annotated it with the percentage sign in [25i].

The objection to the use of **he** as a sex-neutral pronoun is particularly compelling where the antecedent has to do with some kind of employment. Consider, for example:

- [26] i <sup>%</sup>*A Member of Parliament should always live in his constituency.*  
 ii <sup>%</sup>*The successful candidate will be required to take up his duties in January.*  
 iii A: *They’re going to appoint a new manager.*  
 B: <sup>%</sup>*Well, I hope he does a better job than the present one has.*

Examples [i–ii] can easily be read as conveying that the speaker or writer regards it as the default case for a Member of Parliament or the successful candidate to be male. And in [iii] it is questionable whether B intends the **he** to be sex-neutral at all: it is most likely to be interpreted as reflecting an assumption on B’s part that the new manager will be male. It is for this reason that we have labelled **he** as **purportedly** sex-neutral: it is

<sup>69</sup>Strictly speaking the relevant concept is “animate”, for the issue arises with animals as well as with humans. *It* is of course more generally available with animals, but it could not be used anaphorically to such an antecedent as *which of Fido, Rex, and Lassie* (names of dogs). We will simplify, however, by ignoring such cases, focusing on the issue raised with human antecedents.

<sup>70</sup>Attempts have been made, beginning in the nineteenth century, to create new pronouns to fill this gap: these neologisms include *thon*, *unus*, *co*, and a good few others. Such forms have failed to gain acceptance in the past, and there is no reason to expect that they will be any more successful in the future.

not a genuinely sex-neutral form, for the primary, male, meaning will often colour the interpretation in varying degrees.

There are some places where the distinction between basic **he** and sex-neutral **he** can be somewhat blurred, as in the following attested example:

[27] *An independent counsel cannot let himself get caught up in a political process.*

This is formulated as a judgement about limitations on the legitimate behaviour of independent counsels in general: *an independent counsel* is here non-referential, and **he** therefore has a purportedly sex-neutral interpretation. But the statement was made as an indirect criticism of a particular male independent counsel, suggesting that he had let himself get caught up in a political process. In this kind of context **he** is less likely than it is in [26] to give offence or to be systematically avoided.

#### (b) Purportedly sex-neutral **she**

This represents a new and very much minority usage that can be thought of as the linguistic equivalent of affirmative action, consciously introducing linguistic discrimination in favour of females to counterbalance the effects of the long tradition of linguistic discrimination in favour of males implicit in purportedly sex-neutral **he**. Some writers alternate between **he** and **she**: in a book on language, for example, one might use one pronoun as anaphoric to *the speaker* and the other as anaphoric to *the addressee*. **She** could also be used by a wider range of speakers in non-referential examples like [27] in a context where the relevance of the general statement is its applicability to some particular female.

#### (c) Disjunctive coordination

**He or she** has long been used as a means of avoiding the sexist bias of **he** without resorting to singular **they**. It is more common in relatively formal style, but it is by no means rare in, for example, informal conversation. It is likely to be regarded as somewhat ‘clumsy’ if repeated frequently, especially where reflexive forms are involved:

[28] *Everyone agreed that he or she should apply him- or herself without delay to the task which he or she had been assigned.*

#### (d) Composite forms

Use of such forms is a relatively recent strategy, a simplification of the coordination approach; it is normally restricted to written texts. For the nominative, (*s*)**he** and *s/he* are alternants of *he/she*.

#### (e) Singular **they**

The use of **they** with a singular antecedent goes back to Middle English, and in spite of criticism since the earliest prescriptive grammars it has continued to be very common in informal style. In recent years it has gained greater acceptance in other styles as the use of purportedly sex-neutral **he** has declined. It is particularly common with such antecedents as *everyone*, *someone*, *no one*; indeed its use in examples like *No one<sub>i</sub> felt that they<sub>i</sub> had been misled* is so widespread that it can probably be regarded as stylistically neutral. Somewhat more restricted is its use with antecedents containing common nouns as head:

- [29] i *The patient<sub>i</sub> should be told at the outset how much they<sub>i</sub> will be required to pay.*  
 ii *But a journalist<sub>i</sub> should not be forced to reveal their<sub>i</sub> sources.*  
 iii *A friend of mine<sub>i</sub> has asked me to go over and help them<sub>i</sub> with an assignment.*

The antecedents in [i–ii] are non-referential; they have multiple-situation-bound interpretations of the type discussed in §8.3: it's a matter of the patient being told at the outset of each treatment, of the journalist not being forced to reveal sources for any of their reports. Examples of this kind are common in conversation (including relatively formal radio or television interviews), but in formal writing **they** will often be avoided in this type of context in favour of one of the other strategies illustrated in [25]. Example [iii] is a rare case where the antecedent is referential: the speaker knows the sex of the referent but uses **they** to avoid indicating whether the friend is male or female. **He** and **she** could not be used in a sex-neutral sense in such a context, while *he or she* and *he/she* would generally be avoided as too formal in style and as making the intention to conceal the sex too obvious.

The prescriptive objection to examples like [25v] and [29] is that **they** is a plural pronoun, and that such examples therefore violate the rule of agreement between antecedent and pronoun. The view taken here is that **they**, like **you**, can be either plural or singular. Plural is of course the primary sense, but the use we are concerned with here involves a secondary, extended sense, just as purportedly sex-neutral **he** involves a secondary, extended sense of **he**. The extension to a singular sense has not been reflected in subject–verb agreement, just as the historical extension of **you** from plural to singular (replacing **thou**) did not have any effect on the form of the verb. With **they** we therefore have a conflict between the number it has as an agreement target (plural or singular) and the number it has as source for subject–verb agreement (plural only): the former is more semantically oriented.

Singular **they** has two reflexive forms, *themselves* and *themselves*:

- [30] i *Everyone promised to behave themselves.*  
 ii *%Someone had apparently locked themselves in the attic.*

*Themselves* is morphologically marked as plural, and hence creates a number conflict with the singular antecedent. Such a conflict is of little consequence with *everyone* as antecedent since this implies a plural set, but is potentially more problematic with an antecedent like *someone*. Examples of the morphologically singular *themselves* are attested in the standard dialect from the 1970s onwards, but they are very rare and acceptable only to a minority of speakers; the use of this form is, however, likely to increase with the growing acceptance of **they** as a singular pronoun.

The use of **they** with a singular antecedent is comparable with that where the antecedent is a disjunctive coordination of singular NPs:

- [31] i *Let me know if your father or your brother changes their mind.*  
 ii *Let me know if your father or your mother changes their mind.*

*His* could substitute for *their* in [i], but few if any speakers would find **he** acceptable in [ii] (which is a further indication that it is not a genuinely sex-neutral pronoun). In this kind of context, the morphologically plural reflexive *themselves* is also of very doubtful acceptability, with *themselves* clearly preferable for those who have adopted this form:

- [32] *Either the husband or the wife has perjured ~~\*himself~~? themselves / % themselves.*

#### (f) Avoidance

The avoidance strategy chooses a formulation that does not require a pronoun with an antecedent of the relevant kind. In the case of [32], for example, we could simply say

*Either the husband or the wife has committed perjury.* The most general avoidance strategy is to use a plural antecedent. This is particularly useful in cases like [29i–ii], where *they* is still not regarded as completely acceptable in formal writing:

- [33] i *Patients should be told at the outset how much they will be required to pay.*  
 ii *But journalists should not be forced to reveal their sources.*

In this book we ourselves commonly employ a much more specific avoidance strategy, using *I* and *you* instead of *the speaker* and *the addressee* respectively so that we do not need to select a pronoun anaphoric to these latter NPs; since the book has joint authorship, *I* could not be interpreted as referring to any particular individual and is therefore free to be used non-referentially.

### 17.2.5 Person and number

Person–number agreement between a personal pronoun and its antecedent works in very much the same way as person–number agreement between a verb and its subject, as described in §18: an NP which, as subject, determines a 3rd person singular verb will, as antecedent, determine a 3rd person singular pronoun, and so on. For this reason, we can deal with pronouns relatively briefly, though we will see that there are some differences between the two agreement systems.

#### (a) Collectives and partitives

Singular NPs headed by a collective noun such as *committee* may be interpreted as either singular or plural for the purposes of subject–verb agreement, and the same holds for antecedent–pronoun agreement:

- [34] i *The committee; hasn't yet made up its; mind.*  
 ii *The committee; haven't yet made up their; mind/minds.*

Here the pronoun matches the verb-form, singular in [i], plural in [ii]. It is possible, however, to switch from singular verb to plural pronoun – but one would not normally switch from a plural verb to a singular pronoun in close proximity:

- [35] i *The committee; hasn't yet made up their; mind.*  
 ii *\*The committee; haven't yet made up its; mind.*

A plural pronoun is particularly likely where there is an overt plural oblique:

- [36] i *A group of bystanders were having their names and addresses taken down.*  
 ii *A group of bystanders was having their names and addresses taken down.*  
 iii *#A group of bystanders was having its names and addresses taken down.*

Version [i] is unproblematic, and [ii] is possible though the singular verb has no evident semantic motivation: it is likely to be due just to the application of what we call the simple (subject–verb) agreement rule. But there is no comparable reason for having a singular pronoun, as in [iii]. There is, moreover, a strong pragmatic reason in this example for having a plural pronoun: the names and addresses belong to the members of the group as individuals, i.e. distributively, not to the group as a unit (note that replacing plural *names and addresses* by singular *name and address* in [iii] would make it pragmatically worse).

Note, however, that a plural reflexive pronoun could not occur as complement with a singular verb:

- [37] i *A group of bystanders were behaving themselves rather badly.*  
 ii *A group of bystanders was behaving itself\*themselves rather badly.*

Partitives with *one* as head (e.g. *one of the boys*) take singular pronouns:

- [38] i [*One of the boys*]<sub>i</sub> *was behaving himself<sub>i</sub> rather badly.*  
 ii [*One of the boys*]<sub>i</sub> *had forgotten his<sub>i</sub> lunch.*

And this type of construction often gives rise to the problem discussed in §17.2.4 above of selecting a singular pronoun that does not specify sex: [*One of the children*]<sub>i</sub> *had forgotten their<sub>i</sub> lunch.*

### 1st and 2nd person partitive obliques

If the partitive oblique is 1st or 2nd person plural, we find the following pattern, very much along the lines sketched above for 3rd person obliques:

- [39] i a. [*A group of us*]<sub>i</sub> *are in the process of getting ourselves<sub>i</sub> ready for the election.*  
 b. [*A group of you*]<sub>i</sub> *are behaving yourselves<sub>i</sub> rather badly.*  
 ii a. [*A group of us*]<sub>i</sub> *has spent all morning filling in our<sub>i</sub> application forms.*  
 b. [*A group of you*]<sub>i</sub> *is going to have your<sub>i</sub> results sent to you<sub>i</sub> by email.*  
 iii a. [*A group of us*]<sub>i</sub> *is in the process of getting itself<sub>i</sub> ready for the election.*  
 b. [*A group of you*]<sub>i</sub> *is behaving itself<sub>i</sub> rather badly.*

In [i] the antecedent is construed as plural with respect to subject–verb agreement. Here the pronoun takes its person and number from the partitive oblique: *themselves* would be very marginal here. In [ii] the antecedent takes a 3rd person singular verb but a 1st or 2nd person plural pronoun; many will feel that this difference makes the construction less than fully felicitous (and would feel more comfortable with a plural verb), but for others it is acceptable and explicable in terms of the potentially more mechanical nature of subject–verb agreement. Agreement with the oblique is again hardly possible with reflexives, *ourselves*, *yourselves* being excluded from [iii], *themselves* from [37ii].

In the *one of* . . . construction, there is a slight difference between 1st and 2nd person:

- [40] i a. [*One of us*]<sub>i</sub> *will have to move his<sub>i</sub>/her<sub>i</sub>/their<sub>i</sub>/our<sub>i</sub> car.*  
 b. [*One of you*]<sub>i</sub> *will have to move his<sub>i</sub>/her<sub>i</sub>/their<sub>i</sub>/your<sub>i</sub> car.*  
 ii a. [*One of us*]<sub>i</sub> *is going to hurt himself<sub>i</sub>/herself<sub>i</sub>/themself<sub>i</sub>/themselves<sub>i</sub>/\*ourselves<sub>i</sub>.*  
 b. [*One of you*]<sub>i</sub> *is going to hurt himself<sub>i</sub>/herself<sub>i</sub>/themself<sub>i</sub>/themselves<sub>i</sub>/yourself<sub>i</sub>.*

In [i], where we have a genitive pronoun, the 1st and 2nd person behave alike. All four pronouns are possible. *His* and *her* are applicable if the whole set consists of males or females respectively (cf. also the sex-neutral issue discussed in §17.2.4 above). With *one of us* as antecedent *our car* has a distributive interpretation: we each have a car, and for one person *x* among us, *x* will have to move *x*'s car. (*Our* could also be co-indexed with *us* rather than *one of us*; in this case there is only one car, belonging to us as a group.) The same applies with *your car* in [ib]. The difference between 1st and 2nd person is seen in [ii], where we have reflexive forms of the pronoun. Since *we* can only be plural, the reflexive form is *ourselves*, which clashes with the singular *one* in the subject/antecedent. But *you* can be singular or plural and hence we can avoid such a clash with singular *yourself*. Even here, however, acceptability diminishes the closer the reflexive is to a 3rd person singular verb: ?[*One of you*]<sub>i</sub> *always behaves yourself<sub>i</sub> badly when we have guests.*

## (b) Coordination

Where the antecedent is an *and*-coordination, the choice of pronoun is quite straightforward:

- [41] i [Kim and I]<sub>i</sub> have had our<sub>i</sub> applications turned down.  
 ii [You and Kim]<sub>i</sub> need to get your<sub>i</sub> passports renewed.

*Kim and I* refers to a group containing the speaker and hence takes **we** as pronoun in accordance with the ordinary meaning of **we** – note that **we** is the pronoun that would be used to refer to a group consisting of Kim + the speaker when there was no antecedent expression. Analogously for **you** in [ii].

With *or*-coordinations of singulars we can also get 1st and 2nd person plural pronouns:

- [42] i [Either Kim or I]<sub>i</sub> will have to move our<sub>i</sub> car.  
 ii [You or Kim]<sub>i</sub> will need to take your<sub>i</sub> secretary to the meeting to take minutes.

The coordinations here are likely to be interpreted exclusively, making them like *one of us/you*. *His*, *her*, and *their* would then just be possible here, as in [40i], but *our* and *your* are the preferred forms. But problems can arise with non-genitives, as with the following reflexives:

- [43] i <sup>?</sup>[Either Kim or I]<sub>i</sub> may find ourselves<sub>i</sub> having to chair the meeting.  
 ii <sup>?</sup>[You or Kim]<sub>i</sub> may find yourself<sub>i</sub>/yourselves<sub>i</sub> having to chair the meeting.

The plurality of *ourselves* and *yourselves* clashes with the singular meaning, and singular *yourself* appears to relate exclusively to *you* rather than the whole coordination. The rules for coordination provide no fully satisfactory solution in such cases, and in monitored speech or writing one would normally avoid the construction.

Note that while in subject–verb agreement some usage manuals say that the final element of an *or*-coordination should determine the form of the verb, such a rule could not apply with pronoun agreement:

- [44] i <sup>#</sup>*Kim or I* may have my application knocked back.  
 ii *Kim or I* will have to move my car.

The antecedent for *my* has to be *I*, not *Kim or I*. Example [i] is therefore anomalous, and in [ii] there is only one car involved, mine.

## 17.3 Agreement between relative pronouns and their antecedents

We are concerned here with the contrast between the relative pronouns **who** and **which**, which contrast in gender as personal vs non-personal. This second gender system differs from the one that figures in personal pronoun agreement in two main respects: (a) it applies with plurals no less than with singulars; and (b) no distinction is made according to whether the antecedent denotes a male or a female. Compare then:

- |     | SINGULAR  | PLURAL  |
|-----|---|---|
| i   | a. the <u>man</u> <i>who</i> lost <u>his</u> head     | b. the <u>men</u> <i>who</i> lost <u>their</u> heads      |
| ii  | a. the <u>woman</u> <i>who</i> lost <u>her</u> head   | b. the <u>women</u> <i>who</i> lost <u>their</u> heads    |
| iii | a. the <u>house</u> <i>which</i> lost <u>its</u> roof | b. the <u>houses</u> <i>which</i> lost <u>their</u> roofs |

For the relatives there is no difference between masculine singular *man* and feminine singular *woman*, as there is for the personal pronouns in [ia] and [iia]; but the contrast

between *who* with the lexemes *man* and *woman*, and *which* with *roof* applies in the plural [b] examples as well as in the singular [a].

#### ■ Likeness between the contrasts *which vs who* and *it vs he or she*

With singular antecedents, *which* is for the most part found with nouns that take *it*, and *who* with those that take *he* or *she*. With human nouns, *which* is possible only with nouns denoting infants without specification of sex:

- [46] i a. *The baby had lost his/her/its rattle.*      b. *the baby who/which took the rattle*  
 ii a. *The boy had lost his/\*its rattle.*              b. *the boy who/\*which took the rattle*

Nouns denoting animals can thus take *which* or *who*, just as they can take *it* or else *he* or *she*. And if an animal is referred to by means of a proper noun then *which* is excluded, just as *it* is:

- [47] i a. *The dog had lost his/her/its bone.*              b. *the dog who/which took the bone*  
 ii a. *Fido was wagging his/\*its tail.*                      b. *Fido, who/\*which was barking again*

The use of *who* rather than *which* with animals, like that of *he* or *she* rather than *it*, indicates a greater amount of interest or empathy. The primary, obligatory use of *who* is with persons, and its extension to animals suggests that they are being treated as relatively like persons: hence the label ‘personal’ for this pronoun.

#### ■ Imperfect match between *which vs who* and *it vs he or she*

In spite of the similarities illustrated in [46–47], the relative and personal pronoun contrasts are not quite the same. It is for this reason that we use separate labels, **non-personal** for *which*, **neuter** for *it*. The differences are as follows:

(a) *Who*, unlike *she*, is not used with nouns denoting ships, etc.

- [48] *The ship, which/\*who was on its/her maiden voyage, was way behind schedule.*

Inanimates always take *which*.

(b) Human collectives can take *who*, but not *he* or *she*

- [49] i *The committee, who haven't yet completed their report, must be in disarray.*  
 ii *\*The committee, who haven't yet completed his report, must be in disarray.*  
 iii *The committee, which hasn't yet completed its report, must be in disarray.*

A singular collective noun like *committee* can be given either a unitary or a set interpretation (§18.2). In the set interpretation the focus is on the individual members of the committee, and this overrides the morphosyntactic singular feature, so that in subject–verb agreement it behaves like a plural, and takes plural *they* as anaphoric personal pronoun. Since the individual members of the committee are humans, this interpretation takes personal *who* as relative pronoun. Hence the combination of *who*, *have*, and *their* in version [i]. In the unitary interpretation, the focus is on the committee as a single entity, so that it behaves as a singular for subject–verb agreement. But this single entity itself is not a human being, so that *who* and *he* or *she* are not permitted – this gives the combination *which*, *has*, and *its* in version [iii], while excluding [ii]. Some speakers also allow <sup>%</sup>*which hasn't yet completed their report*: this involves a shift of focus from unitary to set, but it doesn't affect the point at issue in this section. The set interpretation sanctions *who*, but neither interpretation can sanction *he* or *she* because in neither case is *committee* understood as denoting a single male or female person.

(c) *Which* can itself serve as antecedent to *he* or *she*

- |        |   |   |
|--------|---|---|
| [50] i | } | <i>who</i> attacked <i>his</i> owner.                         |
| ii     |   | <i>That's the dog</i> <i>which</i> attacked <i>its</i> owner. |
| iii    |   | <i>which</i> attacked <i>his</i> owner.                       |

In addition to the congruent combinations of *who* with *he* or *she* and *which* with *it*, the non-congruent combination of *which* with *he* or *she* is also possible, though less likely. The other mismatch, of *who* and *it*, is of very questionable acceptability: ?*That's the dog who attacked its owner.*

## 18 Subject–verb agreement

### 18.1 Simple agreement

Agreement between the subject, as source, and the verb, as target, is limited to clauses where the verb is of one of the following kinds:

- [1] i a present tense form of a verb other than a modal auxiliary  
 ii a preterite form of the verb *be*

Compare, then:

- |     |  |   |
|-----|--|---|
| [2] | VERB AGREES WITH SUBJECT                     |   |
| i   | a. <i>The nurse</i> <u>wants</u> to see him. | b. <i>The nurses</i> <u>want</u> to see him.  |
| ii  | a. <i>The dog</i> <u>was</u> sleeping.       | b. <i>The dogs</i> <u>were</u> sleeping.      |
| [3] | NO VARIATION IN THE VERB                     |   |
| i   | a. <i>The nurse</i> <u>will</u> see you now. | b. <i>The nurses</i> <u>will</u> see you now. |
| ii  | a. <i>The dog</i> <u>slept</u> all day.      | b. <i>The dogs</i> <u>slept</u> all day.      |

In [2] the choice between the inflectional forms *wants* and *want*, *was* and *were* is determined by the subject, whereas in [3] the modal auxiliary *will* and the preterite *slept* remain constant even though the subject changes.

The agreement involves number and person together: *wants* is a 3rd person singular present tense form, while *want* is the plain present tense form, occurring with any other kind of subject – 3rd person plural or else 1st or 2nd person singular or plural (cf. *They/I/You/We want to see him*). Similarly, *was* is the 1st/3rd singular preterite form of *be*, while *were* is the form occurring with any other subject – 1st/3rd plural or 2nd person. And in the present tense of *be* there is a three-way distinction between *am* (1st person singular), *is* (3rd person singular), and *are* (2nd person and plural).

Relatively little needs to be said about 1st and 2nd person subjects: most of the complexity in this area has to do with the contrast between singular and plural in 3rd person subjects. For this reason we will for the most part speak, for convenience, of ‘singular verbs’ and ‘plural verbs’.

The examples in [2] illustrate what we will call **simple agreement**, which may be defined initially as follows:

- [4] In simple agreement, the verb agrees with a subject with the form of an NP whose person–number classification derives from its head noun.

Thus *wants* and *was* agree respectively with *the nurse* and *the dog*, which are 3rd person singular NPs by virtue of having *nurse* and *dog* as their head; *want* and *were* agree with

*the nurses* and *the dogs*, which are 3rd person plural NPs by virtue of having *nurses* and *dogs* as head noun.

## ■ Extensions of simple agreement

### (a) Relative clauses

- [5] i a. *the nurse* [*who wants to see him*]      b. *the nurses* [*who want to see him*]  
 ii a. *the dog* [*that \_\_ was sleeping*]      b. *the dogs* [*that \_\_ were sleeping*]

The default pattern in relative clauses is that the subject takes its person–number properties from its antecedent. In [i] *who* is construed as 3rd person singular in [a] and 3rd person plural in [b] by virtue of its anaphoric relation to the antecedent *nurse* and *nurses* respectively. In [ii] the subject is realised by a gap rather than an overt NP (see Ch. 12, §3.5.6), but this gap likewise inherits the person–number properties of the antecedent.<sup>71</sup>

### (b) Subjects with the form of clauses or phrases of other categories than NP

We can extend the concept of simple agreement to cover constructions where the subject is a clause or some other kind of phrase than an NP. These are treated as 3rd person singular:

- [6] i *That he is trying to hide something* *is* all too plain.      [declarative clause]  
 ii *Why he resigned* *remains* a mystery.      [interrogative clause]  
 iii *Not informing the neighbours* *was* a serious mistake.      [gerund-participial clause]  
 iv *From here to London* *is* over fifty miles.      [PP]  
 v *Rather too big for your boots* *is* what you are, my boy.      [AdjP]

The default category in the system of person is 3rd and, certainly for the purposes of agreement, singular is the default number, so in the absence of any motivation for 1st or 2nd person or for plural, subjects like those in [6] take 3rd person singular verbs.

## ■ Departures from simple agreement

There are many places where the rule of simple agreement is not followed. A sample of attested written examples is given in:

- [7] i \**The Directors believe that [the effect of the above resolutions] are in the best interests of the Company and strongly recommend you to vote in favour of them.*  
 ii \**But at this stage, [the accuracy of the quotes] have not been disputed.*  
 iii \**Cognitive scientists seek . . . to model the ways in which [the ability to perform such tasks] are acquired, changed or impaired.*  
 iv \**In this case a woman may continue to use both names provided [the use of both commonly known names] are disclosed.*  
 v <sup>?</sup>*It is part of one's linguistic competence to be able to control and interpret variations of word-order and grammatical structure of the kind that are exemplified in the sentences cited above.*  
 vi [*A number of special units*] *are* available for patients requiring hospitalisation.  
 vii [*The committee*] *were* informed that the proposal to close the canal had been made by the British Transport Commission . . .

<sup>71</sup>In a similar way, the dummy pronoun *there* takes on the agreement properties of the displaced subject: see Ch. 4, §3.2.2.

Examples [i–iv] – from a letter to shareholders from the chairperson of a major British company, a newspaper, government instructions relating to academic grant applications, a formal notice in a credit union office – are unquestionably ungrammatical, but examples of this kind are not uncommon, even in written texts. They clearly involve processing errors: the subjects are relatively complex, and the verb has been made to agree with a plural NP within the subject rather than with the singular subject NP itself. The position of the plural NP immediately before the verb has presumably given it greater salience for the writer at the time of choosing the verb than the singular NP containing it. In the case of [i] and [iv], and perhaps [ii] also, the selection of the plural NP as agreement source is facilitated by the fact that it could substitute for the larger subject NP with little change to the meaning: *The Directors believe that the above resolutions are in the best interests of the Company*, and so on.

This phenomenon is often described in terms of the concept of ‘proximity’: the verb agrees with the proximate preceding NP. The proximate preceding NP is the one whose head is closest to the verb: in [7i] the NPs *the effect of the above resolutions* and *the above resolutions* both immediately precede the verb, but the second is the proximate one since its head *resolutions* is closer to the verb than *effect*, the head of the first. English clearly has no general rule saying that the verb agrees with the proximate preceding NP (which is why we have starred these examples), but we will see that there are places where proximity is a relevant factor in more acceptable departures from simple agreement – and indeed one such case is seen in [vi].

Example [7v], from a textbook by an eminent linguist, is more acceptable than [i–iv], but still cannot be covered by any established rule of grammar. The underlined verb is in a relative clause whose subject has singular *kind* as antecedent, so the simple agreement rule would predict *is* rather than *are*. The latter form matches the plurality of the sequence *variations of word-order and grammatical structure*, and again the sentence could be reformulated with this as antecedent for the relative clause: *to control and interpret the kind of variations of word-order and grammatical structure that are exemplified in the sentences cited above*.

Examples [7vi–vii] are fully acceptable and grammatical: they illustrate cases where more specific rules require or permit the general rule of simple agreement to be overridden. We will survey a variety of such override constructions in §§18.2–3, and in §18.4 we look at the interaction between coordination and agreement.<sup>72</sup>

## 18.2 Semantically motivated overrides with collective and number-transparent nouns

Two of the most common overrides of the simple agreement rule are found with singular collective nouns and with the number-transparent quantificational noun construction introduced in §3.3 above:

- [8] SINGULAR COLLECTIVE AS HEAD OF SUBJECT NP
- |    |  |                    |
|----|--|--------------------|
| i  | <i>The committee <u>has</u> not yet come to a decision.</i>  | [simple agreement] |
| ii | <i>The committee <u>have</u> not yet come to a decision.</i> | [plural override]  |

<sup>72</sup>Examples like *More than one glass was broken* and *One more application has been received than we had expected* ([6] of §11) follow the simple agreement rule and hence do not need to be dealt with here: what is noteworthy about such examples is the mismatch between the syntactic number of the subject NP and its meaning.

- [9] NUMBER-TRANSPARENT NOUN AS HEAD OF SUBJECT NP
- i *A number of spots have/\*has appeared.* [plural override]
  - ii *Heaps of money has/\*have been spent.* [singular override]

With collectives the override applies only in the case where the subject has a singular noun as head: with a plural head we have a plural verb in accordance with the simple agreement rule (*The committees have not yet completed their reports*). The number-transparent construction has overrides of both types: in [9i] we have a singular head (*number*) but a plural verb, while in [9ii] we have a plural head (*heaps*) but a singular verb. We consider the collective and number-transparent constructions together in this section because the plural override in [9i] is similar to that in [8ii] – and the division between collective and number-transparent nouns is by no means sharply drawn.

### ■ Optional vs obligatory override

The essential difference between the two constructions is that with collectives the override is optional, whereas in the number-transparent construction it is obligatory. As the examples show, *this committee* can take either a singular or a plural verb, whereas a *number of spots* requires a plural verb.<sup>73</sup>

The optionality of the override with collectives reflects the fact that there is potentially a difference of meaning between the versions with singular and plural verbs. From one perspective a committee is a single entity, but since a committee (normally) consists of a plurality of members it can be conceptualised as denoting this plural set. The construction with a plural verb focuses on the members of the committee rather than on the committee as a unit. The plural override is therefore not permitted with predicates that are applicable to the whole but not to the individual members; it is, moreover, of questionable acceptability if the collective has *one* (or *a/another*) as determiner:

- [10] i *The committee consists/\*consist of two academic staff and three students.*  
 ii *This committee, at least, is/\*are not chaired by one of the premier's cronies.*  
 iii *One committee, appointed last year, has/\*have not yet met.*

The version with singular agreement may reflect a focus on the collection as a whole, or may just result from application of the simple agreement rule. The plural version is more common in BrE than in AmE – and in informal style than in formal written style, where some writers may have the feeling that the singular is grammatically more correct. It must be emphasised, however, that the plural construction is unquestionably fully grammatical in Standard English, and this is generally recognised by the usage manuals. The plural override is particularly likely with predicates that necessarily apply to individuals rather than collective wholes, and it is virtually required if a quantifying adjunct such as *all* is included in the clause:

- [11] i *The other crew were not even born at the time I won my first championship.*  
 ii *The class have/\*has now all received certificates of merit.*

<sup>73</sup> Examples of a singular verb with *a number* are occasionally attested, as in this one from an editorial in an Australian national newspaper: *In the past year a number of illegal drug operations has been uncovered in relatively close proximity*. They are too rare, however, to qualify as an established variant in Standard English: they can be regarded as hypercorrections attributable to an overzealous application of the simple agreement rule. And one case where no one would consciously apply the simple agreement rule is with *lot* as head: *A lot of people like/\*likes it*.

In the case of the number-transparent *a number of spots*, by contrast, there is no potential meaning difference, just as there is none with the semantically similar *some spots*.

### ■ Complementation

A second difference between *committee* and number-transparent *number* is that the latter occurs predominantly with an *of* complement, and if there is no such complement expressed one must be recoverable anaphorically from the context. *A number have accepted the offer*, for example, is elliptical: it can only be properly interpreted if an oblique can be reconstructed (e.g. partitive *of the shareholders* or non-partitive *of shareholders*). This is not so with *committee*. *The committee has/have finally reached a decision* is interpretable as it stands: it does not require contextual information about the members of the committee.

Consider now the nouns in:

[12] i	<i>administration</i>	<i>army</i>	<i>band<sub>1</sub></i>	<i>board</i>	<i>class<sub>1</sub></i>
	<i>clergy</i>	<i>couple<sub>1</sub></i>	<i>crew</i>	<i>enemy</i>	<i>family</i>
	<i>government</i>	<i>intelligentsia</i>	<i>jury</i>	<i>party<sub>1</sub></i>	<i>public</i>
	<i>staff</i>	<i>team</i>	<i>union</i>	<i>university</i>	<i>woodwind</i>
ii	<i>band<sub>2</sub></i>	<i>batch</i>	<i>bunch</i>	<i>class<sub>2</sub></i>	<i>couple<sub>2</sub></i>
	<i>flock</i>	<i>group</i>	<i>herd</i>	<i>host</i>	<i>majority</i>
	<i>minority</i>	<i>number</i>	<i>party<sub>2</sub></i>	<i>rash</i>	<i>set</i>

The nouns in [i] occur freely, usually, or invariably without an *of* complement, while those in [ii] are found predominantly or invariably with an overt or understood *of* complement. (*Band<sub>1</sub>* denotes a musical band, while *band<sub>2</sub>* means “group”, as in *a band of ruffians*. *Class<sub>1</sub>* applies to a class at school or university, while *class<sub>2</sub>* denotes a class derived by classification, as in *a class of words*. *Couple<sub>1</sub>* denotes a man and woman who are married or in a comparable relationship, while *couple<sub>2</sub>* means “a set of (approximately) two”, as in *a couple of days*. *Party<sub>1</sub>* denotes a political party, while *party<sub>2</sub>* again means “group”, as in *a party of hitchhikers*. *Clergy* and *intelligentsia* are, for pragmatic reasons, normally restricted to the singular, with *the* as determiner.)

The nouns in [12i] behave straightforwardly like our model collective *committee*: the plural override is optional and there is a potentially clear difference between singular and plural conceptualisations. Those in [ii] are less homogeneous. *Bunch*, for example, can apply to a set of things fastened or closely grouped together or simply to a group of people; the unitary conceptualisation is strongly favoured in the former sense while override is likely in the second: *A bunch of flowers was presented to the teacher* vs *A bunch of hooligans were seen leaving the premises*. The plural override is most likely where the construction simply provides a quantification, as in this latter example with *bunch* or *A group of onlookers were injured*. For many speakers, especially of BrE, simple agreement in such cases sounds unacceptably pedantic: %*A bunch of hooligans was seen leaving the premises*.

The clear cases of number-transparent singular nouns are *lot*, *number*, and *couple<sub>2</sub>*. *Majority* and *minority* are borderline cases; plural override is surely obligatory in such examples as [13i], but one does encounter examples with singular verbs, as in [13ii]:<sup>74</sup>

<sup>74</sup>There can be no override in examples like *The government's majority is likely to be reduced*, which is parallel to the use of *number* in *The number of fatalities has risen*. With the expression *the silent majority* plural override is optional: *The silent majority takes/take a different view*.

- [13] i *The majority of her friends are*\*is Irish.  
 ii %*The fact the overwhelming majority of Americans doesn't want the President impeached does not necessarily mean that that would be the right decision.*

One final point to make is that the collective plural override never applies with non-count nouns like *crockery*, *luggage*, etc., that denote aggregates of heterogeneous entities (§3.1): *Her crockery was*\*were very ornate; *The luggage has*\*have been lost.

### 18.3 Further overrides and alternations

#### (a) Measure phrases

We have already noted that plural measure nominals can be respecified as singular for the purposes of agreement and selection within the NP. This carries over to subject–verb agreement, whether or not there is any marker of singular number within the NP:

- [14] i *That ten days we spent in Florida was* fantastic. (= [71i] of §3)  
 ii *Twenty dollars seems* a ridiculous amount to pay to go to the movies.  
 iii *Five miles is* rather more than I want to walk this afternoon.  
 iv *Three eggs is* plenty.

This is the opposite of the collective override: here an NP that is formally plural is conceptualised as referring to a single measure (of time, money, distance, or whatever) and accordingly takes a singular verb. The measure override is characteristically found with *be* or other complex-intransitive verbs (such as *seem* in [ii]). In [ii], where the predicative complement is a singular NP, the override is obligatory (\**Twenty dollars seem* a ridiculous amount to pay); in [iii–iv] it is optional but quite strongly preferred.

#### (b) Proportional constructions

There are a variety of constructions expressing proportion. Consider first:

- [15] i [*One student in a hundred*] *takes*\*take drugs. } [simple agreement]  
 ii *In a hundred students, [only one] takes*\*take drugs. }  
 iii [*One in a hundred students*] *takes*/take drugs. [optional singular override]

In all cases *out of* could replace *in*. Examples [i–ii] follow the simple agreement rule: the subject has a singular head (underlined), and the verb must be singular too. In [iii], however, the head is plural, but the verb can be singular as well as plural. The optional singular override is clearly motivated by the presence of *one*, and the synonymy with [i–ii]. (For the structure of the subject NP in [iii], see §11.)

#### Proportional constructions with *per cent* (BrE) and *percent* (AmE)

- [16] i *One percent of students* \*takes/take drugs.  
 ii *One percent of the electorate takes*/take drugs.  
 iii *One percent of the cheese was*\*were contaminated.

*Percent* is best analysed here as a noun taking an *of* complement (and for that reason we have used here the single-word AmE spelling). It belongs with the number-transparent nouns, with plural *students* in [i] requiring a plural verb and singular *cheese* in [iii] a singular verb: compare *a lot of students* and *a lot of the cheese*. In [ii] the head of the oblique is *electorate*, and since this is a collective noun, singular agreement can be overridden, just as in *The electorate aren't going to like this*.

## (c) Fused relatives

The following examples illustrate simple agreement:

- [17] i [*What money remains*] *is* in the bank.  
 ii [*What errors were made*] *were* relatively minor.  
 iii [*What amuses you*] *doesn't* necessarily amuse everybody else.

The bracketed expressions are fused relative constructions belonging to the category of NP. In these examples the relativised phrase is subject in the subordinate clause and the whole fused relative construction is subject of the matrix clause, so the issue of number agreement arises in both clauses: in [i], for example, there are two singular verbs, *remains* in the subordinate clause, *is* in the matrix. In *I have already committed what money remains* (where the fused relative is object) it arises only in the subordinate clause, and in *What she says amuses me* (where the relativised element is object) it arises only in the matrix.

In [17i–ii] *what* is a determinative functioning as determiner to a head noun, *money* and *errors* respectively. This head noun determines the number in both clauses, hence the two singular verbs in [i] and the two plural verbs in [ii]. Nothing further need be said about this construction: complexities arise only where *what* is a pronoun, as in [iii].

In general, the pronoun *what* has the default value singular. This accounts for the singular verbs *amuses*, and *doesn't* in [17iii] – and for the deviance of examples like *\*What he bought have all been broken* even in a context in which he bought a plurality of things, such as half a dozen plates. There may, however, be a plural override when the relativised phrase or the whole fused relative construction is predicand to a plural NP in predicative complement function:

- [18] i a. *He withdrew his motion for [what were obviously very sound reasons].*  
 b. *He has given me [what appear to be forged banknotes].*  
 c. [*What appeared to be forged banknotes*] *were* lying all over his desk.  
 ii a. [*What we need*] *are* managers with new ideas and the will to apply them.  
 b. [*What is needed*] *are* managers with new ideas and the will to apply them.  
 c. [*What are needed*] *are* managers with new ideas and the will to apply them.

In [i] the plural predicative is within the subordinate clause, whereas in [ii] it is in the matrix clause. In [ic] the subordinate verb *appeared*, being a preterite, doesn't show agreement, but the plural construal of *what* is manifest in the plural verb of the matrix. Where, as here, we have a plural construal in the subordinate clause, the whole fused relative is construed as plural: we could not replace *were* by *was*. Where a plural predicative in the matrix results in a plural override in that clause, there may or may not be a matching override in the subordinate clause: in [iic] there is, but in [iib] the default singular *is* is retained.

Where the plural predicative that motivates the plural verb is in the matrix, the override is optional: *are* could be replaced by *is* in [18iia–c]. Where the plural predicative is in the subordinate clause matters are not so clear-cut: a singular verb would be possible in [ib] (*appears*), but not in [ia] or [ic] (*\*was*).

## (d) Interrogatives

In general, the interrogative pronouns *who* and *what* take the default value of singular. Compare:

- [19] i a. *Who* wants some more ice-cream?      b. *What* remains to be done?  
 ii *Which (of these) is/are* yours?

There is no presupposition in [i] that only one person wants some more ice-cream or that only one thing remains to be done: the default singular allows for either singular or plural answers. In [ii], with determinative *which* as fused determiner-head, we have a singular or plural verb according to whether the answer is presupposed to be singular or plural.

The default singular values for *who* and *what* can, however, be overridden when there is a presupposition that the answer is plural:

- [20] i *What are going to be the deciding factors?*  
 ii *Who haven't yet handed in their assignments?*  
 iii *Who have excelled themselves in this year's coxed pairs?*  
 iv *What have pointed ears and long tails?*

In [i] the override is obligatory: this case is similar to those discussed for fused relatives such as [18i], with the plural PC *the deciding factors* forcing a plural construal of *what*. A likely context for [20ii] is one where I'm addressing a group of students and assuming that a plurality of them haven't handed in their assignments; singular *hasn't* would be possible (but without indicating any expectation of a plural answer and favouring singular *assignment* if there is only one each). In [20iii], coxed pairs involve three people (two rowers and the cox), so the presupposition is again that the answer is plural. The reflexive has to be plural, and this favours a plural verb. Finally, [iv] presupposes a generic bare plural as answer, e.g. *foxes*, but the motivation for a plural override is relatively small since the answer could be given in the form of a generic singular, e.g. *a fox*.

#### (e) Singular override with *one of X who* . . .

NPs of the form 'one of Det N relative-clause' may have one or other of two structures, depending on whether the relative clause belongs in the embedded NP (with N as head) or the upper one (with *one* as fused determiner-head). Compare, for example:

- [21] i *Max is [one of the people the previous head had appointed].* [Type I]  
 ii *[One of her colleagues whom she deeply admired] had betrayed her.* [Type II]

In [i] the relative clause modifies *people*: there is a set of people whom the previous head had appointed, and Max is a member of this set. But this is not how we interpret [ii] (or at least it is not the natural interpretation of [ii]). The relative clause belongs in the topmost NP, not the one with *colleagues* as head: it is not a matter of there being a set of colleagues whom she admired, but of there being one colleague whom she admired.

The relativised element in these examples is object. Where it is the subject that is relativised, the expectation would be that the number of the verb would be determined by the antecedent, giving a plural verb in Type I, and a singular in Type II. In practice, however, singular verbs are often found as alternants of plurals in Type I:

- [22] i *He's [one of those people who always want to have the last word].* } [Type I]  
 ii *He's [one of those people who always wants to have the last word].* }  
 iii *He's [one of her colleagues who is always ready to criticise her].* [Type II]

Examples [i] and [iii] follow the ordinary rules, but [ii] involves a singular override. It can presumably be attributed to the salience within the whole structure of *one* and to the influence of the Type II structure (it is in effect a blend between Types I and II). But it cannot be regarded as a semantically motivated override: semantically the relative clause modifies *people*. This singular override is most common when the relative clause follows *those* or *those* + noun.

(f) *Any and none, either and neither as fused determiner-heads*

*Any* and *none* naturally take singular verbs when they are construed as non-count singular – for example, when they have a singular NP as oblique partitive, as in *Has any of the money been recovered?* or *None of the food was contaminated*. When they quantify over a plural set, they take either plural or singular verbs:

[23] i *Please let me know immediately if [any of the set texts] are/is unavailable.*

ii *He made quite a few mistakes but [none (of them)] were/was very serious.*

The alternation correlates with the fact that as pure determiners *any* and *no* can combine with plural or singular heads.

*Either* and *neither* quantify over sets of two and as pure determiners take only singular heads. In the fused determiner-head construction the default verb-form is singular; plurals are also found, but they are likely to be avoided in formal style:

[24] i *Has/Have [either of the candidates] arrived yet?*

ii *He made two mistakes but [neither (of them)] was/were very serious.*

(g) *3rd person override in cleft relatives*

[25] i *It is I [who am at fault].* [simple agreement]

ii *It is me [who is at fault].* [3rd person override]

Example [i] follows the general rules for relative clauses, with the relative pronoun *who* being construed as 1st person singular by virtue of its anaphoric relation to *I*. In the less formal [ii], however, the antecedent is in accusative case, and here the 1st person property is not carried over to *who*; the latter therefore takes on the default 3rd person feature.

## 18.4 Coordination within the subject

Rules which determine the agreement feature values of coordinate structures as a whole on the basis of the values of each of the coordinates are generally known as **resolution rules**.

(a) *Coordination with and*

In general a subject with the form of a coordination of NPs linked by *and* takes a plural verb, as in *Mary and John are here*, etc. It doesn't matter whether the individual coordinates are singular or plural: the coordination as a whole here denotes a set containing at least two members, and hence takes a plural verb.

*And-coordinations with a singular verb*

There are several constructions, however, where the verb is singular. One case is seen in:

[26] i [*Eggs and bacon*] is/\*are my favourite breakfast.

ii [*The hammer and sickle*] was/\*were flying over the Kremlin.

iii [*Your laziness and your ineptitude*] amazes/amaze me.

Such examples can be regarded as involving a singular override similar to that found with measure phrases: the subject is conceptualised as a single unit and this determines the singular verb. In [i] the predicative *my favourite breakfast* can only apply to eggs and bacon as a unit, and hence a plural verb is impossible. If we change the predicative to, say, *good for you*, both singular and plural verbs are possible, but with a difference of meaning. In *Eggs and bacon is good for you* the subject is again conceptualised as a

single unit (a meal consisting of eggs and bacon), whereas in *Eggs and bacon are good for you* the two foods are separately good for you. In [ii] the coordination is between two nouns rather than two NPs, but again we have a unitary conceptualisation: the subject refers to a flag. In [iii] both singular and plural verbs are possible, the singular conveying that the laziness and ineptitude form a single cause of amazement, the plural conveying that each of them is a cause of amazement. The choice between singular and plural conceptualisations is more readily available with abstract NPs, as here, than with concrete NPs: compare, for example, *\*John and his father amazes me*.

A second case where an *and*-coordination takes singular agreement is illustrated in:

- [27] i [*The chair of the finance subcommittee, and the source of all our problems,*] has  
voted in favour of cuts for the twenty-first time.  
ii [*Our chef and chauffeur*] has decided to emigrate.

The singular verbs reflect the fact that the subject as a whole refers to a single person. The chair of the finance subcommittee and the source of all our problems are one and the same person, and likewise our chef and our chauffeur. In [ii] we could have *Our chef and chauffeur have decided to emigrate*, but this would entail that two separate people are involved; the same applies in principle to [i], but in practice the second coordinate would be very unlikely to be used to refer to a distinct person.

Finally, coordinations of NPs containing distributive *each* or *every* take singular verbs:

- [28] i [*Each dog and each cat*] has/\**have* to be registered.  
ii [*Every complaint and every suggestion*] was/\**were* thoroughly investigated.

#### And-coordinations of clauses

Subjects with the form of an *and*-coordination of clauses generally take singular verbs:

- [29] i [*That the form was submitted on the very last day and that the project had not been properly costed*] suggests that the application was prepared in a rush.  
ii [*How the dog escaped and where it went*] remains a mystery.

It is nevertheless possible to have a plural verb when the predicate treats the coordinates as expressing separate facts, questions, or the like:

- [30] i [*That the form was submitted on the very last day and that the project had not been properly costed*] are two very strong indications that the application was prepared in a rush.  
ii [*How the dog escaped and where it went*] are questions we may never be able to answer.

#### (b) Coordination with *or*

The use of *or* indicates that the coordinates are to be considered separately. In the case of *or*, therefore, a coordination of two singulars does not yield a plural, as it generally does with *and*. With symmetric uses of *or* – those where the coordinates are of fully equal status and could be reversed – the resolution rules give fully acceptable results only where the coordinates have the same number, i.e. all are singular or all are plural:

- [31] i [(*Either*) *Mary or John*] is/\*are sure to go. [sg or sg = sg]  
ii [(*Either*)*Mary or the twins*] ?is/\*are sure to go. [sg or pl = ?sg/?pl]  
iii [(*Either*)*the twins or Mary*] ?is/\*are sure to go. [pl or sg = ?sg/?pl]  
iv [(*Either*)*the twins or their parents*] are/\*is sure to go. [pl or pl = pl]

In [i] and [iv] the whole coordination has the same number as each coordinate, singular in [i], plural in [iv]. But where the coordinates are of different number, neither singular nor plural agreement feels right: whichever we choose, there will be conflict between the number of the verb and the number of one of the coordinates. Usage manuals generally invoke the principle of proximity, saying that the verb should agree with the nearest coordinate. This rule would select *are* in [ii] and *is* in [iii]. In practice, however, many speakers tend to feel uncomfortable with both forms and will typically find ways of avoiding the conflict, e.g. by using a modal auxiliary, which has no agreement properties: (*Either*) *Mary or the twins will be sure to go*.

The acceptability of a plural verb with coordinates of mixed number, or indeed with coordinates that are all singular, is increased in such contexts as the following:

- [32] i *I don't think [(either)Mary or the twins] are<sup>i</sup>/is going to help you.*  
 ii *I don't think [(either)Mary or John] is/are going to help you.*

Here the coordination is within the scope of a negative and a negated *or* entails that all coordinates fail to have the property in question. Example [i] thus conveys that both Mary and the twins are not going to help you, and analogously for [ii]. This makes the plural *are* sound better, though it would still generally be avoided in [ii] in formal style.

One also occasionally finds plural verbs with singular coordinates when *X or Y* is thought of inclusively rather than exclusively, i.e. as “X or Y or both”:

- [33] <sup>?</sup>*Problems arise when emotional involvement or lack of experience prevent an objective appraisal of the situation.*

#### Or in supplements

In the following, *or* introduces a supplement rather than an element which is strictly coordinate with the preceding NP:

- [34] i *His proposal, or rather the ramifications of it, are<sup>i</sup>/\*is going to have a serious effect on our plans.*  
 ii *Her eyes, or rather the visible one, was<sup>i</sup>/\*were pale blue.*  
 iii *Arrhythmia, or irregular contractions of the ventricles, is<sup>i</sup>/\*are a serious heart condition.*

In [i–ii] the underlined NP represents a correction of the preceding one. It therefore supersedes the first NP and determines the number of the verb, plural in [i], singular in [ii]. In [iii] the supplement is merely an explanatory and parenthetical reformulation of the first NP, and it is therefore the latter that determines the number of the verb.

#### Person

Where one of the coordinates is 1st or 2nd person singular there tends to be a preference for agreement with the final coordinate, except that the 1st person singular form *am* is felt to be awkward and the construction is likely to be avoided in monitored style:

- [35] i *You mustn't go unless [either I or your father] comes<sup>i</sup>/come with you.*  
 ii *I don't think [either your father or I] have<sup>i</sup>/has had much say in the matter.*  
 iii *[Either your father or I] <sup>?</sup>am<sup>i</sup>/is going to have to come with you.*

#### (c) Coordination with *neither . . . nor*

A clause with a *neither . . . nor* coordination as subject can be thought of semantically in either of two ways (see Ch. 15, §2.4):

- [36] i *Neither Mary nor John will help.*  
 ii “It isn’t the case that either Mary or John will help”  
 iii “Both Mary and John will not help”

The conceptualisation given in [ii] incorporates an *or*-coordination, while that given in [iii] shows *neither...nor* to be like (*both...and*). This then yields the following agreement patterns:

- [37] i [*Neither Mary nor John*] *is/are* here yet. [neither sg nor sg = sg/pl]  
 ii [*Neither Mary nor the twins*] *are/\*is* here yet. [neither sg nor pl = pl/\*sg]  
 iii [*Neither the twins nor Mary*] *are/\*is* here yet. [neither pl nor sg = pl/\*sg]  
 iv [*Neither the twins nor their parents*] *are/\*is* here yet. [neither pl nor pl = pl]

In [i] the singular verb matches the singular that is found with an *or*-coordination of two singulars, while the plural verb matches the conceptualisation “Both Mary and John are not here yet”. We have seen that *or*-coordinations of coordinates with unlike number are problematic, so the singular verb in [ii–iii] is of questionable acceptability (especially in [ii], where the nearest coordinate is plural). The “both...and + not” conceptualisation, however, sanctions the plural verb: this can certainly be regarded as fully acceptable and is strongly preferred over the singular.

#### (d) *Not only...but also*

In constructions of this kind, number is determined by the second coordinate:

- [38] i *Not only Mary / her parents but also Helen has been questioned.*  
 ii *Not only Mary / her parents but also the twins have been questioned.*

#### (e) *Coordination with and not or but not*

Coordinations with *and not* and *but not* follow a simple rule. Since only the first coordinate has the property ascribed to it by the predicate, it is the first coordinate that determines the form of the verb:

- [39] i a. *Ed, and not the twins, is/\*are here.* b. *The twins, and not Ed, are/\*is here.*

## 19 Number in predicatives and their predicands

### 19.1 The semantic nature of matching number

Very often the number of an NP functioning as predicative matches that of its predicand:

- | [1] | SINGULAR PREDICAND                 | PLURAL PREDICAND                      |
|-----|------------------------------------|---------------------------------------|
| i   | a. <i>My daughter is a doctor.</i> | b. <i>My daughters are doctors.</i>   |
| ii  | a. <i>*My daughter is doctors.</i> | b. <i>*My daughters are a doctor.</i> |

Here the predicand is subject and the predicative NP must have the same number as the subject, singular in [a], plural in [b]. Similarly where the predicand is object in the complex-transitive construction:

- [2] i *He considers his colleague a complete idiot / \*complete idiots.*  
 ii *He considers his colleagues complete idiots / \*a complete idiot.*

In these examples the predicative is a complement of the verb, but we find the same matching of number when it is within an *as* phrase adjunct:

- [3] i As a doctor / <sup>#</sup>*doctors*, my daughter makes vital decisions.  
 ii As *doctors* / <sup>#</sup>*a doctor*, my daughters make vital decisions.

This phenomenon bears an obvious resemblance to agreement, and indeed it is commonly said that a predicative agrees with its predicand. We have noted, however, that it is not a straightforward matter to distinguish between grammatical agreement and mere semantic congruence, and in this instance we believe that an account in terms of semantics is more appropriate than one in terms of grammatical agreement. It is for this reason that we have marked the unacceptable examples above with the symbol ‘#’ rather than ‘\*’. We will see that the requirement for matching number applies only in a semantically restricted range of cases: it does not have the generality that would justify the postulation of a grammatical rule of agreement.

### ■ No agreement of person

One initial point to make is that there is certainly no agreement between predicative and predicand with respect to the category of person: the relationship between predicative and predicand is therefore clearly different from that holding between subject and verb (predicator). Compare, for example:

- [4] i I am [a doctor who believes/\**believe in euthanasia*].  
 ii It is I who am master now.  
 iii You are obviously [someone who has/\**have thought carefully about this issue*].  
 iv [The one who is causing all the trouble] is you.

In [i] the matrix subject *I* is 1st person, while the predicative – the NP headed by *doctor* – is 3rd person. The difference in person is reflected in the contrast between the verb-forms *am* and *believes*. *Am* is 1st person singular agreeing with *I*, while *believes* is 3rd person singular agreeing with *who*, which takes its person–number properties from its antecedent *doctor*. Conversely in the matrix clause of [ii] the subject is 3rd person while the predicative is 1st. Example [iii] has a 2nd person subject with 3rd person predicative, while [iv] has the opposite arrangement.

### ■ No agreement of gender

Similarly we do not have gender agreement between predicative and predicand, as we do between a pronoun and its antecedent. Predicatives are headed by nouns with their own inherent content which can independently determine the gender features involved:

- [5] i [Your brother] is clearly [a problem which/\**who we will have to resolve*].  
 ii [The dean] is [an obstacle which/\**who I didn't foresee*].

In these examples, the relative clause is semantically applicable only to the head noun of the predicative complement (e.g. it is possible to resolve a problem, but not a brother), and the relative pronoun has to be the non-personal *which*.

In examples like the following the gender of the predicative does seem to vary so as to match that of the predicand:

- [6] i [This house] is [a shambles which is going to take days to sort out].  
 ii [The government] are [a shambles who don't deserve to be in power].

The switch from *which* to *who* here, however, is due to the fact that *shambles* can be interpreted as a human collective noun; this sanctions the *who* (together with the plural verb) in [ii]. But it is simply a semantic fact that *shambles* can be predicated of both human and non-human entities.

Similarly, the match between personal pronoun and the matrix subject in the following can be accounted for semantically:

[7] [The younger daughter] is [a doctor<sub>i</sub> who<sub>i</sub> is dedicated to her<sub>i</sub> / #his<sub>i</sub> patients].

*Doctor* is a dual-gender noun that does not itself encode information about sex, but the anaphoric link between the genitive personal pronoun, relative *who*, and *doctor* gives the predicative a female or male interpretation. The anomaly of *his* here simply reflects the semantic fact that the property of being a doctor who is dedicated to his patients is an inappropriate one to ascribe to a female.

### ■ No agreement of number

As for number, we find numerous cases where predicative and predicand differ in grammatical number. We will illustrate in turn from the specifying and ascriptive uses of the copula distinguished in Ch. 4, §5.5.

#### Specifying *be*

[8] i [The only thing we need now] is [some new curtains].

ii [The major asset of the team] is [its world-class opening bowlers].

Here the subject (predicand) is singular, the predicative complement plural: clauses of this kind are commonplace. Since this construction is generally reversible we likewise find plural subject with singular predicative complement: *Its world-class opening bowlers are the major asset of the team*. Compare also *The Morning Star and the Evening Star are both Venus*.

Number mismatches that result in unacceptability are due to semantic incompatibility between the terms:

[9] i # [The person who complained most] was [my parents].

ii # [The two people who complained most] were [my parents and my uncle].

The incompatibility results from identifying a single person with a set of two in [i], and identifying a set of two with a set of three in [ii]. Example [ii] could not be handled in terms of agreement of grammatical number, since both elements are plural, and it would therefore be inappropriate to invoke violation of grammatical agreement in [i], for the nature of the anomaly is the same in both cases.

#### Ascriptive *be*

With this use of *be* number mismatches most often have a plural subject in construction with a singular predicative, but the opposite pairing is also found:

[10] i a. [Our neighbours] are [a nuisance].

b. [The people who live out there] are [a minority cult group].

c. [The accidents] were [the result of a power failure].

d. [These results] were really [something to be proud of].

ii a. [His Ph.D. thesis] was [simply four unrelated articles collected together].

b. [This gadget] is [five different tools in one].

Overall, the cases of mismatches are too prevalent for them to be treated as exceptions to a grammatical rule of agreement holding generally between predicate and predicand – as involving overrides comparable to those suggested in our discussion of subject–verb agreement. A more satisfactory approach is to provide a semantic account of the restricted range of cases where mismatches result in unacceptability of the kind illustrated in [iii] (*\*My daughter is doctors; #My daughters are a doctor*).

## 19.2 Distributive and non-distributive predicatives in non-quantificational constructions

In this section we leave aside clauses involving explicit quantification in the subject (as in *All my daughters are doctors*) or the predicate (*My daughters are all doctors*): such quantification creates complications that we will take up in §19.3 below. Our account will be concerned exclusively with ascriptive predicative constructions.

Within this domain we distinguish between predicatives which have a **distributive** and those which have a **non-distributive** interpretation.

- |        |  |                    |
|--------|--|--------------------|
| [11] i | <i>My daughters are doctors.</i> (= [iib]) | [distributive]     |
| ii     | <i>Ed's daughters are a pest.</i>          | [non-distributive] |

Distributive predicatives combine with plural predicands and the property they express is ascribed to the individual members of the set referred to by the predicand (or to various subsets of that set). In [i], for example, the property of being a doctor is ascribed distributively to each of my individual daughters. In [ii], by contrast, the property of being a pest is ascribed non-distributively to the set of Ed's daughters as a whole.

The distributive interpretation is subject to the following rule:

- [12] With semantically plural predicands, pluralised forms of predicatives are ascribed distributively, singular forms non-distributively.

This accounts for the interpretations in [11], where the predicative is pluralised in [i] but singular in [ii]. The latter contrasts with the distributive interpretation obtained by pluralising the predicative: *Ed's daughters are pests*. This is like [11i]: it ascribes the property of being a pest not to the daughters as a combined set but to each of them individually. The formulation of [12] in terms of semantically plural predicands caters for examples like *This group are doctors*, where *this group* is grammatically singular but refers to a plural set of individuals (this group of delegates, perhaps), and the property of being a doctor is ascribed distributively to these individuals.

It is then necessary to distinguish between different types of property, **non-collective**, **neutral**, and **collective**.

### ■ Non-collective properties

These properties are ascribable only to individual entities. **Doctor** expresses a property of this kind. Example [1ia], *My daughter is a doctor*, thus illustrates the ascription of the property of being a doctor to an individual person. Thus [1iib], *#My daughters are a doctor*, is semantically anomalous because the predicative is not in its pluralised form, and hence the property of being a doctor must be ascribed non-distributively to the set consisting of my daughters as a whole, which is of course incoherent. In [iib], *My*

*daughters are doctors*, the pluralised form indicates that the property of being a doctor is ascribed distributively to the individual daughters.

### Neutral properties

These can be ascribed to individual entities but they can also be ascribed collectively to a set. Compare, then:

- [13] i *Our neighbour is a nuisance.*  
 ii *Our neighbours are a nuisance.* (= [10ia]) [non-distributive]  
 iii *Our neighbours are nuisances.* [distributive]

Here, [i] has a singular subject and the predicative ascribes a property to the individual it refers to. Example [ii] has a plural subject and the predicative ascribes the property of being a nuisance to the set it refers to as a whole: they are collectively a nuisance. And in [iii] the subject is again plural and the predicative ascribes the property of being a nuisance to each member of the set it refers to: each of them is individually a nuisance. A sample of other nouns denoting neutral properties is as follows:

- [14] *delight*          *disgrace*          *embarrassment*          *godsend*          *mess*  
           *obstacle*          *pest*                  *pigsty*                  *problem*          *tip*

*Shambles* has no plural form, and hence cannot be used distributively: *This room is a shambles*, *These rooms are a shambles*, but not \**These rooms are shambles*.

### Collective properties

These properties are ascribed to sets, even when used in the plural with a distributive interpretation:

- [15] i *#This stamp is a superb collection of rare issues.*  
 ii *Bill's stamps are a superb collection of rare issues.* [non-distributive]  
 iii *Bill's stamps are superb collections of rare issues.* [distributive]

Example [i] is excluded because *this stamp* refers to an individual entity which cannot have a collective property ascribed to it. A grammatically singular subject is permitted if it refers to a set: *This is a superb collection of rare issues*. In [ii] the property expressed in the predicative is ascribed to the set of Bill's stamps as a whole. Example [iii] is less likely, but possible with a distributive interpretation which assigns the collective property not to the individual stamps but to subsets of them.

Nouns like **twin** can express either a non-collective or a collective property, the latter interpretation being possible only if the noun is plural. Compare:

- [16] i *Bill is a twin.*  
 ii *Bill and Fred are twins.*  
 iii *Bill, Fred, and Mary are twins.*  
 iv *Bill and Fred, and Mary and Jane are twins.*

Example [i] ascribes the non-collective property of being a twin (of someone) to the individual Bill. In the salient interpretation of [ii] the collective property of being twins of each other is ascribed non-distributively to the set consisting of Bill and Fred. Since the set concerned must have just two members, [iii] can only have an interpretation where the non-collective property of being a twin of someone is ascribed distributively to Bill, Fred, and Mary. And the most likely interpretation of [iv] has the collective property of

being twins of each other ascribed distributively to two subsets of the set referred to by the subject, one consisting of Bill and Fred, the other of Mary and Jane.

### 19.3 Distributive interpretations in quantified constructions

Distributivity of the kind considered above does not mean that the property expressed in the predicative necessarily applies to every individual in the set referred to by the subject. Consider, for example:

[17] *The office buildings downtown are skyscrapers.* [distributive]

This does not explicitly say (and thus does not have as a truth condition) that every individual office building downtown is a skyscraper (the old courthouse, for example, might be a single-storey edifice). To ensure an interpretation in which every atom either individually (in the case of distributive predicatives) or collectively (in the case of non-distributive ones) possesses the predicative complement property, explicit quantification is required. This is illustrated in the examples in [18], which have distributive interpretations, still in accordance with rule [12]:

- [18] i *All/Both the office buildings downtown are skyscrapers.*  
 ii *The office buildings downtown are all/both skyscrapers.*

We find, however, that rule [12] does not apply in all cases of explicit quantification in that distributive interpretations can be obtained without pluralisation:

- [19] i *Ed's daughters are a nuisance.* [non-distributive]  
 ii *Both Ed's daughters are nuisances / a nuisance.* [distributive]

In [i], only the collective interpretation of *a nuisance* is possible, since the only interpretation which can apply in the absence of pluralisation or quantification is the non-distributive one. With the presence of the quantifier *both* in [ii], however, the versions with *nuisances* and *a nuisance* are equivalent, having distributive interpretations in which each daughter individually is a nuisance. The semantic basis for the effect of the quantifier here is clear. *Both* itself yields a distributive interpretation (see §7.3), so that it is not essential for distributivity to be marked by pluralisation of the predicative, which can therefore maintain its basic singular form.<sup>75</sup> The plural, however, remains the default option, with the singular available only with a restricted range of predicatives. We could not, for example, have a singular in the *both* version of [18]: \**Both the office buildings downtown are a skyscraper.*

## 20 Proper names, proper nouns, and vocatives

### 20.1 The distinction between proper names and proper nouns

The central cases of **proper names** are expressions which have been conventionally adopted as the name of a particular entity – or, in the case of plurals like *the Hebrides*, a collection of entities. They include the names of particular persons or animals (*Mary, Smith, Fido*), places of many kinds (*Melbourne, Lake Michigan, the United States of*

<sup>75</sup>The quantifiers *each* and *every* are themselves explicitly distributive and as quantifiers in subject NPs enforce singularity on the whole clause, including the predicative complement: *Each/Every office building downtown is a skyscraper.* This can be seen as a fully grammaticalised version of the principle that distributive quantification removes the need for plural forms.

America), institutions (*Harvard University, the Knesset*), historical events (*the Second World War, the Plague*). The category also covers the names of days of the week, months of the year, and recurrent festivals, public holidays, etc. (*Easter, Passover, Ramadan*). In many cases there are different versions of a proper name, typically with one more formal than the other(s): *the United States of America* vs *the United States, the US, the States*, or *Elizabeth* vs *Liz* and *Lizzie*.

In their primary use proper names normally refer to the particular entities that they name: in this use they have the syntactic status of NPs.<sup>76</sup> For the most part, however, they can also be nominals that are parts of larger NPs: such nominals may be attributive modifiers or heads that are accompanied by dependents that are not part of the proper name itself. Compare:

- |     |   |     |  |    |  |            |
|-----|---|-----|--|----|--|------------|
| [1] | i | a.  | <i>She lives in <u>New Zealand</u>.</i>      | b. | <i><u>Clinton</u> was re-elected.</i>    | [full NP]  |
|     |   | ii  | a. <i>the <u>New Zealand</u> government</i>  | b. | <i>the <u>Clinton</u> administration</i> | [modifier] |
|     |   | iii | a. <i>the <u>New Zealand</u> of my youth</i> | b. | <i>the new <u>Clinton</u></i>            | [head]     |

**Proper nouns**, by contrast, are word-level units belonging to the category noun. *Clinton* and *Zealand* are proper nouns, but *New Zealand* is not. *America* is a proper noun, but *The United States of America* is not – and nor are *The United States* or *United* and *States* on their own. Proper nouns function as heads of proper names, but not all proper names have proper nouns as their head: the heads of such proper names as *The United States of America, the Leeward Islands, the University of Manchester*, for example, are common nouns. Proper names with common nouns as head often contain a smaller proper name as or within a dependent, but they do not need to: compare *Madison Avenue* and *Central Avenue*, or *Harvard University* and *The Open University*. We noted above that many proper names have alternant versions, and one type of alternation is between a formal name with a common noun as head and a less formal version with the common noun omitted: *The Tate Gallery* vs *The Tate*.

Proper nouns are nouns which are specialised to the function of heading proper names. There may be homonymy between a proper noun and a common noun, often resulting from historical reanalysis in one or other direction. For example, the underlined word in *the Earl of Sandwich* is a proper noun, while that in *a ham sandwich* is a common noun. Similarly proper *Rosemary* (a female name) is homonymous with common *rosemary* (denoting a type of shrub). As this formulation indicates, we take such cases to involve pairs of different words, so that we can still say that proper *Sandwich* and *Rosemary* are specialised to the proper name use. Note by contrast that we don't have homonymy in pairs like *the University of Manchester* and *I haven't yet decided which university to apply to*: there is a single word *university*, functioning as the head of a proper name NP in the first case and of an ordinary NP in the second. The difference, of course, is that while the University of Manchester is a university, *Sandwich* is not a sandwich, and so on.

## 20.2 The form of proper names

Most proper names, in their primary use, are NPs. The names of various kinds of artefact – the **titles** of written works, movies, TV programmes, etc. – allow a wider range

<sup>76</sup>Also included under the primary use is the non-referential use of proper names in identification statements: see §8.3 above.

of forms, including main clauses (e.g. declarative *White Men Can't Jump*, interrogative *Who's Afraid of Virginia Woolf?*, imperative *Kiss Me Kate*) and subordinate interrogatives (*How the West was Won*; *How to Marry a Millionaire*). Even when they have the form of NPs, titles are much less constrained than other kinds of proper name and are excluded from the following account.

To a large extent the syntactic structure of proper names conforms to the rules for the structure of ordinary NPs, but there are a number of respects in which they depart from the general pattern. We consider first the question of determiners, and then look at the structure of proper names with composite heads.

### 20.2.1 Strong and weak proper names

By virtue of its use to refer to a particular entity or collection of entities that bears the name, a proper name is inherently definite. This excludes the inclusion of an indefinite determiner, and makes the marking of definiteness unnecessary. We distinguish, then, between **strong** proper names like *Kim* or *New York*, where there is no determiner, and **weak** proper names like *the Thames* or *the Bronx*, where definiteness is redundantly marked by the definite article *the*. In some names *the* is optional, so that we have both strong and weak versions: e.g. *Gambia* or *the Gambia*.<sup>77</sup>

Weak proper names normally lose the definite article when they don't constitute a full NP – when they are modifying the head of an NP or are themselves modified:

- [2] i *a Thames cruise, two United States warships, both Republic of Chad delegates*  
 ii *It was [a very different Thames from the one I remembered from my youth].*

These are positions where the grammar allows nominals, not NPs, so the dropping of the article reduces the proper name to nominal form.<sup>78</sup> There are, however, differences among weak proper names as to how readily they enter into these constructions. It is virtually impossible, for example, to drop the article from *the Hague*: \**two Hague councillors*, \**an impressively modernised Hague*.

Plural proper names are always weak. Plural names apply to mountain ranges (*the Alps, the Himalayas, the Urals*); island groups (*the Bahamas, the Hebrides, the Maldives*); occasional other geographical entities (*the Netherlands, the Balkans, the Dardanelles*). Groups of performers may have weak plural names (*the Beatles*) or strong collective singulars (*Abba*).

Among weak singular names with proper nouns as head we find the following types:

- [3] i *the Argentine, the Ukraine, (the) Sudan, (the) Yemen* [countries]  
 ii *the Crimea, the Caucasus, the Ruhr* [geographically defined regions]  
 iii *the Colisseum, the Pantheon, the Parthenon* [famous buildings]  
 iv *the (River) Thames, the Potomac, the Bosporous* [rivers, straits]

<sup>77</sup> Whether proper names are strong or weak is, from a cross-linguistic perspective, a rather arbitrary matter. Personal names like *Mary* are weak in modern Greek, but strong in English. Similarly, river names are invariably weak in English, but in Bulgarian some are strong and some weak. Nevertheless, as we shall see, there are some generalisations that can be made about the strong/weak distinction **within** English.

<sup>78</sup> There are some cases where the article is exceptionally retained in attributive modifier function, as in *The Gap State High School*. This refers to a state high school in a suburb of Brisbane called *The Gap*; such schools in suburbs with strong names have no article (cf. *Kenmore State High School*), so we can infer that *the* forms a constituent with *Gap* rather than being an immediate constituent of the matrix NP. Note, however, that the matrix NP in this case is itself a proper name: in ordinary NPs the article drops in the usual way: *Gap residents are protesting against this decision*.

v	<i>the Adriatic, the Atlantic, the Mediterranean</i>	[seas, oceans]
vi	<i>the Gobi, the Sahara, the Negev</i>	[deserts]
vii	<i>the Eiger, the Jungfrau, the Matterhorn</i>	[Swiss Alpine peaks]
viii	<i>the Knesset, the Kremlin, the Pentagon</i>	[political/military authorities]
ix	<i>the Bodleian, the Guggenheim, the Tate</i>	[libraries, galleries, etc.]
x	<i>the Bible, the Koran, the Talmud</i>	[religious tracts]
xi	<i>The Economist, The Guardian, The Times</i>	[newspapers, periodicals]

There are in addition isolated weak names in other categories: e.g. *the Hague* as a city name, *the Bronx* naming a borough of New York City. The names in [i] are relatively exceptional: countries usually have strong names (and note *Argentina* as a strong version of *the Argentine*). Names of the categories illustrated in [ii–vi] are normally weak, but region names formed from Latinate proper nouns in *-ia* are strong: *Scandinavia, Siberia, Transylvania*. Names of individual mountains (as opposed to ranges) are generally strong, but those in the Swiss Alps may have weak names, as in [vii]. The categories in [viii–x] are normally weak, as are the names of newspapers (with capitalised *The*). Periodicals often have strong names as their official titles: *New Scientist, Journal of Linguistics*; in most contexts, however, a weak alternant is used: *I doubt whether the New Scientist would publish a paper like that.*

### 20.2.2 Proper names with simple and composite heads

The head of a proper name is the name less the article in the case of weak names. This may be **simple**, i.e. a single noun (including compounds of various kinds: *Fortescue-Smythe, Alsace-Lorraine*), or **composite**, i.e. a nominal with internal syntactic structure.

#### ■ Simple heads

In strong proper names, simple heads are normally proper nouns: *Kim, Jones, Boston, Italy*, etc. Within a family, however, there are constraints on the use of given names, so that kin terms are commonly used instead when a child is referring to an adult, or when one is talking to a child: *Mum/Mom/Mummy/Mother wants you; Have you seen Grandma/Granny/Nana?* In such cases the terms have the status of proper names, though they belong syntactically to the category of common nouns. One or two other common nouns can similarly be used with the status of proper names in restricted contexts: *Have you seen Nurse?*

#### ■ Composite heads

The main kinds of composite head structures are illustrated in [4]:

- [4] i *Kim Jones, Emma Ann Barton, J. C. Smith, John C. Smith, J. Edgar Hoover*  
 ii *Queen Mary, Pope John Paul, Major White, Nurse Fox, Dr Brown, Mr Black*  
 iii *British Columbia, Upper Saxony, North America, the Northern Territory,  
New York, Long Island, Good Friday, the Iron Duke, the National Gallery*  
 iv *Oxford Road, Harvard University, the Ford Foundation, Christ's College*  
 v *Lake Michigan, Mount/Mt Everest, the River Thames, Ward 17*  
 vi *The Isle of Skye, the Bay of Biscay, the University of Sydney, John of Gaunt,  
Massachusetts Institute of Technology, the Institute of Modern Art*  
 vii *Henry Cotton Senior, Peter the Great, (King) George the Fifth / Y*

### Combinations of given and family names

Personal names typically consist of a combination of one or more given (first, Christian) names and a family name (surname), as in [4i]; given names may be reduced to an initial letter. This construction is unique to personal names, and there is no convincing evidence for treating one element as head.

### Appellations

The underlined elements in [4ii] are appellations, pre-head modifiers of personal names, expressing the status of the individual concerned.<sup>79</sup> The kinds of status they indicate include: royal/aristocratic office or rank (*King, Queen, Prince, Earl, Lord, Emperor, Count*, etc.); clerical office (*Pope, Archbishop, Sister*); military and police rank (*Private, Captain, Squadron Leader, Admiral, Inspector*); political office (*President, Senator, Governor, Councillor*); judicial office (*Judge*); academic status (*Dr, Professor*). The default set of appellations – *Mr, Ms, Mrs, Miss, Master* – indicate sex and in some cases also marital or maturity status. It is arguable whether appellations form part of the proper name or are an embellishment of it; the case for including them within the name would seem to be stronger in cases like *King George* or *Pope John* (where a particular personal name is chosen for use with the appellation on accession to the office) than with others. Some combinations of appellations are permitted: *Professor Sir Ernest Rutherford, Her Majesty Queen Elizabeth*.

### Other pre-head dependents

Pre-head dependents may, as in ordinary NPs, have the form of adjectives ([4iii]) or nouns – generally nouns that are themselves proper names ([iv]), or **descriptors** indicating what kind of entity the name applies to ([v]). The descriptors are generally omissible: compare *Everest, the Thames*, and so on. The others tend to be an essential part of the name, but in a few cases are omissible too, as when *the States* is used as an informal variant of *the United States*. As elsewhere, the construction is recursive: compare [*New [South Wales]*] or [[*Cambridge University*] *Press*].

Genitives, such as *Christ's* in [4iv], we take to be modifiers not determiners. They occur readily in names that are themselves functioning as modifier within a larger construction, as in *a Christ's College don*: this is a construction which accepts nominals but not full NPs in modifier position. Such genitives cannot normally contain a determiner – compare *King's College, Women's College*, etc.

### Post-head dependents

These most often have the form of PPs, generally headed by *of*, as in [4vi]. The oblique NP in this construction is commonly another proper name. A different kind of post-head dependent is seen in [4vii]: *Junior* is an adjective while the other two have the form of fused modifier-head NPs. Such post-head dependents as *the Great* occur only in proper names.

## 20.3 Embellishments

Proper names may occur, with the status of nominals, as head of a larger NP that refers to the bearer of the name:

<sup>79</sup>The term 'title' is more commonly used than 'appellation', but we have used 'title' for the proper name of a literary work or comparable artefact, and from a grammatical point of view appellations and titles are quite different.

- [5] i *architect* Norman Foster, *mother of two* Eileen Jones, *special agent* Cully, *well-born Hampshire gentleman* John Grant, *nuclear physicist* Lord Rutherford
- ii *beautiful* Italy, *dear old* Mr Smithers, *poor* Henry, *sunny* Italy, *historic* Virginia; *the inimitable* Oscar Wilde, *the distraught* Empress Alexandra
- iii *Who's [this Penelope who's been sending you emails]?*, [*That* Senator Fox] *should be locked up*, [*Your* Mr Jenkins] *has been arrested again!*

The underlined elements are semantically non-restrictive dependents that we refer to as **embellishments** of the proper name. The examples in [5] illustrate three main kinds of embellishment: nominal and adjectival attributive modifiers, and determiners.

Nominal modifiers generally occur with personal names and serve to categorise the person concerned. The construction is to be distinguished from the one where the proper name is an appositive: in *architect Norman Foster* the proper name is head and *architect* an omissible embellishment, whereas in *the architect Norman Foster* the head is *architect* and the proper name is an omissible appositive dependent.<sup>80</sup> We noted above that it is arguable whether appellations should be regarded as part of the proper name or as embellishments; certainly expressions like *Secretary of State Colin Powell* or *Prime Minister Tony Blair*, used more extensively in AmE than in BrE, bear a significant resemblance to those in [5i].

Adjectives occur as embellishments of proper names in two constructions: in bare NPs or in ones determined (redundantly) by *the*, as in the last two examples of [5ii]. The bare NP construction is restricted to a fairly small set of adjectives with emotive colouring: *beautiful* and *ugly*, *young* and *old*, and so on. The determined NP construction allows a somewhat larger range including *beautiful*, *dazzling*, *incomparable*, *inimitable*, *irrepressible*, *unfortunate*, *wretched*, and adjectives denoting emotional states such as *distraught*, *furious*, *jealous*. Such adjectives can in general modify the head of weak proper names: *the ill-fated Titanic*.

The main determiners that are used as embellishments are the demonstratives and genitive personal pronouns, as in [5iii]. The genitive indicates a close relationship: *your Mr Jenkins* suggests that you are a close acquaintance of Mr Jenkins. Often it is a parental relationship: [*My* Jennifer] *has won the school prize again*.

## 20.4 Secondary uses of proper names

In their primary use proper names are inherently definite, and for this reason their heads do not select from the determiner system in the same way as ordinary heads in NP structure. Proper names also have various secondary uses where this inherent definiteness is lost, and where determiners are thus selected in the ordinary way.<sup>81</sup> Five such uses may be distinguished:

<sup>80</sup>The presence or absence of *the* does not serve to distinguish apposition from non-apposition in the case of such titles as *Emperor*, *Empress*, *Archduke*, which occur in both strong and weak proper names: *Emperor Haile Selassie* or *the Emperor Haile Selassie*. *The emperor Haile Selassie*, however, is possible though unlikely as an appositive construction.

<sup>81</sup>Note, then, that in its primary use a noun such as *Kim* is non-count: it is only in certain of the secondary uses that it can combine with numerals and hence qualify as a count noun.

## (a) To denote a set of bearers of the name

- [6] i [*The Mary that you met yesterday*] is my fiancée.  
 ii *I've never met [an Ophelia] before.*  
 iii *There are [two Showcase Cinemas] in Manchester.*  
 iv *Shall we invite [the Smiths]?*  
 v *Was it [THE Bill Gates] he was talking about?*

This use exploits the fact that names are quite typically not uniquely assigned. Although there is only one country named *Zaire*, there are thousands of people named *Mary*. The name *Mary* can then denote the set of people bearing this name, rather than some specific individual, as in the primary use. As a set-denoting noun, the name *Mary* then takes a full range of dependents, including determiners and restrictive modifiers, comparable to those permitted by common nouns. In [i], for example, I select from amongst the set of people named *Mary* the particular one that you met yesterday, and in [ii] I say that I have never met a person named *Ophelia*. Example [iii] illustrates the use of a proper name with a common noun head: it says there are two cinemas with that name in Manchester. A more specific use is seen in [iv]: *the Smiths* refers to an identifiable group of people with the surname *Smith*; here it will be a married couple or a family, but in other contexts it might be a dynasty. In [v] the stressed article indicates reference to the famous bearer of the name, as opposed to other people with that name.

## (b) To denote a set of entities having relevant properties of the bearer of the name

- [7] i *We need [another Roosevelt].*  
 ii *She's [no Florence Nightingale].*

In [i] we understand “another person with the properties associated with Roosevelt”, while [ii] says that she doesn't have the properties needed to qualify as another Florence Nightingale.

## (c) To denote a set of manifestations of the bearer of the name

- [8] i *This is not [the Paris I used to know].*  
 ii *This is [a United States I prefer to forget].*  
 iii [*The young Isaac Newton*] showed no signs of genius.

In [i] I distinguish between a previous manifestation of Paris (which may have been a pleasant one), and a current manifestation. Example [ii] shows that, in this use, a normally plural name can head a singular NP – when we are concerned with a single manifestation. In [iii] the adjective *young* is used restrictively: what is referred to is the manifestation of Isaac Newton in his youth, rather than as an established scientist; such a use should be contrasted with the non-restrictive embellishment use of the adjective in *Young Isaac Newton went off to Cambridge*.

## (d) To denote a set of products created by the bearer of the name

- [9] i *The gallery has acquired [a new Rembrandt].*  
 ii *Let's listen to [some Beethoven] tonight.*

In [i] the gallery has acquired a new picture by Rembrandt, and in [ii] I want us to listen to some music by Beethoven. As this latter example demonstrates, this use allows non-count as well as count interpretations.

This use covers various commercial products: in *She was driving [a Ford]*, for example, we understand “a car manufactured by Ford (i.e. the Ford Motor Company)”. This case is to be distinguished, however, from *She was driving [a Cortina]*, where *Cortina* is a tradename but not a proper name. It is not a name assigned to an **individual**: rather, it is a term coined to denote a **kind**. The same applies to a great number of commercial names. In *I bought [some Maltesers]*, for example, **Malteser** is simply a common noun denoting a kind of chocolate confection.

(e) To denote a set of copies/editions, etc., of the entity bearing the name

- [10] i *Can I borrow [your Guardian] for a few minutes?*  
 ii *The film was reviewed in [yesterday's Herald-Tribune].*

This use is largely restricted to proper names belonging to the category of titles. These examples involve newspaper titles: we understand “your copy of ‘The Guardian’”, “yesterday’s edition of the ‘(New York) Herald-Tribune’”. The particular interpretation will depend on the kind of work bearing the title: compare *last night's ‘Carmen’* (“performance”), *Peter Hall's ‘Hamlet’* (“production”).

## 20.5 NPs in vocative function

NPs serving as terms of address are said to be in **vocative** function:<sup>82</sup>

- [11] *What do you think, Senator Fox?*

The main kinds of NP that can realise the vocative function are illustrated in:

- [12] i *Mary, Smith, Mary Smith, Mr/Dr Smith, Sir John* [personal names]  
 ii *Mum/Mom/Mummy; son, daughter, aunt, uncle, cousin* [kin terms]  
 iii *Your Majesty, Your (Royal) Highness, Ma'am, sir, madam* [status terms]  
 iv *driver, officer* (“member of police force”), *waiter, vicar* [occupational terms]  
 v *buddy* (AmE), *mate* (BrE/AusE), *gentlemen, ladies, guys* [general terms]  
 vi *darling, dear, honey, love, sweetheart, gorgeous, handsome* [terms of endearment]  
 vii *fatty, idiot, imbecile, nitwit, slowcoach, swine* [derogatory terms]  
 viii *you, you-all* (Southern US), *you with the glasses* [2nd person pronoun]  
 ix *somebody, anybody, everybody, someone* [compound determinatives]

Personal nouns are used alone or with certain appellations. The use of a surname alone, once quite prevalent in Victorian Britain, is now restricted to a very few contexts, such as certain British public schools and the armed forces (addressing those of low rank). Forms like *Mary Smith* are also contextually restricted, but may be used in the classroom, especially if there is more than one Mary in the class. The kin terms include those that can be used with the status of proper names, but also others, such as *son* or *cousin*, that are hardly possible as proper names. (As a vocative, *son* can be applied to any young male, and in this sense it belongs with the general terms in [v].) The status terms include a good number of appellations. There are also special vocative terms for aristocrats and others of especially high status: *Your Majesty*, *Ma'am* (for the Queen), *My Lord*, *Your*

<sup>82</sup>The term ‘vocative’ is standardly used for both a function, as here, and, where relevant, a case (contrasting with nominative, accusative, etc.) used in vocative function. English of course has no vocative case, and hence ‘vocative’ is used in this grammar exclusively for the function.

*Honour* (for a judge), and so on. Some appellations and other terms have *Mr* or *Madam* added for the vocative: *Mr President*, *Madam Chair!*<sup>6</sup> *Chairman*. *Sir* and *Madam* are the polite terms for strangers (or in certain contexts for those of higher social rank); *Mr* and *Mrs* would generally be considered non-standard or impolite as vocatives, though *Miss* is used for girls or young women (and schoolteachers). The occupational terms in [iv] are not used as appellations, and as vocatives are normally used only when the person addressed is engaged in the relevant occupation.

General human nouns are often accompanied by such dependents as *my*, *old*, *young*: *my boy/girl*, *old chap* (BrE), *young man*. Genitive *my* is also often used with the terms of endearment: *my darling*; some of these terms are used as attributes to personal names or general nouns, as in *darling Anna*, *my dear friends*. Vocative *gorgeous*, *handsome*, and the like are syntactically NPs with fusion of modifier and head of a type permitted only in vocative function. Derogatory terms are commonly accompanied by determinative *you*, as in *you stupid bastard*, etc. The pronoun *you* (or *you-all*) in [12viii], by contrast, is head of the vocative NP. Among the compound determinatives ([ix]) the *some-* and *any-* forms are used when no specific person is addressed: *Fetch me a chair*, *somebody!* One further vocative type is the fused relative in, say, *Come out*, *whoever you are!*, characteristically used when I can't see you or otherwise don't know who you are.

Vocatives can be used to call someone (*Kim, dinner's ready!*), to attract their attention, to single out one person among a group as the addressee, and so on. It will be clear from the above survey, however, that vocative terms generally convey a considerable amount about the speaker's social relations or emotive attitude towards the addressee, and their primary or sole purpose is often to give expression to this kind of meaning, as in *Yes, sir!* or *I agree, my dear, that it's quite a bargain*.

A vocative can stand alone without any sense of ellipsis, and for this reason cannot be regarded as a dependent of the verb. It is best regarded as a kind of interpolation – one that can appear, like certain adjuncts, in front, central, or end position (cf. Ch. 8, §20).

## 1 Preliminaries

The last three chapters have dealt with the two most fundamental lexical categories (parts of speech) in English, verbs and nouns. Nouns are the commonest words in text, the most abundant in the dictionary, and the most productively added to the language by word-formation processes and borrowing. Verbs are fundamental in the sense that they function as head in clause structure, and they are second only to nouns in text and dictionary frequency. All canonical clauses contain at least a noun and a verb, and the simplest ones contain just one of each: *Rain fell*; *People change*; *Kim disappeared*.

But there are not enough nouns and verbs to express every shade of meaning needed. There is a noun to denote water, but not different nouns for water at various temperatures. There is a verb to denote falling (indeed, several: *fall*, *drop*, *sink*, *plummet*, . . .), but not enough different verbs to denote falling at all the different speeds we might want to distinguish, or in all the different ways things might fall.

In English the necessary finer gradations of meaning are expressed by means of words (and phrases) that alter, clarify, or adjust the meaning contributions of nouns and verbs. The words used to modify nouns are typically **adjectives**, and the words that similarly modify verbs are **adverbs**:

- [1] i a. [*Heavy rain*] *fell*.                      b. [*Young people*] *change*.                      [adjective]  
       ii a. *Rain* [*fell heavily*].                      b. *People* [*change slowly*].                      [adverb]

Many of the adverbs that modify verbs can also modify adjectives and other adverbs. The primary syntactic distinction, therefore, is between adjectives, which modify only nouns, and adverbs, which modify all the other categories – verbs, adjectives, prepositions, determinatives, and other adverbs. Compare, for example:

- [2] i *They made a lot of* [*unnecessary changes*].                      [noun]  
       ii *They had* [*worried unnecessarily*].                      [verb]  
       iii *Their response was* [*unnecessarily long*].                      [adjective]  
       iv *They had treated him* [*unnecessarily harshly*].                      [adverb]

Here the noun *changes* is modified by the adjective *unnecessary*, while the verb *worried*, the adjective *long*, and the adverb *harshly* are all modified by the adverb *unnecessarily*.

In addition to modifying nouns, adjectives may have a predicative function: *The rain was heavy*; *They are young*. In these examples the adjectives are syntactically complements of the verb *be*, but semantically they constitute the main part of the predicate. As a lexeme,

but under restricted conditions they occur in NPs with nouns as head. Postpositive adjectives are much less frequent than attributive and predicative ones: adjectives are admissible in this position only under severe syntactic constraints.

Strictly speaking it is AdjPs that occur in these functions, but we can talk of attributive, predicative, and postpositive uses of an adjective with the understanding that the adjective is head of an AdjP in the function in question. The AdjP will consist of the head adjective alone or accompanied by its dependents.

The majority of adjectives can occur in all of these three main functions, as illustrated for *happy* in [1i]. Nevertheless there are a significant number of adjectives which, either absolutely or with a certain meaning, are restricted to attributive function (e.g. *mere, former, main*) or excluded from it (e.g. *alone, asleep, glad* “happy/pleased”). Adjectives that can function predicatively can also occur in postpositive function (subject to the syntactic constraints alluded to above), but there are a handful of adjectives that qualify as such solely by the ability to occur in postpositive function: *the president elect, gifts galore*.

### ■ Further adjectival functions

- |     |     |                        |                                    |                                |                         |
|-----|-----|------------------------|------------------------------------|--------------------------------|-------------------------|
| [3] | i   | <i>such a nuisance</i> | <i>so serious a problem</i>        | [predeterminer]                |                         |
|     | ii  | <i>the rich</i>        | <i>the bigger of the two</i>       | <i>the most useful of them</i> | [fused modifier-head]   |
|     | iii | <i>He died young.</i>  | <i>They served the coffee</i>      | <i>blindfolded.</i>            | } [predicative adjunct] |
|     | iv  | <i>Furious,</i>        | <i>he stormed out of the room.</i> |                                |                         |

**Predeterminer** AdjPs occur as external modifier in NP structure, preceding the definite article *a*. This construction is subject to highly restrictive structural conditions described in §3.3. All adjectives that can head a predeterminer AdjP can also be used attributively – cf. *such tools, a serious problem*.

The **fused modifier-head** AdjPs in [3ii] combine the functions of internal modifier and head in NP structure; this construction is described in Ch. 5, §9.3. All adjectives that can function in this construction can also be used attributively.

Finally, the AdjPs in [3iii–iv] function as **predicative adjunct**. Those in [3iii] are integrated into clause structure and hence modifiers, while that in [iv] is detached and hence a supplement. All adjectives that can function as predicative adjunct can also function as predicative complement.

### ■ Functional potential as the feature distinguishing adjectives from adverbs

It is function that provides the primary basis for the distinction between adjectives and adverbs. Consider such adjective–adverb pairs as those in:

- |     |  |   |
|-----|--|---|
| [4] | ADJECTIVE                                | ADVERB                                    |
|     | i a. <i>a <u>rapid</u> improvement</i>   | b. <i>It <u>rapidly</u> improved.</i>     |
|     | ii a. <i>a <u>surprising</u> depth</i>   | b. <i><u>surprisingly</u> deep/deeply</i> |
|     | iii a. <i>Progress was <u>rapid</u>.</i> | b. <i>We progressed <u>rapidly</u>.</i>   |

In [i–ii] the underlined word is in modifier function, and the adjective member of the pair occurs when the modifier is modifying a noun (*improvement* in [ia], *depth* in [iia]), and the adverb occurs when it is modifying a verb (*improved* in [ib]) or else an adjective or another adverb (*deep* and *deeply* respectively in [iib]). While *rapid* in [ia] is attributive, in [iiia] it is predicative complement, and adverbs cannot function as predicatives: in

[iiib] *rapidly* is modifying the verb, just as in [ib], differing only in its position relative to the head.

For the most part, the forms that occur in attributive and predicative function are distinct from those modifying verbs, adjectives, or adverbs: in a great number of cases, as in [4], the adverb is morphologically derived from the adjective by suffixation of *·ly*. Where there is overlap, as with such lexemes as *fast*, *hard*, *early*, or such inflected forms as *better* or *worse*, we treat the item concerned as belonging to both categories. Whether any given instance is an adjective or adverb can be determined indirectly by seeing which member of pairs like *rapid/rapidly* or *surprising/surprisingly* could replace it, or directly, on the basis of the function:

- | [5] | ADJECTIVE                                      | ADVERB                                 |
|-----|--|--|
| i   | a. <i>an <u>early</u> departure</i>            | b. <i>They departed <u>early</u>.</i>  |
| ii  | a. <i>Kim's performance was <u>better</u>.</i> | b. <i>Kim performed <u>better</u>.</i> |

### ■ Predicative complements of *become*, *make*, *seem*

Predicative adjectives most often occur as complement to the verb *be*, but *be* allows such a wide range of complements that its value as a diagnostic is quite limited. Much more useful from this point of view are the verbs *become* and *make*, and to a lesser extent *seem*, *appear*, *feel*, *look*, *sound*, which take a more restricted range of complements. In particular, they wholly or largely exclude PP complements. Compare [6], where the complements are adjectives, with [7], where they are PPs:

- |     |     |  |  |
|-----|-----|--|--|
| [6] | i   | a. <i>The car is <u>rusty</u>.</i>         | b. <i>The car became <u>rusty</u>.</i>               |
|     | ii  | a. <i>They are <u>impatient</u>.</i>       | b. <i>This made them <u>impatient</u>.</i>           |
|     | iii | a. <i>They are all <u>content</u>.</i>     | b. <i>They all seem <u>content</u>.</i>              |
| [7] | i   | a. <i>The car is <u>in the garage</u>.</i> | b. <i>*The car became <u>in/into the garage</u>.</i> |
|     | ii  | a. <i>They are <u>behind schedule</u>.</i> | b. <i>*This made them <u>behind schedule</u>.</i>    |
|     | iii | a. <i>They are all <u>outside</u>.</i>     | b. <i>*They all seem <u>outside</u>.</i>             |

We are of course concerned here with *make* as a complex-transitive verb (“cause to be”): other uses of *make* allow PPs, but not as predicative complement.

*Seem*, *appear*, etc., allow predicative PPs with idiomatic meanings, such as in a *bad temper*, *in good working order*, *in good shape*, *out of control*, *under the weather*. But even these are normally excluded by *become* and *make*: compare *He seems in a bad temper*; *\*He became in a bad temper*; *\*This made him in a bad temper*.

### ■ Predicative adjuncts in front position: the predicand requirement

Predicatives require an overt or understood predicand. In *Kim seemed sad*, the predicand is the subject *Kim*; in *I consider his behaviour outrageous*, it is the object *his behaviour*; and in *Be careful*, it is the understood 2nd person subject.

This requirement provides the basis for distinguishing between adjectives and prepositions functioning as head of a phrase in front position in the clause. Compare:

- |     |    |   |        |
|-----|----|---|--------|
| [8] | i  | <i><u>Upset</u>, the children had daubed paint on the walls.</i>    | [AdjP] |
|     | ii | <i><u>Upstairs</u>, the children had daubed paint on the walls.</i> | [PP]   |

In [i] *upset* is in predicative function, with the subject *the children* as predicand: the sentence entails that the children had been upset. In [ii] *upstairs* is an adjunct of location and has no predicand: its role is to indicate where the event took place, not to give the location of the children. Of course, if the event took place upstairs it is a reasonable inference that

the children were upstairs, but this is incidental, and not in fact an entailment. One could imagine a scenario, for example, where the children were standing on ladders outside the house and had a paintbrush attached to a long pole which they put through the window. The point can, however, be made more simply by contrasting such a pair as:

- [9] i \**Upset*, there was nothing going on.  
 ii *Upstairs*, there was nothing going on.

*Upset* is unacceptable here because it has no predicand, whereas the location adjunct *upstairs*, having no such requirement, is fine. The same distinction is found with the adjective *alone* and the preposition *ashore*: *Ashore*/\**Alone*, there was much drunkenness.

This is not to say that PPs in front position cannot be predicative. Idiomatic PPs like those mentioned above as admissible complements to *seem* – i.e. *in a bad temper*, *under the weather*, etc. – function predicatively, and in front position require a predicand: *In a bad temper*, Max seemed intent on ruining everybody's fun, but not \**In a bad temper*, there was nothing to do. But *in a bad temper* is a phrase with *in* as its head, and phrases headed by *in* can in general freely occur non-predicatively: *In winter there isn't much to do*. The predicand requirement thus provides a test that applies to head words:

- [10] Adjectives cannot head clause-initial phrases unless they are related to a predicand, whereas prepositions can.

## 2.2 Grading

### ■ Gradable and non-gradable adjectives

The prototypical adjective is **gradable**: it denotes a property that can be possessed in varying degrees. The degree can be questioned or indicated by means of a degree adverb: [*How good*] *is it?*; *She seems* [*very young*]; *Things are getting* [*rather serious*].

There are, however, a great many adjectives that are non-gradable. The following small sample will give an idea of how extensive the class of non-gradable adjectives is:

- [11] *alphabetical*    *ancillary*    *chief*    *equine*    *federal*    *glandular*  
*latter*            *left*            *marine*    *medical*    *obtainable*    *orthogonal*  
*phonological*    *pubic*            *residual*    *syllabic*    *tenth*            *utter*

It should be emphasised, however, that the distinction between gradable and non-gradable – like that between count and non-count in nouns – applies to uses or senses of adjectives rather than to adjectives as lexemes. Many items can be used with either a gradable or a non-gradable sense (often with the latter representing the primary meaning of the adjective). Compare:

- | [12] | NON-GRADABLE SENSE                  | GRADABLE SENSE                                       |
|------|-------------------------------------|--|
| i    | a. <i>the <u>public</u> highway</i> | b. <i>a very <u>public</u> quarrel</i>               |
| ii   | a. <i><u>Christian</u> martyrs</i>  | b. <i>not very <u>Christian</u> behaviour</i>        |
| iii  | a. <i>a <u>British</u> passport</i> | b. <i>He sounds very <u>British</u>.</i>             |
| iv   | a. <i>The door was <u>open</u>.</i> | b. <i>You haven't been very <u>open</u> with us.</i> |

### On so-called 'absolute' adjectives

Adjectives such as the following are traditionally classified as 'absolutes':

- [13] *absolute*            *complete*    *correct*    *equal*    *essential*    *eternal*  
*ideal*                  *impossible*    *perfect*    *supreme*    *total*            *unique*

There has been a prescriptive tradition of saying that such adjectives are non-gradable, and hence should not be used in comparative constructions or with degree modifiers such as *very*, *somewhat*, etc. *Unique* is especially picked on: students are vilified for writing *highly unique* or *one of the more unique features* or *the most unique person*. The meaning of *unique*, it is claimed, guarantees that it is absolutely non-gradable: a thing is unique if and only if it is the sole thing that has the property under consideration. Hence, the reasoning goes, I cannot speak of a piece of jewellery as ‘very unique’: if its uniqueness is not absolute then it is not unique at all. Likewise, some hold, an object cannot be more unique than another, since an absolute degree of uniqueness is the only degree of uniqueness there is.

Only the most conservative of manuals still present this rule without qualification. Others recognise that it conflicts with established usage, as illustrated in such examples as:

- [14] i *His technical ignorance had proved [even more complete than he had thought].*  
 ii *A [more perfect] rake has seldom existed.*  
 iii *The [most essential] characteristic of mind is memory.*

As for *unique*, we find *more unique* meaning “more nearly unique”, but the adjective has also acquired the sense “exceptional, unusual”, which quite readily accepts degree modification: *this rather unique situation*, *the most unique person I’ve ever met*, and so on.

Gradability itself is not an all-or-nothing matter. Even conservative manuals accept that adjectives such as *complete*, *perfect*, *total*, *unique* admit the degree adverbs *almost* and *nearly*, but these are incompatible with most of the adjectives in [11]. And there are differences among the adjectives in [13]: *essential* accepts interrogative *how* more readily than most of the others, *unique* (in the “exceptional” sense) accepts *rather* more readily than most of the others, and so on. But these are matters of semantic compatibility, not of grammaticality.

### ■ Gradability not restricted to adjectives

The gradable vs non-gradable contrast applies with adverbs in the same way as with adjectives: *soon* and *quickly* are gradable, *alphabetically* and *phonologically* are not. It is function, not grading, that distinguishes adverbs from adjectives.

More important for present purposes is that nouns and verbs can be gradable (though the proportion of gradable words in these categories is much smaller). The noun *success*, for example, is gradable: one can have varying degrees of success. Similarly with *problem*: something can be a problem in varying degrees. The same applies to such verbs as *love*, *like*, *enjoy*: these are just as gradable as the adjectives *fond*, *likeable*, *enjoyable*.

What distinguishes adjectives and adverbs from nouns and verbs, therefore, is not that the former may take degree dependents while the latter may not. It is a matter of the syntactic constructions used to express grading.

### ■ Modification by the degree adverbs *very* and *too*

The degree adverbs *very* and *too* modify adjectives and adverbs, but not nouns and verbs:

- [15] i a. *She was [very helpful].*                      b. *His delivery was [too hurried].*                      [Adj]  
 ii a. *She acted [very helpfully].*                      b. *He spoke [too hurriedly].*                      [Adv]  
 iii a. *\*It wasn’t of [very help].*                      b. *\*He is in a [too hurry].*                      [N]  
 iv a. *\*You haven’t [very helped] us.*                      b. *\*He had [too hurried].*                      [V]

The adverb *very* (“to a high degree”) is to be distinguished from the adjective *very* (“exact, true”). The latter does not express degree and can of course modify nouns, as in *That’s the very thing we’re looking for* or *The child was the very picture of innocence*. Similarly the degree adverb *too* (“excessively”) is to be distinguished from the focusing adverb *too* (“in addition”), which can occur in post-head position in phrases of any of the major categories – cf. [*Kim too*] *was present*; *They play the piano and [sing too]*.

With nouns and verbs the closest counterparts to the constructions in [15i–ii] contain the determinative *much*: (*very*) *much* and *too much*. *Much* is a polarity-sensitive item and hence distributionally more restricted than *very* (see Ch. 9, §4.1.2): it is for this reason we are using negatives for the [a] examples. Compare, then:

- [16] i a. *You haven’t [helped us (very) much]*.      b. *He [worries too much]*.      [V]  
 ii a. *It wasn’t [(very) much help]*.      b. *It was [too much trouble]*.      } [N]  
 iii a. *It wasn’t [(very) much of a success]*.      b. *He’s in [too much of a hurry]*.

With verbs, *much* functions as head of a degree modifier in the VP. With nouns there are two constructions to consider. In [ii], *much*, together with its dependents, functions as determiner with the noun as head of the NP; *much* here is restricted to occurrence with non-count singular nouns. In construction [iii], *much* is fused determiner-head with an *of* phrase complement; the noun in that PP must be a count singular determined by *a*.

Under restricted conditions, adjectives and adverbs can also take *much* as degree modifier, but for present purposes the major point is that they are distinguished from nouns and verbs by their ability to take *very* and *too* in central constructions like [15i–ii].

In general, PPs don’t take *very* and *too* as degree modifiers. Some of the idiomatic PPs mentioned above as admissible complements of *seem*, etc., do allow them, but with *much* as an alternative construction:

- [17] i a. *\*It was [very before lunch]*.      b. *\*We placed it [too above the floor]*.  
 ii a. *He’s [very (much) in the know]*.      b. *He was [too (much) out of sorts to join in]*.

## ■ Inflectional and analytic grade

The second respect in which grading in adjectives and adverbs is syntactically distinctive concerns comparison. Gradable adjectives and adverbs enter into a system of grade, marked inflectionally or analytically.

### The inflectional system

A large number of adjectives and a few adverbs inflect for grade, but verbs and nouns do not:

[18]	PLAIN	COMPARATIVE	SUPERLATIVE	
i	<i>flat</i>	<i>flatter</i>	<i>flattest</i>	[Adj]
ii	<i>soon</i>	<i>sooner</i>	<i>soonest</i>	[Adv]
iii	<i>enjoy</i>	<i>*enjoyer</i>	<i>*enjoyest</i>	[V]
iv	<i>success</i>	<i>*successer</i>	<i>*successesest</i>	[N]

For the most part determinatives and prepositions do not inflect for grade either, but there are a handful of exceptions, the determinatives *much*, *many*, *little*, and *few* (e.g. *few, fewer, fewest*) and the prepositions *near*, *close*, and *far*. Such forms as *inner*, *outer*,

and *upper* are morphologically related to the prepositions *in*, *out*, and *up*, but it is a derivational relationship, not an inflectional one. *Inner* is not the comparative form of a lexeme *in*, but a distinct lexeme which belongs to the category of adjectives. It differs from the preposition *in* that it cannot take an NP complement (*in*/\**inner the woods*), and it differs from inflectional comparatives in that it cannot take a *than* complement (\**This is inner than that*). The same applies to *outer* and *upper*, and such forms as *innermost* are likewise adjectives formed by derivation, not inflectional superlatives.

### Analytic comparatives and superlatives

With adjectives and adverbs, analytic comparatives and superlatives are formed by means of the degree adverbs *more* and *most* in pre-head position:<sup>2</sup>

- [19] i *useful*                      *more useful*                      *most useful*                      [Adj]  
 ii *seriously*                      *more seriously*                      *most seriously*                      [Adv]

Verbs and nouns can combine with *more* in the constructions illustrated in [16]:

- [20] i *He* [*worries more than I do*].                      [V]  
 ii *It was* [*more trouble than it was worth*].                      }  
 iii *It was* [*more of a success than I'd expected*].                      [N]

The *more* in [20] is the inflectional comparative form of the determinative *much* of [16], rather than an adverb serving as an analytic marker of the comparative: see Ch. 13, §4.1.1, for this distinction. In the verbal construction, *more* follows the head rather than preceding it, as with adjectives and adverbs. Compare, then: *It was more enjoyable than usual* and *I enjoyed it more than usual*. In [20ii], *more* is in determiner function and again excludes count singular heads. Unlike *much*, however, it accepts count plurals (*It caused more problems than usual*): *more* is the inflectional comparative of *many* as well as of *much*. With count singular nouns, we again have the distinctive *of + a* construction, as in [20iii].

In general, PPs don't allow analytic comparatives: compare, for example, prepositional \**They arrived more before lunch than I did* with adverbial *They arrived earlier than I did*. However, the idiomatic PPs that allow *very* and *too*, as in [17ii], also accept *more*: *They now seem more in control than they were last week*.

### ■ Placement of *enough*

The third place where we find differences in the expression of grading depending on the category of the head concerns the determinative *enough*. Compare first:

- [21] i a. *He wasn't* [*old enough*].                      b. \**He wasn't* [*enough old*].                      [Adj]  
 ii a. *He can't speak* [*clearly enough*].                      b. \**He can't speak* [*enough clearly*].                      [Adv]  
 iii a. *He doesn't* [*care enough*].                      b. \**He doesn't* [*enough care*].                      [V]  
 iv a. *There isn't* [*enough time*].                      b. *There isn't* [*time enough*].                      }  
 v a. *He isn't* [*enough of a scholar*].                      b. \**He isn't* [*of a scholar enough*].                      [N]

When the head is an adjective, adverb, or verb, *enough* follows, as in [i–iii]. With nouns there are again two constructions. In [iv], which admits plural and non-count singular nouns, *enough* can occur in either pre-head or post-head position. The pre-head version [iva] is, however, much the more usual; as it stands, [ivb] is perhaps only

<sup>2</sup>On the question of which adjectives and adverbs take inflectional comparatives and superlatives, and which take analytic ones, see Ch. 18, §3.2.

marginally acceptable, but it improves considerably if we add a complement licensed by *enough*: *There isn't time enough for that*. In construction [v], *scholar* is not head of the whole NP but part of the *of* phrase complement, and for this reason it must follow *enough*.

In [21i–iv] the head word has no dependent other than *enough*; consider next some cases where it also has a complement:

- [22] i a. *He isn't [keen enough on the idea].*      b. *?He isn't [keen on the idea enough].*  
 ii a. *He didn't [care enough about me].*      b. *He didn't [care about me enough].*  
 iii a. *\*He doesn't [like enough the idea].*      b. *He doesn't [like the idea enough].*

In [i–ii] the complement has the form of a PP; with adjectives the preferred position for *enough* is between the head and the complement, as in [ia], whereas with verbs there is no clear preference for this position over one where it follows the complement, as in [iib]. One completely general rule, however, is that *enough* cannot intervene between the head and an NP complement (leaving aside the case where a heavy NP is postposed – see Ch. 16, §4). This applies whatever the category of the head. As far as the verb is concerned, the deviance of [iiia] is the same as that of *\*He didn't read carefully the report*: modifiers cannot in general intervene between a verb and its object.

Like *much*, *enough* does not generally occur with PPs: *\*We left enough before the end of the meeting to catch our train*. It is found with the idiomatic PPs that allow the other kinds of grading. The positional possibilities are illustrated in:

- [23] i *I'm not [enough in control of things to go away for a week].*  
 ii *\*I'm not [in enough control of things to go away for a week].*  
 iii *?I'm not [in control enough of things to go away for a week].*  
 iv *?I'm not [in control of things enough to go away for a week].*

The normal position for *enough* is before the head, as in [i]. In accordance with the general rule given in the last paragraph, it cannot come between a preposition and an NP complement. This is illustrated in [ii] – which is to be understood with *enough* a modifier to *in*, not determiner to *control* (compare *We're in enough trouble as it is*, where *enough trouble* is an NP, so that the construction belongs with [21iva]). The positions shown in [23iii–iv] are marginally possible; there is some variation in judgements on these constructions, and also with respect to different prepositional idioms: *He wasn't in love with her enough to give up his career*, for example, seems fine.

## 2.3 Adverbs as dependents

Pre-head modifiers of adjectives characteristically belong to the adverb category, as in attributive *a [highly controversial] proposal* or predicative *The proposal is [highly controversial]*. This feature is related to the last in that adverbial modifiers commonly indicate degree. But this is by no means their only semantic function: compare *her [often irate] father-in-law*, where *often* is a frequency modifier, or *an [obviously phonological] issue*, where *obviously* is a modal modifier – and *phonological* is non-gradable.

This property distinguishes adjectives from nouns. We have noted that characteristically single-word modifiers of nouns are adjectives, while those modifying verbs are adverbs, and – leaving aside *very* and *too* – modifiers of adjectives and adverbs are,

broadly speaking, a subset of those that modify verbs. This is illustrated in [24], where double underlining marks the head, and single underlining the modifier:

[24]	HEAD	MODIFIER
i <i>They were subjected to [<u>excessive</u> <u>force</u>].</i>	noun	adjective
ii <i>She [<u>worries</u> <u>excessively</u>].</i>	verb	} adverb
iii <i>He was [<u>excessively</u> <u>persistent</u>].</i>	adjective	
iv <i>They had been driving [<u>excessively</u> <u>fast</u>].</i>	adverb	

The form of the dependent thus provides a test for distinguishing between predicative complements with the form of an AdjP and those with the form of a bare NP. Compare *That's stupid* and *That's nonsense*, for example. *Stupid* is an adjective taking adverbs as modifier (*That's utterly stupid*), while *nonsense* is a noun taking adjectives as modifier (*That's utter nonsense*).

## 2.4 Adjectives in comparison with words of other categories

In the last three sections we have presented the positive features of adjectives, and seen how they distinguish adjectives from other words. In this section we aim to develop our account of adjectives a little further by comparing them in turn with nouns, determinatives, and verbs. The distinction between adjectives and prepositions is discussed in Ch. 7, §2.2.

### 2.4.1 Adjectives vs nouns

The properties of nouns have been described in detail in Ch. 5, but the ones most relevant to distinguishing nouns from adjectives are repeated summarily in:

- [25] i Phrases with a noun as non-fused head can occur as subject, object, or predicative complement in clause structure.  
 ii Count nouns inflect for number.  
 iii Nouns characteristically take adjectives as pre-head modifiers.  
 iv Nouns take determiner dependents.

In *They had left [some rotten apples] on the table*, for example, *apples* qualifies as a noun by all four criteria: it is head of the phrase in object function, it is in plural form, contrasting with singular *apple*, it is modified by the adjective *rotten*, and determined by the determinative *some*. As far as property [i] is concerned, we should exclude, for diagnostic purposes, clauses headed by *be* in its specifying sense, since phrases of any major category can occur as subject or predicative complement in clauses of this type. In *Rather more humble is how I'd like him to be*, for example, the subject is an AdjP.

The adjective and noun properties in [1] and [25] for the most part distinguish clearly between the two categories. Where the criteria give conflicting results we have homonymy:

- [26] i *It was a very professional performance.* [Adj]  
 ii *She did better than all the professionals.* [N]

Attributive *professional* in [i] is modified by *very*, indicating that it is an adjective, while the plural form in [ii] must be a noun: the singular form *professional* is thus a noun

thus strong grounds for distinguishing *the* and *a* from adjectives at the primary level of classification.

### ■ Criteria for determinatives

Words like *this* and *that* or *some* and *any* can be seen to have more in common with the articles than with *good* and *bad* and *happy*.

#### (a) Mutual exclusiveness with the articles

The clearest members of the determinative category cannot combine with the articles. Thus we have *a good book*, but not *\*a this book*, and so on. This criterion admits the following items as determinatives:

[31]	<i>another</i>	<i>any</i>	<i>each</i>	<i>either</i>	<i>enough</i>	<i>every</i>
	<i>much</i>	<i>neither</i>	<b>no</b>	<i>some</i>	<i>that</i>	<i>this</i>
	<b>we</b> <sub>d</sub>	<i>what</i> <sub>int/rel</sub>	<i>whatever</i>	<i>which</i>	<i>whichever</i>	<i>you</i> <sub>d</sub>

Also admitted by this criterion are the complex forms *a few* and *a little*. The items **we**<sub>d</sub> and **you**<sub>d</sub> (as in *we/you students*) are distinguished from the pronouns **we** and **you**, and the *what* in [31] is the interrogative or relative determinative; exclamative *what* can combine with *a*, as in *What a disaster it was!*, and is best included in the adjective category (see below).

#### (b) Admissibility of count singular NPs

Cardinal *one* does not qualify by criterion (a) since it can follow *the* – though it is mutually exclusive with *a* (*the one problem that remains*, but not *\*a one problem that remains*). *One* is nevertheless like the articles and those determinatives in [31] that do not require plural or non-count heads in that it allows count singular nouns to occur as head of an NP. Compare again, then, *I bought one/neither book* (with *one* and *neither* determinatives) and *\*I bought good book* (with *good* an adjective).

#### (c) The partitive construction

The other cardinal numerals are semantically like *one* and a number of the determinatives in [31] in that they have to do with quantification, and syntactically this similarity is brought out by their ability to occur as fused determiner-head in a partitive construction. Adjectives cannot occur in this construction unless in comparative or superlative grade. Compare:

[32]	a. <i>one/three/which/neither of them</i>	b. <i>*(the) good of them</i>
------	---	-------------------------------

Instead of [b] we need *the good ones among them* or the like. Words not included in [31] that are admitted to the determinative category on the basis of this criterion are:

[33]	<i>all</i>	<i>both</i>	<i>certain</i>	<i>few</i>	<i>little</i>	<i>many</i>
	<i>several</i>	<i>sufficient</i>	<i>various</i>		cardinal numerals	

### ■ Consideration of selected items

#### *Many, few, much, little*

These items are admitted to the determinative category by criterion (c): cf. *many of them*, *much of it*, etc.; *much* also satisfies criterion (a). They nevertheless bear a considerable resemblance to adjectives. **Many** and **few** can occur as predicative complement: *Her virtues are many*. More importantly, all four are gradable, and have inflectional comparative and superlative forms. Even with grading, however, there is one syntactic feature

which differentiates them from adjectives. Compare:

- [34] i a. *He made [so many mistakes].*      b. \**He made [so numerous mistakes].*  
 ii a. *He gave me [so much sugar].*      b. \**He gave me [so hard work].*  
 iii a. [no count singular]      b. *He made [so big a fuss].*

Adjectives modified by *so* cannot function as pre-head dependent in NP structure except as a predeterminer before the indefinite article, but the determinatives *many*, *much*, etc., can. Thus *so numerous* cannot function as an internal modifier, but *so many* can function as determiner. This difference applies not just to *so* but to all the items that can modify adjectives in construction [iiib] (see §3.3 below). Compare, for example, *How many mistakes did they make?* and \**How numerous mistakes did they make?*

### Sufficient

We have classified *sufficient* as both a determinative and an adjective. It is a determinative when it is replaceable by *enough*, as in *sufficient helpers* or *sufficient help*, and it is an adjective in *a sufficient reason*, where it means “satisfactory, good enough”. The determinative *sufficient* meets criteria (a) and (c), and since it doesn’t occur with count singular heads (b) is inapplicable. It is, however, more limited in its distribution than *enough*, for it cannot occur in post-head position. Thus we have *time enough* but not \**time sufficient*, and *good enough* but not \**good sufficient*. Instead of the latter we have *sufficiently good*, and this relationship with a *ly* adverb differentiates *sufficient* from central members of the determinative category.

### Exclamative *what*

We take this – unlike interrogative and relative *what* – to be an adjective. It fails all of the determinative criteria (a)–(c). Compare, for example, the count singular exclamative *What a great book that is!* with interrogative *What book is that?*, where *a* is required in the former but inadmissible in the latter. The distribution of exclamative *what* is comparable to that of the adjective *such*, and in *what a great book* it is functioning as predeterminer like the AdjP *so big* in [34iiib] above.

## 2.4.3 Adjectives vs verbs

Primary forms of verbs, and also the plain form, are clearly distinct from adjectives: it is only with the gerund-participle and past participle forms that problems arise, for there are many adjectives that are homophonous with these forms of verbs. We need to consider two cases, one where the verb or adjective follows the verb *be*, and one where it modifies a noun.

### ■ Following the verb *be*

Gerund-participle and past participle forms of verbs follow *be* as a marker of progressive aspect and passive voice respectively, whereas adjectives follow *be* as a copula. Compare:

- |      |                                    |               |  |
|------|------------------------------------|---------------|--|
| [35] | VERB                               |               | ADJECTIVE                                |
| i    | a. <i>She was <u>sleeping</u>.</i> | [progressive] | b. <i>This was <u>disturbing</u>.</i>    |
| ii   | a. <i>He was <u>killed</u>.</i>    | [passive]     | b. <i>He was very <u>distressed</u>.</i> |
| iii  | a. <i>They were <u>seen</u>.</i>   |               | b. <i>He was <u>drunk</u>.</i>           |

This distinction is discussed for gerund-participles in Ch. 3, §1.4, and for past participles in Ch. 3, §1.3, and Ch. 16, §10.3, and hence can be dealt with here quite summarily. One

test for adjectival status is the possibility of replacing *be* by other complex-intransitive verbs such as *seem* and *become*. Thus we have *This seemed disturbing*, *He became very distressed*, *He appeared drunk*, but not *\*She seemed sleeping*, *\*He became killed*, *\*They appeared seen*. A second test is modification by *very* and *too*, as discussed in §2.2 above: *very* is present in [iib] and can be added to [ib/iib], but not to any of the [a] examples. A third, much less general, factor is meaning: the adjective *drunk* is semantically distinct from the past participle verb-form of *The milk had already been drunk*.

The two constructions are also often distinguished by the different patterns of complementation of verbs and adjectives. Most obviously, gerund-participles of transitive verbs take objects, whereas no participial adjective does: in *She was mowing the lawn*, therefore, *mowing* is very clearly a verb. Conversely, a verbal reading of *disturbing* in [35ib] can be excluded because there is no object: contrast verbal *This was disturbing me*. (The verb *disturb* can occur without an object, but [35ib] cannot plausibly be construed as an intransitive use.)

Past participles following *be* have a passive rather than perfect interpretation and (leaving aside cases of semantic specialisation as in the *drunk* example) the same normally applies to corresponding adjectives. Thus *distressed* in [35] denotes a state resulting from being distressed in the passive verbal sense. There are, however, a few exceptions. *Kim is retired*, for example, means that Kim is in the state resulting from having retired. Similarly, *They are gone* means that they are in the state resulting from having gone or departed.<sup>5</sup>

### ■ Modifying a noun

[36]	VERB	ADJECTIVE
i	a. <i>a sleeping child</i>	b. <i>some disturbing news</i>
ii	a. <i>a rarely heard work by Purcell</i>	b. <i>her very worried parents</i>

Two of the criteria we used in the construction with *be* are inapplicable in this modifying construction, and the distinction between verbs and adjectives is here not so sharply drawn, certainly in the past participle case. Since there is no verb *be* in [36], the issue of replacing it by *seem*, *become*, etc., does not arise. And complements are virtually excluded with attributive modifiers, so we do not have clearly verbal constructions like *\*a mowing the lawn gardener*.

*Very* again provides a sufficient but not a necessary condition for adjective status; it is present in [36iib], and can be added in [ib], but not in [ia/iiia]. Similarly, semantic divergence from the verb is sufficient to establish adjective status, as in *a winning smile* or, less obviously, *the winning team*, which means not “the team that is/was winning” but “the team that wins/won”.

In general, we will take the form as a verb if it cannot function as a predicative adjective. We have already seen that *sleeping* has no predicative adjective use; cf. also *a smiling face*, *the sinking ship*, *a dying man*, etc. Similarly with the past participle *heard* in [36iia] – or *this frequently visited shrine*, *the murdered man*, etc.

Again, past participles and corresponding adjectives in attributive position are usually interpreted passively: a rarely heard work is a work which one rarely hears. But here too

<sup>5</sup>The adjective *gone* also has various specialised meanings in informal style, including “pregnant” (cf. *She’s five months gone*) and “infatuated” (cf. *He’s quite gone on her*).

### ■ Adjectives that do not license complements

A large number of adjectives do not license complements of any kind. It is hard or impossible to find or envisage complements occurring with such adjectives as:

- [4]    *ambulatory*    *bald*            *concise*            *dead*            *enormous*    *farcical*  
           *gigantic*        *hasty*            *immediate*        *jaunty*        *lovely*        *main*  
           *nefarious*     *ostentatious*    *purple*            *quiet*        *red*            *regular*  
           *salty*            *tentative*        *urban*            *vivid*        *wild*            *young*

### ■ PP complements

We review here a range of constructions with PP complements. For each of the prepositions concerned we give a few examples of AdjPs containing a complement, followed by a sample of adjectives that license complements headed by this preposition. In the lists of adjectives we underline those where (for a given sense of the adjective) the complement is wholly or virtually obligatory in non-attributive constructions.<sup>6</sup>

#### Adjective + *about*

- [5]    *annoyed* *about the delay*    *concerned* *about the cost*    *mad* *about you*  
 [6]    *aggrieved*    *angry*            *annoyed*            *concerned*    *cross*            *delighted*  
           *glad*            *happy*            *knowledgeable*    *mad*            *pleased*        *reasonable*

In many cases, *about* alternates with *at* (*annoyed at the delay*). With *mad* in the sense “angry”, *at* and *about* are possible, but when it indicates enthusiasm or love only *about* is used, and here the complement is obligatory; both senses belong to informal style.

#### Adjective + *at*

- [7]    *aghast* *at the news*    *indignant* *at the allegations*    *pleased* *at being invited*  
           *adept* *at making people feel at home*    *good* *at chess*    *hopeless* *at arithmetic*  
 [8]    *adept*            *aghast*            *alarmed*            *amazed*            *amused*            *angry*  
           *astonished*    *bad*                *brilliant*            *clever*            *delighted*        *disgusted*  
           *gifted*            *good*                *hopeless*            *indignant*        *mad*                *marvellous*  
           *pleased*        *puzzled*            *skilled*            *superb*            *talented*        *terrible*

Semantically these adjectives fall into two groups. In one (*aghast*, *indignant*, etc.) the adjective denotes a psychological reaction to the phenomenon expressed in the complement of *at*: here *at* is generally replaceable by *about*. In the other (*adept*, *good*, etc.) the adjective denotes a property, capacity, or failing and the *at* phrase indicates its domain.

#### Adjective + *by*

- [9]    *very distressed* *by these insinuations*    *completely unaffected* *by the changes*  
 [10]    *amused*            *distressed*        *hurt*                *unaffected*        *unperturbed*    *worried*

This construction is confined to adjectives deriving from past participles in their passive use; it is discussed in Ch. 16, §10.1.3.

<sup>6</sup>We do not provide a list for *against*, but there is one adjective that selects complements headed by this preposition: *No security system is proof against the truly professional burglar.*

Adjective + *for*

- [11] *responsible for the poor performance*    *bad for you*    *greedy for power*  
 [12] *answerable*    *anxious*    *bad*    *difficult*    *eager*    *easy*  
       *good*        *grateful*    *greedy*    *necessary*    *responsible*    *sorry*

Adjective + *from*

- [13] *divorced from reality*    *remote from everyday life*    *distinct from each other*  
 [14] *alienated*    *averse*    *different*    *differentiated*    *distant*    *distinct*  
       *divorced*    *free*    *immune*    *remote*    *removed*    *separated*

*Averse*, *different*, and *immune* also take *to* (which is strongly favoured in the case of *averse*). With *free*, *from* alternates with *of*.

Adjective + *in*

- [15] *bathed in sunlight*    *fortunate in our choice*    *confident in my ability*    *covered in dust*  
       *dressed in military uniform*    *engaged in a court battle*    *steeped in history*  
 [16] *bathed*    *clothed*    *confident*    *covered*    *decisive*    *domiciled*  
       *dressed*    *embroiled*    *engaged*    *fortunate*    *inherent*    *interested*  
       *lacking*    *lucky*    *rooted*    *secure*    *steeped*    *swathed*

*Covered* also takes *with*, which is preferred over *in* in examples like *covered with a blanket*.

Adjective + *of*

- [17] *afraid of dogs*    *capable of murder*    *fond of children*    *sure of his facts*  
       *indicative of its importance*    *supportive of her husband*    *very kind of you*  
 [18] i *afraid*    *ashamed*    *aware*    *beloved*    *bereft*    *capable*  
       *certain*    *characteristic*    *cognisant*    *conscious*    *constitutive*    *convinced*  
       *desirous*    *destructive*    *devoid*    *distrustful*    *fond*    *full*  
       *heedless*    *ignorant*    *illustrative*    *indicative*    *mindful*    *productive*  
       *proud*    *reminiscent*    *representative*    *respectful*    *scared*    *short*  
       *suggestive*    *supportive*    *sure*    *tired*    *wary*    *worthy*  
       ii *careless*    *considerate*    *generous*    *good*    *honest*    *idiotic*  
       *kind*    *naive*    *noble*    *pleasant*    *silly*    *stupid*

*Beloved* incorporates a past participle, which accounts for the fact that the semantic roles are ordered as in a passive clause: compare *This tactic is much beloved of administrators* and *This tactic is loved by administrators*. The adjectives in [18ii] commonly occur in combination with *it* + extraposed subject, as in *It was very kind of you to wash the dishes*, alternating with a construction with a personal subject: *You were very kind to wash the dishes*.

Adjective + *on/upon*

- [19] *based on/upon firm evidence*    *bent on/upon vengeance*    *incumbent on/upon us*  
       *set on/upon regaining power*    *a bit tough on the audience*    *sweet on her*  
 [20] i *based*    *bent*    *contingent*    *dependent*    *incumbent*    *intent*    *reliant*    *set*  
       ii *big*    *easy*    *hard*    *keen*    *severe*    *sweet*

*Upon* occurs as a somewhat more formal alternant to *on* with the adjectives in [20i], but not those in [ii] – where *big* and *sweet* are markedly informal.

Adjective + *to*

- [21] *accustomed to getting his own way*    *allergic to morphine*    *beholden to no one*  
*good to me*    *responsible to the president*    *similar to mine*    *subject to revision*
- [22] accustomed    *allergic*    *allied*    *answerable*    attributable    *attuned*  
averse    *beholden*    *comparable*    *conducive*    *congruent*    *connected*  
*devoted*    *different*    *distasteful*    *due*    *equal*    *equivalent*  
*generous*    *good*    *hospitable*    *hostile*    *impervious*    inclined  
*inferior*    *injurious*    *integral*    *kind*    liable    *mean*  
*nice*    *opposed*    *parallel*    prone    *proportional*    *receptive*  
*reconciled*    *related*    *resigned*    *resistant*    *responsible*    *similar*  
subject    *subordinate*    *subservient*    *superior*    *susceptible*    tantamount

Adjective + *toward(s)*

- [23] *very friendly towards us*    *strongly inclined towards the other candidate*  
*respectful towards authority*    *not very sympathetic towards new ideas*
- [24] *antagonistic*    *friendly*    *hostile*    *inclined*    *respectful*    *sympathetic*

Except perhaps with *inclined*, *to* occurs as an alternant of *towards*.

Adjective + *with*

- [25] *careful with money*    *conversant with the rules*    *fed up with the noise*  
*good with her hands*    *happy with the result*    *obsessed with sex*    *tinged with gold*
- [26] *angry*    *annoyed*    *bored*    *browned off*    *busy*    *careful*  
*cautious*    *comfortable*    *compatible*    *concerned*    *connected*    consonant  
*content*    conversant    *covered*    *cross*    *delighted*    *depressed*  
*disappointed*    *disgusted*    *distressed*    *effective*    *enchanted*    *familiar*  
*fed up*    *firm*    fraught    *friendly*    *furious*    *gentle*  
*good*    *happy*    *harsh*    *impatient*    *obsessed*    *occupied*  
*parallel*    *pleased*    *reckless*    riddled    *rife*    *satisfied*  
*sick*    *skilful*    *stricken*    *strict*    taken    tinged

Adjective + comparative *as* or *than*

- [27] a. %*different than it used to be*    b. *the same as last time*
- [28] a. %*different other*    b. *same*    ?*similar*    *such*

The adjectives in [28a] express comparison of inequality and take *than*; those in [b] express comparison of equality and take *as*: for detailed description, see Ch. 13. *Different* also takes comparative complements headed by *from* or *to*, with *than* of questionable acceptability in BrE, while *similar* normally takes *to*, with *as* marginal in all varieties.

## ■ Clausal complements

The range of clausal complements found in AdjP structure is illustrated in:

- [29] i *I'm [glad that you were able to come].*    [declarative content clause]  
 ii *She was [insistent that the charge be dropped].*    [mandative]  
 iii *I'm not [sure whether that will be possible].*    [interrogative]  
 iv *I was [amazed what a fuss he made].*    [exclamative]

- v *She is [willing to renegotiate the deal].* [to-infinitival]  
 vi *Kim is [hard to please].* [hollow infinitival]  
 vii *She was [busy marking assignments].* [gerund-participial]  
 viii *The offer is certainly [worth considering].* [hollow gerund-participial]

Interrogatives and exclamatives, however, may also be related to the adjective via a preposition, rather than directly, as in the above examples: compare *They weren't interested in why we were protesting* or *They seemed surprised at how strongly we felt about the issue*. All these constructions are dealt with in the chapters on subordinate clauses: see Ch. 11 for the ones involving finite clauses, and Ch. 14 for those involving non-finites.

### ■ NP complements

In the structure of phrases headed by adjectives, as in those headed by nouns, NPs are usually related to the head via a preposition, rather than immediately. There are, however, four adjectives that license NP complements: *due*, *like*, *unlike*, and *worth*. Compare:

- [30] i *The book turned out to be [worth seventy dollars].*  
 ii *Jill is [very like her brother].*

The NP complement of *worth* expresses the value of the predicand. It may denote a sum of money, as in [30i], or a more abstract value, as in *I'm sure you'll find this [worth the effort / your time]*. *Like* and *unlike* are used to express comparison of equality and inequality respectively: they are dealt with along with other comparative expressions in Ch. 13, §5.6. *Like* and *unlike*, moreover, belong to the category of prepositions as well as that of adjectives: we discuss in Ch. 7, §2.2, the issue of distinguishing between adjectival and prepositional constructions consisting of head + NP complement.

### *Due*

In the sense in which it can take an NP complement, *due* is semantically and syntactically similar to the past participle of the verb *owe*, as used in passive constructions. Compare:

- |      |  |                                    |
|------|--|------------------------------------|
| [31] | VERBAL OWE                                   | ADJECTIVAL DUE                     |
|      | i a. <i>The bank now owes you \$750.</i>     | b. ___                             |
|      | ii a. <i>You are now owed \$750.</i>         | b. <i>You are now due \$750.</i>   |
|      | iii a. <i>\$750 is now owed you.</i>         | b. <i>\$750 is now due you.</i>    |
|      | iv a. <i>The bank now owes \$750 to you.</i> | b. ___                             |
|      | v a. <i>\$750 is now owed to you.</i>        | b. <i>\$750 is now due to you.</i> |

Examples [ia/iva] are active, and have no counterpart with *due*, but in the three passive examples with *owed*, there is an equivalent construction with *due*. Semantically, there are three entities involved: the creditor (“you”), the debt (“\$750”), and the debtor (“the bank”). In [ii], the creditor is expressed as subject and the debt as object – reflecting the fact that in active [ia] *you* is indirect object and *\$750* direct object. In [iii/v] the debt is expressed as subject, and the creditor as either object or complement of the preposition *to* – reflecting the alternation between the two active constructions [ia/iva]; [iiib] is predominantly AmE, with BrE favouring [vb]. With the verb *owe*, the debtor is expressed as subject in the active and (optionally) as complement of *by* in the passive:

You are now owed \$750 by the bank, etc. In general, the debtor is not expressed in the *due* construction, but some speakers accept *by* or *from* phrases: %\$750 is due (to) you *by/from* the people you worked for last month. This results in a highly exceptional AdjP containing two complements.

### ■ Indirect complements

We have been concerned so far with complements that are licensed by the adjective lexeme in head position. AdjPs may also contain indirect complements, complements licensed by a modifier of the head, or by the comparative inflection:

- [32] i *The bill wasn't [as large as we'd expected].*  
 ii *I'm [fonder of them than you].*  
 iii *They were [so small you could hardly see them].*  
 iv *This is still [too hot to drink].*

Here single underlining indicates the indirect complement (a PP in [i–ii], a clause in [iii–iv]), while double underlining indicates the modifier or inflectional suffix that licenses it. As illustrated in [ii], an indirect complement can combine with a direct one.

## 3.2 Modification

Modifiers in the structure of AdjPs may have the form of AdvPs, determinatives, NPs, PPs, and, under very restricted conditions, relative clauses:

- [33] i *She is [quite incredibly generous].* [AdvP]  
 ii *It surely isn't [that important].* [determinative]  
 iii *The nail was [two inches long].* [NP]  
 iv *The view was [beautiful beyond description].* [PP]  
 v *He is now [the fattest he's ever been].* [relative clause]

Relative clauses occur only with superlatives; the construction is discussed in Ch. 12, §4.1, and need not be considered further here. The other types of modifier we will review in turn, but first we should make two general points.

### ■ Stacked modification vs submodification

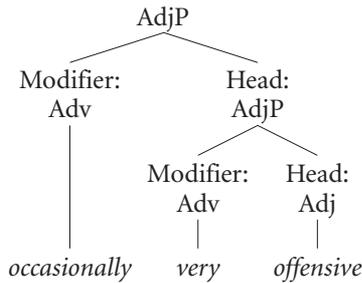

AdjPs may contain more than one layer of modification, and in such cases we need to distinguish between the structures illustrated in [34], where underlining indicates the lower-level construction:

- [34] i *his [occasionally very offensive] behaviour* [stacked modification]  
 ii *his [quite unbelievably offensive] behaviour* [submodification]

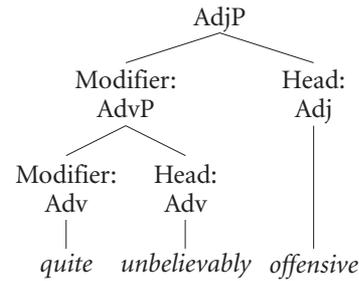

In [i] *very* modifies *offensive*, and then at a higher level *occasionally* modifies *very offensive*: we understand that occasionally his behaviour was very offensive. Here both cases of modification have an adjectival head (*offensive* being an adjective and *very offensive* an AdjP), and in such constructions we say there is **stacked** modification. In [ii], by contrast, *quite* modifies the adverb *unbelievably*, and it is the resultant AdvP *quite unbelievably* that modifies the adjective *offensive*: here the lower level of modification is within the modifier, not the head, and we refer to this as **submodification**. Tree structures for the

bracketed phrases are as follows:

[35] a. STACKED MODIFICATION

b. SUBMODIFICATION

### ■ Distinction between comparative and non-comparative forms affects modification

A considerable proportion of modification in AdjP structure has to do with the expression of degree with gradable adjectives, as in *very good* and *extremely old*, etc. What kind of degree modifiers are permitted depends in part on whether the phrase is comparative or not. Compare:

[36] NON-COMPARATIVE

- i a. *very*/\**much* *young*
- ii a. *this* / \**this much* *expensive*
- iii a. \**far* *excellent*

COMPARATIVE

- b. *much*/\**very* *younger*
- b. *this much* / \**this more* *expensive*
- b. *far* *superior*

Non-comparatives like *young* allow *very*, while comparative *younger* does not: it takes *much*, or (with submodification) *very much*, modifiers which are for the most part inadmissible with non-comparatives. Similarly, determinative *this* is found with non-comparative *expensive*, but not with comparative *more expensive*, which again requires *much*: *this much more expensive*. Again, *far* occurs with comparatives, but not with non-comparatives.

The comparatives in [36ib–iiib] are respectively inflectional, analytic, and lexical. Modification of an analytic comparative yields a submodification structure along the lines of [35b]: in *far more expensive*, for example, *far more* is an AdvP modifying *expensive*. The lexical forms (mainly *different*, *superior*, *inferior*, *preferable*) can in some respects also behave like non-comparatives. We can have, for example, either *very different* or (*very*) *much different*. The comparatives considered here are comparatives of inequality: for comparatives of equality, see Ch. 13, §4.4.1.

### ■ AdvPs

The most common type of modifier is an AdvP, consisting of an adverb alone (*unbelievably offensive*), or an adverb together with its own modifier (*quite unbelievably offensive*). In the former case we will often say simply that the modifier is an adverb (rather than an AdvP), and – in keeping with our general practice – we have omitted the AdvP constituent in the tree diagram [35a]. The use of adverbs as modifiers in AdjP structure is described in §7.2 below.

## ■ Determinatives

The determinatives that function as degree modifiers are illustrated in [37]:

- |        |  |                     |
|--------|--|---------------------|
| [37] i | [ <i>The bigger</i> ] <i>it is</i> , [ <i>the more likely</i> ] <i>it is to break down</i> . | [ <i>the</i> ]      |
| ii     | <i>They are</i> [ <i>this tall</i> ].  | [ <i>this</i> ]     |
| iii    | <i>The meals aren't</i> [ <i>that expensive</i> ].   | [ <i>that</i> ]     |
| iv     | <i>It's</i> [ <i>no better than it was before</i> ].   | [ <i>no</i> ]       |
| v      | <i>We're not getting</i> [ <i>any younger</i> ].   | [ <i>any</i> ]      |
| vi     | <i>It's</i> [ <i>much smaller than I expected</i> ].   | [ <i>much</i> ]     |
| vii    | <i>They spent a lot of money, but it's</i> [ <i>little better than it was before</i> ].      | [ <i>little</i> ]   |
| viii   | <i>I'm feeling</i> [ <i>a little disappointed</i> ].   | [ <i>a little</i> ] |
| ix     | <i>I thought you were</i> [ <i>old enough to know better</i> ].                              | [ <i>enough</i> ]   |
| x      | <i>He seemed</i> [ <i>all confused</i> ].  | [ <i>all</i> ]      |

*The* occurs with inflectional and analytic comparatives (see Ch. 13, §4.4.2), and with *same*: *Everything seems* [*the same as it was before*].

The demonstratives *this* and *that* are discussed in Ch. 17, §5.4. Both are used deictically, with some accompanying gesture indicating the degree intended. *That* is also used anaphorically (*Max is in his eighties and Kim is about that old too*) or, in informal style, with the sense “particularly”, as in [37iii]. In this latter use, *that* is restricted to non-affirmative contexts. The demonstratives also occur with *much* in a submodification construction, as in *She's about* [*this much taller than me*], where *this much* is a DP modifying *taller*.

*No*, *any*, *much*, and *little* occur in comparisons of inequality. *Much* and *little* are also found with various adjectives formed from past participles: *They don't seem much inclined to leave / much impressed by his argument*. Somewhat different is the use of *very much* in examples like *He seemed very much separate from the rest of the group*. This doesn't indicate a high point on a gradable scale of separateness: rather, it emphasises that he was indeed separate from the rest of the group. **Good** is exceptional in that it accepts *no*, *any*, and (in non-affirmative contexts) *much* in the plain form as well as in the comparative: *This car is no good; The radio reception wasn't any/much good*.

*Enough* is positioned after the head. If the AdjP also contains a complement, there is a strong preference for *enough* to precede it: *careful enough with money* rather than *?careful with money enough*, and so on. It licenses a *for* phrase (*good enough for most purposes*) or a clause (such as *to know better* in [37ix]) which functions as indirect complement in the AdjP. Note, then, that we take the immediate constituents in [37ix] to be *old enough + to know better*, not *old + enough to know better*: this is because a complement will be placed between *enough* and the indirect complement licensed by *enough*, as in *fond enough of them to make this sacrifice*.

*All*, as in [37x], *all confused*, means “completely”. In addition, it occurs, as in NP structure, before *the* and *that*: *I feel all the better for it* (suggesting a somewhat higher degree than *the better for it*) and *It wasn't all that good* (hardly distinguishable from *that good*).

## ■ NPs

Only a narrow range of NPs are used to modify adjectives:

- |        |   |
|--------|---|
| [38] i | <i>three years old</i> <i>five centimetres thick</i> <i>a foot wide</i> <i>two hours long</i>               |
| ii     | <i>a great deal smaller</i> <i>a (whole) lot different</i> <i>lots better</i> <i>heaps worse</i>            |
| iii    | <i>a bit lax</i> <i>a smidgin overripe</i> <i>a tad greasy</i> <i>a trifle shy</i> <i>plenty big enough</i> |

The NPs in [i] are measure phrases, while the others are quantificational NPs (see Ch. 5, §3.3). Those in [ii] occur only with comparatives. *A tad* and *a trifle* differ from the others in that they do not occur in NP structure with an *of* complement: *a bit of trouble*, but not *\*a trifle of trouble*. *Plenty* occurs (in informal style) in combination with *enough*, indicating a degree clearly above that which qualifies as enough. The construction without *enough*, as in *%plenty hot*, is informal AmE. Expressions like *stone cold* or *time-poor* are best regarded as compound adjectives: see Ch. 19, §4.3.1.

#### ■ PPs

Modifiers with the form of PPs are found in both post-head and pre-head position:

- [39] i *cautious to excess* *clear in his mind* *dangerous in the extreme* *deaf in both ears* *very good for a beginner* *happy beyond belief* *polite in her manner*  
*young at heart* *too long by a mile* *not very good at all*
- ii *these [in some respects highly controversial] ideas* *his [at times very offensive] behaviour* *this [in my view quite outrageous] suggestion* *an [on the whole persuasive] argument* *their [to some extent perfectly valid] objections*

The default position in predicative AdjPs is after the head, as in [i], but the construction with pre-head PP modifiers in attributive AdjPs, as in [ii], is certainly possible, though very restricted with respect to the kinds of PPs permitted.<sup>7</sup>

### 3.3 Structural differences correlating with the function of the AdjP

Not all AdjPs can occur in all four of the functions that can be realised by AdjPs: attributive, predicative, postpositive, and predeterminer. Some of the restrictions concern the adjective lexeme itself: *mere*, for example, is always attributive, while *tantamount* is never attributive. Restrictions of this kind are dealt with in §4. There are also restrictions relating to the syntactic structure of the AdjP. For example, *keen on golf* is excluded from attributive position not because of any restriction on the head *keen*, but because it contains the complement *on golf*. It is syntactic restrictions of this kind that we are concerned with here.

#### (a) Predeterminer AdjPs

AdjPs occurring in predeterminer position in NP structure, before the article *a*, must meet one or other of the following conditions:

- [40] i The AdjP begins with one of the modifiers *how*, *as*, *so*, *too*, *this*, *that*.  
 ii The AdjP has *such* or exclamative *what* as head.

<sup>7</sup>In addition to the four categories of modifier considered above, one finds a few adjectives (including one or two participial ones): *icy cold*, *freezing cold*, *red-hot*, *boiling hot*, *scalding hot*. These expressions have the character of fixed phrases, however: this is not a productive construction. One also occasionally finds more complex modifying expressions comparable to the nonce-formations that occur much more readily as attributive modifiers in NP structure (cf. Ch. 5, §14.1): *He usually looks happy not just [things-are-OK happy], but [things-are-so-exciting-and-wonderful happy]*.

Example [ib] may be contrasted with the well-formed *some much better proposals*: the inadmissible *a great deal* is an NP, whereas *much* is a determinative.<sup>8</sup> Similarly, the NP *three years* is permitted in the predicative AdjP, but not in the attributive. Instead we have *a three-year-old child*, with no plural marking on *year*: *three-year-old* is a compound adjective (see Ch. 19, §4.3.3).

#### Initial *how, as, so, too, this, that* not permitted

- [45] i a. How safe are these cars?                      b. \*How safe cars are these?  
 ii a. This coffee is too sweet.                              b. \*I don't like too sweet coffee.

In NPs determined by the indefinite article, AdjPs of this kind appear in predeterminer position, as in *How safe a car is it?*, but in other kinds of NP this alternative is not available. Note the contrast between [iib] and the well-formed *I don't like excessively sweet coffee*. Instead of \**a this long letter* we can have either predeterminer *this long a letter* or postpositive *a letter this long*.<sup>9</sup>

#### (c) Postpositive AdjPs

AdjPs follow the head in two kinds of NP construction:

- [46] i *They want [someone young].*                      [compound determinative as fused head]  
 ii *They want [a leader younger than you].*                      [ordinary noun as head]

In [i] the AdjP follows *someone*, which functions as fused determiner-head (cf. Ch. 5, §9.6); here there is no possibility of the AdjP occurring in attributive modifier position, and there are accordingly no structural constraints on postpositive AdjPs. In [ii] the head is an ordinary noun, so that attributive AdjPs are permitted provided they satisfy the conditions given under (b) above. For NPs that do satisfy those conditions, moreover, the attributive position is generally the default, and in many cases the only possibility:

- [47] i a. *They chose [a young leader].*                      b. \**They chose [a leader young].*  
 ii a. *We saw [a black swan].*                                  b. \**We saw [a swan black].*

Postpositive AdjPs without a post-head dependent of their own are generally restricted to the fused-head construction of [46i] or to a restricted set of adjectives, as described in Ch. 5, §14.2.

#### (d) Predicative AdjPs

With AdjPs in predicative position it is not a matter of certain kinds of dependents being excluded but of their being construed as clause-level modifiers. Compare:

- [48] i a. *his often irrational behaviour*                      b. *His behaviour was often irrational.*  
 ii a. *a probably futile attempt*                                  b. *The attempt will be probably futile.*

In the [a] examples the underlined adverb is clearly a modifier within the attributive AdjP, whereas in [b] it is more natural to take it as a modifier in clause structure. It does not make any semantic difference, however, and there may well be indeterminacy

<sup>8</sup>An exceptional case where an NP modifier is permitted is seen in *She's a lot better player than me*; here the indefinite article of *a lot* is lost following an indefinite article determining the matrix NP (compare *a player who is a lot better than me*).

<sup>9</sup>Examples are found where *too* + adjective occurs attributively in NPs containing a determiner: *She slid her feet round [the too-warm sheets] in search of a cool place* or *They sat in [the too-perfect living-room created by their mother]*, but such examples are somewhat marginal and are punctuated as compound adjectives.

as to whether a modifier belongs in the structure of the clause or of the AdjP. Since *very* cannot modify verbs, examples like *It is very late* can only have the adverb in the AdjP, and other cases of degree modification can be assumed to have the same analysis.

## 4 Restricted function for adjectives

The default is for an adjective to be able to function in any of the attributive, postpositive, and predicative functions: *any intelligent person* (attributive), *anyone intelligent* (postpositive), *anyone who is intelligent* (predicative). But there are a number of items that are restricted in function, and many adjectival constructions and meanings of adjectives that are associated with restrictions on function. The major distinction we need to make is between adjectives which – either absolutely or in a given sense – are restricted to attributive function and those which are excluded from it. We refer to these as, respectively, **attributive-only** adjectives and **never-attributive** adjectives. A small subset of the latter occur only postpositively: these are **postpositive-only** adjectives.

### 4.1 Attributive-only adjectives

#### ■ Adjectives wholly restricted to attributive function

Adjectives that do not normally occur except as (heads of) attributive modifiers include:<sup>10</sup>

[1]	<i>damn</i>	<i>drunken</i>	<i>ersatz</i>	<i>erstwhile</i>	<i>eventual</i>	<i>former</i>
	<i>frigging</i>	<i>future</i>	<i>latter</i>	<i>lone</i>	<i>maiden</i>	<i>main</i>
	<i>marine</i>	<i>mere</i>	<i>mock</i>	<i>only</i>	<i>own</i>	<i>premier</i>
	<i>principal</i>	<i>putative</i>	<i>self-confessed</i>	<i>self-same</i>	<i>self-styled</i>	<i>soi-disant</i>
	<i>sole</i>	<i>umpteenth</i>	<i>utter</i>	<i>veritable</i>	<i>very</i>	<i>would-be</i>

Thus we have *that damn noise*, but not *\*That noise is damn*; *a drunken sailor* but not *\*a sailor who was drunken*; and so on. Three of these items, *former*, *latter*, and *own* are exceptional among attributive-only adjectives in that they can occur in the fused modifier-head construction: *She chose the former/latter*; *I prefer my own*.

There are also numerous compound adjectives that are attributive-only – adjectives based on gerund-participles or past participles, as in a *fund-raising dinner* or a *Sydney-based engineering company*. Again we do not find *\*The dinner was fund-raising* (cf. *The dinner was to raise funds for . . .*) or *\*The company is Sydney-based* (cf. *The company is based in Sydney*).

#### ■ Meaning differences between attributive and non-attributive uses

There are numerous cases where an attributive adjective has a meaning that it cannot have in predicative function, or where the semantic relation between the adjective and the head nominal is different from that which it bears to its predicand when it is used predicatively. Compare, for example:

<sup>10</sup>The qualification ‘normally’ means that they have no established non-attributive use. It excludes nonce-uses, as when one says, in jocular vein, *His ignorance could only be described as utter*.

- | [2] ATTRIBUTIVE-ONLY USE                            | PREDICATIVE USE                                |
|---|--|
| i a. <i>the late queen</i> (“recently deceased”)    | b. <i>She is late.</i> (“behind schedule”)     |
| ii a. <i>my old school</i> (“former”)               | b. <i>He is old.</i> (“has lived a long time”) |
| iii a. <i>a hard worker</i> (“one who works hard”)  | b. <i>The work is hard.</i> (“difficult”)      |
| iv a. <i>complete nonsense</i> (“absolute”)         | b. <i>The work is complete.</i> (“finished”)   |
| v a. <i>the lawful heir</i> (“lawfully determined”) | b. <i>It is quite lawful.</i> (“legal”)        |

Thus *She is late* cannot mean “She recently died”, *This school is old* cannot mean “This is the school I (or someone else) formerly attended”, and so on.

### ■ Potential differences between attributive-only and ordinary attributive adjectives

Ordinary attributive adjectives can be used predicatively with the same sense: we can call these **ascriptive** adjectives since they can occur as complement to the verb *be* in its ascriptive sense (Ch. 4, §5.5.1). Ascriptive attributive adjectives characteristically have the four properties illustrated summarily for *shy* in [3], whereas most attributive-only adjectives lack one or more of them.

- |       |               |   |
|-------|---------------|---|
| [3] i | ENTAILMENT    | <i>X is a shy N</i> entails <i>X is an N</i> (e.g. <i>Tom is a shy man</i> entails <i>Tom is a man</i> ).   |
| ii    | SUBSET        | <i>A shy N</i> gives an answer to the question <i>What kind of an N is X?</i> (e.g. <i>A shy man</i> is an answer to the question <i>What kind of a man is Tom?</i> ) |
| iii   | MODIFIABILITY | <i>Shy</i> can itself be modified (e.g. <i>a very shy man</i> ).  |
| iv    | PRO-FORM      | <i>Shy</i> can modify the pro-form <b>one</b> (e.g. <i>Tom is the shy one</i> ).  |

#### (a) The entailment property

If some entity falls within the denotation of a nominal containing an ascriptive adjective, it also falls within the denotation of the nominal formed by omitting that adjective. Most attributive-only adjectives also have this property, but some do not. Compare:

- |       |  |
|-------|--|
| [4] i | <i>Tom is a lone parent</i> entails <i>Tom is a parent</i> .                 |
| ii    | <i>Tom is the putative father</i> does not entail <i>Tom is the father</i> . |

#### (b) The subset property

The nominal *man* denotes the set of all men, and *shy man* denotes a smaller set included within it. The adjective here is thus semantically restrictive. Ascriptive adjectives are not always used restrictively. For example, *the industrious Chinese* can be interpreted restrictively or non-restrictively. In the former case it denotes just a subset of the Chinese, whereas in the latter it denotes the full set of Chinese, who are said to have the property of being industrious. All ascriptive adjectives have the potential to be used restrictively, however. As for attributive-only adjectives, many also have this property, but there are a good number that do not. Compare:

- |       |  |
|-------|--|
| [5] i | <i>A marine biologist</i> is an answer to the question <i>What kind of a biologist is she?</i> |
| ii    | <i>A mere child</i> is not an answer to the question <i>What kind of a child is she?</i>       |

We must of course distinguish between a genuine answer and a jocular response. One might say *A mere child* in response to the question in [ii], but it doesn't answer the question. *Mere child* does not denote one subset of children.

In the following, the adjective expresses various other kinds of quantification:

- |     |                                   |                                |                                   |
|-----|-----------------------------------|--------------------------------|-----------------------------------|
| [9] | <i>her <u>complete</u> works</i>  | <i>the <u>entire</u> class</i> | <i><u>full</u> agreement</i>      |
|     | <i><u>further</u> instalments</i> | <i>a <u>lone</u> parent</i>    | <i>an <u>occasional</u> truck</i> |
|     | <i>the <u>odd</u> lizard</i>      | <i>the <u>only</u> escape</i>  | <i><u>scant</u> attention</i>     |
|     | <i>a <u>single</u> objection</i>  | <i>the <u>usual</u> place</i>  | <i>the <u>whole</u> book</i>      |

The quantification applies to frequency with *occasional*, *odd*, and *usual* (e.g. *You might see the odd lizard*, “You might see a lizard from time to time”, etc.). These quantifying adjectives all have the entailment property but mostly lack the subset property – though *lone parent* can be said to denote a kind of parent (analogously for *only* in the collocation *an only child*). They are heterogeneous with respect to the other properties – compare *a very occasional truck* but not (in the relevant sense) *\*a very odd lizard*; and *the only ones* but not *\*her complete ones*.

### (b) Temporal and locational attributives

Our next group have to do with the relative time at which the description expressed in the head applies, or with location in space:

- |      |    |                                      |                                     |                                    |
|------|----|--------------------------------------|-------------------------------------|------------------------------------|
| [10] | i  | <i>his <u>current</u> girlfriend</i> | <i>an <u>erstwhile</u> gangster</i> | <i>the <u>eventual</u> outcome</i> |
|      |    | <i>his <u>former</u> wife</i>        | <i><u>future</u> progress</i>       | <i>a <u>new</u> friend</i>         |
|      |    | <i>my <u>old</u> school</i>          | <i>the <u>original</u> plan</i>     | <i><u>past</u> students</i>        |
|      |    | <i>the <u>present</u> manager</i>    | <i>the <u>previous</u> attempt</i>  | <i>its <u>ultimate</u> demise</i>  |
|      | ii | <i>the <u>lower</u> lip</i>          | <i>her <u>right</u> eye</i>         | <i>the <u>southern</u> states</i>  |

We can also include in this group the adjectives *former* and *latter* that are used to indicate relative location within the text (e.g. *the former/latter observation*).

Some of these items lack the entailment property: *She's his former wife*, for example, doesn't entail *She's his wife*. They fail the subset test, and again show variation with respect to the other properties. Note, for example, that *old* doesn't accept modification in *my old school* but we can have *a very old friend* (“one who has been a friend for a very long time”).<sup>11</sup> For the pro-form test, compare *his current one* and *\*an erstwhile one*.

### (c) Associative attributives

In a large class of attributive adjective constructions, the property expressed by the adjective does not apply literally to the denotation of the head nominal, but rather to some entity associated with it. Some examples are given in [11]:

- |      |                                     |                                 |                                  |
|------|-------------------------------------|---------------------------------|----------------------------------|
| [11] | <i><u>clerical</u> duties</i>       | <i><u>criminal</u> law</i>      | <i><u>foreign</u> affairs</i>    |
|      | <i>a <u>historical</u> novelist</i> | <i>a <u>lunar</u> landing</i>   | <i>a <u>marine</u> biologist</i> |
|      | <i>a <u>mathematical</u> genius</i> | <i>a <u>medical</u> journal</i> | <i>a <u>medieval</u> scholar</i> |
|      | <i>a <u>military</u> expert</i>     | <i>a <u>moral</u> dilemma</i>   | <i><u>musical</u> analysis</i>   |
|      | <i>a <u>nuclear</u> physicist</i>   | <i><u>Platonic</u> realism</i>  | <i><u>urban</u> policy</i>       |

Literally, duties are not clerical, but clerical duties are associated with being a clerk. Criminal law is not itself criminal but is the branch of the law that concerns crime. Similarly, foreign affairs aren't themselves foreign, but concern relations with foreign countries; and so on. Adjectives of this kind have a classifying function similar to that

<sup>11</sup> *New* is attributive-only in certain collocations but not others. *She is new* might be used to say that someone has recently become a student or employee, for example, but not that she has recently become a friend or wife.

commonly realised by nominals: compare *clerical duties* with *office duties*, *a lunar landing* with *a moon landing*, *a mathematical genius* with *a computer genius*, *a military expert* with *a safety expert*.

A good number of the adjectives of this kind are derived from nouns by means of suffixes like *·al* and *·ar*. In some cases the head noun may also be morphologically derivative in such a way that two associative links are involved in the interpretation. A nuclear physicist, for example, works in the field of nuclear physics, and nuclear physics is concerned with the nuclei of atoms.

Many of these adjectives can also be used ascriptively, with a different sense or semantic function. Compare, for example, *criminal behaviour* or *a highly moral person*. There may even be ambiguities between the associative and ascriptive uses, as in the case of *a criminal lawyer* (discussed in Ch. 5, §14.1).

Associative attributives all have the entailment property, and also the subset property: their function is to classify, so naturally they define a subset. They mostly lack the other two properties, though some accept such modifiers as *purely* (e.g. *purely clerical duties*).

#### (d) Process-oriented attributives

[12]	<i>a <u>big</u> eater</i>	<i>a <u>fast</u> worker</i>	<i>a <u>firm</u> believer</i>
	<i>a <u>hard</u> worker</i>	<i>a <u>heavy</u> smoker</i>	<i>a <u>rapid</u> reader</i>
	<i>a <u>slow</u> learner</i>	<i>a <u>sound</u> sleeper</i>	<i>a <u>strong</u> advocate</i>

These bear some resemblance to the associative type, since *a big eater*, for example, denotes not someone who is big, but someone who eats a lot. The property expressed by the adjective thus applies not to the denotation of the nominal but to an associated process. It describes the degree or manner of this process, and in most cases there is a paraphrase in which the corresponding adverb modifies the verb: *one who works fast / believes firmly*, etc. These adjectives differ from the associatives, however, in that they are gradable (cf. *a very big eater*), and they do not all naturally pass the subset test. *A big eater* would hardly make a natural answer to the itself unlikely question *What kind of an eater is he?*

#### (e) Modal attributives

[13]	i	<i>the <u>actual</u> cause</i>	<i>an <u>apparent</u> discrepancy</i>	<i>a <u>certain</u> winner</i>
		<i>the <u>likely</u> benefits</i>	<i>a <u>possible</u> explanation</i>	<i>a <u>potential</u> customer</i>
		<i>the <u>probable</u> result</i>	<i>the <u>putative</u> father</i>	<i>the <u>true</u> course of events</i>
	ii	<i>a <u>self-confessed</u> thief</i>	<i>the <u>self-styled</u> prince</i>	<i>the <u>soi-disant</u> emperor</i>
	iii	<i><u>ersatz</u> champagne</i>	<i>a <u>mock</u> trial</i>	<i>a <u>would-be</u> novelist</i>

The adjectives in [i] are clearly modal in meaning and have corresponding adverbs which function as adjunct in related clausal constructions: *that which is actually the cause*, *something which is apparently a discrepancy*, *one who will certainly be a winner*. They thus express a modal qualification to the applicability of the nominal. For this reason, those expressing medium or weak modality (cf. Ch. 3, §9.2.1) fail the entailment test: *He's a potential customer*, for example, does not entail *He's a customer*. The items in [ii–iii] likewise fail this test: a self-styled prince isn't necessarily a prince (in fact there's a strong implicature that he isn't), and even a self-confessed thief may have made a false confession.

They mostly fail the other tests, though a few allow modification (*an absolutely certain winner*) or accept *one* as head (*not a possible flaw but an actual one*).

#### (f) Particularising attributives

- |        |                                 |                                    |                                      |
|--------|---------------------------------|------------------------------------|--------------------------------------|
| [14] i | <i>a <u>certain</u> house</i>   | <i>a <u>particular</u> area</i>    |                                      |
| ii     | <i>the <u>chief</u> reason</i>  | <i>the <u>main</u> objection</i>   | <i>our <u>premier</u> scientists</i> |
|        | <i>the <u>prime</u> suspect</i> | <i>the <u>principal</u> factor</i> | <i>the <u>ultimate</u> perk</i>      |

These adjectives serve to pick out a specific member or group of members of the set denoted by the head. Those in [ii] all indicate a high ranking in importance, and have some affinity with superlatives: we refer to them as **primacy** adjectives.<sup>12</sup>

Particularising attributives pass the entailment test but not the subset one: a certain house is not a kind of house, and so on. They allow the pro-form *one* (cf. *the main one*), but do not normally accept modification.

#### (g) Expressive attributives

- |        |                                 |  |                                       |
|--------|---------------------------------|--|---------------------------------------|
| [15] i | <i>my <u>dear</u> mother</i>    | <i>her <u>poor</u> father</i>          | <i>the <u>wretched</u> car</i>        |
| ii     | <i>a <u>bleeding</u> nitwit</i> | <i>the <u>bloody</u> tax inspector</i> | <i>a <u>fucking</u> investigation</i> |

These items are all semantically non-restrictive. They pass the entailment test, but fail the other three. Those in [ii] are illustrative of a quite large number of attributive-only **expletives**, items that make no contribution to the propositional meaning of the clause but express the speaker's ill-will, irritation, anger, agitation, or in some cases enthusiastic approval (*You're a bloody genius!*). These expletives vary considerably in expressive strength, with *damn(ed)* at the low end of the scale and regarded as quite mild, *fucking* at the high end, and widely regarded as coarse and offensive.

#### (h) Hypallage: transferred attributives

- |      |   |                                  |                                     |
|------|---|----------------------------------|-------------------------------------|
| [16] | <i>smoked [a <u>discreet</u> cigarette]</i> | <i>a <u>drunken</u> brawl</i>    | <i>their <u>insane</u> cackle</i>   |
|      | <i>a <u>nude</u> photo of the mayor</i>     | <i>a <u>quiet</u> cup of tea</i> | <i>your own <u>stupid</u> fault</i> |

This is another case where the adjective does not apply literally to the head nominal. It wasn't the cigarette that was discreet, but the way it was smoked. Similarly it was the participants in the brawl that were drunk, the people cackling who were (apparently) insane, the mayor who was nude, the tea-drinking event that was quiet, the person at fault who was stupid.

Traditional rhetorical analysis uses the term **transferred epithet** or the word **hypallage** (from the Greek for "exchange") for such cases. There is considerable variation with respect to how well established adjectives are in this usage. *Drunken* is very often used in this way, with a fair range of nouns (*drunken speech/walk/behaviour*, etc.). There are numerous expressions like *insane cackle* (*casual glance, hasty browse, hostile gaze, cold stare, impudent grin*, etc.), but with some at least of these there is no restriction to the attributive construction: *His gaze was openly hostile*; *That grin was impudent*. Nouns denoting representations, such as *photo, picture, statue*, readily take *nude* as a transferred attributive, but few other adjectives are used in this way. (In *a beautiful photo of their baby*, for example, the adjective is interpreted ascriptively – cf. *This photo is beautiful*.)

<sup>12</sup>For many speakers *key* also belongs here, but in AmE it is coming to be used predicatively, as in <sup>o</sup>*This point is absolutely key*. *Chief* has a minor predicative use in front position in the clause and with an *among(st)* phrase complement: *Chief among them is the issue of cost*.

The expressions *a quiet cup of tea* and *your own stupid fault* are likely to be recognised as familiar or unexceptional, but *a discreet cigarette* is not: it represents a nonce-use, an extension of the established pattern.<sup>13</sup>

Transferred attributives pass the entailment test. Results on the other tests are largely negative, except for the *nude photo* type, though some accept modification (*an outrageously drunken brawl, a very quiet cup of tea*).

## 4.2 Never-attributive adjectives

We turn now to adjectives which cannot occur in attributive position – again, either absolutely or in a given sense.

### ■ Adjectives which can occur predicatively or postpositively, but not attributively

These fall into three groups:

#### (a) Adjectives formed with the *a-* prefix

One group of very clearly non-attributive adjectives comprises those formed with the prefix *a-* that originates in the Middle English preposition *an* ‘in, on’. We list them (excluding some like *abed* and *afire* that are rather archaic) in [17]:

[17]	<i>ablaze</i>	<i>afloat</i>	<i>afoot</i>	<i>afraid</i>	<i>aghast</i>	<i>agleam</i>
	<i>aglimmer</i>	<i>aglitter</i>	<i>aglow</i>	<i>agog</i>	<i>ajar</i>	<i>akin</i>
	<i>alight</i>	<i>alike</i>	<i>alive</i>	<i>alone</i>	<i>amiss</i>	<i>askew</i>
	<i>asleep</i>	<i>averse</i>	<i>awake</i>	<i>aware</i>	<i>awash</i>	<i>awry</i>

Phrases like *a child who was asleep* do not have attributive paraphrases: *\*an asleep child* is strongly ungrammatical. Note, however, that expansion by modification or coordination can greatly improve the acceptability of the attributive use: compare *\*their awake children* and *their still awake children* or *\*She flashed me an aware glance* with the attested *She flashed me an aware, amused glance*. *Alert* and (somewhat marginally) *aloof* are permitted in attributive function, though they occur much more readily as predicatives.

#### (b) Adjectives with complements

Because adjectives with complements cannot in general have attributive function, those adjectives with obligatory complements are normally excluded from this position. A sample of these are given in [18] with an indication of the type of complement they take (a PP headed by the preposition given, or an infinitival clause):

[18]	<i>able</i> (INF)	<i>accustomed</i> (to)	<i>apt</i> (INF)	<i>conscious</i> (of)	<i>desirous</i> (of)
	<i>devoid</i> (of)	<i>fond</i> (of)	<i>fraught</i> (with)	<i>intent</i> (on)	<i>liable</i> (INF)

Some license more than one type of complement: *accustomed*, for example, licenses an infinitival as well as a *to* PP; for fuller lists, see §3.1 above and Ch. 14, §8.1. Compare, then, predicative *The minister is desirous of meeting with them* and attributive *\*the desirous minister*. Again, expansion may improve acceptability, as seen in this attested example of attributive *fond*: *Gina Verity, . . . , would be seen by any court in the way that I had seen*

<sup>13</sup>The extended use of hypallage for humorous effect is a notable stylistic device of the British author P. G. Wodehouse. Examples from his writings include: *He uncovered the fragrant eggs and I pronged a moody forkful; I balanced a thoughtful lump of sugar on the teaspoon; I fumbled with a fevered foot at the self-starter of the car.*

sense of *His behaviour was not considered proper*. The adjectives in [ii] occur with a very narrow range of heads: *designate* and *elect* with nominals denoting various kinds of roles to which one may be appointed or elected, *laureate* mainly with *Poet* or *Nobel (prize)*.

#### 4.3 Two intensificatory attributive constructions

We conclude this section by drawing attention to two intensificatory constructions containing adjectives in attributive function:

- [22] i *It was a [long, long way].* [intensificatory repetition]  
 ii *A [tiny little bird] flew in.* [intensificatory tautology]

We take these to involve stacked modification (Ch. 5, §14.2), so that the immediate constituents of the bracketed nominals are *long + long way* and *tiny + little bird*.

##### ■ Intensificatory repetition

The effect of the repetition in [22] is like that of modifying the adjective by *very*: “It was a very long way”. It is thus restricted to gradable adjectives: we will not find \**I hurt my left, left hand*, and the like. There are usually just two occurrences of the adjective, but there is no grammatical limitation to two, and three or even more may be found, especially in informal style or in expressive telling of anecdotes, as in the attested example *That’s become a big, big, big issue at our school*.

By no means every gradable adjective is found in this construction, but many are, frequent and basic adjectives in the language more so than rare or erudite ones. The construction is used more frequently in children’s stories and other language addressed to children (*a big, big elephant; a naughty, naughty boy*), and thus may have a patronising or jocular tone if over-used, but it is unquestionably established and quite common in serious prose usage addressed to adults, both spoken and written. Among the adjectives that are common in the intensificatory repetition construction are the following:

- [23] *bad big bright cold cool cruel deep fine*  
*good great hard heavy high hot huge large*  
*long low nasty real sad short sick small*  
*smart soft tight tiny tough vast wide wild*

However, plenty of other adjectives are also found in the construction, including not only other relatively short high-frequency words (*awful, close, dark, lovely, nice, picky, pretty, strong, stupid, touchy, ugly, weak*) but also longer and less frequent ones, as in these attested examples:

- [24] i *In numerous, numerous instances, what he told us has turned out to be true.*  
 ii *This has become a powerful, powerful weapon for the government.*  
 iii *The company has faced a series of major, major setbacks.*

The construction should be distinguished from that where a repetition arises in hesitant speech, or as recapitulation: *We have a unique, [pause] unique opportunity here*. The recapitulatory nature of the repetition can be rendered explicit by an adverb: *We have a unique, simply unique, opportunity here*. This latter type of repetition is found also with predicative adjectives: *It was gorgeous, (absolutely) gorgeous*.

Intensificatory repetition is also distinct from the ironic use of repetition, as in *Is this the final final draft?*, which asks whether this is really the last in a series of drafts each of which was supposed to be the last.

### ■ Intensificatory tautology

In [22ii], *a tiny little bird*, there is a sequence of two adjectives with identical or nearly identical meanings, interpreted as “a very little bird”: we accordingly call this **intensificatory tautology**. It belongs to informal style, and is found with a very narrow range of adjective meanings – normally “very small” or “very big” (e.g. *a huge big box*).

The adjective *great* is not much used for expressing largeness in contemporary English: *It was great*, for example, means “It was extremely good”, and likewise *They have a great house* means “They have a wonderful house”, not “They have a big house”. One of the places where *great* retains its “large” sense, however, is in this intensificatory tautology construction, as in *an enormous great house*, *a great big hole*, and so on. Some of the attributive-only degree adjectives with the *-ing* suffix are also found here: *a whopping great hole*, *a thumping big majority*, and so on.

## 5 Adverbs: delimitation of the category

### 5.1 Adverbs as modifiers of heads that are not nouns

We noted at the beginning of this chapter that the words that modify verbs are in general distinct from the words that modify nouns. Compare:

- | [1] | MODIFIER OF NOUN                           | MODIFIER OF VERB                               |
|-----|--|--|
| i   | a. <i>old houses</i>                       | b. * <i>They endured old</i> .                 |
| ii  | a. * <i>her quite enjoyment of it</i>      | b. <i>She quite enjoyed it</i> .               |
| iii | a. <i>a remarkable/ *remarkably change</i> | b. <i>It changed remarkably/ *remarkable</i> . |

*Old* and *remarkable* are adjectives, modifying nouns but not verbs, while *quite* and *remarkably* are adverbs, modifying verbs (or VPs) but not nouns. In a great number of cases, there are morphologically related pairs of adjective and adverb, with the latter derived from the former by suffixation of *-ly*, as with *remarkable* and *remarkably* in [iii].

This provides the starting point for a definition of adverb: a grammatically distinct category of words whose members are characteristically used to modify verbs but not nouns. Broadly speaking, however, the words that can modify verbs can also modify adjectives and other adverbs – and many can also modify expressions of additional categories other than nouns (or nominals). Compare, for example:

- |     |    |   |                 |
|-----|----|---|-----------------|
| [2] | i  | a. <i>They [almost suffocated]</i> .                                    | [verb]          |
|     |    | b. <i>The article was [almost incomprehensible]</i> .                   | [adjective]     |
|     |    | c. <i>She [almost always] gets it right</i> .                           | [adverb]        |
|     |    | d. [ <i>Almost all</i> ] <i>the candidates failed</i> .                 | [determinative] |
|     |    | e. <i>They are [almost without equal]</i> .                             | [PP]            |
|     |    | f. <i>She read [almost the whole book] in one day</i> .                 | [NP]            |
|     | ii | a. <i>He [behaved annoyingly]</i> .                                     | [verb]          |
|     |    | b. <i>We'd had enough of his [annoyingly unpredictable] behaviour</i> . | [adjective]     |
|     |    | c. <i>They are late [annoyingly often]</i> .                            | [adverb]        |
|     |    | d. <i>Annoyingly, they hadn't left us any milk</i> .                    | [clause]        |

*Almost* is amongst the most versatile, occurring not just with verbs, adjectives, and adverbs, as in [ia–c], but also with determinatives, PPs, and NPs. Note that it is necessary

to distinguish between nouns and NPs. Adverbs do not occur as attributive modifiers within a nominal, but many can occur as external modifier with an NP as head. *Almost the whole book*, for example, has the NP *the whole book* as head, and may be contrasted with *\*She congratulated him on his [almost success]*, where it is inadmissibly functioning as modifier of the noun *success*. In [ii] we see *annoyingly* in construction with not only a verb, adjective, and adverb, but also a whole clause.<sup>15</sup>

The most important defining property of adverbs thus needs to be given in the form:

- [3] Adverbs characteristically modify verbs and other categories except nouns, especially adjectives and adverbs.

### ■ Heterogeneity of the adverb category

The fact that adverbs can modify such a wide range of expressions makes the category somewhat heterogeneous, for by no means all adverbs occur with all of the heads illustrated in [2]. For example, *very* “to a high degree” and *too* in the sense “excessively” modify adjectives and adverbs (and a few PPs), but not verbs or NPs or clauses. Their inability to modify verbs makes them sharply different from prototypical adverbs: compare *I enjoyed it considerably* and *\*I enjoyed it very*, or *He worries excessively* and *\*He worries too* (possible only with a quite different sense of *too*). Such adverbs as *moreover* and *nevertheless* modify clauses, but not verbs or predicative adjectives. Adverbs such as *only* and *even* differ from most adverbs by virtue of their ability to occur with a particularly wide range of heads, e.g. a content clause in *I regret [only that I couldn't do more to help]*, a non-idiomatic PP in *They open [even on Christmas Day]*. To say that a word is an adverb thus gives only a very rough indication of its syntactic distribution. A fuller description needs to include a statement of which categories it can modify.

It is worth emphasising, however, that some degree of unity is brought to the category of adverbs by the fact that all the types of expression that accept adverbs as modifier take some that are derived from adjectives by means of the *·ly* suffix. For example, the class of connective adverbs containing *moreover* and *nevertheless* also includes de-adjectival *consequently*. Similarly, the class of adverbs which, like *almost* in [2if], modify NPs includes *absolutely*, *possibly*, and numerous other *·ly* adverbs – cf. *absolutely the best way of handling the situation*.

It is also the case that no *·ly* adverb modifies nouns. This is the hallmark modifying function from which adverbs are absolutely excluded. (There are words ending in *·ly* that can modify nouns, as in *a likely story*, *the ugly building*, *my only daughter*, *this lovely party*; but these are adjectives, not adverbs: see Ch. 19, §5.8.)

### ■ Reducing the extension of the adverb category

In the practice of traditional grammar (as reflected, for example, in the classification of words in dictionaries), the adverb is a miscellaneous or residual category – the category to which words are assigned if they do not satisfy the more specific criteria for nouns, verbs, adjectives, prepositions, and conjunctions. Nouns function as (head of

<sup>15</sup> *Annoyingly* in [2iid] is prosodically detached from the rest, and hence is a supplement rather than a modifier, but the relations are similar in the case of adverbs. Examples with an adverb integrated into the structure as a modifier of a clause are *Suddenly there was a tremendous crash* or *Perhaps you made a mistake*.

the) subject or object in clause structure, and (mostly) inflect for number and combine with determiners. Verbs function as head in clause structure and inflect for tense. Adjectives can normally function as attributive modifier in the structure of a nominal, and/or as predicative complement. Traditional prepositions take NP complements. Traditional conjunctions introduce subordinate clauses or coordinates. With fairly small-scale exceptions (including interjections), all other words are assigned to the adverb category.

In the present grammar we have endeavoured to make the adverb a more coherent category. To this end we have significantly reduced its membership in the following ways.

#### Major change: adverbs and prepositions

The main difference between our analysis and traditional grammar with respect to the adverb category concerns the boundary between adverbs and prepositions. We count as prepositions words that take other kinds of complement than NPs, and we also include in the preposition category some words that occur without any complement. In our analysis, then, the underlined words in [4] are prepositions, not adverbs:

- [4] i [According to Mary,] *we have no chance of winning.*  
 ii *The basket is outside.*

We discuss this issue in detail in Ch. 7, §2.4, and here will make only two brief points.

(a) PPs, no less than AdvPs, can function as adjunct in clause structure; the difference is then primarily a matter of their internal structure, and there are no good reasons for restricting PPs to phrases with an NP complement. From this point of view, there is a strong case for taking the head + complement phrase *according to Mary* in [4i] as a PP rather than an AdvP.

(b) *Outside* in [4ii] is complement of the verb *be*, a function that does not admit *-ly* adverbs; note that in cases where we have an adjective–adverb pair with the latter derived from the former by *-ly* suffixation, it is the adjective, not the adverb, that appears in this position. *Outside* cannot plausibly be said to be modifying the verb, and there are thus good grounds for removing it and similar words from the adverb category.

#### Minor changes: pronouns and determinatives

We also exclude the following from the adverb category:

- [5] i *yesterday, today, tomorrow, tonight* [pronouns]  
 ii *the, this, that, all, any, a little, **much, little**, enough* [determinatives]

Traditional grammar takes the items in [5i] to be nouns in examples like [6i] and adverbs in [6ii–iii]:

- [6] i *Yesterday* *was the first day for weeks that it hasn't rained.*  
 ii *They arrived yesterday.*  
 iii [*Their behaviour yesterday*] *was quite embarrassing.*

There is, however, no need to distinguish the *yesterday* of [i] and [ii] in terms of category as well as function. There are a considerable number of NPs that can function as adjunct in clause structure – adjunct of temporal location (*They arrived last week*), duration (*They stayed a long time*), frequency (*They tried many times*), manner (*They did it this way*),

and so on. *Yesterday* in [ii] thus fits in with this pattern: an adjunct of temporal location realised by an NP with a deictic pronoun as head. As for [iii], *yesterday* is here modifying the noun *behaviour*, which makes it unlike an adverb. Compare, for example, \**Their behaviour so badly was quite embarrassing*. To correct this we must replace the noun *behaviour* by a verb (*Their behaving so badly was quite embarrassing*) or the adverb *badly* by an adjective (*Their bad behaviour was quite embarrassing*).

The same general point applies to the items in [5ii], which are traditionally analysed as adjectives in examples like [7i] and adverbs in [7ii]:

- [7] i a. *We haven't got [much time].* b. *She wrote [this book].*  
 ii a. *We didn't [like it much].* b. *She is [this tall].*

Again, we do not need to distinguish in terms of category as well as function, for the dual use applies to a significant proportion of the words that function as basic determiners. Determinatives which in NP structure select plural heads (such as *these, those, we, you, both, several, many, few, a few*) naturally do not occur as modifiers to verbs, adjectives, and adverbs. The same applies to those that select count singulars (*a, each, every, either, neither, another*). But apart from the interrogatives and relatives, virtually all determinatives that can occur in NP structure with a non-count singular head can also function as modifier to verbs and/or adjectives and adverbs: see the account of individual items given in Ch. 5, §7.

## 5.2 The morphological form of adverbs

Adverbs differ from nouns, verbs, and adjectives in that the great majority of them are morphologically complex: there are relatively few adverbs with simple bases like *as, quite, soon*. For this reason, we survey the morphological form of adverb lexemes in this section, rather than in Ch. 19.

### (a) De-adjectival adverbs in *·ly*

A very high proportion of adverbs are formed from adjectives by suffixation of *·ly*. Many Adj + *·ly* forms can be paraphrased as “in an Adj manner/way” (e.g. *careful·ly, hasti·ly*, etc.), or “to an Adj degree” (*extremely, surprisingly*, etc.), but numerous *·ly* adverbs do not have this kind of meaning, and those that do can generally be used in other senses too, as described in Ch. 8. It must be emphasised, therefore, that there is no simple and regular semantic relation between adjectives and their *·ly* adverb counterparts. Thus in such pairs as the following the adverb cannot be paraphrased in any uniform way on the basis of the adjective:

- [8] i a. *their final performance* b. *They finally left.*  
 ii a. *the individual members* b. *We must examine them individually.*  
 iii a. *a real disappointment* b. *I really enjoyed it.*  
 iv a. *a total failure* b. *She's totally absorbed in her work.*

There are also pairs where the meaning of the adverb is related much less directly to that of the adjective than in [8]: compare *bare* ~ *barely*, *hard* ~ *hardly*, *scarce* ~ *scarcely*, *late* ~ *lately*, *present* ~ *presently*, *short* ~ *shortly*.

### Adjectives that do not form *-ly* adverbs

Although a great many adjectives form the base for *-ly* adverbs, there are also many that do not. Adjectives that do not accept the *-ly* suffix include the following:

[9] i	<i>afraid</i>	<i>aghast</i>	<i>alive</i>	<i>asleep</i>	<i>awake</i>	<i>awash</i>
ii	<i>inferior</i>	<i>junior</i>	<sup>%</sup> <i>major</i>	<i>minor</i>	<i>senior</i>	<i>superior</i>
iii	<i>friendly</i>	<i>leisurely</i>	<i>lonely</i>	<i>poorly</i>	<i>silly</i>	<i>ugly</i>
iv	<i>hurt</i>	<i>improved</i>	<i>surrounded</i>	<i>unexplained</i>	<i>written</i>	<i>Paris-based</i>
v	<i>American</i>	<i>British</i>	<i>Chinese</i>	<i>European</i>	<i>Iraqi</i>	<i>Parisian</i>
vi	<i>blue</i>	<i>brown</i>	<i>orange</i>	<i>purple</i>	<i>scarlet</i>	<i>yellow</i>
vii	<i>big</i>	<i>content</i>	<i>drunk</i>	<i>fake</i>	<i>fat</i>	<i>female</i>
	<i>foreign</i>	<i>good</i>	<i>key</i>	<i>little</i>	<i>long</i>	<i>macho</i>
	<i>male</i>	<i>modern</i>	<i>nuclear</i>	<i>old</i>	<i>prime</i>	<i>sick</i>
	<i>small</i>	<i>sorry</i>	<i>tall</i>	<i>urban</i>	<i>woollen</i>	<i>young</i>

We ignore at this point cases of homonymy between adverb and adjective: see (c) below.

The adjectives in [9i–iv] illustrate morphological constraints: *-ly* does not attach to adjectives beginning with the prefix *a-* or, in general, ending with the Latin comparative suffix *-or*, or to adjectives that themselves end in *ly* (whether or not this represents the adjective-forming suffix *-ly*). Thus there are no adverbs *\*afraidly*, *\*inferiorly*, *\*friendlyly*, etc. The <sup>%</sup> annotation on *major* reflects the fact that <sup>%</sup>*majorly*, ‘‘in a major way, to a considerable degree’’, has recently come to be used by some, predominantly younger, speakers. Likewise most adjectives based on past participles do not form adverbs, though there are some exceptions, such as *tiredly* or *determinedly*.

Semantic constraints are illustrated in [9v–vi]. The *-ly* suffix does not attach to adjectives derived from place-names, nor in general to those denoting colours. There are, however, a few colour terms that are occasionally found: *blackly*, *whitely*, *greenly*, *redly* (e.g. *The Huntleys’ farmhouse rose redly out of the red Herefordshire earth, as if it had, over the centuries, just slowly emerged from it*).

Finally, [9vii] gives a miscellaneous set of other adjectives without adverbial counterparts in *-ly*. Note that the set includes a number of very common short adjectives denoting size or age. *Good* has a morphologically unrelated adverbial counterpart, *well*. *Content* and *drunk* are to be distinguished from *contented* and *drunken*, which do form *-ly* adverbs.

### Adverbs in *-ly* derived from non-adjectival bases

[10] i	<i>bodily</i>	<i>namely</i>	<i>partly</i>	<i>purposely</i>	<i>matter-of-factly</i>
ii	<i>accordingly</i>	<i>exceedingly</i>	<i>jokingly</i>	<i>longingly</i>	

In [i], *-ly* attaches to a noun or, in *matter-of-factly*, to a phrase; for *daily*, *hourly*, etc., see (c) below. The bases in *-ing* in [ii] exist as verbs, but not (or hardly) as adjectives.

### (b) Other morphologically complex adverb lexemes

[11] i	<i>afresh</i>	<i>again</i>	<i>aloud</i>	<i>anew</i>	<i>apace</i>	
ii	<i>almost</i>	<i>already</i>	<i>also</i>	<i>altogether</i>	<i>always</i>	<i>anyhow</i>
	<i>anyway</i>	<i>somehow</i>	<i>sometimes</i>	<i>somewhat</i>		

iii	<i>edgeways</i>	<i>lengthways</i>	<i>sideways</i>	<i>clockwise</i>	<i>crabwise</i>	<i>crosswise</i>
	<i>likewise</i>	<i>otherwise</i>	<i>moneywise</i>	<i>healthwise</i>	<i>plotwise</i>	<i>weatherwise</i>
iv	<i>forthwith</i>	<i>furthermore</i>	<i>indeed</i>	<i>maybe</i>	<i>meantime</i>	<i>meanwhile</i>
	<i>moreover</i>	<i>nevertheless</i>	<i>nonetheless</i>	<i>nowadays</i>	<i>oftentimes</i>	<i>doubtless</i>
v	<i>never</i>	<i>neither</i>	<i>nor</i>	<i>once</i>	<i>thrice</i>	<i>twice</i>

The prefix *a-* forms adjectives (such as *afraid*), prepositions (*along*), and also adverbs, as in [i]. The adverbs in [ii] are compounds beginning with a determinative base: in none of them is the meaning predictable from the parts. The examples in [iii] end in *-wise* or *-ways*, which sometimes yield alternants, as in *lengthwise* ~ *lengthways*. The last four illustrate a more recent use of *-wise*, with the sense “as regards”, which yields numerous nonce-forms, largely restricted to informal style, and more common in AmE than in BrE. There are also nonce-forms compounded with *fashion*, as in *doggy-fashion*. Set [iv] contains a miscellaneous group of compounds, together with the derivative *doubtless*. The first three items in [v] are negative forms, while the last three are morphologically irregular forms based on numerals. We might also include in the present category the underlined expressions in such examples as *It sort of collapsed*, *It looks kind of dangerous*, *He as good as admitted it*. These are best regarded as having been reanalysed as adverbs modifying the following verb or adjective. Note, for example, that *sort of collapsed* is a finite VP in predicate function: the verb *collapsed* must be head of this VP, not complement of *of*. For further examples of reanalysed comparative expressions like *as good as*, see Ch. 13, §4.5.

### (c) Adverbs that are homonymous with adjectives

There are a good number of adverbs that are identical in form with adjectives. The overlap is greater in non-standard speech, and within the standard variety there are some adverbs of this kind that are restricted to informal style. Compare:

[12]	ADJECTIVE	ADVERB
i	a. <i>She's a <u>hard</u> worker.</i>	b. <i>She works <u>hard</u>.</i>
ii	a. <i>It's a <u>real</u> gem.</i>	b. <i>That's <u>real</u> nice of you.</i>
iii	a. <i>They make <u>regular</u> payments.</i>	b. <i><sup>!</sup>They pay the rent <u>regular</u>.</i>

*Hard* is one that is stylistically neutral; there is an adverb *hardly*, but its meaning is quite different, and there is no alternation between *hard* and *hardly* in [ib]. The use of *real* in [iib] is very informal: other styles would have *really*. And [iiib] is clearly non-standard, the standard variety requiring the *-ly* form *regularly*. Many examples of this last kind are familiar to speakers of Standard English through popular culture, e.g. song lyrics, as in *<sup>!</sup>Love me tender*, *<sup>!</sup>Treat me nice*. It should be noted that this non-standard usage is restricted to cases where the adverb follows the head: we do not find *\*She tender loved him* and the like.

One further general point to be made is that the distinction between adjective and adverb is not always entirely obvious. Adjectives can occur in predicative function with verbs other than *be*, as in *They sat still* or *We laid them flat*. Thus although we can have both *The moon shone brightly* and *The moon shone bright* these clauses do not have to be assigned the same structure: *bright* in the second is best taken as a predicative adjective (cf. *The moon was bright*), not an adverb.

with *first* and *last* as connective adjuncts used in enumeration (*First/Firstly I would like to thank my parents, . . .*), but not normally elsewhere (*It was first/\*firstly noticed last week*). Adverbial *scarce* is archaic or literary relative to *scarcely*: *She could scarce/scarcely remember what she'd said*. Adverbial *dear* is largely restricted to modifying such verbs as *cost* and *pay*: compare *It cost us dearly/dear* but *They loved her dearly/\*dear*. Adverbial *direct* is restricted to post-head position and situations of movement or transfer: compare *We went directly/direct to New York*, but *It won't affect us directly/\*direct* and *We live [directly/\*direct opposite the park]*. By contrast, *mighty* (more common in AmE than in BrE) occurs as a pre-head modifier of adjectives and adverbs: *mighty impressive*; *mightily* mainly occurs as postmodifier to a verb (*He laboured mightily against the elements*). *Slow* occurs only with verbs of motion, especially *go* and *drive*, and cannot occur in preverbal position: *Don't go so slowly/slow*, but *It improved slowly/\*slow* and *They slowly/\*slow moved away*.

There are no forms in *-ly* for the items in [15v] (leaving aside *nextly*, which has virtually disappeared from use, and the semantically quite distinct *hardly* and *lately*). *How* is not traditionally analysed as an adjective, but that is the appropriate category to assign it to in examples like *How are you?* and *How was the concert?*, where it is in predicative complement function – compare the adjectives in answers to these questions, such as *I am well* and *It was excellent*. Likewise *however*, though as an adverb this also has a distinct use as a connective adjunct.

Adverbial *long*, as in *It won't last long*, has a temporal meaning: “a long time”. Its distribution is quite exceptional for an adverb, in that it can head phrases functioning as internal complement to a few verbs such as *take*, *have*, *need*, *spend*, *give*, and *be*:

- [17] i a. *Take as long as you like*.  
 b. *You won't have very long to wait*.  
 ii a. *How long can you give me?*  
 b. *I won't be long*.

The underlined phrases are functionally comparable to NPs: compare *Take as much time as you like*; *You won't have more than ten minutes to wait*; *How much time can you give me?*; *I won't be more than ten minutes*. It is nevertheless clear from the dependents of *long* in [17] (*as*, *very*, *how*) that it is an adverb, not a noun. Notice, moreover, that such AdvPs cannot replace temporal NPs in subject function: *A long time* / *\*Long had passed since their last meeting* (except, somewhat marginally, in passives – *How long was spent on the job?*). In post-verbal position, *long* tends to prefer non-affirmative contexts: *She didn't stay long*, but not *\*She stayed long* – compare pre-verbal (and somewhat formal) *I had long realised that it was dangerous*.

### Inflected forms

The overlap between adjective and adverb is somewhat greater with comparatives and superlatives than with the plain form. Compare:

- [18] i a. *\*They are singing loud*. b. *They are singing louder than usual*.  
 ii a. *\*Kim was moving slow*. b. *Kim was moving the slowest of them all*.

Note in this connection that the irregular *better* and *best* are forms of both the adjective

*good* and the adverb *well*, and *worse* and *worst* of both the adjective *bad* and the adverb *badly*.

#### ■ Other lexically simple adverb lexemes

Finally, there are a number of adverb lexemes that are morphologically simple but not homonymous with adjectives, though some of them are homonymous with words of other categories. They include the following:

[19]	<i>as</i>	<i>but</i>	<i>either</i>	<i>else</i>	<i>ever</i>	<i>least</i>
	<i>less</i>	<i>more</i>	<i>most</i>	<i>no</i>	<i>not</i>	<i>often</i>
	<i>perhaps</i>	<i>please</i>	<i>quite</i>	<i>rather</i>	<i>seldom</i>	<i>so</i>
	<i>some</i>	<i>soon</i>	<i>though</i>	<i>thus</i>	<i>too</i>	<i>way</i>
	<i>why</i>	<i>yes</i>	<i>yet</i>			

In examples like *as big as usual* the first *as* is an adverb, while the second (which requires a complement) is a preposition. *But* is an adverb in the construction *We can but hope* (“only”), but more often is a coordinator (*old but alert*) or preposition (*nothing but trouble*). *Either* is an adverb when functioning as a connective adjunct (*Kim didn’t like it either*); elsewhere it is a determinative. For the analysis of *else*, see footnote 5 of Ch. 7. *Least*, *less*, *more*, and *most* are adverbs when functioning as markers of analytic comparative constructions but determinatives when they are inflectional forms of *little* and *much* or *many* (see Ch. 13, §4.1.1). *No* is an adverb when it is in construction with a clause, as in *No he isn’t* (contrasting with *Yes he is*), but a determinative in *no money*. The determinative analysis carries over to cases like *It’s no better than it was* in accordance with the treatment proposed for the items in [5ii] above. *Please* is of course a verb in *This won’t please them*, but it has been reanalysed as an adverb in *Please don’t tell anyone* or *Wait here a moment, please*, where it is functioning as adjunct. *Some* is an adverb in *They had invited some thirty guests* (“approximately”), but a determinative in *They had invited some friends over*, and again the determinative analysis extends to *%She may be oversimplifying some*, where the meaning is broadly the same. *Though* is an adverb when used in the sense “however” (*It wasn’t very successful, though*); elsewhere it is a preposition, usually taking a clausal complement and alternating with *although* (*He couldn’t help us, though he certainly tried*). Finally, *way* is an adverb in *It was way too big*, but a noun, of course, in *Do it this way*.

## 6 The structure of AdvPs

Adverbs head full phrases (AdvPs) that may, like AdjPs, contain modifiers and/or complements. Overall, however, adverbs occur with dependents less often than adjectives. Only a few license complements, and even modifiers are excluded by a number of those that are not formed by *-ly* suffixation, such as:

[1]	<i>about</i>	<i>also</i>	<i>but</i>	<i>either</i>	<i>however</i>	<i>moreover</i>
	<i>neither</i>	<i>nor</i>	<i>perhaps</i>	<i>please</i>	<i>therefore</i>	<i>though</i>

## 6.1 Complementation

Only adverbs with the *-ly* suffix license direct complements. Elsewhere, we take the ability to take a complement as an indication that a word belongs to some other category, such as preposition: see Ch. 7, §2.4.

### ■ PPs

Direct complements in AdvP structure almost always have the form of PPs. In the following examples, the AdvP is enclosed in brackets, with double underlining marking the head and single underlining the preposition which it licenses:

- [2] i *The subsidiary is today operating* [almost entirely separately from *the rest of the company*].  
 ii *The duel solves disputes* [independently of *abstract principles of justice*].  
 iii *We should make our decision* [independently of *whether we plan to take immediate action to implement it*].  
 iv *Purchase of State vehicles is handled* [similarly to *all State purchases*].  
 v *Foreign firms in US markets are treated* [equally with *their US counterparts*].  
 vi %*There were some people who reacted* [differently than *you did*].

The complement of the preposition is usually an NP, but it can also be an interrogative content clause in the case of *independently of* and a comparative clause with *differently than*. Other prepositions occurring with *differently* are *from* and *to* (see Ch. 13, §5.4), while *independently* can also take *from*.

This construction is to be distinguished from that where a PP following an adverb is a separate dependent of the verb, as in:

- [3] *The two plaintiffs' lawyers also dissented* [separately] *from most of the major recommendations in the report.*

Here the *from* phrase is a complement of *dissent*, whereas in [2i] it is a complement of *separately* – note that the verb *operate* in [2i] does not license a *from* complement.

The complementation in [2] matches that of the adjectives from which the adverbs are derived. Compare *The subsidiary is* [separate from *the rest of the company*]; *Neither part is* [independent of *the other*]; *This condition is* [independent of *how much experience the candidate has had*]; and so on.

It is only with a few adverbs, however, that the complementation carries over from the adjective in this way. Adverbs licensing the prepositions in [2] are virtually limited to those mentioned, together with the following:

- [4] i to: *analogously* *comparably* *identically* *similarly*  
 ii with: *concomitantly* *concurrently* *consistently* *simultaneously*

### For PPs

There is, however, one kind of PP complement that is less restricted in its occurrence, namely the *for* PP that occurs in evaluative adjuncts like those in:

- [5] i [Fortunately for *me*,] *my mother was unusually liberal-minded.*  
 ii [Luckily for *them*,] *Mr Keswick decided not to call their bluff.*  
 iii [Happily for *the middle class*,] *the workers hate pointy-headed intellectuals.*

Note that while the adjectives *fortunate* and *lucky* license PP complements of this kind,

Both constructions are being distinguished, of course, from stacked modification within an AdjP. In *This is a [generally highly competitive] market*, for example, *highly* modifies the adjective *competitive*, and *generally* modifies the AdjP *highly competitive*. We have here a sequence of two adverbs, *generally* and *highly*, but they do not form an AdvP (like *quite remarkably* in [9ii]), and are not even contained within a larger AdvP (like *only very* in [9i]).

### ■ Categories of modifier

The modifier function is realised by the same range of categories as in AdjPs. Relative clauses occur only with superlatives, as in *She ran [the fastest she had ever run]*. The other categories we review briefly in turn.

#### AdvPs

Adverbs commonly modify other adverbs, as in [9]. It is possible for an adverb in *·ly* to modify another adverb of that same form:

- [10] i *They are fairly evenly matched.*  
 ii *He reads surprisingly slowly.*  
 iii *They had done the job really incredibly meticulously.*

Sequences of *·ly* adverbs, however, run the risk of sounding stylistically clumsy, and certainly those with more than two will tend to be avoided in monitored prose. Thus an AdvP like *practically totally incomprehensibly*, while perfectly grammatical, is unlikely to occur in edited text.

An adverb modifying another adverb normally indicates degree or is of the focusing type, like *only* in [9i]. Such adverbs thus have a narrower range of semantic functions than those occurring in the structure of AdjPs, especially attributive AdjPs. For example, while we can have *his [occasionally intemperate] remarks*, with the frequency adverb *occasionally* modifying the adjective *intemperate*, there is no AdvP *occasionally intemperately*. If these adverbs occurred in succession (*He spoke occasionally intemperately*) they would be separate modifiers of the verb – and it would be much more natural to put the first before the verb (*He occasionally spoke intemperately*).

#### Determinatives

The same items occur as in AdjP structure:

- [11] i *The bigger it is, [the sooner] it disintegrates.* [the]  
 ii *I hadn't expected to be able to do it [this easily].* [this]  
 iii *I'm afraid we didn't do [all that well].* [that]  
 iv *She can run [much faster than me].* [much]  
 v *They had performed [little better than the previous time].* [little]  
 vi *I had [no sooner] got into bed than the phone rang.* [no]  
 vii *She doesn't seem to have grown [any less] extravagant.* [any]  
 viii *He had answered [a little indiscreetly].* [a little]  
 ix *You didn't express yourself [clearly enough].* [enough]  
 x *They had begun [all enthusiastically].* [all]

Note that when modifying *too* the determinative **no** appears in the independent form: *It was [none too] successful*.

## NPs

- [12] i *We arrived [three hours late].*  
 ii *He works [a great deal harder than he used to].*  
 iii *Things are moving [a bit slowly].*  
 iv *She died [later that morning].*

There are far fewer adverbs than adjectives that accept measure phrase modifiers: such modifiers occur with **early** and **late**, and also in phrases headed by **soon** (*two hours sooner, a day too soon*, though not *\*a week soon*). The post-head NP in [iv] has no analogue in AdjP structure; similarly with that in *twice a week* (cf. Ch. 5, §8.4).

## PPs

- [13] i *They had behaved [badly in the extreme].*  
 ii [Later in the day] *the situation had improved slightly.*  
 iii [Increasingly of late,] *one of the latter varieties may dominate, particularly merlot.*

PPs occur less readily as postmodifier in AdvPs than in AdjPs, but they are certainly possible. In [ii] we take *later* as head on the grounds that the phrase can be reduced more readily to *later* than to *in the day* (*?In the day the situation had improved slightly*); this analysis is extended to [12iv], though here *that morning* could stand on its own. The position of the idiomatic PP *of late* in [13iii] – as part of a sequence that would be prosodically detached – suggests that it is construed syntactically as a modifier of *increasingly* rather than as a separate modifier of the verb.

## 7 The external syntax of AdvPs

AdvPs function almost exclusively as modifiers, or supplements. They occur as complement only to a small handful of verbs and prepositions, as in:

- [1] i *You'll have [to word your reply very carefully].*  
 ii *It is now only occasionally that they travel interstate.*  
 iii *I didn't hear about it [until recently].*  
 iv *There's no way they can treat us [except leniently].*

A few verbs such as *word*, *phrase*, *treat*, and *behave* take manner phrases that qualify as complements by virtue of being obligatory. AdvPs are also occasionally found as complement of *be* in its specifying sense, as in the cleft clause [ii]. A few AdvPs can also function as complement of a preposition, as in [iii–iv], the latter being a case of ‘matrix licensing’ (Ch. 7, §5.1). Note also the complement use of phrases headed by *long* illustrated in [17] of §5.

The use of AdvPs as adjuncts (modifiers in clause structure or supplements to a clause) is mainly dealt with in Ch. 8, since the various semantic categories of adjunct we need to distinguish – manner, means, frequency, purpose, condition, etc. – can also be realised by expressions of other categories, primarily PPs. We do take up in the present chapter, however, the issue of the linear position of AdvPs in clause structure, since PPs do not in general show the same range: this is the topic of §7.1. In §7.2 we survey the use of AdvPs as modifiers of adjectives and adverbs. And finally, in §7.3, we examine the use

of adverbs as focusing modifiers. For adverbial modifiers in NP structure, see Ch. 5, §§12–13.

## 7.1 Linear position of AdvPs in clause structure

### ■ Front, end, and central positions

We distinguish three main positions for adjuncts, as described in Ch. 8, §20.1. **Front** position is before the subject. **End** position is after the verb, and perhaps some or all of its dependents. **Central** position in clauses headed by a lexical verb is between the subject and the verb; for clauses headed by an auxiliary verb it can again be between subject and verb, but is more often just after the verb (and hence not always clearly distinct from end position). We illustrate in [2], where the adjunct *happily* can be either an evaluation or a manner adjunct:

[2]	SEMANTIC TYPE	POSITION
i <i>Happily, they watched TV until dinner.</i>	evaluation	front
ii <i>They happily watched TV until dinner.</i>	manner	central
iii <i>They watched TV happily until dinner.</i>	manner	end
iv <i>They watched TV until dinner happily.</i>	manner	end

Placement in end position immediately after a lexical verb is possible when no object is present (*They watched happily until dinner*) but impossible in [2]: *\*They watched happily TV until dinner*. The latter is excluded by the general prohibition against separating a head from an NP functioning as its object (except where heavy complements are postposed) – recall the discussion of *\*He doesn't like enough the idea* in §2.2).

As noted in Ch. 8, §20.2, an adjunct immediately following a catenative auxiliary verb may belong either in the clause headed by the auxiliary or in the non-finite clause functioning as its complement. Compare:

[3] i <i>I would frankly [want a lot more money than that for it].</i>	[speech act-related]
ii <i>I would [frankly explain to him what the position was].</i>	[manner]

Note then the different possibilities in [4] for placement of the modality adjunct *probably*, which belongs in the upper clause, and the manner adjunct *contentedly*, whose basic position is in the *watch* clause:

[4] i a. <i>Probably they would watch TV for hours.</i>	modality	front
b. <i>They probably would watch TV for hours.</i>	modality	pre-auxiliary
c. <i>They would probably watch TV for hours.</i>	modality	post-auxiliary
ii a. <i>?Contentedly they would watch TV for hours.</i>	manner	front
b. <i>?They contentedly would watch TV for hours.</i>	manner	pre-auxiliary
c. <i>They would contentedly watch TV for hours.</i>	manner	post-auxiliary
d. <i>They would watch TV contentedly for hours.</i>	manner	end
e. <i>They would watch TV for hours contentedly.</i>	manner	end

### ■ VP-oriented and clause-oriented AdvP adjuncts

Modality *probably* is oriented towards the clause as a whole rather than more specifically to the VP, whereas it is the other way round with manner *contentedly*. This distinction can be generalised to the other semantic types discussed in Ch. 8, so that we will distinguish,

for purposes of setting out the relevant generalisations about AdvP positioning, two significantly different groups of adjunct types:

- |     |                          |   |
|-----|--------------------------|---|
| [5] | VP-ORIENTED ADJUNCTS     |   |
|     | i MANNER                 | <i>She walked <u>unsteadily</u> to the door.</i>            |
|     | ii MEANS OR INSTRUMENT   | <i>Planets can be detected <u>radio-telescopically</u>.</i> |
|     | iii ACT-RELATED          | <i>They <u>deliberately</u> kept us waiting.</i>            |
|     | iv DEGREE                | <i>The share price has increased <u>enormously</u>.</i>     |
|     | v TEMPORAL LOCATION      | <i>She <u>subsequently</u> left town.</i>                   |
|     | vi DURATION              | <i>We were staying in a motel <u>temporarily</u>.</i>       |
|     | vii ASPECTUALITY         | <i>Some of the guests are <u>already</u> here.</i>          |
|     | viii FREQUENCY           | <i>Do you come here <u>often</u>?</i>                       |
|     | ix SERIAL ORDER          | <i>The play was <u>next</u> performed in 1901.</i>          |
| [6] | CLAUSE-ORIENTED ADJUNCTS |   |
|     | i DOMAIN                 | <i><u>Politically</u>, the country is always turbulent.</i> |
|     | ii MODALITY              | <i>This is <u>necessarily</u> rather rare.</i>              |
|     | iii EVALUATION           | <i><u>Fortunately</u> this did not happen.</i>              |
|     | iv SPEECH ACT-RELATED    | <i><u>Frankly</u>, I'm just not interested.</i>             |
|     | v CONNECTIVE             | <i><u>Moreover</u>, he didn't even apologise.</i>           |

Only rather broad and approximate flexible generalisations about adjunct placement and sequence can be made. There is a great deal of variation in use, and features of context, style, prosody, and euphony play a role in some decisions. However, a useful rule of thumb can be framed in terms of the distinction between the adjunct types in [5] and those in [6]. The generalisation, in two parts, can be stated thus:

- [7] i AdvPs realising VP-oriented adjuncts are more closely associated with the VP constituents, and more likely to be positioned in the VP or adjacent to the VP.
- ii AdvPs realising clause-oriented adjuncts are less closely associated with the VP constituents and less likely to be positioned in the VP or adjacent to the VP.

The statement about positioning in [7i] correlates with a semantic observation, namely that VP-oriented adjuncts denote modifications of the details of the predicate of a clause: if the predication corresponds semantically to a type of action, adjuncts of these types tend to specify aspects such as the way in which the action was carried out, the time it took, the degree to which it was carried out, or the order in which it was done relative to other actions.

There is also a semantic observation relevant to [7ii]. Clause-oriented adjuncts represent modifications of the applicability of the clause content. That is, their semantic effect is to characterise how the propositional content of the clause relates to the world or the context: the sphere of discourse within which it holds (domain), the array of possible situations within which it is true (modality), the extent to which its obtaining is a good or a bad thing (evaluation), or the attitude the speaker has towards its obtaining (speech act-related). Clause-oriented adjuncts have meaning contributions that are much more external to the content of the proposition.

Putting the syntactic and semantic observations together, we see that the closeness of the adjuncts in linear proximity to the predicator at the heart of a clause tends to correlate with the closeness of what the adjuncts express to the content of the predication.

### ■ Adjunct orientation and linear position

The rough generalisation in [7] can be adapted to yield a more detailed guide to AdvP positioning if we note that front position is furthest from the VP, central position is closer, and end position means being in or adjacent to the VP. Clause-oriented adjuncts often favour front position; VP-oriented adjuncts favour end position. Central position before an auxiliary is a less common alternative to front position; and central position after an auxiliary may be found with either, since it is ambiguous with respect to clause or VP orientation.

It follows from this that if a clause-oriented AdvP and a VP-oriented AdvP are both in central position, they will be in that order, or will acquire a different and perhaps unusual meaning if not in that order:

- [8] i a. *They had luckily already left.*      b. <sup>?</sup>*They had already luckily left.*  
 ii a. *It probably sometimes fails.*      b. <sup>?</sup>*It sometimes probably fails.*

The [b] examples are not fully acceptable: [ib] has an aspectuality adjunct before an evaluation adjunct, and [iib] has a frequency adjunct before a modality adjunct; both illustrate clause-oriented adjuncts closer to the verb than VP-oriented ones.

### ■ Prosodic detachment and AdvP positioning

Adjuncts in any of the three basic positions may be **prosodically detached**, i.e. set off from the rest of the clause by intonational phrase boundaries. In this case they have the status of supplements, elements that occupy a linear position but are not integrated into the structure of the clause, as modifiers are (see Ch. 15, §5). In writing, supplementary adjuncts are often set off by punctuation, most often commas, but it is important to note that there is a great deal of variation in usage on this point, some authors putting in such commas far more often than others. In the examples below, however, we systematically indicate prosodic detachment and integration respectively by the presence and absence of a comma.

Prosodic detachment is more likely and more appropriate for adjuncts that are out of the positions their semantic type would normally determine for them. Thus, for example, if a means adjunct were ever to be in front position, or if a speech act-related adjunct were placed in end position, prosodic detachment would be demanded:

- [9] i a. <sup>?</sup>*Statistically, we analysed it.*      b. <sup>\*</sup>*Statistically we analysed it.*  
 ii a. <sup>?</sup>*Are you a spy, honestly?*      b. <sup>\*</sup>*Are you a spy honestly?*

The [a] examples in [9], with an intonation break separating the adverb from the rest of the clause, are not fully acceptable; but they are better than the [b] examples, in which they are prosodically integrated into the clause.

It is particularly natural for front position adjuncts to be prosodically detached. With central position adjuncts, prosodic detachment marks the adjuncts as interpolations, and thus indicates that front or end would be their more normal position.

There is a difference between clause-oriented and VP-oriented adjuncts regarding detachment, though in illustrating it we shall mark disfavoured examples with ‘<sup>?</sup>’ rather than ‘<sup>\*</sup>’ in recognition of the considerable variability found, in both intonation in speech and the use of commas in writing. The relevant generalisations are set out in [10],

with examples following.

- [10] i VP-ORIENTED ADJUNCTS
- a. VP-oriented adjuncts often prefer end position, where prosodic detachment is not normal except to separate the indication of manner from the rest of the clause, perhaps as a kind of afterthought.
  - b. Central position (after the tensed auxiliary if there is one) is an alternative, especially if this means the adjunct is adjacent to the lexical verb of the VP it is semantically associated with, rather than being separated from it by secondary forms of auxiliaries. Prosodic detachment in this case is not normal, but would signal that the adjunct was an interpolation.
  - c. Front position is highly unusual for VP-oriented adjuncts, and if used will normally require prosodic detachment.
- ii CLAUSE-ORIENTED ADJUNCTS
- a. Clause-oriented adjuncts tend to prefer front position, where prosodic detachment is normal.
  - b. Central position (preferably after the auxiliary if there is one) is an alternative, with prosodic detachment often preferred.
  - c. End position is strongly disfavoured unless there is prosodic detachment.
- [11] VP-ORIENTED ADJUNCT (MANNER)
- |  |  |
|--|--|
| i a. <sup>?</sup> <i>Expertly</i> , Chris had repaired it. | b. <sup>?</sup> <i>Expertly</i> Chris had repaired it. |
| ii a. Chris, <i>expertly</i> , had repaired it.            | b. <sup>?</sup> Chris <i>expertly</i> had repaired it. |
| iii a. Chris had, <i>expertly</i> , repaired it.           | b. Chris had <i>expertly</i> repaired it.              |
| iv a. Chris had repaired it, <i>expertly</i> .             | b. Chris had repaired it <i>expertly</i> .             |
- [12] CLAUSE-ORIENTED ADJUNCT (EVALUATION)
- |  |  |
|--|--|
| i a. <i>Luckily</i> , Chris had forgotten it.    | b. <i>Luckily</i> Chris had forgotten it.              |
| ii a. Chris, <i>luckily</i> , had forgotten it.  | b. <sup>?</sup> Chris <i>luckily</i> had forgotten it. |
| iii a. Chris had, <i>luckily</i> , forgotten it. | b. Chris had <i>luckily</i> forgotten it.              |
| iv a. Chris had forgotten it, <i>luckily</i> .   | b. *Chris had forgotten it <i>luckily</i> .            |

Manner adjuncts are generally not placed in front position, as the marks on both examples in [11i] indicate, but, again, in some contexts such sentences will be encountered; in particular, where the manner in which some action is taken is crucial to the context of the action, a manner adjunct might perhaps be found in front position (*Smoothly the boat slid down the ramp into the water*). Similarly, although [11iib] is not a normal positioning of an integrated manner adjunct, it should not be assumed that such sentences will never be encountered. Similar remarks hold for [12iib] (consider *We fortunately hadn't gone very far*, which has the same structure), though [12ivb] seems implausible enough to be marked as ungrammatical.

### ■ Survey of semantic types

To indicate in summary form where AdvPs can be positioned with full or partial acceptability, we will exhibit a sequence of words with indicators of acceptability for each of the potentially available positions in which a given adjunct might occur. We will put '✓' where it would be acceptable, '?' where it might occur but would be disfavoured (not fully acceptable), and '\*' where it is outright ungrammatical, or else so implausible (because

some other reading would be assumed) that we can treat it as ungrammatical. These marks apply to readings in which the adjunct is prosodically integrated, not detached. Thus for *frankly* as a manner adverb combining with *Chris won't talk about it*, we would write [13], which is interpreted as in [14]:

[13] *frankly*                      MANNER                      \**Chris* \* *won't* ✓ *talk* ✓ *about it* ✓

- [14] i *Frankly Chris won't talk about it* and *Chris frankly won't talk about it* have no chance of being interpreted with *frankly* as a manner adjunct (both would be interpreted with *frankly* as speech act-related).
- ii Any of *Chris won't frankly talk about it*, *Chris won't talk frankly about it*, and *Chris won't talk about it frankly* are fully acceptable with the manner adjunct reading.

We do not put any mark between *about* and *it* since these are not separate dependents in clause structure, and no integrated adjunct could occur here.

We now summarise how the classes of adjuncts listed in [5–6] are typically positioned in clauses.

### Manner, means, and instrument

- [15] i *erratically*                      MANNER                      \* *Bill* \* *would* ✓ *stagger* ✓ *around* ✓
- ii *arithmetically*                      MEANS                      \* *it* \* *was* ✓ *established* ✓ *today* ✓

Adjuncts of manner, means, and instrument must normally be within the VP whose head they modify, in either end position (which is preferred) or central position. Manner adjuncts may sometimes be found preposed (*Erratically he staggered across the room*), but this is not at all common.<sup>16</sup>

### Act-related

- [16] ACT-RELATED
- foolishly*                      (subjective) ✓ *she* ✓ *has* ✓ *gone* \* *to the police* \*
- deliberately*                      (volitional) ? *they* ? *were* ✓ *delaying* ✓

Act-related adjuncts of the subjective subtype (*carefully*, *foolishly*, *rudely*, *wisely*, etc.) occur in front or central position: end position is possible only with prosodic detachment. For the volitional subcategory (*deliberately*, *intentionally*, and so on) the preference is for central position, following the auxiliary if there is one; end position is an available alternative.

### Degree

- [17] i *almost*                      DEGREE                      \* *I* ✓ *died* \*
- ii *thoroughly*                      DEGREE                      \* *I* ✓ *agree* \* *with you* ✓

There are significant differences among degree adverbs. Some, such as *almost*, *nearly*, *quite*, normally occur only in central position. Others, such as *thoroughly*, *enormously*, *greatly*, occur in either central or final position. With this second set, end position is the default, and acceptability in central position depends on the verb. Thus *He enormously admires them* is fine, but we cannot have \**The price has enormously gone up*.

<sup>16</sup>In earlier centuries manner adjuncts could be preposed with subject–auxiliary inversion: *Gladly would I accept your invitation if I could*; but this is seldom found in Present-day English.

### Temporal location, duration, aspectuality, and frequency

[18] i	<i>earlier</i>	TEMPORAL LOCATION	✓ <i>she</i> ? <i>had</i> ✓ <i>left</i> ? <i>for Chicago</i> ✓
ii	<i>temporarily</i>	DURATION	? <i>we</i> ? <i>are</i> ✓ <i>staying</i> ✓ <i>with mother</i> ✓
iii	<i>already</i>	ASPECTUALITY	? <i>our guests</i> ? <i>are</i> ✓ <i>here</i> ✓
iv	<i>often</i>	FREQUENCY	? <i>he</i> ? <i>would</i> ✓ <i>visit her</i> ✓

AdvPs expressing temporal location prefer central position; they are also acceptable in front position, and mostly in end position too (though a longer one, such as *subsequently*, would be questionable in end position in [i]). Duration, aspectuality, and frequency adjuncts are similar except that they are less likely to be in front position (but for a use of *already* in front position see example [10ii] in Ch. 8, §8).

### Serial order

[19] i	<i>last</i>	SERIAL ORDER	* <i>I</i> ? <i>had</i> ✓ <i>eaten</i> ✓ <i>the previous day</i> *
ii	<i>next</i>	SERIAL ORDER	* ‘ <i>Salome</i> ’ ? <i>was</i> ✓ <i>performed</i> ✓ <i>in 1926</i> ?

The serial order adverbs *again*, *first*, *last*, and *next* generally resist front position quite strongly, and must precede the temporal adjuncts with which they frequently occur. Front position is not impossible for the word *next* in [ii], but the sentence *Next ‘Salome’ was performed in 1926* would be interpreted with *next* as a simple temporal location adjunct (“What happened after that was that ‘*Salome*’ was performed in 1926”), not with the reading where *next* has the serial order sense (“The next time ‘*Salome*’ was performed was in 1926”).

### Domain and modality

[20] i	<i>politically</i>	DOMAIN	✓ <i>this</i> ? <i>will</i> ? <i>become</i> ? <i>very unpleasant</i> ✓
ii	<i>probably</i>	MODALITY	✓ <i>she</i> ✓ <i>will</i> ✓ <i>go</i> ✓ <i>with them</i> ✓

Domain adjuncts prefer front position and also accept end position, but in central position normally require prosodic detachment. For modality adjuncts the preferred position is central; they occur readily in front position, and are also found in end position (but often with prosodic detachment).

### Evaluation and speech act-related

[21] i	<i>unfortunately</i>	EVALUATION	✓ <i>they</i> ? <i>had</i> ? <i>set out</i> ? <i>too late</i> ?
ii	<i>frankly</i>	SPEECH ACT-RELATED	✓ <i>this</i> ? <i>is</i> ? <i>becoming</i> ? <i>a joke</i> ?

Both of these types of adjunct are most often prosodically detached. When prosodically integrated both can occur in front position, and the evaluation type also centrally.

### Connective

In general, connective adjuncts most often occur with prosodic detachment. In this case front position is preferred, but with numerous alternatives. In writing, it is common to find them in immediate post-subject position (as in *The plan, however, had one serious flaw*), but this is markedly more formal, and less common in speech. There are nevertheless some connectives that can be prosodically integrated – like the centrally positioned *nevertheless* in this sentence. *So* is exceptional in being more or less invariably integrated and in front position.

### ■ The so-called ‘split infinitive’

In infinitival clauses containing the marker *to*, there are two variants of the pre-verbal central position, one in which the adjunct precedes *to*, and one in which it follows:

- [22] i *We ask you [not to leave your seats].* [pre-marker]  
 ii *We ask you [to please remain seated].* [post-marker]

The construction with an adjunct in post-marker position is traditionally called a ‘split infinitive’. There has been prescriptive pressure against it for more than a century; in fact it is probably the best-known topic in the whole of the English pedagogical grammatical tradition. Disapproval of the construction leads many writers (and subeditors) to avoid it in favour of pre-marker placement of the adjunct. That is, in written English, sentences like those in [23i] will be found as alternatives to sentences like those in [23ii].

- [23] i a. *I want really to humiliate him.* b. *We aim utterly to ignore it.* [pre-marker]  
 ii a. *I want to really humiliate him.* b. *We aim to utterly ignore it.* [post-marker]

### No rational basis for the prescriptive rule

Prescriptive condemnation of the ‘split infinitive’ did not arise until the second half of the nineteenth century. The construction can be found in the literature of the preceding several hundred years, but it became more popular in English writing as the nineteenth century went on, and the adoption of the rule in prescriptive grammar reflected disapproval of this change. No reason was ever given as to why the construction was supposedly objectionable, however.

It should be noted that the term ‘split infinitive’ is a misnomer: nothing is being split. In Latin there is an infinitive form of the verb, which is traditionally translated into English by means of *to* + the plain form. Latin *amare*, for example, is translated as *love*. But while *amare* is a single word, *to love* is not: it is a sequence of two words. Thus the fact that no adjunct can be positioned within *amare* provides no basis for expecting that it should be contrary to grammatical principles to position one between *to* and *love*. Moreover, we will argue in Ch. 14, §1.4.2, that in such a VP as *to love her* the immediate constituents are *to* and *love her*, so that *to love* does not form a syntactic constituent, let alone a word. From a grammatical point of view, therefore, the adjunct in *to genuinely love her* does not split anything.

### Avoiding ambiguity

Prescriptive rules and recommendations are often motivated by the wish to achieve clarity of expression, in particular to avoid ambiguity – cf., for example, the discussion of the traditional rule concerning the placement of *only* in §7.3 below. A curious feature of the ‘split infinitive’ rule, however, is that following it has the potential to reduce clarity, to create ambiguity.

A modifier placed between *to* and a following verb will always be interpreted as modifying that verb, but one located before the *to* can in principle be interpreted as modifying either the following verb or a preceding verb in a matrix clause. Compare first the following unambiguous examples:

- [24] i *I urge you [to really immerse yourself in the topic].*  
 ii *I hope [eventually to have my own business].*  
 iii *I want desperately [to see him again].*

In [i] *really* belongs in the infinitival clause: it is a matter of your really immersing yourself, not of my really urging you. In [ii] *eventually* will also be interpreted as modifying the infinitival: it is my having my own business that is in the future, for my hoping is in the present. In [iii], by contrast, *desperately* is interpreted as modifying *want*, not *see*: the adjunct here belongs in the matrix clause (where it is in end position, after the lexical verb). Modifiers with the same linear position between a matrix verb and infinitival *to* can thus occupy different positions as far as the constituent structure is concerned.

Compare now:

- [25] i *The board voted [to immediately approve building it].*  
 ii *The board voted immediately to approve building it.*

In [i] *immediately* unambiguously modifies *approve*: the board decided (perhaps after months of debate with opponents) that they would give immediate approval for some building project. This violates the prescriptive rule, however, so one might seek to remedy that by placing the adverb to the left of *to*, as in [ii]. But this is ambiguous, and indeed much the more salient and natural interpretation is the one where *immediately* modifies *voted*: they voted immediately that the proposal should be approved. Note, moreover, that we do not fare any better if we move the adverb to the right instead of to the left:

- [26] i *The board voted to approve immediately building it.*  
 ii *The board voted to approve building it immediately.*

The salient interpretation of [i] has *immediately* modifying *building*. In [ii] the adverb can be interpreted as modifying any of the three verbs, but the one where it modifies *approve* is the least likely of the three. It is clear, then, that for the intended meaning, version [25i] is far superior to any of the others.

### Current usage

Placement of a modifier after infinitival *to* is not uncommon in either speech or writing (including works of many of the most prestigious authors). Among the adverbs that particularly lend themselves to placement in this position are those marking degree (such as *really* and *utterly* in [23ii]), *actually*, *even*, *further*, and so on:

- [27] i *I hadn't expected her to almost break the record.*  
 ii *Following this rule has the potential to actually create ambiguities.*  
 iii *I wouldn't advise you to even consider accepting their offer.*  
 iv *It's important not to further complicate an already very tense situation.*

Such examples are unquestionably fully acceptable. Note, moreover, that it is not just adverbs that can appear in post-marker position: we also find PPs (e.g. *at least*, *in effect*, *in some measure*) and NPs (e.g. *one day*).

Modern usage manuals are generally aware of the points made above, and present the rule only with the qualification that a 'split infinitive' is acceptable if it improves clarity or avoids awkwardness. Nevertheless, there can be no doubt that in careful or edited writing adjuncts are often consciously placed in pre-marker (or end) position in order to avoid infringing the traditional rule.

## 7.2 Adverbial modifiers of adjectives and adverbs

In the structure of attributive AdjPs, adverbs (or AdvPs) can be used with virtually any of the semantic functions that they have in clause structure. In the following

examples, the labels on the right match the ones used in the account of adjuncts presented in Ch. 8.

- |        |  |                      |
|--------|--|----------------------|
| [28] i | his [ <i>quietly confident</i> ] <i>demeanour</i>                | [manner]             |
| ii     | their [ <i>unintentionally humorous</i> ] <i>remarks</i>         | [act-related]        |
| iii    | his [ <i>internationally famous</i> ] <i>daughter-in-law</i>     | [spatial location]   |
| iv     | his [ <i>recently very aggressive</i> ] <i>behaviour</i>         | [temporal location]  |
| v      | his [ <i>permanently sullen</i> ] <i>expression</i>              | [duration]           |
| vi     | an [ <i>already quite difficult</i> ] <i>situation</i>           | [aspectuality]       |
| vii    | her [ <i>sometimes very harsh</i> ] <i>criticisms</i>            | [frequency]          |
| viii   | his [ <i>again totally uncomprehending</i> ] <i>response</i>     | [serial order]       |
| ix     | an [ <i>extremely valuable</i> ] <i>contribution</i>             | [degree]             |
| x      | the [ <i>consequently inevitable</i> ] <i>decline</i>            | [reason]             |
| xi     | their [ <i>nevertheless very valid</i> ] <i>objection</i>        | [concession]         |
| xii    | the [ <i>otherwise preferable</i> ] <i>course of action</i>      | [condition]          |
| xiii   | a [ <i>philosophically very naive</i> ] <i>argument</i>          | [domain]             |
| xiv    | a [ <i>probably unintentional</i> ] <i>slight</i>                | [modality]           |
| xv     | their [ <i>fortunately quite rare</i> ] <i>misunderstandings</i> | [evaluation]         |
| xvi    | this [ <i>frankly rather unsavoury</i> ] <i>character</i>        | [speech act-related] |

The degree function, however, is by far the most common, and in AdvPs and predicative AdjPs it is virtually the only possibility apart from that of the focusing adverbs *only*, *even*, etc. Moreover, degree modifiers are found in AdjP and AdvP structure much more frequently than in clause structure, because verbs are less readily gradable than adjectives and adverbs. For these reasons we will focus in the remainder of this section on degree modification, though we will not repeat the semantic classification of degree modifiers presented in Ch. 8, §11.

### ■ Degree adverbs in *-ly*

A great many adverbs function as degree modifiers. The following is a sample of *-ly* adverbs that can be used in this way:

- |      |                     |                     |                     |                      |                    |                     |
|------|---------------------|---------------------|---------------------|----------------------|--------------------|---------------------|
| [29] | <i>absolutely</i>   | <i>amazingly</i>    | <i>awfully</i>      | <i>barely</i>        | <i>completely</i>  | <i>considerably</i> |
|      | <i>dreadfully</i>   | <i>easily</i>       | <i>enormously</i>   | <i>entirely</i>      | <i>exceedingly</i> | <i>excessively</i>  |
|      | <i>extensively</i>  | <i>extremely</i>    | <i>fairly</i>       | <i>fantastically</i> | <i>fully</i>       | <i>greatly</i>      |
|      | <i>hardly</i>       | <i>highly</i>       | <i>hugely</i>       | <i>immensely</i>     | <i>incredibly</i>  | <i>infinitely</i>   |
|      | <i>intensely</i>    | <i>largely</i>      | <i>moderately</i>   | <i>nearly</i>        | <i>noticeably</i>  | <i>partly</i>       |
|      | <i>perfectly</i>    | <i>positively</i>   | <i>practically</i>  | <i>profoundly</i>    | <i>purely</i>      | <i>really</i>       |
|      | <i>reasonably</i>   | <i>relatively</i>   | <i>remarkably</i>   | <i>simply</i>        | <i>slightly</i>    | <i>strikingly</i>   |
|      | <i>strongly</i>     | <i>sufficiently</i> | <i>supremely</i>    | <i>suspiciously</i>  | <i>terribly</i>    | <i>totally</i>      |
|      | <i>tremendously</i> | <i>truly</i>        | <i>unbelievably</i> | <i>utterly</i>       | <i>virtually</i>   | <i>wonderfully</i>  |

For some of these the primary meaning has to do with manner, with the degree meaning secondary. Compare:

- |      |   |  |
|------|---|--|
| [30] | MANNER                                    | DEGREE   |
| i    | a. They behaved <i>dreadfully</i> .       | b. I'm <i>dreadfully</i> sorry.                |
| ii   | a. He was acting <i>suspiciously</i> .    | b. The kids are <i>suspiciously</i> quiet.     |
| iii  | a. She solved the problem <i>easily</i> . | b. She speaks <i>easily</i> the most fluently. |

In [ia] *dreadfully* means “very badly” (“in a dreadful manner”), whereas in [ib] it simply indicates a very high degree (“extremely”). In [iia] *suspiciously* likewise indicates manner (“in a manner that gave rise to suspicion”), while in [iib] it is a matter of the kids being quiet to a degree that caused suspicion. *Suspiciously* does not occur with this extended sense as a modifier of verbs.

As a manner adverb, *easily* means “with ease”; as a degree adverb it occurs mainly with superlatives or expressions indicating sufficiency (*easily loud enough*, *easily sufficient*). The interpretation is that the degree expressed in the head is achieved by a considerable margin; in [3oiiib] she excelled the others in fluency by such a margin, and in *She’s easily good enough* she is considerably higher on the relevant scale than the minimum necessary to count as good enough.

*Fairly* indicates a moderately high degree: *The weather has been fairly good* (“quite, reasonably”). This is very different from the manner sense of *They played fairly*, etc. *Fairly* does not occur in clause structure with the same sense as in AdjPs or AdvPs: it cannot, for example, replace *quite* in *I quite liked it*. It is found in clause structure, however, as a synonym of *positively*, as in *They fairly jumped at the idea*.

### ■ Degree adverbs without the *-ly* suffix

Other adverbs that function as degree modifier include the following:

[31]	<i>about</i>	<i>almost</i>	<i>altogether</i>	<i>as</i> –v	<i>bloody</i>	<i>damn</i> –v
	<i>dead</i> –v	<i>downright</i>	<i>even</i> –v c	<i>extra</i> –v	<i>far</i> c	<i>how</i>
	<i>however</i>	<i>indeed</i>	<i>jolly</i> –v	<i>just</i>	<i>least</i>	<i>less</i>
	<i>mighty</i> –v	<i>more</i>	<i>most</i>	<i>not</i>	<i>outright</i>	<i>plain</i> –v
	<i>pretty</i> –v	<i>quite</i>	<i>rather</i>	<i>real</i> –v	<i>so</i>	<i>somewhat</i>
	<i>still</i> c	<i>too</i> –v	<i>very</i> –v	<i>way</i> c	<i>well</i>	<i>yet</i> c

#### The ‘c’ subset

The items marked ‘c’ occur with comparisons of inequality or (in most cases) *too*:

[32]	i	<i>far less useful</i>	<i>far too old</i>	<i>*far old</i>
	ii	<i>still better</i>	<i>*still too expensive</i>	<i>*still expensive</i>
	iii	<i>way better</i>	<i>way too dangerous</i>	<i>*way dangerous</i>

The relevant sense of *still* is seen in:

- [33] i *I enjoyed the evening but it would have been still better if you had been there.*  
 ii *Tuesday is possible, but Friday would be better, and Sunday better still.*

In this sense *still*, *even*, *yet*, and *again* are equivalent: these are the ones that do not combine with *too*. *Still too expensive* and *still expensive* are possible as attributive AdjPs with *still* having its aspectual sense.

#### The ‘–v’ subset

The items in [31] marked ‘–v’ do not occur with the same sense as modifiers of verbs.<sup>17</sup> Their use as modifiers of adjectives is illustrated in:

[34]	<u><i>as</i></u> tall as Kim	<u><i>damn</i></u> rude	<u><i>dead</i></u> right	<u><i>even</i></u> better	<u><i>extra</i></u> careful	<u><i>jolly</i></u> good
	<u><i>mighty</i></u> generous	<u><i>plain</i></u> wrong	<u><i>pretty</i></u> stupid	<u><i>real</i></u> kind	<u><i>too</i></u> big	<u><i>very</i></u> old

<sup>17</sup>Strictly speaking we should also have marked *more*, *most*, *less*, *least* as –v, since in clause structure they are forms of the determinatives *much* and *little* rather than adverbs. Moreover, *not* (expressing “zero degree”) does not belong syntactically with the degree modifiers in clause structure.

But we do not find *\*I as enjoyed it as Kim*, *\*I damn hated it*, *\*They dead hit the target*, etc. In clause structure *as*, *too*, and *very* modify *much* rather than modifying the verb directly: *I enjoyed it as much as Kim*; *You indulge yourself too much*; *I regret it very much*. *Pretty* also combines with *much*, but with the meaning “just about, more or less”: *I’ve pretty much ruined my chances*. In addition, *still* and its synonyms occur in clause structure in combination with *more*, the comparative form of *much*. Compare [33i], for example, with *I enjoyed the party, but I would have enjoyed it still more if you had been there*. *Damn* and *jolly* combine with *well* to form clause-level modifiers with emphatic meaning: *I damn/jolly well hope you’re right*.

We have noted that informal *real* alternates with *really*, and it is only the latter form that occurs in clause structure: *I really/\*real like him*. *Dead* and *plain* combine with a quite narrow range of adjectives. Compare, for example, *dead bored* and *\*dead interested* or *plain silly* with *\*plain bright*. There are others that are even more restricted in their occurrence, largely confined to one or two fixed phrases: *fast asleep*, *wide open*, *wide awake*.<sup>18</sup>

The primary sense of *too* is to indicate a higher degree than the maximum that is consistent with meeting some condition, achieving some purpose, actualising some situation:

- [35] i *She was too tired to continue.*  
 ii *We didn’t go out: it was too wet.*

In [i] the degree of tiredness was greater than the maximum consistent with her continuing: the sentence thus entails that she didn’t continue. In this sense, *too* licenses an indirect complement with the form of an infinitival clause or a *for* phrase (*too valuable for this kind of use*). This indirect complement indicates the condition, purpose, or potential situation, but does not have to be overtly expressed. In [ii], for example, there is no complement in the *wet* phrase, but we understand “too wet to go out”. In informal style, *too* can be used with more or less the sense of *very*, as in *You are too kind* or *That’s too bad* (“very unfortunate”). In negative contexts it can be glossed as “particularly”: *I wasn’t too impressed*; *It wasn’t too bad* (“It was tolerable”).

### ■ Submodification and iteration

It is possible to have non-coordinate sequences of degree adverbs, involving either submodification of one by another or iteration of the same word:

- [36] i *way more useful*    *almost unbelievably greedy*    *quite amazingly irresponsible*  
           *just barely alive*    *not entirely too eager*    *bloody nearly completely useless*  
 ii *very, very good*    *much, much better*    *far, far more interesting*

The examples in [ii] illustrate the adverbs that iterate most readily, but the construction is not limited to these – cf. *It’s quite, quite beautiful* or *You’re too, too kind*.

<sup>18</sup>Because there are degree modifiers that combine with adjectives and adverbs but not verbs, some modern grammars assign the items in [29] and [31] to a distinct lexical category called ‘intensifier’. This cannot be regarded as an improvement on the traditional analysis, however, for the number of –v items is very small in comparison with the total number of items that can function as degree modifier in the structure of AdjPs and AdvPs: there is no basis for making a primary category distinction here. The term ‘intensifier’ is also used as a functional term, but again this is no improvement on the traditional ‘degree modifier’. A large proportion of degree adverbs indicate a relatively high degree, but there are a good number that do not, and it is semantically inappropriate to apply the term ‘intensifier’ to the modifiers in phrases like *moderately cool*, *slightly unusual*, *barely noticeable*, etc.: in this book ‘intensifier’ is used only for those indicating a high degree.

### ■ Linear position

Degree modifiers generally precede the head. *Still* and its synonyms, however, optionally follow, as in [33ii]. In addition, the preferred position for *indeed* is after the head (reflecting its transparent resemblance to a PP):

[37] *We are fortunate indeed to live in such a wonderful country.*

This example belongs to quite formal style; elsewhere *indeed* normally modifies a head that contains its own degree modifier, typically *very*, as in *very good indeed*. Post-head position is not possible in an attributive AdjP. Instead, *indeed* is delayed and appears after the head of the NP: *a very good book indeed*.

## 7.3 Focusing modifiers

We conclude this section with a survey of the kind of modifying function realised by such adverbs as *only* and *also* in:

- [38] i *You can [only exit from this lane].*  
 ii *Jill had [also attended the history seminar].*

In writing, both of these examples are ambiguous, with the interpretations given in:

- [39] i a. “The only thing you can do from this lane is exit”  
 b. “This is the only lane from which you can exit”  
 ii a. “Those attending the history seminar included Jill as well as others”  
 b. “The seminars Jill attended included the one on history as well as others”  
 c. “The things Jill attended included the history seminar as well as others”  
 d. “The things Jill did included attending the history seminar as well as others”

Thus if the lane is on a motorway, then in [ia] you are prohibited from continuing along the motorway, and in [ib] you are prohibited from exiting from other lanes. A context for [iia] is one where Kim and Pat attended the history seminar: Jill did too. For [iib] it might be that she attended the history seminar as well as the philosophy seminar. For [iic] she may have attended the history seminar as well as some committee meeting. And in [iid] it might be that Jill attended the history seminar as well as giving a lecture on semantics.

The square brackets in [38] enclose the constituents in which *only* and *also* are modifiers, with underlining marking the head. But it follows from the ambiguities that in order to understand the meaning contribution of *only* and *also* it is not sufficient to identify the syntactic head that they modify: one must know which element they apply to semantically. This element is called the **focus** – hence the term **focusing modifier** for this type of modifier. In [38i] the focus is *exit* in the case of interpretation [39ia], and *this lane* (or just *this*) for interpretation [39ib]. Similarly, the focus of [38ii] for the four interpretations given is respectively *Jill*, *history*, *the history seminar*, *attended the history seminar*. Note that the first of these, *Jill*, is not part of the head constituent that *also* syntactically modifies.

Focusing modifiers occur in a wide range of constituent types: all the major phrasal categories, and in some cases whole clauses. They are, moreover, predominantly realised by adverbs. It is for these reasons that we deal with them in the present chapter.

*Only* has a restrictive meaning, *also* an additive one. These represent the two main kinds of focusing modifier, and we will consider them in turn. But we should first note that neither of them can be made complement of *be* in a cleft clause:

- [40] i \**It is only that you can exit from this lane.*  
 ii *It is also that Jill had attended the history seminar.*

Example [i] is ungrammatical, while [ii] is not a cleft clause. It is not a cleft counterpart of *Also, Jill had attended the history seminar.* Thus the complement of *be* here is not *also* but the content clause: compare *It* (“the problem”, perhaps) *is that Jill had attended the history seminar.*

### 7.3.1 Restrictive focusing modifiers

Adverbs that function as focusing modifiers of the restrictive type include the following:

- [41] *alone*      *but*              *exactly*      *exclusively*      *just*      *merely*  
          *only*          *precisely*      *purely*      *simply*          *solely*

#### ■ Range of constructions accepting restrictive focusing modifiers

It is a characteristic of focusing adverbs that they modify a wide range of constructions:

- [42] i *He loves [only his work].* [NP]  
 ii *It’s the sort of thing that could happen [only in America].* [PP]  
 iii *The problem is [only temporary].* [AdjP]  
 iv *He agreed [only somewhat reluctantly] to help us.* [AdvP]  
 v *He apparently [only works two days a week].* [VP]  
 vi *I regret [only that I couldn’t be there to see it].* [declarative content clause]  
 vii *I need to know [only how much it will cost].* [interrogative]  
 viii *I remembered [only what a close shave we’d had].* [exclamative]  
 ix *She forbade [only his living there], not just visiting.* [gerund-participial]  
 x *[Only to help you] would I have anything to do with him.* [to-infinitival clause]  
 xi *Things will [only get worse].* [bare infinitival]  
 xii *We had it [only checked once].* [past-participial]  
 xiii *Only disturb me if there’s a genuine emergency.* [imperative clause]

They cannot, however, modify any other kind of main clause than an imperative. Compare [42iv], for example, with [43i]:

- [43] i A: *What’s the matter?* B: \**Just there’s nothing to do.*  
 ii A: *What’s the matter?* B: *There’s just nothing to do.*

B cannot reply to A’s question by *just* (or *simply*, *only*, etc.) + main clause. Instead we can place *just* in the VP, as in [ii], or use a construction with *it is* (*It’s just that there’s nothing to do*). Nor do focusing adverbs modify nouns or nominals (as opposed to NPs): in *my only reservation*, for example, *only* is an adjective, and as such it is not replaceable by the other items in [41].<sup>19</sup>

<sup>19</sup>There are other limitations which apply to the additive type too. For example, they cannot modify a vocative element (\**Hey, only Pat, would you like one of these biscuits*), coordinators (\**You can have cheese and biscuits only or dessert* – i.e. you can’t have both), or parts of idioms (\**My opponent gave only in*).

### ■ Interpretation of *only*

The meaning of an elementary and unambiguous example like [44i] can be broken down into the two propositions given as [iia–b]:

- [44] i *Only Kim resigned.*  
 ii a. “Kim resigned”  
 b. “Nobody except Kim resigned”

Proposition [iia] is a presupposition: it is [iib] that constitutes the foregrounded part of the information, the main assertion. The “except” component of the main proposition is based on the focus – *Kim*.

In some cases the relevant concept is not “except”, but “more than”. Compare:

- [45] i *Sue is only a tutor.*  
 ii *I saw them only yesterday.*

The natural interpretation of [i] is that Sue is located on the hierarchy of academic positions no higher than the rank of tutor. And for [ii] we understand “as recently as yesterday”. There can be ambiguity between the two kinds of interpretation. *I’ve only got a Mini*, for example, might be understood in context as “I’ve only got one car, a Mini” or “The car I’ve got is no grander than a Mini”. Example [45ii] is in fact ambiguous in this way, for it could also be interpreted in the “except” sense: “Yesterday was the only time I saw them”. And indeed the same applies with [45i]: it could be saying that Sue has only one job.<sup>20</sup>

### ■ Negation

We observed that proposition [44iia] is presupposed, and this is reflected in the fact that it is normally preserved under negation, as in:

- [46] *Not only Kim resigned.*

This conveys that Kim resigned and that someone else did too. Matters are more complex when *only* has the “not more than” sense. *Sue isn’t only a tutor* (ignoring the case where it is denying that she has only one job) would require a context where it has been claimed that Sue was only a tutor, and in this case it would be saying that she isn’t a tutor but holds some higher position. *Only yesterday* in the sense “as recently as yesterday” cannot occur within the scope of negation (see Ch. 9, §1.3, for this concept): the natural interpretation of *I didn’t see them only yesterday* has the “except” sense of *only*, “Yesterday was not the only time I saw them”.

It will be apparent from what was said about [46] that negation relates restrictive *only* and additive *also*. It follows from [46] that there was **also** someone else who resigned. This relationship is reflected in the fact that *also* is often used correlatively with *not only*:

- [47] i *He not only apologised, he also sent flowers.*  
 ii *She’ll be working late not only today but also every other day this week.*

Similarly with synonyms of *only* and *also*: primarily *simply*, *merely*, *just* on the one hand, *too* on the other (see also Ch. 15, §2.7).

<sup>20</sup>For the interpretation of *only* + *if*, see Ch. 8, §14.2.1.

### ■ Scopal focus and informational focus

In speech, the focus of a focusing modifier is commonly marked by stress. But the main stress in a clause certainly does not have to fall at this point. Compare:

- [48] i *They only gave me a SANDWICH for lunch.*  
 ii *Only Kim preferred the ORIGINAL version.*

In [i] the main stress is on *sandwich*, and this will be interpreted as the focus of *only*: “They didn’t give me anything except a sandwich for lunch”. In [ii], however, the focus of *only* is *Kim*, but for reasons of contrast the main stress falls on *original*: we understand “No one except Kim preferred the original version – everyone else preferred some later version”.

It is a common practice to use the term ‘focus’ for the constituent carrying the main stress as well as for the constituent that a focusing modifier applies to. This of course stems from the fact that they coincide in the default case. It will be clear from what has just been said, however, that they are distinct concepts, and it is potentially confusing to use the same term for both. We will therefore distinguish them as **scopal focus** and **informational focus** respectively. The latter denotes the constituent carrying the main stress, and represents the principal new information in the clause, or intonation group: see Ch. 16, §2.

Scopal focus is the type we are concerned with in this section. Focusing modifiers are scope-bearing items, and the scopal focus is the contrastive element in their scope. In [48ii], for example, the scope of *only* is the whole clause, since the meaning of the whole clause is affected by it. That is, the restriction to Kim applies to the variable *x* in the open proposition “*x* preferred the original version”. The scope is thus the whole clause and the scopal focus is *Kim*.

The scope does not always embrace everything in the sentence. Compare:

- [49] *Pat said that only Kim preferred the ORIGINAL version.*

Here *Pat said that* is outside the scope of *only*, and this means that neither *Pat* nor *said* could possibly be the scopal focus of *only*. For example, [49] cannot mean that nobody except Pat said that Kim preferred the original version. (For further discussion of the concept of scope, which applies to many elements besides focusing modifiers, see Ch. 8, §1, and Ch. 9, §1.3.) In the rest of this chapter, the term ‘focus’ when used without modification is to be understood as ‘scopal focus’.

### ■ Linear position of focusing modifier relative to focus

There are two questions to consider concerning the order of focusing modifier and focus: does the modifier precede the focus, and is it adjacent to the focus? These two parameters yield the following combinations of values, where double underlining marks the modifier and single underlining the focus:

[50]	PRECEDES?	ADJACENT?
i <i>We found <u>only one</u> <u>mistake</u>.</i>	yes	yes
ii <i>We <u>only</u> found <u>one</u> <u>mistake</u>.</i>	yes	no
iii <i><u>Technology alone</u> cannot solve these problems.</i>	no	yes
iv <i><u>Technology</u> cannot <u>alone</u> solve these problems.</i>	no	no

Which of these four possibilities are admissible in a given instance depends on the particular focusing adverb concerned. The modifier is also occasionally found following part of the focus and preceding the rest. This is what we have in [43ii], where the focus is the rest of the clause, *There's nothing to do*.

#### Position of *only*

*Only* usually precedes its focus. Unlike *just*, *purely*, and *simply*, however, it can also follow, as in *This is for your eyes only* or *I'm giving these to special friends only*. Such examples seem slightly formal in style, and *only* is relatively unlikely to occur in post-head position within a subject NP: *Kim only went to the movies*, for example, will normally be construed with *only* modifying *went to the movies*, not *Kim*.

When *only* precedes the focus and the latter is contained within the VP, *only* is commonly non-adjacent, functioning syntactically as modifier to the whole VP, as in [50ii]. There is a long-standing prescriptive tradition of condemning this construction and saying that in writing *only* should be placed immediately before its focus. It is recognised that one needs to distinguish here between speech and writing, because in speech the focus will usually be prosodically marked (as noted above, the scopal focus usually coincides with the informational focus). In writing, however, there is generally no analogue of stress, and hence no comparable way of marking the intended focus. For this reason, the prescriptive argument goes, the focus should be marked by placing *only* immediately before it.

This is another of those well-known prescriptive rules that are massively at variance with actual usage, including the usage of the best writers. The more empirically based manuals recognise this, and cite numerous literary examples that violate the rule, such as those in [51], where the focus is marked by underlining:

- [51] i *I [only saw Granny at carefully spaced intervals].*  
 ii *Boris doesn't eat shanks so, of course, I [only cook them when he's away].*

Examples of this kind are clearly impeccable. There is no grammatical rule requiring that *only* be adjacent to its focus. And all that can validly be said from the perspective of style is that the general injunction to avoid potential confusion or misinterpretation should be respected as usual. In the absence of contextual indications to the contrary, *saw* and *Granny* in [i] are not plausible candidates for the status of focus: it is not necessary therefore to place *only* adjacent to the PP to indicate that it is the intended focus. Similarly, in [ii], the context provided by the first clause together with the connective *so* makes it obvious that *when he's away* is the intended focus, and it is therefore quite mistaken to insist that *only* must be placed after *cook them*. Such examples may be contrasted with those in [52], where there is significantly greater potential for misinterpretation, and hence a stronger case for recommending that *only* be placed next to the intended focus:

- [52] i *You can only access the web at this workstation.*  
 ii *Last Christmas he only gave money to his children.*

In [i] either *the web* or *this* might reasonably be taken as focus, yielding an ambiguity between the readings “At this workstation accessing the web is all you can do” and “This is the only workstation at which you can access the web”. And in [ii] both *money* and *children* might be plausible candidates for focus: “He didn't give his children anything

except or more than money” or “His children were the only ones to whom he gave money”. But of course, the issue of whether there is any real danger of misinterpretation will depend on the context in which the sentences are used.

### ■ *Alone*

#### Association with NPs

The syntax of *alone* is strikingly different from that of other restrictive focusing adverbs. Leaving aside cases where it is non-adjacent to its focus, it occurs only in post-head position in NP structure, with the head of the NP as its focus. Compare:

- [53] i a. [*Only the president*] has the key. b. [*The president alone*] has the key. [NP]  
 ii a. [*Only reluctantly*] did he relent. b. \**[Reluctantly alone] did he relent.* [AdvP]  
 iii a. *Things can [only improve].* b. \**Things can [improve alone].* [VP]

Notice, moreover, that while the default place for the main stress in [ia] is *president*, in [ib] it is *alone*.

#### Two senses of *alone*: upper bound and lower bound

As a focusing modifier, *alone* has two senses, as illustrated in:

- [54] i *Los Angeles alone made a profit on the Olympic Games.*  
 “Only Los Angeles made a profit on the Olympic Games” [upper bound sense]  
 ii *Los Angeles alone has more murders than Britain.*  
 “Los Angeles by itself has more murders than Britain” [lower bound sense]

In [i] *alone* is equivalent to *only*: Los Angeles made a profit, but no other city did. We call this the ‘upper bound’ sense, since it places an upper bound or limit on the set of cities that made a profit on the Olympic Games – in this case, a limit of one. *Only* cannot substitute for *alone* in the natural interpretation of [ii]: it is not saying that nowhere but Los Angeles has more murders than Britain, but that if you count only those murders that take place in Los Angeles the number will exceed the number of murders committed in Britain. This is the ‘lower bound’ sense: it’s not that you can’t go beyond Los Angeles, but that you don’t need to, for this city is sufficient to satisfy the condition of having more murders than Britain.

There may be ambiguity between the two senses:

- [55] *Musical excellence alone makes the drama memorable.*

In the upper bound sense nothing but musical excellence makes the drama memorable – other features, such as the plot and the dialogue, do not. In the lower bound sense the music is so excellent that it suffices to make the drama memorable irrespective of other features. We have noted that *only* cannot have the lower bound sense, but *just* can, provided it is adjacent to the focus. Compare:

- [56] i *They paid her \$50,000 for just that one performance.*  
 ii *They just paid her \$50,000 for that one performance.*

Here [i] is ambiguous between upper and lower bound interpretations: “There was only one performance that they paid her \$50,000 for” vs “That one performance on its own earned her \$50,000”. Example [ii] does not permit the latter interpretation, though it does allow for something other than *that one performance* to be focus (e.g. “They paid her only \$50,000 for that one performance”).

Both [ia] and [ib] entail that Kim resigned: the obvious difference between additive *too* and restrictive *only* is shown in [iii]. But there is also a difference with respect to the status of the component propositions given in [ii–iii]. We saw that with *only* the main assertion is [iib], with [iib] being backgrounded. With *too*, however, it is [iia] that is the main assertion, and [iia] that is backgrounded. And in fact [iia] (unlike [iib]) is not an entailment, not a truth condition, but merely a conventional implicature. The only scenario in which [ia] can be false is one where Kim didn't resign. To see more easily that this is so, consider a situation in the future. You say *Pat will sign the cheque* and I respond *Kim too will sign it*. And suppose that in fact Pat does not sign, and only Kim does so: it is clear that the prediction I made will be judged to have turned out to be true, not false.

Correlating with this is a difference with respect to negation. We have seen that negating [62ib] affects [iib]: *Not only Kim resigned* says that there was someone else besides Kim who resigned. But we can't negate [ia] so as to cancel [iia], while leaving [iia] intact. \**Not Kim too resigned* is ungrammatical, and *Kim too didn't resign* has *too* outside the scope of negation, so that the two components are "Kim didn't resign" and "Someone besides Kim didn't resign".

#### ■ Position of *also*, *too*, and *as well*

- [63] i a. Sue also bought a CD.                      b. Sue bought a CD too.  
 ii a. We plan to visit Paris also.                      b. I too think the proposal has merit.  
 iii a. Also, it was pouring with rain.                      b. I realised too that he was in great pain.

The preferred position for *also* is central, as in [63ia]; auxiliaries tend to precede *also*, as in *Sue had also bought a CD*. End position is certainly possible, as in [iia]. In both [ia] and [iia] *also* can have a variety of foci – e.g. *Sue* or *a CD* or *bought a CD* in [ia], *We* or *Paris* or *to visit Paris* or *plan to visit Paris* in [iia]. In informal style *also* can occur in front position, with the whole clause as focus, as in [iia].

*Too* most often occurs at the end of the VP, as in [63ib]. Here it can have the same range of foci as *also* in [ia]; and indeed it can have the whole clause as focus, so that an alternant of [iia] is *It was pouring with rain too*. A second possibility is for *too* to occur as postmodifier in a non-final NP, as in [iib]. Note, then, that [iib] is structurally different from [ia]: in [ia] *also* is premodifier in the VP, while the *too* of [iib] is part of the subject, and can have only *I* as its focus. Example [iib] illustrates the fairly rare case where *too* precedes a post-verbal focus. There is no reason here, however, to analyse *too* as a premodifier of the following content clause: it is a modifier of *realised*, the structure being like that of *I realised suddenly that he was in great pain*.

The distribution of the idiomatic AdvP *as well* is similar to that of *too*, the preferred position being at the end of a VP. It can replace *too* in [63iib], but not so readily in [iib]. In addition, it can, in informal style, occur in front position with the clause as focus, e.g. in the position of *also* in [iia].

The relation of addition is closely associated with coordination, and *also*, *too*, and *as well* commonly occur in coordinates marked by *and* or *but*: *We saw Kim [and also Pat] at the wedding* or *She was bright [and energetic too / as well]*.

### ■ Even

*Even* differs from the other items in [61] in that it contributes an extra component of meaning, and can be negated. Let us consider the positive and negative together:

- |   |  |
|---|--|
| [64] i a. <i>Even Kim resigned.</i>                                 | b. <i>Not even Kim resigned.</i>                                     |
| ii a. “Kim resigned”  | b. “Kim didn’t resign”   |
| iii a. “Someone besides Kim resigned”                               | b. “Someone besides Kim didn’t resign”                               |
| iv a. “Kim was the one least likely or<br>least expected to resign” | b. “Kim was the one least likely or<br>least expected not to resign” |

Propositions [iia/iiia] are the same as with *too* in [62]: it is for this reason that *even* belongs with the additive modifiers. Moreover, the status of these propositions is the same: [iia] is the main assertion, while [iiia] is a backgrounded conventional implicature. With *too* the information that someone other than Kim resigned will be retrievable from the prior discourse, but this need not be so with *even*.

Because [64iia] is the main assertion it is affected by negation, so in [iib] we have its negative counterpart. And [iiib] is likewise negative: Kim is added to the set of those who didn’t resign.

The component of the meaning distinctively associated with *even* is [64iv]. *Even* indicates that the proposition expressed is being compared with one or more related propositions and judged stronger or more surprising. In the case of [64ia] there is implicit reference to a set of people who might have resigned – the members of some committee or society, perhaps – and Kim is judged to be the member of that set who was least likely to resign (or to be among a subset who were least likely to do so).

Consider some other examples:

- [65] i *Your task will be difficult, maybe even impossible.*  
 ii *She can’t have voted against the proposal: she didn’t even attend the meeting.*  
 iii *We can’t even afford to go to the movies, let alone the theatre.*  
 iv *He smiled, yet even so I sensed a deep terror within him.*

In [i–iii] both terms in the comparison are overtly expressed. In [i] to say that your task will be impossible is to make a stronger claim than that made by saying that it will be difficult. Example [ii] illustrates a common form of argument, where one negative proposition is presented as following from a second stronger one: the claim that she didn’t attend the meeting is stronger than the claim that she didn’t vote against the proposal. In [iii] the stronger term in the comparison is presented before the weaker, with the latter introduced by the idiom *let alone* – expressions such as *never mind*, *not to mention*, *still less* are used in the same way. In [iv] *even* modifies the pro-form *so*: we understand “even though he smiled”. It is more surprising that I should have sensed a deep terror within him when he smiled than if he hadn’t done so. (For discussion of *even though* and *even if*, see Ch. 8, §14.1.3.)

### Position

*Even* is typical of focusing adverbs in being able to occur in a wide range of positions:

- [66] i *Even you would have enjoyed dancing tonight.*  
 ii *You would even have enjoyed dancing tonight.*  
 iii *You would have enjoyed even dancing tonight.*

iv *You would have enjoyed dancing even tonight.*

v *You would have enjoyed dancing tonight, even.*

It usually precedes the head it modifies, but in informal speech it occasionally follows, as in [v]. Where it modifies a VP there will typically be a number of possible foci, with the intended one being marked prosodically in speech. Thus the focus of *even* in [ii] could be *dancing*, *tonight*, or *you* – which are the only possible foci in [iii], [iv], and [i] respectively.

### Multiple occurrences

It is possible, though rare, for a clause to contain two instances of *even*:

[67] *Not even digital tape recorders, which everyone is ballyhooing, can even approach the new adapter format.*

## 1 The category of prepositions

This book employs a definition of the category of prepositions that is considerably broader than those used in traditional grammars of English. The purpose of this section is to give an overview of the items that are assigned to the category of prepositions under our analysis.

### ■ Traditional definition

The general definition of a preposition in traditional grammar is that it is a word that governs, and normally precedes, a noun or pronoun and which expresses the latter's relation to another word. 'Govern' here indicates that the preposition determines the case of the noun or pronoun (in some languages, certain prepositions govern an accusative, others a dative, and so on). In English, those pronouns that have different (non-genitive) case forms almost invariably appear in the accusative after prepositions, so the issue of case government is of less importance, and many definitions omit it.

In our framework we substitute 'noun phrase' for the traditional 'noun or pronoun'. With that modification, the traditional definition can be illustrated by such examples as the following, where the preposition is underlined.

- [1] i *Max sent a photograph of his new house to his parents.*  
 ii *They are both very keen on golf.*

In [i] the preposition *of* relates the NP *his new house* to the noun *photograph* (we understand that the new house is depicted in the photograph), while *to* relates the NP *his parents* to the verb *send* (we understand his parents to have been the recipients of the photograph). Similarly, in [ii] *on* relates the NP *golf* to the adjective *keen* (the semantic relation is like that between direct object and verb in *They both very much like golf*: the semantic role associated with *golf* is that of stimulus for the emotional feeling).

### ■ Prepositions as heads

In this book, in keeping with much work in modern linguistics, we adopt a significantly different conception of prepositions. We take them to be heads of phrases – phrases comparable to those headed by verbs, nouns, adjectives, and adverbs, and containing dependents of many different sorts. This change in conception leads to a considerable increase in the set of words that are assigned to the category of prepositions. Before turning to a description of the full membership of the category, we will explain, by

reference to words that are uncontroversially prepositions, why they should be regarded as heads of phrases taking various kinds of dependent.

### Modifiers

Note first that some prepositions can take modifiers like those found in other phrases:

- [2] i *She died [two years after their divorce].*  
 ii *She seems [very much in control of things].*  
 iii *It happened [just inside the penalty area].*

These modifiers, marked with single underlining, are found also in AdjPs (*two years old*), NPs (*very much a leader*), and VPs (*She [just managed to escape]*).

### Prepositions followed by constituents that are not NPs

Secondly, it is not only ‘nouns or pronouns’ (NPs in our terms) that occur after prepositions:

- [3] i *The magician emerged [from behind the curtain].* [PP]  
 ii *I didn’t know about it [until recently].* [AdvP]  
 iii *We can’t agree [on whether we should call in the police].* [interrogative clause]  
 iv *They took me [for dead].* [AdjP]

In [i], one PP (underlined) is embedded inside a larger one (enclosed in brackets). This parallels the way one NP is embedded inside a larger NP in *a house that size*, or one clause is embedded inside another in *That she survived is a miracle*. In [ii], *until* has an AdvP as complement, instead of the NP that it has in examples like *until last week*. In [iii], *on* takes an interrogative clause complement rather than an NP, as in *We can’t agree [on a course of action]*. And in [iv], *dead* is an AdjP, which has a predicative function, with *me* as predicand.

It is important to note that different prepositions license different types of complement. *Until* can take an AdvP but not an interrogative clause, while *on* can take an interrogative clause but not an AdvP, and so on. This is entirely parallel to the way verbs, nouns, and adjectives select particular types of complement. And the fact that the AdjP in [3 iv] is predicative means that in the structure of the PP, as in that of the VP (or clause), we must make a distinction between objects and predicative complements. Compare:

- |     |  |   |          |
|-----|--|---|----------|
| [4] | OBJECT   | PREDICATIVE COMPLEMENT                        |          |
| i   | a. <i>She consulted <u>a friend</u>.</i>       | b. <i>She considered him <u>a friend</u>.</i> | [clause] |
| ii  | a. <i>She bought it [<u>for a friend</u>].</i> | b. <i>She took him [<u>for a friend</u>].</i> | [PP]     |

## ■ Extending the membership of the preposition category

Once it is recognised that prepositions head phrases comparable in structure to those headed by verbs, nouns, adjectives, and adverbs, we need to take a fresh look at what words belong in the category. When we do this, we find there are strong grounds for including a good number of words beyond those that are traditionally recognised as prepositions.

### Traditional grammar’s subordinating conjunctions

We have noted that prepositions take complements that are not NPs, such as the PP, AdvP, interrogative clause, and AdjP in [3]. This conflicts with the general definition for ‘preposition’ given in most traditional grammars and dictionaries, though in practice traditional grammarians would have no hesitation in classifying *from*, *until*, *on*, and *for*

in [3] as prepositions. Traditional grammarians thus tacitly accept that there can be PP, AdvP, or AdjP complements of prepositions. They do not, however, allow declarative content clauses. A word otherwise similar to a preposition but taking a declarative content clause complement is traditionally analysed as a ‘subordinating conjunction’. This is not a policy that can be justified. Consider the analogy with verbs that take both NP and declarative content clause complements:

- |     |   |  |
|-----|---|--|
| [5] | NP COMPLEMENT                                       | DECLARATIVE COMPLEMENT                                   |
|     | i a. I <u>remember</u> <u>the accident</u> .        | b. I <u>remember</u> <u>you promised to help</u> .       |
|     | ii a. He left [ <u>after</u> <u>the accident</u> ]. | b. He left [ <u>after</u> <u>you promised to help</u> ]. |

No one suggests that the difference in the category of the complement between the [a] and [b] examples requires us to assign *remember* to different parts of speech in [i]. It would traditionally be treated as a verb in both cases. There is no reason to handle *after* in [ii] any differently: it can be analysed as a preposition in both cases. Or take the following pairs, where the complement clause is declarative in [a], and interrogative in [b]:

- |     |   |  |
|-----|---|--|
| [6] | DECLARATIVE COMPLEMENT                            | INTERROGATIVE COMPLEMENT                               |
|     | i a. I <u>assume</u> <u>he saw her</u> .          | b. I <u>wonder</u> <u>whether he saw her</u> .         |
|     | ii a. <u>the fact</u> <u>that he saw her</u>      | b. <u>the question</u> <u>whether he saw her</u>       |
|     | iii a. <u>glad</u> <u>that he saw her</u>         | b. <u>unsure</u> <u>whether he saw her</u>             |
|     | iv a. He left [ <u>after</u> <u>he saw her</u> ]. | b. It depends [ <u>on</u> <u>whether he saw her</u> ]. |

The head words in [i–iii], those with double underlining, belong uncontroversially to the same category in [a] as in [b] (verb, noun, and adjective respectively). We are proposing that the same applies in [iv]. The difference in the type of complement between [a] and [b] in [iv] no more justifies a part-of-speech distinction in the head than the similar difference in [i–iii]. *After* in [iva] and *on* in [ivb] are both appropriately analysed as prepositions.

We therefore include in the preposition category all of the subordinating conjunctions of traditional grammar, with three exceptions. The exceptions are, first, *whether*; second, those occurrences of *if* that are equivalent to *whether* (as in *Ask him if he minds*); and, third, *that* when it introduces a subordinate clause. These items we take to be markers of subordination, not heads of the constructions in which they figure: see Ch. 11, §8.1, for detailed discussion of this issue.

#### A subset of traditional adverbs

The traditional account does not allow for a preposition without a complement, but within a framework where prepositions function as heads of phrases, like verbs, nouns, adjectives, and adverbs, there is again no principled basis for imposing such a condition. Compare:

- |     |  |   |
|-----|--|---|
| [7] | WITH COMPLEMENT  | WITHOUT COMPLEMENT                      |
|     | i a. She was <u>eating</u> <u>an apple</u> .               | b. She was <u>eating</u> .              |
|     | ii a. She’s [ <u>the director</u> <u>of the company</u> ]. | b. She’s [ <u>the director</u> ].       |
|     | iii a. I’m [ <u>certain</u> <u>it’s genuine</u> ].         | b. I’m [ <u>certain</u> ].              |
|     | iv a. I haven’t seen her [ <u>since</u> <u>the war</u> ].  | b. I haven’t seen her [ <u>since</u> ]. |

The presence or absence of a complement has no bearing on the classification of the head in [i–iii], where in both the [a] and [b] members of the pair *eating* is a verb, *director*

a noun, and *certain* an adjective. There is no reason to treat [iv] any differently, and we accordingly take *since* as a preposition not only in [a], but also in [b], where traditional grammar analyses it as an adverb.

We also include in the preposition category certain words like *downstairs*, which never take complements. We look further at the relation between prepositions and adverbs in §2.4, where we note that moving a subset of traditional adverbs into the preposition category reduces the heterogeneity of the adverb category.

### ■ Grammaticised uses of prepositions

A number of the most frequent and central prepositions have what we call **grammaticised** uses:

- [8] i *He was interviewed by the police.*  
 ii *They were mourning the death of their king.*  
 iii *You look very pleased with yourself.*

Here the preposition has no identifiable meaning independent of the grammatical construction in which it occurs. Example [i] is a passive clause, and *by* marks the element that is subject of the corresponding active, *The police interviewed him*. *Of their king* in [ii] is complement of the noun *death*, and corresponds to the subject of the clausal construction *Their king died*.

With very minor exceptions, nouns do not take NP as internal complement: instead, the NP is related to the head noun by a preposition. Compare, for example, the clause *They destroyed the city* with the NP *their destruction of the city*, where the NP *the city* is related to the noun *destruction* by means of the grammaticised preposition *of*. Other prepositions than the default *of* are seen in *Kim's marriage to Pat* and *the ban on smoking*. Adjectives behave in very much the same way: compare *proud of her achievements*, *keen on opera* and *very pleased with yourself* (from [8iii]). Many verbs, of course, do take NPs as internal complement, but there are others that take a PP complement introduced by a certain grammaticised preposition: *It depends on the weather*; *I owe everything to her*; and so on.

In their grammaticised uses, prepositions often serve the same kind of functions as inflectional cases. Compare, for example, *the death of their king* and *their king's death*, with *their king* related to the head noun by the preposition *of* and genitive case respectively. Similarly *to* in *I gave it to Kim* marks a role that in many languages is marked by the dative case (cf. Ch. 5, §16.1).

In such uses, prepositions cannot take modifiers like those in [2], and they are virtually restricted to occurrence with NP complements. The traditional definition thus covers these grammaticised uses quite adequately. However, there are a good number of uncontroversial prepositions that have no grammaticised uses: *behind*, *below*, *since*, *underneath*, etc. And the ones that do have such uses have non-grammaticised ones too. The grammaticised uses of *by*, *of*, and *with* in [8], for example, may be contrasted with the non-grammaticised uses seen in *I left the parcel by the back-door*, *That is of little importance*, and *He's with Angela*. An adequate account of prepositions must thus cover much more than the grammaticised uses. The traditional definition is too restrictive to allow this to be done.

### ■ Position of the preposition relative to its complement

The traditional definition specifies that prepositions usually precede the NP they govern. Simplified versions often omit the qualification ‘usually’, but it is indispensable for two reasons. In the first place, a very small number of English prepositions can follow the complement: compare *notwithstanding the weather* (head + complement) and *the weather notwithstanding* (complement + head) – we deal with these items in §4.2. Secondly, we have to allow for cases like *What are you looking at?*, where the complement appears in prenuclear position in the clause and the preposition is said to be **stranded** – this matter is discussed in §4.1. Preposition stranding is restricted to various kinds of non-canonical construction such as open interrogatives, relatives, etc.: in canonical constructions traditional prepositions (with the minor exception of the *notwithstanding* type) always do precede their complements. But so do verbs, adjectives, and adverbs. The location of prepositions before their complements is thus not a distinguishing feature of the category. Moreover, we have argued that not all prepositions have complements, and where they don’t the issue of relative position obviously doesn’t arise.

It should be clear that the term ‘preposition’ is by no means ideal for our purposes, for it is etymologically divisible into a base *position* and a prefix *pre-* meaning “before”. However, the term is so thoroughly established that we have found it best to retain it despite the shift in sense, and the application to a category of words not defined by linear order at all.

It is helpful that the first syllable of ‘preposition’ is pronounced /pre/, as in *prep* (“home-work”), not /pri/, as in *pre-war*, where the “before” meaning is transparent. *Preposition* thus falls together with such words as *supposition* or *proposition*, in which there is no longer a prefix that makes an independent contribution to the meaning.

There are languages where words of the category in question characteristically follow the NP complement, as in Japanese, and in grammars of such languages they are generally called ‘postpositions’. However, in most such languages transitive verbs follow their objects, so again order is not distinctive. Rather, there is a general typological distinction between head + complement and complement + head languages. The term ‘postposition’ is transparently analysable into a meaningful prefix and a base, and when it is contrasted with ‘preposition’ the etymological meaning of ‘pre-’ is revived.

Because position relative to the complement reflects general typological features, one wouldn’t want to regard Japanese postpositions as representing a different primary category from English prepositions. For example, the phrase *Tōkyō ni* clearly has a structure parallel to that of its English translation *to Tokyo*. The term ‘adposition’ is accordingly used by some linguists as a more general term covering both ‘postposition’ and ‘preposition’. This term is not used, however, to form a term for the phrases headed by adpositions. There is no established term ‘adposition phrase’.

It has to be recognised, therefore, that the term ‘preposition’ is ambiguous. In one sense it is neutral as to linear position, and in the other it is restricted to words which precede their complements. In this book we are using it in the former sense, but since we are describing a language where these words do characteristically precede their complements the dual usage should not create any problems. All that is necessary here is that the reader should see that in our sense of the term there is no contradiction in saying that *the weather notwithstanding* is a preposition phrase headed by the preposition *notwithstanding*.

### ■ General definition

The number of prepositions is far smaller than the number of nouns, verbs, adjectives, or adverbs, and though new prepositions are added to the language from time to time there is no freely productive morphological process for forming them. We have pointed out that the removal of the traditional requirement that all prepositions take NP complements means that the class is somewhat larger than is often suggested, but in comparison with the others it remains a relatively closed class (i.e. one that does not readily accept the addition of new members).

The most central members have meanings which, at least in origin, have to do with relations in space. The situation may be either static (*Kim is in Boston*) or dynamic (*Kim went to Boston*). The most frequent preposition, *of*, derives from a word meaning “away from”. This feature of prepositions, together with their grammaticised uses, provides the basis for a general definition of the category along the following lines:

- [9] PREPOSITION: a relatively closed grammatically distinct class of words whose most central members characteristically express spatial relations or serve to mark various syntactic functions and semantic roles.

## 2 Distinctive properties of prepositions in English

### 2.1 Overview

The most important properties that distinguish prepositions from lexemes of other categories are as follows:

- [9] i COMPLEMENTS The most central prepositions can take NP complements; in addition, non-expandable content clauses are almost wholly restricted to occurrence as complement to a subset of prepositions. More generally, most prepositions license a complement of one kind or another.
- ii FUNCTIONS All prepositions can head PPs functioning as non-predicative adjunct; many can also head PPs in complement function.
- iii MODIFIERS A subset of prepositions are distinguished by their acceptance of such adverbs as *right* and *straight* as modifiers.

In addition, of course, there are negative properties: prepositions are distinguished from verbs and nouns, for example, in that they don't inflect for tense or number and don't take determiners as dependents.

### ■ Complements

#### (a) NPs

We have seen that traditional grammar in effect defines prepositions as words taking NP complements, and though we have rejected that definition it remains the case that the prototypical PP has the form of a preposition as head and an NP as complement. No adverb takes an NP complement, and only four adjectives do, namely *worth*, *due*, *like*, and

*unlike*. With very few exceptions, therefore, the only words that take NP complements are verbs and prepositions, and prepositions are generally easily distinguished from verbs in terms of function and inflection (see §2.3 below). Occurrence with NP complements is thus an important distinguishing property of prepositions, and in general those that take complements of this type are the clearest members of the class: prepositions that do not take NP complements are admitted into the class by virtue of being similar in other respects to these central members.

### (b) Non-expandable content clauses

Declarative content clauses are non-expandable if they do not permit the subordinator *that*. Almost all words that license complements of this kind are prepositions, though there are also prepositions that take expandable content clauses, like heads of other categories:

- |     |     |  |                  |
|-----|-----|--|------------------|
| [2] | i   | <i>We left [before <u>the meeting ended</u>].</i>                          | [non-expandable] |
|     | ii  | <i>I'll come with you [provided (<u>that</u>) <u>it doesn't rain</u>].</i> | } [expandable]   |
|     | iii | <i>I [know (<u>that</u>) <u>you've done your best</u>].</i>                |                  |

In [i] it is not possible to insert *that* (*\*We left before that the meeting ended*), and this is sufficient to establish that *before* is a preposition. With *provided*, however, *that* is permitted, as it is with the verb *know* in [iii], and here we therefore need further evidence that it is a preposition. There are also two adverbs, *directly* and *immediately*, that take non-expandable content clause complements: see Ch. 6, §6.1.

### (c) Complementation in general

Prepositions allow a wide range of complement types, a rather large subset of those licensed by verbs. Most prepositions license an obligatory or optional complement; those that do not are almost wholly restricted to the spatial domain. As we shall see in §2.4, it is the pattern of complementation that provides the most general criterion for distinguishing prepositions from adverbs.

## ■ Functions

### (a) Non-predicative adjunct

The ability of PPs to function as an adjunct in clause structure that is not in a predicative relation to the subject is one of the main respects in which prepositions differ from adjectives, as explained in Ch. 6, §2.1. Compare, for example:

- |     |    |   |          |
|-----|----|---|----------|
| [3] | i  | a. <i><u>Tired of the ship</u>, the captain saw an island on which to land.</i> | } [AdjP] |
|     |    | b. <i>*<u>Tired of the ship</u>, there was a small island.</i>                  |          |
|     | ii | a. <i><u>Ahead of the ship</u>, the captain saw an island on which to land.</i> | } [PP]   |
|     |    | b. <i><u>Ahead of the ship</u>, there was a small island.</i>                   |          |

In [ia] *tired of the ship* is an AdjP predicated of the subject: it entails that the captain was tired of the ship. The deviance of [ib] is then attributable to the fact that there is no appropriate subject for the AdjP to be predicated of. No such constraint applies to the PP *ahead of the ship* in [ii]: [iia] does not entail that the captain was ahead of the ship, and [iib] is perfectly well-formed.

A number of prepositions have arisen by conversion from adjectives, and it is the ability to occur as head of non-predicative adjuncts that shows such conversion to have

taken place:

- [4] i [Opposite the church] there is a path leading down to the lake.  
 ii [Contrary to popular belief,] Eskimos don't have huge numbers of 'snow' words.

Occurrence as a non-predicative adjunct also distinguishes, for the most part, prepositions from gerund-participle and past participle forms of verbs. Compare:

- [5] i [Owing to my stupid bank,] there's no money for the rent. [preposition]  
 ii [Owing money to my stupid bank,] I have to live very frugally. }  
 iii \*[Owing money to my stupid bank,] there's no money for the rent. } [verb]

*Owing* can be either a preposition or the gerund-participle of *owe*. As a preposition it takes a *to* phrase complement and is non-predicative; as a verb, it can take a direct object + *to* complement, but it then needs a predicand, an understood subject, such as *I* in [ii]: "as I owe money to my stupid bank, I must live very frugally". The lack of any such predicand in [iii] makes the example ungrammatical. Example [i], however, is fine: the predicand requirement applies to *owing* as a verb but not as a preposition.

### (b) Complement

The ability of many prepositions to head phrases in complement function is an important property distinguishing them from adverbs, which can appear as complements only under extremely restricted conditions. Particularly useful from a diagnostic point of view are cases where the complement is obligatory.

One such case is the goal complement of certain transitive verbs such as *put* or *place* and a few intransitives such as *dart* and *slither*:

- [6] i a. I put it in the drawer. b. \*I put it.  
 ii a. He darted behind the curtain. b. \*He darted.

The [a] examples here have prototypical PPs consisting of preposition + NP complement. But other forms can be assigned to the PP category on the basis of their ability to occur in this position. Compare:

- |     |   |                                    |
|-----|---|------------------------------------|
| [7] | PREPOSITION                               | ADVERB                             |
|     | i a. I put it <u>in/downstairs/away</u> . | b. *I put it <u>adjacently</u> .   |
|     | ii a. He darted <u>off/indoors</u> .      | b. *He darted <u>immediately</u> . |

Phrases consisting of such words as *in*, *downstairs*, *away*, *off*, *indoors* by themselves are distributionally like uncontroversial PPs such as *in the drawer* or *behind the curtain*, and are accordingly assigned to the same category. Prototypical adverbs, those formed from adjectives by suffixation of *-ly*, do not occur in these positions.

A second case of an obligatory complement is in clauses with the verb *be* as head:

- [8] i a. Jill is in the office. b. \*Jill is.  
 ii a. The proposal is without merit. b. \*The proposal is.

The [b] examples are admissible if elliptical, with a complement recoverable from the preceding text (*Max isn't in the office, but Jill is \_\_\_*), but otherwise *be* normally requires an internal complement. Leaving aside the specifying use of *be*, which allows complements of just about any category (cf. Ch. 4, §5.5), adverbs cannot in general function as complement to *be*. Where we have morphologically related adjective–adverb pairs it is the adjective that is required in this function: *Jill is sad*, not \**Jill is sadly*. The fact that the

underlined words in [7ia/ia] can occur as complement to *be* is thus further support for their classification as prepositions: compare *Jill is in/downstairs/\*locally*.

### ■ Modifiers

There are a small number of adverbs such as *right* and *straight* which occur with a certain sense as modifiers of prepositions but not (in Standard English) of verbs, adjectives or adverbs:

- |     |     |  |               |
|-----|-----|--|---------------|
| [9] | i   | <i>They pushed it [right <u>under</u> the bed].</i>                  | [preposition] |
|     | ii  | <i>*They were [right <u>enjoying</u> themselves].</i>                | [verb]        |
|     | iii | <i>*I believe the employees to be [right <u>trustworthy</u>].</i>    | [adjective]   |
|     | iv  | <i>*The project was carried through [right <u>successfully</u>].</i> | [adverb]      |

Not all prepositions accept these modifiers – they occur primarily with prepositions indicating spatial or temporal relations. But they are not restricted to phrases containing preposition + NP:

- |      |    |   |
|------|----|---|
| [10] | i  | <i>They pushed it [right <u>in/inside</u>].</i> |
|      | ii | <i>She ran [straight <u>upstairs</u>].</i>      |

The occurrence of such highly restricted modifiers with words like *in*, *inside*, and *upstairs* as well as in uncontroversial PPs thus provides further evidence for recognising PPs without complements.

## 2.2 Prepositions vs adjectives

Central members of the preposition category such as *of*, *to*, *in* differ syntactically in numerous ways from central members of the adjective category such as *good*, *big*, *new*. At the periphery, however, we have to recognise some items which belong to both categories, and some cases of adjectives and prepositions that are exceptional by virtue of having properties that are normally restricted to the other category.

The properties most relevant to distinguishing between prepositions and adjectives are as follows:

- |      |     |  |
|------|-----|--|
| [11] | i   | Prepositions but not adjectives can occur as head of a non-predicative adjunct in clause structure.  |
|      | ii  | AdjPs, other than those restricted to attributive or postpositive function, can mostly occur as complement to <i>become</i> ; in general, PPs cannot.  |
|      | iii | Central adjectives accept <i>very</i> and <i>too</i> as degree modifiers, and have inflectional or analytic comparatives and superlatives; in general, prepositions do not.  |
|      | iv  | Central prepositions license NP complements; in general, adjectives do not.  |
|      | v   | Central prepositions accept <i>right</i> and <i>straight</i> as modifiers; adjectives do not.  |
|      | vi  | Prepositions taking NP complements can normally be fronted along with their complement in relative and interrogative constructions, as in <i>the knife [<u>with which</u> she cut it]</i> or <i>I don't know [<u>to whom</u> you are referring]</i> ; in general, adjectives cannot. |

Property [i] was presented in §2.1 above and provides the most decisive criterion for distinguishing between prepositions and adjectives.

In this section we consider the analysis of a number of problem items, and some cases of overlap between the categories.

### ■ *Worth*

*Worth* belongs to the categories of noun and adjective. The noun use (as in *You should make an estimate of your net worth*) is unproblematic and need not be considered further. As an adjective, however, *worth* is highly exceptional. Most importantly for present purposes, it licenses an NP complement, as in *The paintings are [worth thousands of dollars]*. In this respect, it is like a preposition, but overall the case for analysing it as an adjective is strong.

#### Functional properties

It is the more specific properties associated with predicative function that establish that *worth* belongs to the adjective category. It readily occurs as complement to *become*, and when functioning as adjunct it must have a predicand:

- [12] i *What might have been a \$200 first edition suddenly became [worth perhaps 10 times that amount].*  
 ii [Worth over a million dollars,] *the jewels were kept under surveillance by a veritable army of security guards.*  
 iii \* [Worth over a million dollars,] *there'll be ample opportunity for a lavish lifestyle.*

In [ii] the predicand of the *worth* AdjP is the subject *the jewels*, whereas in [iii] there is no such predicand and the result is inadmissible.

#### Grading and modification

*Worth* is hardly gradable, so there is little evidence in this area to count for or against its classification as an adjective. An analytic comparative seems just possible: *It was more worth the effort than I'd expected it to be*. This construction is not incompatible with a preposition analysis, though it occurs with prepositions in idiomatic or secondary senses rather than in their primary sense, and this is clearly not an idiomatic or secondary sense of *worth*. *Very* is excluded: \**It was very worth the effort*. Instead we can have *very much*: *It was very much worth the effort*. But the sense here is “decidedly” rather than “to a high degree”, and in this sense *very much* is quite admissible with adjectives – cf. *The ship was very much unique in its class*.

*Enough* provides no useful diagnostic evidence in favour of either analysis, for it cannot normally combine with *worth* in any position: \**The proposal didn't seem enough worth the sacrifices it would require for us to accept it* or \**It didn't seem worth the sacrifices enough for us to go through with it*. Nor do the adverbs *straight* and *right* provide evidence in favour of one analysis over the other. They do not occur with *worth*, but since they are incompatible with many prepositions as well as with adjectives no weight can be attached to this. Overall, then, there is nothing in the area of grading and modification that is inconsistent with the analysis of *worth* as an adjective or that would favour its analysis as a preposition.

#### Fronting with complement in relatives, etc.

*Worth* differs from prepositions with respect to property [11vi]. Compare:

- [13] i *This was far less than the amount [which she thought the land was now worth].*  
 ii \**This was far less than the amount [worth which she thought the land was now].*

Here the complement of *worth* is relativised as *which*: in [i] *which* alone is fronted, whereas in [ii] *worth* is fronted with it, resulting in sharp ungrammaticality.

We conclude that although *worth* differs markedly from central members of the adjective category, the evidence shows that that is the category to which it belongs.

### ■ Like and unlike

These items belong to both adjective and preposition categories. One quite restricted use of the adjectives is as attributive modifier, as in *Like poles repel, unlike poles attract*, “poles which are like/unlike each other”. For the rest, the adjective and preposition uses are as illustrated in:

- |        |   |   |               |
|--------|---|---|---------------|
| [14] i | <i>John is [(very) like his father].</i>                            | } | [adjective]   |
| ii     | <i>John is becoming [more like his father] every day.</i>           |   |               |
| iii    | <i>[Like his father,] John had been called to give evidence.</i>    | } | [preposition] |
| iv     | <i>[Just like in the summer,] there is dust all over the house.</i> |   |               |

The adjective occurs in predicative complement function, with *be like* meaning “resemble”. It accepts modification by *very* and analytic comparison, though it is also possible to have *John is very much like his father*. The preposition *like* occurs as head of an adjunct. While the adjective is related to a predicand, the preposition is not. This is evident in [iv], but even in [iii] the adjunct is not interpreted predicatively: we understand the clause as saying that John had been called to give evidence, just as his father had, rather than as saying that John was like his father. The fact that both had been called to give evidence doesn’t establish that they were alike: [iii] does not entail *John was like his father*. Moreover, in its prepositional use, *like* is not gradable: we could not insert *very* in [iii].

There are thus good grounds for distinguishing between an adjective and a preposition *like* – but the adjective, no less than the preposition, can take an NP complement. And the same applies to *unlike*.<sup>1</sup>

### ■ Due

*Due* also belongs to both adjective and preposition categories. It is straightforwardly an adjective when used as an attributive modifier (*the due sum, with due diligence, pay them due respect*), and when used predicatively with either no complement (*The rent is now due*) or an infinitival complement (*We are due to arrive in less than an hour*). The adjective also licenses an NP or *to* phrase complement, while *due* as a preposition takes an obligatory *to* phrase:

- |        |  |                  |
|--------|--|------------------|
| [15] i | <i>We are [due a refund of about fifty dollars].</i>                 | [adj + NP comp]  |
| ii     | <i>Sincere thanks are [due to all those who gave so generously].</i> | [adj + PP comp]  |
| iii    | <i>[Due to the rain,] the match was cancelled.</i>                   | [prep + PP comp] |

*Due* does not take any relevant kind of modification, and the classification of these examples is based on the predicand test: *due* requires a predicand when it has the senses illustrated in [i–ii], but not when understood as in [iii]. The status of *due* as an adjective

<sup>1</sup> *Like* can also take a clause as complement. In the case of the adjective, this is a comparative clause: *He was like he always is – sullen and unco-operative*. In the case of the preposition, it is a non-expandable content clause: *It looks like we’re going to have some rain*.

in [i–ii] seems clear, and example [i] thus confirms that there are exceptional adjectives taking an NP as complement: note in fact that it is the adjective, not the preposition, that licenses this form of complement.

The construction illustrated in [15iii] has been subject to a great deal of prescriptive criticism: it is commonly claimed that this usage is incorrect, that *due to* in such cases should be replaced by *owing to* or *because of*. The prepositional usage is, however, unquestionably well established, and this is recognised by the more empirically-based manuals. The sense of *due* in [15iii] is the same as that in:

[16] *The delay was due to a signal failure.*

Historically, this *due* is an adjective – and the prescriptive objection to [15iii] is in effect that *due* there is not admissible because, being an adjective, it requires a predicand. Given, however, that *due* is now established as a preposition, there is no reason why that analysis should not apply to [16] as well as to [15iii], i.e. to all occurrences of *due* in this causal sense, for PPs are not in general excluded from functioning as complement to *be*.

### ■ *Near, close, far*

These lexemes too belong to both categories, though the prepositional uses are much more common than the adjectival. All three occur as attributive adjectives, in examples like *a near relative*, *close friends*, *the far side of the building*. The comparative form *further* also belongs to the adjective category when it has the sense “additional”: *There are some further issues to be discussed*. The adjective *close* is used predicatively in examples like *The election result is going to be very close* (cf. *a closely fought election*) or *Kim and Pat are getting very close* (in the sense of *close friends*). But for the most part, non-attributive uses involve the prepositions.

Consider first ***near***:

[17] i *We should put it [near/nearer the pool].*

ii *This place is a dead end, but [near/nearer the city] there's plenty going on.*

***Near*** has a locative meaning and the phrases it heads are distributionally like uncontroversial locative PPs such as *in the pool* or *beyond the city*. Most importantly, examples like [ii] show that ***near*** fails the predicand test for adjectives. ***Near*** can also be fronted along with its complement, as in *the tree near which we had parked*. It accepts *right* as modifier: *We found it right near the house*. In general, it does not occur as complement to *become*: *\*The water had become near the house*; acceptability is greater, however, when ***near*** has no complement: *?The storm was becoming nearer*. With respect to grading, on the other hand, ***near*** behaves like an adjective. It inflects for grade (hence our use here of the bold face representation), and it accepts modification by *very* and *too*: *You have put it very/too near the pool*. It is thus highly exceptional in its syntax, combining a number of adjectival properties with those of the preposition.

The same applies with ***close*** and ***far***, except that they do not license an NP complement. Thus while ***near*** takes as complement either an NP, as above, or a *to* phrase (*near/nearer to the pool*), ***close*** takes only a *to* phrase and ***far*** only a *from* phrase.<sup>2</sup>

<sup>2</sup>The complement of *from* can be a gerund-participial: *Far from advancing our cause, this made things much more difficult for us*. Unlike the others, *far* can also be a degree adverb, as in *It was far better than last year*.

The following examples show that *close* and *far* fail the adjective test of requiring a predicand:

- [18] i [Closer to election day,] *the audience is much larger.*  
 ii [Not very far from their house] *the road deteriorates into a dirt track.*

### ■ Further cases of overlap or conversion

- [19] *absent*          *adjacent*          *consequent*          *contrary*          *effective*  
*exclusive*          *irrespective*          *opposite*          *preliminary*          *preparatory*  
*previous*          *prior*          *pursuant*          *regardless*          *subsequent*

These items all qualify as prepositions by virtue of being able to occur as head of an adjunct with no predicand, as in such examples as:

- [20] i [Absent such a direct threat,] *Mr Carter professes to feel no pressure.*  
 ii [Right adjacent to the church] *there is a liquor store.*  
 iii [Consequent on this discovery,] *there will doubtless be some disciplinary action.*  
 iv *He had not been seen in the area [prior to this].*  
 v *The plan will go ahead [regardless of any objections we might make].*

*Irrespective* and *regardless*, although historically adjectives (as reflected in their morphological form), are now virtually restricted to the preposition category. The other items in [19] occur in addition as adjectives in attributive function – compare *absent friends*, *the adjacent building*, *the consequent loss of income*, etc. In the case of *absent*, *effective*, *exclusive*, *opposite*, *preliminary*, and *preparatory*, there are also complement uses which are clearly adjectival: *Five of them were absent*; *The film was very effective*; *This club seems very exclusive*; and so on. With the others, however, there is little reason to distinguish the complement use from the clearly prepositional adjunct: compare, for example, *This was prior to the election* and *This happened prior to the election*. NP complements are licensed only by a few of the prepositions: *opposite* (*opposite the church*) and, in specialised registers, *absent* (as in [20i], “in the absence of”) and *effective* (*Effective 1 July the fee will be increased to \$20*).

## 2.3 Prepositions vs verbs

For the most part, verbs are clearly distinguishable from prepositions by their ability to occur as head of a main clause and to inflect for tense. There are, however, a number of prepositions that have arisen through the conversion of secondary, non-tensed, forms of verbs:

- [21] i [Barring accidents,] *they should be back today.*  
 ii *There are five of them [counting/including the driver].*  
 iii [Pertaining to the contract negotiations,] *there is nothing to report.*  
 iv [Given his age,] *a shorter prison sentence is appropriate.*

The basis for analysing the underlined words here as prepositions is that there is no understood subject. This is effectively the same criterion as we have used in distinguishing prepositions from adjectives: prepositions can be used in adjunct function without a predicand, i.e. an element of which they are understood to be predicated. The preposition *counting* in [ii], for example, is to be distinguished from the gerund-participial

verb-form in:

- [22] [*Counting his money before going to bed last night,*] *Max discovered that two \$100 notes were missing.*

The boundary between the prepositional construction [21] and the verbal [22] is slightly blurred by the usage illustrated in:

- [23] i [*Turning now to sales,*] *there are very optimistic signs.*  
 ii [*Bearing in mind the competitive environment,*] *this is a creditable result.*  
 iii [*Having said that,*] *it must be admitted that the new plan also has advantages.*

These differ from [22] in that no subject for the underlined verb is recoverable from the matrix clause. They are similar to what prescriptivists call the ‘dangling participle’ construction illustrated in examples such as \**Walking down the street, his hat fell off*, ungrammatical in the sense where it was he, not his hat, that was walking down the street. Unlike the latter, however, the examples in [23] are generally regarded as acceptable. They differ from the prepositional construction in that there is still an understood subject roughly recoverable from the context as the speaker or the speaker and addressees together. Syntactically, they differ from the prepositions with respect to the dependents permitted: the verbs in [23i–ii], for example, accept the same dependents as in tensed constructions. In [i] we have the adjunct *now* as well as the complement *to sales*, and we could add other adjuncts such as *briefly* or *if I may*. Similarly, in [ii] the PP complement *in mind* is part of the idiom *bear in mind*, and again we could add adjuncts (e.g. *bearing in mind, as we must, the competitive environment*). In [iii] *having* is a form of the perfect auxiliary, and – unlike any preposition – takes an obligatory past-participial complement; little expansion is possible this time, but that is because *having said that* is a more or less fixed phrase in this use.

The main prepositions that are homonymous with the gerund-participle or past participle forms of verbs are as follows:

- |      |                      |                     |                  |                   |                  |
|------|----------------------|---------------------|------------------|-------------------|------------------|
| [24] | <i>according</i> † T | <i>allowing</i> F   | <i>barring</i> † | <i>concerning</i> | <i>counting</i>  |
|      | <i>excepting</i>     | <i>excluding</i>    | <i>failing</i> † | <i>following</i>  | <i>including</i> |
|      | <i>owing</i> † T     | <i>pertaining</i> T | <i>regarding</i> | <i>respecting</i> | <i>saving</i> †  |
|      | <i>touching</i> †    | <i>wanting</i> †    | <i>given</i>     | <i>gone</i> † BrE | <i>granted</i>   |

The symbol ‘†’ indicates that the preposition differs in complementation and/or meaning from current usage of the verb: we have prepositional *according to Kim* but not verbal \**They accorded to Kim*, and so on. *Gone* differs from *given* and *granted* in that the corresponding verb is not understood passively; it is used, in informal style, with expressions of time or age as complement: *We stayed until gone midnight* (“after”); *He’s gone 60* (“over”).

As prepositions, the items in [24] take an obligatory complement – an NP, except for those marked T or F, which take a *to* or *for* phrase respectively. The prepositions *during*, *notwithstanding*, and *pending* contain the *-ing* suffix, but are not homonymous with a verb.

There are also a few deverbal prepositions that take content clause complements: *given*, *granted*, *provided*, *providing*, *seeing* (see Ch. 11, §4.8).

## 2.4 Prepositions vs adverbs

Adverbs are traditionally defined as words that modify verbs, adjectives, and other adverbs. Elements traditionally regarded as modifying the verb are, in our framework, adjuncts, but prepositions also occur as heads of phrases with this function. Almost every semantic type of adjunct can be realised by a phrase with either an adverb or a preposition as head. In the following, for example, the first underlined word in each clause is an adverb, the second a preposition:

- [25] i *She did it carefully / with great care.* [manner]  
 ii *They communicate electronically / by email.* [means]  
 iii *They live locally / in the vicinity.* [spatial location]  
 iv *The prices went up astronomically / by a huge amount.* [extent]  
 v *I haven't seen her recently / since August.* [temporal location]  
 vi *She's working with us temporarily / for a short time.* [duration]  
 vii *They check regularly / at regular intervals.* [frequency]  
 viii *I loved her immensely / with all my heart.* [degree]  
 ix *It failed consequently / for this reason.* [reason]

Thus in [i] we can have either *She did it carefully* (where *carefully* is an adverb) or *She did it with great care* (where *with* is a preposition), and similarly with the others. The labels on the right give the semantic type of adjunct, matching those used in the description of adjuncts given in Ch. 8, §1.<sup>3</sup> It is clear then that the property of being able to head a phrase in adjunct function does not itself help distinguish prepositions from adverbs.

The traditional definition of preposition says that they have (in our terms) an NP complement, but we have shown that stipulation to be unwarranted (and it is not in fact observed in practice). However, we will not depart further from the traditional account than is justified. Prototypical prepositions have NP complements, and other items will be admitted into the preposition category only if there is positive evidence to support such an extension beyond the core members.

### ■ Words without dependents

Consider first words without dependents – words which by themselves constitute a full phrase. Several types can be distinguished.

#### (a) Prepositions that optionally take NP complements

The case for allowing prepositions with no complements is most compelling where the same word occurs either with or without an NP complement, as in *The owner is not in the house* ~ *The owner is not in*. There are several reasons for saying that these two instances of *in* belong to the same category.

Firstly, as illustrated in [7] of §1, the relation between the constructions with and without the NP complement is the same as is found with verbs, nouns, and adjectives: there is no more reason for saying that *in* here belongs to two different categories than

<sup>3</sup> It is because of this functional similarity that the PPs here are traditionally called 'adverbial phrases'. From our perspective, that term represents a confusion of functions and categories: we say that the two sets of expressions in [25] have the same function but belong to different categories, and in terms with the form 'X phrase' the 'X' indicates the category of the head word.

for saying that *eating* does in *She was eating an apple* and *She was eating*, and so on. In particular, there is no functional difference between *in the house* and *in*, just as there is none between *eating an apple* and *eating*.

Secondly, the same modifiers are permitted whether the NP complement is present or not. Compare:

- [26] i a. *He'd left [two hours before the end].*      b. *He'd left [two hours before].*  
 ii a. *She went [straight inside the house].*      b. *She went [straight inside].*

Thirdly, a considerable proportion of prepositions show a similar alternation between occurrence with NP and occurrence without. A sample of them is shown in [27].

[27]	<i>aboard</i>	<i>about</i>	<i>above</i>	<i>across</i>	<i>after</i>
	<i>against</i>	<i>along</i>	<i>alongside</i>	<i>apropos</i>	<i>around</i>
	<i>before</i>	<i>behind</i>	<i>below</i>	<i>beneath</i>	<i>besides</i>
	<i>between</i>	<i>beyond</i>	<i>by</i>	<i>down</i>	<i>for</i>
	<i>in</i>	<i>inside</i>	<b><i>near</i></b>	<i>notwithstanding</i>	<i>off</i>
	<i>on</i>	<i>opposite</i>	<i>outside</i>	<i>over</i>	<i>past</i>
	<i>round</i>	<i>since</i>	<i>through</i>	<i>throughout</i>	<i>to</i>
	<i>under</i>	<i>underneath</i>	<i>up</i>	<i>within</i>	<i>without</i>

Most of these belong to the domains of space and time, predominantly the former, but there are a few with other meanings: *apropos*, *besides*, *notwithstanding*, *without*.<sup>4</sup> There is a good deal of variation with respect to how readily they occur without a complement. *In*, *on*, *over*, *under*, *up*, for example, are very common in this use, whereas *to* is restricted to secondary senses (*He pulled the door to*, “just not completely closed”; *He came to*, “recovered consciousness”; etc.), and the use of *against* and *for* without a complement is mainly restricted to contexts involving voting: *We had a huge majority, with only two people voting against*.

Occurring with no NP complement is not a property found just occasionally with one or two prepositions, or only with marginal items. It is a property found systematically throughout a wide range of the most central and typical prepositions in the language.

#### (b) Compounds with *here*, *there*, and *where*

- [28] i *hereat*   *hereby*   *herefrom*   *herein*   *hereof*   *hereon*   *hereto*   *herewith*  
 ii *thereat*   *thereby*   *therefrom*   *therein*   *thereof*   *thereon*   *thereto*   *therewith*  
 iii *whereat*   *whereby*   *wherefrom*   *wherein*   *whereof*   *whereon*   *whereto*   *wherewith*

Half a dozen or so preposition bases form compounds with *here*, *there*, and *where*. Most are archaic, though some – particularly the *-by* series – are merely rather formal. The *where* forms are relatives. There is also a series in *-abouts*: *hereabouts* (with *hereabout* a variant in AmE), *thereabouts* (most often used in the expression *or thereabouts*, “or roughly that”), and interrogative *whereabouts*.

#### (c) Spatial terms

Among the words that do not license NP complements there are a fair number belonging to the spatial domain that occur as goal complement with such verbs as *come* and *go*,

<sup>4</sup>Prepositional *apropos* on its own means roughly “talking of that” (e.g. *I went to a College reunion on Friday; apropos, did you ever hear what happened to Webster?*) In addition, *apropos* can be an adjective meaning “appropriate, suitable”: *His behaviour was not exactly apropos*.

*Here* and *there* ([30ii]) are deictic expressions, discussed in detail in Ch. 17, §9.1; *where* is the corresponding interrogative and relative form. All three have both dynamic and static uses: e.g. *Where did she go?* and *Where is she?* The forms *hence*, *thence*, and *whence* incorporate the meaning “from”. As spatial terms, they are restricted to dynamic contexts and are somewhat archaic: *They travelled to Calais and thence to Paris*. They also have secondary senses in the realm of reasoning (*Hence it follows that . . .*). There is, in addition, an archaic triple incorporating the meaning “to”: *hither, thither, whither*. Note also the archaic or dialectal *yonder*, meaning something like “there” but typically locating at some distance from the speaker; it has a marginal determinative use (*yonder hills* “those hills over there”) but is a preposition in *He was headed over yonder*.

The compass terms in [30iii] are primarily nouns (often spelled with an initial capital): *She comes from the North of England*. As prepositions, they are used dynamically in examples like *We were travelling east*; in their static use they require an *of* phrase complement, as in *It is 50 miles north of Paris*. The prepositions are often modified by the adverb *due* “exactly”: this occurs only with compass terms and belongs in a class with *straight* and *right* as adverbs modifying only prepositions. In addition to the simple forms cited, there are compounds such as *north-east, south-west*, etc.

The words in [30iv] form a miscellaneous group, all morphologically simple, apart from *together*. They all occur as complement of *be*, as in *We’ll be home soon*, with the exception of *forth*, which has directional meaning and occurs with verbs of going (*go forth, venture forth, sally forth*, etc.). Another directional item that might be added here is AusE *bush* “off into the forest or countryside”, as in *Once hatched, the chicks immediately head bush on their own*.

The remaining items in [30] are compounds. *Overland* and *underfoot* are marginal members, morphologically like the others but syntactically different in that they do not occur as goal or complement of *be*. *Overland* functions as path (Ch. 8, §4.3), as in *They travelled overland from Paris to Athens*. The items in [30vii] have variants with and without *-s*: *homeward* or *homewards*, etc. Only the forms without *-s* are used attributively (*the homeward journey, a backward move*). Elsewhere, AmE also normally uses the forms without *-s*, while BrE allows both forms, generally preferring the *-s* variant (though *forwards* is more restricted in use than *forward*).

#### (d) Non-spatial terms

Outside the spatial domain there are only a handful of prepositions beyond those given in [27] that occur without a complement. Almost all belong to the temporal domain:<sup>5</sup>

- [31] i *now*                      *then*                      *when*  
 ii *afterward(s)*        *beforehand*        *henceforth*        *thenceforth*

*Now*, *then*, and *when* are the temporal counterparts of spatial *here*, *there*, and *where*. *Afterward* (AmE) and *afterwards* (most other varieties) have essentially the same meaning

<sup>5</sup> *Why* has certain affinities with prepositions in that it can occur as complement to *be*, as when you say, for example, *I won’t be seeing them again*, and I ask: *Why is that?* This is a somewhat unusual construction, however: semantically it is quite different from *Where is Kim?* or *Kim is out*. The *why* is not interpreted predicatively, the meaning being essentially the same as that of *Why is that so?*; for this reason, we do not regard this use as incompatible with the analysis of *why* as an adverb. One borderline case is *else*. This is an adverb when following *or*, as in *Hurry up or else you’ll miss the bus*, but arguably a preposition when it postmodifies interrogative heads and compound determinatives: *who else, why else, something else than this*. The function of internal postmodifier in NP structure is characteristic of PPs rather than AdvPs, and note also that since the head can be the adverb *why* it would be implausible to take *else* as an adjective here.

as the simple form *after*, and similarly *beforehand* means much the same as *before*; *henceforth* and *thenceforth* are compounds of the prepositions *hence/thence* and *forth*. The case for analysing single-word temporal terms as prepositions is weaker than with spatial ones, since they occur predominantly as adjunct rather than complement. Those in [31] are closely related to forms whose assignment to the preposition class is strongly motivated, and *now*, *then*, and *afterward(s)* accept modification by *right* and/or *straight*. Most single-word forms in the domain of time location, duration, and frequency, however, are adverbs: *previously*, *subsequently*, *immediately*, *shortly*, *soon*, *long*, *always*, *often*, *frequently*, etc.

### ■ Words with PP complements

Consider next words taking PP complements, as in:

- [32] i *Everything has been badly delayed [owing to a computer failure].*  
 ii [According to Kim,] *most of the signatures were forged.*  
 iii *We had to cancel the match [because of the weather].*  
 iv *She suddenly jumped [out of the window].*  
 v *They gave me a knife [instead of a fork].*

The traditional definition of preposition excludes the underlined words, precisely because they are not followed by NPs. For the most part, these and other words of the same kind are therefore analysed as adverbs in traditional grammar.<sup>6</sup> In some cases, however, the similarity between the whole bracketed expression and a PP is recognised, and catered for by analysing the first two words as a single unit. This unit does have an NP as complement, and hence is traditionally analysed as a preposition – what is often called a ‘complex preposition’. We discuss the concept of complex preposition in detail in §3, but three points can be made briefly here with respect to the particular kind of ‘complex preposition’ found in these examples.

In the first place, there is a good deal of inconsistency in the traditional account, as reflected in the practice of dictionaries, as to which combinations are analysed as complex prepositions and which as sequences of adverb + preposition. For example, *owing to* and *out of* are listed as prepositions, but *according to*, *because of*, and *instead of* are treated as adverb + preposition. Modern descriptive grammars have tended to extend the category of complex prepositions, and there is accordingly some variation in dictionary practice, depending on how far they are influenced by such work.

Secondly, the complex preposition analysis fails to provide a satisfactory account of the optionality of the complement in cases like [32iv–v]. If the NP is omitted, the *of* drops too. Compare, then:

- [33] i a. *I ran [through the tunnel].*      b. *I ran [out of the house].*  
 ii a. *I ran [through].*                      b. *I ran [out].*

The complex preposition analysis is saying that *out of* is the same kind of unit as *through*, but the data in [33] shows that this is clearly not so. If *out of* were like *through*, the form

<sup>6</sup>Our primary concern in this discussion will be with the internal structure of the bracketed phrases, but there is one point that should be made about syntactic function. Some of these phrases can appear as complement to *be*: *This voucher is [instead of the watch I intended to get for you].* As we observed earlier, an analysis as an adverb is hardly consistent with the traditional definition: the *instead* phrase is not modifying the verb but is in a predicative relation to the subject.

we would have in [iib] would be *\*I ran out of*. It is *out*, not *out of*, that is syntactically similar to *through*: for example, both head phrases that can function as complement to motion verbs like *run*. The difference between *out* and *through* is a matter of their complementation: *through* takes an NP, while *out* takes a PP with *of*.<sup>7</sup>

The third point concerns the motivation for the complex preposition analysis. It seems clear that the recognition of units like *out of* as a complex preposition is intimately related to the restrictive definition of prepositions, which requires them to have an NP complement. *Out* does not have an NP complement in *out of the house*, but if the *of* is grouped with *out* then we can say that there is an NP complement and hence treat the whole sequence like *through the window*. But as we have noted, there is no justification for restricting prepositions to words that take NP complements, and in practice traditional grammar does not exclude the occurrence of prepositions with certain other types of complement: examples like *The magician emerged [from behind the curtain]* ([3i] of §1) show that a preposition can take a PP complement.

In the present grammar we are taking prepositions to function as heads of phrases that allow a rich range of complementation. We have seen that there are functional differences between PPs and AdvPs, but these do not by any means apply in all cases. The most general syntactic difference between prepositions and adverbs, therefore, concerns their complementation.

Most prepositions license an obligatory or optional complement; as described above, those that do not, with only a handful of exceptions, belong in the spatial domain, which is where the sharp functional differences apply.

Adverbs, by contrast, usually occur without a complement: none of them take obligatory complements, and most of them do not even license optional ones. The adverbs that license complements all contain the *·ly* suffix, as in *The lawsuit was filed [simultaneously with the consent decree]*, and words of this kind can be readily assigned to the adverb category on independent grounds.

This provides, then, a reasonably clear basis for distinguishing between prepositions and adverbs. If a word not ending in the *·ly* suffix licenses a complement, it is not an adverb; if a word other than those of the type covered in [30–31] fails to license a complement, it is not a preposition.

### 3 Idiomatic and fossilised expressions headed by a preposition

One of the hallmarks of English is the remarkable profusion of idiomatic and semi-idiomatic constructions into which prepositions enter. These extend the inventory of expressions in English in a way that is equivalent to adding hundreds of new words to the dictionary. In this section we illustrate and review a range of expressions of this kind in which the first word belongs to the traditional category of preposition.

Many consist simply of preposition + noun, or preposition + determinative + noun:

- [1] i *for example, in abeyance, in person, in sum, on purpose, under protest*  
 ii *after a fashion, in a word, on the spot, under the weather, with one voice*

<sup>7</sup>In some varieties of English *out* also allows an NP complement: see §5.1 below.

These are simply PPs with a preposition as head and an NP as complement: syntactically, there is nothing further to be said. Less straightforward are those where the noun is followed by a second preposition, as in *in accordance with* + NP. We consider these in §3.1, and then cover other structural types more briefly in §3.2.

### 3.1 Expressions of the type *for the sake of X, at odds with X*

Our concern in this section is with expressions consisting of a preposition followed by a noun (sometimes preceded by *the* or *a*), followed in turn by a second preposition and an NP (or gerund-participial), as in:

- [2] i *He did it [for the sake of his son].*  
 ii *I'm [at odds with my boss].*

We will represent such expressions schematically as:

- [3] Prep<sub>1</sub> (Article) N<sub>1</sub> Prep<sub>2</sub> X

The article, in those containing one, is usually *the*, but *a* is also found, as in *with a view to finishing the report*. In some cases even the *X* element is specified as part of the idiom, as in *in point of fact*, *in the nick of time*, *in the twinkling of an eye*, and so on. Usually, however, this part is independently variable: countless NPs could replace *his son* and *my boss* in [2]. A sample of such expressions, omitting the *X* element, is given in [4], where they are arranged alphabetically on the basis of N<sub>1</sub>:

- |                               |                              |                              |
|-------------------------------|------------------------------|------------------------------|
| [4] <i>in accordance with</i> | <i>on account of</i>         | <i>in addition to</i>        |
| <i>under the aegis of</i>     | <i>in aid of</i>             | <i>under the auspices of</i> |
| <i>in back of</i>             | <i>in/on behalf of</i>       | <i>at the behest of</i>      |
| <i>in case of</i>             | <i>in charge of</i>          | <i>in comparison with</i>    |
| <i>in compliance with</i>     | <i>in conformity with</i>    | <i>in consequence of</i>     |
| <i>in contact with</i>        | <i>by dint of</i>            | <i>with effect from</i>      |
| <i>with the exception of</i>  | <i>in exchange for</i>       | <i>at the expense of</i>     |
| <i>in (the) face of</i>       | <i>in favour of</i>          | <i>by (the) force of</i>     |
| <i>in front of</i>            | <i>on (the) ground(s) of</i> | <i>at the hands of</i>       |
| <i>in league with</i>         | <i>in lieu of</i>            | <i>in (the) light of</i>     |
| <i>in line with</i>           | <i>at loggerheads with</i>   | <i>by means of</i>           |
| <i>in the name of</i>         | <i>at odds with</i>          | <i>on pain of</i>            |
| <i>on the part of</i>         | <i>in place of</i>           | <i>in (the) process of</i>   |
| <i>in quest of</i>            | <i>in/with reference to</i>  | <i>in/with regard to</i>     |
| <i>in relation to</i>         | <i>in/with respect to</i>    | <i>in return for</i>         |
| <i>at (the) risk of</i>       | <i>for (the) sake of</i>     | <i>in search of</i>          |
| <i>in spite of</i>            | <i>in step with</i>          | <i>on the strength of</i>    |
| <i>in terms of</i>            | <i>on top of</i>             | <i>in touch with</i>         |
| <i>at variance with</i>       | <i>in view of</i>            | <i>with a view to</i>        |
| <i>by virtue of</i>           | <i>for/from want of</i>      | <i>by way of</i>             |

These differ in two respects from **free expressions** such as:

- [5] *She put it [on the photo of her son].* [free expression]

In the first place, they are in varying degrees idiomatic, so that the meaning of the whole is not derivable in a fully systematic way from the meanings of the components.

Secondly, they do not permit the full range of syntactic manipulation that applies with free expressions – manipulations involving additions, omissions, and replacements. Those where no manipulation at all of the pre-*X* sequence is permitted are said to be fully fossilised.

A number of such manipulations of the free expression – including, for comparative purposes, one inadmissible one – are shown in [6]:

- |     |      |  |   |
|-----|------|--|---|
| [6] | i    | <i>She has lost [the photo of her son].</i>                | [occurrence without Prep <sub>1</sub> ] |
|     | ii   | <i>She put it [on the photo].</i>                          | [omission of Prep <sub>2</sub> + X]     |
|     | iii  | <i>She put it [on the crumpled photo of her son].</i>      | [modification of N <sub>1</sub> ]       |
|     | iv   | <i>She put them [on the photos of her son].</i>            | [number change in N <sub>1</sub> ]      |
|     | v    | <i>She put it [on this photo of her son].</i>              | [determiner change]                     |
|     | vi   | <i>She put it [on her son's photo].</i>                    | [genitive alternation]                  |
|     | vii  | <i>She put it [on the photos and drawings of her son].</i> | [coordination of N <sub>1</sub> ]       |
|     | viii | <i>She put it [on the photos of her son and of Kim].</i>   | [coordination of Prep <sub>2</sub> + X] |
|     | ix   | <i>*the son of whom she put it [on the photo]</i>          | [fronting of Prep <sub>2</sub> + X]     |

In [i] the sequence following Prep<sub>1</sub> occurs on its own as an NP in object function. In [ii] the sequence following N<sub>1</sub>, i.e. *of X*, has been dropped. In [iii] an attributive adjective has been added, modifying N<sub>1</sub>. Example [iv] contrasts with the original with respect to the number of N<sub>1</sub>, plural instead of singular. In [v] there has been a change in the determiner, from *the* to *this*. In [vi] we have a genitive subject-determiner in place of the original *the* as determiner + *of her son* as complement. The next two examples involve coordination: of N<sub>1</sub> in [vii], and of the sequence Prep<sub>2</sub> + X in [viii]. Finally, in [ix] X has been relativised and placed in pre-nuclear position in the clause, along with Prep<sub>2</sub>, and in this case the result is ungrammatical.

The most fossilised of the expressions in [4], such as *in case of*, *by dint of*, *in lieu of*, *by means of*, *on pain of*, *in quest of*, *in search of*, *in spite of*, *in view of*, *by virtue of*, *by way of*, disallow all of these manipulations. Compare *She achieved this [by dint of hard work]*, for example, with:

- |     |      |  |   |
|-----|------|--|---|
| [7] | i    | <i>*[Dint of hard work] achieves wonders.</i>                              | [occurrence without Prep <sub>1</sub> ] |
|     | ii   | <i>*She achieved this [by dint].</i>                                       | [omission of Prep <sub>2</sub> + X]     |
|     | iii  | <i>*She achieved this [by pure dint of hard work].</i>                     | [modification of N <sub>1</sub> ]       |
|     | iv   | <i>*She achieved this [by dints of hard work].</i>                         | [number change in N <sub>1</sub> ]      |
|     | v    | <i>*She achieved this [by the dint of hard work].</i>                      | [determiner change]                     |
|     | vi   | <i>*She achieved this [by hard work's dint].</i>                           | [genitive alternation]                  |
|     | vii  | <i>*She achieved this [by dint and way of hard work].</i>                  | [coordination of N <sub>1</sub> ]       |
|     | viii | <i>*She achieved this [by dint of hard work and of sheer persistence].</i> | [coordination of Prep <sub>2</sub> + X] |
|     | ix   | <i>*the hard work of which she achieved this [by dint]</i>                 | [fronting of Prep <sub>2</sub> + X]     |

The only place where there may be some doubt is [viii]; some speakers may find this marginally acceptable, but there is at least a very strong preference for the version with only one *of* (i.e. with the coordination simply within X: *by dint of hard work and sheer persistence*).

The less fossilised expressions in [4] allow one or a few changes, but none of them allow all. Moreover, the manipulations cannot be ordered in a strict hierarchy such that

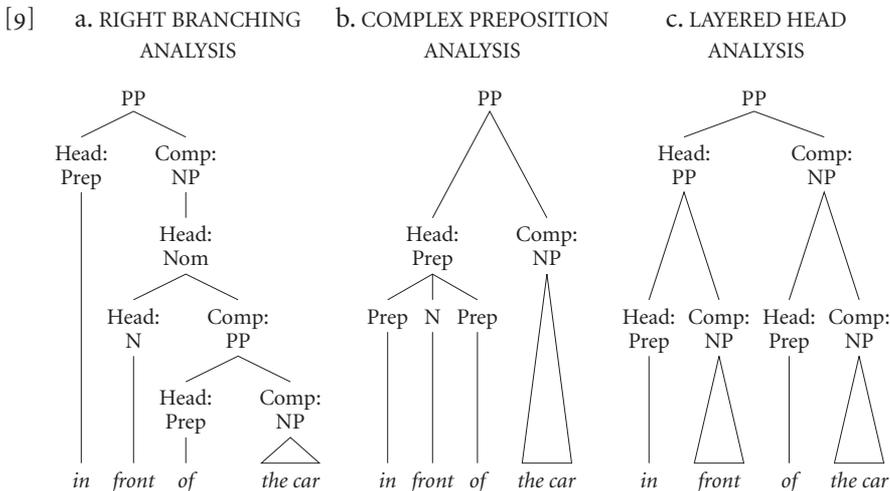

if a given manipulation is permitted then all others below it in the hierarchy will be permitted too. For example, *in/on behalf of* allows genitive alternation but not omission of Prep<sub>2</sub> + X, but it is the other way round with *in front*:

- [8] i a. *I'm writing [in/on behalf of my son].*  
 b. *I'm writing [in/on my son's behalf].* [genitive alternation]  
 c. *\*I'm writing [in/on behalf].* [omission of Prep<sub>2</sub> + X]
- ii a. *She was sitting [in front of the car].*  
 b. *\*She was sitting [in the car's front].* [genitive alternation]  
 c. *She was sitting [in front].* [omission of Prep<sub>2</sub> + X]

In testing for the various properties, one must ensure that relevant aspects of meaning remain constant. Compare [iia], for example, with *She was sitting [in the front of the car]*. This is well-formed, but the sense of *front* is quite different: it means “She was sitting in the front portion of the car, the driver’s seat or the adjacent one”, while [iia] means that she was sitting outside the car, near the front end, or between the car and the observer.

### Syntactic structure

There are at least three different syntactic structures that might be assigned to expressions like those in [4]. They are illustrated here (with simplification of the X component) for the expression *in front of the car*:

### Arguments against the complex preposition analysis

Structure [9a] is essentially the same as that which we assign to the free expression *on the photo of her son*: the sequence N<sub>1</sub> Prep<sub>2</sub> X is an NP functioning as complement to *in*. This is called a right branching analysis since the embedded X element is located in the tree at the end of a series of steps down to the right. Structure [b] treats *in front of* as a complex preposition, but we have not attempted to assign functions to the component parts of it. Structure [c] divides the whole expression first into *in front of* as head and *of the car* as complement: the *of* phrase is licensed by *in front of* as a unit. We call this the ‘layered head analysis’ since it has one PP functioning as head within another.

Much modern work in descriptive grammar adopts the complex preposition analysis, thus treating *in front of* as similar to the simple preposition *behind*. The close semantic

### The right branching analysis

We have seen that an analysis along the lines of [9a] is required in those cases where there is alternation with a genitive construction, as in the *in/on behalf of* type. Other expressions in [4] which permit this alternation are: *under the aegis of*, *under the auspices of*, *at the behest of*, *at the expense of*, *in favour of*, *at the hands of*, *in the name of*, *on the part of*, *in place of*, *for (the) sake of*.

Less direct evidence for a right branching structure applies in such cases as:

- [12] A: *The murder charge was dropped on the grounds of diminished responsibility.*  
 B: *I don't think it should have been dropped on those grounds.*

The use of the anaphoric demonstrative *those* indicates that *the grounds of diminished responsibility* is construed as an NP.

### The layered head analysis

Strong evidence for an analysis like [9c] is provided by fronting of Prep<sub>2</sub> + relativised X:

- [13] i *He was [in league with the guys from down the road].*  
 ii *the guys from down the road, with whom he was [in league]*

If the *with* phrase were a dependent in the NP headed by *league* it would not normally behave in this way: compare the deviance of [6ix] (*\*the son of whom she put it on the photo*). The layered head analysis treats the *with* phrase as a dependent of the PP *in league*, not of the noun *league*. The expressions in [4] where such fronting is permitted are a subset of those with *with* as Prep<sub>2</sub>: *in compliance with*, *in conformity with*, *in contact with*, *in line with*, *at loggerheads with*, *at odds with*, *in touch with*, *at variance with*.

Where we do not have positive evidence of the kinds given above for the right branching and layered head analyses, it is difficult to choose between them. It is reasonable, however, to prefer the layered head analysis in those cases where N<sub>1</sub> cannot occur elsewhere (with the same meaning) with Prep<sub>2</sub> + X as dependent. Compare, for example:

- [14] i a. [*Comparison with earlier results*] *supports such a hypothesis.*  
 b. *You could have predicted the [consequence of your action].*  
 ii a. *\*The [front of the car] was strewn with daffodils.*  
 b. *\*The [view of his remorse] led them to be lenient.*

*Comparison* and *consequence* can take PP complements with *with* and *of* respectively, and this lends some plausibility to a right branching structure for *in comparison with* and *in consequence of*. Conversely, the absence of such complementation for *front* and *view* in relevant senses provides some support for a layered head analysis of *in front of* and *in view of*.<sup>8</sup> But the effect of fossilisation is to reduce the amount of positive evidence available, and as a result there may be some indeterminacy as to the correct syntactic analysis in some cases.

### Compound prepositions

In a small number of cases there has been coalescence of Prep<sub>1</sub> + N<sub>1</sub> into a single compound preposition. One very clear case is *because*, as in *because of the weather*: historically, *because* derives from *by cause*, but the connection with *by* is no longer apparent. Another compound is *instead*, as in *He gave me a knife [instead of a fork]*. There is still a noun *stead*, but it is of very limited distribution, occurring in such expressions as *This will stand you in good stead for future dealings with him* or *I attended the meeting in her stead*. The latter construction might suggest that *stead* allows genitive alternation, but in fact there is no systematic alternation

<sup>8</sup> Example [14iia] is fine for describing a scene where the daffodils are on the front part of the car itself but, as noted in connection with [8ii], that is not the sense of *front* that we have in *in front of the car*.

between *instead of X* and *in X's stead*: compare, for example, *They gave it to me instead of her* ~ *\*They gave it to me in her stead*.

The layered head analysis is clearly very similar to one involving a compound preposition: [9c] takes *in front* as a constituent just as *instead* is a constituent in *instead of a fork*. The difference is that the former is syntactically composite while the latter is not, but there is no sharp difference between the two cases.

### 3.2 Other types of expression: on the grounds that ..., up against, in brief

There are three other kinds of expression to be considered.

#### (a) Expressions licensing content clauses or infinitivals

- [15] i a. *in the event*                    *on the basis*                    *on the grounds*                    *to the effect*  
       b. *for all*                            *for fear*                        *on condition*  
       ii *in case*                            *in order*                        *in two minds*

The expressions in [ia] are followed by declarative content clauses although the nouns *basis*, *event*, and *grounds* do not normally take such complements elsewhere. Compare:

- [16] i a. [*In the event that something happens to me*] *give them this letter*.  
       b. *\*[The event that something happens to me] would shock my family*.  
       ii a. *She declined*, [*on the basis that she was too tired*].  
        b. *\*[The basis that she was too tired] was unsatisfactory*.  
       iii a. *He defends guns* [*on the grounds that they enhance public safety*].  
        b. *\*[The grounds that handguns enhance public safety] are implausible*.

Nevertheless, there is some evidence that the content clause is syntactically a dependent of the preceding noun:

- [17] i *Something may happen to me, and [in that event] please give them this letter*.  
       ii *I can't believe she declined [on that basis]*.  
       iii *His wife doesn't think they can be defended [on such grounds]*.

*In that event* in the context of [i] is equivalent to *in the event that something happens to me*, and it is plausible to see the content clause in the latter as serving, like demonstrative *that* in the former, to define some unique event. Similarly, [17ii/iii] could be used following [16iia/iiia] respectively: *that basis* and *such grounds* are interpreted anaphorically with *the basis that she was too tired* and *the grounds that they enhance public safety* as their antecedents, suggesting that these latter expressions are NPs.

We therefore analyse *in the event that something happens to me* as a PP consisting of the preposition *in* and an NP containing a content clause complement. In terms of constituent structure it is thus like the bracketed PP in *This follows [from the fact that they contested the will]*. It differs from the latter in that the content clause complement is not licensed by the head noun itself but by the sequence *in the event*, as illustrated in [16i]: it is in this sense that *in the event* is idiomatic. Analogously for *on the basis*, *on the grounds*, and *to the effect*.

*In the event that something happens to me* means essentially the same as *if anything happens to me*, and for this reason some works analyse *in the event that* as a 'complex conjunction'. In our framework, where most subordinating conjunctions are included in the preposition category, this is to assign an analysis very like that of [9b] (but with *that* a subordinator rather than a preposition, and *something happens to me* a clause, not an NP). Again, however,

there is no syntactic justification for making the first division between *in the event that* and the clause: *that* belongs with *something happens to me* just as *of* belongs with *the car in in front of the car* (see Ch. 11, §8.1).

The expressions in [15ib] also take content clauses:

- [18] i [For all that I'm not guilty,] I'll still be a suspect in the eyes of history.  
 ii She didn't reply, [for fear she might offend him].  
 iii They donated a print of the film [on condition it was not shown commercially].

In [i] the content clause is clearly licensed by *for all* (“although”), not by *all* alone. And while the nouns *fear* and *condition* do license content clause complements, in the construction shown in [ii–iii] it may be best to analyse *for fear* and *on condition* too as heads, like *for all* in [i]. *For fear* differs from the expressions of [15ia] in that we couldn't have a demonstrative instead of the content clause: \**I didn't reply for that fear either*. And the absence of a determiner in [18iii] supports an analysis with *on condition* as the head. The bracketed PPs thus have structures along the lines of [9c] or else have compound prepositions as head.

Consider, finally, the expressions in [15ii], illustrated in:

- [19] i You'd better take an umbrella [in case it rains].  
 ii We set out early [in order to avoid the rush-hour traffic].  
 iii I'm [in two minds whether to accept their offer].

When the nouns *case*, *order*, and *minds* occur without the preceding *in* they do not have the same meaning and do not accept clausal complements (cf. \**Consider the case it rains*, etc.). We therefore take the first constituent division to be between the underlined expression and the following clause. This gives a layered head structure like [9c], with *in case*, *in order*, and *in two minds* PPs taking clausal complements – except that again the first two might alternatively be considered compound prepositions.

*In case* takes a non-expandable declarative clause (*that* is not permitted: \**in case that it rains*), and also allows a PP (*in case of rain*). *In order* takes a *to*-infinitival or a declarative clause in which *that* is more or less obligatory (*in order that we might get some peace and quiet*). *In two minds* – meaning “undecided”, a more obvious case of an idiom – licenses an interrogative clause, infinitival or finite (*I was in two minds whether I should accept their offer*); it also takes a PP complement, *about* + NP (*about their offer*) or *as to* + interrogative clause (*as to whether to accept their offer*).

### (b) Sequences of preposition + preposition

In examples like *He emerged [from behind the curtain]* or *She went [down to the post office]* we have ‘free’ sequences of prepositions: there is nothing idiomatic or fossilised about such cases. Our concern here is not with these but with such combinations as:

- |        |                   |                   |                              |
|--------|-------------------|-------------------|------------------------------|
| [20] i | <i>out of</i>     | <i>because of</i> |                              |
| ii     | <i>up to</i>      | <i>up against</i> | <i>upon</i>                  |
| iii    | <i>in between</i> | <i>into</i>       | <i>onto / on to</i>          |
| iv     | <i>as to</i>      | <i>as for</i>     | <i>as from</i> <i>as per</i> |

*Out of* in [i] shows a high degree of fossilisation. It is virtually impossible to separate the two components or to repeat *of* in coordination: cf. \**the door of which she had come out* or \**All the furniture will have to be taken out of the dining-room and of the lounge*. We have seen, however, that there is good syntactic evidence against treating *out of* as a

composite preposition, namely that if the following NP is omitted the *of* must drop too: *They came out of the building* or *They came out*. *Because of* is similar, except that instead of omitting *of* + NP we can replace it by a content clause: *because of the rain* or *because it was raining*.

Metaphorical or idiomatic uses of *up to* are illustrated in:

- [21] i *Up to page 400, the book does not mention transformations.* ["prior to"]  
 ii *I've asked Jake to help, but I'm not sure he's up to it.* ["fit or competent for"]  
 iii *It's up to you to set the guidelines.* ["a responsibility for"]  
 iv *That child is up to something.* ["doing (illicitly and/or furtively)"]

In [i] the meaning can be related via metaphorical extension to the free combination sense seen in *They had climbed up to the summit by lunchtime*: the direction referred to in [i] is not towards a more elevated point in space but towards a higher point on the scale determined by treating the reading of a book as like a climb with the beginning of the book at the bottom and the end at the top. *Up to page 400* refers to the portion of the book that extends from the lowest point of this scale 'upward' until page 400 is reached. The senses in [ii–iv] are clearly idiomatic. A person is described as being up to some activity if they are fit, capable, or competent enough for it (the sense in [ii]). A task is described as being up to a person who has responsibility and discretion for it (the sense in [iii]). And a person is described as being up to something in a different sense from [ii] if they are involved in nefarious and probably reprehensible activity (the sense in [iv]).

There is no good reason, however, for saying that idiomatisation is accompanied here by syntactic reanalysis. In [21iii] and probably also [21ii] it is possible to repeat *to* in coordination: cf. *It's up to you, or to your staff, to set the guidelines* or *I'm not sure that Jake is up to this, or to anything else that needs stamina*. We thus analyse *up to you* as *up + to you*, and similarly for the others. This is probably the appropriate way to handle *up against* too. This is found as a free combination in *The balloon is up against the ceiling* and as an idiom in *We're up against a criminal mastermind – or We're up against it* ("facing very adverse circumstances"), where the idiom includes the pronoun *it*.

The case of *upon*, however, is different: as reflected in the orthography, this is a compound preposition which occurs as a slightly formal alternant of *on* in some but not all uses of the latter. Compare: *We placed it on/upon the roof*; *On/Upon hearing the news, she phoned her sister*; *She's writing a thesis on/\*upon the poetry of Judith Wright*.

The free combination of *in* and *between* is seen in *He placed his fingers in between his toes*. In *I managed to mow the lawn in between the showers* we understand "in the intervals between the showers"; though this sense tends to be noted separately in dictionaries, it is perfectly consistent with an analysis which matches that of the free combination, i.e. *in + between the showers*. *Into*, however, is a compound, as again reflected in the orthography. *Onto* is likewise a compound, whereas *on to* can be either a free combination or a variant spelling of the compound. The free combination is seen in *We travelled on to Manchester* ("onward as far as Manchester"), the compound in <sup>9</sup>*The ball dropped on to the carpet* ("to a position on the carpet"). In AmE the compound is spelled *onto*, while both *onto* and *on to* are found in BrE.<sup>9</sup>

<sup>9</sup>One place where the distinction between compound and non-compound uses is somewhat blurred is in complements to the verb *hold*, as in *Hold on to / onto the railing*. The spelling *onto* is certainly found here, but the meaning is not that of the compound in its ordinary use.

The expressions in [20iv] beginning with *as* are illustrated in:

- [22] i *There's no doubt [as to her suitability] / [as to whether she's suitable].*  
 ii *[As for your other objections,] I'll return to them next week.*  
 iii *[As from tomorrow] the library will close at 9 p.m.*  
 iv *We'll be meeting at six, [as per usual].*

The underlined expressions bear no clear relation to free expressions, and are probably best analysed as compound prepositions. *As to* licenses an NP or interrogative clause complement, *as for* an NP or gerund-participial, *as from* an NP. In [iv] *as per* takes an adjectival complement in an idiom of the type we now turn to.

### (c) Preposition + adjective combinations: *in brief*

- [23] *at first      at last      for certain      for free      for sure      in brief*  
*in full      in private      in short      in vain      of late      of old*

PBs of this kind consist of a preposition as head and an adjective as complement. In the case of the informal expression *for free*, the adjective is related to a predicand: in *You can have the other book for free*, for example, we understand that the other book is free. The other adjectives do not stand in any such relation to a predicand: in *I tried in vain to persuade her*, for example, *in vain* simply means “vainly”. This use of adjectives has some affinity with that seen in *out of the ordinary* or *verging [on the impossible]*, where *ordinary* and *impossible* function as fused modifier-heads in NP structure, but the absence of *the* in [23] means that we have no syntactic justification for extending the fused-head analysis to these expressions: we treat them simply as preposition + adjective idioms.

One such expression, *in common*, licenses a *with* phrase complement: *Jill has a lot in common with her brothers.*<sup>10</sup>

## 4 The position of a complement relative to the head preposition

In the default case, a preposition precedes its complement, as in *with pride*, *to the car*, etc. In this section we review three constructions that depart in various ways from this pattern.

### 4.1 Preposition stranding: *What was she referring to?*

In constructions like the following the preposition is said to be **stranded**:

- [1] a. *What was she referring to?*                      b. *This is the book she was referring to.*

Here *to* is stranded in that its complement is missing from the normal post-head position – missing, but recoverable from elsewhere in the construction. In [a] the

<sup>10</sup>One idiom that does not belong with any of the structural types considered above is *what with*, used to introduce a reason adjunct, as in [*What with all the overtime at the office and having to look after his mother at home,*] *he'd had no time to himself for weeks*. This idiom has developed out of an otherwise almost obsolete use of *what* to introduce lists or coordinations, especially of PPs – and indeed *what with* is characteristically followed by a coordination, as in the example given. A rare example of this *what* with a preposition other than *with* is: *What between the duties expected of one during one's lifetime, and the duties exacted from one after one's death, land has ceased to be either a profit or a pleasure*.

understood complement is the interrogative phrase *what* in prenuclear position, while in [b] *she was referring to* is a relative clause with the complement of *to* recoverable from the nominal *book* that the clause modifies: we understand that she was referring to some book.

Stranding can be represented by means of the gap symbol, co-indexed with the element which supplies the interpretation, the antecedent (see Ch. 2, §2):

- [2] a. *What<sub>i</sub> was she referring to \_\_<sub>i</sub>?* b. *This is the book<sub>i</sub>; she was referring to \_\_<sub>i</sub>.*

### ■ The traditional prescriptive rule against preposition stranding

There has been a long prescriptive tradition of condemning preposition stranding as grammatically incorrect. Stranded prepositions often, but by no means always, occur at the end of a sentence, and the prescriptive rule is best known in the formulation: ‘It is incorrect to end a sentence with a preposition.’ The rule is so familiar as to be the butt of jokes, and is widely recognised as completely at variance with actual usage.<sup>11</sup> The construction has been used for centuries by the finest writers. It would be almost impossible to find a writer who does not use it. Everyone who listens to Standard English hears examples of it every day.

Instead of being dismissed as unsupported foolishness, the unwarranted rule against stranding was repeated in prestigious grammars towards the end of the eighteenth century, and from the nineteenth century on it was widely taught in schools. The result is that older people with traditional educations and outlooks still tend to believe that stranding is always some kind of mistake. It is not. All modern usage manuals, even the sternest and stuffiest, agree with descriptive and theoretical linguists on this: it would be an absurdity to hold that someone who says *What are you looking at?* or *What are you talking about?* or *Put this back where you got it from* is not using English in a correct and normal way.

### ■ Syntactic constructions where preposition stranding is found

Stranded prepositions occur in the constructions illustrated in [3]:

- [3] i *Your father<sub>i</sub>; I'm even more deeply indebted to \_\_<sub>i</sub>.* [preposing]  
 ii *Who<sub>i</sub> are they doing it for \_\_<sub>i</sub>?* [open interrogative]  
 iii *What a magnificent table<sub>i</sub>; the vase was standing on \_\_<sub>i</sub>!* [exclamative]  
 iv *He's the one [who<sub>i</sub>; I bought it from \_\_<sub>i</sub>].* [wh relative]  
 v *He's the one<sub>i</sub>; [(that) I bought it from \_\_<sub>i</sub>].* [non-wh relative]  
 vi *Kim went to the same school<sub>i</sub> as [I went to \_\_<sub>i</sub>].* [comparative]  
 vii *His performance<sub>i</sub>; was easy [to find fault with \_\_<sub>i</sub>].* [hollow clause]  
 viii *The bed looks as if [it<sub>i</sub> has been slept in \_\_<sub>i</sub>].* [passive]

In constructions [3i–iv] the antecedent for the gap occupies prenuclear position within the clause, and here it is in principle possible to avoid the stranding construction

<sup>11</sup>The ‘rule’ was apparently created ex nihilo in 1672 by the essayist John Dryden, who took exception to Ben Jonson’s phrase *the bodies that those souls were frightened from* (1611). Dryden was in effect suggesting that Jonson should have written *the bodies from which those souls were frightened*, but he offers no reason for preferring this to the original.

by placing the preposition before its complement in what we call the **PP fronting** construction:

- [4] i *To your father* I'm even more deeply indebted. [preposing]  
 ii *For whom* are they doing it? [open interrogative]  
 iii *On what a magnificent table* the vase was standing! [exclamative]  
 iv *He's the one* [from whom I bought it]. [wh relative]

In [3v–viii] the antecedent is not in prenuclear position, and stranding cannot be avoided by placing the preposition in front of its complement. In the case of non-*wh* relatives, however, we can avoid stranding simply by switching to a *wh* relative construction and using PP fronting, as in [4iv]. Stranding in comparative clauses can often be avoided by using a more reduced form: compare [3vi] with *Kim went to the same school as I did*. With hollow clauses it will be necessary to change to a different construction; in the case of [3vii] we could use extraposition to give *It was easy to find fault with his performance*, but other kinds of hollow clauses would require different strategies. Finally, for passives like [3viii] stranding of the preposition can be avoided by switching to an active construction: *The bed looks as if [someone has slept in it]*.

Examples like *We played squash together last Tuesday, but I haven't seen her since* are not relevant here. Although *since* is interpreted as *since last Tuesday*, the omission of the complement is restricted to certain prepositions: compare *\*She's coming back next Tuesday and I intend to stay here until*. Thus *since* is not stranded, but merely allows – unlike *until* – a choice between uses with and without a complement.

### ■ Style level

There is a tendency for preposition stranding to be avoided in the most formal style. Hence, if what is desired is a public speaking manner that sounds lofty, solemn, or remote, *To whom may we appeal?*, for example, will be preferred over *Who can we appeal to?* And for a deeply serious funeral oration a phrase like *a colleague to whom we are so much indebted* will be preferred over *a colleague we're so indebted to*. But in most contexts stranding will often be considered more appropriate than the fronting construction. Stranded prepositions are not even markers of distinctively informal style. They are found in nearly all styles. We will see below that there are conditions under which stranding is preferred over PP fronting, and the use of PP fronting in such cases runs the risk of creating an impression of pedantry or stuffiness.

In the remainder of this section we will be concerned with the choice between preposition stranding and PP fronting, and hence will confine our attention to the constructions where PP fronting is in principle available – i.e. preposing, open interrogatives, exclamatives, and relatives. The examples above were chosen as ones where both versions are acceptable, stranding in [3i–v], PP fronting in [4i–iv]. Very often, however, only one version is admissible or else one is strongly preferred over the other. We group such cases into two sets: those where PP fronting is inadmissible or disfavoured relative to stranding, and those where stranding is inadmissible or disfavoured relative to PP fronting.

### ■ Constructions in which PP fronting is inadmissible or disfavoured

#### (a) The fused relative construction

- [5] i *Somebody has to clean* [what<sub>i</sub> graffiti artists write on \_\_\_<sub>i</sub>]. [stranding]  
 ii *\*Somebody has to clean* [on what graffiti artists write]. [PP fronting]

The fused relative construction is discussed in Ch. 12, §6, and it will be clear from the analysis presented there why PP fronting is not possible. Briefly, *what graffiti artists write on* in [i] is an NP in which the head element is fused with the relative phrase in the subordinate clause: *what* is here equivalent to *that* + *which*. PP fronting places the PP in prenuclear position in the clause – compare *that on which graffiti artists write*. Because *what* represents a fusion of the head and the relative pronoun, the *on* in [ii] has been placed before the head of the NP: the resulting ungrammaticality is comparable to that of \**Somebody has to clean [on that which graffiti artists write]*.

#### (b) Subordinate interrogative clauses functioning as complement of a preposition

- [6] i *We can't agree on [which grant<sub>i</sub>; we should apply for \_\_<sub>i</sub>].* [stranding]  
 ii \**We can't agree on [for which grant we should apply].* [PP fronting]

In [i] the bracketed interrogative clause is complement of *on*; putting *for* at the front results in a sequence of two prepositions, and although there is no general ban on such sequences they are not permitted when the second involves PP fronting.

#### (c) Complement of prepositional verb or verbal idiom

In many cases the stranding construction is preferred or required when the preposition is specified by the verb or a verbal idiom, as in *account for*, *ask for*, *come across*, *consist of*, *face up to*, *look out for*, *tie in with*, etc. (see Ch. 4, §6). Compare:

- [7] i a. *What<sub>i</sub> are you asking for \_\_<sub>i</sub>?*  
 b. ?*For what are you asking?*  
 ii a. *My brother<sub>i</sub>; you can certainly rely on \_\_<sub>i</sub>.*  
 b. ?*On my brother you can certainly rely.*  
 iii a. *That wasn't the one [which<sub>i</sub>; we were looking out for \_\_<sub>i</sub>].*  
 b. ?*That wasn't the one [for which we were looking out].*  
 iv a. *This is the sort of English [which<sub>i</sub>; I will not put up with \_\_<sub>i</sub>].*  
 b. ?*This is the sort of English [with which I will not put up].*<sup>12</sup>

It is not possible, however, to give any simple, general rules. Much depends on individual verb + preposition combinations. Some are fossilised, so that the preposition must be adjacent to the verb: compare *the documents which he had come across* and \**the documents across which he had come*. Many such combinations belong to informal style and will thus resist occurrence with the noticeably formal PP fronting construction. Compare, for example, informal *pick on* and neutral *dispose of*, as in ?*the people on whom he was always picking* and *the goods of which he had disposed*.

The acceptability of PP fronting may be affected by other factors. While the preposing in [7iib] is questionable, for example, a *wh* relative with the same verb and preposition is undoubtedly acceptable: *He's certainly someone on whom you can rely*. Or compare:

- [8] i \**I wonder for what he was hoping.*  
 ii *I am not able to say for what kind of outcome he was hoping.*

<sup>12</sup>This example is based on a much-quoted joke attributed to Sir Winston Churchill, who is said to have annotated some clumsy evasion of stranding in a document with the remark: *This is the sort of English up with which I will not put*. Unfortunately, the joke fails because it depends on a mistaken grammatical analysis: in *I will not put up with this sort of English* the sequence *up with this sort of English* is not a constituent, *up* being a separate complement of the verb (in the traditional analysis it is an adverb). Churchill's example thus does not demonstrate the absurdity of using PP fronting instead of stranding: it merely illustrates the ungrammaticality resulting from fronting something which is not a constituent.

Subordinate interrogatives tend to disfavour PP fronting, as illustrated in [i], which seems clearly inadmissible; in [ii], however, the relative formality of *I am not able to say* and *what kind of outcome* matches that of PP fronting, and the result is acceptable, though very markedly formal.

### ■ Constructions in which stranding is inadmissible or disfavoured

#### (a) The gap precedes a content clause

- [9] i \**Who<sub>i</sub> did she declare to \_\_<sub>i</sub> that she was not going to take any more abuse?*  
 ii *To whom did she declare that she was not going to take any more abuse?*

Construction [i] is ungrammatical because the gap following *to* is located before a content clause (functioning as second complement of the verb *declare*).

#### (b) The PP is itself complement of a larger PP

- [10] i \**Which couch<sub>i</sub> did you rescue the pen from under \_\_<sub>i</sub>?*  
 ii *From under which couch did you rescue the pen?*

In *I rescued this pen from under your couch* the PP *under your couch* is complement of the preposition *from*, and *under* cannot be stranded in this context. To remove the ungrammaticality we must front the matrix PP, as in [ii]. Fronting just the smaller PP leaves *from* stranded, and the result is again unacceptable: \**Under which couch<sub>i</sub> did you rescue the pen from \_\_<sub>i</sub>?*

This case is to be distinguished from the following, where stranding is permitted (and in fact preferred):

- [11] i *Which account<sub>i</sub> did you take the money out of \_\_<sub>i</sub>?*  
 ii *Out of which account did you take the money?*

The difference here is that *of* is specifically selected by the head *out*, whereas in [10] *under* is potentially in contrast with other prepositions (such as *behind*).

#### (c) Elliptical interrogatives where the NP consists of more than one word

- [12] i a. A: *I've got an interview at 2.* B: *Who<sub>i</sub> with \_\_<sub>i</sub>?*  
 b. A: *I've got an interview at 2.* B: *With whom<sub>i</sub>?*  
 ii a. A: *I've got an interview at 2.* B: \**Which tutor<sub>i</sub> with \_\_<sub>i</sub>?*  
 b. A: *I've got an interview at 2.* B: *With which tutor<sub>i</sub>?*

Here B's response has the form of an interrogative clause consisting of just a preposition and its NP complement. In [i] the NP complement is the single word *who(m)*, and both stranding and PP fronting constructions are permitted. In [ii], however, the NP complement contains more than the interrogative word itself, and in such cases stranding is prohibited.

#### (d) The gap occurs at the end of the subject NP

- [13] i \**To the left is a door [which<sub>i</sub> the key to \_\_<sub>i</sub> has been lost].*  
 ii *To the left is a door [to which the key has been lost].*

In *The key to this door has been lost* the PP *to this door* is the final element in the subject NP, and a preposition heading a PP in this position cannot normally be stranded, as illustrated in [i]. But such a PP can be fronted, as in [ii]. For further discussion of this kind of constraint, see Ch. 12, §7.3.

## (e) The PP is in adjunct function

Stranding occurs most readily when the PP is functioning as complement; with adjunct PPs stranding is often prohibited or of doubtful acceptability, though there are certainly some cases where it is permitted. Compare:

- [14] i a. \**What circumstances<sub>i</sub> would you do a thing like that under* \_\_\_<sub>i</sub>?  
 b. *Under what circumstances would you do a thing like that?*  
 ii a. ?*That was the party [which<sub>i</sub> we met Angela at* \_\_\_<sub>i</sub>].  
 b. *That was the party [at which we met Angela].*  
 iii a. *What year<sub>i</sub> were you born in* \_\_\_<sub>i</sub>?  
 b. *In what year were you born?*

Wholly or marginally acceptable cases of stranding in adjuncts, such as [iiia] and [iia], tend to involve short and frequent prepositions in adjunct types that go naturally enough with the VP to be almost like complements.

(f) The preposition *than*

- [15] i \**They appointed Jones, [who<sub>i</sub> no one could have been less suitable than* \_\_\_<sub>i</sub>].  
 ii *They appointed Jones, [than whom no one could have been less suitable].*

Fronting of *than* + NP is rare and confined to very formal style. Stranding is inadmissible in the somewhat formal style of [i], where it is in a supplementary relative clause. The integrated relative ?*He's the only one<sub>i</sub> I was taller than* \_\_\_<sub>i</sub> is better, but still very marginal. For the most part, both constructions are avoided (cf. *He's the only one who is shorter than me*). In comparisons of equality, which take *as* instead of *than*, both stranding and PP fronting are unacceptable: \**They appointed Jones, who<sub>i</sub> no one was as suitable as* \_\_\_<sub>i</sub> and \**They appointed Jones, as whom no one was as suitable.*

## 4.2 Prepositions following their complement in PP structure

■ *Notwithstanding, apart, aside*

These items either precede or, less often, follow their complement. *Apart* and *aside* take a *from* phrase complement when they precede, but an NP when they follow:

- [16] i a. [*Notwithstanding these objections,*] *they pressed ahead with their proposal.*  
 b. [*These objections notwithstanding,*] *they pressed ahead with their proposal.*  
 ii a. [*Apart/Aside from this,*] *he performed very creditably.*  
 b. [*This apart/aside,*] *he performed very creditably.*

The construction with the complement before the preposition bears some resemblance to an absolute construction with a subject–predicate structure. Compare:

- [17] i *No one* – [*including missionaries*] – *had any right to intrude on their territory.*  
 ii *No one* – [*missionaries included*] – *had any right to intrude on their territory.*

In [i] *including* is a preposition derived by conversion from the gerund-participle form of a verb, and taking a following complement. In [ii] *included* is the past participle form of the verb, and there is no basis for saying that it has been converted into a preposition: *missionaries* is interpreted as the subject of a passive clause. *Notwithstanding*, *apart*, and *aside*, however, are not used predicatively (cf. \**These objections are notwithstanding* or \**This is apart/aside*), and hence a subject–predicate analysis of [16b/iib] would not be

valid: instead we treat them as exceptional PP constructions in which the complement precedes the head.

#### ■ *Ago* and *on* following expressions denoting periods of time

More problematic is the analysis of the bracketed phrases in:

- [18] a. *She died [ten years ago].*                      b. [*Ten years on*] *nothing had changed.*

Etymologically, *ago* derives from a past participle form *agone* (the prefix *a-* + the past participle of *go*), so that *ten years ago* has its origin in a subject–predicate construction comparable to that in [17ii] except that the past participle is active rather than passive. *Ago* is of course no longer construed as a past participle, but how the construction should now be analysed is unclear: it is syntactically highly exceptional. Expressions like *ten years* occur as optional modifiers modifying prepositions (*ten years before her death*) and adverbs (*ten years earlier*), but with *ago* such an expression is obligatory, which indicates that it has the status of a complement. Traditional grammar classifies *ago* as an adverb, but on the basis that it takes a complement we analyse it as a preposition, in accordance with the criteria given in §2.4. It is even more exceptional than *notwithstanding*, etc., in that it always follows its complement.

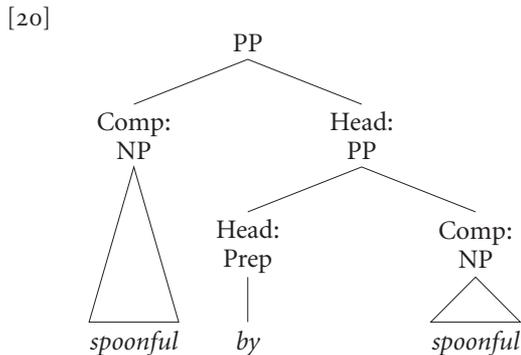

*On*, in the sense it has in [18b], namely “later”, likewise cannot occur without the accompanying phrase: \**On, nothing had changed.* We again take the dependent to be a complement, therefore, and treat *on* in this sense like *ago*, as a preposition that follows its complement.<sup>13</sup>

#### 4.3 PPs of the form *spoonful by spoonful*

Expressions like *spoonful by spoonful*, *step by step*, *day by day*, *one by one* begin with a noun or cardinal numeral but do not have the distribution of NPs, being normally restricted to adjunct function. Compare:

- [19] i a. \**I used spoonful by spoonful.*                      b. \**One by one* *exited.*  
 ii a. *I drank my milk spoonful by spoonful.*                      b. *They exited one by one.*

For this reason we take the head to be the preposition *by*, with the phrase as a whole, therefore, an exceptional PP construction. The constituent structure (ignoring the internal structure of the NPs) will be as follows:

<sup>13</sup>One further case where a preposition follows its complement is in the idiom *(all) the world over*, which is essentially equivalent to the syntactically regular construction *all over the world*.

The distinction between internal and external complements applies to this minor type of PP as well as to clauses and NPs. The second NP is an internal complement in that it forms a PP with the head *by*, and the first NP is then an external complement.<sup>14</sup>

In the examples given, the two complements are identical single-word NPs. A minor variant has modification in one or both: (*dogged*) *step by dogged step*. The same kind of structure also seems applicable to such adjunct expressions as *one at a time*, as in *She marked them one at a time*.<sup>15</sup>

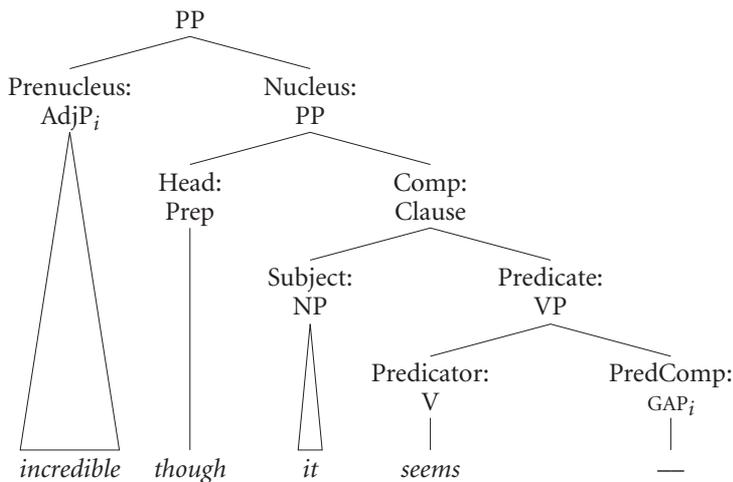

It is arguable that a PP analysis along these lines is also appropriate for a number of lexicalised phrases like *arm in arm*, *face down*, *side by side*, *back to back*, *inside out* which function either as adjuncts or as predicatives: *They were walking arm in arm* or simply *They were arm in arm*. In the case of *face down* and *inside out*, however, the inner PP is intransitive, consisting of a head preposition alone. These expressions have their origin as verbless clauses, and we discuss them further in Ch. 14, §10.

#### 4.4 Preposing in PP structure

The domain for preposing is usually the clause, but it can also be a PP. Compare the examples in [21], where the structure of [iib] is as shown in [22]:

- [21] i a. *I gave some of them to Angela.* [basic]  
 b. *Some of them<sub>i</sub> I gave   <sub>i</sub> to Angela.* [preposing]  
 ii a. [*Though it seems incredible,*] *sales of these cars are falling.* [basic]  
 b. [*Incredible<sub>i</sub> though it seems   <sub>i</sub>,*] *sales of these cars are falling.* [preposing]

[22]

<sup>14</sup>We do not, however, need to recognise a category intermediate between PP and preposition, comparable to VP and nominal. There are major distributional differences between a VP and a clause and between a nominal and an NP, but there are no comparable grounds for having an intermediate category in the structure of PPs.

<sup>15</sup>But not in *She marked one at a time*, where *one at a time* does not form a constituent: *one* is object, and *at a time* is an ordinary PP adjunct. We do not include in the PP construction expressions like *day after day* or *quarrel after quarrel*. These are NPs, with the first noun as head and the PP as dependent. This is evident from the fact that their distribution depends on the first noun. *Day after day*, for example, can function as subject,

In [21ib] the preposed *some of them* occupies prenuclear position in the clause; the notation ‘\_’ marks the corresponding gap in the nucleus. In [iib], however, the preposed *incredible* appears in prenuclear position within the PP, while the gap is located within the clause functioning as complement of the preposition.<sup>16</sup> In this construction, then, the preposition follows part, but not all, of its complement.

### ■ Restriction to *though* and *as*

Preposing in PP structure applies only with *though* or *as* as head. Note, for example, that while *though* is elsewhere interchangeable with *although*, the latter cannot replace it in [21iib]. *Though* always has concessive meaning; *as* is most often used with that meaning too, but it can also be used with the sense “since, given that”. Compare:

- [23] i *This brouhaha, [colourful<sub>i</sub> as it is \_\_<sub>i</sub>,] would have little significance outside of Idaho if it did not reflect some of the larger problems facing the NRA.*  
 ii *This exhibition, [composed as it is \_\_<sub>i</sub> of a large number of small works,] cannot have been an easy one to select.*

In [i] we understand that the brouhaha would have had little significance in spite of being colourful, but in [ii] the exhibition can't have been easy to select because it is composed of a large number of small works. *Though* could thus replace *as* in [i], but not in [ii]. In the concessive sense *as* occurs only in the preposing construction: *as it is colourful* cannot be substituted for the bracketed PP in [i] without changing the meaning from concessive to causal.

### ■ Form and function of the preposed element

In the examples given above, the gap is in predicative complement function. Other examples of this kind are as follows:

- [24] i *The house, [close to the highway<sub>i</sub> though it is \_\_<sub>i</sub>,] seems quiet and secluded.*  
 ii *The house, [close<sub>i</sub> though it is \_\_<sub>i</sub> to the highway,] seems quiet and secluded.*  
 iii <sup>%</sup> [*As bad<sub>i</sub> as last week was \_\_<sub>i</sub>,] this week promises little respite for the premier.*  
 iv [*Gifted exponent of the classical guitar<sub>i</sub> though he is \_\_<sub>i</sub>,] his excursions into jazz have on the whole been considerably less convincing.*  
 v <sup>%</sup> [*As big a hit as it is \_\_<sub>i</sub> in Europe,] Timotei never made it out of the test market in the US.*

As illustrated in [i–ii], the preposing may affect the whole of the predicative element or just the first part of it: in [ii] the complement of *close* remains within the nucleus. With concessive *as* some speakers have a preposed predicative adjective modified by the adverb *as*: see example [iii]. *As bad as* here looks like a comparison of equality (such as we have in, for example, *It was as bad as expected*), but that is not how it is interpreted: the meaning of the PP is simply “though last week was bad”.

When the preposed predicative complement is an NP, it normally has no determiner, even when it is count singular, as in [24iv]. In the more basic construction, without preposing, the NP here would require the indefinite article: *though he is a gifted exponent of the classical guitar*. In the variety that allows the adverb *as* as modifier, however, the

object, or adjunct (*Day after day was wasted; They wasted day after day; She worked on it day after day*), while *quarrel after quarrel* does not allow the adjunct function. Note, moreover, that the PP can be followed by another PP within the same NP: *They climbed [flight after flight of stairs]*.

<sup>16</sup>Preposing within a PP, like preposing in general, is an unbounded dependency construction: see Ch. 12, §7.

article can appear in a preposed NP, but not in initial position: see [24v], where *a* follows the AdjP.<sup>17</sup> The version without adverbial *as* would again have a bare NP (*big hit<sub>i</sub> as it is \_\_<sub>i</sub> in Europe*), while the basic version would have just the article (*though it is a big hit in Europe*). Note that with NPs it is again possible for a post-head dependent to be positioned in the nucleus: compare the initial PP in [24iv] with *Gifted exponent<sub>i</sub> though he is \_\_<sub>i</sub> of the classical guitar*.

It is also possible to prepose other elements, such as a degree modifier or the complement of an auxiliary verb:

- [25] i *I can't come, I'm afraid, [much<sub>i</sub> as I would like \_\_<sub>i</sub> to].*  
 ii [Try<sub>i</sub> as I might \_\_<sub>i</sub>], *I couldn't improve my time.*  
 iii [Apologise<sub>i</sub> though he did \_\_<sub>i</sub>], *Jill declared she would never forgive him.*

## 5 The structure and functions of PPs

### 5.1 Complementation

In this section we review fairly summarily the kinds of complement found in PPs.

#### (a) Object NPs

The prototypical preposition takes an NP as complement: *in the garden*, *to Paris*, etc. As we will see under (b) below, the distinction drawn in clause structure between an object and a predicative complement applies to PP structure too. The NPs *the garden* and *Paris* in the above examples are thus objects, and the contrast of transitive vs intransitive can be applied to prepositions as well as to verbs. *In*, for example, is transitive in *She stayed in the house*, and intransitive in *She stayed in*.

A number of prepositions that take objects have been identified in §2: [24] lists those that are derived by conversion from verbs, while [27] lists those with either an object or no complement at all. The following take an obligatory complement (though some of them accept other types than an object NP):

- |       |                 |                  |                |                  |               |
|-------|-----------------|------------------|----------------|------------------|---------------|
| [1] i | <i>amid(st)</i> | <i>among(st)</i> | <i>as</i>      | <i>at</i>        | <i>bar</i>    |
|       | <i>beside</i>   | <i>come</i>      | <i>despite</i> | <i>during</i>    | <i>ere</i>    |
|       | <i>from</i>     | <i>into</i>      | <i>less</i>    | <i>like</i>      | <i>minus</i>  |
|       | <i>of</i>       | <i>onto</i>      | <i>per</i>     | <i>plus</i>      | <i>save</i>   |
|       | <i>than</i>     | <i>till</i>      | <i>times</i>   | <i>unlike</i>    | <i>until</i>  |
|       | <i>upon</i>     | <i>versus</i>    | <i>via</i>     | <i>with</i>      |               |
| ii    | <i>à la</i>     | <i>chez</i>      | <i>circa</i>   | <i>contra</i>    | <i>modulo</i> |
|       | <i>pace</i>     | <i>re</i>        | <i>sans</i>    | <i>vis-à-vis</i> |               |

The items in [ii] are borrowings from French or Latin (*sans* being archaic or jocular, as in *sans teeth*, “without teeth”). The *as* in [i] is the comparative *as* of *She had saved as much [as twenty dollars]: for *He struck me [as an impostor]* see (b) below. *Beside* usually means “close to” (*Come and sit beside me*) or “wide of”, but it is also used with the same meaning*

<sup>17</sup> An exception to the rule that a preposed NP cannot begin with a determiner is seen in the following example from journalistic prose: *No intellectual though he is on many issues, Mr Bush can out-wonk most people when it comes to public education*. It is questionable whether this construction is well enough established to be considered grammatical.

as *besides*, “in addition to”; the object is obligatory in either case, whereas with *besides* it is optional. *Come* takes a future time expression as complement: *Come the end of the year, we should be free of all these debts*. Historically, this is a subjunctive clausal construction, with *come* a plain form verb and *the end of the year* its subject; synchronically, however, its function and internal structure are like those of a PP (compare *by the end of the year*), and it is plausible to suggest that *come* has been reanalysed as a preposition.

### Between vs among

The complement of *between* and *among* is required to be semantically plural. Syntactically, it generally has the form of a plural NP (*between/among the trees*) or an *and*-coordination of NPs (*I found it hard to choose between/among cornflakes, bran flakes, oat flakes, and muesli*). In addition, *among* readily accepts a collective singular (*among the crowd*), and *between* accepts a singular determined by distributive *each* or *every* (*There will be a five-minute interval between each lecture* – we understand “between each lecture and the next”).<sup>18</sup>

There is a well-known prescriptive rule saying that *between* is required when the complement denotes a set of two, and *among* when it denotes a larger set. This rule is based on the etymology of *between*, and is empirically quite unjustified, as is now recognised by most usage manuals. The restriction to a set of two does not apply to the *between* examples given in the last paragraph, nor to the following, where *among* is not acceptable:

- [2] i *I have sand between/#among my toes.*  
 ii *I never eat between/#among meals.*  
 iii *He hid it somewhere between/#among the back door, the shed, and the oaktree.*

The difference between the prepositions is thus not a matter of the size of the set denoted by their complement. It is, rather, that with *between* the members of the set are considered individually, whereas with *among* they are considered collectively. In [2i], for example, the sand is located between one toe and the one(s) adjacent to it, and similarly in [ii] we are concerned with the time between one meal and the next. In [iii] the back door, the shed, and the oaktree define the boundary points of a triangular area.

Such examples may be contrasted with the following, where only *among* is acceptable:

- [3] i *Among/#Between the meals that we had, several stand out as exceptional.*  
 ii *Police paced among/#between the crowd.*

Here the members of the set are taken all together. Such verbs as *choose*, *divide*, *share* can accept both prepositions, though the collective interpretation of *among* will normally require a set of more than two: *I can't choose between/#among the two of them*.

### (b) Predicative complements

The main preposition taking a predicative complement is *as*: this is the prepositional analogue of the verb *be*. The whole *as* phrase may function as complement or adjunct in the larger construction containing it:

- [4] i *I regard their behaviour [as outrageous].* [complement]  
 ii *[As treasurer] I recommend we increase the fees by 10%.* [adjunct]

<sup>18</sup> *Between* is sometimes found with *or* or *to* instead of *and*: *This forces many to choose between work or having a family and Lambs are usually marked at between 1 to 6 weeks*. These are blends between the regular constructions *choose between X and Y* and *choose X or Y*, and *between 1 and 6 weeks* and *from 1 to 6 weeks*. It is doubtful if they are well enough established to be considered grammatical.

The complement is predicative in that it is related to a predicand: the object *their behaviour* in [i], the subject *I* in [ii]. In the complement use, the *as* is selected by the verb – in this example, by the prepositional verb *regard* (see Ch. 4, §6.1.2).

### Syntactic differences between predicatives and objects

In the discussion of clause structure we noted three syntactic differences between predicative complements and objects: a predicative can be realised by an AdjP or bare role NP; it can never correspond to the subject of an equivalent passive clause; and it can under certain conditions be realised by a nominative case pronoun (cf. Ch. 4, §5.1). Compare:

- [5] i a. *Kim was ill/treasurer.* b. \**Kim attacked ill/treasurer.*  
 ii a. \**The treasurer was been by Kim.* b. *The treasurer was attacked by Kim.*  
 iii a. *It was I who told them.* b. \**Kim attacked I.*

In [i/iii] the underlined complement is predicative in [a], object in [b], while in [ii] it is a subject corresponding in [a] to the predicative complement of the active (*Kim was the treasurer*) and in [b] to the object of the active (*Kim attacked the treasurer*). The nominative case factor is irrelevant with *as* since (in the sense we are concerned with here) it does not license personal pronouns as complement. The other two differences are illustrated in the contrast between *as* and *into* in:

- [6] i a. *He regards your answer as correct.* b. \**This turned your answer into correct.*  
 ii a. \**My guide was acted as by Kim.* b. *The matter will be looked into by Kim.*

The AdjP *correct* is acceptable with *as* but not with *into*, which takes an object. And the deviance of [iia] is attributable to the fact that in the active *Kim acted as my guide* the complement of *as* is predicative. The passive voice factor, however, is of less significance for the complements of prepositions than for the complements of verbs, for there are many transitive prepositions which also cannot be stranded in the passive construction – cf. \**This setback was continued despite by Kim* (corresponding to *Kim continued despite this setback*).

The important factor is thus the form of the complement: *as*, like the verb *be*, allows AdjPs and bare role NPs. AdjPs are of course the more sharply distinct from object NPs, but they are not permitted in all cases. For example, *as* phrases in adjunct function permit bare role NPs, as in [4ii], but not AdjPs. Compare:

- [7] i \**As ill, Kim withdrew from the competition.* [complement of preposition]  
 ii *Being ill, Kim withdrew from the competition.* [complement of verb]

### The category of number in predicative NPs

The predicative complement of *as*, like that of a verb, characteristically matches its predicand in number when it has the form of an NP. Compare *as* and *from*:

- [8] i a. *I regard her as a friend / \*friends.* b. *I bought it from a friend / friends.*  
 ii a. *I regard them as friends / \*a friend.* b. *I bought them from friends / a friend.*

We have noted, however, that this is a matter of semantic compatibility rather than grammatical agreement (compare, for example, the plural + singular combination in *I regard them as a nuisance*): see Ch. 4, §§5.1–2, Ch. 5, §19.

### Predicative complements with prepositions other than *as*

- [9] i *I took him for harmless.*  
 ii *The situation went from bad to worse.*  
 iii *I don't want to make an announcement qua head of department.*

*For* takes a predicative complement after two verbs, *take* and *pass* (as in *He passed for dead*). *From* and *to* take predicatives in clauses expressing a change of state: see Ch. 4, §5.2. *Qua* is another preposition borrowed from Latin, very similar in meaning to *as*, which could substitute for it in [iii]. It belongs to formal style, and perhaps its most characteristic use is between two instances of the same noun: *It wasn't a very good novel qua novel* ("considered as a novel"). It differs from *as* in that the complement must be a bare NP, whether it denotes a role or not.<sup>19</sup>

Adjectives occur as complement in a few expressions like *in brief*, *of old*, but these are idioms, and as there is no predicand we have no reason to analyse the complement as predicative (see §3.2 above).

### Prepositions taking reducible clauses as complement

- [10] i [*Although she was moderately rich,*] *she lived very frugally.*  
 ii [*Although moderately rich,*] *she lived very frugally.*

In [i] *although* has a content clause as complement, but the subject and predicator can be omitted, leaving just the predicative complement, as in [ii]. This latter construction differs from the one with *as* precisely by virtue of its relation with the full content clause. The *as* phrases in [4] cannot be expanded in this way: *\*I regard their behaviour as it is outrageous* is ungrammatical, while *As I am treasurer, I recommend we increase the fees by 10%* has a quite different meaning from [4ii], with *as* now having a causal sense. For this reason we take *moderately rich* in [10ii] to be a reduced clause, and classify *although* as taking a reducible clause as complement.

### (c) Complements with the form of a PP

The complement of a preposition may itself have a preposition as its head. There are two cases to distinguish:

- [11] i *We didn't see anyone [apart from Jill].* [specified by matrix prep]  
 ii *They have lived here [since before the war].* [not specified]

In [i] the head of the larger PP, *apart*, takes a PP complement headed by *from*: the *from* is thus specified by the head of the matrix construction. In [ii], however, *before* is not specified by *since* but makes an independent contribution to the meaning, and potentially contrasts with other prepositions – compare, for example, *They have lived here [since just after the war]*. The distinction is comparable to that found in clause structure between *They referred to her article* (where *to* is specified by the verb *refer*) and *They went to Paris* (where *to* is not specified by *go* and potentially contrasts with other prepositions, such as *towards*, *over*, etc.).

<sup>19</sup>Dictionaries differ in their grammatical classification of *qua* (which derives from the ablative form of the relative pronoun "who"): while some treat it as a preposition, others call it a conjunction or an adverb. It is clearly not a coordinating conjunction, but it doesn't fit the traditional definition of a subordinating conjunction either, for it cannot introduce a subordinate clause. It is like a preposition, and unlike an adverb, in that it obligatorily occurs with a following NP.

### Complements headed by specified prepositions

Prepositions specified by the preceding head are *of*, *to*, *from*, *for*, *on*, and *with*:

- [12] i *She took it [out of the box].*  
 ii *She was sitting [next to her sister].*  
 iii *They were running [away from us].*  
 iv *She would have broken the record [but for the appalling weather conditions].*  
 v *[Consequent on the fire,] the shop closed.*  
 vi *[Together with Jim,] I moved the piano.*

Prepositions which select *of* as head of their complement include the following:

- [13] i *because*            *exclusive*            *irrespective*  
 ii *abreast*            *ahead*            *instead*            *regardless*            *upward(s)*  
           *east*            *north*            *south*            *west*  
 iii *alongside*            *inside*            %*off*            *out*            *outside*

Those in [i] do not occur without a complement, though the adjective *exclusive* can, and *because* also takes a clausal complement. With the prepositions in [ii–iii] the complement is optional, those in [iii] also allowing an NP complement.

*Off* licenses an *of* phrase only in AmE (%*He fell off of the wall*). Conversely, *out* usually takes an *of* PP: an NP complement is primarily AmE (or informal), and generally restricted to NPs determined by *the* in combination with such verbs as *look*, *jump*, *go*, etc. Compare %*He jumped/looked out the window* and \**He jumped out bed* or \**I took it out my pocket*, etc.

*Inside* of commonly occurs with time periods (*She'd finished inside of a week*), but is otherwise restricted to AmE. *Outside* takes *of* rather than an NP when the meaning is “except” (*Outside of us two, no one knew what was going on*), but with the locative sense of *is* again restricted to AmE (%*outside of Boston*).

Prepositions selecting *to* as head of their complement include the items in [14] (where boldfacing, in accord with our usual conventions, identifies the two lexemes that – exceptionally for prepositions – have inflected comparative and superlative forms):

- [14]    *according*    ***close***            *contrary*    *counter*            *due*            *further*  
           ***near***            *next*            *owing*            *pertaining*    *preliminary*    *preparatory*  
           *previous*    *prior*            *pursuant*    *subsequent*    *thanks*            *unbeknown(st)*

For the most part the *to* phrase complement is obligatory when these items are prepositions. The exceptions are ***close*** and ***near***, as in *Bring it a little closer/nearer*; ***near*** also takes an object. *Further to*, as in *Further to our correspondence, I am happy to enclose details of the property*, is an idiom: in other senses *further* (the comparative form of *far*) can occur without a complement. Many of the items in [14] are converted from adjectives, as discussed in §2.2; *thanks*, however, is an isolated case of a preposition converted from a noun. The meaning of *thanks to X* is something like “because of X”. When X is human (or animate) we find an extra dimension of personal responsibility deserving of recognition; there may be an implicit element of gratitude, either sincere (*Thanks to Jim, we're safe and well*) or ironical (*Thanks to you, all my clothes are soaking wet*).

Only a few items select the other grammaticised prepositions. *On* is selected only by *consequent*, and *with* only by *together*, as in [12v–vi]. The others are selected as follows:

- |      |    |                  |                |                   |                   |                         |
|------|----|------------------|----------------|-------------------|-------------------|-------------------------|
| [15] | i  | <i>allowing</i>  | <i>but</i>     | <i>except</i>     |                   | [select <i>for</i> ]    |
|      | ii | <i>apart</i>     | <i>aside</i>   | <i>away</i>       | <b><i>far</i></b> | } [select <i>from</i> ] |
|      |    | <i>downstage</i> | <i>upstage</i> | <i>downstream</i> | <i>upstream</i>   |                         |

*But* selects *for* only in the conditional sense illustrated in [12iv] (“if it hadn’t been for the appalling weather conditions”); elsewhere it takes an object (*Anyone but you would have jumped at the opportunity*). *Except* requires *for* in the conditional interpretation (it can substitute for *but* in [12iv]), and elsewhere takes either a *for* complement or an object: *Everyone liked it except Kim / except for Kim*. With *away* and ***far*** the complement is optional; *apart* and *aside* with the sense “except” require a complement – a *for* phrase if it follows, an NP if it precedes (see §4.2).

### Complements headed by non-specified prepositions

The prepositions that most readily take PP complements of the potentially contrastive type are *from*, *since*, and *till* or *until*. *From* is used in the spatial or temporal domains, the others just in the temporal one. *Since* is illustrated in [11ii], the others in:

- [16] i *He emerged [from under the bed].*  
 ii *The meeting lasted [from just before twelve] [until/till after six].*

*To* is generally not used in this way: we say *He crawled under the bed* rather than <sup>3</sup>*He crawled to under the bed* (see Ch. 8, §4.3). It is certainly not wholly excluded, however: we can have *They have moved to across the river* (“They have relocated to a place across the river”).

The PPs *here*, *there*, *now*, *then* occur as complement to a wider range of prepositions than do such PPs as *under the bed* or *after six*. We find, for example, *They live near here*; *Put it on there*; *I found it behind here*; *You should have told me before now*; *He certainly stayed past then*.

### (d) Complements with the form of an AdvP

This construction is very restricted, the most clearly acceptable combinations being those marked by the plus signs in [17], where the top row gives the heads, the left column the complements:

- |      |     |                         |            |                   |
|------|-----|-------------------------|------------|-------------------|
| [17] |     | <i>before/ere</i>       | <i>for</i> | <i>till/until</i> |
|      | i   | <i>later</i>            | +          | +                 |
|      | ii  | <i>lately, recently</i> |            | +                 |
|      | iii | <i>ever, once</i>       | +          |                   |
|      | iv  | <i>long</i>             | +          | +                 |

In [18] we give one example of each combination, with the PP bracketed and the complement underlined.

- [18] i *Why don't you save it [for later]?*  
 ii *I didn't hear about it [until later].*  
 iii [Until recently] *there wasn't even a road.*  
 iv *Why don't you listen [for once]?*  
 v *You'll be feeling better [before long].*  
 vi *He won't have that car [for long].*

## (e) Complements with the form of clauses

- [19] i *This happened [after Stacy left].* [non-expandable declarative]  
 ii *I'll do it [provided that you help me].* [expandable declarative]  
 iii *[Although (we were) nearly exhausted,] we pressed on.* [reducible declarative]  
 iv *Let me repeat, [lest there be any doubt about the terms].* [subjunctive]  
 v *They ignored the question [of whether it was ethical].* [interrogative]  
 vi *We can't agree [on how much to charge].* [infinitival interrogative]  
 vii *They're talking [about moving to New York].* [gerund-participial]  
 viii *He's not as enthusiastic [as he used to be].* [comparative]

Non-interrogative infinitivals are found with the expressions *in order* and *so as*: *He only mentioned it [in order to embarrass his wife]* or *We left at dawn [so as to miss the rush-hour traffic]*. Constructions with clausal complements are dealt with in the context of our discussion of subordinate clauses in Chs. 11, 13, and 14. Note that in *They kept blaming him [for what he had done]* the underlined constituent is not a clause but an NP (a fused relative), and hence does not belong under the present heading.

## (f) Double complementation

We suggested in §3.1 that in examples like *in league with the guys from down the road* the *with* phrase is complement of *in league*, while *league* is complement of *in*: we have a layered structure of the kind shown in diagram [9c] of §3. There are also non-idiomatic examples that have such a layered structure:

- [20] i [*From Boston to Providence*] *is not far.*  
 ii [*To Los Angeles from Chicago*] *is the path of the fabled Route 66.*  
 iii [*Across the road from the post office*] *there is a children's playground.*

In [i] *Boston* is complement of *from*, and *to Providence* is complement of *from Boston*: thus at the top level the head of the whole PP is the smaller PP *from Boston*, and at the next level *from* is head of this latter PP. In support of this analysis, note that *to Providence* is clearly a complement because it cannot be omitted, and it is also clear that it is not a dependent of *Boston*, for it depends crucially on the presence of *from*. The bracketed PP in [ii] is similar, but has *to* rather than *from* as the ultimate head. Example [iii] is not so clear because *from the post office* is omissible. Nevertheless, it qualifies as a complement because it is licensed by *across the road*: note the contrast, for example, between this construction and *on the road from the post office*, where *from the post office* is a dependent of *road*, so that the structure is simply *on* as head + *the road from the post office* as object. (*Downstream from where we were camped* is somewhat similar, but here *down* and *stream* are compounded, so syntactically there is only one layer of complementation, and the construction is covered under [15ii].)

## (g) Matrix-licensed complements

Some prepositions appear with a wide range of complements that are licensed not by the preposition itself but by an element in the matrix clause to which the PP in question bears a modifier relation. One clear case of a preposition of this kind is *except*, as illustrated in the following examples:

- [21] i *There's nobody here [except the cleaners].* [NP]  
 ii *I've been everything [except president].* [bare role NP]  
 iii *I don't know where to look [except in the garden].* [PP]  
 iv *I have felt every imaginable way [except proud of myself].* [AdjP]  
 v *This thesis treats the topic in every way [except competently].* [AdvP]  
 vi *There is nothing any of us can do [except be cautious].* [bare infinitival]  
 vii *I don't intend to do anything [except to wait for news].* [*to*-infinitival]  
 viii *I can't think what to advise [except staying home].* [gerund-participial]  
 ix *He said not a thing [except that he was sorry].* [declarative content clause]  
 x *They told me everything [except whether I'd passed].* [closed interrogative]  
 xi *I asked little [except what they had been doing].* [open interrogative]  
 xii *She asked nothing [except that they be reprimanded].* [subjunctive clause]

What this indicates is not that *except* licenses complements of all the different phrasal categories in the grammar, but rather that it takes as its complement something licensed by features of the clause containing it. That is, the internal syntax of a PP with a head like *except* is, unusually, not independent of the syntax of the matrix clause in which it appears: we accordingly speak of the underlined expressions as **matrix-licensed complements** of *except*.

That it is the matrix clause, not *except* itself, that licenses the complements in [21] is evident from the fact that if we shift *except* PPs from one example to another at random we will get some starkly ungrammatical results. Compare, for example, \**There's nobody left here except be cautious*; \**I've been everything except that they be reprimanded*; \**I can't think what to advise except proud of myself*; and so on.

What makes the examples in [21] admissible is that they entail or implicate [22i–xi] respectively:

- [22] i *The cleaners are here.*  
 ii *I have not been president.*  
 iii *I know to look in the garden.*  
 iv *I have not felt proud of myself.*  
 v *This thesis does not treat the topic competently.*  
 vi *We can be cautious.*  
 vii *I intend to wait for news.*  
 viii *I advise staying home.*  
 ix *He said (that) he was sorry.*  
 x *They didn't tell me whether I'd passed.*  
 xi *I asked what they had been doing.*  
 xii *She asked that they be reprimanded.*

The underlined expressions are directly admissible in these contexts, and this is sufficient to sanction their occurrence as complement to *except* in the corresponding member of set [21].

The grammatical relationship between the corresponding clauses in [21] and [22] is, however, in some cases quite loose. Although we can say that the polarity is changed (positive

to negative and negative to positive), and that such features as tense, aspect, and mood are left unchanged, there is no simple syntactic manipulation of the clauses in [21] that systematically yields the clauses in [22]. For example, if we change [21viii] in the same way as [21iii], we get the anomalous \**I can think to advise staying home*.

*Except* is representative of a wider class of prepositions with matrix-licensed complements. Other members are *bar*, *but*, *excepting*, *excluding*, *save*, and *including*.<sup>20</sup> The first five of these are semantically close to *except*, but *including* has the opposite meaning, so that the corresponding clause that licenses the complement directly does not differ in polarity:

- [23] i a. *I have felt every imaginable way [including proud of myself].*  
       b. *I have felt proud of myself.*  
       ii a. *I have looked everywhere, [including in the garden].*  
        b. *I have looked in the garden.*  
       iii a. *He said quite a lot, [including that he was sorry].*  
        b. *He said that he was sorry.*

Comparative *as* and *than* can be followed by a similarly wide range of expressions provided they are licensed by the matrix construction. Compare:

- [24] i a. *He should have said more [than that he was sorry].*  
       b. *He said that he was sorry.*  
       ii a. *She asked nothing more [than that they be reprimanded].*  
        b. *She asked that they be reprimanded.*

*As* and *than*, however, also take comparative clauses as complement, and in cases like *He has more enemies [than friends]* it is arguable that *friends* should be analysed as a reduced clause: see Ch. 13, §2.2, for discussion of this issue.

## 5.2 Modification

In this section we survey the kinds of modifier found in the structure of PPs.

### (a) Idiomatic PPs with gradable meanings

We have seen that there are a number of idiomatic PPs that are gradable, and as far as their external syntax is concerned they bear significant resemblances to adjectives – PPs such as *in a bad temper*, *in control*, *out of sorts*, *out of order*, *on top of the world*. These take degree expressions as modifier:

- [25] i. *She seemed [completely in control of the situation].*  
       ii. *That remark was [wholly out of order].*  
       iii. *I was feeling [very much out of sorts].*

For the choice between *very much* and *very* or *too much* and *too*, see Ch. 6, §2.2.

<sup>20</sup>To a certain extent, *beyond* behaves in a similar way, as in this AusE example: *He is understood to have been given no assurances [beyond that the Coalition did not believe Labor's cross-media regulations were effective]* (corresponding to *He was given the assurance that the Coalition did not believe Labor's cross-media regulations were effective*).

## (b) NPs indicating spatial and temporal extent

- [26] i *We live [two miles / a few minutes' walk beyond the post office].*  
 ii *It happened [ten minutes / a long time after the accident].*

This is a common type of modification of PPs headed by spatial and temporal prepositions.

(c) PP-specialised pre-head modifiers (*right, straight, etc.*)

As mentioned in §2.1, there are a few adverbs which occur as modifiers in PPs but not in phrases of other categories. These PP-specialised modifiers include *clear, right, smack,* and *straight*:<sup>21</sup>

- [27] i *The bank robber was [clear across the state] before the police were alerted.*  
 ii *The ball went [right out of the park].*  
 iii *Torbin drove his car [smack into the rear end of a truck] this morning.*  
 iv *When he saw me, he walked [straight into the other room].*

*Clear* conveys movement to a distant point that breaks free and clear of restraints: *flew clear out of sight, went clear over the house, drove clear across town.*

*Right* denotes exactitude or immediacy of location or direction, either literally or metaphorically, the connection to the adjective *right* “correct” being that the prepositional description is fully and literally correctly satisfied: *ran right up a tree, collapsed right in front of me, went right back to her mother, fell right into my hand, heading right for the shore.* *Right* may also emphasise completion, as in *ate it right up, came right up to me, fell right over on its side.*

Informal *smack* indicates complete exactitude of location, often but not always combined with a suggestion (perhaps metaphorical) of impact: *dropped smack on top of the other one, walked smack into the door, lay smack in the centre.*

*Straight* describes the accuracy and directness of a path either in space (*climbed straight up the tree, sailed straight between the goalposts*) or time (*met straight after lunch*) or both (*went straight to the police*), and thus connects to the sense of the adjective *straight* “not bent”.

## (d) Other adverbial modifiers

- [28] i *The ball had landed [very clearly beyond the base-line].*  
 ii *You will find it [immediately on the left of the post office].*  
 iii *They had arrived [shortly after midnight].*  
 iv *That all happened [way before Kim's appointment].*  
 v *I regard it as [quite obviously and uncontroversially within the dean's powers].*

Like VPs, AdjPs, and AdvPs, PPs may be modified by any of an open class of AdvPs expressing extent, precision, epistemic status, etc., preceding the head. The range of AdvPs permitted is determined not by grammatical rule but by the kind of modification that is appropriate to the meaning of the phrase. Thus *shortly* “a short time”, for example, modifies temporal prepositions such as *before* and *after*, but not spatial ones like *from* or *to*.

<sup>21</sup>The word *spot* also occurs in this function in a very restricted way, in the idiom *spot on*, where it connotes exactness of position on some point: *We were spot on with our estimate of the cost.*

## (e) All

- [29] i *There were troops [all round the building].*  
 ii *He had blood [all over his shirt].*

All indicates completeness: in [i] the building was completely surrounded. *All over* is partly idiomatic, for if we omit *all* the natural preposition to use would be *on* rather than *over* – and *on* does not accept *all* as modifier (*\*He had blood all on his shirt*). *All* also occurs with some of the idiomatic PPs that are used predicatively: *I was all of a dither*; *It's all up in the air now*.

(f) Directional preposition modifiers (*over in the corner*)

Certain directional prepositions are frequently found functioning as pre-head modifiers in PPs. The clearest cases are *down*, *out*, *over*, *round*, and *up*.

- [30] i [Down under the house] *it was cool*.  
 ii *I saw you last night [out on the edge of town].*  
 iii *My ball went right [over into the neighbours' garden].*  
 iv *I think dad may be [round at the pub].*  
 v *You'll find it [up on top of the filing cabinet].*

To a limited extent these modifiers can be iterated: *right up over the house*, *up round the corner*. They modify the sense of the head preposition by indicating the path that should be envisaged: there are several ways one might go into the neighbours' garden, but *over into the neighbours' garden* suggests a path going over the fence. They are particularly common with *here* and *there*: *over here*, *out there*, *up in here*, *down over there*, etc.

We can see that it is the last preposition in the relevant preposition sequences that is the head, because the last preposition is the one that determines whether the whole phrase is admissible in a given context:

- [31] i a. *I placed it [up on the shelf].*                      b. *I placed it [on the shelf].*  
 ii a. *\*I placed it [up to the attic].*                      b. *\*I placed it [to the attic].*  
 iii a. *He headed [over into the next valley].*              b. *He headed [into the next valley].*  
 iv a. *\*He headed [over on that hill].*                      b. *\*He headed [on that hill].*

The [a] examples, with the modifier, are admissible only if the [b] ones, without the modifier, are admissible. The verb *place*, for example, licenses a PP with *on* as head, but not *to*, so both examples in [i] are admissible and both in [ii] are not. Analogously for the verb *head* in [iii–iv].

## (g) Post-head modifiers

- [32] i [Downstairs in the kitchen] *were several other guests*.  
 ii [Underneath on a low shelf] *stood the dishwasher detergent*.  
 iii *You'll find it [outside the back door by the garbage bin].*  
 iv *We're having a great time [over here in Guernsey].*  
 v [Astern of us on the horizon] *we saw the sails of a galleon*.

These examples illustrate PPs functioning as post-head modifiers within a PP. Semantically, *in the kitchen* in [i] modifies *downstairs* just as it modifies *sat* in a VP like *sat in the kitchen*. Syntactically, the fact that the underlined PPs are within the bracketed PPs is shown by such tests as constituent order; in [ii] and [v], for example, the containing PP has been preposed as a unit.

### 5.3 Functions of PPs

We have already seen from the account of the internal structure of PPs that one PP can function within a larger one, as head, complement, or modifier:

- [33] i *Sue was still [at odds with her parents] on this issue.* [head in PP]  
 ii *She lives [just down the street from Kim's].* [complement in PP]  
 iii *I'm [down here by the back door].* [modifier in PP]

For the most part, however, PPs function in other constructions, as in:

- [34] i *I gave the key to Sue.* } [complement in clause]  
 ii *She put the key in her bag.* }  
 iii *They are under the table.* }  
 iv *She had slept in the attic.* [adjunct in clause]  
 v *Where's [the key to the safe]?* [complement in NP]  
 vi *They bought [a house with a flat roof].* [modifier in NP]  
 vii *There are now [fewer than a hundred] seats left.* [complement in DP]  
 viii *[Only one in twenty] candidates were shortlisted.* [modifier in DP]  
 ix *They are still [very keen on surfing].* [complement in AdjP]  
 x *He was [tired to the point of exhaustion].* [modifier in AdjP]  
 xi *He likes to do things [differently from everyone else].* [complement in AdvP]  
 xii *I'll be seeing her [later in the week].* [modifier in AdvP]

In [i], *to Sue* is a PP complement whose head preposition is specified by the verb: this type is discussed in Ch. 4, §8.2.1. *In her bag* in [ii] is a goal complement, and *under the table* in [iii] a locative complement, while in [iv] *in the attic* is an adjunct in the clause: complements and modifiers where the head preposition is not specified by the verb are dealt with in Ch. 8. The remaining examples show PPs functioning as complement or modifier in the structure of NPs and DPs (see Ch. 5, §§11, 14), AdjPs and AdvPs (Ch. 6, §§3, 6).

#### ■ PPs with quantificational complements

Certain types of PP containing a numeral or measure phrase have a distribution like that of a DP or NP rather than of an ordinary PP. Compare:

- [35] i a. *She wrote [over fifty novels].* b. *She wrote [between forty and fifty novels].*  
 ii a. *I spent over a year here.* b. *I spent between ten months and a year here.*

In [i] the underlined PPs function as determiner in the bracketed NPs. *Over fifty* denotes a number larger than fifty, and as such is a suitable realisation of the determiner function; similarly, *between forty and fifty* denotes a number within the specified range. In [ii] the complements are an NP and an NP-coordination, and the PPs function as object of *spend*. See Ch. 5, §§4, 11, for further examples.

The prepositions or prepositional idioms used in this way include the following:

- [36] i *around*      *over*      *under*  
 ii *close to*      *up to*      *in excess of*  
 iii *from ... to*      *between* (+ *and*-coordination)

#### ■ PPs as subject and object in clause structure.

PPs of the type shown in [35ii] have a distribution like that of an NP, and hence can function as object (as in the examples given) or subject (cf. *Over a year was spent on this problem*). It is also possible, though unusual, for PPs denoting places or times to fill the

subject and object functions:

- [37] i a. Under the mat is the place where we used to leave the key for the boys.  
 b. Under the mat isn't a very sensible place to leave the key.  
 c. Before the end of the week would suit me better.  
 d. Will at the week-end suffice, or do you need it sooner than that?
- ii a. We must prevent under the desk from getting too untidy.  
 b. We asked where to put it, and the man recommended just above the front door.  
 c. They won't consider after Christmas, of course, to be soon enough.

In the case of the subject, the verb is usually *be*, in either its specifying or its ascriptive sense, as in [ia–ib] respectively, but a restricted range of other verbs are also possible, as illustrated in [ic–id]. The underlined phrases in [ii] are interpreted in the same way as *the area under the desk*, *the area just above the front door*, *some time after Christmas*, and syntactically they behave in the same way as these NPs. In particular, they correspond to the subject of related passive clauses: compare *Under the desk must be prevented from getting too untidy* or *After Christmas won't of course be considered to be soon enough*.

## 6 Grammaticised prepositions

Some prepositions have become **grammaticised** in the sense of having specific syntactic roles in the language that are not determined by their meanings. A preposition like *under* is an example of a preposition that is clearly not grammaticised. It is an ordinary lexical item with a meaning, and it is used where a preposition is permitted and the meaning that it has is the appropriate one. No rule of sentence formation or condition on complement licensing needs to single it out in any way. Indeed, any syntax for English that did make specific mention of it would be insufficiently general. In all contexts where it can appear, other prepositions can appear too: beside *Put it under the table* we have *Put it above the table*, *Put it near the table*, and so on.

The grammaticised prepositions are not like *under*. Each of them is specifically mentioned in the definition of at least one grammatical construction or the statement of some grammatical condition on the distribution of some class of lexical items. For example, the verb *dispose* (meaning “get rid”, etc.) cannot be used correctly without *of* being present as the preposition marking its complement: *They disposed of the box* is grammatical but *\*They disposed the box* is not. And other prepositions are not permitted where the *of* appears: *\*They disposed at/below/on/through/under the box*.

This section surveys the semantic and syntactic properties of those prepositions that are grammaticised in this sense. To set these facts in context it will be useful to begin with some general remarks about the meanings associated with the most basic prepositions of English.

### 6.1 Meanings of prototypical prepositions

#### ■ Basicness of location

Most of the central prepositions in English (or any language) have meanings that are quite clearly locational in origin. More specifically, they concern either spatial location

or change of location, or extensions of those notions into the dimension of time, or notions derived more broadly from them through other metaphors.

### ■ Landmark and trajector

In formulating expressions about spatial relationships, typically one entity is taken as a reference point (or area) with respect to which another is located. Let us call the reference point or area the **landmark** and the item whose location or movement is specified the **trajector**. For example, in *The pen is on the table*, the pen is the trajector and the table is the landmark. In *He collapsed in the bedroom*, the trajector is the event of him collapsing and the landmark is the bedroom. Trajectors can be physical objects, abstract objects, or situations such as events and states; landmarks are typically physical objects or places (points or regions) in space, or else something metaphorically represented in those terms.

### ■ Location and change of location

While *Kim is at the supermarket* simply gives Kim's location, *Kim walked from the post-office to the supermarket* indicates a change of location. A change of location involves (explicitly or implicitly) an initial location and a final location: we refer to these as **source** and **goal** respectively. In this example, then, *from* marks the source and *to* the goal. There are two other prepositions besides *at* that have distinct source and goal counterparts, as shown in:

[1]	LOCATION	GOAL	SOURCE
i	<i>at</i>	<i>to</i>	<i>from</i>
ii	<u><i>on</i></u>	<u><i>on/onto</i></u>	<u><i>off</i></u>
iii	<u><i>in</i></u>	<u><i>in/into</i></u>	<u><i>out</i></u>

Double underlining indicates that the preposition can occur without a complement, giving the following range of possibilities:<sup>22</sup>

[2]	LOCATION	GOAL	SOURCE
i	<i>I'm <u>at</u> Heathrow.</i>	<i>I went <u>to</u> Heathrow.</i>	<i>I departed <u>from</u> Heathrow.</i>
ii a.	<i>It is <u>on</u> the floor.</i>	<i>It fell <u>on/onto</u> the floor.</i>	<i>I lifted it <u>off</u> the floor.</i>
b.	<i>The roof is still <u>on</u>.</i>	<i>She jumped <u>on</u>.</i>	<i>I fell <u>off</u>.</i>
iii a.	<i>It is <u>in</u> the box.</i>	<i>It fell <u>in/into</u> the box.</i>	<i>I took it <u>out</u> of the box.</i>
b.	<i>The doctor is <u>in</u>.</i>	<i>She jumped <u>in</u>.</i>	<i>They won't come <u>out</u>.</i>

The source prepositions *off* and *out* can also be used for static location, contrasting with *on* and *in* respectively. Compare *The car is on/off the road* and *The boss is in her office / out of her office*. Since in a source use such as *He fell off the ledge* he was on the ledge to start with, but not on it at the end, we can regard static *off* and *out* as the semantically negative counterparts of *on* and *in*.

One other source preposition is *away*, which occurs with a *from* complement or on its own: *I walked away (from them)*. Like *off* and *out*, it is also used for static location, where it contrasts with *at*: compare *She is at home / away from home*. In its source use, it often alternates with *from*: *He moved away from the window / from the window*. It could not, however, be used with *departed* in [2i], and *from* is normally used when the source is paired with a goal, as in *She flew from London to Glasgow*.

<sup>22</sup>We noted in §2.4 that *to* can also occur without a complement, but only in secondary senses, which are not relevant to the present discussion.

Adding *away* and the static uses of *off* and *on* to [1] gives:<sup>23</sup>

[3]	LOCATION		CHANGE OF LOCATION	
	Positive	Negative	Goal	Source
i	<i>at</i>	<u><i>away</i></u>	<i>to</i>	<u><i>away/from</i></u>
ii	<u><i>on</i></u>	<u><i>off</i></u>	<u><i>on/onto</i></u>	<u><i>off</i></u>
iii	<u><i>in</i></u>	<u><i>out</i></u>	<u><i>in/into</i></u>	<u><i>out</i></u>

There are no other source prepositions beside the four given here. Many of the other spatial prepositions, however, can be used both for location and for goal. Thus for *under*, for example, we have *The key is under the mat* (location) and *I put the key under the mat* (goal).

### Ordinary location and endpoint location

Two cases of static location are to be distinguished, as illustrated in:

[4]	ORDINARY LOCATION	ENDPOINT LOCATION
i	a. <i>There is a light <u>over the table</u>.</i>	b. <i>The cottage is <u>over the hill</u>.</i>
ii	a. <i>A large snake lay <u>across our path</u>.</i>	b. <i>They live <u>across the river</u>.</i>

In the [a] examples the preposition simply indicates the position of the trajector relative to the landmark. In the [b] examples, however, there is an implicit path from some point of orientation (in the default case the current position of the speaker) to the trajector. Thus the location of the cottage in [ib] is at the end of an implicit path or journey: to get to where the cottage is, you go over the hill. Similarly, in [iib]: to get to where they live, you go across the river, i.e. they live on the other side of the river from the point of orientation. For further discussion of the concepts of location, goal, and source, see Ch. 4, §5.2, Ch. 8, §4.3.

### ■ Plasticity of meaning

All prepositions demonstrate a considerable degree of flexibility in the way that they apply to locative situations. There are systematic ways in which such flexibility is shown, across differing prepositional meanings.

#### Containment and *in*

Whereas *in* prototypically denotes a relation in which the trajector is a physical object completely contained within a clearly bounded landmark (*the man in the study*), there are many cases in which the notion of containment applies only loosely. For example, in *the flowers in the vase* only a part of the trajector is contained within the confines of the landmark (cf. also *the woman in the white blouse*). And in *the bird in the tree* the boundaries of the landmark do not manifest themselves in the kind of concrete physical form characteristic of a prototypical container such as a building. Similarly a corner is a landmark with relatively ill-defined boundaries. Thus the trajector in *the chair in the corner* is not totally enclosed by the corner, but is contained in a vaguely delimited area of space that is nearer the corner than the middle of the room.

<sup>23</sup> *Into* has a very restricted locational use indicating distance travelled: *They camped five miles into the forest*. In addition it is used in static situations outside the spatial domain in examples like *He's into basket-weaving now*, an informal way of saying that he has gone into, or embarked upon, basket-weaving – metaphorically a journey into a new region of activity. *To* is used for static location with a narrow range of NP complements, such as those headed by *left* or *right* or compass terms: *It is situated a little to the north of the cathedral*. *From* can be used in static situations to indicate origin, as in *She is from London*.

Different aspects of a landmark may be prominent in different examples. In *the water in the vase*, for example, it is the sides that define the contained region, whereas in *the cracks in the vase* the surface of the object defines it.

Functional considerations may also come into play. A foot is described as being in a stirrup (in spite of being only partially contained by the landmark) but a finger is not described as being in a ring, even though the topographical relationships are similar. The difference is that the function of a stirrup is to hold a foot in a particular position, so it is naturally seen as a landmark, but there is no such function for a ring (being small and mobile, the ring is easily seen as a trajector). The same point applies to the contrast between *the bulb in the socket* and *\*the jar in the lid*. The function of a socket is to hold a bulb, so the description is in terms of containment, but holding a jar in place is not the function of a lid.

### Support and *on*

Similar points can be made about examples containing *on*. The prototypical situation for *on* is one in which trajector and landmark are in physical contact with each other, with the landmark located below the trajector and supporting it (as with *the pen on the desk*). However, an example like *the poster on the wall* diverges somewhat from this scenario: the physical contact and support apply in the horizontal rather than the vertical plane.

In *the wrinkles on his face* the vertical separation between landmark and trajector is notional rather than actual, as we see from the fact that a similar situation can be construed in terms of embedding rather than separation (*the wrinkles in his skin*). Similarly, the objective nature of the relationships in cases such as *the writing on the paper*, *the writing in the margin* is less important than the way in which these relationships are construed. We use *on the paper* because the paper serves as a background against which the writing is displayed, but we say *in the margin* because the landmark is a restricted area, and that motivates a construal in terms of containment.

Vehicles such as buses, trucks, trains, and large boats can be construed as containers (*She's in that bus over there*), but if the context is such that the role of the vehicle as transporter is salient, then the relationship between trajector and landmark is more likely to be construed in terms of support (*She'll be on the next bus*). Small boats and cars are normally conceptualised as containers rather than supporting surfaces (*I was sitting in a tiny little boat*), perhaps because of the close proximity of the external boundary of the trajector and the internal boundary of the landmark.

### Point location and *at*

The preposition *at* provides a particularly clear example of the processes of abstraction involved in the expression of spatial relationships. The function of *at* is to describe two entities as having precisely the same spatial location, each entity being construed as a point. This means that some degree of idealisation is inevitably inherent in its use.

Consider, for example, the contrast between *John is in the supermarket* and *John is at the supermarket*. If one were standing outside the supermarket, it would be more natural to use *in* than *at*, since the discrepancy between the physical size of the person and the building makes a containment construal appropriate. But *at* becomes progressively more natural as the viewpoint shifts further away from the situation. Speaking from home, one says *John is at the supermarket*. This is because distance facilitates abstraction – naturally enough, for as we move away from objects in our visual field, their image on the retina grows smaller, approximating gradually to a point.

A consequence of the abstraction associated with *at* is that, if I arrange a meeting with someone and use the phrase *at the library*, there may be difficulties when the time of meeting arrives, since it does not specify whether the rendezvous is inside or outside the building. This distinction is lost when the building is conceptualised as a point.

An example like *The cafe is at the highway* seems at first sight a counterexample to this account of the meaning of *at*, since an entity like a highway surely cannot be construed as a point. In fact, however, the typical context of use for such an example is a situation in which we are referring to travel along a road that intersects with the highway at some point ahead and the cafe is located at precisely this point. The following examples constitute similar cases: *The bomb exploded at 1,000 feet* (intersection of downward path of the bomb with the plane of 1,000 feet); *We'll hold a lifeboat drill at the equator* (intersection of ship's course with equator line); *The horse fell at the water jump* (intersection of steeplechase route with obstacle line). In all of these there is an implicit notion of path and a point where the path crosses some non-parallel line.

Implicit paths are also present in abstract form in the following examples: *The bird has a white band at its neck* (the visual scan route along the bird intersects the white band line); *The bird is at the top of the tree* (the upward scan of the tree intersects with the plane of the bird's height); *There are bubbles at the surface* (the upward scan through the liquid intersects with the plane of the surface). Notice that this notion of a mental path has no role in comparable examples with *on*, such as *The bird has a white band on its neck* or *There are bubbles on the surface*.

There is further evidence for saying that *at* involves the notion of path. A sentence like *The cyclists are at Dijon* would only be natural if Dijon were one of a series of points on a journey (such as the Tour de France cycle race). Otherwise, the size of a city like Dijon in relation to a group of cyclists would make it much more natural to conceive of the city as a container rather than as a point (hence *They took this photo when they were in Dijon*).

### ■ Metaphorical extensions from the locative domain

The locative domain is the source for a large variety of semantic extensions to non-locative domains through metonymy and metaphor. Such processes help to explain numerous facts that might seem puzzling at first sight – for example, the fact that *out* means “active in the visual field” in *The sun is out*, but “inactive in the visual field” in *The light is out*.

There is certainly some degree of arbitrariness in the use of prepositions to express non-locative meanings. For example, although certain emotional states are metaphorically construed as containers of the experiencer (*in love*, *in pain*, *in ecstasy*, *in despair*, *in anger*), this is by no means always the case (*\*He's in hate*; *\*She's in happiness*). Similarly, there is no obvious reason why *on* rather than *in* is used in such expressions as *The building is on fire*. However, the degree of arbitrariness is lower than might at first be thought if the role of metonymy and metaphor were not appreciated. We will illustrate first with *out*, and then with the pair *up* and *down*.

#### *Out*

One important factor in some of these extended prepositional meanings has to do with perspective, and this is particularly relevant to those associated with *out*. Take, for example, the contrast mentioned above: *The sun is out* means that the sun is visible, whereas *The light is out* means that the light is invisible. The difference here is attributable

to contrasting perspectives. In both cases there is an implicit opposition between an inner and an outer area. The difference is that in the *sun* example the observer-conceptualiser is located in the outer area, so that any other entity in that area (in this case the sun) is within the observer's visual field. By contrast, in the *light* example the perceiver is conceptualised as located in the inner area so that *out* indicates that the trajector (the light) is outside that field. There is independent support for this claim: the coming about of the first kind of situation is construed in terms of movement towards the observer, using the verb *come* (*The sun came out*), whereas the coming about of the second situation is construed as movement away from the observer, using the verb *go* (*The light went out*).

Both these situations connect to other extended uses. The notion of movement into the observer's visual field is associated with movement into the observer's domain of awareness or understanding (*work out the answer, figure out, find out, sound someone out*). Also related are expressions like *everything turned out all right* or *I've sorted it out* where the result (or outcome) of a process comes to be known or available, and becoming available in this way is conceptualised as emerging from an inner space where the trajector was previously hidden.

Conversely, the notion of exit from the observer's visual field extends not only to processes involving exit from other perceptual areas (*The noise drowned out the music*) but also movement into domains outside the observer's consciousness (*He tried to blot out the memory*). This notion further modulates into the process of unavailability of a particular phenomenon or resource (*The supplies ran out; The bulb burned out*), and there are various idioms that express such ideas with the human experiencer expressed as clause subject (*We're out of gas; I'm tired out*).

There is also a conceptual link between the notion of exit from a landmark and that of change from a normal to an abnormal state, such as from consciousness into unconsciousness, or from self-control into lack of control. Hence the use of *out* in an extensive and growing set of verb + preposition idioms, including *black out, bomb out, fade out, flip out, freak out, knock out, lash out, pass out, pig out, psych out, space out, tune out, wig out, zone out*.

### Up and down

Some of the metaphors associated with the up–down axis play an important role in the extension of meaning generally, not just in the domain of prepositions. They include:

(a) Status. We talk of 'high' and 'low' status, and to achieve higher status is to go 'up' in the world, while to lose status is to go 'down' in the world; compare also *look up to someone* and *look down on someone*, or *put someone down* ("make someone feel inadequate/unimportant").

(b) Size. *Up* and *down* are used in various expressions indicating respectively increase and decrease in size: *blow up a balloon, fatten up cattle, scale up a map, let down a tyre, scale down a map*. Compare again *high* and *low* in *high/low prices, high/low achievement*.

(c) Degree of activity or intensity. Again *up* correlates with 'high' degree and *down* with 'low' degree: compare *wake up, liven up, brighten up, cheer up, speed up, start up, pep up, perk up, wind up, keyed up, tense up, psych up* with *calm down, slow down, shut down, settle down, quieten down, get someone down*.

Increasing size is also perceptually associated with the notion of approach, as might be expected from the fact that the retinal image expands as an entity approaches an

observer, so that it is no accident that *up* expresses this meaning in such collocations as *go up to someone*, *walk up*, *come up*, *creep up*, *loom up*, *sidle up*, and so on. The association between *up* and the notion of approach probably also helps to explain why *up* is used in various expressions having to do with coming or bringing into existence, such as *conjure up an image*, *dream up an excuse*, *make up a story*, *whip up a dessert*.

The notion of approach is in turn related to that of completion of a process on a more abstract level, given that both notions involve movement towards a goal. Hence such expressions as *cut up*, *settle up* (a bill), *even up*, *balance up*, *square up*, *use up*, *sum up*, *carve up*.

When *up* and *down* are used geographically, the choice between them is sometimes arbitrary. Movement along such linear spaces as streets or railway tracks on level ground is sometimes expressed with *up* and sometimes with *down*. Naturally, if there is a slope the direction of increasing elevation is much more likely to be called *up the street*, but in many circumstances what one person refers to as a short distance up the street might be referred to by another as a short distance down the street.

Where the choice is not arbitrary, there are various different geographical metaphors motivating uses of *up* and *down* in connection with travel to towns, cities, etc., and they sometimes conflict.

*Up* is almost always used for travel that goes perceptibly up a hill, so that people use the phrase *up to Kuranda* when speaking about travel from the coastal city of Cairns in Queensland to the town of Kuranda in the nearby hills. But the ascent must be perceptible: although the ground between Illinois and Colorado steadily increases in elevation for 1,000 miles, so that Denver is actually a mile higher than Chicago, no Chicagoan says *going up to Denver*.

*Up* and *down* are also commonly used in association with north and south respectively: cf. *They live up north* or *We travelled down from France into Spain*. This of course correlates with the convention in maps of putting northern areas above southern ones.

A less common and more localised use of *up* in England is for travel from less prestigious to more prestigious cities – this is a special case of the metaphor relating to status mentioned above. People in England often use the phrase *going up to London* or *going up to town*, even though this may involve travel south. In addition, universities, in particular the long-established universities of Oxford and Cambridge, are conceptualised as if they towered above the surrounding area: attending Oxford or Cambridge is generally called ‘going up to university’, and being expelled from those universities is called ‘being sent down’.

## 6.2 Syntactic uses of grammaticised prepositions

We now summarise the syntactic uses of the main grammaticised prepositions in English, indicating the semantic roots of those syntactic uses where this is possible. We consider *as* and *than*, *at*, *by*, *for*, *from*, *in*, *of*, *on*, *to*, and *with*.<sup>24</sup>

<sup>24</sup>Note that all of these are monosyllabic. The majority of them (*as*, *at*, *by*, *for*, *from*, *of*, *than*, and *to* but not *in*, *on*, or *with*) have strong and weak pronunciations, the weak ones (with the vowel [ə]) being used when the preposition is completely unstressed. We omit *against* and *toward(s)*, which are specified in the complementation of very few items: the former occurs with *proof* and the latter with a few adjectives and associated nouns such as *friendly* and *friendliness* (see Ch. 6, §3.1).

### ■ As and than

These occur in comparisons of equality and inequality respectively:

- [5] i *Kim is as tall [as Pat].*  
 ii *Kim is taller [than Pat].*  
 iii [*As you may have noticed,*] *several members are absent.*

In [i–ii] the bracketed PP is a complement, licensed by the degree adverb *as* and the comparative inflection. *Than* is restricted to PPs in complement function, while *as* can head comparative adjuncts, as in [iii]. These constructions are described in detail in Ch. 13.

In addition, *as* has the uses illustrated in:

- [6] i [*As they were checking the proofs,*] *they came across a serious error.*  
 ii [*As it was raining*] *we had to take a taxi.*  
 iii *I regard her [as my best friend].*

The *as* PPs in [i–ii] are adjuncts of temporal location and reason respectively, the former being clearly related to the comparative use. In [iii] *as* takes a predicative complement, as described in §5.1 above: here it plays a role among prepositions analogous to the role that *be* plays among verbs.

### ■ At

As discussed in §6.1, the core lexical meaning of *at* expresses location in a specific geographical position conceived as a point in the plane. Thus *at the North Pole* is a typical literal use. The static meaning can be extended to cover movement of a trajector headed for such a spot (*The truck was coming right at me*) or the point where a path intersects with a non-parallel line (*We were stopped at the Albanian border*). It extends metaphorically into temporal meaning, with the progress of time conceptualised as a one-dimensional line, allowing it to be used for exact times corresponding to points at certain distances along the line (*at three o'clock*).

*At* is only marginally a grammaticised preposition, but it is grammatically selected in the complements of certain verbs, nouns, and adjectives, as in:

- |     |   |   |                                     |
|-----|---|---|-------------------------------------|
| [7] | COMP OF VERB                              | COMP OF NOUN                              | COMP OF ADJECTIVE                   |
|     | i <i>She <u>laughed at</u> me.</i>        | <i>her <u>attempt at</u> a compromise</i> | <i>agog <u>at</u> this</i>          |
|     | ii <i>We <u>rejoiced at</u> the news.</i> | <i>our <u>joy at</u> the news</i>         | <i><u>delighted at</u> the news</i> |
|     | iii <i>She <u>excels at</u> chess.</i>    | <i>her <u>skill at</u> chess</i>          | <i><u>good at</u> chess</i>         |

The examples in [i] represent the clearest case, with other prepositions being completely excluded: cf. *\*laughed on me*, *\*attempt to a compromise*, etc.

There is also a semi-productive semantic contrast between constructions with direct objects and constructions with *at* PPs, as described in Ch. 4, §8.1.1. The semantic difference is that in the transitive case the action is direct and has its effect, while in the version with the *at* PP the action is aimed or attempted but not successful:

- [8] i a. *Jerry shot a rabbit so let's have it for dinner.*  
 b. *Jerry shot at a rabbit but it got away.*  
 ii a. *The creature clawed my face and now I look terrible.*  
 b. *The creature clawed at my face so I dropped it before I got hurt.*

■ **By**

*By* has a locative meaning expressing proximity (*by the wall*), an intransitive version of that meaning, “near the contextually retrievable location” (*They stood by and watched*), a dynamic variant of that signifying motion past a point (*Many people passed by*), and temporal analogues of the latter (*Time was passing by*), in addition to idioms like *by myself* (not “near myself” but “alone”), *side by side* (“adjacent”), *day by day* (“continuously through a sequence of days”), *by night* (“during the night”).

The fact that in simple and stereotypical cases causes, agents, instrumentalities, methods, and routes are close at hand has permitted various extended meanings to evolve, including instrument or technique used (*by unscrewing it, by hand*), cause (*do something by mistake*), mode of transport (*by boat, by car*), or route of access (*They came in by the window*).

*By* has also assumed an array of other meanings: marking the extent of differences in comparisons (*We won the game by two points*), time deadlines (*Be here by ten o'clock*), products in multiplication and area measurement (*The problems had been multiplied by two; Our room is twenty feet by thirty feet*), units used in selling a commodity (*sold by the pound*), identification marks (*I recognised him by his hair*), and many others (books listing phrasal verbs and other idioms list more than fifty distinguishable uses of *by* in particular expressions).

Most importantly among this large array of lexical and idiomatic meanings, for our present purposes, the preposition *by* is used to head complements in passive clauses and in NPs:

- [9] i a. *The plan was approved by the boss.*      b. *the approval of the plan by the boss*  
 ii a. *The boss was hated by everyone.*      b. *a new book by Italo Calvino*

In spite of the similarity suggested by pairs like those in [i], there are significant differences between the constructions, and we do not analyse [ib] as a passive NP (cf. Ch. 5, §16.5.3). In the clausal construction, *by* marks the internalised complement of the passive, corresponding to the subject of the active counterpart (*The boss approved the plan; Everyone hated the boss*). In the NP construction, *by* marks a complement with the semantic role of agent. Note, then, that as hating is non-agentive there is no NP corresponding to [iib]: *\*the hatred of the boss by everyone*. A special case of the agent NP is seen in [iib], where it identifies the creator of an object such as a work of art. This construction allows such paraphrases as *a new book from Italo Calvino, a new book from the hand of Italo Calvino*, etc., but these are not possible in passive clauses: *\*It was written from Italo Calvino; \*It was written from the hand of Italo Calvino*.

■ **For**

*For* is perhaps the most polysemous of the prepositions of English, with a plethora of subtly distinct meanings and a small set of grammaticised uses in addition.

Among the most basic meanings of *for* are “in favour of” (*My position on the tax cut is that I'm for it*); “as a favour to” (*I took the garbage out for you*); intended recipient (*I have a package for Mr Markby*); beneficiary (*Say a prayer for me*) and “on behalf of” (*I am appearing for the defence in this case*); duration (*We stayed for a week*); distance (*We walked for five miles*). In a variety of idiomatic combinations it can convey something more like “as a result of” (*It was somewhat the worse for wear*); reason or purpose

(*He wouldn't help for some reason; He kept quiet for fear of making a fool of himself; We were only doing it for fun*); suitability (*time for reading*); destination (*heading for the city*); consideration in relation to (*lovely weather for the time of year*); and numerous other senses in idiomatic combinations with various verbs, adjectives, and nouns. There may be some common core of positive or favourable orientation towards a goal here, but at best it is very general and vague.

### Complementation of verbs

A fair number of verbs select *for* PPs as complement, as in:

- [10] *I can't account for these results. We didn't allow for human error. He asked for help. I begged for mercy. He blamed me for the delay. Good intentions alone count for nothing. We exchanged it for a new model. I'm hoping for some respite. I paid \$5 for it. We must provide for the children. Why do you stand for such nonsense? Why not try for promotion? Wait for me.*

With *pass* and *take*, *for* is used instead of the usual *as* with a predicative complement: *I took him for a friend of mine*. At the boundary between complement and modifier status is the beneficiary element in clauses like *They bought a tie for me*; with many verbs this alternates with a ditransitive construction (*They bought me a tie*), as discussed in Ch. 4, §8.2.1.

### Complementation of nouns, adjectives, and prepositions

- [11] i *the blame for our failure cause for complaint consideration for others  
a desire for revenge lust for power a request for help a reward for bravery*  
ii *Jogging can be [bad for you]. The task was [easy for most of them].*  
iii *I would have failed [but for you]. I enjoyed it all [except for the ending].*

With some of the nouns the construction matches that of the corresponding verb, but with others the verb takes a direct object. Compare *They lust for power* vs *They desire revenge*.
