Here we have a direct contrast between Kim's departure time and Pat's, between my parents' reaction to the show and mine, and so on. Note that the coordinates differ in two respects: [i] Kim vs Pat, six vs noon; [ii] my parents vs me, enjoy vs not like; [iii] arrogant vs unassuming, positive vs negative; [iv] many vs few, acquaintances vs friends; [v] opera vs chamber music, negative vs positive.

A single difference is sufficient if it is located in a predicative or modifying element, but hardly otherwise:

- [54] i *She loved her husband but betrayed him.* [predicator]  
 ii *He was [rich but very mean].* [predicative comp]  
 iii *He had a [demanding but low-paid] job in the public service.* [modifier]  
 iv *\*She likes opera but (she likes) chamber music.* [object]

In the above examples the contrast is derivable very directly from the content of the coordinates: from the grammatical opposition of positive vs negative, or lexical oppositions like *rich vs mean*, *opera vs chamber music*, and so on. More often it is derived indirectly, via various assumptions and inferences:

- [55] i *He called round at Jill's, but she was out.*  
 ii *She was in considerable pain but insisted on chairing the meeting.*  
 iii *She likes opera but (she likes) chamber music too.*

In [i] we will assume that he called at Jill's with the aim of seeing her: her being out made this impossible, so we have a contrast between intention and actuality. Example [ii] illustrates a broad category of cases where the second coordinate contrasts with what one would or might expect on the basis of the first: if she was in considerable pain one might have expected her not to chair the meeting. In [iii] we have an explicit opposition between opera and chamber music, but we have noted that this is not sufficient (cf. [54iv]). The *too* introduces another implicit difference: *She likes opera* on its own might be pragmatically interpreted as "That's all (the only type of music) she likes", and *too* serves to deny that possibility, so that [55iii] entails [53v].

In general, *but* conveys "and" together with some further, non-propositional, meaning – commonly an adversative meaning such as we find in the connective adverbs *nevertheless*, *however*, *yet*. Thus [55ii], for example, might be paraphrased: *She was in considerable pain and yet insisted on chairing the meeting*. Such cases also allow paraphrases with subordinative *although*: *Although she was in considerable pain she insisted on chairing the meeting*. In some cases, such as [55iii], the implicit relation is "moreover": compare *She likes opera and moreover she likes chamber music too* (similarly with the coordinate negatives, *Kim hadn't read it, but Pat hadn't either*). Neither a "nevertheless" nor a "moreover" relation applies in cases like [53iii], where the second proposition entails the first (when negated, as here) and adds relatively little to it – compare similarly *He didn't go to work yesterday but stayed at home all day* – the relation here might be expressed by *instead*. Where, as in these two examples, the contrast is so sharp, it is barely possible to replace *but* by *and* + connective adverb.

Other cases which resist substitution of *and* + adverb are illustrated in:

- [56] i *I would have gone, but I was too busy.*  
 ii *You may not believe this/it, but I usually keep the house quite tidy.*  
 iii *I'm sorry but you'll have to do it again.*  
 iv *He said it was your fault, but then he would say that, wouldn't he?*

Example [i] illustrates the preventative use of *but*: the situation expressed in the second coordinate prevents the realisation of the one hypothetically entertained in the first – my being too busy prevented my going (compare the remote conditional construction *I would have gone if I had not been too busy*). In [ii], the first coordinate contains a pronoun anaphoric to the second: *this/it* is interpreted as “that I usually keep the house quite tidy”. We call this anticipatory anaphora: the pronoun precedes its antecedent. This kind of anaphora is sanctioned by *but*, but not *and* (Ch. 17, §2.4). Example [iii] is similar except that the anaphoric relation is implicit: we understand “sorry to say this” or the like. *But then* in [iv] is idiomatic: it is used to indicate that what precedes is not surprising.

### ■ Restriction to binary structures

Unlike *and*, *but* is restricted to binary coordination:

- [57] i *Kim is Irish but Pat is Welsh.*  
 ii *\*Kim is Irish but Pat is Welsh but Jo is Scottish.*

Dropping the first *but* in [ii] would make the example marginally acceptable, but it would be interpreted as a layered structure: the first two clauses would form an asyndetic coordination, so that Jo’s being Scottish would be contrasted with the other two being Irish or Welsh.

### ■ Emphatic reaffirmation

*But* is occasionally used for emphatic effect with a repeated phrase:

- [58] *Nothing, but nothing, will make me change my mind.*

The meaning is “absolutely nothing”. The repeated expression is generally a negative, though we also find adjectives, particularly if they denote extreme values on a scale: *It was perfect, but perfect.*

### ■ *But* with the sense “except”: preposition vs coordinator

- [59] i a. *Everyone but Jill was told.*                      b. *\*But Jill, everyone was told.*  
 ii a. *Everyone but<sup>%I/</sup>%me was told.*                      b. *Everyone was told but me.*

*But* here has the same meaning as the preposition *except*, suggesting that it too is a preposition. It differs syntactically from *except*, in that it can’t occur initially, as shown in [ib]: in this respect it is like a coordinator – cf. property (d) of §2.1. In [iia] both nominative and accusative forms of the pronoun are found, and this suggests that *but* can be construed as either a coordinator or a preposition. Following a coordinator, the pronoun will take nominative case because it is part of the subject (cf. *Neither Jill nor I was told*); following a preposition it will take accusative case (cf. *Everyone except / with the exception of me was told*). In *They told everyone but me* the accusative is obligatory, but provides no evidence as to the structure since a coordinate pronoun in this position would also be accusative (*They told neither Jill nor me*). Accusative is much the more usual case in [iia], with nominative very formal in style, and very much a minority variant: for most speakers *but* in this sense is a preposition. Notice, moreover, that in [iib], where *but* + pronoun is postposed, a nominative is virtually excluded even for speakers who have one in [iia]: it seems that in this position *but* is construed as a preposition by just about all speakers.

## 2.6 Not

## ■ ‘X but not Y’ and ‘not X but Y’

Coordinates joined by *but* very often contrast as positive vs negative, or negative vs positive:

- |  |   |                           |
|--|---|---------------------------|
| [60] i a. <i>Jill had been invited but her husband hadn't.</i> | } | [clausal coordination]    |
| b. <i>Jill hadn't been invited but her husband had.</i>        |   |                           |
| ii a. <i>They had invited [Jill but not her husband].</i>      | } | [subclausal coordination] |
| b. <i>They had not invited [Jill but her husband].</i>         |   |                           |
| c. <i>They had invited [not Jill but her husband].</i>         |   |                           |

In clausal coordination the negation is expressed within one of the bare coordinates, the clause *her husband hadn't* in [ia], *Jill hadn't been invited* in [ib]. With subclausal coordination matters are more complex. In [iia] *her husband* is the bare coordinate, *but* the marker, and *not* a modifier (*not her husband* does not constitute an NP: we can't have \**Not her husband accompanied her*, etc.). In [iib] the coordination is *Jill but her husband*, so the negation is not expressed within the coordination itself. However, the scope of the negative includes the first coordinate, but not the second: the meaning is, therefore, “They hadn't invited Jill but they had invited her husband”. This is also the meaning of [iic], but here the *not* has been attracted into the coordination. We take *not* to be part of the coordination because it could not appear in this position in a non-coordinative construction (\**They had invited not Jill*). The object here is therefore *not Jill but her husband*, with *not* a modifier expanding the first coordinate. Similar examples are:

- [61] i *This is surely evidence [not of his guilt but of his innocence].*  
 ii *He married her [not because he loved her but because he was desperately lonely].*  
 iii *What she needs may be [not criticism, not advice, but simply encouragement].*

When *not* appears in an initial coordinate in this way, it is paired with *but* in the second: *not ... but* is thus comparable to *both ... and*, *either ... or*, *neither ... nor*. This might suggest that *not* should be treated as a marker of correlative coordination, like *both*, *either*, *neither*. The reason we don't analyse it that way, but take it rather as a modifier, is that the parallel with *both*, *either*, *neither* is only partial. This can be seen from [61iii], where *not* is repeated. The coordination here is layered. The first layer has *not criticism*, *not advice* as the first coordinate, and *but simply encouragement* as the second. The second layer then consists of a further, asyndetic, coordination with *not criticism* and *not advice* as coordinates. The fact that *not* can appear in a second coordinate and that *and* could be inserted before it (*not criticism, and not advice*) shows that – unlike *both*, *either*, *neither* – *not* has not taken on the function of a marker of the initial coordinate in a correlative construction.

## ■ ‘X, not Y’

It is possible to have ‘X, not Y’ without a *but*:

- [62] i *They had invited Jill, not her husband.*  
 ii *He died in 1984, not 1983.*

The meaning is not quite the same as that of ‘*X but not Y*’. With [60iia] (*They had invited Jill but not her husband*) we understand that they might in principle have invited both Jill and her husband, but in fact did not do so. In [62i], however, the issue is which of Jill and her husband it was that they invited. This is why it would be anomalous to add *but* to [ii]: it is not in principle possible for him to have died in both years.

## 2.7 Not only

### ■ ‘Not only X but Y’

A special case of negative + positive coordinations with *but* involves *not only*; *but* is often accompanied by *also*, *as well*, or *too*:

- [63] i *Our correspondents cover [not only this country but the whole world].*  
 ii *He [not only never went to school, but never even learned to read].*  
 iii *Not only was he incompetent, but he was also corrupt.*

### ■ Position of not only

*Not only* is often found to the left or right of its basic position, like *both*, *either*, and *neither*:

- [64] i a. *He not only knew [soldiering] [but history and literature as well].*  
 b. *They had given copies not only to [the staff] [but the students too].*  
 c. *It is not only a question [of honour] [but of life and death].*  
 ii a. *[Complete power not only corrupts] [but it also attracts the mad].*  
 b. *He [had not only photocopied it] [but had even read it].*  
 c. *Religion offers the best rewards to those [who not only abide by its norms] [but who engage in good works].*

Like *not* on its own, however, *not only* can be repeated in layered coordination:

- [65] *Practice among authorities varies [not only on the question of the parental means scale, not only in the way they assess parental incomes, but in the amounts which they give].*

It thus functions as a modifier, not a marker of correlative coordination. The location of *not only* then simply reflects the range of positions available to focusing adverbs like *only*.

### ■ ‘Not only X, Y’

Where *but* introduces a main clause, it is omissible:

- [66] i *Not only was he incompetent, he was also corrupt.* (cf. [63iii])  
 ii *Complete power not only corrupts, it also attracts the mad.* (cf. [64iia])  
 iii *She said that he was not only ill, he was also penniless.*

It is questionable whether this construction is a case of asyndetic coordination or simply one of juxtaposition. It differs from clear cases of coordination in that it cannot be subordinated: \**Since not only was he incompetent, he was also corrupt, they regarded him as a total liability.* The second clause thus has to be a main clause, although the clause containing *not only* may be a subordinate one, as in [66iii]. From a syntactic point of view it is unclear whether *he was penniless* here enters into construction with *that he was not only ill* (as suggested by the *not only . . . also* pairing) or with *she said that he was not only ill* (as suggested by the fact that this is the only other main clause).

### ■ Three emphatic variants of ‘X and Y’:

- [67] i *He was both incompetent and corrupt.* [‘both X and Y’]  
 ii *He was incompetent but also corrupt.* [‘X but also Y’]  
 iii *He was not only incompetent but also corrupt.* [‘not only X but also Y’]

All of these entail *He was incompetent and corrupt*. All emphasise the separateness of the coordinates: none of the three constructions can be used with the joint coordination of §1.3.2 (*\*Both Kim and Pat are a happy couple*; *\*Kim and also Pat are a happy couple*; *\*Not only Kim but also Pat is/are a happy couple*). In addition, [i] emphasises the equality of the coordinates; [ii] contrasts the coordinates and may suggest that there is something unexpected about the second; [iii] highlights the second coordinate at the expense of the first, which tends to be backgrounded. Note, then, that [iii] is the most likely of the three in a context where his incompetence is old information.

### ■ Alternative forms

*Simply, solely, merely* can substitute for *only* in all the above. *Just* is also possible, except that *not just* does not occur in clause-initial position (*\*Not just was he incompetent, . . .*), or pre-verbally (*\*He not just knew soldiering, . . .*).

### ■ Alternation with verbal negation

Where *not only/simply/solely/merely* precedes a tensed lexical (i.e. non-auxiliary) verb, we have alternation with the *do*-support construction. Corresponding to [64ia/iiia], for example, we have:

- [68] i *He did not only know soldiering but history and literature as well.*  
 ii *Complete power doesn't only corrupt, but it also attracts the mad.*

Here the negation is associated syntactically with *do* rather than with *only*. In [63–64], by contrast, we take *not* and *only* to form a single syntactic element.<sup>31</sup> This is particularly clear in cases like [63iii], where neither *not* nor *only* could appear without the other: compare *\*Not was he incompetent* and *\*Only was he incompetent*.

## 2.8 Expressions based on comparison (*as well as, rather than, etc.*)

Comparative constructions bear a significant resemblance to coordination in that they may relate syntactically like terms from a wide range of categories:

- [69] i *He was [more sad than angry].* [predicative Adjs]  
 ii *He presented [not so much rational as emotional] arguments.* [attributive Adjs]  
 iii *His success was due [less to his own efforts than to his father's].* [PPs]  
 iv *I'd [rather resign than accept such humiliation].* [infinitival VPs]

<sup>31</sup>Examples where the *not* immediately follows an auxiliary verb, as in [64c/iib], are structurally indeterminate as to whether *not* belongs with *only* or with the verb (as it does in the inflectional negatives *It isn't only a question of honour but of life and death* and *He hadn't only photocopied it but had even read it*). Another place where *not* and *only* do not combine into a single element is where *only* appears at the end of its coordinate: *Racial discrimination is not about racist discrimination only but also about the oppression of one racial group by another*.

In these examples the comparative meaning is clearly in evidence, and we analyse them in terms of the grammar of comparison described in Ch. 13, with *than* and *as* prepositions that function as head of comparative complements. There are some cases, however, where the literal comparative meaning is bleached away, yielding expressions that resemble coordinators.<sup>32</sup>

### ■ *As well as*

The literal use of *as well as* is seen in comparisons of equality like *He played as well as he'd ever done*. Here *well* is an adverb heading the underlined phrase, an adjunct of manner. There is also an idiomatic use meaning approximately “and, in addition to”, illustrated in:

- [70] i a. *She [means what she says] [as well as says what she means].*  
 b. [*Abstraction*] [as well as *impressionism*] were Russian inventions.  
 c. [*Both increasing ewe liveweight,*] [as well as *liveweight at mating,*] *influence ovulation rate and lambing performance.*
- ii a. [*Beauty*] [as well as *love*] *is redemptive.*  
 b. *He will have,* [as well as *the TV stations,*] [*a book publishing empire*].  
 c. *I met her father,* [*whom*] *she had invited along* [as well as *her college friends*].  
 d. *She [has experience in management],* [as well as *being an actor of talent*].

In [i] *as well as* behaves like the coordinator *and*. In [ia] it links two finite VPs, a property characteristic of coordinators: cf. property (c) of §2.1. Note in this connection that while *She plays the piano as well as the violin* (with paired NPs) is ambiguous between a literal meaning (“as proficiently”) and the idiomatic one (“and”), *She plays the piano as well as sings lieder* (with paired finite VPs) has only the idiomatic meaning. In [ib] the form *were* indicates that the subject NP is plural, just like *abstraction and impressionism*. And in [ic] we have not only such plural agreement, but also a correlative pairing of *both* with *as well as* instead of the usual *and*.

In [70ii], by contrast, *as well as* behaves markedly differently from a coordinator. In [iia] the 3rd person singular verb-form *is* indicates that this time the subject is singular: *is* agrees with *beauty*, so that *as well as love* is treated syntactically as an adjunct, not a coordinate. In [iib] *as well as the TV stations* precedes *a book publishing empire*, making it clearly an adjunct. *And* could not appear in the position *as well as* has here: cf. property (d) of §2.1. In [iic] relativisation has applied to just one of the bracketed constituents, contrary to coordinator property (e). And in [iid] the bracketed constituents are syntactically unlike, the first being a finite VP, the second a gerund-participial, contrary to coordinator property (b). Note that order reversal is possible in [iid] (*As well as being an actor of talent, she has experience of management*), but not in [ia] (*\*As well as says what she means, she means what she says*).

We must conclude that idiomatic *as well as* can be construed syntactically in two ways, introducing an element that is either coordinate (as in [70i]) or subordinate

<sup>32</sup>A similar pairing of a range of syntactically like terms is found with *if* and *though* (especially in combination with *not*): *He has read most if not all of her novels; This would minimise if not eliminate the problem; Several highly confidential, though not top secret, messages were intercepted*. Here, however, reversal is quite generally possible, making the construction more clearly subordinative: *He has read, if not all then certainly most, of her novels*.

(as in [ii]). In the former case, we take it to have been reanalysed as a compound coordinator. In the latter case there has been no such syntactic reanalysis, and here *as well as* does not form a constituent. This is evident from the fact that *as well* can occur on its own: compare *Beauty is redemptive and love is as well*. In [iia], then, the second *as* is a preposition taking the NP *love* as its complement, and the whole PP *as love* is an indirect complement in the AdvP *as well as love*. Similarly for the other examples in [ii].

As a coordinator, *as well as* is restricted to subclausal coordination: *She plays the piano as well as she sings lieder*, for example, has only the literal comparative interpretation. Even as a coordination, ‘*X as well as Y*’ differs from ‘*X and Y*’ in that the second term is backgrounded: *Y* often expresses information that is discourse-old, i.e. familiar from the prior discourse.

### ■ *Rather than*

The primary sense of *rather* is seen in [69iv] above, *I’d rather resign than accept such humiliation*. Here it is an adverb with a comparative meaning: approximately “more readily, in preference to”. There are also uses where this meaning is largely or wholly lost – a change facilitated by the fact that the morphological base *rath-* no longer occurs without the *-er* suffix. Like *as well as*, *rather than* may introduce a constituent that is syntactically coordinate or subordinate. Compare:

- [71] i a. *In the end he [survives] [rather than conquers].*  
 b. *The dilemma has [deepened] [rather than been resolved].*  
 c. *Wisdom and folly are [moral] [rather than intellectual] categories.*  
 ii [Rather than individual security] *it is [the security of an ideological group] that is basic.*

In [i] *rather than* links finite VPs, past-participials, and attributive adjectives, and it is plausible to suggest that it, like *as well as*, has been reanalysed as a coordinator. The meaning of coordinative ‘*X rather than Y*’ is “*X*, not *Y*”. In [ii], however, *rather than* cannot be a coordinator because of its position: there is no reason to postulate reanalysis here, and we take the first bracketed phrase to be an adjunct, with the adverb *rather* as its head. Note that such fronting of ‘*rather than Y*’ is not possible in [i]. Compare [ia] in this respect with the clearly non-coordinative *They obeyed the order rather than suffer torture or death*. Here the underlined constituents are not syntactically alike (the first being finite, the second non-finite), and fronting is permitted: *Rather than suffer torture or death they obeyed the order*. In this case, unlike [71], *rather* has its comparative “in preference to” meaning.<sup>33</sup>

### ■ ‘*Not so much X but Y*’

The similarity between comparison and coordination is reflected in the not infrequent blending of comparative ‘*not so much X as Y*’ and coordinative ‘*not X but Y*’:

- [72] *Insofar as science generates any fear, it stems [not so much from scientific prowess and gadgets] [but from the fact that new unanswered questions arise].*

<sup>33</sup> A less frequent variation of ‘*X rather than Y*’ is ‘*rather X than Y*’: *I rather sensed them than saw them*.

### ■ *Much less, still less*

These are found in non-affirmative contexts within a final coordinate. They occasionally combine with *and* and hence (by virtue of coordination property (f), §2.1) are not themselves coordinators, but function as modifiers:

- [73] i *She was prettier than he had any right to [hope for,] [much less expect].*  
 ii *The conference decisions did not reflect the opinions of [the majority of party members] [and still less the party's supporters in the country].*

## 2.9 Expressions of addition, inclusion, etc. (*including, instead of, plus, etc.*)

### ■ *In addition to, including, instead of, along with*

Such expressions bear some resemblance to coordinators in that they can link phrases in a considerable range of functions ([74i]) and of syntactic categories ([74ii]):

- [74] i a. [*Friends from Limpsfield,*] [in addition to *the villagers,*] *came to the party.*  
 b. *They got [free milk and free meat] [in addition to *their wages*].*  
 c. *I was subjected to [crippling fines,] [in addition to *usurious interest on unpaid debts*].*  
 ii a. *There is a need to provide [special,] [including *institutional,*] *treatment as well.*  
 b. *She might have turned it [full] on [instead of *faintly*].*  
 c. *She would make him [stand face-to-wall in a corner] [instead of *stay in after school*].**

The first term is subject in [ia], object in [ib], complement of a preposition in [ic]. These constructions are nevertheless clearly not coordinative in that the PP can be moved to front position, or to the position before the term to which it is linked (*They got, in addition to their wages, free milk and free meat*). The similarity with coordination is greater in [ii], where the order cannot be changed in this way. Such examples provide some evidence for suggesting that *including* and *instead of* – like *as well as* and *rather than* – have a use where they are reanalysed as marginal members of the coordinator category.<sup>34</sup>

### ■ *Plus*

This is another item that straddles the boundary between prepositions and coordinators:

- [75] i *Each boy's parents pay [\$2,000 a term in fees,] [plus *extras*].*  
 ii *[The cost-billing system] [plus *other control refinements*] *has reduced the deficit.*  
 iii *[His stamina] [plus *his experience*] *make him unbeatable.*  
 iv *The committee consists of [two staff] [plus *four students*] [plus *the secretary*].*  
 v *[He spoke with a funny accent] [plus *he wore socks with his sandals*].***

*Plus* is predominantly followed by an NP, making it more like a preposition than a coordinator.<sup>35</sup> Examples like [v], where it introduces a main clause, are restricted to

<sup>34</sup>Compare also this example where *along with* is paired with *both* in a correlative coordination: *They emphasise the keeping of both the old covenant with its food laws, cultural traditions, circumcision and sabbath keeping, along with the new covenant.* This can hardly be regarded as an established construction, but it does illustrate the way in which the category of coordinators can extend beyond the clear-cut members.

<sup>35</sup>It can also occur in phrase-final position: *They were both forty plus*; there is of course no question of a coordination here.

informal style – a style where it has undoubtedly been assimilated to the coordinator category.<sup>36</sup> It differs from prototypical prepositions in that it does not permit fronting (*\*Plus other control refinements the cost-billing system has reduced the deficit*) and only very rarely occurs as head of a predicative complement (*The electrical charge is plus, of course, the initial pulse of current*). ‘X plus Y’ tends to count as singular for agreement purposes, as in [ii], but it is sometimes taken as plural, as in [iii] – in the singular case it is being treated as a preposition, in the plural case as a coordinator. Example [iv] shows that it occurs in multiple as well as binary structures, which also puts it with the coordinators.<sup>37</sup> As a coordinator, however, it is largely if not wholly restricted to joining main clauses or NPs.

### ■ *Let alone, not to say*

The wide range of categories they can link suggests that these idioms might be regarded as marginal coordinators:<sup>38</sup>

- [76] i *Few people [have seen the document,] [let alone know what’s in it].* [finite VPs]  
 ii *His behaviour was in [questionable,] [not to say downright bad] taste.* [AdjPs]

## 2.10 Connective adverbs (*so, yet, however, etc.*)

*So*, in the sense “therefore, as a result”, and *yet*, “nevertheless”, appear in constructions where they are very clearly distinct from coordinators, but they also have uses where the resemblances are such that they may be regarded as marginal members of the coordinator category.

### ■ Differences from coordinators

#### (a) Links between non-coordinate elements

- [77] i *The mill could be sold off, so providing much-needed capital.*  
 ii *He was gone, leaving her caught up to a pitch of excitement and ecstasy that was yet perilously close to tears.*  
 iii *Certain this menace was only imaginary, he yet stared in fascinated horror.*

Here *so* and *yet* are adverbs linking elements that are clearly not coordinate. In [i–ii] the adverb links a subordinate clause to the matrix, while in [iii] it links the main predication to the initial adjunct – compare also *Though he was certain this menace was only imaginary, he yet stared in fascinated horror*, where *yet* is correlative with *though*.

#### (b) Combination with coordinator

- [78] i *This may make the task seem easier and so increase self-confidence.*  
 ii *You can look as fit as a fiddle and yet feel quite listless.*

<sup>36</sup>This is particularly evident when it links imperative clauses, as in the advertiser’s *Save \$300.00 plus choose \$300.00 worth of free gifts*.

<sup>37</sup>This reflects its basic use in mathematics; in that register other operators such as *minus* and *times* behave in the same way, and are perhaps also marginal members of the coordinator category.

<sup>38</sup>*Not to mention*, though similar in meaning, can link unlikes (*He is a four-star general, not to mention also being president of the tiny country of Concordia*) and can introduce an adjunct in front position (*Not to mention other things, every day I am under the pressure of my concern for all the churches*).

Here it is *and* that marks the coordination relation: *so* and *yet* are thus modifiers within the second coordinate (cf. property (f) of §2.1). *So* combines just with *and*, while *yet* is also found with *but* and *nor* (*He was created not exactly immortal, nor yet exactly mortal*).

### ■ Similarities with coordinators

#### (a) Initial position

*So* and *yet* normally occupy initial position (save for the coordinator itself in examples like [78]); in this respect they are closer to coordinators than to such adverbs of similar meaning as *therefore*, *consequently*, *nevertheless*, *however*, etc., which readily occur in central or end position. Compare: *He therefore!\*so had to resign* or *The two speeches were, however!<sup>39</sup>yet, very similar in content*.

#### (b) Occurrence as sole linking item in coordinative construction

Although *so* and *yet* can combine with a coordinator, as in [78], they much more often occur without one:

- [79] i [ *There was a bus strike on,* ] [ so *we had to go by taxi* ].  
 ii [ *The book was written ten years ago,* ] [ yet *conditions are still the same* ].

In cases like these, *so* and *yet* are just about indispensable elements of the construction. If we omit them the result is a mere juxtaposition of clauses rather than a coordination: it would therefore be misleading to treat the constructions here as asyndetic coordination. It is more plausible to analyse *so* and *yet* here as markers of coordination.

#### (c) Range of coordinates

Both *so* and *yet* can link finite VPs:

- [80] i *He* [ *wanted to avoid the rush-hour* ] [ so *took the early train* ].  
 ii *He* [ *worked for peace all his life,* ] [ yet *sadly died by a gun* ].

In this respect they are like coordinators. But this use of *so* is quite infrequent: whereas *so* on its own is much commoner than *and so* as a link between main clauses,<sup>40</sup> the reverse is the case with subclausal coordination. *So* can also link adjectives (*It was an untried, so rather risky, undertaking*), but not NPs, subordinate clauses, non-finite VPs, etc. (note, for example, that *and* is not omissible from [78i]). *Yet*, on the other hand, is similar in meaning to the coordinator *but*, and occurs in a similar range of coordinative constructions – for example:

- [81] i *A person* [ *who has a master's degree,* ] [ yet *who has not taken education courses,* ] *is not permitted to teach in the public schools*.  
 ii *The speech was delivered in* [ *simple* ] [ yet *eloquent* ] *words*.  
 iii *It was a proposal which* [ *sickened* ] [ yet *fascinated* ] *me*.

<sup>39</sup> *Yet* occurs centrally in subordinative constructions such as [77ii–iii]. A rare example of central *so* is seen in: *It is found in the works of those who held the first chairs and lectureships when the monopoly on legitimate educational theory shifted to universities about a century ago, and who so set the tone for modern contemporary studies – so could not precede relative who here. Hence can occur centrally (They involve long computations and are not, hence, very useful in practice), but is much less frequent in this position than therefore, etc.*

<sup>40</sup> Note that *so* can link main clauses of unlike type, as in *It'll be quite cold, so take plenty of warm clothing*: it would hardly be possible to add *and* here, and the clauses are clearly not of equal status pragmatically – the first gives a reason for issuing or complying with the directive expressed in the second (compare the subordinative construction *Take plenty of warm clothing because it will be quite cold*).

*Yet* can link relative clauses, as in [i]; adjectives, as in [ii]; verbs, as in [iii], and so on. It is thus syntactically somewhat closer to the coordinators than is *so*.<sup>41</sup>

## 2.11 *For, only, and resultative so + that*

As used in [82], these items fall at the boundary between coordinators and prepositions (prepositions that take clausal complements, thus subordinating conjunctions in a traditional analysis). They lack the more positive features of each, so that their classification remains problematic.

- [82] i [*He went to bed,*][*for he was exhausted*].  
 ii [*I would have gone,*][*only I was too busy*].  
 iii [*The dust clogged their throats,*][*so that the women were always making ice water*].

*For* is semantically quite close to the clearly subordinative *because*, but differs from it syntactically. *Only* is replaceable by the coordinator *but*, or the preposition *except* (which may take a content clause with the subordinator *that*: *except that I was too busy*). In [82ii] *only* has a preventative interpretation: “being too busy prevented me from going” (cf. [56i]), but it is also found with a limiting, excepting sense, as in *He’s very like his father, only he has blue eyes*. Example [iii] has a resultative interpretation and is to be distinguished from the purposive *He left early* [*so that he would miss the rush-hour traffic*], which is clearly subordinative.

### (a) Differences from coordinators

*For, only, and resultative so + that* lack most of the properties distinguishing prototypical coordinators from prepositions with clausal complements.

#### No requirement of syntactic likeness

The clause following them cannot contain any internal marker of subordination whereas the first clause can, which means that the two clauses may be syntactically unlike. Compare, for example:

- [83] i *They’ve postponed the meeting till tomorrow, [which is a great nuisance] [for it means that several members will be unable to attend]*.  
 ii *He said [that he would have gone,] [only he had been too busy]*.

In [i] relativisation does not apply across the board: we have *which* in the first clause but *it* in the clause following *for*, with *for* therefore relating syntactically unlike clauses. Similarly for *only* in [ii]: one clause is marked by the subordinator *that*, but we cannot insert *that* after *only*. Contrast here the behaviour of the coordinator *but* in *He said [that he would have gone,] [but that he had been too busy]*.

<sup>41</sup> However, whose meaning is similar to that of *yet* and *but*, also has uses where it behaves like a coordinator for speakers who accept such examples as: <sup>96</sup>*Other services have been expanded to meet the need, however the situation is still critical* and *Please note that the costs are correct, however are subject to change prior to final payment*. A further item similar in meaning to *but* is (*al*) *though*; in general this differs syntactically quite sharply from *but* (cf. properties (d) and (e) of §2.1) and belongs to the category of prepositions taking a finite clause as complement. It too, however, is sometimes found linking finite VPs, as in *They both remembered Jane, though rarely spoke of her*. There is no possibility of fronting here (*\*They both, though rarely spoke of Jane, remembered her*), and this too might be regarded as a marginal coordinative construction.

### Restriction to binary constructions

They cannot appear in multiple coordinations like ‘X (*and*) Y *and* Z’. Compare:

[84] *He went to bed, for he was exhausted, for he had been gardening all day.*

This kind of example would generally be avoided on stylistic grounds, but it can only be interpreted as a right-layered construction (cf. diagram [2b] of §2). The gardening explains the exhaustion not, directly, the going to bed, so the scope of the first *for* is *he was exhausted, for he had been gardening all day*. Unlike a coordinator in multiple coordination, the first *for* cannot be omitted.

### Restriction to finite clauses

Coordinators can link a wide range of categories but the present items can be followed only by a finite clause. Note, for example, that while *only* can replace *but* in [56i], it differs from *but* in not allowing a following VP: *I would have gone, but/\*only was too busy*. In the case of *so that* in [82iii] the *that* is the subordinator that introduces declarative content clauses.

## (b) Differences from prototypical prepositions with clausal complements

They also differ significantly from prepositions such as *if*, *because*, purposive *so* (+*that*).

### Inability to occur in initial position

The order of the bracketed elements in [82] is irreversible. Contrast here *for* and *because*: *Because/\*For he was exhausted, he went to bed*. Similarly, resultative *\*So that the women were always making ice water, the dust clogged their throats* may be contrasted with purposive *So that he would miss the rush-hour traffic he left early*.

### Inability to coordinate

The constituent formed by these items and the following clause cannot function as a coordinate:

- [85] i *\*He went to bed, [for he was exhausted][and for he had to get up early next day].*  
 ii *\*I would have gone [only I was too busy][and only I was short of money].*  
 iii *\*The dust clogged their throats, [so that they quickly felt parched][and so that the women were always making ice water].*

Again, this restriction does not apply to the clearly subordinative constructions with *because* and purposive *so*.

The (a) properties make these items like prepositions, the (b) properties make them like coordinators. On balance, we would favour putting them with the prepositions: in the absence of positive coordinator properties the ability to link unlike elements, as in [83], can hardly be reconciled with a coordinator analysis.<sup>42</sup>

<sup>42</sup>In terms of their meaning, they are very different from prototypical cases of coordination since they express relations that are clearly asymmetric. Nevertheless, *for* is traditionally classified as a coordinator – an analysis that may reflect the fact that its translation equivalent in Latin belongs syntactically with the coordinators. On a prepositional analysis, there is no need to treat *so* + *that* as a unit: *that* is simply the subordinator that introduces the content clause complement of *so*. The *that* is, however, obligatory in this construction: in the absence of *that*, *so* is the connective adverb discussed in §2.10.

### 3 The range of coordination: what can be coordinated with what

#### 3.1 Conditions on the distribution and form of coordinations

Coordinations can occur at almost any place in the structure of a sentence. As a first approximation, we may put it as follows:

- [1] If (and only if) in a given syntactic construction a constituent *X* can be replaced without change of function by a constituent *Y*, then it can also be replaced by a coordination of *X* and *Y*.

This may be illustrated by reference to sentence [2]:

- [2] *Kim wanted to take them.*

Here *to* is a unique marker of the infinitival construction: it cannot be replaced by any other word and hence not by a coordination. But all the other constituents in [2] allow both simple and coordinative replacement. This is illustrated in [3] for the four words other than *to*:

- |     |                  |                   |  |
|-----|------------------|-------------------|--|
| [3] | A                | B                 | C  |
|     | i <i>Kim</i>     | <i>Pat</i>        | <u><i>Kim and Pat</i></u> wanted to take them.         |
|     | ii <i>wanted</i> | <i>intended</i>   | <i>Kim</i> <u>wanted and intended</u> to take them.    |
|     | iii <i>take</i>  | <i>keep</i>       | <i>Kim</i> wanted to <u>take and keep</u> them.        |
|     | iv <i>them</i>   | <i>the others</i> | <i>Kim</i> wanted to take <u>them and the others</u> . |

Column A gives the original word, B a simple replacement, and C the clause resulting from substituting a coordination of A and B for the original word in [2]. Similarly for the non-minimal constituents: *take them* can be replaced by *give them to Pat* and hence by a coordination of this and the original – *Kim wanted to take them and give them to Pat*.

The possibility of layered coordination (§1.2) can now be seen to follow directly from [1]. We can apply rule [1] to the coordination *Kim and Pat* in the C column of [3i]: *Kim and Pat* can be replaced by *Jill and Max* and hence by a coordination of the two coordinations, yielding the layered structure in *Both Kim and Pat and Jill and Max wanted to take them*.

Rule [1] says that there must be no change in function when we make the replacement. This condition excludes examples like:

- [4] i \**He left this morning and the room*.  
 ii \**She became and admired the best teacher in the university*.

Example [i] is inadmissible because *He left this morning* has *this morning* as adjunct whereas *He left the room* has *the room* as object. Similarly [ii] is excluded because *the best teacher in the university* is predicative complement in *She became the best teacher in the university*, but object in *She admired the best teacher in the university*.

Rule [1] does not require, however, that *X* and *Y* belong to the same category, and hence allows for cases like *He left this morning or just after lunch*, where the first coordinate is an NP, the second a PP. The major condition on coordination, then, is that coordinates must be **alike in function**, they must stand in the same syntactic relation to any surrounding material.

It is to be understood that when *X* is replaced by *Y* the meaning of other expressions in the sentence remains unaffected. Take, for example, *This excited her interest*: if we replace

## (c) Expanded coordinates

These cannot coordinate. In *Kim or Pat should give the course* we can replace *or Pat* by *and Max*, but not by a coordination of these:

[7] \**Kim or Pat or and Max should give the course.*

To express this meaning we need to repeat *Kim*, giving *Kim or Pat or Kim and Max*.

## (d) For, only, and resultative so

As noted in §2.11, we cannot coordinate phrases headed by these items, in the senses discussed. This is the main property making them partially like coordinators, as the deviance of [85] of §2.2 (\**He went to bed, for he was exhausted and for he had to get up early next day*, etc.) is comparable to that of [7] above.

## (e) Grammaticised words

Words that are grammatically distinctive, e.g. by virtue of belonging to closed categories, tend to coordinate less freely than open category ones. For example, we do not say \**my and this book* (but rather *my book and this book/one*). We take up this issue in §3.3.

## (f) Departures from strict functional likeness

We occasionally find minor and semantically motivated violations of the requirement that coordinations be functionally alike, as in:

[8] i *all and only the corrected copies* [predeterminer + focusing modifier]  
 ii *our and future generations* [determiner + attributive modifier]

## (g) Coordination of word-parts

In general, coordinations are whole words or larger expressions, hence the reference to syntactic construction in [1]. But to a limited extent it is possible to coordinate parts of words:<sup>44</sup>

[9] i *pro- and anti-marketeers* *pre- and post-war living conditions*  
 ii *the [four- and five-year-old] boys* *red- or auburn-haired*

Coordination of prefixes is found with a few pairs of opposite meaning, such as those in [i], or *inter-* and *intra-*. Coordination of bases is well established with numerals and in denominal adjectives formed by suffixation of *-ed* (see Ch. 19, §5.8), as in [ii]; it is also commonly found in compounds formed from past participles: *Sydney- or Melbourne-based companies*.

## (h) Joint coordination

Rule [1] does not allow for cases of joint coordination where one of the coordinations cannot replace the whole coordination:

[10] i *Kim and Pat are a happy couple.* (= [17ii] of §1)  
 ii *Kim and Pat are respectively scrupulously honest and an inveterate liar.*

Example [ii] can be seen as following from the acceptability of *Kim is scrupulously honest* and *Pat is an inveterate liar*, but this kind of solution is not available for [i]. Here we

<sup>44</sup>Very occasionally one finds coordination between a word and a prefix: *Please list all publications of which you were the sole or co-author.*

need to accept that an *and*-coordination of NPs can be used directly to enumerate the members of a set.

(i) **Lexicalised coordinations**

We must also go beyond [1] to allow for fixed phrases like *spick and span*, *to and fro*, etc. (§1.4).

(j) **Special syntactic treatment of coordinates**

Compare next:

- [11] i a. <sup>90</sup>*They invited Kim and I.*                      b. *\*They invited I.*  
       ii a. *I need pen and paper.*                        b. *\*I need pen.*

In [1a] we have a nominative case pronoun where the corresponding non-coordinative construction would require accusative *me*; not all speakers accept examples like [1a], but for the many who do the rules for case selection in coordinations are clearly not the same as those applying elsewhere (cf. Ch. 5, §16.2.2). Similarly, [ii] shows that the normal rules concerning the requirement of a determiner with count singulars are sometimes relaxed in coordinations.<sup>45</sup>

(k) **Avoidance of adjacency constraints**

In such an example as *They disagreed as to whether it should be allowed* we could replace *whether* by *how often* but not by *to what extent*, and yet a coordination of *whether* and *to what extent* is perfectly possible:

- [12] i *\*They disagreed as to to what extent it should be allowed.*  
       ii *They disagreed as to whether and to what extent it should be allowed.*

Open interrogatives beginning with a preposition are hardly permissible as complements to a preposition, especially when the prepositions are identical, as in [i]. But in [ii] the prepositions are not adjacent, and hence there is nothing to rule out the *to what extent* PP.<sup>46</sup>

### 3.2 Coordination of unlike categories

In the great majority of cases, coordinates belong to the same syntactic category, but a difference of category is generally tolerated where there is likeness of function. This section surveys the main functions allowing coordinations of this kind.

(a) **Predicative complement**

One of the most straightforward cases is the coordination of AdjPs, NPs, and PPs in predicative complement function:

- [13] i *It was [extremely expensive and in bad taste].*                      [AdjP + PP]  
       ii *He became [very forgetful and an embarrassment to his family].*                      [AdjP + NP]

<sup>45</sup>Two other cases where a form is found in coordination that would not be permitted in a non-coordinate construction are illustrated in *Teachers have been uncertain how or if to incorporate grammar into the approach*, and *It was a hilarious scene as fat and thin alike swooped, swayed, tripped, and fell*. The interrogative subordinator *if* which appears in the first of these cannot normally occur with an infinitival complement: *\*They have been uncertain if to incorporate grammar into the approach*. In the second the adjectives *fat* and *thin* are functioning as fused modifier-head NPs, which would not be possible without the coordination.

<sup>46</sup>This example also belongs under (f), since *to what extent* has adjunct function, but *whether* does not: it is purely a marker of subordination and closed interrogative clause type.

It is also possible to coordinate an AdjP, NP, or PP with a non-finite clause:

- [14] i He's [in love and behaving quite irrationally]. [PP + gerund-participial]  
 ii He is [known to have a gun and likely to use it]. [past-participial + AdjP]  
 iii This process [is perfectly natural and to be welcomed]. [AdjP + infinitival]

Example [i] can be expanded to *He's in love and he's behaving quite irrationally*, where the *be* of the second clause marks progressive aspect. Similarly [ii] can be expanded to *He is known to have a gun and he is likely to use it*, where the first clause is passive. And expansion of [iii] gives *This process is perfectly natural and it is to be welcomed*, where the second coordinate contains quasi-modal *be*.<sup>47</sup> The progressive and passive constructions can themselves combine: *He was living in the Latin Quarter and thought to have AIDS*. Mixed coordinations involving non-finites are much less usual than those in [13]: certainly in the case of passives, the version where *be* is repeated will often be preferred or required, as in *He was invited but was unable to accept* or *He was insolent and was dismissed*.

Coordinations like those in [14] are found only with *be*. *Get* can take an adjectival predicative complement (*He got insolent*) and any of the three non-finites (*He got going / sacked / to see it*) but these are all interpreted as different constructions, so that mixed coordinations like *\*He got insolent and sacked* are not acceptable. Similarly *He kept awake* and *He kept listening for her* involve different uses of *keep*, so that we cannot have *\*He kept awake and listening for her*.

#### (b) Other complements, including subject

Where a head element can take different categories as complement (without a change in sense), unlike coordinations are generally possible.

- [15] i a. [The stamp purchases and how the cash float was administered] were the subject of prolonged questioning yesterday.  
 b. It lists [the value of assets and which partner owned them before the marriage].  
 c. He was sure [of himself and where he was going].  
 ii a. I remembered [reading about you in the papers and that you lived here in Wigan].  
 b. We were told [to wait in the terminal and that we would be informed when we could reboard].  
 iii a. They reported [a deep division of opinion between the government and the people and that the African population was almost solid in its opposition to federation].  
 b. After [their rubber plantation failed, and her husband's death on the Upper Rewa in 1885], she maintained her three young children with a tiny store.  
 c. I was planning [a four-month trip across Africa and to then return to England].  
 d. They believe [in the fall of man and original sin and that all mankind is descended from a single couple].  
 e. The University provides a great opportunity [for adventures of the mind and to make friendships that will last a lifetime].  
 f. They want to know [his financial arrangements in Italy and about the people he met there].

<sup>47</sup>Where *be* has a more centrally deontic interpretation, such coordination is not possible: we could not, for example, omit the second *you are* from *You are on duty and you are to remain in the guard-room until relieved*.

The head is an adjective (*sure*) in [ic],<sup>48</sup> a preposition (*after*) in [iiiib], a noun (*opportunity*) in [iiiie], and a verb in the others – with the complement external (i.e. subject) in [ia]. The examples in [i] illustrate what is probably the most common case, coordination of a finite interrogative with an NP; the latter will then often express a ‘concealed question’ (Ch. 11, §5.3), as in [ib] (*the value of assets* = “what the value of assets was”). The coordinations in [ii] are of non-finite and finite clauses; this order is obligatory with gerund-participials and almost so with infinitivals. A sample of other combinations are given in [iii]: NP + declarative clause (with and without *that*), NP + infinitival, PP + declarative clause, PP + infinitival, NP + PP.

### (c) Adjunct

No difficulty arises in coordinating different categories within the adjunct function, including PPs with different kinds of complement (as in [iii] below, where the first PP consists of *because* + clause, the second of *for* + NP):

- [16] i *She did it [slowly and with great care].* [adverb + PP]  
 ii *I’ll do it [tonight or in the morning].* [NP + PP]  
 iii *He’ll reject it [because it’s too long or for some other reason].* [PP + PP]  
 iv *He signed on [to please his wife but with no hope of success].* [clause + PP]

### (d) Modifier in NP structure

The most usual case involves post-head modifiers: PPs, AdjPs, participial clauses, and finite clauses, as in [17i]. Mixed coordinations in pre-head (attributive) modifier position, however, are not common. As illustrated in [17ii], they tend to involve adjectives and nominals belonging within a single semantic set.

- [17] i a. *They still won’t recommend grants for people [over the age of 65 or who have retired].*  
 b. *She won in a match [interrupted by showers but which lasted under an hour].*  
 c. *A man [in singlet and shorts and wearing a green baize apron] finally appeared.*  
 d. *It would be an opportunity to do something [quite new for me and in which I believed much more strongly than in our government’s economic policy].*  
 ii a. *the civic, school, and religious life of the community*  
 b. *the state and federal laws*  
 c. *the Australian and New Zealand flags*  
 d. *in [daily or evening newspapers]*

The nominals *school, state, New Zealand, evening* are used here because there is no corresponding adjective.

A final possibility is the coordination of pre- and post-head modifiers:

- [18] *The demise of the liberals has been [a long and complicated process but which now looks as though it is fairly decisive].*

This construction is comparatively rare: it would be more usual to drop the *but*, expressing the adversative relation between the adjuncts by a connective adjunct such as *however* within the relative clause.

<sup>48</sup>Strictly speaking there is indeterminacy as to whether the coordination is complement of *sure* (with the form PP + clause) or of *of* (with the form NP + clause), for the non-coordinative version could be either *he was sure where he was going* or *He was sure of where he was going*.

## (e) Sentential coordinations

Finally there are coordinations which have no function within a larger construction but constitute a sentence. Mixed coordinations here consist of a fragment and a clause:

- [19] i *Now I can only write, and that only when I get out of pain.*  
 ii *One more remark like that and I'm leaving.*

In [i] *that* is a pro-clause, interpreted anaphorically as “I can write”; [ii] exemplifies the implicit conditional construction discussed in §2.2.3.

## 3.3 Coordination of grammaticised words

We have noted that grammaticised words tend to coordinate less readily than others: in this section we survey the coordination possibilities for the main kinds of grammaticised word.

## (a) Coordinators

The idiom *and/or* is an asyndetic coordination meaning “and or or”:

- [20] a. *They're inviting [Kim and/or Pat].* b. *They're inviting [Kim or Pat].*

We have seen (§2.2.1) that *or* on its own is characteristically associated with an implicature of exclusiveness, so that [b] suggests they're only inviting one of them: *and/or* then serves to block this implicature, explicitly allowing for the situation where they invite both Kim and Pat as well as that where they invite only one.

## (b) Subordinators

The clause subordinators do not normally coordinate: *for* takes a different construction from *that* and *whether*, and the latter two are simply markers of different clause types. *Whether*, however, does coordinate with *not* or with an interrogative phrase in adjunct function:

- [21] i *I don't know [whether or not he saw her].*  
 ii *They must consider [whether and in what circumstances it should be allowed].*

Example [i] is equivalent to *I don't know whether he saw her or not* (where *or* coordinates a clause with a clause fragment), but *whether or not* is probably best handled as a fixed phrase, a subordinator complex. *Whether or no* is sometimes found as a variant. In [ii] we understand “and if so . . .” (*if so* can be added as an adjunct to the second coordinate, but is commonly omitted) – the order is therefore fixed. The likeness here is that both elements are interrogative markers: only the first has a subordinating role.<sup>49</sup> *If* cannot substitute for *whether* in [i], and would be at best unidiomatic in [ii].

## (c) Prepositions

These cover a considerable range on the scale of grammaticisation. At one extreme we have uses where the preposition is fully determined by the head element and hence – in accordance with [1] – cannot coordinate: *I'll give it to Kim; the search for gold; He's intent on revenge*. At the other extreme, numerous alternatives are available and coordination

<sup>49</sup>Because the marking of closed interrogatives is so different in subordinate and main clauses, there is no analogue in main clauses of this kind of coordination: we would have to say *Should it be allowed, and if so in what circumstances?*

is commonplace. This applies particularly in the areas of time and space, as in *before and after*, *above and below*, *at or near*, etc.; it is much more difficult to find plausible coordinations for such items as *although* or *because*, which take clausal complements. Some coordinations have the character of fixed phrases: *if and only if*, *if and when*.<sup>50</sup>

#### (d) Determinatives

Coordination of quantifiers, especially with *or*, occurs freely: *one or two mistakes*, *three or more witnesses*, *little or no money*, *some or all applicants*. The emphatic *each and every* is a fixed phrase.<sup>51</sup> But for the rest, determinative coordinations are comparatively rare, there being a preference for coordinating at NP level: *this copy and those*, for example, is more likely than *this and those copies*.

#### (e) Auxiliaries

Certain coordinations of modals occur very readily: *I can and will finish it*; *He must and will be punished*. Perfect *have* and progressive *be* are unique markers of these constructions and don't coordinate with any other lexemes. Nor can passive *be*, even though *get* is an alternative (non-auxiliary) marker of passive – there is no clear semantic distinction between them to motivate a coordination (*\*He was or got arrested*).

### 3.4 Coordination and genitives

We look first at constructions containing NPs other than personal pronouns, then at coordinations of personal pronouns, and finally at mixed coordinations, i.e. those involving a personal pronoun and an ordinary NP.

#### (a) NPs other than personal pronouns

There are three main types of coordination to distinguish:

- |        |  |  |
|--------|--|--|
| [22] i | [ <i>Kim and Pat</i> ']s children      | [Type I: single genitive]              |
| ii     | [ <i>Kim's and Pat's</i> ] children    | [Type II: direct multiple genitive]    |
| iii    | <i>Kim's</i> children and <i>Pat's</i> | [Type III: indirect multiple genitive] |

In [i] we have Type I, the 'single genitive': there is a single marking of genitive case, applying to the NP-coordination *Kim and Pat* as a whole. In the others, there is multiple marking of genitive case. In [ii] the coordination is between the two genitive NPs themselves, i.e. *Kim's* and *Pat's*: this is Type II, which we will call the 'direct multiple genitive'. In [iii] the coordination is between two NPs that are not themselves genitive but contain genitive determiners, i.e. *Kim's children* and *Pat's* (equivalent to *Pat's children*): this is Type III, the 'indirect multiple genitive'.

Types I and II are not semantically contrastive. Both allow either a joint or a distributive interpretation of the genitive relation. In the joint interpretation of [22i–ii] the matrix NP denotes the set of children who have Kim and Pat as their parents, while in the

<sup>50</sup>This has some affinity with the coordination in [21ii]: in both cases the first coordinate cancels the presupposition normally associated with the second. *I'll do it when he pays me* presupposes that he'll pay me, but *I'll do it if and when he pays me* does not. Similarly, *They must consider in what circumstances it should be allowed* presupposes that there are circumstances where it should be allowed, but [21ii], with *whether*, does not.

<sup>51</sup>Another fixed phrase is *one or other*, a coordination of a determinative and an adjective; it functions as a determiner meaning "either/any".

distributive interpretation it denotes the set consisting of Kim's children and Pat's children. Note, then, that in a context where Kim is married to Pat we can appropriately use either Type I, *Kim and Pat's marriage*, or Type II, *Kim's and Pat's marriage*. Conversely, if Tom is married to Jill and Max is married to Sue, we can refer to the husbands as either *Jill and Sue's husbands* (Type I) or *Jill's and Sue's husbands* (Type II). The Type III construction, however, has only a distributive interpretation: [iii] denotes the set comprising Kim's children and Pat's children.

Two factors affect the choice between Types I and II. First, some speakers generally opt for Type II rather than Type I, at least in the relatively careful use of language, because they take it to be grammatically more 'correct' for an inflectional suffix to attach to single words than to coordinations. Secondly, Type I will often be preferred over Type II when the genitive relation is interpreted jointly, when there is a strong (and relevant) association between the referents of the coordinated NPs. Thus we say *Gilbert and Sullivan's popularity* rather than *Gilbert's and Sullivan's popularity* because we are concerned with them as a team rather than as individuals. This is why the contextualisation of [22] with Kim and Pat as parents of the same children is more salient for [i] than for [ii]. In the Gilbert and Sullivan case this second factor will strongly outweigh the first, whereas in [22] the factors are more evenly balanced, allowing for variation according to formality and speaker. The second factor also explains why a preference for Type I over Type II is more likely with *and* than with *or*: the kind of association relevant here is found only with *and*.<sup>52</sup>

In [22] the coordination is between NPs, but Types I and II are also found with coordination of nominals:

- [23] i *her [mother and father's] letters* [Type I: single genitive]  
 ii *her [mother's and father's] letters* [Type II: direct multiple genitive]

### (b) Genitive pronouns

The pattern with personal pronouns differs in two respects. In the first place, Type I, with a single genitive, is not admissible in the standard language. Secondly, there are two series of genitive pronouns, dependent (*my*, *your*, etc.) and independent (*mine*, *yours*, etc.). This gives two variants of Type II. Compare, then:

- [24] i *\*[you and my] letters* [Type I: single genitive]  
 ii *[your and her] letters* [Type IIA: direct multiple genitive – dependent]  
 iii *yours and hers* [Type IIB: direct multiple genitive – independent]  
 iv *your letters and hers* [Type III: indirect multiple genitive]

With pronouns, the Type II construction hardly allows a joint interpretation. *His and her children*, for example, strongly conveys that the children don't all have the same parents. Similarly *his and her quarrel* could hardly be used to denote a quarrel between him and her.

One common use of Type IIA is in examples like *Everyone must face his or her partner*, where the antecedent is a non-referential NP that is neutral as to sex (see Ch. 5, §17.2.4). Otherwise this construction is felt to be somewhat awkward, and tends to be disfavoured relative to Type III or to a non-coordinative plural genitive: *our/your/their letters*.

<sup>52</sup> Another case where the second factor outweighs the first is that involving measure expressions, as in *a week and a day's delay* ('eight days' delay'): *a week's and a day's delay* denotes two delays, one of a week, the other of a day.

## (c) Mixed coordinations

The possibilities here are as follows:

[25]	PRONOUN FIRST	PRONOUN LAST	
i a.	?[ <i>you and Kim's</i> ] <i>letters</i>	b. *[ <i>Kim and your</i> ] <i>letters</i>	[Type I]
ii a.	[ <i>your and Kim's</i> ] <i>letters</i>	b. [ <i>Kim's and your</i> ] <i>letters</i>	[Type II <sub>A</sub> ]
iii a.	<i>yours and Kim's</i>	b. <i>Kim's and yours</i>	[Type II <sub>B</sub> ]
iv a.	<i>your letters and Kim's</i>	b. <i>Kim's letters and yours</i>	} [Type III]
v a.	<i>yours and Kim's letters</i>	b. [pre-empted by iib]	

Type I is at best very marginal. The version with a genitive pronoun, [ib], is of the same status as [24i], though the construction with an independent pronoun may be slightly better (*These are Kim and yours*). The version with a non-genitive pronoun, [ia], is most acceptable when the second coordinate contains a dependent genitive: *you and your partner's letters*. With pronouns that have distinct nominative and accusative forms, the accusative is clearly non-standard: *me and Kim's letters*. The nominative is inadmissible with a 1st person pronoun, *\*I and my partner's letters*, but perhaps marginally acceptable for some speakers with a 3rd person, *they and their partners' letters*.

Type II is grammatical but again disfavoured relative to Type III or a non-coordinative construction. For Type III there is a variant in which the head noun (*letters*) appears in the second coordinate, as in [va]. An attested example (from an address by a managing director) is *It is mine and the board's responsibility to maximise profits*. The effect is to use an independent form of the pronoun in place of the dependent one that would normally be expected when the head noun comes at the end of the matrix NP, i.e. in place of *my* in *my and the board's responsibility*. There is no counterpart to [va] with the pronoun in final position, since it is only with pronouns that the distinction between independent and dependent genitives applies: *Kim's and your letters* will thus be construed as having the structure indicated in [iib] rather than [*Kim's*] [*and your letters*].

## 3.5 Coordination of clause types

## ■ Coordination of unlike types

Coordinated clauses are usually of the same type, but do not have to be: this is one reason why we take declarative, imperative, etc., to be categories of the clause rather than the sentence. Coordination of unlike types is seen in [26i] (main clauses) and [26ii] (subordinate clauses):

[26] i a.	[ <i>It'll be very hot,</i> ][ <i>so take plenty of drink</i> ].	[declar + impve]
	b. [ <i>They've finished the job,</i> ] [ <i>but why did they take so long?</i> ]	[declar + interrog]
	c. [ <i>Did you make your own contributions to a complying superannuation fund</i> ] [ <i>and your assessable income is less than \$31,000?</i> ]	[interrog + declar]
	d. [ <i>You give the first three lectures</i> ] [ <i>and then I'll take over</i> ].	[impve + declar]
	e. [ <i>Come around six,</i> ][ <i>or is that too early?</i> ]	[impve + interrog]
	f. [ <i>What a disaster it was</i> ][ <i>and yet no-one seemed to mind</i> ].	[exclam + declar]
ii a.	<i>I knew</i> [ <i>that he would come</i> ][ <i>and what he would say</i> ].	[declar + interrog]
	b. <i>I remember</i> [ <i>who was there</i> ][ <i>and what a success it was</i> ].	[interrog + exclam]

With main clauses such mixed coordinations characteristically involve a sequence of separate speech acts (statements, questions, directives, etc.), so that the coordinator will

have wider scope than the illocutionary components. A normal utterance of [ia], for example, consists of a statement (or prediction) followed by a directive. Similarly, in [ib] we have a statement followed by a question, in [if] an exclamatory statement followed by an ordinary statement.

But this is not so in all cases. Most obviously, [26ic] (taken from an income tax form) expresses a single question, not question + statement: this is a rather unusual case where in a coordination of full main clauses a feature of the first coordinate (here the closed interrogative clause type) has semantic scope over the whole coordination.<sup>53</sup> A different case again is seen in [ie]. It is not a matter of a choice between a directive and a question: the question has priority, and only if the answer is negative does the directive stand (“Come around six if that is not too early”).

### ■ Coordinations of like type

An unmixed coordination of main declaratives (*Kim is in Bonn and Pat is too*) can generally be taken as a single statement of a composite proposition, though (at least with *and*) it would make no effective difference if we regarded it as a combination of statements, each of a simple proposition. Analogously for imperatives.

The situation with interrogatives is more complex. *And*, as in *Who is it and what do they want?*, can be taken to join questions, though again this hardly differs from an interpretation as a single composite question (with answers like “It’s Jill and she wants to borrow the saw”). *But* does not normally coordinate main interrogatives (we would not say *Who is it but what do they want?*).<sup>54</sup> With *or* we have several distinct possibilities:

- [27] i *Is it genuine or is it a hoax?* [alternative Q]  
 ii *Have you moved or are you about to move?* [alternative or polar Q]  
 iii *Either can you eat it or have I got one?* [two polar questions]

Example [i] is a single question, with *or* marking it as of the alternative kind: the answers are “It is genuine” and “It is a hoax”. Example [ii], discussed in Ch. 10, §4.4, could also be an alternative question, asking whether your move has already taken place or is imminent. But it can also be a single polar question, asked for example in order to find out whether the writer’s record of your address needs changing: here the answers are “Yes, I have moved or am about to move” and “No, I have not moved nor am I about to move”. This is comparable to [26ic], for in both of them the whole coordination expresses a single polar question, but whereas with *and* the second clause is declarative, with *or* it has to be interrogative. Example [27iii] is a coordination of questions: much less usual, but possible in a context where, for example, I am trying to solve a puzzle and say, *Give me a clue by answering one of the following questions: Either can . . .* The *either* in [iii] makes explicit that the coordination has wide scope, i.e. that it is a coordination of questions. It could not appear at the beginning of [i–ii], where the coordination has narrow scope (coordination within a question). This scope factor accounts for the

<sup>53</sup>The same applies in informal speech in examples like *Did he come in and I was still asleep?* (= [30ii] of §2), or *How could you have been so spiteful, and her your best friend?* (where the second clause is verbless, and is interpreted as “given that she was your best friend”). A further case where an element in the first coordinate may have scope over the second is seen in *It might be up there and I can’t see it*: here *might* has wide scope, the meaning being “it might be that it is up there and I can’t see it”.

<sup>54</sup>Exceptions arise when one of the interrogatives is used as an indirect statement: *Isn’t it a bargain, but where could we put it?*

fact noted earlier (§2.3) that *either* can never correlate with the *or* of an alternative question.<sup>55</sup>

### 3.6 Level of coordination

#### ■ Equivalence at different levels

It is an important property of coordination, we have noted, that it can occur at almost any place in constituent structure. As a result, we have equivalences such as those shown in:

- [28] i *They shot her father and they shot her mother.* [clauses]  
 ii *They shot her father and shot her mother.* [VPs]  
 iii *They shot her father and her mother.* [NPs]  
 iv *They shot her father and mother.* [nouns]

(Coordinations at different levels may differ in meaning in ways described in §1.3: we will not be concerned with those differences in the present section.) The lower the level, the less repetition there is; but the most economical version, the one with the coordination at the lowest level, is not always the preferred one.

In general, lower-level coordination tends to suggest a closer association between the coordinates than higher-level coordination. Given that there is a very close association between one's father and one's mother, the word-level coordination in *They shot her father and mother* is perfectly natural; in the absence of special contextual factors, however, there is no similarly close association between one's father and one's solicitor, and hence one would be more likely to say *She was accompanied by her father and her solicitor*, with the coordination at phrase level, than ... *by her father and solicitor*. Compare, similarly, *I need a shirt and tie* (strong association: coordination of nouns) and *I need a diary and a calculator* (weaker association: coordination of phrases). Or again: *my friend and colleague* (a single person) and *my boss and my secretary* (different people).

We have also noted that determinatives tend not to coordinate readily, with a higher-level coordination preferred in cases like *this copy and those*. Similarly, while *be* allows mixed coordinations as complement, a version where *be* is repeated will often be preferred or required when non-finites are involved, as in *He was insolent and was dismissed*.

#### Number constraints on coordination of nouns

In NP structure certain determiners are sensitive to the number of the head, as described in Ch. 5, §3.4. The demonstratives **this** and **that** agree with the head, and determiners such as *a*, *one*, *each* select singular heads, while *many*, *several*, *two*, etc., select plurals. Coordinations of nouns (or nominals) in head function are subject to various constraints illustrated in:

- [29] i a. \**these elephant and giraffe*                      b. \**two elephant and giraffe*  
 ii a. *this cup and saucer*                                b. *alone cup and saucer*  
 iii a. \**this elephant and giraffe*                      b. #*an/one elephant and giraffe*

The examples in [i] demonstrate that a coordination of singulars does not count syntactically as plural, and hence cannot combine with a plural demonstrative or a determiner

<sup>55</sup>In the case of [27ii] it is marginally possible to have *either* to the right of its basic position before the first coordinate, as in *Have you either moved or are you about to move?*

that selects a plural head. Such a coordination can combine with a singular demonstrative or a determiner selecting a singular head if there is a close association between the coordinates, as in [ii]. Thus a cup and a saucer can be conceptualised as a unit, but this would not normally be possible with an elephant and a giraffe. Instead of [iii], therefore, we would normally have coordination at the NP level, with separate determiners: *this elephant and this giraffe*, and so on. Note, moreover, that whatever the determiner, a singular cannot coordinate with a plural at the word level: *the women and the man*, not *\*the women and man*.<sup>56</sup>

### The dissociating effect of higher-level coordination

When the close association factor could be expected to sanction a lower-level coordination, use of a higher-level one may serve to separate, to partially dissociate the coordinates. Compare:

- [30] i *He had dinner and watched TV.* [VP-coordination]  
 ii *He had dinner and he watched TV.* [clause-coordination]

In [i] we have a common sequence of events, whereas in [ii] we might be listing more sharply distinguished events, and it does not convey as strongly as [i] that the events took place in the order in which they are expressed.

### ■ Coordination at unlike levels

We also find examples where the coordinates are at different levels in the hierarchy:

- [31] i *If you are homeless, an orphan, a refugee in State care or your parents can't provide you with a home, care or support, you can get Austudy from the minimum school leaving age.*  
 ii *He was middle-aged, of sallow complexion and had penetrating blue eyes.*  
 iii *He reads widely, has a questioning mind and he's very mature for his years.*  
 iv *He had read the report, discussed it with colleagues and was now drafting a reply.*

In [i] the first three coordinates are phrases, each of which could occur as predicative complement to *be*, while the final coordinate is a clause. In [ii] the first two coordinates are phrases within a VP while the third is a full VP. In [iii] the first two are VPs, the third a clause. And in [iv] the first two are past-participials dependent on perfect *have*, while the third is a finite VP. The status of such examples is somewhat uncertain. They are more likely to be found in casual speech than in more carefully monitored speech or writing – but they do occur in the latter, as evident from [i], taken from an Australian Government document on its tertiary education allowance.

The examples in [31] cannot be described directly in terms of the structures outlined in §1, for the underlined expressions do not combine into a constituent with a definable function. If they are to be regarded as grammatical and given an analysis, we will need to treat the coordination as being at the level of the final coordinate, with ellipsis of elements at the beginning of the medial coordinates. Thus [ii], for example, would be a case of VP-coordination, with the second coordinate, *of sallow complexion*, having ellipsis

<sup>56</sup>Where a numeral higher than *three* combines with a noun-coordination the generally preferred interpretation is that where it applies to the coordinates jointly. Thus *ten elephants and giraffes* is most likely to be interpreted as denoting a set of ten animals in all. But a distributive interpretation (“ten elephants and ten giraffes”) cannot be excluded.

of the verb *was*. This would put them in the category of non-basic coordination, to be discussed in the next section, but given their marginal status we will not consider them any further.

#### 4 Non-basic coordination

So far we have focused on what we will now call **basic coordination**, in contrast to various more complex constructions, **non-basic coordination**, to which we now turn.

Basic coordination is illustrated in [1], and has the three properties summarised in [2]:

[1] [*Sue and her brother*] *live in Paris*.

- [2] i Bare coordinates are normal constituents. That is, they can appear as constituents in corresponding non-coordinative constructions: *Sue lives in Paris*; *Her brother lives in Paris*.<sup>57</sup>
- ii Coordinates appear in succession. In [1], for example, the second coordinate, including its marker *and*, immediately follows the first.
- iii Bare coordinates appear alone or in combination with a marker. In [1] *Sue* stands on its own, while *her brother* is marked by *and*.

Non-basic coordination lacks one or more of these properties. We have already noted in connection with [2iii] that a coordinate can be expanded by a modifier as well as (or instead of) a coordinator, as in *Jill and her brother too live in Paris*: we look at this kind of expansion first, and then turn to various constructions differing from basic coordination in respect of properties [i] or [ii].

##### 4.1 Expansion of coordinates by modifiers (*the guests and indeed his family too*)

In this construction an expanded coordinate contains one or more modifiers in addition to the bare coordinate and the marker (coordinator) if present:

- [3] i *He offended [the guests and indeed his family too]*. [expansion by modifier]  
 ii *He offended [the guests and his family]*. [basic NP-coordination]

The second coordinate in [i] consists of *his family* as bare coordinate, *and* as marker, and *indeed* and *too* as modifiers – see [9] of §1 for a tree diagram.

##### ■ Distinct constructions only with lower-level coordinates

Expansion by a modifier does not yield a special coordination construction with main clause coordinates (or their VPs). For here comparable modifiers have a place in the structure that is quite independent of coordination:

- [4] i *He offended the guests and indeed he offended his family too*.  
 ii *He offended the guests. Indeed he offended his family too*.

<sup>57</sup>We have noted that in a joint coordination like *Sue and her husband are a happy couple* there are no non-coordinative counterparts, but the coordinates here can still be regarded as normal constituents in that their status as constituents elsewhere (e.g. in *Her husband is happy*) is quite unproblematic.

There is no coordination in [ii], but the modifiers *indeed* and *too* have the same function here as in [i]. For this reason we treat them as belonging within the bare coordinate in [i], so that [i] will be simply an instance of basic coordination of clauses.<sup>58</sup> Note that with a subordinate clause, by contrast, the modifier can be clearly outside the bare coordinate: *I can't recall any task which at first seemed so simple and yet which subsequently proved so troublesome.*

### ■ Types of modifier

The central type of modifier in this construction is one which reinforces the relation expressed by the coordinator, including as a special case negative *not* as modifier to the first term in a *but*-coordination:

- [5] i *She had read the report and taken notes too.*  
 ii *It must have been a rat or else a very large mouse.*  
 iii *I want it not next week but now.*

These include additive focusing adverbs, as discussed in Ch. 6, §7.3. Others of this kind include *also*, *as well*, *in addition* (with *and* or *but*), *alternatively* (with *or*), *rather* (with *but*). Also common are various connective modifiers such as *consequently*, *by contrast*, *of course*, *on the one hand*, and modifiers expressing epistemic modality such as *perhaps*, *probably*, *certainly*, *obviously*, *no doubt* (cf. *They're inviting Jill and probably her husband as well*).

Similar to this construction is one where a coordinate is anchor to a supplement (cf. §5 below), as in *It had been affected by both the inflation rate and, more recently, devaluation.*

## 4.2 Gapped coordination (*Kim is an engineer and Pat a barrister*)

Gapped coordinates are structurally incomplete clauses: the predicator is omitted, so that there is a gap in the middle of the clause. Compare:

- [6] i *Kim is an engineer and Pat is a barrister.* [basic coordination]  
 ii *Kim is an engineer and Pat \_\_ a barrister.* [gapped coordination]

The gap, marked in [ii] by ‘\_\_’, is interpreted anaphorically from the underlined antecedent in the first clause. Usually a gapped coordination is semantically equivalent to a basic coordination in which there is repetition rather than a gap,<sup>59</sup> as [ii] here is equivalent to [i]. Gapping is possible only when the coordinates have parallel structures: the gap is flanked by elements which match elements of like function flanking the antecedent. In [ii], for example, *Pat* matches the subject *Kim* and *a barrister* matches the predicative complement *an engineer*. In multiple coordination all the coordinates after the first can be gapped: *Kim is an engineer, Pat \_\_ a barrister, and Alex \_\_ a doctor.*<sup>60</sup>

<sup>58</sup>An exception is *else*: even with clauses this does not normally occur except with *or* and hence should be treated as expanding the coordinate.

<sup>59</sup>The repetition need not be exact, since agreement features are irrelevant: the basic counterpart of *Kim is an engineer and the two boys \_\_ doctors* will have *are*, not *is*.

<sup>60</sup>The term ‘gapping’ is taken from formal grammar; there is no established term in traditional grammar for this construction. It should be emphasised, however, that there are numerous constructions that we analyse in terms of a gap, and the term ‘gapping’ or ‘gapped coordination’ applies only to the one discussed in this section.

In the simplest case the gap has just the predicator of the first clause as antecedent, and is flanked on the left by the subject and on the right by a single element (complement or adjunct). In [6ii] the right element is a predicative complement, while in [7i–ii] it is object and adjunct respectively:

- [7] i *Their daughter studied law, their son \_\_ medicine.* [subject \_\_ object]  
 ii *The PM arrived at six and the Queen \_\_ an hour later.* [subject \_\_ adjunct]

The gap in combination with the structural parallelism serves to tie the clauses together, so that *and* is more readily omitted than in basic coordination – compare [7i] with *Their daughter studied law, their son studied medicine*, where in speech it would be more difficult to decide whether we have asyndetic coordination or simply a sequence of two sentences.

### ■ More complex cases of gapping

Consider now the possible extensions of this elementary type of gapping.

#### (a) The antecedent may be a sequence of elements

- [8] i *Jill came to Fiji in 1967 and her parents \_\_ the following year.*  
 ii *Their daughter was studying law, their son \_\_ medicine.*  
 iii *Kim expects to get a credit, Pat \_\_ only a pass.*  
 iv *His father wanted him to marry Sue, but his mother \_\_ Louise.*

This is particularly common in the catenative construction: the antecedent contains a verb – either an auxiliary (e.g. progressive *be* in [ii]) or a lexical verb (e.g. *expect* and *want* in [iii–iv]) – that takes a non-finite complement. It is possible for the whole of the non-finite complement to be included within the antecedent (*Ed wanted to join the firm because of the pay, Bill \_\_ because his girlfriend worked there*), but more often only part of it is, as in the above examples, and this then means that the antecedent does not form a constituent: in [iv], for example, *wanted him to marry* is clearly not a constituent, for in constituent structure *to marry* combines first with *Sue*.<sup>61</sup>

One limitation is that the antecedent cannot end with a preposition or infinitival *to*, so that the underlined items cannot be omitted in [9] even though they appear in the first clause too:

- [9] i *I went by car and Bill \_\_ by bus.*  
 ii *Kim was hoping to go to university and Pat \_\_ to join the family business.*

#### (b) A gapped coordinate need not contain a subject

We distinguish two cases of gapped clauses with no subject:

- [10] i *On Monday she'd been in Paris and on Tuesday \_\_ in Bonn.*  
 ii *Always do it with your left hand, never \_\_ with your right.*

In [i] the subject (*she*) is part of the antecedent; this is possible only when the subject is preceded by another clause element. In this example the element preceding the subject is an adjunct, but it could also be a complement: *Some of them she cut with an ordinary knife, the others \_\_ with a razor-blade*. In [ii] there is no subject in the gapped clause because the coordination is of subjectless clauses, imperatives. But we again have a

<sup>61</sup>It is possible, though considerably less usual, for the catenative verb alone to be the antecedent, and again this applies whether it is an auxiliary or a lexical verb: *Kim will lead the party and Pat bring up the rear; One was reading, the other \_\_ watching television; Two of them intended to go to university, and one \_\_ to join the army.*

pre-verbal element (here the modifier *never*) so that the gap is still medial, flanked on both sides by contrasting elements.

(c) The antecedent may be non-verbal

This very rare case is found with a verbless complement of *with*:

- [11] *With [Jill intent on resigning and Pat \_\_ on following her example], we look like losing our two best designers.*

(d) The gap may be followed by two elements

It is possible, but rare, to have more than one element after the gap – e.g. object + adjunct:

- [12] *Ed had given me earrings for Christmas and Bob \_\_ a necklace for my birthday.*

(e) There may be two gaps rather than one

- [13] i *One had treated his whole family appallingly, the other \_\_ only his wife \_\_.*  
 ii *I wanted the Italian to win, my wife \_\_ the Italian \_\_.*  
 iii *Too few fathers had been rostered for Saturday and \_\_ mothers \_\_ for Sunday.*  
 iv *His criticisms of Kim were inaccurate and \_\_ of Pat \_\_ irrelevant.*  
 v *Max hadn't finished his assignment, nor \_\_ Jill \_\_ hers.*

In [i] we interpret the gapped coordinate as “the other had treated only his wife appallingly”; this sense of *treat* requires a manner dependent, so the antecedent must be the discontinuous sequence *had treated . . . appallingly*. In [ii] we understand “my wife wanted the Italian to win”: we reconstruct both the main predicator and the infinitival complement following the object. In [iii] the determiner element in the subject, *too few*, is carried over as well as the verbal sequence *had been rostered*; note that the omission of the determiner (creating a secondary gap) is possible only in combination with the primary gapping of the predicator – we can’t say *\*Too few fathers had been rostered for Saturday and \_\_ mothers had volunteered for Sunday*. Secondary gapping of this kind is extremely restricted: it would hardly be possible, for example, if we replaced *too few* by *all the* or *five*. In [iv] the first part of the subject is likewise missing, this time determiner + head. Finally [v] could be expanded as *nor had Jill finished hers*, where *nor* triggers subject–auxiliary inversion, separating the auxiliary *had* from the past participle *finished*.

(f) Exceptionally, the gap may be in final position

- [14] *In most households the adults make these decisions, but in ours the kids \_\_.*

This possibility reflects the fact that the basic position for the adjuncts *in most households*, *in ours* is after the object: in the version without fronting of the adjuncts the gap will be in its normal medial position (*The adults make these decisions in most households, but the kids \_\_ in ours*).

## ■ Case

The case of a subject pronoun in a gapped clause may be either nominative or accusative: *Kim took the upper route, I/me \_\_ the lower one*. This is in accordance with the general rules for case assignment, which in a finite clause require a nominative when there is an overt verb but allow either case elsewhere, with the nominative representing the more formal alternant (see Ch. 5, §16.2.1). However, when a gapped clause consists of a subject pronoun followed by an object pronoun, an accusative subject is appreciably less

acceptable: *Max loathed the Smiths and they/²them \_\_ him*; informal style would tend to avoid the gapped construction here.

### ■ Possible non-equivalence with basic coordination

In all the examples so far the gapped coordination has been semantically equivalent to the corresponding basic coordination, as noted for [6]. But such an equivalence does not always hold:

- [15] i a. *Kim can't have a new bicycle and Pat \_\_ just a t-shirt.* } [a≠b]  
       b. *Kim can't have a new bicycle and Pat can't have just a t-shirt.* }  
       ii a. *Kim wasn't at work on Monday or Pat \_\_ on Tuesday.* } [a≠b]  
        b. *Kim wasn't at work on Monday or Pat wasn't at work on Tuesday.* }

A context for [i] might be a discussion between parents concerning possible presents for their children. We interpret [ia] as something like “We can’t allow/accept a situation where Kim has a new bicycle and Pat has just a t-shirt”; semantically there is just one “can’t” but it applies to the composite situation in which Kim and Pat are treated so differently, Kim receiving a new bicycle, Pat just a t-shirt. Here, then, *can't* has scope over the coordination. In [ib], however, it does not, for this time “can’t” appears twice, applying separately and independently to the two simple situations. A plausible response to [ia] might be *OK, let's give them both a new bicycle*, but this would be incoherent as a response to [ib], because [ib] rules out giving a new bicycle to Kim. The difference in [ii] is likewise a matter of scope. The meaning of [iia] is “It is not the case that Kim was at work on Monday or that Pat was at work on Tuesday”. Semantically we again have just one negative here, with scope over the whole coordination. We have noted that “not A-or-B” is equivalent to “not-A and not-B” (*I didn't like his father or mother = I didn't like his father and I didn't like his mother*), and the same applies here, so that [iia] is equivalent not to [iib] but to *Kim wasn't at work on Monday and Pat wasn't at work on Tuesday*. Example [iia] says there were two absences, while [iib] implicates that there was just one.

### ■ Analysis

On the basis of the simple examples with which we began it is tempting to analyse gapped coordination in terms of the deletion of repeated material, but [15] shows that a syntactic analysis of this kind is not satisfactory. We must accept that the syntactic structure of the gapped coordinate is simply fragmentary (e.g. subject + predicative complement for [6ii]); the context enables us to derive a semantic interpretation, but this may be a more complex matter than just filling in missing words.

It was with such examples as [15ia/iia] in mind that we defined clausal coordination in §1.3.1 as coordination of **full** main clauses. This puts gapped coordination with subclausal coordination: it belongs here because, as in more central cases, the coordinator may fall within the scope of a preceding element.

### ■ Gapping in non-coordinative constructions

In general, gapping is not found with subordination: *\*I will help you if you \_\_ me*; *\*Jill danced with Max because Liz \_\_ with his brother*. There are, however, some exceptions, notably comparatives (which in other respects too have a good deal in common with coordinative constructions): *Max loved Jill more than she \_\_ him*, or *I wanted the Indian to win as much as my wife \_\_ the Italian \_\_* (cf. [13ii]). The comparative and coordination

cases are not entirely parallel, however, for they behave differently with respect to negation. In *Max didn't love Jill as much as she \_\_ him*, for example, we interpret the gap as “loved”, not “didn't love”, but we could not similarly leave out *loved* in *Max didn't love Jill but she loved him*.

#### 4.3 Right nonce-constituent coordination (*I gave \$10 to Kim and \$5 to Pat*)

This is coordination of sequences that do not form syntactic constituents elsewhere, e.g. in corresponding basic coordination:

- [16] i *I gave \$10 to Kim and I gave \$5 to Pat.* [basic coordination]  
 ii *I gave \$10 to Kim and \$5 to Pat.* [nonce-constituent coordination]

In [i] *\$10* and *to Kim* do not go together to form a constituent as they are separate complements of *give*, and likewise for *\$5* and *to Pat*; yet in [ii] these sequences *\$10 to Kim* and *\$5 to Pat* form the bare coordinates, and by virtue of that they are constituents. The term ‘nonce-constituent’ is intended to convey, therefore, that constituent status is conferred on the sequence simply by the coordination relation – they are constituents for the nonce, as it were, just by virtue of the coordination.<sup>62</sup> And we call it ‘right’ nonce-constituent coordination because the coordinates follow the head element on which the components are dependent, in this case *give*.

##### ■ The structural parallelism requirement

The coordinated sequences are required to be parallel in structure. In [16ii], for example, each consists of a direct object followed by a *to* phrase complement. Further examples meeting this requirement are given in [17i], including one that has three elements within each coordinate, and [17ii] illustrates the deviance that results when the coordinates are not parallel:

- [17] i a. *We persuaded one of them to cycle and the others to catch a bus.*  
 b. *It was criticised by some for being too short, by others for being too long.*  
 c. *Ted considered Kim too young and Pat too earnest.*  
 d. *Jill bought Kim a t-shirt and Pat some shorts.*  
 e. *I sent Ed a letter on Monday and Sue a postcard on Friday.*  
 ii a. \**In the afternoon I wrote a report and my wife a letter.*  
 b. \**He blamed his wife for the debts and the untidy state of the house on the boys.*

Examples [ic–e] are in fact ambiguous between this construction and gapping (where the meaning would be “. . . and Pat considered Kim too earnest”, etc., but the right nonce-constituent reading is generally much more likely in such cases.<sup>63</sup> Similarly [iia] is grammatical as an instance of gapping (“. . . and my wife wrote a letter”): the asterisk indicates that it can't be a case of right nonce-constituent coordination. This is because the two coordinates are not structurally alike or parallel: the first contains just a single element (direct object) while the second contains two (indirect object + direct object). In

<sup>62</sup>Precisely because these sequences are constituents of the coordination construction we prefer ‘nonce-constituent’ to the more usual term in formal grammar, ‘non-constituent coordination’.

<sup>63</sup>This is where the NPs are all of the same type: in *Some of them considered me too young and others too old*, where *others* contrasts more naturally with *some of them* than with *me*, it is the gapped coordination reading that is more salient.

[iib] both coordinates contain two elements, but they reflect different complementation patterns for *blame*: ‘*blame X for Y*’ and ‘*blame Y on X*’.<sup>64</sup>

### ■ Right nonce-constituent coordination in NP structure

Unlike gapping, the present construction is not restricted to clause structure, but is found also in NPs:

[18] *She’s read [the lectures on Goethe by Dr Smith and on Schiller by Dr Jones].*

### ■ Possible non-equivalence with basic coordination

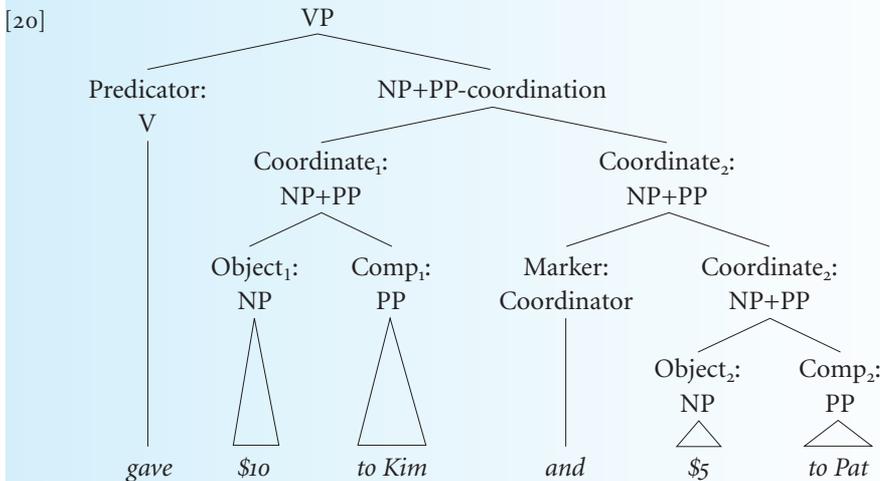

As with gapping, this construction is usually equivalent to corresponding basic coordination (as [16ii] is equivalent to [16i]), but it is not invariably so. The following examples of non-equivalence are of the same kind as those given in [15]:

- [19] i a. *I can’t give a new bicycle to Kim and just a t-shirt to Pat.* } [a≠b]  
 b. *I can’t give a new bicycle to Kim and I can’t give just a t-shirt to Pat.*  
 ii a. *He said nothing to Kim about Pat or to Pat about Kim.* } [a≠b]  
 b. *He said nothing to Kim about Pat or he said nothing to Pat about Kim.*

In [ia] a single composite situation is excluded, the one where I give a new bicycle to Kim and just a t-shirt to Pat, whereas [ib] excludes the two simple situations separately. In [ia] *and* has narrow scope relative to *can’t*, whereas in [ib] *and* has wide scope. Similarly in [iia] the negative *nothing* has scope over *or*, and hence (by the equivalence of “not A-or-B” to “not-A and not-B”) the sentence can be paraphrased not as [iib], but as *He said nothing to Kim about Pat and he said nothing to Pat about Kim*.

### ■ Analysis

In view of the non-equivalence shown in [19], it would not be satisfactory to derive the right nonce-constituent construction from basic coordination by deletion of repeated material. Instead we propose an analysis along the lines shown in [20], a simplified representation of the structure of the VP in [16ii].

<sup>64</sup>Some speakers find acceptable such examples as *He left his daughter \$20,000 and half that amount to each of his grandchildren*; it is certainly better than [17iib] and also than the opposite breach of parallelism seen in *\*He left \$20,000 to his daughter and each of his grandchildren half that amount*.

The notation ‘NP + PP’ means a sequence of NP followed by PP. The sequence *\$10 to Kim and \$5 to Pat* is a coordination of such sequences, but no function is assigned to it: it is only the smaller elements *\$10*, *\$5*, *to Kim*, and *to Pat* that can be assigned clause-level functions, direct object for the first two, prepositional complement for the others.

Further evidence for saying that the first coordinate is the sequence *\$10 to Kim* (rather than *I gave \$10 to Kim* or *gave \$10 to Kim*) is that it can be marked by correlative *both*: *I gave both \$10 to Kim and \$5 to Pat.*<sup>65</sup>

#### 4.4 Delayed right constituent coordination (*knew of but never mentioned my work*)

In this construction the constituent which in basic coordination would appear as the rightmost element of the first coordinate is held back until after the final coordinate:

- [21] i *She knew of my other work but never mentioned it.* [basic coordination]  
 ii *She knew of but never mentioned my other work.* [delayed right constituent]

In general, the effect is to heighten the contrast between the coordinates by removing from them material that would be the same in each. But the construction is appreciably more difficult to process than basic coordination, both for the addressee, who has to hold the first coordinate in mind until the sense is completed at the end, and for the speaker, who has to plan ahead to ensure that each coordinate ends in a way that syntactically allows completion by the delayed element – as *knew of* and *never mentioned* both allow completion by an NP complement.<sup>66</sup> Characteristically, there is a prosodic break after the final coordinate, signalling that the element that follows relates to the whole coordination, not just to the final coordinate.

#### ■ Range of uses

We illustrate here a sample of the main types of coordination where a right constituent is delayed in this way.<sup>67</sup>

##### (a) Heads taking different complementation

Probably the most common case is where the heads of the coordinates differ in the syntactic complements they take. Example [21ii] is of this kind: *know* (in the sense intended) takes an *of* PP, while *mention* takes an NP object. Other examples are seen in:

- [22] i *I'm interested in but rather apprehensive about their new proposal.*  
 ii *He ought to, but probably won't, make a public apology.*

<sup>65</sup> One type of example that does not readily fit into the structure shown in [20] is *We'll be in Paris for a week and Bonn for three days*. The complication here is that *for a week* is a clause-level function (adjunct of duration), but *Paris* is not – it is the complement of the preposition *in*. The best solution is probably to treat *in* as part of the coordination; we will then have a PP+PP-coordination, with ellipsis of *in* in the second coordinate.

<sup>66</sup> Examples are found where this condition is not satisfied. One case is illustrated in *I always have and always will value her advice*, where the plain form *value* is an admissible continuation of *will* but not of *have*: compare basic *I have always valued her advice and always will value it*. Another involves coordination of comparisons of equality and inequality: *It's as good or better than the official version*, where *as good* takes a complement headed by *as* not *than*. Such examples are not fully grammatical and would generally be avoided in monitored speech and writing; the second can be corrected to *It's as good as or better than the official version*.

<sup>67</sup> We focus on cases where the delayed element is a single constituent; occasional examples are found where what follows the coordination is not a single constituent but a sequence: *It had to be ascertained whether the managers had suitable people to put forward for possible appointment from persons [registered with, or applying to, them for employment]*.

In [i] the heads *interested* and *apprehensive* take different prepositions, *in* and *about*. In [ii] *ought* and *will* take different kinds of infinitival complement, with *to* appearing only with *ought*.

#### (b) Contrasts of time or modality

A second pattern has the same verb in each coordinate but with differences expressing such concepts as time or modality:

- [23] i *She was then, is now, and always will be, devoted to the cause of peace.*  
 ii *They regarded him, or appeared to regard him, as a complete liability.*

#### (c) Pairing of lexically simple and lexically complex coordinates

- [24] i *He had either telephoned or written a letter to his son's boss.*  
 ii *You should welcome, not take offence at, the suggestions they make.*  
 iii *He was accused but found not guilty of stalking a woman for seven years.*

The first coordinates here are simple verbs, while the final ones are complex expressions: [ii] illustrates the fairly common case where one or more of the coordinates in this construction is a verbal idiom of the kind considered in Ch. 4, §6.4.

#### (d) Contrasting sequences of pre-head dependents in NP structure

- [25] i *They have [five new and two second-hand copies of his novel].*  
 ii *[Neither the American nor the Russian people] want war.*

In [i] both dependents in the coordinated sequences contrast, whereas in [ii] only the second does. The repetition of *the* in [ii] is motivated by *neither* which could not occur between *the* and *American*, but such repetition is not restricted to cases where it is syntactically or semantically required: *He was comparing the American and the Russian versions.*

#### (e) Contrasting pairs of subject and verb

- [26] *Kim may accept, but Pat will certainly reject, the management's new proposal.*

### ■ Construction not confined to coordination

Delayed right constituents occur predominantly in coordination, but they are found in some subordinative constructions too:

- [27] i *I enjoyed, although everyone else seemed to find fault with, her new novel.*  
 ii *Those who voted against far outnumbered those who voted for my father's motion.*

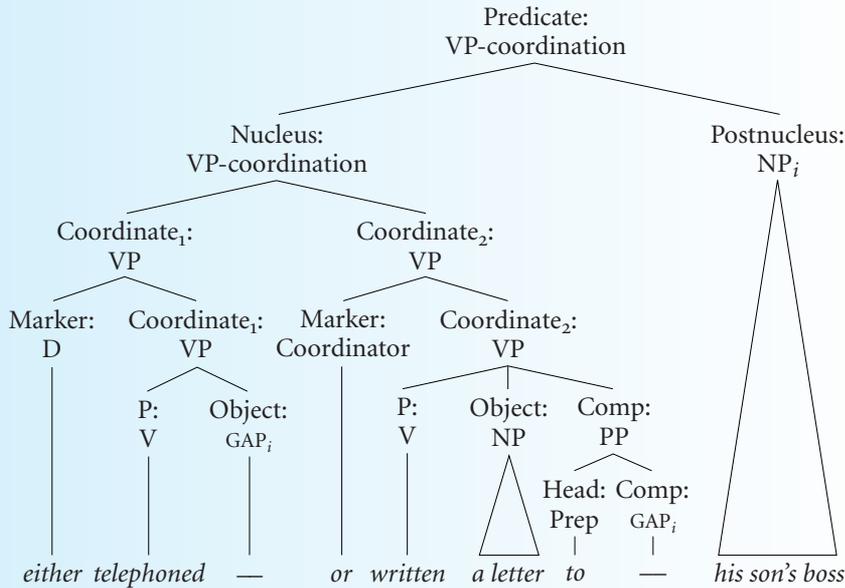

These most closely resemble case (e) above in that the contrasting sequences (shown by underlining) that could combine with the delayed right constituent contain a subject: *I* vs *everyone else* in [i], and *who* in [ii].

### ■ Analysis

In some cases the present construction looks like the mirror image of right nonce-constituent coordination: compare *five new and two second-hand copies* with *gave \$10 to Kim and \$5 to Pat*, and so on. But there are two important differences. One is the point just noted, that a delayed right constituent can occur in subordination. The other is that the present construction does not require the parallelism that is found with right nonce-constituent coordination. In [24i], for example, the coordinates are *telephoned* and *written a letter to*, which are quite different in their internal structure.

One possible analysis is to take the right constituent as being related to the coordinates, in a way analogous to that in which a relative pronoun is related to a relative clause (and similarly in other unbounded dependency constructions: cf. Ch. 12, §7): [24i] might then be compared to *his son's boss whom he had either telephoned or written a letter to*. Applying this idea to [24i] gives a structure along the lines of [28]:

[28]

Both coordinates contain a gap co-indexed with the NP in postnuclear position, just as in the relative construction they will be co-indexed with the relative pronoun. The difference is that in the relative construction there may be, and most often is, only one gap (cf. *everyone whom he had telephoned*): the delayed right constituent, by contrast, is found only with gaps in two or more matching sequences, usually coordinate.

No functional label other than ‘postnucleus’ is assigned directly in [28] to the delayed right constituent. However (like the relative pronoun) it is understood as inheriting the functions in the coordinates of the gaps with which it is co-indexed. This caters for the case, illustrated in this example, where the delayed element is understood as having different functions in the coordinates: *his son's boss* is here understood as object of *telephoned* and complement of the preposition *to*. We leave open the question of whether this kind of structure is appropriate to all cases of delayed right constituents – in particular, those where there is no prosodic break before the final element, and where it can be an unstressed personal pronoun, as in *He's as old as or older than me*.

#### 4.5 End-attachment coordination (*They had found Kim guilty, but not Pat*)

A subclausal coordinate may be attached at the end of a construction, following a clause; it may, but need not, have the informational status of an afterthought, in which case

it has the status of a supplement. Two subtypes can be distinguished, as illustrated in [29ia/iiia]:

- [29] i a. *They had found Kim guilty of perjury but not Pat.* [postposing of coordinate]  
 b. *They had found Kim but not Pat guilty of perjury.* [basic coordination]  
 ii a. *I spoke to her, but only briefly.* [addition of new element]  
 b. *I spoke to her only briefly.* [single clause]

One subtype we call ‘postposing of coordinate’: here the attached element is in a coordinative relation to a non-adjacent element in the preceding clause, as *but not Pat* in [ia] is coordinate with *Kim*. Usually there is an equivalent basic coordination in which the coordinates are adjacent, as in [ib]; the second coordinate of [ia] can thus be thought of as ‘postposed’ in that it occurs to the right of its basic position.

In the second subtype, ‘addition of a new element’, we could drop the coordinator and integrate what follows it into the preceding clause, yielding a non-coordinative construction, as in [29ii]. The difference between [a] and [b] here is that the attached coordinate construction divides the overall message into two separate units of information, and thereby gives increased prominence to the added element; with *but* as coordinator there is also the adversative meaning discussed in §2.5.

### ■ Postposing of coordinate

This construction allows either *and* or *or* as coordinator, as well as *but*:

- [30] i *Jill has been charged with perjury, and her secretary too.*  
 ii *Jill must have told them, or else her secretary.*

Note that where the basic position is within the subject, postposing has an effect on subject–verb agreement: in [i], for example, *has* agrees with *Jill* (compare *Jill and her secretary too have been charged . . .*). A special case of *or* is in questions, where we note that *Did Jill tell you that, or her secretary?* exhibits the same ambiguity as the basic coordination *Did Jill or her secretary tell you that?* It can be either an alternative question (“Which of them told you?”) or a polar one (“Did one or other of them tell you?”), again with a clear intonational difference between the readings (Ch. 10, §4.4); note here that in the alternative interpretation the appended element wouldn’t normally be an afterthought.

As with several of the other constructions considered in this section, factors such as negation may result in a difference of meaning between basic and non-basic coordination:

- [31] i *Jill or her secretary hadn’t complied with the regulations.*  
 ii *Jill hadn’t complied with the regulations – or her secretary.*

Example [i] says that one or other of them hadn’t complied with the regulations; this is a possible meaning of [ii] (with unstressed *or*), but in a more likely interpretation (with stressed *or*) it says that neither had. *Or* is outside the scope of the negation in [i], where *or* comes before *hadn’t*, but potentially inside the scope of the negative in [ii], where their order is reversed.

### ■ Analysis

A major difference between this postposing of coordinate construction and basic coordination is that the coordinates do not combine into a syntactic constituent: in [29ib] the NP-coordination *Kim but not Pat* forms a constituent functioning as object, but in [ia] there is no such constituent. In the postposing construction the coordinative relationship

is simply marked **linearly** by *but*: as far as the hierarchical constituent structure is concerned *but not Pat* is attached as an NP at the end of the clause and can be assigned the function ‘coordinate object’. Note that it would not do to claim that the coordination was in fact of clauses: the full clause *They had found Kim guilty of perjury* and the clause fragment *but not Pat*. The appeal of such an analysis is that it brings the construction into line with normal coordination in that the coordinates would together form a constituent (co-extensive with the whole sentence), but whereas it might work for the majority of examples it doesn’t cover cases like [31iii] above, or similarly:

- [32] i *They hadn’t issued sheets to the new recruits – or towels.*  
 ii *How many had they issued sheets to, but not pillow-slips?*

These exhibit the now familiar phenomenon of narrow scope coordination, so that they are not equivalent to the coordination of full clauses. Thus [i], for example, is not equivalent to *They hadn’t issued sheets to the new recruits or they hadn’t issued towels to them*: the latter says that either sheets or towels hadn’t been issued, whereas [i] says that neither sheets nor towels had been. The difference is that in [i], but not in the clause-coordination, *or* is within the scope of the preceding negative. In [ii] there is no corresponding clause-coordination that is well formed (cf. *\*How many had they issued sheets to but how many had they not issued pillow-slips to?*), but even if there were (as would be the case if we substituted *and* for *but*) it would not be equivalent to [ii] since it would be questioning the number of two sets (those issued with sheets and those not issued with pillow-slips) instead of one (those issued with just sheets). In [ii], therefore, the coordinator is within the scope of the interrogative phrase *how many*. An analysis in terms of clause-level coordination fails to bring out that the second coordinate relates not to the whole of what precedes but to a particular constituent within it.

#### ■ Addition of a new element

Further examples of this construction are given in:

- [33] i *The match was won by Kim, and very convincingly too.*  
 ii *He was reading, but nothing very serious.*  
 iii *I’ll drive you there, but only if you pay for the petrol.*

*But* is the most common coordinator in this construction; *and* is also possible, but *or* is not. The added element is very often interpreted as an adjunct, but it can also be a complement provided the verb is one that can occur with or without a complement of the type in question. In [ii], for example, *nothing very serious* is interpreted as object of *read*, this being a verb that occurs in both transitive and intransitive clauses. Example [iii] represents a rather special use of this construction. Normally *A but B* (like *A and B*) entails both A and B. This applies to basic coordination: *Kim left at six but Pat stayed on till noon*, for example, entails both that Kim left at six and that Pat stayed on till noon. It also applies to most cases of the present construction: [33i] entails that the match was won by Kim and that it was won very convincingly. However, [iii] does not entail that I’ll drive you there – it has only the weaker, conditional entailment that I’ll drive you there if you pay for the petrol. *But* here thus introduces a qualification that weakens what precedes it; note that *only* is not omissible, though *not* could take its place (*I’ll drive you there, but not if you criticise my driving*).

The distinction between this construction and basic coordination is not completely straightforward; compare:

- [34] i *He comes not from Alabama but from Georgia.*  
 ii *He's from Alabama, but from the city of Birmingham, not rural Alabama.*

Example [i] is a very clear case of basic coordination, the coordinates being *not from Alabama* and *but from Georgia*. We take [ii], however, as adding a new element: the two *from* PPs are not coordinates. An important difference in meaning is that while Georgia is distinct from Alabama, Birmingham is not – it is included within it. Example [ii] is like the earlier examples of the addition of a new element construction in that we can drop the *but* to yield a non-coordinative construction: *He's from Alabama, from the city of Birmingham, not rural Alabama*. We noted in §2.5 that *but* generally indicates a contrast between the coordinates, a contrast that is, however, very often derived indirectly via various assumptions and inferences; this is what is going on in [ii], where the *but* reflects an assumption that people's image of Alabama might be formed mainly by reference to rural stereotypes.

#### ■ Analysis

In this construction *but* or *and* coordinates the added element to the whole preceding clause. Here, then, in contrast to the postposing of coordinate construction, the clause does have the form of a coordination between a clause and a clause fragment.

### 4.6 Coordination as evidence for constituent structure

It is a common practice in linguistic analysis, one we have followed a number of times in this grammar, to use the potential for coordination as evidence that a given sequence of words forms a syntactic constituent. The principle can be stated as follows:

- [35] In general, if a sequence *X* can be coordinated with a sequence *Y* to form a coordination *X and Y*, then *X* and *Y* are constituents.

The qualification 'in general' is needed because, as we have noted above, exceptions are to be found in various kinds of non-basic coordination. In this final section, therefore, we examine the criterion in the light of the distinction between basic and non-basic coordination.

#### ■ Coordination as evidence for a VP constituent

The example we will take is that of the VP: how does coordination support the analysis of a clause like *Sue found the key* into two immediate constituents, as in [36i], rather than three, as in [ii]?

- [36] i *Sue | found the key.* [NP + VP: the VP analysis]  
 ii *Sue | found | the key.* [NP + V + NP: the 'no VP' analysis]

Principle [35] supports the VP analysis

The sequence *found the key* can be readily coordinated:

- [37] *Sue found the key and unlocked the door.*

Only analysis [36i] is therefore consistent with principle [35]; other things being equal, it is to be preferred over [36ii] because it allows us to subsume [37] under basic coordination, so that it requires no special treatment. Principle [35], however, is qualified, not absolute, so we need to consider the matter further.

### VP-coordination vs clause-coordination with ellipsis of the subject

An alternative treatment of the coordination here, one that is consistent with [36ii], is to say that the coordinates are clauses, the second having ellipsis of the subject. The first coordinate will then be not *found the key* but *Sue found the key*, and the second will be ‘   *unlocked the door*. This accounts for the equivalence between [37] and *Sue found the key and she unlocked the door*. But we saw in §1.3.1 that there are many cases where no such equivalence obtains, as in:

- [38] i *No one treats me like that and gets away with it.* [VP-coordination]  
 ii *No one treats me like that and no one gets away with it.* [clause-coordination]

An elliptical clause analysis doesn't provide a satisfactory account of coordination like [38i].

### Basic vs right nonce-constituent coordination

Another alternative consistent with [36ii] would be to say that the underlined sequences in [37] are merely nonce-constituents, constituents in the coordination but not elsewhere. This is to treat [37] like our earlier example:

- [39] *I gave \$10 to Kim and \$5 to Pat.* (= [16ii])

There are, however, two important differences between [37] and [39]. In the first place, the nonce-constituents in [39] have to be parallel in structure (as noted in §4.3), whereas those in [37] do not – compare, for example, *Sue found the key and departed*. Secondly, the reason why *\$10 to Kim* is not a normal constituent is that there is no direct syntactic relation between the parts, *\$10* and *to Kim*: they are, rather, separately dependents (complements) of *give*. *Found the key* in [37] is quite different: here there is a syntactic relation between the parts, *found* being head and *the key* dependent. The nonce-constituent analysis is a more complex type of construction than basic coordination, applying under restricted conditions (the requirement of parallelism) and justified by strong independent arguments against recognising the coordinates as normal constituents: in the case of [37] we have no reason to prefer the more complex analysis to the one that follows the general principle given in [35].

### Basic vs delayed right constituent coordination

The relevance of [37] to constituent structure might be challenged on the grounds that it is also possible for coordination to group *found* with *Sue*:

- [40] *Max lost but Sue found the key.*

If coordination can group *found* with either *the key* or *Sue*, the argument would go, then it can't provide evidence for a constituent grouping of *found* with just one of them, *the key*. But such an argument fails to recognise that there is a major difference between the coordination of [37] and that of [40]. The latter represents a much less usual type of coordination than [37], and this instance of it is indeed of somewhat marginal acceptability because of the low weight of *the key*; acceptability is increased by expanding to *the key to the safe* but greatly diminished by reducing to *it*. Example [40] would characteristically have special prosody, with a clear break before *the key*. But [37], by contrast, has no such limitations or special prosody,<sup>68</sup> and can be taken to represent the most elementary type of coordination: as such, it does provide valid evidence in support of the VP analysis.

<sup>68</sup>These properties do not hold for all cases of delayed right constituent coordination, but even when they do not there will be independent evidence for treating the coordination as non-basic. Take, for example, [24iii], *He was accused but found not guilty of stalking a woman for seven years*: it is evident that in the non-coordinative *He was found not guilty of stalking a woman for seven years* the *of* phrase is a complement of *guilty*, not *find not guilty*, because it regularly occurs with *guilty* quite independently of the presence of *find*, as in *He was/seemed guilty of treason*.

### ■ Conclusion: coordination provides a criterion, other things being equal

Coordination clearly does not provide a simple and absolute criterion for constituent structure: the qualification ‘in general’ in [35] is indispensable. It nevertheless remains a useful criterion: if a sequence *X* can be coordinated, then the simplest account will be one where it is a constituent entering into basic coordination, and we will adopt some other, more complex, analysis only if there are independent reasons for doing so.

## 5 Supplementation

We turn now to supplementation constructions, illustrated in such examples as:

- [1] i *Pat – the life and soul of the party – had invited all the neighbours.*  
 ii *The best solution, it seems to me, would be to readvertise the position.*  
 iii *Jill sold her internet shares in January – a very astute move.*

The underlined expressions are **supplements**, elements which occupy a position in linear sequence without being integrated into the syntactic structure of the sentence.

### 5.1 General properties of supplementation

In the clear and central cases, supplements have the character of **interpolations** or **appendages**. An interpolation, as in [1i–ii], is located at a position between the beginning and end of a main clause: it represents an interruption to the flow of the clause. An appendage is attached loosely at the beginning or end of a clause. In speech, supplements are marked as such by the prosody: they are intonationally separate from the rest of the sentence. In writing, they are normally set off from the rest of the sentence by punctuation marks – commas, or stronger marks such as dashes, parentheses, or (in the cases of appendages in end position) a colon. Punctuation allows for different degrees of separation, as described in Ch. 20, §§4–5.

### ■ Supplementation in relation to dependency constructions and coordination

It is the lack of integration into the syntactic structure that distinguishes supplementation from dependency constructions and coordination. But supplementation is like coordination in being non-headed: since the supplement is not integrated into the structure it cannot function as a dependent to any head. The three types of construction are thus distinguished as shown in:

[2]		INTEGRATED?	HEADED?
	i DEPENDENCY CONSTRUCTION	Yes	Yes
	ii COORDINATION	Yes	No
	iii SUPPLEMENTATION	No	No

It should be noted, however, that expressions introduced by a coordinator can have the status of supplements rather than coordinates in an (integrated) coordination construction:

- [3] *Jill – and I don't blame her – left before the meeting had ended.* [supplement]

In spite of the *and*, the underlined clause is an interpolation, and is clearly not of equal syntactic status with the clause *Jill left before the meeting had ended*. We thus treat [3] as an instance of supplementation, not coordination, such as we have in *Jill left before the end of the meeting and I was sorely tempted to follow her*.

### ■ Supplements and anchors

Although supplements are not syntactically dependent on a head, they are semantically related to what we will call their **anchor**.<sup>69</sup> In [1i] the anchor is the NP *Pat*, while in [1ii–1iii] and [3] it is a clause – the clause which the supplement interrupts or follows. Other possibilities are shown in [4], where double underlining marks the anchor, single underlining the supplement:

- [4] i *When the patient closed his eyes, he had absolutely no spatial (that is, third-dimensional) awareness whatsoever.*  
 ii *The goal is to produce individuals who not only possess ‘two skills in one skull’, that is, are bicultural, but can also act as human links between their two cultures.*

In [i] the anchor is the adjective *spatial* (which functions as attributive modifier to the noun *awareness*); in [ii] it is the VP *possess ‘two skills in one skull’* (first coordinate in a VP-coordination).

A supplement must be semantically compatible with its anchor. Compare, for example:

- [5] i *This stipulation – that the amount of damages not be divulged – was ignored.*  
 ii *\*This stipulation – whether the press could be informed – was ignored.*

The supplement in [i] is a declarative clause and as such can appropriately combine with the anchor *this stipulation*. The anomaly of [ii] stems from the fact that the supplement is an interrogative clause and hence is not semantically compatible with this anchor.

### ■ Supplements vs dependents

#### Semantic compatibility vs syntactic licensing of complements

The restriction illustrated in [5] is comparable to that which holds between a complement and the head nominal in NP structure:

- [6] i *The stipulation that the amount of damages not be divulged was ignored.*  
 ii *\*The stipulation whether the press could be informed was ignored.*

This time, single underlining indicates the complement, double underlining the head. The noun *stipulation* licenses a declarative content clause as complement, but not an interrogative, so [ii] is inadmissible.

There is a significant difference between [5] and [6], however. The integrated construction shown in [6] requires that the complement be syntactically licensed, whereas in supplementation it is, as we said above, a matter of semantic compatibility. Compare:

- [7] i a. *The stipulation that Harry could not touch the money until he was eighteen annoyed him enormously.*  
 b. *\*The codicil that Harry could not touch the money until he was eighteen annoyed him enormously.*

<sup>69</sup>Some writers use the term ‘host’, but we have avoided this because we use it elsewhere in its primary sense, where it applies to the word to which a clitic is attached (see Ch. 18, §6.2).

- ii a. *This stipulation – that Harry could not touch the money until he was eighteen – annoyed him enormously.*
- b. *The codicil in the will – that Harry could not touch the money until he was eighteen – annoyed him enormously.*

The examples in [i] belong to the integrated head + complement construction. *Stipulation* licenses a declarative complement, but *codicil* does not: hence the ungrammaticality of [ib]. In [ii] the content clause is a supplement, interpreted as specifying the content of its anchor NP. And this time the *codicil* example is acceptable: the NP it heads denotes an addition to a will and hence has propositional content which can be specified by a declarative content clause.

As a second illustration of the difference between the integrated and non-integrated constructions, consider:

- [8] i a. *The question (of) where the funding would come from wasn't discussed.*
- b. *\*The thing (of) where the funding would come from was rather more important.*
- ii a. *The second question – where the funding would come from – wasn't discussed.*
- b. *The thing they didn't discuss – where the funding would come from – was rather more important.*

Here the content clause is interrogative. In [ia] it is a dependent within the NP headed by the noun *question*: it may appear as an immediate complement or it may be related to the head noun by the preposition *of*. Again, the complement needs to be licensed by the head noun: *question* takes interrogative complements, but *thing* does not, so [ib] is ungrammatical. In [ii] the interrogative clause is a supplement and is subject to the weaker constraint that it be semantically compatible with its anchor. Example [iib] is therefore admissible because the anchor NP as a whole denotes a potential topic of discussion, so that the content of this topic can be specified by means of an interrogative clause supplement.

### Form and interpretation of supplements realised by clauses

A further important difference between supplements and dependents is that the former may be realised by main clauses with their own illocutionary force:

- [9] *Sue felt – can you blame her? – that she was being exploited.*

The supplement here has the form and interpretation of a main clause: there is no change in form or loss of independent illocutionary force such as is found with clauses realising a dependent function.

### ■ Supplements and non-restrictiveness

By virtue of not being integrated into the syntactic structure, supplements are necessarily semantically non-restrictive. Compare, for example, [8ia–iia]. In the former, the integrated construction, the content clause is semantically restrictive, distinguishing the question being referred to from other questions. It provides the identifying information that makes it appropriate to use the definite article *the*. By contrast, in [iia], the supplementation construction, *the second question* by itself constitutes a definite referring NP. The supplement doesn't serve to distinguish one second question from other second questions: it doesn't restrict the denotation of the head nominal.

The same contrast between dependency and supplementation constructions is commonly found with relative clauses and appositives:

- [10] i a. *The necklace which her mother gave to her was in the safe.* [modifier]  
 b. *The necklace, which her mother gave to her, was in the safe.* [supplement]  
 ii a. *They are working on a new production of the opera ‘Carmen’.* [modifier]  
 b. *Bizet’s most popular opera, ‘Carmen’, was first produced in 1875.* [supplement]

In [ia] the relative clause is a modifier of the head noun *necklace* and serves semantically to identify which necklace is being referred to, but in [ib] it is a supplement to the anchor NP *the necklace*, which is assumed to be identifiable independently of the information given in the relative clause. Similarly, in [iia] the appositive *Carmen* is a modifier of *opera*, identifying which opera is being referred to, while in [iib] it is a supplement to the anchor NP *Bizet’s most popular opera*, and since there can be only one entity satisfying that description the supplement is again non-restrictive.

However, we have noted in our description of relative clauses and appositives that the integrated construction is not necessarily semantically restrictive – see Ch. 12, §4.2, and Ch. 5, §14.3, respectively. Compare, then:

- [11] i *The father who had planned my life to the point of my unsought arrival in Brighton took it for granted that in the last three weeks of his legal guardianship I would still act as he directed.*  
 ii *This is my husband George.*

In [i] the relative clause doesn’t distinguish one father from another: the narrator has only one father, so the modifier provides non-restrictive information about him. And [ii] does not convey that the speaker has more than one husband.

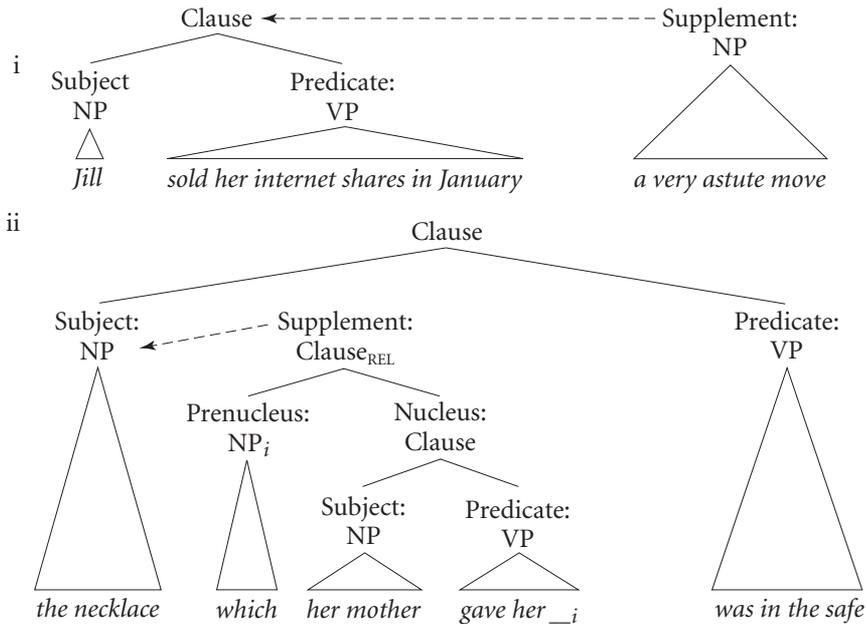

It is for this reason that we have departed from the traditional account of relative clauses, in which the two main constructions are distinguished as ‘restrictive’ and ‘non-restrictive’. A distinction in terms of integrated versus supplementary reflects the semantic difference more accurately and also matches the prosodic difference that distinguishes them in speech. It enables us, moreover, to capture the similarity between the unintegrated relatives and other elements that are semantically, prosodically, and syntactically unintegrated with the rest of the sentence: these can all be subsumed under the concept of supplement.

### ■ Syntactic representation of supplementation

A supplement, as we have seen, requires a semantically appropriate anchor: it cannot occur, as a supplement, without the anchor. Thus if we drop the anchor from [10ib], for example, the result is ungrammatical: \**Which her mother gave to her, was in the safe.* And if we drop it from [10iib] ‘*Carmen*’ takes on the status of an integrated dependent, the subject: ‘*Carmen*’ *was first produced in 1875.* For this reason, we take the anchor and its supplement to form a construction – a supplementation construction. But the lack of integration of the supplement into the syntactic structure means that there is no good reason to treat the supplementation as a syntactic **constituent**. We propose, therefore, that in the syntactic representation supplements should be kept separate from the tree

structure, related to their anchors by some different notational device, as in [12]:

[12]

In [12i], representing the structure of example [1iii], the supplement *a very astute move* has the clause *Jill sold her internet shares in January* as its anchor: this is shown by the broken line leading from the functional label ‘Supplement’ to the category label ‘Clause’. Similarly in [12ii] the broken line shows that the relative clause is a supplement to the NP *the necklace*.

### ■ Indicators

Supplements may contain **indicators** which serve to clarify the nature of their semantic relation to the anchor. In the following examples, the supplement is enclosed in square brackets and the indicator is marked with single underlining (with the anchor marked with double underlining, as above):

- [13] i No wonder that Pozzatti and I had at times difficulty in remembering the real purpose of our presence, [namely, Cultural Exchange].
- ii Mature connective tissues are avascular, [that is, they do not have their own blood supply].
- iii Much to everybody’s amazement, I got along splendidly with Max; [that is, until I became an editor and hence a potential rival].
- iv The poem asserts emotion without evoking it – [that is to say, it is sentimental].
- v Other pairs of phonological subsystems also interact or overlap in this way; [for example, duration sometimes figures in both the vowel system and the intonation].
- vi She was highly critical of both proposals, [especially the second one].

*Namely* (like formal *viz* and *to wit*) indicates that the supplement has a specifying function: the real purpose of our presence **was** Cultural Exchange. *That is* and *that is to*

say can be used in the same way, but they can introduce a wider range of supplement types, including finite VPs or main clauses, with the supplement typically providing an explanation of the anchor. It is also possible, however, for the supplement to serve as a qualification to the anchor, as in [iii], where we understand: “or rather I got along splendidly with him until I became an editor . . .”.

Indicators are to some extent analogous to coordinators in that they link together the elements in a construction. We will therefore generalise the contrast between syndetic and asyndetic to the supplementation construction. The supplementations in [13] are thus syndetic, while the corresponding constructions without the indicator are asyndetic. Compare syndetic [13iv], for example, with asyndetic *The poem asserts emotion without evoking it: [it is sentimental]*.

One difference between indicators and coordinators, however, is that some at least of the indicators can occupy non-initial position in the supplement:

- [14] i *It is these other differences between North and South – [other, that is, than those which concern discrimination and social welfare] – which I chiefly discuss in this paper.*  
 ii *The therapist’s level tone is bland and neutral – [he has, for example, avoided stressing ‘you’].*

#### ■ Linear position

When the anchor is a main clause, the supplement may interrupt it as an **interpolation**, or be loosely attached as an **appendage** at the beginning or end:

- [15] i *He claimed – and everyone believed him – that it was all my fault.*  
 ii *Having reviewed all the evidence, they decided he had no case to answer.*  
 iii *He sent her some flowers – the least he could do in the circumstances.*

When the anchor is subclausal, there are two aspects of the position of the supplement to consider: its position relative to the anchor, and its position relative to the main clause that contains the anchor. Compare:

- [16] i *It is almost mandatory for anyone in the financial business to have ready – that is, virtually real-time – access to sources of information about overseas markets.*  
 ii *Exeter clearly enjoyed full employment – as full, that is, as was attainable in the conditions of the time.*  
 iii *When political art (that is, art which challenges the status quo in some way) succeeds it is most often by reinventing the real.*  
 iv *One question still needs to be considered: who’s going to pay for it all?*  
 v *Eric Hoffer once said that America was a paradise – the only one in the history of the world – for workingmen and small children.*

In [i] the supplement is adjacent to its anchor, the attributive adjective *ready*, but it is still an interpolation with respect to the main clause that forms the sentence as a whole. In [ii], by contrast, the supplement is an appendage to the main clause, but is separated from its anchor. Examples [iii–iv] are like [i–ii] respectively, but have an NP as anchor. But in [v] the supplement is not only an interpolation with respect to the main clause: it is also located internally within its NP anchor.

### ■ Multiple supplementation

Because they are syntactically only loosely related to the rest of the sentence, supplements naturally receive far less attention in grammars than do integrated constructions. It should be emphasised, however, that in many kinds of speech and writing they are extremely frequent. Moreover, sentences commonly contain more than one supplement:

- [17] i *A recent newspaper report said there were five Negroes in the 1960 graduating class of nearly one thousand at Yale; that is, about one-half of one per cent, which looks pretty 'tokenish' to me, especially in an institution which professes to be 'national'.*  
 ii *Professionally a lawyer, that is to say associated with dignity, reserve, discipline, with much that is essentially middle-class, he is compelled by an impossible love to exhibit himself dressed up, disguised – that is, paradoxically, revealed – as a child, and, worse, as a whore masquerading as a child.*

In [i] there are three supplements. The first (*that is, about one-half of one percent*) has as its anchor the preceding content clause, the complement of *said*. The second (the relative clause *which looks pretty 'tokenish' to me*) is a supplement to the first, and then the third (*especially in an institution which professes to be 'national'*) is a supplement to the second. Example [ii] is more complex. It begins with the supplement *professionally a lawyer*, which is anchor to another supplement, *that is to say associated with dignity, reserve, discipline, with much that is essentially middle-class* (which, we may observe, contains two instances of asyndetic coordination, one between the two *with* PPs, one between the three NPs *dignity, reserve, discipline*). The participial adjective *disguised* is anchor for the supplement *that is, revealed*, which has another supplement, *paradoxically*, interpolated within it. Finally, *worse* is a supplement preceding its anchor, *as a whore masquerading as a child*.

## 5.2 The form of supplements

Supplements can be realised by a very wide range of categories. The indicator *that is*, in particular, can link supplements of most categories to anchors of the same category. In [4i–ii] above, for example, it links an adjective to an adjective, and a finite VP to a finite VP, a versatility comparable to that of a coordinator. The following review of types of supplement thus does not aim for exhaustive coverage.

### (a) Relative clauses

- [18] i *We called in to see Sue's parents, which made us rather late.*  
 ii *They'd given me two diskettes, both of which turned out to be defective.*

Supplementary relative clauses can have a clause or various kinds of phrase as anchor. In form they are a type of subordinate clause, but differ from integrated relative clauses in ways described in detail in Ch. 12, §4.

### (b) NPs

#### Specifying and ascriptive supplements to NP anchors

In supplementations with one NP as anchor and another as supplement, the relation between the two is comparable to that between subject and predicative complement in a

*be* clause. In particular, the distinction between specifying and ascriptive complements applies also to supplements. Compare [19i–ii], for example, where double underlining marks the subject of the clausal construction and the anchor in supplementation, single underlining the predicative complement and the supplement:

- [19] i a. The first contestant was Lulu. [specifying]  
 b. Kim Jones was a quite outstanding student. [ascriptive]  
 ii a. The first contestant, Lulu, was ushered on stage. [specifying]  
 b. Kim Jones, a quite outstanding student, won a scholarship to MIT. [ascriptive]

In the [a] examples *Lulu* is interpreted as specifying who the first contestant was, while in [b] *a quite outstanding student* expresses a property that is ascribed to Kim Jones. One formal difference in the case of supplementation is that specifying NPs accept the indicators *namely, that is, i.e., etc.*: *The first contestant, namely Lulu, was ushered on stage.*

### Apposition

The construction with a specifying NP as supplement is known as **apposition**. More particularly, this is the supplementary type of apposition, corresponding to the integrated apposition of *the opera 'Carmen'* or *my husband George* (in [10iia/11ii] above). Thus the appositive NP can be substituted for the whole supplementation yielding an entailment of the original: [19iia] entails *Lulu was ushered on stage.*

Further examples of supplementary apposition are given in:

- [20] i The murderer, the man with the scar, will be arrested soon.  
 ii A university lecturer, Dr Brown, was arrested for the crime.  
 iii A surprise present, a bouquet of roses, was delivered to my door.  
 iv An entire genre, the comedy thriller, has been made obsolete by the invention of the mobile phone.  
 v A Seyfert galaxy – a galaxy with a brilliant nucleus – usually has a massive red-shift.

Example [20i] is just like [19iia] except that the appositive is not a proper name but an NP with a common noun as head. Example [20ii] shows that the relation between supplementation and predication in a *be* clause is not always as straightforward as in the pair [19ia/iiia]. Indefinite NPs are certainly not excluded from functioning as subject in a specifying *be* clause (cf. *One problem is the cost*), but they occur there much less readily than in appositive supplementation. Thus the predicational counterpart of the supplementation in [20ii] is anomalous: <sup>#</sup>*A university lecturer was Dr Brown*. The appositive is nevertheless clearly of the specifying type, and can be matched up with the predicational *The university lecturer arrested for the crime was Dr Brown*. In [20iii] both NPs are indefinite, and again may be compared with predicational *The surprise present delivered to my door was a bouquet of roses*.

The anchor NP in supplementary apposition is non-referential, in the sense of Ch. 5, §8.3. In [20i–iii] the appositive NP is referential, but examples [20iv–v] show that it too can be non-referential: in [iv] it is generic, and in [v] definitional.

In all the above examples the appositive is adjacent to the anchor, but where the anchor is non-final in its clause the appositive may be separated from it. In such cases

the anchor is generally but not invariably indefinite:

- [21] i *I met a friend of yours at the party last night – Emma Carlisle.*  
 ii *The two dominical sacraments stand out from all the rest – namely baptism and Holy Communion.*

### Ascriptive NP supplements

Further examples of NP supplements with an ascriptive interpretation are given in:

- [22] i *Her father, a die-hard conservative, refused to even consider the proposal.*  
 ii *Wilson, Secretary to the Cabinet, had informed the Prime Minister immediately.*  
 iii *Robert, no genius, is applying for a scholarship to Harvard.*

This construction does not qualify as apposition because the supplement cannot always be substituted for the whole construction in such a way as to yield an entailment of the original. In [ii], for example, the supplement is a bare role NP unable to take over the subject function: \**Secretary to the Cabinet had informed the Prime Minister immediately*. And *No genius is applying for a scholarship to Harvard* is clearly not an entailment of [iii].

Ascriptive NPs are also found in such constructions as the following:

- [23] i *United will be playing at home, a not inconsiderable advantage.*  
 ii *A die-hard conservative, her father refused to even consider the proposal.*

In [i] the anchor is not an NP, but a clause, or perhaps a VP: we understand that it is an advantage to play at home. In [ii] the supplement precedes the anchor. Although the subject NP *her father* is the predicand for the ascriptive NP (it is her father who was a die-hard conservative), it is arguable that the anchor for the supplement is the whole clause rather than just the subject NP, for we understand it as providing some explanation for her father's refusal to consider the proposal.

### (c) Content clauses

Content clause supplements generally have an NP or another content clause as anchor:

- [24] i *The excuse he gave – that the train had been late – seemed to satisfy the boss.*  
 ii *I don't know what its status is, that is, whether or not it is confidential.*

In [24i] we again have a parallel with a specifying *be* clause: compare *The excuse he gave was that the train had been late*. This construction, however, is distinct from apposition, for the systematic entailment relation that is an essential feature of apposition does not apply. Example [i] itself demonstrates this. It does not entail *That the train had been late seemed to satisfy the boss*: what seemed to satisfy the boss was the excuse, not the fact that the train had been late. As we noted in Ch. 5, §14.3, the same point applies to integrated constructions where a content clause is a dependent of a noun, as in *The suggestion that they cheated is quite outrageous*: the content clause here is a complement, not an appositive modifier.

We thus need to distinguish two kinds of specifying supplement with an NP as anchor. A specifying NP supplement is apposition, while the supplement in [24i] may be called **content-specifying**. This type of specifying supplement can also be realised by other categories than content clauses: see [25i] and [3oi] below.

## (d) Main clauses

Anchors for supplements with the form of main clauses again include NPs and clauses:

- [25] i *I raised a more serious objection: it's against the law.*  
 ii *The universe is expanding, that is, the galaxies are receding from each other at immense speeds.*  
 iii *If he says he can't afford it – he usually does – tell him I'll pay for us both.*

In [i], with an NP anchor, the supplement clause is again of the content-specifying type. It cannot substitute for the whole supplementation (*\*I raised it's against the law*), and hence cannot satisfy the condition for apposition.

Supplement main clauses in final position (especially those without any indicator) are not clearly syntactically distinguishable from separate sentences. In speech, one can use intonation to link a clause to what precedes as supplement to anchor, and in writing punctuation serves to mark more explicitly whether a main clause is being presented as a supplement to what precedes or as a separate orthographic sentence.

## Parentheticals and tags

- [26] i *There are, I think, some grounds for optimism.*  
 ii *Such behaviour runs the risk, wouldn't you agree, of alienating our customers.*  
 iii *You're not proposing to go out in those trousers, are you?*

The underlined expressions here have the form of main rather than subordinate clauses, but they are syntactically distinct from canonical main clauses by virtue of being structurally incomplete. Those in [i–ii] are known as 'parentheticals', while *are you?* in [iii] is an interrogative 'tag'. The form and interpretation of these constructions is discussed in Ch. 10, §5.

## (e) AdjPs

- [27] i *The editor, angry at the delay, resigned from the project.*  
 ii *Too afraid to venture out, Kim stayed barricaded in the house all week.*  
 iii *The editor has been sacked and, worse, they're imposing strict censorship.*

These constructions are similar to those with an ascriptive, as opposed to specifying, NP supplement. Construction [iii] is exceptional in that *worse* has as its predicand not an NP, but a clause (*they're imposing strict censorship*); it is more usual to have a relative construction – *what/which is worse*.

## (f) Verbless clause

- [28] i *The tourists, most of them foreigners, had been hoarded onto a cattle truck.*  
 ii *The defendants sat in the dock, their heads in their hands.*  
 iii *The only household chore men excelled at was – drumroll please – taking out the rubbish.*

In [i] the supplement is comparable in function to a relative clause: compare *who were most of them foreigners* (or *most of whom were foreigners*). If the supplement consisted of *foreigners* on its own, it would be an ascriptive NP, like those in [22]; *most of them*, however, does not function as a modifier in NP structure, so *most of them foreigners* must be analysed as a reduced clause – one which could not stand alone as a sentence. The

supplement in [28ii] could likewise not stand alone, but differs in its internal structure in that *their heads* is subject. An equivalent integrated construction would have a modifier with the form of *with* + verbless clause: *with their heads in their hands*.

The supplement in [28iii], by contrast, could stand alone as a sentence. It is simply a fragmentary main clause (with the illocutionary force of a directive) used as an interpolation.

### (g) Non-finite clauses

- [29] i *All things considered, the result was reasonably satisfactory.*  
 ii *Having read the report, Max was sure he had nothing to worry about.*  
 iii *Not to put too fine a point on it, he's an absolute layabout.*

Example [i] illustrates the construction where the non-finite clause contains a subject. Usually, however, the subject is understood; in most cases it is recoverable from the anchor, as in [ii] (where it is Max who read the report), but it may also be recoverable contextually, as in [iii], where it is the speaker who is putting it bluntly. For further discussion of these constructions, see Ch. 14, §9.

### (h) PPs and AdvPs

- [30] i *This final portrayal – of Stalin – does no credit to the author.*  
 ii *In my opinion, the idea isn't worth pursuing.*  
 iii *The Dean, as you know, is totally opposed to the proposal.*  
 iv *Frankly, I think we could do better ourselves.*  
 v *They go – probably – by bus.*

Pps can occur as supplement to an NP anchor, and here again the specifying–ascriptive distinction applies. Example [i] is of the specifying type – more particularly, the content-specifying type. It contrasts in the familiar way with the integrated construction *this final portrayal of Stalin*.

The other supplements in [30] have a clause as anchor, and their function is very much like that of a modifier. In cases like [v] there is a contrast with an integrated construction, *They probably go by bus*: the latter has the adverb in its default position, and it is only when set off intonationally as an interpolation that it can occur in the position it occupies in [v]. For the rest, there is little difference between supplements with a clause as anchor and modifiers, and in this book we generally treat them together, using **adjunct** as a general term covering both.

The supplements differ from the most central modifiers in that they do not fall within the scope of negatives in the anchor and cannot be made the complement of *be* in the *it*-cleft construction. In [ii], for example, *in my opinion* is outside the scope of the negative *isn't*: the meaning can be glossed as “My opinion is that the idea isn't worth pursuing”, not “That the idea is worth pursuing isn't my opinion”. Their inability to be foregrounded in the *it*-cleft construction is seen in the ungrammaticality of examples like *\*It is as you know that the Dean is totally opposed to the proposal*.

### (i) Interjections

- [31] i *Ah, so you were there after all!*  
 ii *Damn, we've missed the bus again!*

The general definition of interjection is that it is a category of words that do not combine with other words in integrated syntactic constructions, and have expressive rather than propositional meaning. Central members of the interjection category in English are such words as *ah, hey, oh, oops, ouch, sh, ugh, wow* (or the now dated *alas*), which in their sole or primary meaning are used as expressive exclamations, on their own, or as supplements with clausal anchors, as in [31i]. There are also a number of words such as *blast, bugger, damn, fuck* which are primarily verbs, but which in supplements like that in [ii] have lost their verbal meaning, and are best regarded as having been reanalysed as interjections.<sup>70</sup>

### (j) Clauses and phrases introduced by a coordinator

As we have noted, expressions introduced by the coordinators can be set apart from the rest of the sentence like supplements instead of functioning as coordinates in integrated constructions:

- [32] i *If he checks my story – and he probably will – I'll be sacked.*  
 ii *It's clear – and let's not mince words – that he's been embezzling the funds.*  
 iii *He told the manager – and her secretary – that the report was defamatory.*

The status of the expression as a supplement rather than a coordinate is clearest in examples like [i–ii], where it could not enter into a coordination relation with what precedes. In [i] it could not coordinate with *he checks my story* because the latter is a subordinate clause functioning as complement of *if*, whereas *he probably will* is a main clause outside the scope of *if*. The structure is thus quite different from that of *If I tell that story and he checks it, I'll be sacked*, where the underlined sequence is a coordination of clauses which together form the complement of *if*. It would be possible to have a coordination reading if the underlined expression were placed at the end: *If he checks my story I'll be sacked, and he probably will*. In [ii] the underlined sequence could not even be placed felicitously at the end: *\*It's clear that he has been embezzling the funds and let's not mince words*. The clauses are not sufficiently alike in terms of their meaning to permit felicitous coordination.

Example [32iii] is closely related to the obviously coordinative construction *He told the manager and her secretary that the report was defamatory*. The difference is that in [32iii] *and her secretary* is set apart by dashes, and in the corresponding spoken version it is set apart by intonation. It is this punctuational or prosodic separation that gives *and her secretary* the status of a supplement in [32iii]: it is presented as secondary information rather than being on a par with *the manager*. Nevertheless, it is a marginal and exceptional kind of supplementation. Normally, supplements can be omitted without loss of well-formedness, but this is not always so in the present case:

- [33] *The manager – and her secretary – have been charged with defamation.*

If the supplement were omitted, the verb-form *have* would have to be replaced by *has*: the supplement is relevant to determining the form of the verb, just as it is in the integrated

<sup>70</sup>The verbal origin is more relevant in expressions like *Damn these mosquitoes!* or *Fuck you!*, where they have an NP complement. Historically, the *blast* and *damn* constructions were understood with *God* as subject, but that doesn't match their normal interpretation now: there is no more reason to postulate an understood subject in *Blast you!* than in *Fuck you!* It may be best to regard such words as exceptional interjections that combine with an NP complement to form an interjection phrase.

structure *the manager and her secretary*. Note that in cases like this the dashes cannot be replaced by parentheses: see Ch. 20, §5.

Supplements introduced by *or* are used to express reformulations or corrections:

- [34] i *I'm convinced it was masterminded by Tom – or Ginger, as everyone calls him.*  
ii *They'll be finishing on Tuesday – or at least that's what they said.*

## 1 Syntactic overview

### ■ Information-packaging constructions

Our concern in this chapter is with a number of clause constructions which we refer to collectively as **information-packaging constructions**, and which differ syntactically from the most basic, or canonical, constructions in the language. These information-packaging constructions characteristically have a syntactically more basic counterpart differing not in truth conditions or illocutionary meaning but in the way the informational content is presented. Compare, for example:

- | [1] | CANONICAL VERSION                              | NON-CANONICAL VERSION                          |
|-----|--|--|
| i   | a. <i>Kim wrote the letter.</i>                | b. <i>The letter was written by Kim.</i>       |
| ii  | a. <i>Two doctors were on the plane.</i>       | b. <i>There were two doctors on the plane.</i> |
| iii | a. <i>We rejected six of the applications.</i> | b. <i>Six of the applications we rejected.</i> |

In each pair [b] is an instance of one of the information-packaging constructions, while [a] is the syntactically more basic counterpart. In each pair the truth conditions are the same, so that [a] entails [b] and [b] entails [a]; and there is no illocutionary difference between them: all six examples are declaratives and would normally be used as statements. The syntax makes available different ways of ‘saying the same thing’, with the various versions differing in the way the content is organised informationally.

We have said that information-packaging constructions **characteristically** enter into relationships of the kind illustrated in [1]. The qualification is needed for two reasons. In the first place, for most of the constructions there are conditions under which the syntactically more basic counterpart is in fact unacceptable for syntactic or pragmatic reasons:

- |     |     |  |   |
|-----|-----|--|---|
| [2] | i   | a. <i>*The nanny said Kim to have been devoted to the children.</i>      | b. <i>Kim was said by the nanny to have been devoted to the children.</i> |
|     | ii  | a. <i>*An accident was at the factory.</i>                               | b. <i>There was an accident at the factory.</i>                           |
|     | iii | a. <i>*I find that he got away with it for so long quite incredible.</i> | b. <i>That he got away with it for so long I find quite incredible.</i>   |

Secondly, the canonical and non-canonical versions do not invariably have the same truth conditions:

- |     |     |  |  |
|-----|-----|--|--|
| [3] | i   | a. <i>Kim didn't sign many of them.</i>      | b. <i>Many of them weren't signed by Kim.</i>  |
|     | ii  | a. <i>Many MPs weren't in the House.</i>     | b. <i>There weren't many MPs in the House.</i> |
|     | iii | a. <i>I haven't met many of her friends.</i> | b. <i>Many of her friends I haven't met.</i>   |

In each pair the relative order of the quantifier *many* and the negative is different in [b]

than in [a], and this affects the relative semantic scope. The difference is sharpest in [ii], where the issue has to do with how many Members of Parliament were in the House (the British House of Commons, let us assume). In [iia] *many* has scope over the negative: the meaning is that a large number of MPs were absent from the House. In [iib] the negative has scope over *many*: the number of MPs present in the House was not large. Thus in a context where we have 600 MPs, of whom 300 are present in the House and 300 absent, version [a] would rate as true, whereas [b] would not. These issues of relative scope are dealt with elsewhere (see Ch. 5, §5, & Ch. 9, §1.3.2), and need not be taken further in this chapter.

#### ■ Overview of main information-packaging constructions

The main constructions to be considered are illustrated in [4], with the default counterpart given in the right-hand column; the underlining draws attention to the syntactic differences between the two versions.

[4]	i	PREPOSING	<u>This one</u> she accepted.	She accepted <u>this one</u> .
	ii	POSTPOSING	I made without delay <u>all the changes you wanted</u> .	I made <u>all the changes</u> <u>you wanted</u> without delay.
	iii	INVERSION	<u>On board</u> were two nurses.	<u>Two nurses</u> were <u>on board</u> .
	iv	EXISTENTIAL	<u>There is a frog</u> in the pool.	<u>A frog</u> is in the pool.
	v	EXTRAPOSITION	<u>It is clear that he's guilty</u> .	<u>That he's guilty</u> is clear.
	vi	LEFT DISLOCATION	<u>That money I gave her,</u> <u>it</u> must have disappeared.	<u>That money I gave her</u> <u>must have disappeared</u> .
	vii	RIGHT DISLOCATION	<u>They're still here,</u> <u>the</u> <u>people from next door</u> .	<u>The people from next door</u> <u>are still here</u> .
	viii	CLEFT	<u>It was you who</u> broke it.	<u>You</u> broke it.
	ix	PASSIVE	<u>The car was taken by Kim</u>	<u>Kim took the car</u> .

For some of the information-packaging constructions we will be distinguishing various subtypes, and we shall also be introducing certain extensions and additional, relatively minor, constructions.

In the case of [4ix] there is an independent term, **active**, for the default version on the right (*Kim took the car*), but for the rest there are no established terms for the constructions that lack the distinctive properties of the non-canonical information-packaging constructions. For the latter we have largely retained established terms. Some of them can apply equally to clauses and constructions: *The car was taken by Kim*, for example, is a passive clause and is an instance of the passive construction. Similarly for 'existential' and 'cleft'. The others apply, in the form cited, to the construction rather than the clause. Thus *It is clear that he is guilty* in [v] illustrates the extraposition construction, but we do not refer to it as an 'extraposition clause' – it is a clause with an extraposed subject. Similarly, *This one she accepted* in [i] is not a 'preposing clause', but a clause with a preposed object. The inversion in [iii] of the subject (*two nurses*) and an internal complement of the verb (*on board*) is to be distinguished from the inversion of subject and auxiliary verb (as in *Were two nurses on board?*): we speak, therefore, of subject-dependent inversion and subject-auxiliary inversion. However, since subject-auxiliary inversion is of relatively little relevance to the concerns of this chapter we will often use 'inversion' on its own, as in [iii], as an abbreviation for 'subject-dependent inversion'.

Several of the terms in [4] are based on processes, and it is worth repeating at the beginning of this chapter that process terms are to be interpreted simply as a convenient metaphorical means of describing how one construction differs from a syntactically more basic one (cf. Ch. 2, §2). When we say that *this one* is preposed in *This one she accepted*, we mean only that in this construction it is in front position although the default or basic position for it is after the verb.

### ■ Reordering and realignment

The differences between information-packaging constructions and their more basic counterparts are in some cases simply a matter of the linear order of the syntactic elements, and in others a matter of how semantic elements are aligned with syntactic functions. Using process terminology with the interpretation just explained, we can say, then, that constructions [4i–iii] involve reordering, while the others all effect a realignment of semantic and syntactic elements.

In [4i–iii] the non-canonical version can be regarded as less basic than its default counterpart in that the order is not only less frequent but subject to pragmatic constraints that do not apply to the default version. In [iv–ix] the non-canonical version is syntactically less basic by virtue of its greater syntactic complexity: the realignment is accompanied by the addition of one or more elements, such as *there* in [iv], *it* in [v], the auxiliary *be* and the preposition *by* in [ix] and so on.

### ■ Combinations

Certain of the information-packaging constructions are mutually exclusive because the processes concerned apply under distinct conditions. For example, extraposition cannot apply in [4iv] because *A frog was in the pool* does not contain a subordinate clause, and conversely existential formation cannot apply in [v] because *That he is guilty is clear* has a subordinate clause as subject: no one clause can be an instance of both the existential and extraposition constructions. In the absence of such restrictions, however, the constructions can combine, as illustrated in [5]:

- [5] i a. *My mother found some of them offensive.*  
       b. *Some of them she found offensive, my mother.* [preposing, right dislocation]  
 ii a. *That she was joking became clear at that point.*  
       b. *It was at that point that it became clear she was joking.* [cleft, extraposition]  
 iii a. *Everyone assumed that Jill would win.*  
       b. *It was assumed by everyone that Jill would win.* [passive, extraposition]  
 iv a. *The police had interviewed Kim.*  
       b. *Kim it was who had been interviewed by the police.* [passive, cleft, preposing]

## 2 Information packaging: concepts and general principles

The information-packaging constructions, we have said, characteristically differ from their default counterparts with respect to the way the information they convey is presented. In this section we introduce the major concepts we need to describe these differences, and outline certain general principles governing the way information is presented in the clause. We take information to cover entities and properties as well

as propositions. Thus in an example like *My father was angry* we can talk about the informational status of the proposition “My father was angry”, but also about that of the person referred to by *my father* and the property “angry”. We will also apply the concepts to the linguistic expressions that represent the entities, properties, and propositions.

#### ■ Familiarity status: old and new information

**Familiar** or **old** information is information that the speaker takes to be shared by speaker and addressee, contrasting with **unfamiliar** or **new** information. More specifically, we must distinguish between information that is old or new with respect to the discourse, and information that is old or new with respect to the addressee.

#### Discourse-familiarity status: discourse-old vs discourse-new information

Here we are concerned with the status of the information within the current discourse – or, for very long discourses (such as a book) within the currently salient stretch of discourse. Consider the following examples of discourse-old information:

- [1] i *Two letters have arrived for Jill; she'll be calling round to pick them up.*  
 ii *I haven't heard from Jill for a long time – have you?*  
 iii *As a child, I used to pretend a unicorn lived in my backyard. I called him Joe.*  
 iv A: *What did Max tell Jill?* B: *He told her I'd been delayed at the office.*

In [i] the first clause introduces two letters into the discourse: we say then that the letters are **discourse-new**, and by extension that the linguistic expression *two letters* is discourse-new. In the second clause, however, the letters are **discourse-old** because they have already been mentioned (in the preceding clause); and again we will say that the corresponding linguistic expression, *them*, is discourse-old. This represents one of the most obvious cases of a discourse-old constituent, a pro-form with a preceding antecedent. Similarly, in a context where there has been no prior mention of Jill, the NP *Jill* has the status of new information, while the coreferential pronoun *she* represents old information. In [ii] the pronouns *I* and *you* can be regarded as discourse-old because they refer to participants in the discourse. Example [iii] (ignoring now the 1st person pronoun) is like case [i] in that *him* is discourse-old by virtue of its anaphoric link with *a unicorn* in the preceding sentence: we give a second example of this type to make the point that the status of an entity as discourse-old does not depend on its actually existing in the real world, or even on the interlocutors' belief that it exists. In [iv] it is not just the NPs *he* and *her* that are discourse-old, but the whole sequence *He told her*, or the corresponding open proposition “He told her *x*”.

Discourse-old status applies not only to elements that have themselves been explicitly evoked in the prior discourse, but also to those that stand in some salient and relevant relationship to elements that have been evoked:

- [2] i *I don't in general care for puzzles, but crossword puzzles are fun.*  
 ii *I tried to get into the library after hours, but the door was locked.*  
 iii *That book is awful; the author doesn't have any writing ability at all.*

In [i] *crossword puzzles* is discourse-old information because there has been prior mention of the more general class of puzzles: crossword puzzles are a kind of puzzle. In [ii] we have a part-whole relationship between the door and the library, so we can infer that

*the door* refers to the door of the library; it has the status of discourse-old information as the latter has been mentioned. Similarly, books characteristically have authors, and hence we understand *the author* to refer to the author of the book just mentioned. It is of course possible for a book not to have an author (it could be an edited collection of papers), but that is irrelevant: there is a close relationship between books and authors, and this is sufficient to make *the author* discourse-old information in the context of the preceding NP *that book*.

The relationship in question must be a salient and relevant one if I am to be able to assume that you can make the necessary inference – from crossword puzzles to puzzles, from doors to libraries, from authors to books. Compare, for example:

- [3] i *I walked into the kitchen. [On a stool was a large book.]*  
 ii *I walked into the kitchen. [#On an overcoat was a large book.]*

There is a salient relationship between stools and kitchens: kitchens commonly have stools in them. But there is no comparable relationship between overcoats and kitchens. Mention of the kitchen thus serves to give the underlined NP the status of discourse-old information in [i] but not in [ii]; and the bracketed clause of [ii] is then infelicitous, i.e. unacceptable in this context, because (as we shall demonstrate in §5.2) inversion requires the preposed constituent to represent a link to the prior discourse. The discourse-old information in [i] serves as such a link – that is, it acts as a point of connection between the information in the current utterance and what has already been evoked in the discourse; it is then the absence of any such link in [ii] that makes the discourse infelicitous.

In the same way, propositions can be discourse-old even if they have not been directly expressed in the prior discourse, provided they stand in some salient relationship to ones that have, and/or to features of the situation of utterance. Consider, for example:

- [4] A: *Are those cupcakes for sale?* B: *No, they're a special order. But the bagels you can have.*

One component of the meaning of the underlined clause is the open proposition “You can have *x*”. This hasn’t been expressed in what precedes, but has the status of discourse-old information because it is inferrable from A’s question, which conveys that A wants to buy (hence have) something.

#### Addressee-familiarity status: addressee-old vs addressee-new information

Information that is familiar from the discourse, by virtue of prior mention or a salient and relevant relationship to what has been previously mentioned, is necessarily familiar to the addressee. Discourse-old information is also **addressee-old information**. But the addressee can also be assumed to be familiar with things that have not been mentioned in the discourse or that cannot be inferred from what has been mentioned. Consider, for example, an utterance in the United States of the sentence:

- [5] *The President is giving the State of the Union address later tonight.*

Here I can assume on the basis of common knowledge shared by citizens of the United States that you know who *the President* refers to, and this NP accordingly has the status of addressee-old information even though it is discourse-new.

### ■ Focus and focus-frame

The **focus** of a clause (or portion of a clause) is the constituent bearing the strongest, or ‘nuclear’, stress, as indicated by the small capitals notation:

[6] *Mary bought RICE yesterday.*

Here *rice* is the focus. The residue we refer to as the **focus-frame**. This can be given in the form of an open proposition containing a variable in place of the element represented by the focus: “Mary bought *x*”. The phonological prominence given to the focus accords it prominence in the message: it is presented as the most informative element in the clause, with the focus-frame backgrounded. The focus typically represents **addressee-new information**, and the focus-frame addressee-old information.<sup>1</sup>

Foci come in a variety of sizes. Consider, for example:

[7] *She bought a bag of RICE.*

If I say this in response to the question *What did Mary buy a bag of?*, the focus is *rice* and the focus-frame “She bought a bag of *x*”. If I say it in response to *What did Mary buy?*, the focus is *a bag of rice* and the focus-frame “She bought *x*”. If I say it in response to *What did Mary do?*, the focus is *bought a bag of rice* and the focus-frame “She did *x*”. The focus is a constituent containing the nuclear stress, but it can contain varying amounts of material in addition to the stressed syllable: for further discussion, see Ch. 9, §1.3.3.<sup>2</sup>

It is possible for a clause to have more than one focus:

[8] A: *What did they BUY?* B: *MARY bought a bag of RICE, . . .*

In B’s response both *Mary* and *a bag of rice* are foci, with the focus-frame being “*x* bought *y*”.

### Focus and familiarity

We have said that the focus typically represents new information, but the sense in which it is new may be different from that considered in our discussion of examples like [11–iii]. Consider:

[9] A: *Did they give the job to you or to Mary?* B: *They gave it to HER.*

Here *her* refers to Mary and is old information by virtue of prior mention. At the same time *her* is focus and as such is new. This apparent paradox can be resolved by distinguishing between the familiarity status of Mary considered as an entity, a person (from this point of view Mary is old information), and Mary considered as the value assigned to the variable in the focus frame “They gave it to *x*” (from this point of view Mary is new information). I assume you know who the referent of *her* is, but I don’t assume you know that Mary was the one to whom they gave the job: that is precisely the new information that I’m imparting to you.

<sup>1</sup>Throughout this chapter ‘focus’ is to be understood as ‘informational focus’, as opposed to ‘scopal focus’: see Ch. 6, §7.3, for this distinction.

<sup>2</sup>The focus-frame is often called a ‘presupposition’, but this represents a different sense of the term presupposition from that adopted in this book (see Ch. 1, §5.4, and Ch. 11, §7.4). The two concepts overlap, but are not synonymous. Note, in particular, that the presupposition can contain the focus, as in *It’s unfortunate that he gave the key to KIM*. Here the underlined content clause is presupposed by virtue of *unfortunate* being a factive adjective, but it contains the focus *Kim*, and hence is not a focus-frame – the focus-frame here is “It’s unfortunate that he gave the key to *x*”.

### ■ Some general tendencies regarding information structure

A few general tendencies are stated summarily in [13]:

- [13] i Heavy constituents tend to occur at or towards the end of the clause.  
 ii The focus typically appears at or towards the end of the clause.  
 iii Subjects are the dependents that are the most likely to be addressee-old.  
 iv Information that is familiar tends to be placed before that which is new.  
 v Information-packaging constructions tend to be restricted with respect to the range of contexts in which they can felicitously occur.

In view of point [v], discussion of information-packaging issues in the following sections will be largely concerned with the constraints applying to the non-canonical constructions. It must be emphasised, however, that there are conditions under which the default version is inadmissible (due to ungrammaticality or infelicity; cf. [2] of §1), and there are others where it may sound awkward, less natural than the non-canonical construction. It should also be borne in mind that the choice of one of the non-canonical constructions may be motivated by stylistic considerations, by the need for variety: a discourse consisting of clauses all of which follow the default pattern would likely be perceived as tiresome and repetitive.

## 3 Complement preposing

Complement preposing is a construction in which a complement whose basic position is internal to the VP occurs in front position, preceding the nucleus of the clause:

- [1] i Most of it she had written \_\_ herself.  
 ii Anything you don't eat put \_\_ back in the fridge.  
 iii It appears [that from one of them he had borrowed several hundred dollars \_\_].

The underlined complements in these examples are in prenuclear position, rather than in their basic position, indicated here by ' \_\_ '. Preposing occurs most readily in declarative main clauses, as in [i], and our discussion of the pragmatic constraints on complement preposing will concentrate on examples of this kind. The construction is certainly not restricted to such clauses, however, as is evident from [ii] (imperative) and [iii] (subordinate).<sup>4</sup>

### ■ Pragmatic constraints on complement preposing

Adjuncts may also be located in prenuclear position, but when complements occur there the construction is subject to pragmatic constraints on familiarity status that do not apply with initial adjuncts. Compare, for example:

- [2] i In New York there is always something to do.  
 ii #In a basket I put your clothes.

While [i] could perfectly well occur as the opening sentence in a discourse, [ii] could not: it requires a context that motivates the preposing.

For complement preposing to be felicitous, the complement must be discourse-old, acting as a link to other entities evoked in the prior discourse. Compare, for example,

<sup>4</sup>Preposing is an unbounded dependency construction, as described in Ch. 12, §7.

the following, where speaker A is a customer and B the server:

- [3] i a. A: *Can I have a bagel?* B: *Sorry, we're out of bagels.* A: *How about a bran muffin?* B: [A bran muffin I can give you.]  
 b. A: *Do you have any muffins?* B: [A bran muffin I can give you.]  
 c. A: *Can I have a bagel?* B: *Sorry, we're out of bagels.* [A bran muffin I can give you.]  
 ii A: *Where can I buy a pen like that?* B: *At the bookstore.* [Six dollars it costs.]

Example [ia] illustrates the simplest case: here the preposed constituent is identical with a preceding one. In [ib] *bran muffin* is related to *muffins* in that it denotes a subset of muffins. And in [ic] it is related to *bagels* in that both denote members of some contextually relevant set, the set of breakfast foods. In [ii] the relationship is less direct, but nevertheless still apparent: buying a pen evokes the concept of a price, and *six dollars* then denotes one of the set of potential prices.

Such examples may be contrasted with the infelicitous

- [4] *I was in the library last night and [<sup>#</sup>an interesting guy I met].*

Here there is no relevant relationship between *an interesting guy* and anything in the preceding discourse to justify the preposing: mention of a library does not readily call to mind the set of people one might meet there. In this context, then, only the default version of the second clause would be acceptable: *I met an interesting guy.*

The requirement of an appropriate relationship to some preceding constituent applies in all cases of complement preposing. Most cases also satisfy a second condition, that the clause as a whole be related to what precedes via an open proposition that represents discourse-old information.

In [3i] this open proposition is “I can give you *x*”, whose status as old rather than new information derives from the fact that A has been asking for something. In [3ii] the open proposition is “It costs amount *x*”, and this is again evoked by the talk of buying a pen, and hence counts as discourse-old.

As two further examples, consider:

- [5] i *Colonel Bykov had delivered to Chambers in Washington six Bokhara rugs which he directed Chambers to present as gifts from him and the Soviet Government to the members of the ring who had been most co-operative.* [One of these rugs Chambers delivered to Harry Dexter White.]  
 ii A: *Did you buy a whole new wardrobe for school?* B: *No, I have lots of clothes.* [Most of my stuff my mom gets at Alexander's.]

The requirement that the preposed complement itself relate to the preceding discourse is clearly satisfied: in [i] *one of these rugs* relates back to *six Bokhara rugs*, and in [ii] *most of my stuff* relates to *a whole new wardrobe* in that both are concerned with B's clothes. In addition, we have the open propositions “Chambers delivered the rugs to *x*” and “My mom gets my stuff at *x*”, and these are both discourse-old in that they are inferrable from what has gone before. In [i] delivering rugs to various people is what Chambers had been directed to do. In [ii], speaker B is a student, so it is a reasonable inference that her mother buys her clothes for her, and this she must do at various stores.

### ■ Focus and non-focus complement preposing

The first division we make within the category of complement preposing constructions is between those where the preposed complement is, or contains, the focus and those where the focus follows. The examples in [3] are of the focus preposing type. In [i] the natural placement for the main stress is on *bran*, with the NP *a bran muffin* the focus in [ia/c], and just *bran* itself the focus in [ib] (*bran muffins* are contrasted with other kinds of muffins); in [ii] the stress will be on *dollars*, with the whole NP *six dollars* the focus (picking out this amount from the set of potential prices). In [5], by contrast, the natural place for the main stress is at the end, on *White* and *Alexander's*, the foci being *Harry Dexter White* and *Alexander's* respectively. The preposed complements here will certainly be stressed, for preposing does accord them a significant amount of intonational prominence, but the degree of stress will be less than on the final words. These then are examples of non-focus preposing.

We noted in §2 that a constituent may be discourse-old when considered as an entity and discourse-new when considered as specifying the value in an open proposition. This dual status will always apply in the case of focus preposing. The general constraint on complement preposing requires that the link be discourse-old in the first sense, but in focus preposing it is necessarily discourse-new in the second sense by virtue of being focus. As we observed for [3ii], for example, *six dollars* represents a price for a pen and as such is discourse-old in the context since there has been talk of buying a pen, but at the same time it specifies the value of the variable in “It costs *x*”, and as such is discourse-new.

We will look first at non-focus preposing, in §3.1 and §3.2 (the latter dealing with one particular subtype, called ‘proposition assessment’); then in §3.3 we return to focus preposing.<sup>5</sup>

### 3.1 Non-focus complement preposing

The preposed complement may belong to any of the major categories that function as a complement. The following examples have a preposed NP, PP, AdjP, and VP respectively:

- [6] i *I work on the 6th floor of a building. I know some of the elevator riders well. [Others I have only that nodding acquaintance with] and some are total strangers.*  
 ii *Consume they did – not only 15 kegs of beer, which they guzzled like soda pop, but also the free Coors posters which they seized as works of art to adorn their dorm walls. [For their heads, they were given free Coors hats] and for their cars free Coors bumper stickers.*  
 iii A: *This is not another vulgar disgusting exploitation film.* B: [*Vulgar it's not. Dumb it is.*] *Did we see the same movie?*  
 iv *As members of a Gray Panthers committee, we went to Canada to learn, and [learn we did].*

The NP case, also seen in [5] above, is the most common variety and needs no further commentary here. The VP case is found in the proposition assessment construction

<sup>5</sup>Complement preposing in general or, for some scholars, non-focus preposing in particular, is commonly called ‘topicalisation’. We do not adopt that term here because we do not accept the implication that the (characteristic) function of the construction is to accord topic status to the preposed complement.

discussed in §3.2. In this section we will look further at preposing of AdjPs and PPs, the latter of which are characteristically locative.

### ■ Preposing of AdjPs

Preposing of AdjPs is less common than that of the other categories and subject to a different constraint. It is restricted to cases where we have an explicit contrast between one property and another, as between “vulgar” and “dumb” in [6iii]. Note, for example, that [6iii] would be infelicitous if we dropped the *Vulgar it isn’t* clause, so that *dumb* was no longer contrasting with any other property expression.

Typically, as in this example, we have a pair of clauses with preposing, involving a salient set of two properties, one of which is affirmed and the other denied: the clauses are used in tandem to evaluate some salient discourse entity. This pattern is further illustrated in [7]:

- [7] i *The Philadelphia Fish & Co. is grilling fresh seafood so good the competition is broiling mad.* [*Casual and affordable they are. Expensive they are not.*]  
 ii *The ratings no doubt will show that some small number of Americans failed to escape and ended up watching the two-hour NBC ‘World Premiere Movie.’* [*A premiere it may be, but new it’s not.*]  
 iii [*Pretty they aren’t. But a sweet golden grapefruit taste they have.*]

In [i] the preposed complement is an AdjP (or AdjP-coordination) in both clauses, while in [ii] the first clause has a preposed predicative NP and in [iii] the second has a preposed object NP, property assignment here being expressed by means of *have* rather than *be*. As with complement preposing in general, the preposed complement is related to the preceding discourse. In [6iii] the property “vulgar” has been mentioned before and “dumb” belongs with it in a set of potential properties of sex-ploitation films. In [7i] the AdjPs denote members of a set of properties typically associated with restaurants and hence potentially applicable to the one under discussion.

The following examples illustrate relatively minor variations on the above pattern:

- [8] i *‘In the early days, our productions were cheap and cheerful’, says producer John Weaver of London-based Keefco. ‘We’d go into a seven-light studio, shoot the band in one afternoon and edit as we went along. The client would walk out with a tape that day.’* [*Today’s tapes may still be cheerful, but cheap they are not.*]  
 ii A: *All my friends think she’s wonderful and generous. Well, she’s certainly generous . . .*  
 B: [*Wonderful you’re not so sure about?*]  
 iii A: *I can’t stand him. He’s stupid, arrogant, and totally off-the-wall.* B: [*Stupid I wouldn’t really say he is.*]

In [i] only the second of the paired clauses has the AdjP preposed, the first having the default order. In [ii] A affirms the property “generous” (with default order), while B queries A’s evaluation of the person under discussion with respect to the property “wonderful”. In [iii] A affirms a set of properties and B denies one of them. These examples have in common with [6iii]/[7] that there is a contrast between two or more properties that are explicitly evoked either in the prior discourse or in the speaker’s own utterance.

### ■ Preposed locative complements

Semantically locative preposings differ from other types of complement preposing in that while the complement is still required to be related to some constituent in the prior discourse, there is with locatives no requirement of a discourse-old open proposition.

Compare, for example:

- [9] i *There are two issues we'll have to deal with.* [One we can discuss tomorrow.]  
 ii A: *Do you think you'd be more nervous in a job talk or a job interview?*  
 B: [A job talk I think you'd have somewhat more control over.]  
 iii *In the VIP section of the commissary at 20th Century Fox, the studio's elite gather for lunch and gossip. The prized table is reserved for Mel Brooks, and [from it he dispenses advice, jokes, and invitations to passers-by].*

In non-locative [i] the preposed *one* is straightforwardly related to the prior *two issues* and at the same time we have an open proposition, “We can discuss the issues at times *x*”, which is inferrable from what precedes: if we have to deal with the issues there will be various times at which we can discuss them. Similarly in [ii]: the preposed complement denotes something already mentioned, and in addition A's talk of nervousness evokes the concept of having control over a situation, so the open proposition “You'd have *x* amount of control over the situation” counts as discourse-old. In the locative [iii], however, there is no such open proposition recoverable from the prior discourse. The NP *it* within the preposed PP relates of course to *the prized table*, but the proposition “He dispenses *x* from some location” is not inferrable from the context.

The relaxation of the usual requirement for a discourse-old open proposition applies only with static as opposed to dynamic situations. Compare:

- [10] i *My neighbours have a huge back yard.* [Through it they've run a string of beautiful Japanese lanterns.]  
 ii *My neighbours have a huge back yard.* [\*Through it my kids like to run.]

Here we have different interpretations of *run through*. In [i] it has a static interpretation: the clause is simply describing the location of the string of lanterns. In [ii], by contrast, it is interpreted dynamically, as denoting movement across a path. Example [ii] is then infelicitous because it fails to satisfy the general requirement of a discourse-old open proposition: “people like to do *x* through it” is not inferrable from the preceding sentence.

## 3.2 Proposition assessment

One special case of non-focus complement preposing has the focus on the polarity of the clause, positive or negative, and serves as a means of assessing the truth of the proposition expressed. The main stress typically falls on the auxiliary verb or the negative marker *not*:

- [11] i *I've promised to help them* [and help them I WILL].  
 ii *It's odd that Diane should have said that, if [say it she DID].*  
 iii *The NBA's new collective-bargaining agreement sounds as though it was written by the IRS.* [Simple it is NOT.]

In all but a small range of exceptions that we will return to at the end of the section, the clause has emphatic polarity and hence requires the verb to be an auxiliary (see

Ch. 3, §2.1.3). The supportive auxiliary *do* is then required to carry the focal stress if there is no semantically contentful auxiliary in the corresponding unemphatic default order clause – compare *say it she did* in [ii] with *She said it*. Because the preposed element is a complement of an auxiliary it is very often a non-finite VP, like *help them* and *say it* in [i–ii], but other categories of complement are found with auxiliary *be* and (for some speakers) *have*, as seen in the preposed AdjP of [iii].<sup>6</sup>

Examples [11i–iii] illustrate respectively the three main types of proposition assessment: **proposition affirmation**, **proposition suspension**, and **proposition denial**. The first two are distinguished from other types of complement preposing in that the preposed complement has to be identical with a constituent in the prior discourse, save for minor differences such as the use of pro-forms or morphological changes like those in [12]:

- [12] i *The developers either couldn't count or they didn't count on the city enforcing the law. [But enforce the law we did, all the way to the United States Supreme Court.]*  
 ii *Inside the truck was beer for the students' consumption. [Consume they did – not only 15 kegs of beer, but also the free posters which they seized to adorn their dorm walls.]*

In [i] the verbs differ in their inflectional form, whereas in [ii] we have a difference in lexical morphology, with *consumption* a noun, *consume* a verb. Note, however, that it would not be admissible to have *Drink they did* in this context: although consuming beer implies drinking, the present construction requires a close formal relation between the preposed complement and the prior discourse.

#### (a) Proposition affirmation

In the most common type of proposition assessment the speaker affirms a belief in or a commitment to a proposition explicitly evoked in the preceding discourse. This is what we have in [11i]: the preceding clause says that I've promised to help them, and the clause with complement preposing affirms that I will indeed do so.

##### Logically independent and dependent proposition affirmation

On one dimension we can distinguish two uses of proposition affirmation according to whether or not the proposition has already been presented as true. Compare:

- [13] i *Asked what he thought about during today's race on a sultry day, Tour de France winner Greg LeMond said: 'I didn't think. I just rode.' [Ride he did.] LeMond won the time trial easily.*  
 ii *At the end of the term I took my first exams; it was necessary to pass if I was to stay at Oxford, and [pass I did].*

In [i] the prior evocation of the proposition that LeMond rode is in the form *I just rode*, which of course presents it as true, as factual. In [ii], by contrast, the prior discourse merely talks of the necessity of my passing if I was to be able to stay on at Oxford, and this itself does not entail that I passed. We will say that in [i] the affirmation is **logically dependent** on the prior discourse, while in [ii] it is **logically independent**. The logically dependent case involves affirmation of a previously asserted proposition, and for this

<sup>6</sup>The construction is often called 'VP preposing', but because auxiliary verbs are not wholly restricted to non-finite complements we find this an inappropriate term.

reason is distributionally more constrained than the independent case: one needs some justification or motivation for affirming what has already been affirmed.<sup>7</sup>

### Concessive, scalar, and simple affirmation

On another dimension we distinguish between concessive, scalar, and simple affirmation. The first two can be either logically dependent or logically independent in the sense just explained, while the simple (or neutral) type is restricted to logically independent affirmation.

In **concessive affirmation** the proposition is affirmed in the context of some countervailing consideration that is conceded in the prior discourse.

- [14] i *It was ironic that he eventually learned more of his mother's story from her papers and tapes than he had from her. [But learn her story he did.]*  
 ii *Waiting in long lines can be infuriating. Waiting in long lines to pay someone else money seems unconscionable. Waiting in long lines to pay someone else more money than they seem to be entitled to is lunacy. [But wait in line they did Monday in Chicago and the Cook County suburbs.]*

In [i] the suggestion is that one wouldn't have expected him to have to learn his mother's story primarily from indirect sources rather than directly from her, but nevertheless he did learn it. In [ii] waiting in line in the relevant circumstances is said to be lunacy, but in spite of this they did it. The examples are logically dependent and independent respectively. In [i] the prior discourse conveys that he did in fact learn her story, the issue being where he learned it. In [ii] the proposition that they waited in line is evoked but not entailed in the prior context. Another example of this type is [12i]: it is concessive in that we enforced the law in spite of their not counting on us to do so, and logically independent in that their not counting on us to enforce the law clearly doesn't entail that we did so. In all cases of concessive affirmation the clause is introduced by the concessive coordinator *but* or a concessive adjunct such as *yet* or *nevertheless*: replacing *but* by *and* in [14] would make the examples infelicitous.

**Scalar affirmation** affirms a proposition whose predicate can be construed as a scale on which the referent of the subject NP is assigned a high value:

- [15] i *'This is one of the things that symbolises the best Evanston has to offer,' David Bradford, chairman of the Evanston Human Relations Commission, said at a public hearing Saturday. 'People will come out and talk about things.' [And talk they did.] For five hours more than 150 residents, police officers and officials, community leaders and politicians filled to capacity the City Council chambers in a public hearing.*  
 ii *Kenny Rogers had asked his fans to bring cans to his concerts to feed the hungry in the area. [And bring cans they did.]*

What is conveyed by the proposition affirmation in [i] is not simply that people talked but that they talked to a remarkable extent – and this is reinforced by the following sentence, which indicates that the talking lasted for five hours. The bracketed clause in [ii] likewise invites an interpretation in which the fans brought a remarkable number of

<sup>7</sup>In [13i] *I just rode* appears as direct reported speech, so the discourse preceding the bracketed clause does not strictly entail its truth. In this context, however, there is no question that what LeMond said was true: the proposition is treated as having been already asserted. Similarly in [15i] below.

cans. Example [13i] above is also of this kind: we understand not simply that LeMond rode but that he rode remarkably well and remarkably fast. Unlike [14], both examples in [15] are logically independent. In [15i], the fact that people will come out to talk does not entail that in this case they did so, and in [ii] Kenny Rogers had merely asked his fans to bring cans, from which it doesn't follow that they did.

**Simple affirmation** is then the residual category, where neither of the special factors found in the concessive and scalar types applies – and here only logically independent affirmations are felicitous:

- [16] i *Andy bet me \$10 he would get 100 on his exam, [and get 100 he did]. No one else got more than 80.*  
 ii *I'm so proud of Andy for getting 100 on his exam, [<sup>#</sup>and get 100 he did]. No one else got more than 80.*

Here there is no countervailing consideration to suggest that it was unlikely that he would get 100, and getting 100 doesn't lend itself to a scalar interpretation: it is difficult to imagine how one could be assigned a high value on a scale representing 'getting 100' (as opposed, say, to getting a good mark). Thus while [i] is perfectly natural, [ii] – where the preceding clause presupposes that Andy got 100 – is not: there is nothing further to affirm.

#### Affirmation with *it + be*

One highly specialised and idiomatic proposition-affirming construction has preposing of the complement of a clause with *it* as subject and *be* as verb:

- [17] i A: *What would you like for breakfast?* B: *French toast.* A: [French toast it is.]  
 ii A: *At First Bank YOU choose the length of your certificates.* B: *What if I want a certificate for only fourteen days?* A: [Then fourteen days it is.]

Here A affirms or accepts B's choice from some previously evoked set – the set of breakfasts or certificate lengths. The affirmation signals an intention to accommodate the addressee's choice: A is committed to providing the French toast, or a certificate for fourteen days. The preposing is an essential feature of the idiom. *It is French toast*, for example, does not have a comparable meaning and cannot be regarded as a default order counterpart of *French toast it is*, as used in [i].

#### Affirmation with *proposed that*

Another specialised case of affirmation has anaphoric *that* as the preposed complement:

- [18] i A: *It must have surprised you to hear we're home again.* B: Yes, [that it did].  
 ii A: *George Carlin is a great comedian.* B: [That he is.]  
 iii A: *Are you thinking about leaving?* B: [That I am.]

This construction is used to express emphatic agreement, as in [i–ii], or to give a positive answer to a polar question, as in [iii]. In the agreement case, it is more likely to be used in response to a subjective or evaluative statement than to a factual one. The response in [ii], for example, is more natural than if A had said *George Carlin is Emma's brother-in-law*.

### (b) Proposition suspension

- [19] *Mark submitted his report late, if [submit it he did].*

This type of proposition assessment functions syntactically as a complement of the conditional preposition *if*; the *if* phrase is used to suspend the speaker's commitment to

a proposition that would otherwise be entailed. *Mark submitted his report* is an entailment of *Mark submitted his report late*, but not of [19] as a whole. The superordinate clause must contain information beyond that expressed in the subordinate one. If, for example, we drop *late* from [19] the result is anomalous: *#Mark submitted his report if submit it he did* is unacceptably tautological and uninformative.

### (c) Proposition denial

The third type of proposition assessment is used to deny a proposition for ironic effect. It is restricted to clauses where the preposed element is a complement of copulative *be*:

- [20] i *The NBA's new collective-bargaining agreement sounds as though it was written by the IRS. [Simple it is not.]*  
 ii *I will long cherish Mickey Rooney's appearance to receive a special Oscar in recognition of his 60 years as a performer. [Humble he wasn't,] but why should he be? As he told us rather curtly, he'd been the world's biggest box office star at 19.*

Commonly, as in these examples, proposition denial involves **meiosis**, or understatement, resulting in an ironic and colourful interpretation that would not necessarily be induced by the corresponding default-order construction. We understand from [i], for example, that the agreement was not merely not simple, but extremely complicated, and from [ii] that Mickey Rooney was the opposite of humble.

Proposition denial serves to express the speaker's evaluation of some salient person or other entity with respect to some salient or inferrable property. In [20i] (repeated from [11iii] above), "simple" belongs to the set of properties applicable to such documents as agreements and Internal Revenue forms; in [20ii], "humble" represents one of the inferrable properties associated with the ideal Oscar recipient. If the property in question is neither evoked nor inferrable, the construction is infelicitous:

- [21] i *The TV repairman keeps looking in the mirror. [A sex symbol he's not.]*  
 ii *I don't think the TV repairman knows what he's doing. [#A sex symbol he's not.]*

In [i] the preceding sentence raises the issue of the man's physical appearance, and hence *a sex symbol* constitutes an acceptable link to the prior discourse, but in [ii] there is no evident connection between his appearance and his ability to repair television sets.

### Epitomisation

One particular case of proposition denial is called 'epitomisation'. Here the preposed complement is a definite NP, typically a proper name, whose referent can be seen as the epitome of the relevant property:

- [22] i [Mount Everest it wasn't,] but *Engineering School sophomore Benno Matschinsky prepares to rappel from the South St. Bridge yesterday afternoon, and then falls gracefully with a safety rope toward the ground.*  
 ii *The triumphant mood is broken when an usher from the movie theatre next door strolls over. 'You're blocking our marquee,' he bellows in my ear, making it clear that I should move on – hastily.*  
 [Carnegie Hall it isn't,] but *for an amateur musician, a bustling sidewalk can be as good a place as any to begin.*

In [i] the relevant property is the height of entities to be climbed, and Mount Everest represents the highest value on the scale defined by this property. In [ii] the epitomised property is success as a musician, with the highest value on this scale represented by performance at Carnegie Hall.

#### ■ Proposition assessment with lexical verbs

We noted at the beginning of this section that the preposed element in proposition assessment is normally the complement of an auxiliary verb. Compare, for example:

- [23] i *He suggested I phone Emma*, [<sup>#</sup>*so Emma I phoned*].  
 ii *He suggested I phone Emma*, [*so phone her I did*].

In [i] we have the preposing of the complement of the lexical verb *phone*, and in this context, as an instance of proposition affirmation, the preposing is infelicitous. Instead we would have [ii], with preposing of the non-finite complement of auxiliary *do*.

There are, however, some exceptions – cases where the complement of a lexical verb can be preposed in proposition affirmation:

- [24] *I've put Jones in the Green Room* [*and in the Green Room he stays*].

The first clause entails that Jones is in the Green Room, and the second affirms that that situation will continue to obtain. Note that in this context we could not have <sup>#</sup>*and stay in the Green Room he will*, because there has been no prior evocation of the proposition “He will stay in the Green Room”. This extension of the normal pattern is highly constrained, hardly possible except with verbs that are semantically comparable to the auxiliary verbs – in this case, *stay* expresses the aspectual concept of continuity.

#### ■ Inflection with perfect *have*

A special issue arises when the preposed element is a complement of perfect *have*. Compare:

- [25] i *He said he wouldn't tell them*, [*but tell/told them he has*].  
 ii *He denies he has told them*, [*but tell/told them he has*].

Although *have* normally takes a past participle, it is the plain form of the verb that is preferred in [i]. The past participle is preferred in [ii], where it has been used in the preceding clause, but even here the plain form *tell* is acceptable.

### 3.3 Focus complement preposing

We turn now to cases where the preposed complement is focused:

- [26] i *I made a lot of sweetbreads*. [*A couple of POUNDS I think I made for her*].  
 ii *I had two really good friends*. [*DAMON and JIMMY their names were*].  
 iii *I promised my father* – [*on Christmas EVE it was*] – *to write home at my first opportunity*.  
 iv A: *Did you want tea?* B: [*COFFEE I ordered*].

In focus complement preposing the preposed constituent serves both as a link with the prior discourse and as the value of the variable in the discourse-old open proposition expressed by the rest of the clause. In [i] the open proposition is “I think I made x amount of sweetbreads for her”, and *a couple of pounds* gives the value of x. Whenever a discourse involves mention of a relevant yet unspecified quantity (of time, space, objects,

people, etc.), the focus in a clause with focus preposing may provide a specification of the quantity in question. The open proposition in [ii] is “Their names were *x*”, where *x* stands for members of the set of names. The link *Damon and Jimmy* together with the preceding mention of two really good friends evokes this set. Examples of focus preposing with the verbs *name* or *call* are extremely common; apparently the mere mention of a new object or entity renders salient the proposition that the entity is called something. The open proposition in [iii], roughly “It happened at *x* time”, is salient given the fact that events occur at particular times. Finally, [iv] illustrates the case where the link contrasts with a constituent in the prior discourse: tea and coffee are members of the set of drinks on the menu; “I ordered *x*” is inferrable from A’s question, and the focus provides a correction to the specification of the value of *x*.

### ■ Echoing

Echoing is a special type of focus preposing in which the link is being called into question:

- [27] i A: *Cheeseburger, large fries, and a large Coke.* B: [*Large FRIES you wanted?*]  
 ii A: *I wish Newt Gingrich were running.* B: [*Newt GINGRICH you’d vote for?*]  
 iii A: *Diane gets along with all her colleagues.* B: [*DAVID she gets along with?*]

As in focus complement preposing generally, the preposed constituent represents the value of the variable in a discourse-old open proposition: “You wanted *x*”, “You’d vote for *x*”, “Diane gets along with *x*”. An echoing questions whether this link represents the correct value of the variable, reflecting uncertainty or disbelief on the part of the speaker. Examples [i–ii] illustrate the usual case of echoing, where the link repeats a phrase occurring in the preceding utterance. Example [iii] illustrates a less common case: David has not been explicitly mentioned, but he is one of her colleagues, so it follows from what A says that Diane gets along with David, and this is what B calls into question.

## 4 Postposing

An element is said to be postposed when it appears to the right of its basic position, at the end of the clause (save perhaps for one or more adjuncts):

- [1] i *Spain’s financial problems were less acute than [had been those of Portugal].*  
 ii *He seemed at that time very much more sympathetic to the idea than he is now.*  
 iii *There was in her manner a certain aloofness that I found quite disconcerting.*  
 iv *Chris put on the table a large blue bucket full of ice-cubes.*

The postposed elements here are respectively subject, predicative complement, displaced subject (in the existential construction), and direct object. For the subject the default position is before the predicator, and for the other three functions it is immediately after the predicator.

### ■ Weight and relative weight

One major factor that motivates postposing is weight: there is a tendency or preference for heavy constituents to appear late in the clause. The examples in [1] may thus be

contrasted with the structurally similar ones in the right-hand column of [2]; here the postposed constituent is short, and the version with postposing is much less natural or acceptable than the one with default order shown on the left:

- | [2] | DEFAULT ORDER VERSION                                | VERSION WITH POSTPOSING                                |
|-----|--|--|
| i   | a. <i>You weren't as ill as [<u>I had been</u>].</i> | b. # <i>You weren't as ill as [<u>had been I</u>].</i> |
| ii  | a. <i>She seemed <u>sad</u> at that time.</i>        | b. ? <i>She seemed at that time <u>sad</u>.</i>        |
| iii | a. <i>There is <u>some milk</u> in the fridge.</i>   | b. ? <i>There is in the fridge <u>some milk</u>.</i>   |
| iv  | a. <i>Chris put <u>his elbows</u> on the table.</i>  | b. # <i>Chris put on the table <u>his elbows</u>.</i>  |

The felicity of a postposing depends not simply on the weight of the postposed constituent, but on the relative weights of it and the constituent over which it is moved:

- |     |     |  |  |
|-----|-----|--|--|
| [3] | i   | a. <i>You'll find <u>the company's latest financial statement</u> on your desk.</i>  | b. <i>You'll find on your desk <u>the company's latest financial statement</u>.</i>  |
|     | ii  | a. <i>You'll find <u>the company's latest financial statement in the top drawer of the tall black filing cabinet alongside the window</u>.</i> | b. ? <i>You'll find in the top drawer of the tall black filing cabinet alongside the window <u>the company's latest financial statement</u>.</i> |
|     | iii | a. ? <i>You'll find <u>the report that the company has prepared in response to the secretary's latest allegations</u> on your desk.</i>        | b. <i>You'll find on your desk <u>the report that the company has prepared in response to the secretary's latest allegations</u>.</i>            |

In [i] the object NP is considerably heavier than the locative PP and postposing is acceptable, though not obligatory. In [ii] we have the same object NP, but this time it is a good deal less heavy than the PP, with the result that postposing is barely acceptable. Conversely, in [iii] we have the same PP as in [i], but a much heavier object NP, and in this case postposing is more or less obligatory.

One place where it is particularly clear that **relative** weight is the crucial factor is in the object + particle construction (see Ch. 4, §6.2). Almost any NP is heavier than a particle, and postposing is normally permitted with any object other than an unstressed personal pronoun:

- |     |    |   |   |
|-----|----|---|---|
| [4] | i  | a. <i>I brought <u>the chairs</u> in.</i> | b. <i>I brought in <u>the chairs</u>.</i> |
|     | ii | a. <i>I brought <u>them</u> in.</i>       | b. * <i>I brought in <u>them</u>.</i>     |

#### ■ Postposing of NPs representing discourse-new information

Leaving aside the object + particle construction, where object postposing applies very freely, postposed NPs tend to be both heavy and discourse-new. Heavy NPs are likely to be discourse-new since entities that have already been referred to can generally be evoked a second time with few words, but as we noted in §2 there is only an imperfect correlation between weight and discourse-familiarity status. And in the present context we need to note that discourse-new status may be sufficient to motivate postposing when the NP concerned is not heavy:

- [5] *Jenkins walked back into the office and glanced out of the window. Turning around, he saw on the desk a gun.*

A *gun* is not heavy (and in relative terms the locative PP *on the desk* is slightly heavier than the object), but in terms of information status *a gun* is discourse-new while *a desk* is discourse-old (by virtue of the prior mention of the office and the salient relation between desks and offices). It is this difference in information status that motivates the postposing. Postposing of this kind is less frequent than that motivated by weight. Whereas the default order version *he saw a gun on the desk* is quite neutral, the version with a postposed object emphasises the unexpectedness of the gun.

### ■ Subject postposing

Postposing of the subject is usually accompanied by preposing of another complement or an adjunct, giving the subject-dependent inversion construction seen in *More important are the moral objections*, etc.: this we deal with in §5 below. For the rest, postposing of the subject is found in two constructions. One is the comparative construction illustrated in [1i]; here the postposing is motivated by weight, as we have seen. The other is with verbs of reporting:

- [6] i *The best solution, suggested Pat, would be to install a security alarm system.*  
 ii *Said Manager Kim Kessels: 'This is our best result in 20 years!'*

Here subject postposing occurs predominantly in parentheticals, as in [i], but in journalistic style it is also found with the verb in initial position, as in [ii]. This is a different kind of postposing from the others considered in this section, since it is apparently not motivated by weight.

### ■ Object postposing

In the examples given so far, the object is postposed over a PP. Other possibilities are illustrated in [7]:

- [7] i *I have read very carefully / several times all the articles she has written.*  
 ii *I found rather more promising the proposals that his sister had made.*

In [i] the object is postposed over an AdvP or NP in adjunct function, while in [ii] it is moved over a predicative AdjP. Where a complex-transitive clause has an NP rather than an AdjP as the predicative complement, postposing is less readily acceptable:

- [8] <sup>?</sup>*He considers an idiot just about anyone who disagrees with him.*

It is not possible to postpose an indirect object over a direct one. Most ditransitive clauses have an alternant with one object + a PP complement (see Ch. 4, §8.2.1), and the latter construction is used instead of indirect object postposing:

- [9] i *They gave anyone who scored over 90% a special prize.* [O<sup>i</sup> + O<sup>d</sup>]  
 ii *\*They gave a special prize anyone who scored over 90%.* [O<sup>d</sup> + O<sup>i</sup>]  
 iii *They gave a special prize [to anyone who scored over 90%].* [O<sup>d</sup> + PP comp]

One further syntactic restriction is that object postposing is hardly permitted in the complex catenative construction (see Ch. 14, §3):

- [10] i *I believe one of the systems analysts we brought in from Ohio to be responsible.*  
 ii <sup>?</sup>*I believe to be responsible one of the systems analysts we brought in from Ohio.*

## 5 Subject–dependent inversion

### 5.1 Syntactic issues

In subject–dependent inversion the subject occurs in postposed position while some other dependent of the verb is preposed. A considerable range of elements may invert with the subject in this way, as illustrated in [1]:

- [1] i *George, can you do me a favour? [Up in my room, on the nightstand, is a pinkish-reddish envelope that has to go out immediately.]*  
 ii [*Immediately recognisable here is the basic, profoundly false tenet of Movie Philosophy 101, as it has been handed down from “Auntie Mame” and “Harold and Maude”:*] *Nonconformism, the more radical the better, is the only sure route to human happiness and self-fulfilment.*  
 iii *She’s a nice woman, isn’t she? [Also a nice woman is our next guest] . . .*  
 iv *Arrested were Nathan Johnson, 23, of New York, and his brother, Victor Johnson, 32, a 15-year Army veteran.*  
 v *This jacket and cap will keep you warm throughout the chilly autumn days. The jacket is made of a particularly heavy brushed denim, with rivets at the pockets and a brown suede collar. [Complementing the jacket is the cap, crafted of the same denim and featuring a brown suede visor.]*  
 vi *On Saturday they received an astonishing fourteen credit offers in the mail. [Three days later came another eight offers.]*

In the great majority of cases the preposed element is a complement, usually of the verb *be*; [vi] shows, however, that with other verbs it can be an adjunct. It is for this reason that we speak of subject–dependent inversion – inversion of the subject and another dependent of the verb.

The complements in these examples are a PP in [1i], an AdjP in [1ii], an NP in [1iii], and subjectless non-finite clauses, or VPs, in [1iv–v]. The inversion of the subject with an NP in predicative function, as in [1iii], is relatively rare: it results in a structure of the form ‘NP + *be* + NP’, which looks like that of a canonical construction with the first NP as subject and the second as predicative complement. We take *also a nice woman* as the predicative complement rather than the subject here for two reasons. In the first place, this matches the meaning: the propositional meaning is the same as that of *Our next guest is also a nice woman*, i.e. it ascribes the property of being a nice woman to our next guest. Secondly, this analysis is supported by the fact that the first NP lacks the important syntactic property of subjects of being able to invert with an auxiliary verb to form an interrogative: *\*Isn’t also a nice woman our next guest?*<sup>8</sup>

Example [1v] merits further comment because the inverted clause does not correspond semantically to *The cap is complementing the jacket* but rather to the non-progressive *The cap complements the jacket*. Subject–dependent inversion cannot apply to the latter because *complements the jacket* is the entire VP, not a dependent thereof. The progressive form in [1v] thus does not have a non-progressive counterpart: *\*Complements the jacket the*

<sup>8</sup>Subject–dependent inversion is possible with *be* only in its ascriptive use. If one interchanges the NPs in a specifying *be* clause like *Kim was the chief culprit* to give *The chief culprit was Kim* the syntactic structure remains the same, with the first NP the subject and the second the predicative complement.

*cap* is ungrammatical. It is only in cases like this, i.e. when there is no competition with a corresponding non-progressive, that a preposed progressive VP lacks the expected progressive interpretation. Compare:

- [2] i *Being driven out of office* was Senator Johnson. [progressive]  
 ii *Driven out of office* was Senator Johnson. [non-progressive]

Here [i] does have an inverted non-progressive counterpart, namely [ii], and in this case it has the same interpretation as the uninverted form *Senator Johnson was being driven out of office*.<sup>9</sup>

Subject-dependent inversion involves the postposing of the subject and the preposing of another dependent, but there are grounds for regarding it as a distinct construction rather than the mere combination of two separate and more general constructions, complement preposing and postposing. In the first place, it would very often be inadmissible to have one without the other. This is so with all of [1i–v] – compare, for example, [iv] with *\*Arrested Nathan Johnson, 23, of New York, and his brother, Victor Johnson, 32, a 15-year Army veteran, were* (preposing only) and *\*Were arrested Nathan Johnson, 23, of New York, and his brother, Victor Johnson, 32, a 15-year Army veteran* (postposing only).<sup>10</sup> Secondly, as we shall see in §5.2 the pragmatic constraints on the construction are not simply a combination of those applying to complement preposing and postposing.

## 5.2 Pragmatic constraints on inversion

For inversion to be felicitous, the following conditions must obtain:

- [3] i The preposed phrase must not represent information that is less familiar in the discourse than that represented by the postposed NP.  
 ii Unless the preposed dependent is semantically locative, the inversion requires an appropriate open proposition that is discourse-old.  
 iii The verb must not represent information that is new to the discourse.

### ■ Relative discourse familiarity of the preposed and postposed constituents

We have seen that with ordinary preposing the preposed element must be discourse-old; in inversion, however, the constraint is a relative one in that the preposed constituent must not be less familiar than the postposed one. Compare:

- [4] i *They have a great big tank in the kitchen, [and in the tank are sitting a whole bunch of pots].*  
 ii *They have a whole bunch of pots in the kitchen, [<sup>#</sup>and in a great big tank are sitting all of the pots].*

In the felicitous example in [i], the preposed element is discourse-old while the postposed element is discourse-new, but in [ii] the former is new and the latter old, and the result is infelicitous.

<sup>9</sup>The same point arises with participial modifiers in NP structure. *Those being investigated by the police* contrasts with *those investigated by the police* and therefore has a progressive interpretation, but with *those owning their own home* there is no such contrast and the gerund-participial does not have a progressive interpretation (see Ch. 14, §9)

<sup>10</sup>The example with preposing only is marked as infelicitous rather than ungrammatical because the construction is elsewhere quite acceptable: *I said they would be arrested and arrested they were!*

A large majority of inversions are of the type shown in [4i], with the preposed element discourse-old and the postposed subject discourse-new. Two other patterns are possible, but uncommon. In the following, both elements are discourse-new:

- [5] *I had lunch at Ritzzy's yesterday, and you wouldn't believe who was there. [Behind a cluster of microphones was Hillary Clinton,] holding another press conference.*

This shows that the problem with [4ii] is not that the preposed constituent is new: it is the combination of new followed by old that makes it infelicitous. Note that it is discourse-familiarity rather than addressee-familiarity that is relevant. In [5] the addressee is likely to be familiar with Hillary Clinton, the wife of the former President, but this has no bearing on the relative status of the inverted constituents: this is not a new + old inversion, like [4ii].

The combination of old + old is illustrated in [1v], and again in [6]:

- [6] *Lieberman and Clinton go way back. When Lieberman made his run for the Connecticut Senate seat in 1970, [helping him as a young volunteer was Clinton,] a young Yale law student.*

Both the preposed pronoun *him* and the postposed subject *Clinton* are discourse-old by virtue of referring to people mentioned in the preceding discourse. Notice, however, that both here and in [1v] it is the more recently evoked information that appears in preposed position. In [6] *him* refers to Lieberman, who has been mentioned more recently than Clinton, and is thus arguably the more salient of the two at the point of the inversion. Similarly, in [1v] although both the jacket and the cap have been previously mentioned, the jacket has been mentioned more recently and is therefore the more salient of the two at the point of the inversion. With the NPs in the opposite order, the inversion is infelicitous in this context: *\*Complementing the cap is the jacket, which also features zippered side pockets.*

Although the inverted constituents in [1v] and [6] are both old, there is a sense, therefore, in which the preposed one represents more familiar information. Condition [3i] says that the information expressed in the preposed element cannot be less familiar than that expressed in the postposed one, but it will now be evident that in almost all cases it is in fact more familiar.

### Inversion in narrative contexts

An inversion commonly performs a scene-setting function at the outset of a narrative:

- [7] *In a little wooden house in the middle of a deep forest lived a solitary woman who spent her days reading and gardening.*

Such an inversion provides a minimally informative setting relative to which the postposed NP can be interpreted. For this reason, the discourse is far more coherent when the topic of the following clause or clauses is the entity represented by the postposed NP rather than that represented by the NP within the preposed phrase. Thus [8i] would make a natural continuation, but [8ii] would not.

- [8] i *She had recently won the lottery, and had hidden the money under her mattress.*  
 ii *It was badly in need of repairs, and everyone who saw it wondered whether it could hold up another year with its broken shutters and fractured foundation.*

Either of these, however, could felicitously follow the default order counterpart of [7],

*A solitary woman who spent her days reading and gardening lived in a little wooden house in the middle of a deep forest.*

Inversions like [7] have a strongly literary flavour. In the context of storytelling the preposed locative can be regarded as discourse-old: the narrative context evokes the notion of a setting, triggering the inference to a set of possible settings, and the preposed PP provides one of these. Outside of a storytelling context, clauses of this form are much less acceptable:

- [9] *Hey, did you hear the weird report on the evening news? [<sup>#</sup>In the basement of a department store are living a bunch of alligators.]*

In the colloquial context the preposed PP represents discourse-new information, and though the new + new combination is not wholly excluded (as illustrated in [5]), it is out of place in the context of [9].

### ■ The discourse-old open proposition requirement

A second condition on the felicity of inversion is that, except with preposed locatives, an appropriate open proposition must be derivable from the prior discourse, with the value of the variable being given by the postposed subject. Compare:

- [10] i *Two young men were hurt yesterday during a bungled convenience-store robbery, according to police. Two suspects were arrested at the scene and are now in custody. [Wounded were Paul Randolph and Steve Seymour.]*  
 ii *The Air & Water Show did not go as planned yesterday. [<sup>#</sup>Wounded were Paul Randolph and Steve Seymour.]*  
 iii *They had every kind of cake imaginable, all lined up in a row. [Adorning the first one was a monstrous rose sculpted from white chocolate.]*

In [i] the open proposition “x were wounded” is inferrable straightforwardly from the prior statement that two young men were hurt. In [ii], however, the mere fact that the show didn’t go as planned is not sufficient to justify treating “x were wounded” as discourse-old information, and the inversion is infelicitous in this context; note that the default order version, *Paul Randolph and Steve Seymour were wounded* would be admissible here. In [iii] the open proposition “x adorned the first cake” is not so directly related to the prior discourse as the corresponding one in [i], but nevertheless it is easily inferrable from the fact that they had every kind of cake imaginable that one of them should have something adorning it.

### Locatives

As with ordinary preposing, the requirement of an open proposition does not apply when the preposed element is locative and the situation is static. Compare static [11i–ii] with dynamic [11iii]:

- [11] i *The low-income high-rises are universally considered to be among the ugliest complexes in the city. [To the west of the group of ten buildings flows the Grayson River, one of the most polluted in the country.]*  
 ii *My neighbours have a huge back yard. [Through it runs a string of beautiful Japanese lanterns.]*  
 iii *My neighbours have a huge back yard. [<sup>#</sup>Through it run my kids almost every afternoon.]*

### ■ Requirement that the verb not represent new information

The great majority of inversions have *be* as the verb; this is the ascriptive rather than specifying *be*, and accordingly has little if any semantic content. Verbs other than *be* are required to represent information that is evoked or inferrable in the context of the preceding discourse or of the inversion itself – compare [1vi] above and the following:

- [12] i *He opened the door and took a folded canvas bucket from behind the seat. [Coiled on the floor lay a fifty-foot length of braided nylon climbing rope.]*  
 ii *Beneath the chin lap of the helmet sprouted black whiskers.*  
 iii *On the manager's desk sat a large manila envelope.*  
 iv *[At odds with the mayor remain the residents of the condos,] who are willing to fight a long battle over the additional taxes.*

In [1vi] the idea of offers coming has been evoked in the previous sentence, so *come* is salient in the context. In [12i] *lay* is inferrable from the preposed *coiled on the floor*, since an object that is coiled on the floor is known to be lying there; therefore, *lay* contributes no new information. In [12ii] *sprout* is inferrable from the mention of whiskers; that is, *sprout* itself adds no information, and could be replaced by *be* with no loss of information – and the same applies to *sat* in [12iii]. Finally, *at odds* in [iv] is an inherently predicative expression, so a complex-intransitive verb is inferrable, and *remain* merely adds the aspectual concept of continuation.

Verbs other than *be* tend to allow a more restricted range of preposed elements than are found with *be*. A high proportion are locatives, and the most common constituent category is PP. Temporals are not uncommon (cf. the *three days later* of [11vi]), but predicatives, especially with AdjP or NP form, are much less readily accommodated than with *be*.

## 5.3 Clauses with the form 'Here/There + verb + NP'

*Here* and *there* can occur as preposed locative complements in ordinary subject-dependent inversions:

- [13] i ... *one of the major focal points of our concern is the South-Asian region. [Here, in two nations alone, are almost 500 million people, all working, and working hard, to raise their standards.]*  
 ii *At the distant edge of the river, I caught a glimpse of roofs and chimneys, and the quick glitter of glass that marked the hot-houses in the old walled garden that had belonged to the Hall. [There, too, lay the stables, and the house called West Lodge.]*

In addition, however, there are certain specialised clause constructions of the form 'here/there + verb + NP' that differ syntactically and/or pragmatically from the inversion construction described above.

### ■ Here/there + be

- [14] i a. *Here was I, an African woman on the grants committee of a British aid agency, suggesting that we scrap a paragraph that dealt with 'gender implications'.*  
 b. *And there was I imagining that underneath that hostile exterior there was a girl who really held me in high esteem.*

- ii [viewing a photograph] *Here's/There's me, when I was six.*
- iii a. *Here's/There's the money I owe you.*
- b. *Here are your instructions. First, drive down to the bank, . . .*

The examples in [i] differ from the inversion construction exemplified in [13] in that the postposed subject is a personal pronoun. At the same time, *here* and *there* are largely bleached of their locative meaning: the construction does not serve to indicate my spatial location, but is a stylistic device for presenting a personal narrative in a vivid way. It is possible for the subject to occupy its basic, pre-verbal position, and examples occur in which the two orders are used in successive clauses, as in *Then there was I, fighting for control, and there you were wanting to come close again.*

In [14ii] the personal pronoun is in the accusative case, indicating that in this construction *here* and *there* have been reanalysed as subjects, with the pronoun a predicative complement. *Here* and *there* are comparable to the demonstratives *this* and *that*, and like the latter would typically be accompanied by pointing, or some other indexing act.

The examples in [14iii] are inversions. Those in [iiia] can be interpreted as ordinary inversions, giving the location of the money I owe you and alternating with the uninverted construction *The money I owe you is here/there.* However, they also have a use in which they accompany the act of presenting the money to you, whereas the canonical versions could not be felicitously used in this way. In the case of [iiib] this is the only possible use if we assume that the instructions are not written down. In this presentation-accompaniment use *here* and *there* could again be replaced by demonstratives, but in [iiia/b] it is still the post-verbal NP that is the subject, as evidenced by the fact that the verb agrees with this NP. When the NP is a personal pronoun, it precedes the verb, in the nominative case: *Here they are.*

#### ■ *Here/there + come/go*

- [15] a. *Here comes the bus.*
- b. *There goes my last dollar!*

These too are syntactically inversions, but they are not replaceable in context by canonical *The bus comes here* and *My last dollar goes there.* They are comparable to running commentaries, describing a situation that takes place or is taking place as they are uttered. This accounts for the use of the simple present tense for a single present-time event (cf. Ch. 3, §4.2.1); compare the alternative way of announcing the arrival of a bus, with progressive aspect: *Look, the bus is coming.* A personal pronoun subject precedes the verb, as in *Here I come* and *There she goes.*

## 6 Existential and presentational clauses

We are concerned in this section with constructions containing the dummy pronoun *there*: **existentials**, which have *be* as the verb, as in *There's plenty of food in the fridge*, and **presentationals**, which have some verb other than *be*, as in *There remain many problems.*

## 6.1 Syntactic preliminaries

### ■ Dummy *there* vs locative *there*

Historically, dummy *there* derives from the locative *there* of, for example, *Don't leave your shoes there*. Locative *there* is an intransitive preposition contrasting with *here*: it has deictic and anaphoric uses, as described in Ch. 17, §9.1. In the constructions we are concerned with in the present chapter, *there* has been bleached of its locative meaning and reanalysed as a pronoun. The clear split between locative *there* (*there*<sub>loc</sub>) and dummy pronoun *there* (*there*<sub>pro</sub>) is reflected in the fact that they readily combine in the same clause, even in adjacent positions:

- [1] a. *There*<sub>pro</sub> *is nothing there*<sub>loc</sub>.      b. *What is there*<sub>pro</sub> *there*<sub>loc</sub>?

*There*<sub>pro</sub> is generally easy to recognise, being distinguished from *there*<sub>loc</sub> by the following properties:

- [2] i *There*<sub>pro</sub> has no locative or other independent meaning.  
 ii *There*<sub>pro</sub> is always unstressed and has a weak form: /ðə<sup>r</sup>/.  
 iii *There*<sub>pro</sub> functions only as subject or raised object, and can fill the subject position in interrogative tags: *There is something wrong, isn't there?*

As we have said, the original locative meaning has been lost, and *there*<sub>pro</sub> combines as readily with *here* as with *there*<sub>loc</sub>: compare [1a] with *There*<sub>pro</sub> *is nothing here*. Hence our term 'dummy *there*'. It is simply the marker of a grammatical construction, serving to fill the subject position while the element that would be subject in the basic version is displaced to post-verbal position. The phonological property noted in [2ii] reflects this lack of semantic content, and *there*<sub>pro</sub> can never be focus. *There*<sub>loc</sub>, by contrast, always retains its full vowel /eə<sup>r</sup>/ and can occur as focus (*Don't leave it HERE: it belongs over THERE*<sub>loc</sub>). It is property [2iii] that leads us to analyse dummy *there* as a pronoun (see Ch. 5, §10.1.1). It is comparable to certain uses of the pronoun *it*, which can also serve as a dummy subject (e.g. in the extraposition construction *It's a pity we missed them*); there are, indeed, certain cases where we have a paradigmatic contrast between *there*<sub>pro</sub> and *it*, as in *Who was there/it that was playing in the garden?* In the remainder of this section, *there* unless otherwise noted is to be understood as the dummy pronoun *there*<sub>pro</sub>.

### ■ Subject and displaced subject

Many clauses with *there* as subject have syntactically simpler counterparts without *there*, and our analysis of the former is derivative from that of the latter. Compare:

- [3] a. *Several windows were open.*      b. *There were several windows open.*

In [a] *several windows* is the subject, whereas in [b] the subject function is filled by *there*, as argued in Ch. 4, §3.2.2. We accordingly analyse *several windows* as a **displaced subject**: it is an internal complement of the verb that is not syntactically a subject but corresponds semantically to the subject of the counterpart in [a]. Note in this connection that *several windows* is in both examples the predicand to which the predicative complement *open* applies. We then generalise the concept of displaced subject to clauses that have no simpler counterpart. Thus *There was an accident* has *an accident* as displaced subject even though there is no corresponding clause in which it is subject proper (*\*An accident was*).

### ■ *There* as a raised complement

*There* commonly occurs as the raised subject or object of a catenative verb, as described in Ch. 14, §§2–3:

- [4] i *There seems to have been a mistake.*  
 ii *We hadn't expected there to be over a hundred people at the meeting.*

In [i] *there* is the raised subject of *seem*, but *a mistake* is the displaced subject of *be*, just as in the simpler construction *There was a mistake*. Similarly, in [ii] *there* is the raised object of *expect*, but *over a hundred people* is the displaced subject of *be*, just as in *There were over a hundred people at the meeting*. In both cases, then, we take the embedded *be* clause to be an existential even though *there* does not appear as subject of that clause but is located higher in the constituent structure of the sentence.

### ■ Position of the displaced subject

The default position of the displaced subject is immediately after the verb, as in [3b–4]. As an internal complement of the verb, however, it can undergo the processes of postposing and preposing, and in relativisation it need not be overtly present at all:

- [5] i *There were in his in-tray no fewer than thirty unpaid bills.*  
 ii *How much is there in the other account?*  
 iii *Two further points there are that I must make before we leave this topic.*  
 iv *You can have everything [there is on the table] for \$30.*

In [i] the displaced subject is postposed over the locative PP *in his in-tray*. Example [ii] is an open interrogative, with the displaced subject itself as the interrogative element, appearing in initial position. In [iii] we have complement preposing, but with the relative clause that modifies *points* postposed; the default order for the existential would be *There are two further points that I must make before we leave this topic*. Finally, in [iv] we have relativisation of the displaced subject so that it does not appear overtly in the existential clause: instead we have a gap anaphorically linked to the antecedent (*every*)*thing*.

## 6.2 The existential construction

Most clauses with *there* as subject have *be* as the verb, and these are called existential clauses. The general term ‘existential’ derives from the fact that one use of this construction is to express propositions concerning existence: *There aren't any unicorns*; *They were arguing about whether there is a God*; *How many different kinds of jelly-fish are there?* It should be borne in mind, however, that the category of existential clause is defined syntactically in terms of the combination of *there* and *be*: existential propositions can be expressed by other syntactic means (cf. *They were arguing about whether God exists*), existential clauses do not always express existential propositions (cf. *There is also me to consider*, which doesn't serve to assert my existence), and in pairs like [3a–b], where only [b] is an existential clause, the difference is a matter of information packaging rather than of propositional content.

## 6.2.1 Survey of structures

### ■ The distinction between bare and extended existentials

We draw a distinction between **bare** and **extended** existentials, as illustrated in [6]:

[6]	BARE EXISTENTIAL	EXTENDED EXISTENTIAL
i	a. <i>There's no milk (again).</i>	b. <i>There's one copy <u>on the table</u>.</i>
ii	a. <i>(Then) there was silence.</i>	b. <i>There's Sue <u>to consider</u>.</i>
iii	a. <i>There was a short delay (because he'd mislaid his notes).</i>	b. <i>There were two sirens <u>blaring</u>.</i>

Bare existentials contain *there*, the verb *be*, and the displaced subject, alone or accompanied by adjuncts like those enclosed in parentheses in the [a] examples. These adjuncts are of no syntactic significance for the existential construction since they are admissible here under the same conditions as apply in other constructions: compare *She smiled (again)*; *(Then) they departed*; *He was embarrassed (because he'd mislaid his notes)*. Extended existentials contain, in addition to *there*, *be*, and the displaced subject, an **extension**, such as the underlined constituents in the [b] examples. These elements are of relevance to the existential construction, being either complements or adjuncts that are more constrained than those in the [a] examples in that they occur less freely in other types of clause. The locative *on the table* is a complement of *be*: note that it cannot be omitted from the non-existential counterpart *One copy is on the table*. In [iib] the infinitival complement *to consider* is licensed only by *be* and a few other verbs: compare *\*I saw Sue to consider*. In [iiib] *blaring* is not a modifier of *sirens* (as evident from the inadmissibility of examples like *\*Two sirens blaring were expected*): it is a separate element in clause structure licensed by the existential construction.

We look first at bare existentials, and then at the various kinds of extension.

#### (a) Bare existentials

- [7]
- i *There are good teachers and bad teachers.*
  - ii *There is plenty of ice-cream.*
  - iii *There is bound to be an official inquiry.*
  - iv *Is there a bus to the library?*
  - v *There's no doubt we're in a lot of trouble.*
  - vi *There can be no turning back now.*

The verb *be* can hardly occur without an internal complement,<sup>11</sup> and there are accordingly no non-existential counterparts of examples like these: compare *\*Good teachers and bad teachers are*, and so on. Example [i] illustrates the case where the construction expresses an existential proposition – it would be used to assert the existence of good and bad teachers. Example [ii] illustrates the common case where there is an implicit locative: we would generally understand “here”, “in the fridge”, or the like. Many nouns denoting events are found in bare existentials, as with *inquiry* in [iii]: *be* in such cases expresses occurrence. Example [iv] asks not about the existence of buses but whether they run to the library – or about the existence of a bus-service to the library. *Doubt* in [v] is one of a set of nouns expressing modality that are commonly found in bare existentials: the clause

<sup>11</sup> Exceptions are largely limited to philosophical discourse (cf. *I think, [therefore I am]*) or fixed frames (*Time was when . . .*).

can be glossed as “Undoubtedly we’re in for a lot of trouble”. Example [vi] contains what we call a hybrid NP as displaced subject: an NP with a VP (*turning back*) as head – see Ch. 14, §1.6. This irregular type of NP is found predominantly in existentials.

### (b) Locative and temporal extensions

- |     |  |   |
|-----|--|---|
| [8] | NON-EXISTENTIAL                                    | EXISTENTIAL   |
| i   | a. <i>A friend of yours is <u>at the door</u>.</i> | b. <i>There’s a friend of yours <u>at the door</u>.</i> |
| ii  | a. <i>One concert is <u>on Sunday</u>.</i>         | b. <i>There’s one concert <u>on Sunday</u>.</i>         |

One very common type of extended existential has a locative or temporal complement. In the examples given here both existential and non-existential versions are acceptable; often, however, pragmatic factors make one or the other infelicitous. This issue applies quite generally to extended existentials, and is dealt with in §6.2.2.

### (c) Predicative extensions

- |     |     |   |  |
|-----|-----|---|--|
| [9] | i   | a. <i>Two delegates were <u>absent</u>.</i>                   | b. <i>There were two delegates <u>absent</u>.</i>                    |
|     | ii  | a. <i>Two delegates were <u>deaf</u>.</i>                     | b. <i>#There were two delegates <u>deaf</u>.</i>                     |
|     | iii | a. <i>Two delegates were <u>employees of the sponsor</u>.</i> | b. <i>#There were two delegates <u>employees of the sponsor</u>.</i> |
|     | iv  | a. <i>Is anything <u>the matter</u>?</i>                      | b. <i>Is there anything <u>the matter</u>?</i>                       |

Existentials with predicative extensions systematically have acceptable non-existential counterparts. But there are quite severe constraints on the type of predicative permitted in the existential construction. In the first place, the predicative must denote a temporary state as opposed to a (relatively) permanent property, as illustrated in the contrast between [i] and [ii]. A sample of adjectives found in such existentials is given in [10]:

- |      |                |                  |                   |                  |                 |                |
|------|----------------|------------------|-------------------|------------------|-----------------|----------------|
| [10] | <i>afoot</i>   | <i>alarming</i>  | <i>asleep</i>     | <i>available</i> | <i>awake</i>    | <i>better</i>  |
|      | <i>certain</i> | <i>different</i> | <i>empty</i>      | <i>missing</i>   | <i>pleasing</i> | <i>present</i> |
|      | <i>right</i>   | <i>sick</i>      | <i>surprising</i> | <i>vacant</i>    | <i>worth</i>    | <i>wrong</i>   |

Illustrative examples are *There’s a scheme afoot to dump the premier*; *There are two plates missing*; *There are several points worth considering further*.

A second restriction is that predicatives with the form of NPs are normally excluded, as shown in [9iiib]. One exception involves the idiomatic expression *the matter* (“wrong”), as in [ivb].

### (d) Infinitival extensions

- |      |    |   |   |
|------|----|---|---|
| [11] | i  | a. <i>A few replies are still <u>to come</u>.</i> | b. <i>There are still a few replies <u>to come</u>.</i> |
|      | ii | a. <i>One letter is (for you) <u>to sign</u>.</i> | b. <i>There’s one letter (for you) <u>to sign</u>.</i>  |

In [i] *a few replies* is understood as subject of the infinitival, while in [ii] *one letter* is understood as object of the infinitival – see Ch. 14, §6.3.

### (e) Participial extensions

Existential clauses in which *be* is followed by a noun that is in turn followed by a participial clause may be construed syntactically in two ways. Firstly, the subordinate clause may be a modifier of the noun and hence part of the displaced subject NP:

- |      |    |   |
|------|----|---|
| [12] | i  | <i>There were [specimens <u>measuring over twelve inches in length</u>].</i>    |
|      | ii | <i>There were [some letters <u>written by her grandmother</u>] in the safe.</i> |

Example [i] is a bare existential, while [ii] has a locative extension. Secondly, the subordinate clause may be an extension, not part of the displaced subject NP:

- [13] i *There were [some boys] playing cricket.*  
 ii *There were [several people] killed.*

The non-existential counterparts of these are *Some boys were playing cricket* and *Several people were killed*, whereas the counterpart of [12ii] is *Some letters written by her grandmother were in the safe*. Example [12i], being a bare existential, has no non-existential counterpart, but we understand it as asserting the existence of specimens that measured over twelve inches in length.

There is ample evidence for the structure shown in [12]. First, nouns regularly take gerund-participial and past-participial clauses as modifiers. Second, the bracketed sequences in [12] occur elsewhere as NPs: *We had found [specimens measuring over twelve inches in length] / [some letters written by her grandmother]*. Thus, it follows that such NPs should also be able to occur as displaced subjects in existential clauses. Syntactic evidence for recognising a distinct construction of the kind shown in [13] is provided by examples like the following:

- [14] i *There are [some people] going to be disadvantaged by the new tax system.*  
 ii *There were killed [some 650 infantry from the 2nd Battalion].*  
 iii *We postulate a system of particles [on which there are [some forces] acting].*

The *going* of [i] does not occur in clauses functioning as a modifier of a noun: compare *\*Those people going to be disadvantaged by the new tax system will have to be compensated in some way*. Example [ii] is comparable to [5i] above, with postposing of a heavy NP over the extension: this would not be possible if *killed* were a modifier of *infantry from the 2nd Battalion*. In [iii] the existential is a relative clause, which is enclosed by the outer pair of brackets, while the inner pair enclose the displaced subject. The corresponding main clause is *There are some forces acting on a system of particles*. Relativisation applies to an element within the *acting* clause, and again this would not be possible if this clause were a modifier of *forces*. There are thus good grounds for treating these examples as the existential counterparts of [15]:<sup>12</sup>

- [15] i *Some people are going to be disadvantaged by the new tax system.*  
 ii *Some 650 infantry from the 2nd Battalion were killed.*  
 iii *We postulate a system of particles [on which some forces are acting].*

Note that the *be* in these examples is not the copula but the progressive or passive auxiliary.<sup>13</sup>

The position of the displaced subject after the verb *killed* in [14ii] makes this clause look like a presentational construction – compare *Then there had appeared some 650 infantry from the 2nd Battalion*. The resemblance, however, is only superficial: [14ii] differs crucially from

<sup>12</sup> An exceptional gerund-participial construction that doesn't belong with either [12i] or [13i] is found with *there be no use/point*, as in *There's no use/point complaining*, 'Nothing is to be gained by complaining'. There is also a past-participial construction that differs from those of [12ii] and [14ii]: <sup>96</sup>*There's a man been shot*. Here *been* is a perfect past participle, 's being a cliticised form of the auxiliary *has* (cf. *A man has been shot*) – but one which cannot be replaced by the full form.

<sup>13</sup> It is primarily because of examples with passive extensions, such as [13ii] and [15ii], that we prefer 'displaced subject' to the more usual 'logical subject' as the term for the NP corresponding to the subject of the non-existential counterpart. *Several people* and *some 650 infantry from the 2nd Battalion* are associated with the semantic role of patient, not agent, and hence are not logical subjects as that term is traditionally understood.

the latter in that the displaced subject follows *killed* as a result of postposing. If the NP were less heavy it could precede *killed*, as in [13ii], *There were several people killed*. This would not be possible if it were a presentational clause: compare \**Then there had several people appeared*.

(f) **Relative clause extensions**

It may be that a distinction matching the one we have drawn between [12] and [13] applies also to existentials containing relative clauses. Compare:

- [16] i *There are [people that have an IQ far greater than that].* [modifier within NP]  
 ii *There was [one man] that kept interrupting.* [relative clause extension]

In [i] the relative clause is naturally taken as a modifier of *people*: the sentence asserts the existence of people with an IQ far greater than ‘that’. Example [ii], however, might be construed as the existential counterpart of *One man kept interrupting*. Note that the latter is a paraphrase of [ii], whereas [i] cannot be paraphrased as *People have an IQ far greater than that*.

The case for making a structural distinction along the lines indicated is much weaker with relative clauses than with the gerund-participials and past-participials discussed in (e) above, and it remains an open question whether the analysis suggested for [16ii] is valid. One piece of supporting evidence that can be adduced is the possibility of having a relative clause after a proper name. Thus in answer to the question *Who might be able to help?* one might reply: *Well, there’s John you could try*. This cannot have an analysis like [i], for *John you could try* is not a possible NP.

### 6.2.2 Pragmatic constraints

The existential construction is characteristically used to introduce addressee-new entities into the discourse, and for this reason the displaced subject NP is usually indefinite. In many cases, the presence of an indefinite NP makes the existential pragmatically obligatory in that the corresponding non-existential is infelicitous:

- [17] i *There is a serious flaw in your own argument.*  
 ii \**A serious flaw is in your own argument.*

Conversely, replacing an indefinite NP in an existential with a corresponding definite often results in infelicity:

- [18] i *There is a more serious flaw, however, in your own argument.*<sup>14</sup>  
 ii \**There is the more serious flaw, however, in your own argument.*

We will examine these two constraints in turn, and then consider very briefly a constraint on the occurrence as displaced subject of NPs containing certain quantifiers.

#### ■ Indefinites: preference for the existential over the non-existential

Bare existentials, as we have observed, normally have no non-existential counterpart: compare *There was a power failure* to the ungrammatical \**A power failure was*. A choice between the constructions thus arises only in the case of extended existentials. With indefinite NPs, there is in general a preference for the existential.

<sup>14</sup>We have added the adjunct *however* in [18] to ensure that *in your argument* is construed as a complement of *be*, not a modifier of *flaw*.

In many cases the non-existential is infelicitous. Compare [19] and [20], where the non-existentials are felicitous in the former but not the latter:

- [19] i a. *A furniture van was in the drive.*      b. *There was a furniture van in the drive.*  
 ii a. *Two copies of Sue's thesis are on my desk.*      b. *There are two copies of Sue's thesis on my desk.*
- [20] i a. *\*Plenty of room is on the top shelf.*      b. *There's plenty of room on the top shelf.*  
 ii a. *\*A hole is in my jacket.*      b. *There's a hole in my jacket.*  
 iii a. *\*Sincerity was in her voice.*      b. *There was sincerity in her voice.*  
 iv a. *\*Peace was in the region.*      b. *There was peace in the region.*  
 v a. *\*An accident was in the studio.*      b. *There was an accident in the studio.*

When the indefinite NP denotes a physical entity, as in [19], both constructions are felicitous, but when it denotes an abstract entity, as in [20], the existential is generally required. Compare [20iva], then, with *A peace delegation was in the region*. A further relevant feature in [19iia] is that the indefinite NP contains a definite NP within it. *Sue's thesis* is likely to represent addressee-old information, and thus the subject introduces a new token of a previously known type, rendering it felicitous in subject position.

The above examples contain spatial locative complements. Similar contrasts are to be found with other extensions. Compare, for example, [21], where the PP is a temporal complement:

- [21] i a. *One performance is at noon.*      b. *There's one performance at noon.*  
 ii a. *\*A fireworks display is tonight.*      b. *There's a fireworks display tonight.*

Although indefinite (and abstract), *one performance* requires a context that establishes what it is a performance of – the ballet *Swan Lake*, for example. It will thus be related to the prior discourse and it is this relationship that makes it acceptable in subject position in [ia]. There is nothing in [iia], however, to indicate any such connection to prior discourse: the likely context is one where I'm informing you that a fireworks display will be taking place (e.g. with a view to suggesting we go and see it), and in such a context only the existential version is felicitous.

### ■ Displaced definite NPs

There is a strong tendency, we have noted, for the displaced NP to be indefinite. Compare such pairs as:

- [22] i a. *I had a terrible fright in the kitchen today. I just turned on the light, [and sitting in the corner, looking at me, there was a mouse].*  
 b. *I saw a mouse in the kitchen today. I just turned on the light, [<sup>#</sup>and sitting in the corner, looking at me, there was the mouse].*
- ii a. *President Clinton appeared at the podium accompanied by three senators and Margaret Thatcher. [Behind him there was a bodyguard.]*  
 b. *President Clinton appeared at the podium accompanied by three senators and Margaret Thatcher. [<sup>#</sup>Behind him there was the Vice President.]*

It must be emphasised, however, that definite NPs are certainly not excluded from the existential construction: they are admissible provided they represent addressee-new information.

The underlined definite NPs in [22ib/iib] clearly do not satisfy this condition. In [ib] the mouse is discourse-old (by virtue of having been introduced in the preceding sentence), and hence also addressee-old. In [iib] the Vice President is discourse-new but nevertheless addressee-old: you can be assumed to know of the Vice President's existence. It will be evident from our discussion of definiteness in Ch. 5, §6.1, however, that definite NPs do not always represent addressee-old information. We will review in turn five distinct cases where a definite NP satisfies the addressee-new requirement and hence can function as the displaced subject in a felicitous existential.

(a) Addressee-old entities treated as addressee-new

- [23] i *The voters are in a resentful mood, and the governor is adept at exploiting that resentment. His opponent is plagued by other problems as well; he has been accused of dalliances with his underlings, and his support for the funding of controversial art has gained him no friends among conservatives. His waffling on budgetary matters has been noted by several major newspapers. [And then there is that resentment.]*  
 ii A: *I can't imagine what I'm going to make for dinner tonight.* B: [*Well, there's that leftover meatloaf.*]

Here the underlined NPs are addressee-old: the resentment in [i] was mentioned a few sentences before, while B in [ii] assumes prior familiarity with the leftover meatloaf on A's part, whether it has been mentioned in the preceding discourse or not. Nevertheless, the resentment and the meatloaf are treated as new, in the belief that the addressee may have temporarily forgotten them. Such cases have the flavour of reminders. The use of an indefinite in such contexts would incorrectly introduce into the discourse a brand-new entity, as though this resentment or meatloaf were not already familiar to the addressee.

We can also include under the present heading the use which echoes a reminder that has been offered by someone else:

- [24] A: *I know you want to go to the party, but you've got a lot of homework to do first. And wait – didn't you promise your sister that you would spend this evening helping her practise for the school play?* B: *Well, yes – [there is that].*

Here, the existential echoes A's reminder of a forgotten promise, treating the promise on the one hand as new information but on the other as nonetheless previously known and therefore identifiable.

(b) Addressee-new tokens of addressee-old types

- [25] i *Physics majors are required to take three courses in a foreign language, [and there is the same requirement placed on students in the other sciences].*  
 ii *The congressman's sex scandal has captured the entire country's attention. [There are the usual sleazy reasons for that, of course.]*  
 iii *The problem is [that there aren't the necessary funds to complete the project].*

A definite NP is admissible when it represents a new instance of a type that is addressee-old. The underlined NPs here have dual reference: they are being used to refer simultaneously to a type and a token. The definite article is justified because the type is known or inferable: in [i] the requirement has been mentioned in the preceding clause; in [ii] I assume you are familiar with the sleazy reasons why sex scandals involving public figures capture the country's attention; and in [iii] you can infer, given a project,

that some amount of funds will be required to ensure its completion. The occurrence of these NPs as displaced subjects is justified because the current instance of the type is addressee-new: in [i] we are concerned with the foreign-language requirement as it applies to students in sciences other than physics, in [ii] with the reasons for the interest in this particular sex scandal, and in [iii] with the funds needed for the particular project under discussion.

Because of the dual reference, either the type or the token may be available for subsequent pronominal reference:

- [26] i *There was the usual crowd at the beach today. They were there yesterday, too.*  
 ii *There was the usual crowd at the beach today, but this time they were dispersed by the police for being a public nuisance.*  
 iii *There was the usual crowd at the beach today. They were there yesterday, too, but this time they were dispersed by the police for being a public nuisance.*

In [i], the anaphoric pronoun *they* is used to refer to the type, since the statement may be true even if some members of today's group differ from yesterday's.<sup>15</sup> In [ii], on the other hand, *they* refers to the current instantiation – the particular group of people who were dispersed on this occasion. Example [iii] shows that it is not a matter of *the usual crowd* being ambiguous, since both type and token readings apply at the same time.

The definite NP very often contains an adjective indicating that it refers to a type that is known (e.g. *same, usual, regular, traditional, obligatory, expected*) or inferrable (e.g. *ideal, correct, perfect, necessary, required*). All the examples cited are of this kind, but a demonstrative determiner can serve the same function:

- [27] *Jones' stand on abortion angered Republicans for being too liberal and Democrats for being too conservative, [and there was this problem with many of his other views as well].*

### (c) Addressee-old entities newly instantiating a variable

- [28] i *I must be getting sensitive to garlic; it's upset my stomach twice this week. The first time was on Sunday, when I had way too much garlic bread. [Then there was the spicy pasta that you and I shared at lunch yesterday.]*  
 ii A: *What can I get Mary for her birthday?* B: [*There's the new book on birdwatching we were talking about yesterday.*]

The definite article in these examples is felicitous because the NP is addressee-old: I assume you know which pasta or which book I am referring to. But at the same time the NP serves to instantiate, i.e. to specify the value of, the variable in an open proposition that represents discourse-old information. In [i] the open proposition “*x* upset my stomach” is introduced in the prior discourse, and the displaced NP in the existential provides a new value for this variable. In [ii] the open proposition is “A can get Mary *x* for her birthday”, which is a presupposition of A's question, and again the underlined NP provides a new value for *x*. If the definite NP (or coordination of definite NPs) doesn't

<sup>15</sup>There is an ambiguity here associated with the word *usual*: [26i] can mean either that the same general crowd was at the beach again today, or else it can mean that there was a crowd at the beach today, as usual. It is the first reading that we are interested in.

provide a new value for a variable in this way, the existential will be infelicitous. Compare, for example:

- [29] i A: *Who was at the party last night?* B: [*There was Mary, Sue, Fred, Matt, and Sam.*]  
 ii *I had a really great time last night.* [*#There was Mary, Sue, Fred, Matt, and Sam at this party I went to.*]

In [ii], the relevant open proposition is not salient in the context, and the utterance is correspondingly infelicitous.

This variable-instantiating use of the existential often involves a list, as in [29i]: we are given a list of values for the variable in the open proposition “x was at the party last night”. Where only a single value is provided, there is often an implicature of non-exhaustiveness. For example, in [28ii] B implicates that there are also other possibilities worth considering. The implicature can be denied, but infelicity will arise if there is no such denial and yet exhaustiveness is intended:

- [30] i A: *What’s in that drawer?* B: [*There’s the stapler, but nothing else.*]  
 ii A: *What’s in that drawer?* B: [*#There’s the stapler.*]

In [i] *but nothing else* cancels the implicature that the stapler is one of a set of things in the drawer; in [ii] B seems to be giving an exhaustive answer without any such cancellation and the result is infelicitous – compare *Well, there’s the stapler, for a start*, where the final adjunct reinforces the non-exhaustiveness implicature. Note similarly that B’s existential in [28ii] would not be appropriate if A’s question had been *What did you get Mary for her birthday?*, which invites an exhaustive answer.

#### (d) Addressee-new entities with identifying descriptions

- [31] i *In addition to interest-rate risk, there is the added risk that when interest rates fall, mortgages will be prepaid, thereby reducing the Portfolio’s future income stream.*  
 ii *In Johnson’s latest article, there is the claim that earthquakes are affected by the tides.*  
 iii *There was the world’s tallest man at the circus.*  
 iv *If you look at the map, you can see the intersection, [and then a couple of miles north of that, there is this road here that runs from the northwest to the southeast.]*  
 v *There was the sound of a sharp slap, and then a loud cry.*

Here the displaced subjects are not addressee-old in any sense, but a definite NP is in order because the content of the NP is sufficient to fully identify the referent, to pre-empt a *which* question. In [i], for example, the content clause functioning as a complement to *risk* fully defines the risk I’m referring to. Similarly in [ii], the proposition that earthquakes are affected by the tides constitutes a unique and fully identifiable claim. This may be compared with *#In Johnson’s latest article there is the claim about earthquakes and tides*: the PP *about earthquakes and tides*, unlike the content clause in [ii], is not sufficient to identify the claim, and as a result the example is infelicitous. In [iii] the superlative makes *the world’s tallest man* uniquely identifiable: there can only be one person satisfying this description. In [iv] the identification is achieved deictically, by means of *this* and *here*, which would normally be accompanied in such a case by a gesture (an indexing act, in the sense of Ch. 17, §1.1). In [v] *a sharp slap* is indefinite, but associated with any slap

is its own individual sound: the identifiability of the sound justifies the definite article, but the NP is clearly new.

### (e) False definite *this*

There is one use of demonstrative *this* – described more fully in Ch. 17, §5.4 – that is pragmatically equivalent to *a* or *some*, and hence readily found in the displaced subjects of existentials:

- [32] i %*Last week there was this strange dog wandering around the neighbourhood.*  
 ii %*Early in the 70s, there was this rock guitarist that I liked so much that I bought all of his albums.*

*This strange dog* here is replaceable by *a strange dog* but not by *the strange dog*. Hence the name ‘false definite’: the NP is definite in form, but indefinite in meaning. This use is characteristic of informal style and, as indicated by the ‘%’ annotation, is not found in the speech of all speakers. In its ordinary (‘true definite’) use, *this* is excluded from displaced subjects unless the NP falls into one of the categories discussed above (as in [31iv]). Compare [32] with, for example, the anaphoric *this* of *Kim has just written another song about death* [*#and there is this song on the radio every day*]. Here *this song* refers to the one mentioned in the first clause: it thus represents addressee-old information and is inadmissible in the existential construction.

## ■ Quantified NPs

The felicity of existential clauses is also sensitive to quantification. NPs determined by the proportional quantifiers *most* and *all* or the universal distributive quantifiers *each* and *every* are subject to pragmatic restrictions on their occurrence as displaced subjects. In the following, for example, *most* and *all* are felicitous only in the non-existential version, whereas other quantifiers, such as *some*, *many*, *one*, *a* are admissible in both versions:

- [33] i a. *Some/Many/Most/All small firms are experiencing difficulties.*      b. *There are some/many/#most/#all small firms experiencing difficulties.*  
 ii a. *A/One/Each/Every student from my class was at the party.*      b. *There was a/one/#each/ #every student from my class at the party.*

As with definite NPs, however, there is no categorical ban on displaced subject NPs determined by *most*, *all*, *each*, and *every*. Under conditions that are not yet well understood, such NPs can also appear in existential clauses, as in [34]:

- [34] i *Among our dresses there were most kinds of shabby and greasy wear and much fustion and corduroy that was neither sound nor fragrant.*  
 ii *There are all kinds of insurance policies that can meet your needs.<sup>16</sup>*  
 iii *There’s still each student in Group C to be interviewed.*  
 iv *I think that’s probably still a NASA job because of the number of contractors involved. [In firing room two, there’s every contractor we’ve got, just about, over there.]*

<sup>16</sup>Note that *all kinds of insurance policies* is not interpreted literally as “every kind of policy”, but rather something like “a lot of different kinds of policy”. It is, as it were, ‘false universal quantification’, comparable to the false definite use of *this* in [32]. Similarly with *every* (but not *each*). In a sentence like *There’s every reason to believe this winter will be especially mild*, the NP *every reason* means something like “good reason”.

### 6.3 The presentational construction

#### ■ Issues of form

Presentational clauses have dummy *there* as subject and some verb other than *be* as predicator:<sup>17</sup>

- [35] i *After they had travelled for many weeks, there came a moonlit night when the air was still and cool.*  
 ii *Between the two candidates there exists a great deal of antipathy, the result of months of negative campaigning.*  
 iii *There remain only two further issues to discuss.*  
 iv *There seems little doubt that the fire was started deliberately.*

A sample of other verbs (or verbal idioms) found in this construction is given in [36]:

[36]	<i>appear</i>	<i>arise</i>	<i>arrive</i>	<i>develop</i>	<i>emerge</i>	<i>enter</i>
	<i>escape</i>	<i>follow</i>	<i>grow</i>	<i>lie</i>	<i>live</i>	<i>loom</i>
	<i>occur</i>	<i>persist</i>	<i>sit</i>	<i>spring up</i>	<i>sprout</i>	<i>stand</i>

A high proportion have to do with being in a position or coming into view; note then the contrast between *At the edge of the cave there appeared a terrifying grizzly bear* and *\*At the edge of the cave there disappeared a terrifying grizzly bear*.

Most presentational clauses are of the bare type or have a locative extension. *Remain*, however, allows an infinitival extension, as in [35iii], and also licenses a predicative (*There remained only two officers alive*).

#### ■ Pragmatic constraints

The presentational construction differs from the existential with respect to the felicity conditions that apply to the occurrence of definite NPs as displaced subject. Compare [37ia–c], considered in a context where they are continuations of [37i]:

- [37] i *President Clinton appeared at the podium accompanied by three senators and Margaret Thatcher.*  
 ii a. *Behind him there stood/was a bodyguard.*  
 b. *\*Behind him there stood/were the senators.*  
 c. *Behind him there stood/<sup>#</sup>was the Vice President.*

We see from [iia–b] that both the presentational with *stand* and the existential with *be* accept indefinite *a bodyguard* and exclude definite *the senators*, which is discourse-old. The difference is exemplified in [iic]. *The Vice President* is discourse-new but addressee-old: such NPs are excluded by the existential (cf. [22iib] above), but admitted by the presentational. Thus while the existential requires that a definite displaced subject be addressee-new, the presentational makes the lesser requirement that it be discourse-new.

It follows that definite NPs occur more readily as displaced subjects in presentationals than in existentials: addressee-old NPs like *the Vice President* are permitted if

<sup>17</sup>Presentational clauses are generally intransitive, but transitives cannot be wholly excluded, as illustrated in the attested example *There seized him a fear that perhaps after all it was all true*.

discourse-new. At the same time, the presentational allows definites of the five categories discussed for existentials in §6.2.2:

- [38] i *But remember, there still exists that first problem I mentioned.*  
 ii *Through the discussion there ran the usual thread of veiled hostility.*  
 iii *At first they could see nothing but the road and the trees. [But then, as they rounded the bend in the road, there came into view the grocery store, the barber-shop, and the little ramshackle ice cream parlour.]*  
 iv *It's clear that the school needs a significant amount of work on its electrical and plumbing systems, as well as new textbooks and computers. [There remains the sticky issue of how this will all be financed in a district peopled with struggling taxpayers.]*  
 v <sup>%</sup>*I opened the door, [and in front of me there stood this enormous chest of drawers].*

These illustrate respectively an addressee-old entity treated as new (a reminder), a new token of an old type, an old entity newly instantiating a variable (in the open proposition “x came into view”), a new entity with the definite article rendered felicitous by the identifying description, and false definite *this*.

## 7 Extraposition

### 7.1 The central case: extraposition from subject of content and infinitival clauses

The most common and straightforward case of extraposition is illustrated in the [b] examples of [1]:

- | [1] | BASIC VERSION                                      | VERSION WITH EXTRAPOSITION                                   |
|-----|--|--|
| i   | a. <i><u>That he hasn't phoned</u> worries me.</i> | b. <i><u>It</u> worries me <u>that he hasn't phoned</u>.</i> |
| ii  | a. <i><u>Why she told him</u> is unclear.</i>      | b. <i><u>It</u> is unclear <u>why she told him</u>.</i>      |
| iii | a. <i><u>To resist</u> would be pointless.</i>     | b. <i><u>It</u> would be pointless <u>to resist</u>.</i>     |

In the basic version the subject position is filled by a subordinate clause: a declarative content clause in [i], an interrogative content clause in [ii], and an infinitival clause in [iii]. In the version with extraposition, the subject position is filled by the pronoun *it* and the subordinate clause appears at the end of the matrix clause, in what we are calling extraposed subject position. An extraposed subject, like a displaced subject, is not a kind of subject, but an element that is related to a dummy subject. Semantically, the subordinate clause stands in the same relation to the verb (or verb + predicative complement) in [b] as in [a], but syntactically the switch from [a] to [b] transfers the subject properties from the subordinate clause to *it*, as demonstrated in Ch. 4, §3.2.2. The effect of extraposition is to place a heavy constituent at the end of the clause, in conformity with the general tendency noted in [131] of §2 for heavy constituents to occur in this position.<sup>18</sup>

<sup>18</sup>Extraposed subjects can be followed by adjuncts provided they too are relatively heavy: *It worries me that he hasn't phoned, because he knows that we have to settle things before we leave for Cyprus tomorrow.*

### ■ Pragmatic constraints on the basic version

We regard the [a] examples in [1] as the basic version because they are syntactically simpler than their counterparts in [b] and because their clause structure is normally the only one of the two that is available when the subject is an NP: *His silence worries me* but not *\*It worries me his silence*.<sup>19</sup> Nevertheless, with examples like those in [1], where the element concerned is a content clause or an infinitival clause, the version with extraposition is much more frequent than the basic one, and it is to the basic version, not the one with the extraposed subject, that pragmatic constraints relating to familiarity status apply.

#### Non-extraposed content clause treated as background knowledge

Consider first the following examples:

- [2] i a. A: *Jeffrey didn't turn in his term paper until a week after the deadline.*  
 B: *It's a miracle that he did it at all.*  
 b. A: *Jeffrey didn't turn in his term paper until a week after the deadline.*  
 B: *That he did it at all is a miracle.*  
 ii a. *It is amazing that the real problems surrounding NATO's planned bombing raid on Serbia were never addressed during the marathon peace talks now underway in France.*  
 b. *\*That the real problems surrounding NATO's planned bombing raid on Serbia were never addressed during the marathon peace talks now underway in France is amazing.*

In [i] the underlined content clause represents old information: Jeffrey's completion of a term paper has been explicitly evoked in the prior discourse. Here, both the extraposed version [ia] and the basic version [ib] are acceptable. Example [iia] is taken from the beginning of a newspaper article. In that context the information represented by the content clause is new and only the extraposed version [iia] is acceptable: the basic version [iib] would be quite inappropriate as the first sentence of a newspaper article.

In [2i] the content clause information is discourse-old by virtue of prior mention. But felicity of the non-extraposed version is not limited to cases where the information in the content clause is discourse-old: all that is necessary is that the speaker be able to treat the information as familiar to the addressee – that is, as something that doesn't have to be presented as new because it can be assumed to be part of the shared set of background assumptions. Consider the following examples:

- [3] i *That the skin survives these daily torments is a remarkable tribute to its toughness.*  
 ii *[That Pierce Brosnan is the best 007 since Connery is beyond doubt,] and for all its anachronisms this witty, occasionally thrilling 1995 effort (efficiently directed by Martin Campbell) served to reinvigorate what had long seemed to be an exhausted franchise.*  
 iii *His act takes on lunatic proportions as he challenges female audience members to wrestling matches, falling in love with one while grappling it out on the canvas. [How he and feminist Lynne Marguiles (Courtney Love) became life partners is anyone's guess.]*

<sup>19</sup>*It worries me, his silence* is perfectly acceptable but is a right dislocation; for the distinction between the two constructions, see §8.2.

Example [i] follows a paragraph describing the ‘daily abuses’ to which people subject their skin – stretching, scraping, gouging, exposure to excessive and injurious doses of sunlight and wind, and so on. The prior text doesn’t assert that the skin survives these torments, but it is obvious common knowledge that it does. Example [ii] occurs in a newspaper column commenting on the movies that are to be shown on television during the following week: it is the first sentence in the piece on the James Bond (007) movie ‘Goldeneye’. The information represented by the content clause is obviously discourse-new in this context, but the writer is presenting it as a proposition readers can be expected to be familiar with. Example [iii] is from a newspaper review of a movie about the American comedian Andy Kaufman, the referent of the pronoun *he*. The information in the underlined clause is discourse-new; however, it is not being asserted, but rather is being treated as background knowledge.

### Non-extraposed content clauses representing presupposed information

Very often a non-extraposed content clause represents presupposed information, information whose truth is not at issue. This is the case in the declarative examples [2ib] and [3i], and also in [3iii], where the interrogative clause presupposes that Kaufman and Marguiles became life partners. But the condition on the felicity of the non-extraposed version is not a matter of whether or not the content clause is presupposed. Note in the first place that the underlined clause in [2ii] is presupposed by virtue of the semantic properties of the factive adjective *amazing* (see Ch. 11, §7.4), but in context extraposition is obligatory. Secondly, a non-extraposed content clause need not be presupposed: the one in [3ii], for example, is not – it is asserted to be true. And it is no less possible for the matrix clause to deny the truth of the content clause: *That he was motivated by pure altruism is a complete myth.*

### Extraposition and weight

Extraposition places the subordinate clause at or towards the end of the matrix clause, which is in general the preferred position for heavy constituents. In cases where both orderings are permissible, the weight factor may well result in the extraposed version being preferred. But acceptability of the basic version certainly does not require that the content clause be fairly short. This is evident from the following example, where the subject clause is very long and the matrix VP quite short:

- [4] *But, we must never forget, most of the appropriate heroes and their legends were created overnight, to answer immediate needs. . . . Most of the legends that are created to fan the fires of patriotism are essentially propagandistic and are not folk legends at all. . . . Naturally, such scholarly facts are of little concern to the man trying to make money or fan patriotism by means of folklore. [That much of what he calls folklore is the result of beliefs carefully sown among the people with the conscious aim of producing a desired mass emotional reaction to a particular situation or set of situations is irrelevant.]*

Here, the content clause serves as a summary of a long stretch of prior discourse and, as such, it represents familiar information and is thus felicitous in non-extraposed position despite being extremely heavy.

### Processing factors

Extraposition places the subordinate clause in a position where it is easier to process than when it is in subject position. In particular, extraposition makes it possible to have

multiple embedding of a type that is not permitted in the basic construction:

- [5] a. <sup>#</sup>*That that he was angry was so obvious embarrassed her.*      b. *It embarrassed her that it was so obvious that he was angry.*

The sequence of two identical subordinators in [a] makes this basic version unacceptably difficult to process, whereas the version in [b] is impeccable. Here extraposition applies to both the *embarrass* clause and the *be* + *obvious* clause.

### ■ Syntactic constraints on the basic version

There are also syntactic conditions under which the basic version is inadmissible. Most importantly, subjects with the form of declarative content clauses and infinitivals cannot undergo subject–auxiliary inversion, and where such inversion is required only the version with extraposition will therefore be allowed:

- [6] i a. *To pay now would be better.*      b. *It would be better to pay now.*  
 ii a. <sup>\*</sup>*Would to pay now be better?*      b. *Would it be better to pay now?*

Exclamative content clauses are generally unacceptable in the basic version:

- [7] a. <sup>#</sup>*What a fuss some people make is incredible.*      b. *It is incredible what a fuss some people make.*

This constraint, however, is not absolute – compare *What a blunder it was didn't emerge till later* (cf. Ch. 11, §6.2); the unacceptability of [7a] and the like is therefore better handled in terms of the above pragmatic constraint than by a rule of syntax.

### ■ Syntactic constraints on extraposition

There are also syntactic conditions under which extraposition is not permitted:

- [8] i a. *How she escaped is the question we ought to be addressing.*      b. <sup>\*</sup>*It's the question we ought to be addressing how she escaped.*  
 ii a. *That she survived at all shows that she must have been very fit.*      b. <sup>\*</sup>*It shows that she must have been very fit that she survived at all.*

In [i] the matrix clause verb is *be* in its specifying sense, and in such cases the basic version is required. In [ii] the matrix VP has a content clause as an internal complement, and the subject cannot be extraposed over this. The precise nature of this constraint remains unclear. Extraposition is also impossible in *Why they were allowed to get away with it is something I shall never understand*, where *I shall never understand* is a relative clause functioning as modifier in an NP structure: this suggests a more general constraint on extraposition over a finite clause. But cases where an extraposed clause immediately follows a finite clause are certainly attested, as in *It's going to depend on when Mum gets home whether we can go shopping this afternoon*.

### ■ Lexical constraints on the basic version

A number of verbs or verbal idioms occur with dummy *it* as the subject and a declarative content clause or infinitival in post-verbal position without an equivalent version where the subordinate clause appears as subject:

- [9] i a. <sup>\*</sup>*That he was dying turned out.*      b. *It turned out that he was dying.*  
 ii a. <sup>\*</sup>*To notify her family fell to me.*      b. *It fell to me to notify her family.*  
 iii a. <sup>\*</sup>*To short-list three of the candidates was decided.*      b. *It was decided to short-list three of the candidates.*

The main items concerned are given in [10]:

- |      |    |                 |             |               |                   |                 |
|------|----|-----------------|-------------|---------------|-------------------|-----------------|
| [10] | i  | <i>appear</i>   | <i>be</i>   | <i>chance</i> | <i>come about</i> | <i>fall out</i> |
|      |    | <i>happen</i>   | <i>seem</i> | <i>strike</i> | <i>transpire</i>  | <i>turn out</i> |
|      | ii | <i>decide</i> P | <i>fall</i> | <i>hope</i> P | <i>intend</i> P   | <i>remain</i>   |

Those in [i] take declarative content clauses, with *strike* transitive, the others intransitive.<sup>20</sup> Those in [ii] take infinitivals; with the ones marked ‘P’, the relevant construction is passive, as in [9iii]. It is debatable whether the function of the subordinate clause is in all cases to be subsumed under that of extraposed subject: this issue is discussed in Ch. 11, §4.3.1.

## 7.2 Further cases of extraposition

### (a) Extraposition of gerund-participial subjects

Extraposition can apply with gerund-participials as well as content clauses and infinitivals:

- |      |    |   |  |
|------|----|---|--|
| [11] | i  | a. <i>Complaining would be no use.</i>  | b. <i>It would be no use <u>complaining</u>.</i>                                       |
|      | ii | a. <i><u>Getting Ed to agree to our proposal</u> will be no problem whatsoever.</i> | b. <i>It will be no problem whatsoever <u>getting Ed to agree to our proposal</u>.</i> |

We did not include this under the central case of extraposition because gerund-participials extrapose less readily and generally than content clauses and infinitivals. Compare, for example:

- |      |    |  |
|------|----|--|
| [12] | i  | <i>It was stupid <u>to tell my parents</u> / <sup>2</sup><u>telling my parents</u>.</i>                    |
|      | ii | <i>It would make things worse <u>to call in the police</u> / <sup>2</sup><u>calling in the police</u>.</i> |

Here the extraposed infinitivals are impeccable, but the gerund-participials are at best very marginal, though the basic versions are quite unproblematic (*Telling my parents was stupid*; *Calling in the police would make things worse*). Gerund-participials with an overt subject, especially a non-pronominal one, are particularly resistant to extraposition: *Kim and Pat getting married had taken us all by surprise*, but not *\*It had taken us all by surprise Kim and Pat getting married*. Note that gerund-participials differ from infinitivals in that they can undergo subject–auxiliary inversion (cf. *Will getting Ed to agree to our proposal be a problem?*), so extraposition is not obligatory in this context.<sup>21</sup> Gerund-participials in complement function are the most NP-like of subordinate clauses, and the fact that they are less amenable to extraposition than the other subordinate clause categories is a further manifestation of this.

### (b) Extraposition of NPs

NPs generally cannot be extraposed, but there is a very limited range of types that can:

- |      |     |   |
|------|-----|---|
| [13] | i   | <i>It's extraordinary <u>the amount of beer he puts away</u>.</i> |
|      | ii  | <i>It impressed me <u>the way she disarmed him</u>.</i>           |
|      | iii | <i>It's incredible <u>the things they get up to</u>.</i>          |

<sup>20</sup> *Appear*, *seem*, and *strike* allow the content clause to function as subject when they have a predicative complement: *That Kim is ill seems obvious* / *strikes me as obvious*.

<sup>21</sup> There is, however, one item that takes a gerund-participial – namely, *worth* – that enters into the pattern shown in [10]. We have, for example, *In discussing the future it is also worth considering the impact on Antarctica of human activities elsewhere on the globe*, but not *\*Considering the impact on Antarctica of human activities elsewhere on the globe is worth*.

The NPs concerned all have the form ‘*the ... N + relative clause*’. They are a special case of what we have called ‘concealed questions’ (see Ch. 11, §5.3): they are more or less equivalent to the interrogative clauses *how much beer he puts away*, *how she disarmed him*, *what they get up to*. At the same time, the matrix VP gives an exclamatory meaning: [i] conveys that he puts away an extraordinarily large amount of beer, and so on. Extraposition is optional: we can also have the basic versions *The amount of beer he puts away is extraordinary*, and so on.

### (c) Extraposition of non-subjects

The dummy *it* of extraposition may function as object rather than subject, but here we do not find a contrast between a basic version and a version with extraposition comparable to that illustrated in [1]:

- [14] a. \**I find that he got away with it for so long quite incredible.*      b. *I find it quite incredible that he got away with it for so long.*

The deviance of [a] is like that of [6iia]: in both, the subordinate clause is positioned between the verb and its complement. Note that if the subordinate clause in [14a] is proposed the result is well formed: *That he got away with it for so long I find quite incredible* (= [2iib] of §1). For further discussion of clauses like [14b], see Ch. 11, §4.3.2.

## 8 Dislocation

A dislocated clause has a constituent, usually an NP, located to the left or right of the nucleus of the clause, with an anaphorically linked pronoun or comparable form within the nucleus itself. Compare, for example, the non-dislocated [1i] with the two dislocated versions given in [1ii–iii]:

- [1] i *Her parents seem pretty uncaring.* [non-dislocated version]  
 ii *Her parents, they seem pretty uncaring.* [left dislocation]  
 iii *They seem pretty uncaring, her parents.* [right dislocation]

In [i] *her parents* is functioning in the nucleus of the clause (in this case as subject), with no element external to the nucleus. In [ii–iii], by contrast, *her parents* stands outside the nucleus, to the left and right respectively, and the coreferential pronoun *they* occupies the place filled by *her parents* in the non-dislocated version.

In §§8.1–2 we will examine the left and right dislocation constructions in turn, considering only the case where the coreferential form in the nucleus is a personal pronoun. Dislocation of this kind is often found in oral personal narratives and informal writing. In §8.3 we look at further possibilities and contrast dislocation with a number of superficially similar constructions.

### 8.1 Left dislocation

#### ■ Range of functions of the pronoun

In [1iii] the pronoun that is anaphorically linked to the detached element functions as subject of the nucleus of the clause, but other functions are equally possible:

- [2] i *But his mother – I really admire her.*  
 ii *This guy in my cognitive science class, I gave him my notes to copy.*

- iii *My sister, someone threw a rock at her at the beach.*
- iv *The people next door, the police have just arrested their son on a drugs charge.*
- v *The other one, they don't think she'll survive.*

*Her* in [i] is the direct object, *him* in [ii] the indirect object, *her* in [iii] the object of a preposition, *their* in [iv] the subject-determiner within the object NP, and *she* in [v] the subject of a content clause embedded as a complement within the clause nucleus following the dislocated NP.

It is also possible for dislocation to apply to a clause-coordination. Compare:

- [3] i a. *I eat garlic and pretty soon my stomach's upset.*
- b. *I gave this guy in my class my notes to copy and he never returned them.*
- ii a. *Garlic, I eat it and pretty soon my stomach's upset.*
- b. *This guy in my class, I gave him my notes to copy and he never returned them.*

In [iia] there is just one personal pronoun anaphorically linked to the dislocated element, while in [iib] there are two, one in each of the coordinated clauses.

### ■ Left dislocation vs complement preposing

Left dislocation of a complement is to be distinguished from complement preposing. Compare:

- [4] i *Her parents, I don't like them at all.* [left dislocation]
- ii *Her parents I don't like — at all.* [complement preposing]

In left dislocation there is an anaphoric link between the initial element and some overt pronoun in the nucleus, whereas in complement preposing there is a gap in the relevant place in the nucleus. The dislocation construction is syntactically less constrained than preposing: for the latter there are constraints on the function of the gap that do not apply to the overt pro-form. In the first place, preposing places an element before the subject, so we can't have preposing of the subject itself: there is no preposing counterpart of [iii], for example. Secondly, preposing of indirect objects is generally quite restricted (see Ch. 4, §4.3): *?This guy in my class I gave my notes to copy*. Thirdly, there is no preposing counterpart to examples like [2iv], for a genitive subject-determiner cannot be preposed: *\*The people next door's, the police have just arrested son on a drugs charge*.

Left dislocation differs from preposing not only in syntactic form, but also in pragmatic function. In preposing the prenuclear constituent must represent a discourse-old link to the prior context, but in left-dislocation it may introduce discourse-new information:

- [5] *Some guys, they just show up without even calling first.*

### ■ Left dislocation vs marked topic

Left dislocation is also to be distinguished from the *as for* construction in which the initial element is explicitly marked as a topic (see §2 above):

- [6] i *Her father, he didn't want to know about it.* [left dislocation]
- ii *As for her father, he didn't want to know about it.* [marked topic]

*As for* assigns topic status to its complement, but in left dislocation the prenuclear element is not marked as topic: in this construction, as in clauses with no prenuclear element, there is no grammatical indication of what (if anything) is the topic of the

clause. Consider, for example:

- [7] A: *What kind of tips do you get dancing?* B: *Well, this one guy, he gave me a diamond ring that I still wear on my right hand and tell people is from my grandmother.*

The dislocated element here is *this one guy*, but it is much more plausible to interpret B's reply as being about the diamond ring than about the guy who gave it to her. A further difference between the constructions is that in the case of a marked topic there need be no anaphoric link with a pronoun in the nucleus of the clause:

- [8] *As for the concert-hall, the architect excelled herself.*

The initial phrase indicates that the concert-hall is the topic, but there is no reference to this in the nucleus. The nucleus is nevertheless interpreted as saying something about the concert-hall – that is, that the architect of the concert-hall excelled herself in her design of it.

### ■ Pragmatic functions of left dislocation

#### (a) Simplification of processing (production or perception)

One common case where left dislocation has a simplifying function is illustrated in [2iv], where it serves to avoid having an awkward and complex genitive construction: *the people next door's son*. Left dislocation also avoids having a discourse-new element in subject position, which favours discourse-old elements:

- [9] *My sister and her husband were having a terrible fight, and she started to scream. [The landlady, she went up,] and she told them she was going to call the police.*

Here the landlady is new to the discourse (and presumably to the addressee as well). The dislocated NP creates a new information unit and thus eases processing, because the entity is rendered discourse-old before its appearance in subject position in the clause, where it is represented here by the pronoun *she*.<sup>22</sup>

#### (b) Relationship to the previous discourse

We have observed that left dislocation differs from preposing in that the prenuclear constituent is not required to serve as a link to the prior discourse (cf. [5] above), but nevertheless it frequently does represent discourse-old information:

- [10] i *I hate writing term papers. [An exam, you take it and you're done.] But papers seem to drag on forever.*  
 ii *Jane has an interesting idea for a science project. She's going to use three groups of mice. [One group, she'll feed them mouse food. Another, she'll feed them veggies.]*

As with preposing, the entity represented by the dislocated phrase in this type of left dislocation stands in a contextually relevant relation to some previously evoked entity or entities: in [i] exams belong with term papers in a set of assessment exercises; in [ii] one group and another group are included within the set of three groups mentioned in the preceding clause. Left dislocation differs from preposing, however, in that there

<sup>22</sup>The same effect can of course be achieved by numerous different means. For example, the new entity may be introduced in a separate clause with very little other content: *You know those letters we did this morning? They have to go off in today's mail.*

is no requirement for a discourse-old open proposition, as there is with complement preposing (see §3 above). In [ii], for example, the clause nucleus following the dislocated *one group* is *she'll feed them mouse food*, but we might equally have *she'll keep them in the bathroom* or *she'll ignore them*, or *a friend will take care of them*, and so on. Thus, there is no need for the clause to provide the value for a variable in an open proposition that is familiar from the prior discourse.

## 8.2 Right dislocation

### ■ Range of functions of the pronoun

The pronoun in right dislocation can have a wide range of functions within the nucleus, as we saw for left dislocation. Our original example [1iii] (*They seem pretty uncaring, her parents*) had dislocation of the subject; other functions are illustrated in [11]:

- [11] i *I really like him, your dad.*  
 ii *I gave him a dollar, that man back there.*  
 iii *I've never spoken to her before, the Vice Chancellor.*  
 iv *What's his name, your son?*  
 v *There's no doubt they're unusually bright, your kids.*

Again we have a direct object in [i], an indirect object in [ii], an object of a preposition in [iii], a subject-determiner in [iv], and a subject in an embedded clause in [v].

### ■ Pragmatic functions of right dislocation

#### (a) Utterance processing function: clarification of reference

- [12] i *My dad was telling my uncle about how you had said you'd solve the financial problems of your business. It took a while to explain it, because [he didn't really understand what you planned to do, my uncle].*  
 ii *I get back strain from carrying this heavy backpack, especially when I have to take home my huge science book and all of my lit folders. [It's ridiculously heavy, my science book,] and it's really not good for me to be hauling it back and forth all the time.*

Here, I utter a pronoun and then realise it may not be clear what the pronoun is being used to refer to. I then add this information in clause-final position, as a sort of 'afterthought'. In [i], for example, the referent of *he* may be unclear, in view of the presence of two potential antecedents (*my dad* and *my uncle*); the right-dislocated *my uncle* clarifies which is intended. In [ii] there is a similar potential for confusion between two possible antecedents for *it* – that is, *my huge science book* and *this heavy backpack*; again, the right-dislocated *my science book* provides the necessary clarification.

#### (b) Other cases of discourse-old information

- [13] i *Frank has absolutely no social skills, and the way he dresses is an embarrassment. [He's a mess, that guy.]*  
 ii *Have you read this biography of Lincoln? I just started reading it this morning, and already I'm up to chapter 5. [It's fascinating, this book.] I never knew half of this stuff before.*

In examples like these there is no question of the dislocated phrase being needed to clarify what the pronoun refers to: in these contexts there is only one appropriate referent for the pronoun, Frank in [i], the biography of Lincoln in [ii]. Note, moreover, that the dislocated phrases *that guy* and *this book* provide very little identifying information about the referent.

Nevertheless, here, no less than in the disambiguating case, the dislocated phrase must represent discourse-old information. Compare:

- [14] i *I had to take my car in for service again. [It's really in bad shape, that car.]*  
 ii *I just saw 'Titanic' for the eighth time. [He's so cute, that Leonardo DiCaprio!]*  
 iii *Dad took your old desk out to the curb to be taken away with the trash, but forgot that I had been keeping all my important papers in there. Luckily Diana checked the drawers and thought that the papers looked important, so she took them out. [<sup>#</sup>He looked them over, our attorney.]*

In [i] the right-dislocated *that car* has been explicitly evoked in the prior discourse, while in [ii] *that Leonardo DiCaprio* is related to the previously evoked movie 'Titanic' by virtue of being one of the major actors in it. In [iii], however, *our attorney* refers to someone who is new to the discourse and as a result the dislocation is infelicitous.<sup>23</sup>

### ■ Right dislocation and topicality

We have seen that *He looked them over, our attorney* is infelicitous in the context given in [14iii] because *our attorney* is not discourse-old. But it is not sufficient that the right-dislocated constituent be discourse-old: it must also represent topical information. Thus the bracketed clause of [14iii] could be replaced by [15i], but not by [15ii]:

- [15] i *She showed a lot of foresight, that Diana.*  
 ii <sup>#</sup>*She had the foresight to call your lawyer, who came to get them immediately, that Diana.*

Example [i], but not [ii], is naturally interpreted as being primarily about Diana.

## 8.3 Extensions and contrasting constructions

### (a) Left dislocated NPs with forms other than personal pronouns in the nucleus

- [16] i *That brother of yours, the guy's a crook.*  
 ii *The guy next door, the lucky bastard's just won a million in the lottery.*

In [i] *the guy* effectively has no more content than the personal pronoun *he*, and it seems reasonable to regard this as an extension of left dislocation. Similarly with [ii], where *the lucky bastard* is an 'epithet' (cf. Ch. 5, §7.5).

<sup>23</sup>Because of this restriction to discourse-old information, the case where the pronoun is genitive, as in [11iv], is quite rare. Here it is necessary that both the genitive pronoun (*his*) and the NP containing it (*his name*) are discourse-old: your son will have been mentioned and his name is discourse-old by virtue of the standard association between people and their names. Note, then, the contrast in acceptability between *There's John. [<sup>#</sup>His whole family is obnoxious, that guy]*, where *his whole family* is discourse-new, and *There's John's goofy sister. [His whole family is obnoxious, that guy]*, where the prior mention of John's sister makes his family discourse-old.

## (b) Left dislocation and contrast

- [17] i *The people who earn millions and pay next to no tax, those are our targets.*  
 ii *Bill, Paul, Harry – managers like them should get the boot.*

In [i] the demonstrative *those*, although representing discourse-old information, is stressed, in order to contrast the people concerned with others who are not our targets. And in [ii] – where again *them* needs to be contrastively stressed – the relation between the prenuclear constituent and the subject of the nucleus is no longer one of coreference: Bill, Paul, and Harry form a subset of the managers.<sup>24</sup>

## (c) The supplementary epithet construction

Dislocation is to be distinguished from the construction with a non-referential epithet in prenuclear position:

- [18] i *That bastard next door, he's just won a million in the lottery.* [left dislocation]  
 ii *The bastard, he's taken my chair again.* } [supplementary epithet]  
 iii *He's taken my chair again, the bastard.* }

In [i] the NP *that bastard next door* is used referentially, and the fact that it is headed by the noun *bastard* is quite incidental: many other (non-pronominal) expressions referring to the person in question would do as well. In [ii–iii], however, *the bastard* is a supplement (cf. Ch. 15, §5); it is not referential but is used to express the speaker's attitude towards the person referred to by *he*. Any referential NP could be used in place of *he* in the nucleus (cf. *The bastard! Max has taken my chair again*). The epithet can occur within the nucleus, as *Max, the bastard, has taken my chair again* (which is again distinguished from apposition by the non-referential use of the epithet). And when it precedes the clause nucleus, the epithet is prosodically distinct from a left-dislocated NP in that it forms a separate intonational unit (and in writing an exclamation mark or dash will often be preferred to a comma).<sup>25</sup>

## (d) Right dislocation vs extraposition

Right dislocation is to be distinguished from the superficially similar extraposition construction discussed in §7. Compare:

- [19] i *It annoyed us both, having to do the calculations by hand.* [right dislocation]  
 ii *It annoyed us both that we had to do the calculations by hand.* [extraposition]

The *it* of [i] is a referential pronoun and functions like other personal pronouns (cf. *They annoy me, these calculations*); in this example, the pronoun refers to the situation expressed in the gerund-participial. The *it* of [ii] is invariant, on the other hand, and is best treated as a dummy, non-referential pronoun.

<sup>24</sup>Examples are occasionally attested where there is no explicit anaphoric link at all between the prenuclear NP and an NP in the nucleus: *The typical family today, the husband and the wife both work; Tulips, you have to plant the bulbs every year?* Such examples bear some resemblance to the marked topic construction illustrated in [8], differing in that they contain no explicit marking of the topic. The absence of any anaphoric link renders them distinct from left dislocation.

<sup>25</sup>Left dislocation is also to be distinguished from the use of resumptive pronouns in unbounded dependency constructions, as in *My boyfriend, [who I never know what he's going to say,] sometimes embarrasses me when I have friends over* – see Ch. 12, §7.3. This differs from left dislocation in that the placement of *who* in prenuclear position is obligatory, required by the relative clause construction.

In speech the two constructions are strikingly distinct prosodically. Unlike the extraposed constituent, the dislocated constituent almost invariably constitutes a distinct intonational phrase and is separated from the nucleus of the clause by an intonational boundary. In writing there will generally be a corresponding difference in punctuation, with the dislocated constituent, but not the extraposed one, set apart by a comma (or dash).

The prosodic difference correlates with a difference in the information status of the right-dislocated and extraposed constituents. As we have noted, the right-dislocated phrase is required to be discourse-old, whereas the extraposed constituent may be discourse-new. Compare the following as discourse-initial utterances:

- [20] i #*It's really interesting, a book I'm reading.*  
 ii *It now seems likely that there'll be another price increase in the next few weeks.*

The dislocated [i] is infelicitous in this context: instead we would have *A book I'm reading is really interesting* or, more naturally, the existential *There's a book I'm reading that's really interesting*. Conversely, the extraposition [ii] is completely natural, while the version without extraposition, *That there will be another price increase in the next few weeks now seems likely* would be infelicitous in discourse-initial position.

Syntactically, extraposition is found predominantly with content clauses and infinitivals; these are rarely right-dislocated, though not wholly excluded from the construction (cf. *It's an interesting question, why the animals react in this way*). With very few exceptions, NPs can be dislocated but not extraposed. The main overlap between the constructions is thus found with gerund-participials: compare *It was interesting, listening to the debate* (right dislocation) vs *It was interesting listening to the debate* (extraposition).

## 9 Clefts

### 9.1 General properties of clefts

There are two main types of cleft clause, **it-clefts** and **pseudo-clefts**,<sup>26</sup> with the latter category having **basic** and **reversed** versions. These constructions are illustrated in [1] alongside the corresponding non-cleft clause:

- [1] i *I bought a red wool sweater.* [non-cleft]  
 ii *It was a red wool sweater that I bought.* [it-cleft]  
 iii *What I bought was a red wool sweater.* [basic pseudo-cleft]  
 iv *A red wool sweater was what I bought.* [reversed pseudo-cleft]

'Cleft' is a process term: the idea behind it is that a cleft clause is formed by dividing a more elementary clause into two parts. In [1], for example, [ii–iv] can be thought of as being formed from [i] by dividing it into the two parts *a red wool sweater* and *I bought*. One of the two parts, here *a red wool sweater*, is **foregrounded**, and the other, *I bought*, **backgrounded**. Syntactically, the foregrounded element is made a complement of the verb *be* in its specifying sense – an internal complement in the *it*-cleft and basic

<sup>26</sup>The term 'cleft' is often used instead of *it*-cleft, i.e. in opposition to pseudo-cleft, rather than as a more general term covering both types. Pseudo-clefts are also called *wh*-clefts.

pseudo-cleft, a subject in the reversed pseudo-cleft.<sup>27</sup> The backgrounded component, by contrast, is subordinated by being placed in a relative construction.

We will say that [1ii–iv] have a foregrounded direct object, whereas [2ii–iv] have a foregrounded subject (and, as we will see, other constituents may also be foregrounded):

- [2] i *The wording of the question confused me.* [non-cleft]  
 ii *It was the wording of the question that confused me.* [*it*-cleft]  
 iii *What confused me was the wording of the question.* [basic pseudo-cleft]  
 iv *The wording of the question was what confused me.* [reversed pseudo-cleft]

This way of speaking reflects the fact that *a red wool sweater* in [1ii–iv] corresponds to the direct object of the non-cleft [1i], while *the wording of the question* in [2ii–iv] corresponds to the subject of the non-cleft [2i]. Alternatively (and indeed preferably) we can explain the concept of foregrounded object and subject by reference to the relative construction: in [1ii–iv] the foregrounded *a red wool sweater* is the antecedent for the object of the relative, while in [2ii–iv] *the wording of the question* is the antecedent for the subject of the relative.

### ■ Backgrounding interpreted in terms of presupposition

In terms of information packaging, the effect of backgrounding is to mark the backgrounded information as presupposed. Examples [1ii–iv] presuppose that I bought something and assert that this something was a red wool sweater, and similarly [2ii–iv] presuppose that something confused me and assert that this something was the wording of the question. A presupposition, it will be recalled, is a proposition whose truth is taken for granted or not at issue.

Presuppositions are characteristically preserved under negation, and this is the source of an important difference between a cleft and the corresponding non-cleft. Compare:

- [3] i a. *It was Tom that Sue married.* b. *It wasn't Tom that Sue married.*  
 ii a. *Sue married Tom.* b. *Sue didn't marry Tom.*

Both the positive cleft in [ia] and the negative cleft in [ib] convey that Sue married someone, but this is clearly not so in the corresponding negative non-cleft: [iib] can be used as readily in a context where Sue didn't marry anyone as in a context where she married someone other than Tom.<sup>28</sup>

The difference between non-clefts and clefts with respect to the effect of negation will not always be as sharp as this. Consider the following set:

- [4] i a. *It was Sue who wrote the foreword.* b. *It wasn't Sue who wrote the foreword.*  
 ii a. *Sue wrote the foreword.* b. *Sue didn't write the foreword.*

Here both the negative clauses convey that someone wrote the foreword, but in the case of the non-cleft [iib] this feature of the interpretation is attributable to the use of the definite NP *the foreword*. This refers to some actual foreword, and one will therefore infer that someone wrote it. The point is, then, that in the cleft the presupposition is attributable to the cleft construction itself, whereas in the non-cleft if it is present at all it is not attributable to the general syntactic structure but to independent factors.

<sup>27</sup> For the distinction between the specifying and ascriptive senses of *be*, see Ch. 4, §5.5.

<sup>28</sup> The presupposition that Sue married someone has the status of an entailment in [ia] and of a conversational implicature in [ib]: see Ch. 1, §5.4, for a fuller explanation of the concept of presupposition.

in [ii]: it is admissible as an *it*-cleft version of *Kim was sacked*, but *Kim who was sacked*, with an integrated relative clause, could not occur as the complement of *be* in [ii].

There is another, minor, construction that resembles the *it*-cleft more closely but is semantically quite distinct from it. It is found in proverbs like [8i], but also in new creations like [8ii]:

- [8] i *It is a long lane that has no turning.*  
 ii *It is a foolhardy man, surely, who believes that the contrast had nothing to do with the expression of the tradition through, not only the Monarchy as an institution, but also the personal characters and examples set by George V and George VI.*

Example [i] is not an *it*-cleft version of *A long lane has no turning*; the meaning is, rather, “A lane that has no turning is a long one”. Similarly for [ii] – not “A foolhardy man believes so-and-so”, but “A man who believes so-and-so is foolhardy”. The *be* here is ascriptive, not specifying.

### ■ Truncated *it*-clefts: omission of relative clause

The relative clause of an *it*-cleft construction can be omitted if it is recoverable from the prior discourse:

- [9] A: *Who finished off the biscuits?* B: *I don't know; it certainly wasn't me.*

The underlined clause here can be analysed as a **truncated *it*-cleft**, equivalent to *It certainly wasn't me who finished off the biscuits*.

### ■ The cleft as an unbounded dependency construction

Relative clauses are unbounded dependency constructions, as described in Ch. 12, §7, and since the cleft contains a relative clause it too belongs in this family of constructions. Compare, then:

- | [10] NON-CLEFT VERSION                                  | CLEFT VERSION  |
|---|--|
| i a. <i>She wants <u>a VW</u>.</i>                      | b. <i>It's <u>a VW</u> she wants.</i>                    |
| ii a. <i>She said she wants <u>a VW</u>.</i>            | b. <i>It's <u>a VW</u> she said she wants.</i>           |
| iii a. <i>He thinks she said she wants <u>a VW</u>.</i> | b. <i>It's <u>a VW</u> he thinks she said she wants.</i> |

The clefts here have foregrounding of the object of *want*: in [ib] *want* is the predicator of the relative clause itself, in [iib] it is the predicator of the clause functioning as a complement of *say* within the relative clause, and in [iiib] it is the predicator of the clause functioning as a complement of the *say* clause, which itself is a complement within the relative clause headed by *think*. And there is clearly no syntactic limit to how much further embedding of this kind we could add.

### ■ Range of elements that can be foregrounded

The foregrounded element in an *it*-cleft serves as the antecedent for a gap or pro-form in the relative clause, but this relative clause represents a distinct type, differing in certain respects from ordinary relative clauses, whether integrated or supplementary. Most importantly, it allows a somewhat broader range of elements to be relativised. In reviewing the elements that can be foregrounded, we need therefore to consider both the range of categories that can occur as complements of *be* in the matrix clause, and the range of associated functions in the relative clause.

## (a) NPs

The most common type of *it*-cleft has an NP as the foregrounded element. We have already illustrated cases where a foregrounded NP is the antecedent for a subject or direct object in the relative clause; other functional possibilities are illustrated in [11], where the bracketing marks off the relative clauses:

- [11] i *It's the president* [*I'm referring to* \_\_\_\_]. [comp of preposition]  
 ii *It was only last year* [*that he got his tenure* \_\_\_\_]. [adjunct]  
 iii *They made me secretary, but it wasn't secretary* [*I'd wanted to be* \_\_\_\_]. [PC]  
 iv *It's you* [*whose head will roll*]. [subject-determiner in NP]

A more formal alternant of [i] is *It's the president* [*to whom I'm referring*]: see Ch. 7, §4.1, for the relation between these two variants. Relativisation of a predicative complement, as in [iii], is quite rare. A more common variant of [iv] has relativisation of the matrix NP rather than just the subject-determiner: *It's your head* [*that \_\_ will roll*]. As with other relative constructions, relativisation of an indirect object is at best very marginal: *It was Sue* [*I gave \_\_ the key*].<sup>29</sup>

## (b) PPs

- [12] i *It was with considerable misgivings* *that she accepted the position.*  
 ii *It's because you stood up for yourself* *that you were sacked.*  
 iii *It's downstairs* *they want to play.*

The next most common category is that of PP. In these examples we have *with* + NP complement in [i], *because* + clause complement in [ii], and a preposition with no complement, *downstairs*, in [iii]. Where the function is that of the adjunct rather than complement, it depends very much on the semantic category of the adjunct whether foregrounding is possible. Compare, for example, *It was because it was wet that they cancelled the trip* (reason) with *#It was although it was sunny that they cancelled the trip* (concession). The potential for foregrounding in the *it*-cleft construction is one of the parameters considered in the description of adjuncts in Ch. 8.

## (c) Content clauses

Content clauses cannot generally be foregrounded:

- [13] i *#It's that he did it deliberately* *that I'm inclined to think.*  
 ii *#It's why no one told us* *that I'm wondering.*

However, this restriction is not absolute:

- [14] i *It's that he's so self-satisfied* *that I find offputting.*  
 ii *It's not whether you win or lose* *that matters, but how you play the game.*

In general, content clauses are foregrounded much more readily in pseudo-clefts than in *it*-clefts. Compare [13], for example, with *What I'm inclined to think is that he did it deliberately* and *What I'm wondering is why no one told us*.

## (d) Non-finite clauses

- [15] i *It's certainly not to make life easier for us* *that they are changing the rules.*  
 ii *It was listening to Sue's story* *that made me realise how lucky we have been.*

<sup>29</sup>For the choice between nominative and accusative case in foregrounded personal pronouns (*It is I/me who told them*), see Ch. 5, §16.2.

An infinitival purpose adjunct can readily be foregrounded, as in [i], but other infinitivals are hardly possible. In many cases the pseudo-cleft is again strongly preferred: compare *What I want is to be able to spend more time on research* with *\*It's to be able to spend more time on research that I want*. Gerund-participials, as in [ii], are permitted, albeit uncommon. Compare, for example, the non-cleft *They began playing golf* with the *it*-cleft *\*It was playing golf that they began*. The inadmissibility of the latter correlates with the fact that the complement of catenative *begin* cannot be questioned with *what* (*They began playing golf* cannot be used to answer the question *What did they begin?*), and in such cases there is no pseudo-cleft either (*\*What they began was playing golf*).

#### (e) AdvPs

- [16] i *It was only gradually that I came to realise how much I was being exploited.*  
 ii *She learns sex is something sordid, [and when she experiences it for the first time herself it is incoherently, clumsily, but half shyly and half inquisitively].*  
 iii *It isn't often they're as late as this.*

Example [ii] here is truncated, with omission of the relative clause *that she experiences it*.

#### (f) AdjPs

- [17] i *It's not lonely he made me feel – it's angry.*  
 ii *It wasn't green I told you to paint it.*

Here we have foregrounding of an adjectival predicative complement, but (except in Irish English where examples like *%It's selfish you are* are quite normal in informal style) *it*-clefts of this type are very rare.

### ■ *It* as raised complement

The *it* of the *it*-cleft construction commonly occurs in a higher clause than the one with *be*: it can function as a raised subject or object. But, unlike the *it* of extraposition, it cannot occur as the object in a complex-transitive clause – we need a construction with *be*:

- [18] i *It seems to be the switch that is defective.* [raised subject]  
 ii *I believe it to be her father who was primarily responsible.* [raised object]  
 iii *\*I consider it you who are to blame.* [object of complex-transitive]

### ■ Negation

An *it*-cleft clause is a complex structure having a matrix clause with *be* as head and a subordinate clause with the form of a relative. Either clause (or indeed both) can be negated:

- [19] a. *It was Kim who didn't complain.*      b. *It wasn't Kim who complained.*

The difference in meaning is very clear: if the negation is in the relative clause it is part of the presupposition, but if it is in the matrix clause it isn't. Thus the presupposition of [a] is "Someone didn't complain", while that of [b] is "Someone complained".<sup>30</sup>

### ■ Tense

In the default case the tense of the matrix matches that of the relative clause:

- [20] a. *It is you she likes.*      b. *It was you she liked.*

<sup>30</sup>In the case of [19a] there will generally be an implicature that there are one or more others who did complain.

But there is certainly no grammatical requirement that the tenses match in this way: instead of [b] we could equally well have *It is you she liked*, with present tense in the matrix clause and preterite in the relative clause. The felicity of such a mixed tense *it*-cleft will depend on the content of the clause. In *It was my great-grandfather who founded the company in 1892*, for example, it would be inappropriate to have *is* in the matrix clause.

### ■ Preposing of the foregrounded element

As an internal complement in the *be* clause, the foregrounded element can be preposed:

[21] A: *Was it Sue who polished off the cookies?* B: No, [Pat it was who ate them].

### ■ Extensions of the main pattern

#### (a) Non-finite clause in place of the relative clause

The element expressing the presupposition sometimes has the form of a gerund-participial or (for some speakers) infinitival rather than a relative clause:

[22] a. *Is it Kim making all that noise?* b. <sup>0</sup>*It is you to serve.*

These are equivalent to relatives containing the verb *be*: *who is making all that noise*; *who are to serve*.

#### (b) Demonstratives in place of *it*

A demonstrative, interpreted deictically, can be used instead of *it* in subject function:

[23] i *Those are my biscuits you're eating.*  
 ii *This is a serious problem we have here.*  
 iii *This is Jill speaking.*

Example [iii] is most likely to be uttered by Jill herself, to identify who is speaking – e.g. on the telephone.

*It*-clefts and this minor variant with a demonstrative as subject make up the class of clefts proper,<sup>31</sup> as opposed to pseudo-clefts, to which we now turn.

## 9.3 The form of pseudo-clefts

The pseudo-cleft has a fused relative construction defining a variable whose value is specified by the foregrounded element. As we have noted, the usual alignment is for the element defining the variable to occur as subject and the one giving the value as internal complement, but the reverse order is also possible:

[24] i *What I need is a long cool drink.* [basic pseudo-cleft]  
 ii *A long cool drink is what I need.* [reversed pseudo-cleft]

The relation between the syntax and the semantics of pseudo-clefts is more transparent than with *it*-clefts. In [24], the fused relative construction (discussed in detail in Ch. 12, §6) corresponds to “the *x* [I need *x*]” (or “the *x* such that I need *x*”), the foregrounded

<sup>31</sup>One other variant has *seem* instead of *be* as the verb: *It seems (like) only yesterday that we were worrying about which school to send her to*, “It seems as if it were only yesterday that . . .”. This pattern is very restricted: it’s doubtful if anything other than a past time expression could be foregrounded – cf. \**It seems (like) Kim who broke it*. It is exceptional in that *seem* does not normally take a specifying complement: #*The time I saw her last seems yesterday*.

element represents “a long cool drink”, and *be* expresses identity, hence that “a long cool drink” is the value of the variable *x*.

### ■ Contrasting constructions

The pseudo-cleft needs to be distinguished from a number of other constructions that bear some superficial resemblance to it:

- [25] i *What's going to happen next* is a mystery.  
 ii *What we can do to stop them* is the question we ought to be addressing.  
 iii *What they did* was a disgrace.  
 iv Her performance was *what I'd call extremely competent*.  
 v *The easiest such object to analyse* is *what we shall call a 'rigid body'*.

In the first place, we must distinguish between fused relatives and open interrogative clauses, as compared in Ch. 12, §6.2. While the underlined constituent is a fused relative NP in [iii–v], it is an interrogative clause in [i–ii], and this immediately excludes [i–ii] from the category of pseudo-clefts.

Secondly, we must distinguish between specifying and ascriptive uses of the verb *be*: it is the specifying *be* that occurs in pseudo-clefts. This excludes [25iii–iv], which have ascriptive *be*. Thus in [iii] the predicate *was a disgrace* expresses a judgement about what they did: it does not identify what they did. Similarly, [iv] (where the fused relative is an internal complement rather than a subject) does not identify the variable *x* in the open proposition “I'd call *x* extremely competent”: rather, it expresses an evaluation of her performance, and is semantically similar to *Her performance was extremely competent*.

Finally, when we have a clause containing specifying *be* and a fused relative we have to distinguish between cases where the fused relative expresses the variable and those where it expresses the value: only in the former case do we have a pseudo-cleft. This is why [25v] (taken from a science textbook) is excluded. This clause does not serve to identify what we shall call a ‘rigid body’ (it is not a pseudo-cleft version of *We shall call the easiest such object to analyse a 'rigid body'*): rather, it serves to identify the easiest such object to analyse. Putting it slightly differently, the question that it implicitly answers is not “What shall we call a ‘rigid body’?”, but “What is the easiest such object to analyse?”.

### ■ Range of elements that can function as the foregrounded element

#### (a) NPs

The foregrounded element is often an NP, as in [24]. This category itself includes fused relatives, so we may have two fused relatives in the one clause: *What I wanted* was *what you've just given Sue*. The NP category represents the main source of overlap between the *it*-cleft and the pseudo-cleft, as in [1] above (*It was a red wool sweater that I bought* and *What I bought was a red wool sweater*).

#### (b) Declarative and interrogative content clauses

- [26] i *What I meant* was *that you don't have to come if you don't want to*.  
 ii *What puzzles me* is *why they didn't accept the offer in the first place*.

We noted above that content clauses are rare in the *it*-cleft construction; in the basic pseudo-cleft, by contrast, they represent the most common category.

## (c) Non-finite clauses

- [27] i *What would be better would be to try and find a compromise solution.*  
 ii *What you must do is (to) apply for special leave.*  
 iii *What annoys me is having to fill in all these forms.*  
 iv *What he's doing is simply repeating what his wife said.*

Again, non-finites occur predominantly with pseudo-clefts rather than *it*-clefts. In particular, they very commonly occur with *do* as the verb of the fused relative, as in [ii/iv], and here the *it*-cleft is normally inadmissible: \**It is (to) apply for special leave that you must do*; \**It is simply repeating what his wife said that he's doing*. Infinitival *to* is obligatory in [i] (as also in the corresponding non-cleft *To try and find a compromise solution would be better*), but optional in the construction with *do*.<sup>32</sup>

## (d) AdjPs

- [28] i *What her father is, if you want my view, is arrogant, dogmatic, and pig-headed.*  
 ii *Insensitive is how I'd be inclined to describe him.*

AdjPs are rare, but generally more acceptable than in *it*-clefts.

## (e) PPs

- [29] i *Up in the mountains is where I'd like to live.*  
 ii *In the morning is when I do my best work.*

PPs are found predominantly in *it*-clefts, but locative and temporal PPs are possible in pseudo-clefts like [29].

## ■ Range of relative lexemes

Not all relative lexemes are permitted in fused relatives, and hence in pseudo-clefts. Most importantly, **who** is excluded:

- [30] \**Who achieved the best result was Angela.*

Instead we need an *it*-cleft (*It was Angela who achieved the best result*) or some other specifying clause (such as *The one who achieved the best result was Angela*).

## ■ Pseudo-clefts with no non-cleft counterpart

Pseudo-clefts do not always correspond straightforwardly to non-cleft counterparts:

- [31] i *What is unique about milk is its richness in minerals and vitamins.*  
 ii *What I like about it is that it is so compact.*  
 iii *What went wrong was that the timer malfunctioned.*  
 iv *What I object to is that they won't allow a secret ballot.*  
 v *What they want apparently is that we should meet only twice a year.*

For these the non-cleft counterparts are ungrammatical: \**Its richness in minerals and vitamins is unique about milk*; \**I like about it that it is so compact*; \**That the timer malfunctioned went wrong*; \**I object to that they won't allow a secret ballot*; \**They want that we should meet only twice a year*.<sup>33</sup> Compare similarly [28ii] with \**I'd be inclined to describe him insensitive*.

<sup>32</sup>In the *do* construction it is possible, in relatively informal style, for the value phrase to be a declarative content clause: *What they did was they threw us out and locked the door*.

<sup>33</sup>There are some AmE dialects in which this last is allowed, but for most speakers *want* does not take finite complements.

### ■ Related structures

Very similar in meaning to pseudo-clefts are the [b] examples in [32]:

- [32] i a. *What impressed me was her wit.*      b. *The thing that impressed me was her wit.*  
 ii a. *What I need is a little peace.*            b. *All I need is a little peace.*  
 iii a. *\*Who deserves the credit is Jill.*        b. *The one who deserves the credit is Jill.*

As noted above, [iiib] provides one way of filling the gap created by the inadmissibility of *who* in fused relatives. Like pseudo-clefts, the [b] examples contain *be* in its specifying sense, and the internal complement specifies the value of the variable defined in the subject. The subject, however, is not a fused relative, but an NP with a general noun as head (or fused determiner-head), and an integrated relative clause as modifier. This structure allows for expansion of the same kind as is found with NPs occurring in other kinds of clause – compare [ib], for example, with *The two things that impressed me were her wit and her modesty*; *The other thing that impressed me was her wit*; *One of the things that impressed me was her wit*; and so on.

### ■ On the term ‘pseudo-cleft’

The points illustrated in [31–32] help explain why the construction is called ‘pseudo-cleft’. The *it*-cleft can almost invariably be matched with an equivalent non-cleft,<sup>34</sup> and it clearly represents a distinct construction by virtue of the special use of *it* and the special type of relative clause. The pseudo-cleft, by contrast, can very often not be matched with an equivalent non-cleft, and rather than constituting a distinct construction it simply represents the particular case of the specifying *be* construction where the element defining the variable is realised by a fused relative. The difference between the [a] and [b] examples in [32] has to do with the form of the subject NP and has no real significance at the level of the clause.

Examples like [31] show that it would be unsatisfactory to attempt to describe the pseudo-cleft derivatively, in terms of a cleaving operation applied to a more elementary construction. Take [31ii], for example. There is no source for this because *\*I like about it that it is so compact* is ungrammatical. One reason for this is that *like* cannot normally take a content clause as a complement. But this grammatical property of *like* is irrelevant to [31ii] itself: the content clause is admissible here because it satisfies the semantic requirement that it describe a situation that one can like.

This grammar, of course, is not adopting a derivational mode of description, and process terms are serving simply as convenient metaphors. From this point of view, what examples like [31] show is that there is a considerably less systematic relation between pseudo-clefts and non-clefts than there is between *it*-clefts and non-clefts. But from an information-packaging point of view what pseudo-clefts have in common with *it*-clefts is that they divide the message into two parts, one presented as a presupposition, the other a specification of the value of the variable in the presupposition. This is so whether or not there is a corresponding non-cleft.

<sup>34</sup>The qualification is needed to accommodate examples like [14i] above, where the non-cleft counterpart is *\*I find that he's so self-satisfied offputting*. But the unacceptability here can be remedied simply by applying extraposition: *I find it offputting that he is so self-satisfied*.

## 9.4 Issues of information packaging: discourse status of the presupposition

### 9.4.1 Two types of *it*-cleft: old presupposition vs new presupposition

*It*-clefts fall into two types according to whether the information represented by the presupposition is discourse-old or discourse-new.

#### (a) Discourse-old presupposition

- [33] i A: *Did you turn the air-conditioning off?* B: No, *it was Kim*.  
 ii *Inexperienced dancers often have difficulty in ending the Natural Turn in the correct alignment . . . It is usually the man who is at fault.*  
 iii *John only did the illustrations for the book. It was Mary who wrote the story.*

The context for [i] is one in which it is known that someone turned the air-conditioning off; B's response takes the form of a truncated *it*-cleft, a construction that permits the omission of discourse-old information. In [ii] the presupposition that someone is at fault follows from what has just been said. In [iii] the existence of the book suggests that someone wrote the story.

#### (b) Discourse-new presupposition

- [34] i *It was fifty years ago that the first real computer was built in Philadelphia.*  
 ii *It is with great pleasure that I now declare this Exhibition open.*  
 iii *The Indians were helpful in many ways. It was they who taught the settlers how to plant and harvest crops successfully in the New World.*

In examples of this kind the bulk of the new information is conveyed by the relative clause. As in the first type, however, the information in the relative clause is presented as a presupposition, i.e. as shared or uncontroversial. The concept of presupposition is thus distinct from that of familiar information: information does not have to be familiar to be presupposed.

The foregrounded element in this second type of *it*-cleft may be an adjunct, as in [34i–ii], or a complement (typically a subject), as in [iii]. In the latter case, it will tend to represent old information.<sup>35</sup>

### ■ Foregrounding and focus

The kind of prominence given to an element by foregrounding it in an *it*-cleft bears a considerable resemblance to that which is given by marking an element prosodically as focus. Thus in the context of [33iii] *MARY wrote the story* may convey much the same information as *It was Mary who wrote the story*. Very often, moreover, the two kinds of marking are combined, with the foregrounded element being the prosodically marked focus: *It was MARY who wrote the story*. It is important to emphasise, however, that the foregrounded element does not have to be focus: the concepts of foregrounded element and presupposition cannot be identified with those of focus and focus-frame.<sup>36</sup>

First, the type of *it*-cleft that has a discourse-new presupposition generally has the focus within the relative clause, as it is the relative clause that expresses the new and most important information. Secondly, in the type with a discourse-old presupposition

<sup>35</sup> Example [34ii] shows that this construction is one place where the verb of a subordinate clause can be used performatively (see Ch. 10, §3.1).

<sup>36</sup> Many works, however, use the term 'focus' for what we are calling the foregrounded element.

there may be factors that override the default selection of the foregrounded element as focus:

- [35] i *It CAN'T have been Jill who leaked the news to the press.*  
 ii *It was Jill who designed THIS house too.*

Example [i] has *can't* as focus: it is an instance of the emphatic polarity construction, used to deny a salient proposition. In [ii] the focus is located within the relative clause for reasons of contrast between one house and another.

Three other cases worth noting are illustrated in [36]:

- [36] i A: *You cheated me.* B: *On the contrary, it was YOU who cheated ME.*  
 ii *It's JILL'S husband they've charged.*  
 iii *It was a very TROUBLED wife that greeted Harry on his return that night.*

In [36i] we have a discourse-old open proposition “*x* cheated *y*”, and the new information is that the value of *x* is “you (i.e. A)” and the value of *y* is “me (i.e. B)”. The formal structure of the *it*-cleft, however, allows only one variable to be specified by the foregrounded element. This must be a single constituent, and relative clauses (unlike open interrogatives) allow only one relative pro-form or gap, so we can't have \**It was you me who cheated who*. Instead, one variable (corresponding to the subject) is specified by the foregrounded element, and the other by the focused element in the relative clause.

In [36ii] the focus is just part of the foregrounded element. The *it*-cleft construction assigns presuppositional status to “They've charged *x*”, but the selection of *Jill's* as focus treats “husband” as old information too; the old information is thus “They've charged *x*'s husband”, and the new information is that “Jill” is the value of *x*. In this example focus and foregrounded element can be made to match: *It is Jill whose husband they've charged*. Often, however, they can't: *It's Jill's FORMER husband they've charged, not her PRESENT one*. A modifier within an NP can't be foregrounded, so instead of *former* and *present* we must foreground a whole NP, with the focus picking out *former* and *present* as new.

Example [36iii] is an unusual type of *it*-cleft because, in spite of its form, it does not serve to identify who greeted Harry. Note, for example, that *a very troubled wife* would not constitute a felicitous response to the question *Who greeted Harry on his return that night?* Thus rather than specifying the value of the variable in the open proposition “*x* greeted Harry on his return that night”, [36iii] in fact treats the value of *x* as old information, and the new information imparted concerns the state of the person concerned.

#### 9.4.2 Pseudo-clefts in comparison with *it*-clefts

With pseudo-clefts, there is no analogue of the *it*-cleft construction with a discourse-new presupposition: in a felicitous pseudo-cleft the presupposed information expressed in the fused relative must always be discourse-old. Consider the following examples:

- [37] i A: *You said you'd be home early.* B: *No, what I said was that I'd come home as soon as I could.*  
 ii *Why you would want to refinance is perfectly clear. What I can't understand is how you were able to refinance with such a lousy credit rating.*  
 iii *What I want to do in this lecture is to place Racine's work in a historical context.*

In [i] the presupposition represents information (“I said *x*”) that has been explicitly evoked in the preceding discourse. It is more usual, however, for the relation between the presupposition and what has gone before to be somewhat less direct than this. In [ii] the relation is one of contrast – between being perfectly clear and being hard or impossible to understand; mention of something being clear makes salient the question of level of comprehensibility. Example [iii] might be the initial sentence of a discourse, specifically a lecture, and serves to show that the discourse-old status of the presupposition may derive from the context of situation rather than from prior mention. The context is one where I am beginning a lecture, and here it can be taken for granted that I have intentions about what I will discuss in the lecture.

The examples in [37] all have a clause as the foregrounded element, and we have noted that in such cases the pseudo-cleft is generally preferred over the *it*-cleft. Where the foregrounded element is an NP, the two constructions will often be equally felicitous:

- [38] i a. *Sue is planning to buy a Camry, but it's a Lexus that I want.*  
 b. *Sue is planning to buy a Camry, but what I want is a Lexus.*  
 ii a. A: *You're a history teacher, aren't you?* B. *No, it's economics that I teach.*  
 b. A: *You're a history teacher, aren't you?* B. *No, what I teach is economics.*

The *it*-cleft is characteristically used when the foregrounded element is contrastive. In [38] the contrast is explicit: *a Lexus vs a Camry* and *economics vs history*. It may also be implicit, as when in answer to the question *Who broke the vase?* I reply, *It was Kim or It wasn't me*, with an implicit contrast between Kim or me and other potential culprits.

The pseudo-cleft can also be used in contexts of contrast – though there is no truncated version, and no form with *who*, and hence no pseudo-cleft counterpart to *It was Kim* and *It wasn't me* in this question–answer context. The pseudo-cleft also readily occurs in the absence of contrast when the relevant presupposition is salient. Compare the following, where [ii–iii] are to be contextualised as the opening sentence of a lecture:

- [39] i a. *That was hard work. What I need now is a long cool drink.*  
 b. *That was hard work. #It's a long cool drink that I need now.*  
 ii a. *What I want to discuss in this lecture is the historical context of Racine's work.*  
 b. *#It is the historical context of Racine's work that I want to discuss in this lecture.*  
 iii a. *#What my name is, ladies and gentlemen, is Kim Aldermaston.*  
 b. *#It is Kim Aldermaston, ladies and gentlemen, that my name is.*

The end of a piece of hard work makes the needs of the worker salient, though there is no contrast between a long cool drink and anything else. In this context, the pseudo-cleft [ia] is felicitous, but the *it*-cleft [ib] is not. The examples in [ii] can be similarly accounted for. In the context of beginning a lecture, as noted for [37iii], it can be taken for granted that I have plans as to what I am going to discuss. The open proposition “I want to discuss *x* in this lecture” will therefore be salient, and the pseudo-cleft [iia], unlike the *it*-cleft [iib], is accordingly felicitous. This context, however, does not make salient the proposition that I have a name, and hence in [iii] even the pseudo-cleft version is infelicitous.

There are also conditions under which the *it*-cleft is preferred:

- [40] i *What is it you teach?*  
 ii *It is usual for a mare who has produced one winning jumper to produce others, even if not of the same standard, and generally in steeple-chasers it is the influence of the mare that predominates.*

In [i] the foregrounded element is questioned; in general this is not possible in pseudo-clefts: *#What is what you teach?* Even in polar questions the *it*-cleft is often more natural: compare *Is it history you teach?* and *#Is what you teach history?* In [ii] the foregrounded element contains a constituent (*the mare*) that is discourse-old even though it is focal (and hence new as an instantiation of the variable in “the influence of *x* predominates”). The pseudo-cleft *what predominates is the influence of the mare* has *the mare* in final position, which would be more natural if it were not discourse-old.

## 10 Passive voice

Passive contrasts with active in a system of voice, as illustrated in [1]:

- [1] i *Oswald assassinated Kennedy.* [active]  
 ii *Kennedy was assassinated by Oswald.* [passive]

The general term **voice** applies to a system where the contrasting forms differ in the way semantic roles are aligned with syntactic functions, normally with some concomitant marking on the verb. The terms **active** and **passive** are applied on the basis of the alignment of roles with functions in clauses that express an action, like those in [1]. Example [i] is called active because here the subject, *Oswald*, is aligned with an active role, with the role of agent: Oswald performed the action. Example [ii] is called passive because the subject, *Kennedy*, is associated with a passive role, the role of patient: Kennedy was the one on whom the action was performed.

Many clauses of course do not express actions:

- [2] i *Most members of the cabinet hated the premier.* [active]  
 ii *The premier was hated by most members of the cabinet.* [passive]

*Most members of the cabinet* is aligned with the role of experiencer rather than agent, and *the premier* is aligned with the role of stimulus rather than patient, but syntactically [2i] belongs with [1i], and [2ii] with [1ii], and for this reason they are classified as active and passive respectively. As usual, the names of the categories are based on semantic properties that do not apply to all members, but the issue of which clauses in English are active and which are passive is to be determined by their syntactic properties. We begin therefore by looking at the syntactic properties that distinguish passives from actives, and then in §10.2 consider some of the factors that favour or require the selection of an active over a passive or vice versa.

### 10.1 Syntax of the passive

#### 10.1.1 Structural differences between active and passive clauses

From a syntactic point of view we find large-scale structural differences between an active clause and its passive counterpart. A representative pair of examples like those given in [3] differ in the four ways stated summarily in [4]:

- [3] i *Pat stole my surfboard.* [active]  
 ii *My surfboard was stolen by Pat.* [passive]

- [4] i The subject of the active (*Pat*) appears in the passive as the complement of the preposition *by*.  
 ii The object of the active (*my surfboard*) appears as the subject of the passive.  
 iii The verb of the active appears in the passive in the past participle form (*stolen*).  
 iv The passive contains an extra verb, the auxiliary *be*.

We will comment briefly in turn on these four points.

### ■ The internalised complement and the distinction between long and short passives

The PP *by Pat* in [3ii] we refer to as the **internalised complement**: in the active *Pat* is the subject and hence external to the VP, but in the passive it is internal to the VP.<sup>37</sup>

With a small number of exceptions, the internalised complement is omissible, and we accordingly distinguish between **long passives**, in which it is present, and **short passives**, which contain no internalised complement:<sup>38</sup>

- |     |  |                                    |
|-----|--|------------------------------------|
| [5] | LONG PASSIVES                                    | SHORT PASSIVES                     |
|     | i a. <i>My surfboard was stolen by Pat.</i>      | b. <i>My surfboard was stolen.</i> |
|     | ii a. <i>His plan was rejected by the board.</i> | b. <i>His plan was rejected.</i>   |

Short passives have no exact active counterpart. Example [ib] conveys much the same information as *Someone stole my surfboard*, but this is the active counterpart of the long passive *My surfboard was stolen by someone*. The difference between this and [ib] may be negligible, but often there will be a more significant difference between passives with and without an internalised complement. For example, [iib] is not pragmatically equivalent to *His plan was rejected by someone* (the passive counterpart of *Someone rejected his plan*): we will generally understand from [iib] that the plan was rejected by the person or body to whom it was submitted. On the other hand, an active clause will encode some information about the subject that is not explicitly encoded in a short passive even if part or all of it is implied or suggested. We return to this issue in §10.2; in the meantime, where we pair actives with short passives in the examples below, it is to be understood that we are not presenting them as fully equivalent.

The preposition *by* has numerous uses other than that of marking the internalised complement. *This result was achieved by dubious means* is thus a short passive, with the *by* phrase functioning as a means adjunct, just as it does in the active *They achieved this result by dubious means*.

### ■ Externalisation of the object from the VP of the passive

Just as the external complement of the active, the subject, appears internal to the VP in the passive, so the internal complement of the active, the direct object, is external to the VP in the passive, i.e. it appears as subject. Note that *by Pat* in [3ii] is a PP, not an NP,

<sup>37</sup>The internalised complement is very often referred to as the ‘agent’; we avoid the latter term because it is also used (as in this book) as the name of a semantic role. As illustrated in [2ii], this element is not always associated with the agent role, and it is therefore important to maintain a clear distinction between syntactic functions and semantic roles.

<sup>38</sup>Exceptional cases where the internalised complement is not omissible include those with *precede* or *follow* used in a temporal sense: *Dinner was preceded/followed by several speeches*. Also *actuate* as used in *His behaviour was actuated by blind self-interest*. The fact that the *by* phrase is generally omissible leads many grammarians to treat it as an adjunct: see the discussion of this issue in Ch. 4, §1.2. In keeping with the terminology mentioned in footnote 37, short passives are often referred to as ‘agentless passives’.

and hence not an object; the effect of switching from the active to the passive in [3] is thus to switch from a transitive clause to an intransitive one.

It is an invariant feature of the passive that the VP lacks a complement that is present in the corresponding active. The element that is externalised, however, is not invariably the direct object. Compare, for example:

- |     |   |   |
|-----|---|---|
| [6] | ACTIVE  | PASSIVE   |
|     | i a. <i>My aunt gave <u>Ed</u> a pair of shoes.</i> | b. <i><u>Ed</u> was given a pair of shoes by my aunt.</i> |
|     | ii a. <i>Everyone refers to <u>her paper</u>.</i>   | b. <i><u>Her paper</u> is referred to by everyone.</i>    |

In [i] it is the indirect object that is externalised, i.e. *Ed* is the indirect object of the active and the subject, or external complement, of the passive. In [ii] *her paper* is the object of a preposition in the active, and the subject in the passive. We review the various kinds of complements that can be externalised in §10.1.2.

### ■ Past participle inflection of the verb

The passive represents one of the two uses of the past participle form of the verb, the other being the perfect. The perfect use is normally found in the complement of auxiliary *have*, as in *Pat has stolen my surfboard*, and in such cases it is clearly distinguishable from the passive use. There are certain places, however, where passive and perfect uses are in immediate contrast:

- [7] i [*Considered by many overqualified for the post,*] *she withdrew her application.*  
 ii [*Now fallen on hard times,*] *he looked a good deal older.*

The underlined form in [i] is a passive use of the past participle, while that in [ii] is a perfect use. The passive can be recognised by the internalised complement *by many*, and by the fact that the VP lacks the object that we have in active *Many considered her overqualified for the post*. In [ii], however, the VP is interpreted in just the same way as in *He had fallen on hard times*, which is explicitly marked as perfect by the auxiliary *have*.

The past participle form of the verb is almost, but not quite, an invariant feature of the passive. There is one construction in which the verb appears in the gerund-participle form, as in [8]:

- [8] *This draft needs checking carefully by the editor.*

This sentence can be paraphrased as *This article needs to be checked carefully by the editor*. Like the latter, it contains a *by* phrase in internalised complement function, and this is sufficient to establish it as passive in spite of the exceptional morphology. We refer to this construction as a ‘concealed passive’, because it does not have the usual past participle form; for further discussion, see Ch. 14, §2.3.

### ■ Be-passives, get-passives, and bare passives

Consider finally the fourth difference between the active and passive clauses in [3], the presence of auxiliary *be* in the passive. We have noted that the verb of the active appears in the passive in the past participle form: auxiliary *be* then carries the preterite inflection that in the active appears on *steal*. More generally, the auxiliary takes on the inflection of the active verb except for any person–number feature, which is determined by agreement with the subject. Compare, for example:

- [9] i a. *Pat was examining the contract.* b. *The contract was being examined by Pat.*  
 ii a. *Jill writes the reports.* b. *The reports are written by Jill.*

The gerund-participle inflection carried in the active [ia] by *examine* appears in the passive on *be*, with *examine* taking on the past participle inflection; the first *be* in [ib] (*was*) is the progressive auxiliary, matching that of [ia]. In [ii] the present tense inflection carried by active *writes* appears on *be*, but the agreement is with the subject *the reports*.

Not all passive clauses contain *be*; some have *get* instead, while there are also passives that contain neither of these verbs. These latter we call **bare passives**. Compare:

- |      |     |  |                        |
|------|-----|--|------------------------|
| [10] | i   | <i>Kim was mauled by our neighbour's dog.</i>                      | [ <i>be</i> -passive]  |
|      | ii  | <i>Kim got mauled by our neighbour's dog.</i>                      | [ <i>get</i> -passive] |
|      | iii | <i>He saw Kim mauled by our neighbour's dog.</i>                   | [bare passive]         |
|      | iv  | <i>The guy mauled by our neighbour's dog is in intensive care.</i> |                        |

Bare passive clauses usually have no overt subject, as here (*Kim* in [iii] being syntactically an object in the *see* clause: see Ch. 14, §5.6.2). Examples where a bare passive does have an overt subject are seen in [11]:

- |      |     |   |         |
|------|-----|---|---------|
| [11] | i   | <i>All things considered, we're lucky not to have been sued for a lot more.</i> | [short] |
|      | ii  | <i>People really are inconsiderate – present company excepted.</i>              |         |
|      | iii | <i>My house wrecked by a tornado is something I don't ever want to see.</i>     | [long]  |
|      | iv  | <i>Their vehicle immobilised by the mud, they had to escape on foot.</i>        |         |

Because the verb is in the past participle form, such clauses are always non-finite and hence restricted to subordinate position: passive main clauses always contain either *be* or *get*, as in [10i–ii].

### Expanded passives

*Be* and *get* are catenative verbs, verbs taking non-finite complements. The complement they have in [10i–ii] is the same as the second complement of *see* in [iii] and the modifier of *guy* in [iv] – i.e. a bare passive. We therefore take *be*- and *get*-passives to be **expanded passives**: they contain a bare passive augmented by means of a catenative verb that can carry the full range of verb inflections. This enables the passive clause to occur in any syntactic context instead of being restricted to dependent positions, like the passives of [10iii–iv] and [11]. As is clear from the examples given in [5] and [11], the distinction between expanded and bare (depending on the presence or absence of *be* or *get*) is independent of that between long and short (depending on the presence or absence of a *by* phrase as an internalised complement). The distinction between *be* and *get* as markers of expanded passives is discussed in §10.1.4; in the meantime, we will focus on the construction with *be*, which is the more frequent of the two.

### ■ Passives without an overt subject

Because the subject is crucially involved in the relationship between active and passive clauses we cannot have a straightforward voice contrast in a context where it is missing – that is, when the subject is understood. Compare, for example:

- |      |    |   |  |
|------|----|---|--|
| [12] | i  | a. <i>The best solution is [for <u>Dr Jones</u> to examine your son].</i> | b. <i>The best solution is [for <u>your son</u> to be examined by Dr Jones].</i> |
|      | ii | a. <i>The best solution is [ ___ to examine your son].</i>                | b. <i>The best solution is [ ___ to be examined by Dr Jones].</i>                |

In [i] the bracketed subordinate clauses have overt subjects and stand in the normal active–passive relationship. In [ii], however, the subjects are left unexpressed and we no

This represents the simplest and most common case. Most verbs taking just one object permit passivisation, but there are some which – either generally or in certain senses – do not, being restricted to active voice:

- [16] i a. *A strange adventure befell him.*      b. \**He was befallen by a strange adventure.*  
 ii a. *He failed her.*      b. \**She was failed by him.*

The restriction applies to *befall* quite generally but to *fail* only in the sense of “let down”: [iib] is perfectly acceptable when it means “not pass”, as in some kind of test. In [17] we provide some further examples of actives containing verbs that, in the sense illustrated, do not occur in passive clauses:

- [17] *Do you think [this behaviour becomes you]? This resort boasts the best beaches on the east coast. This bottle contains the milk you need for your breakfast. A packet of cigarettes costs around seven dollars. Three squared equals nine. These shoes fit me perfectly. Jill has the best qualifications. This auditorium holds about a hundred people. Most people lack the energy that she has. I don't think [they mind your criticism]. The enemy numbered over 5,000. They're talking politics again. This suitcase weighs exactly that amount.*

Because the objects here cannot be externalised by passivisation they differ sharply from prototypical objects. The view taken here, however, is that the resistance of the verbs in [17] to passivisation does not provide convincing grounds for saying that the post-verbal NPs are not objects: passivisation does not provide either a necessary or a sufficient condition for object status (see Ch. 4, §4.1).

It should also be noted that with some verbs, the direct object cannot be externalised when it combines with some other complement – a catenative or predicative complement:

- [18] i a. *They want Paul to resign.*      b. \**Paul is wanted to resign.*  
 ii a. *People here like beer lukewarm.*      b. \**Beer is liked lukewarm.*

The [b] examples may be contrasted with the well-formed *That isn't [what is wanted]*, where *want* has no catenative complement, and *He isn't much liked by his colleagues*, where *like* has no predicative complement.<sup>39</sup>

### (b) Indirect and direct object in ditransitive clauses

- [19] i a. *My father gave me this watch.*      b. *I was given this watch by my father.*  
 ii a. *My father gave me this watch.*      b. %*This watch was given me by my father.*

In principle, ditransitive actives have two passive counterparts depending on whether it is the indirect or the direct object that is externalised, as in [ib] and [iib] respectively. The version with the indirect object externalised is called the **first passive**, while the one with the direct object externalised is the **second passive** – terms based on the linear position of the relevant object in the active construction. The first passive is much more common; the second is hardly possible in AmE, and even in BrE is acceptable in only a limited range of cases: for further discussion, see Ch. 4, §4.3.

<sup>39</sup>A further point about voice in the catenative construction is that most verbs taking object + bare infinitival in the active require a *to*-infinitival in the passive: compare *They made me do the cooking* and *I was made to do the cooking* (see Ch. 14, §5.6.2).

## (c) Object of a preposition – prepositional passives

- [20] i a. *My mother approved of the plan.* b. *The plan was approved of by my mother.*  
 ii a. *The committee didn't face up to these problems.* b. *These problems weren't faced up to by the committee.*  
 iii a. *The organisers seem to have lost sight of the main goal.* b. *The main goal seems to have been lost sight of.*  
 iv a. *Someone has slept in this bed.* b. *This bed has been slept in.*

Here the underlined NP in the active examples is an object not of the verb but of a preposition. In the passive this NP functions as a subject, with the result that a preposition which is transitive in the active is intransitive in the passive – hence the term **prepositional passive**. The preposition in the [b] examples is ‘stranded’, and as with other cases of preposition stranding (as, for example, the open interrogative *Which bed did you sleep in?*) the construction is often avoided in formal, written prose: see Ch. 7, §4.1.

Prepositional passives fall into two main types. In one, illustrated in [20i–iii], a particular preposition is specified by the verb or verbal idiom; in the other, the preposition is less constrained: compare [20iva], for example, with *Someone has slept on/under/near the bed*.

**Type 1: preposition is specified by the verb or verbal idiom**

The preposition may be specified by a prepositional verb (such as *approve*), or as part of a verbal idiom with the form ‘verb + preposition + preposition’ (*look up to*) or ‘verb + NP + preposition’ (*lose sight of*). We have argued that sequences like *approve of*, *look up to*, and *lose sight of* do not form syntactic constituents – that they cannot be analysed as ‘complex verbs’ (see Ch. 4, §6). Nevertheless, the occurrence of a preposition as the final component of a verbal idiom is one factor that may facilitate its stranding in a prepositional passive.

Note in the first place that it is only with idioms that we find prepositional passives where the preposition follows an object NP, as in [20iiib]. For example, prepositional passives are not permitted with transitive prepositional verbs: compare the active *They accused Kim of the murder* or *She explained the problem to me* with the passive *\*The murder was accused Kim of* or *\*I was explained the problem to*.

Secondly, there are cases where the same sequence of words beginning with a verb and ending with a preposition can occur in a prepositional passive when it has an idiomatic interpretation but not in the literal interpretation. Compare:

- [21] i a. *A First World War uniform was easily come by.*  
 b. *She was a fine manager, one [who was looked up to by them all].*  
 ii a. *\*We need to ask the march organisers [whether our shop is going to be come by].*  
 b. *\*The top of the mountain was looked up to as the volcano erupted.*

The passives are acceptable in [i], where *come by* and *look up to* have the idiomatic meanings ‘obtain’ and ‘respect’, but infelicitous in [ii], where the same sequences have their literal meanings, and the stranded prepositions *by* and *to* are not specified by *come* and *look + up*.

The fact that a preposition is specified by a verb or verbal idiom is no guarantee, however, that it can be stranded in a prepositional passive. For each of the three cases

shown in [20i–iii], there are other examples that are ungrammatical:

- [22] i \**He was taken after by his son.* [verb + preposition]  
 ii \**Justice is being cried out for.* [verb + preposition + preposition]  
 iii \**She had been curried favour with.* [verb + NP + preposition]

Whether a specified preposition can be stranded in a prepositional passive is not something that can be predicted by a general rule: it has to be recorded in the dictionary as a particular property of the verb or idiom concerned.

#### Type 11: locative preposition not specified by verb

Prepositions that are not specified by the verb (or verbal idiom) have a locative meaning: compare *My hat has been sat on* and *The bridge has already been flown under twice* with \**Sundays were never worked on* and \**The fog was set out despite* (cf. *We never worked on Sundays* and *They set out despite the fog*). The locative case is subject to pragmatic constraints that exclude such examples as \**The tree had been died near*; we take up this issue in §10.2.

#### (d) Subordinate clause complements

Complements with the form of a subordinate clause rather than an NP can also be externalised. The following examples contain a declarative, an interrogative, and a gerund-participial respectively:

- [23] i a. *Her son suggested that we should call the police.* b. *That we should call the police was suggested by her son.*  
 ii a. *They haven't yet determined whether this is feasible.* b. *Whether this is feasible hasn't yet been determined.*  
 iii a. *You can't avoid paying taxes.* b. *Paying taxes can't be avoided.*

Where an active contains an object as well as a subordinate clause complement, it is the NP object rather than the subordinate clause that is externalised in the passive:

- [24] i *My solicitor assured me that we would win the case.*  
 ii *I was assured by my solicitor that we would win the case.*  
 iii \**That we would win the case was assured me by my solicitor.*

The passives in [23ib/iib] have content clause subjects, and as such have alternants in which the content clause is extraposed:

- [25] i *It was suggested by her son that we should call the police.*  
 ii *It hasn't yet been determined whether this is feasible.*

As we noted in §7.2, extraposition of gerund-participials is severely restricted, and it cannot apply to [23iiib]: \**It can't be avoided paying taxes.*

We take an extraposed subject to be structurally outside the VP, and on this account there is a difference in the structure of the VP in the active and in the corresponding passive extraposition construction. For example, the active VP of [23iia] (at the level of the complement of perfect *have*) is *determined whether this is feasible*, while the passive VP of [25ii] is just *determined*.

#### Declarative content clauses

For the most part, subordinate clauses of this kind can be externalised. Nevertheless, there are a fair number of verbs that do not permit this; for example, there are no passive

counterparts, with or without extraposition, to the actives in [26]:

- [26] i *We complained that there was no hot water.*  
 ii *They rejoiced that the war was finally over.*  
 iii *He sarled that he would never agree to such terms.*

There are others that permit the passive only with extraposition:

- [27] i *It was charged that they had used the funds for private purposes.*  
 ii *It was objected that the costs would be excessive.*

### Interrogative content clauses

Verbs taking interrogative complements usually allow passivisation, but there are a few that do not, as illustrated in [28]:

- [28] i *Nobody cares/minds what happens to us.*  
 ii *They are wondering whether they made the right decision.*  
 iii *No one had thought what the consequences would be.*

### Gerund-participials

Passives with gerund-participial subjects are uncommon; a fair number of catenative verbs that take complements of this form do not allow passivisation. Compare:

- [29] i *Taking out a mortgage wasn't considered/recommended/suggested.*  
 ii *\*Painting the house was begun/kept/hated/intended/remembered by Sam.*

Note that there is a difference in the interpretation of the corresponding actives. In *Sam remembered painting the house* the understood subject of *paint* is recovered from the matrix clause: it was Sam who painted the house. In *Sam recommended taking out a mortgage*, however, the subject of *take* is not specified syntactically but has to be contextually recovered. It is this type of gerund-participial construction that most readily allows passivisation.

### Infinitivals

Infinitival clauses can occur as subject or extraposed subject in passive clauses in which they are related to a predicative complement; in other types of clause, infinitivals are restricted to just a few catenative verbs (e.g. *decide, desire, hope, prefer*), and then only in extraposed position:

- [30] i a. *Not to go would be considered rude.*      b. *It would be considered rude not to go.*  
 ii a. *\*To accept the offer was decided.*      b. *It was decided to accept the offer.*  
 iii a. *\*To receive more help was expected.*      b. *\*It was expected to receive more help.*

## ■ Verbs restricted to the passive

A handful of verbs occur only in the passive, either generally or with a particular type of complementation. *Be*-passives containing such verbs are given in [31]:

- [31] i *Pat is reputed to be very rich.*  
 ii *It is rumoured that there will be an election before the end of the year.*  
 iii *Kim is said to be a manic depressive.*

The verbs *repute* and *rumour* are wholly restricted to the passive – and are thus morphologically defective, having only a past participle form. *Repute* takes an infinitival complement, *rumour* either an infinitival or a declarative content clause (usually extraposed, as in [ii]). *Say* cannot occur in the active with an object + infinitival

complement: \**They say Kim to be a manic depressive*; in other constructions, of course, it occurs freely in the active.<sup>40</sup>

### 10.1.3 Adjectival passives

There is a large-scale overlap between adjectives and the past participle forms of verbs, and since the verb *be* can take complements headed by either of these categories we find a significant resemblance, and often an ambiguity, between a verbal passive and a complex-intransitive clause containing an adjectival passive as predicative complement. Compare:

- [32] i *The kitchen window was broken by the thieves.* [verbal: *be*-passive]  
 ii *They were very worried.* [adjectival: complex-intransitive]  
 iii *They were married.* [ambiguous]

*Broken* in [i] is a verb, *worried* in [ii] is an adjective, while *married* in [iii] can be either. The ambiguity of [iii] is very clear: in the verbal interpretation it is dynamic, describing an event, while in the adjectival interpretation it is static, describing the state resulting from some prior event. Compare *They were married last week in London* (verbal) and *Hardly anyone knew that they were married – that they had been for over ten years* (adjectival). We will see, however, that this sharp semantic distinction does not apply in all cases.

Adjectival passives are passive only in a derivative sense, and we will not say that [32ii–iii] in their statal interpretations are passive clauses: they belong to the complex-intransitive construction. The term adjectival passive applies only to the predicative complement, that is, to the AdjPs *very worried* and *married*. Thus the clause *They were very worried* is not itself an adjectival passive – it merely contains one. Passives in the strict sense are always verbal;<sup>41</sup> more specifically, we restrict the term *be*-passive to clauses like [i] or [iii] in its dynamic interpretation, i.e. to clauses in which *be* is a catenative verb taking a bare verbal passive as complement.

#### ■ Grammatical tests for adjectival status

##### (a) Modification by *very*: a sufficient condition

Adjectives differ from verbs in that (if gradable) they can be modified by *very* and *too* (in the sense “excessively”), whereas verbs cannot (Ch. 6, §2.2). Compare:

- |      |  |  |
|------|--|--|
| [33] | ADJECTIVE                                    | VERB                                     |
| i    | a. <i>It was [very <u>enjoyable</u>].</i>    | b. * <i>We [very <u>enjoyed</u> it].</i> |
| ii   | a. <i>They are [too <u>quarrelsome</u>].</i> | b. * <i>They [<u>quarrel</u> too].</i>   |

(The [b] examples can be corrected by inserting *much*: *We enjoyed it very much*; *They quarrel too much*.)

The presence of *very* in [32ii] thus makes this unambiguously adjectival. Similarly *He was too embarrassed by their behaviour to acknowledge that he was their son* can only be adjectival. This example shows that adjectival passives allow *by* complements (though

<sup>40</sup>For some speakers *take ill* is also restricted to the passive, as in *They were taken ill* (“became ill”); others allow an active intransitive with the same meaning, %*They took ill*. In BrE the past participle form spelt *born* is also restricted to the passive: compare *I was born in Boston* and *She had borne three children*. This use of *born* is found only in short passives (cf. \**He was born by a Greek peasant*).

<sup>41</sup>Adjectival passives are sometimes called ‘pseudo-passives’, though this term is more widely used for prepositional passives.

there are restrictions we will return to below): the *too* is sufficient to establish that it is adjectival, for it is not permitted in the active verbal construction \**Their behaviour embarrassed him too for him to acknowledge that he was their son.*

Not all adjectives are gradable, however, and the potential for modification by *very* thus provides a sufficient but not a necessary test for adjectival status. In *The new recruits were assembled outside the officers' mess*, for example, *assembled* cannot be modified by *very*, but this doesn't mean that the example cannot be adjectival – it is in fact ambiguous, like [32iii].

#### (b) Occurrence with other verbs taking predicative complements

Adjectival predicative complements are not restricted to occurrence with *be* but are found also with such verbs as *seem*, *look*, and *remain*. All of these can substitute for *be* in [32ii], but not in [i]: *They seemed very worried*, but not \**The kitchen window seemed broken by the thieves*. Leaving aside *meant* and *supposed*, which involve semantic specialisation illustrated in [45] below, there are no adjectival passives that are restricted to occurrence with *be*, so this test virtually provides a necessary condition for adjectival status: if *be* can't be replaced by other such verbs, the passive in question is normally verbal. *It is believed to be a forgery* and *Someone was heard moving around in the attic*, for example, exclude such verbs and are unambiguously verbal. Note, then, that while *assembled* cannot be modified by *very* it can occur as a complement to *remain*: *The new recruits remained assembled outside the officers' mess for over an hour*. Replacement of *be* by *remain* also serves to remove the ambiguity of [iii] in favour of an adjectival reading: *They didn't live together but they remained married*. This test confirms, moreover, that adjectival passives may contain a *by* phrase: *He remained too embarrassed by their behaviour to acknowledge that he was their son*.

#### (c) The negative prefix *un-*

Many adjectives form opposites by prefixation of *un-*, but verbs do not take *un-* with the same sense:

- |      |   |  |
|------|---|--|
| [34] | ADJECTIVE                                 | VERB                                   |
|      | i a. <i>They were <u>unrepentant</u>.</i> | b. * <i>They <u>unrepented</u>.</i>    |
|      | ii a. <i>It was <u>unmemorable</u>.</i>   | b. * <i>We <u>unremembered</u> it.</i> |

Where *un-* occurs with verbs, as in *untie*, *unhorse*, etc., it has a clearly different sense (cf. Ch. 19, §5.5). The presence of *un-* in the following thus marks them clearly as adjectival, for there are no verbs *unanswered* and *unnoticed*:

- [35] i *The letter was still unanswered.*  
 ii *The cat was unnoticed by the guests for several minutes.*

The adjectives here are ungradable, and hence can't be modified by *very* or *too*, but they pass test (b): *The letter remained unanswered*; *The cat remained unnoticed*. Notice again the *by* phrase in the indisputably adjectival example [ii].

### ■ Dynamic vs stative

Adjectival passives always have a stative interpretation. The clearest contrasts are between verbal and adjectival passives that differ as to whether they are interpreted dynamically or statically:

- [36] i *They were injured when the platform they were standing on collapsed.* [verbal]  
 ii *She is injured and will have to miss the next two matches.* [adjectival]

Similarly, the obvious ambiguities are those that allow either a dynamic or a stative interpretation, such as *They were injured* on its own, *They were married* (= [32iii]), *The window was broken*, and so on.

It must be emphasised, however, that adjectival and verbal passives cannot be distinguished simply by asking whether the interpretation is stative or dynamic – it is for this reason that we have not included this among the tests for adjectival status. There are two points to be made.

(a) Verbal passives may have a stative meaning

The meaning of a verbal passive matches that of the corresponding active. Compare:

- |      |   |                                     |
|------|---|-------------------------------------|
| [37] | DYNAMIC                                   | STATIVE                             |
| i    | a. <i>Everyone criticised her.</i>        | b. <i>Everyone loves her.</i>       |
| ii   | a. <i>She was criticised by everyone.</i> | b. <i>She is loved by everyone.</i> |

*Criticise* has a dynamic meaning, while *love* has a stative meaning, and in both cases the active and passive have the same interpretation. The grammatical relation between [ii] and [i] is the same in both pairs, so we must allow [iib] to be a verbal passive – i.e. a passive proper – as well as [iia]. It follows that we must accept that verbal passives can be stative.

In such cases the difference in meaning between the verbal and adjectival constructions is neutralised. Consider:

- [38] i *Kim was worried by the prospect of redundancy.*  
 ii *The village was surrounded by troops from the First Battalion.*

Example [i] can be construed as differing syntactically from the active *The prospect of redundancy worried Kim* in the same way as [37iia/b] differ from [37ia/b] respectively. We have to allow, therefore, that it can be an ordinary, i.e. a verbal, passive counterpart of the active clause. But at the same time it passes the tests for an adjectival passive, for *worried* can be modified by *very* and *be* can be replaced by such verbs as *seem* and *become*: compare the unequivocally adjectival *Kim seemed very worried by the prospect of redundancy*. Syntactically, [38i] can thus be either a verbal or an adjectival passive, but semantically, there is no real perceptible difference in meaning.

Example [38ii] is more complicated, because the verbal passive, like its active counterpart *Troops from the First Battalion surrounded the village*, is ambiguous between a dynamic and a stative interpretation: either the troops moved into position around the village or else they were already in that position. Note that adding the aspectual adjunct *still* to either the passive or the active version forces the stative reading. In addition, we have the adjectival construal, whose meaning is effectively the same as that of the stative reading of the verbal passive. We can show that there must be an adjectival analysis of the clause because although *surrounded* can't be modified by *very*, it can combine with other verbs than *be*: *The village remained surrounded*.

(b) Adjectival passives may function as the predicative complement of a dynamic verb

Compare next the following pair:

- [39] i *It was magnetised.* [verbal or adjectival]  
 ii *It became magnetised.* [adjectival]

Example [i] displays the familiar ambiguity found in *They were injured*, *They were married*, and so on. It can have a dynamic interpretation, like the active *They magnetised it*, which describes an event: in this case it is a verbal passive. It can also have a stative interpretation, with *magnetised* denoting the state resulting from a prior event of magnetisation: in this case it is an adjectival passive. In [ii] *magnetised* is adjectival because it is a complement to *become*. The verb *become* denotes a change of state and thus has a dynamic meaning, so [ii] as a whole

describes an event. But this is not in conflict with our statement that adjectival passives have a stative meaning: the dynamic component in the meaning of [ii] is attributable to *become*, while the adjectival passive *magnetised* still denotes the state resulting from magnetisation.<sup>42</sup>

### ■ Complementation

Verbs and adjectives differ to some extent in their complementation, so that some expressions are admissible as VPs of verbal passives but not as AdjPs in adjectival passives, or vice versa. One very general difference is that verbs but not adjectives can take predicative complements. In other cases there are restrictions applying to specific lexemes. Compare:

- [40] i *Kim was regarded as /considered a liability.* [predicative complement]  
 ii *Max was known to be an alcoholic.* [infinitival complement]

These are unambiguously verbal passives, [i] because it contains a predicative complement, [ii] because the adjective *known* can't take an infinitival complement: compare *He became known as a champion of lost causes* and \**He became known to be an alcoholic*.

#### By phrase complements

We have noted that *by* phrase complements are found in adjectival as well as verbal passives, but their occurrence in the adjectival construction is much more restricted than in the verbal one. Compare:

- [41] i *The window was broken.* [ambiguous: verbal or adjectival]  
 ii *The window was broken by vandals.* [unambiguously verbal]

Example [i] displays the familiar ambiguity between a verbal passive clause describing an event ("Someone or something broke the window") and a complex-intransitive with an adjectival passive complement describing a state ("The window was in the state resulting from prior breaking"). The *by* phrase in [ii], however, is incompatible with the adjectival construction, so [ii] has only the verbal reading ("Vandals broke the window"). That *broken* but not *broken by vandals* can be adjectival is confirmed by the second of our tests for adjectival status, occurrence with complex-intransitive verbs other than *be*. Thus we can have *The window remained broken*, but not \**The window remained broken by vandals*.

*By* phrases are permitted in adjectival passives when the meaning of the corresponding verb is stative but not when it is dynamic. Adjectival *worried by the prospect of redundancy* in [38i] is admissible because the corresponding verb, *worry*, has a stative meaning, but – as we have just seen – *broken by vandals* cannot be adjectival because the verb *break* is dynamic. The verb *surround* can have either a dynamic or a stative meaning, so [ii] construed as a verbal passive is ambiguous, but as we noted above it is unambiguously stative when construed as a complex-intransitive with an adjectival passive as a complement.<sup>43</sup>

There are also cases where the complement in an adjectival passive contains some other preposition instead of *by*:

- [42] i a. *She was pleased at these results.* b. *She was pleased by these results.*  
 ii a. *He is known to the police.* b. *The answer was known by everyone.*

<sup>42</sup> Because the *become* construction presents the event as a change of state, the meaning is not quite the same as that of a verbal *be*-passive. In many cases the latter will be strongly preferred: *The house was painted*, rather than \**The house became painted*, and so on.

<sup>43</sup> For adjectival passives with the *un-* prefix there are no corresponding verbs, as we have noted. This construction allows *by* phrase complements more freely, as evident from *unnoticed by the guests* in [35ii].

The [a] examples are adjectival, while the [b] ones can be verbal or adjectival.

### ■ Adjectival passives with the negative prefix *un-*

We have noted that such examples as the following are unambiguously adjectival because there are no corresponding verbs *unrepair*, *unaccount*, *unsee*:

- [43] i *The vehicle had to go unrepaired for several months.*  
 ii *Nearly half the money was unaccounted for.*  
 iii *He had remained unseen throughout the meeting.*

There are three further points to make about this construction.<sup>44</sup> In the first place, only AdjPs like those in [43] can occur as complements to the verb *go* in the sense “remain”, as in [i]. Thus, although *It went black* is acceptable, *go* here means “become, turn”, not “remain”. Secondly, the adjective may incorporate a preposition, as in [ii]. Although we have argued that in *We accounted for more than half the money* the sequence *accounted for* is not a verb, and not a syntactic constituent, the *unaccounted for* of [ii] is a compound adjective. The difference in status is reflected in the fact that the verb can be separated from the preposition whereas in the adjectival construction the parts are inseparable. Compare *We have accounted already for the money* and *\*The money was unaccounted still for.*

Thirdly, the morphological process of forming such negative adjectives is highly productive, and in many cases the form without the prefix occurs in verbal but not adjectival passives. For example, *unseen* is an adjective, but *seen* is not: compare [43iii] with *\*He had remained seen throughout the meeting*. A sample of forms in *un-* found in adjectival passives is given in [44]:

- [44] *unaffected    unaided    unattended    unbalanced    unchanged    undaunted*  
*undetected    undeterred    unfettered    unharmed    unheeded    unhindered*  
*unimpeded    unintended    unmoved    unopposed    unprotected    unseen*  
*unspoiled    unsupported    unswayed    untouched    untroubled    unwanted*

### ■ Adjectival passives with specialised senses

There are a few adjectives that are morphologically related to the past participles of verbs but whose meanings have changed, so that they are no longer comparable to verbal passives with the same forms, and their connection with passives proper is purely historical:

- [45] *She's bound to win. We're engaged (to be married). Aren't you meant to be working on your assignment? His days are numbered. Are you related? I'm supposed to pay for it. He isn't used to hard work.*

## 10.1.4 Get-passives

### ■ Get in passive and complex-intransitive clauses

Like *be*, the verb *get* functions not only as the catenative verb in an expanded passive but also as head of a complex-intransitive clause, as in *They got angry*. Since the predicative complement in the latter construction can have the form of an adjectival passive, we

<sup>44</sup>Adjectival passives of this kind are often called ‘*un-*passives’.

again have to distinguish between verbal and adjectival passives, with the potential for ambiguity between them:

- [46] i *They got killed by the hijackers.* [verbal: *get*-passive]  
 ii *They got very frightened.* [adjectival: complex-intransitive]  
 iii *They got frightened.* [ambiguous]

Example [i] is synonymous with the *be*-passive *They were killed by the hijackers* and with the active *The hijackers killed them*, while the *very* in [ii] makes this example clearly adjectival, “They became very afraid”. Example [iii] can be interpreted like [ii] without the degree modification: “They became afraid”. But it can also be interpreted as a short passive, comparable to the long passive *They got frightened out of their wits by their teenage children, who turned off the power supply and pretended to be ghosts*.

Ambiguities between verbal and adjectival passives, however, arise much less often with *get* than with *be*. Compare, for example:

- [47] i *The window was broken.* [ambiguous: verbal or adjectival]  
 ii *The window got broken.* [unambiguous: verbal only]

As we have seen, [i] is ambiguous, interpretable either as a verbal passive (“Someone or something broke the window”) or as a complex-intransitive with an adjectival passive complement (“The window was in the state resulting from prior breaking”). Example [ii], however, has only the verbal passive reading: it describes the event of someone or something breaking the window, not the transition into the broken state. Thus *get* accepts adjectival passives as complements less readily than *be*.

The clearest cases of adjectival passives with *get* involve gradable adjectives like the *frightened* of [46]: *alarmed, carried away, depressed, distressed, interested, worried*, etc. A clear non-gradable is *lost*, as in *The children got lost in the woods* (“became lost”). Compare also adjectival *My coat got caught in the door* (“became caught”) vs verbal *Tom got caught in the girls’ dormitory* (“was apprehended”). With *married, dressed, changed, and shaved* there is a semantic contrast that can plausibly be attributed to the adjective vs verb distinction:

- [48] i *They are getting married at the week-end.* [adjectival]  
 ii *They are hoping to get married by the bishop.* [verbal]

In [i] *married* is comparable to *engaged*, which we have already noted is (in the relevant sense) always adjectival – though *married*, unlike *engaged*, does not readily combine with *become*: *We became engaged/#married*. The *by* phrase in [ii] makes this clearly verbal – compare *They are hoping that the bishop will marry them*. Two other forms commonly found as adjectives with *get* (though again not with *become*) are *started* and *finished*, as in *Let’s get started/finished* – compare verbal *The job got finished by their son*. The difference in these last examples is that with the verbal passives there is some explicit or implicit agent (expressed in [48ii] by *the bishop*) distinct from the subject-referent, whereas in the adjectival cases there is not. For example, [48i] means much the same as *They are marrying (each other)*, and *Let’s get started* much the same as *Let’s start*.

#### ■ Differences between *get*-passives and *be*-passives

*Be* is much more commonly used in expanded passives than *get*, especially the long variety, i.e. those with an internalised complement. The main differences between the

Both of these involve sense verbs with non-finite complements. In [i] it is *see* itself that is passivised, and here *be* is required. In [ii] it is the complement of *see* that is passivised, and this time *be* is excluded – but an alternative to the *get* construction is a bare passive: *He saw Kim mauled by my brother's dog.*

### ■ *Get* in the complex catenative construction

The *get*-passive is a simple catenative construction, one with no intervening NP between *get* and the non-finite complement. *Get* is also found (unlike *be*) in the complex construction where there is an intervening NP:

[54] a. *I get my hair cut once a month.*      b. *I got myself exempted from guard duties.*

Where the intervening NP is a reflexive, as in [b], the construction is explicitly agentive, with the subject-referent taking the initiative or being responsible (cf. *Watch out! You're going to get yourself run over*). This construction thus provides an alternative to *get*-passives with agentive subject interpretations. Compare, for example, [51i] with *She managed to get herself transferred to the finance department.*

### ■ Status of the catenative verb in *be*- and *get*-passives

In the light of the above examination of *get*, consider again the analysis of such clauses as:

[55] i *The hospital board reprimanded both doctors.* [active]  
 ii *Both doctors were reprimanded by the hospital board.* [*be*-passive]  
 iii *Both doctors got reprimanded by the hospital board.* [*get*-passive]

All three have the same propositional meaning, and on this basis we are treating [ii] and [iii] as alternative passive counterparts to active [i]. *Be* and *get* are catenative verbs taking a bare passive clause as complement: the *be* and *get* clauses are expanded passives in the sense that they include *be* and *get* in addition to the bare passive. The implication is that *be* and *get* are dummy verbs with no identifiable meaning of their own – comparable in this respect to the *do* of *do*-support constructions. That is, they have a purely syntactic role: they serve to mark the passive voice and to carry the preterite tense inflection that appears on *reprimand* in the active, as explained in §10.1.1.

As far as *be*-passives are concerned, this treatment seems amply justified, but *get*-passives are more problematic. It is clear that in the complex catenative construction illustrated in [54] *get* is not a dummy verb, nor a passive marker: the *get* clauses here are not themselves passive, but merely contain passive clauses as complements. The *get*-passive analysis of clauses like [55iii] thus treats this *get* in a radically different way from that of the complex construction [54] in spite of the semantic affinity between such pairs as *She managed to get transferred* and *She managed to get herself transferred*. An alternative treatment of [55iii] would be to say that here, as in [54], it is only the embedded complement that is passive, with the matrix *get* clause being active. However, the *get*-passive analysis is to be preferred on the grounds that the unembedded forms *She got transferred* and *She got herself transferred* do clearly differ, with the agentive feature being merely a possible implicature in the former.

## 10.2 Pragmatic factors favouring actives or passives

This section deals with issues of information packaging: when both active and passive versions are formally permitted, what factors favour the choice of one over the other? The long and short passive constructions will be considered separately because

the former is sensitive to the relative discourse familiarity of the subject and the internalised NP.

### ■ Long passives

Major constraint: subject must not be less familiar in the discourse than the internalised NP

The felicity of a long passive requires that the subject not represent information that is newer in the discourse than the NP governed by the word *by* in the internalised complement. Compare:

- [56] i *The mayor's term of office expires next month. [She will be succeeded by George Hendricks.]*  
 ii *George Hendricks will take office next month. [<sup>#</sup>The current mayor, Angela Cooke, will be succeeded by him.]*

In [i] the subject *she*, referring to the mayor, is discourse-old, while the internalised NP *George Hendricks* is discourse-new. But in [ii] the subject is discourse-new and the internalised NP old, with resulting infelicity. Instead we would have the active version *He will succeed the current mayor, Angela Cooke*.

As indicated in the formulation of the constraint, what matters is discourse familiarity, not addressee familiarity. Note, then, the contrast between:

- [57] i *A press conference will be held by the President at 3 p.m. today.*  
 ii *<sup>#</sup>A press conference will be held by me at 3 p.m. today.*

Assuming there has been no mention of the president in the prior discourse, [i] is perfectly natural: *the President*, although addressee-old, is discourse-new, and hence the subject is not less familiar in the discourse than the internalised NP. But, as we observed in §2, the speaker and addressee count as discourse-old simply by virtue of their participation in the discourse, and [ii] therefore violates the constraint, with the subject being discourse-new and the internalised complement discourse-old.

The constraint is a matter of the relative discourse familiarity of the two NPs. It excludes new + old ([56ii], [57ii]), allowing not only old + new ([56i]), but also old + old and new + new, as in [58i–ii] respectively:

- [58] i *Paul and Mary have agreed to help with the salads. We'll serve a pasta salad and a traditional bowl of tossed greens. [The pasta salad will be made by Paul,] and Mary will bring the greens.*  
 ii *Before the parade, a flag ceremony will be led by a troop of Girl Scouts.*

### Comparison with subject–dependent inversion

The constraint on long passives given above applies also to subject–dependent inversion, as discussed in §5.2. This reflects the fact that the two constructions differ from their more basic counterparts in similar ways:

- [59] i a. *Her doctor will be with her.*                      b. *With her will be her doctor.*  
 ii a. *Her doctor prescribed the pills.*                      b. *The pills were prescribed by her doctor.*

In both pairs the order of the underlined constituents is reversed, and this reversal is subject to the constraint that the one that comes to occupy first position must not be less familiar in the discourse than the one that comes to occupy a later position.

There are nevertheless significant differences between passivisation and inversion. In the first place, we have seen that (leaving aside the case of locatives) inversion requires a discourse-old open proposition, but passivisation does not:

[60] *An important new bill was introduced by Senator Jill Johansen at the State Capitol yesterday.*

This does not require a context in which the open proposition “*x* was introduced by somebody” has been evoked or is inferrable. Secondly, in terms of the distinction drawn in §1, passivisation involves realignment of syntactic functions with semantic roles, while inversion merely reorders. In [59i] *her doctor* is the subject in [b] as well as in [a], whereas in [ii] the active has *her doctor* as subject and *the pills* as object while the passive has *the pills* as subject and *her doctor* as object within the internalised complement. Because of this difference, passivisation but not inversion can interact with other syntactic constructions (whether in the information-packaging domain or not) which effect a different linear ordering of the elements than that shown in [59iib]:

[61] i *Which doctor were her pills prescribed by?* [open interrogative]  
 ii *By none of them was the question answered satisfactorily.* [preposing]

In [i] *which doctor* occurs in front position by virtue of being the interrogative phrase. Note that the final element in [59ib] cannot be fronted in this way, since *with her* is not the subject: \**Which doctor will with her be?* An open interrogative can only be formed from the [a] version, giving *Which doctor will be with her?* In [61ii] *by none of them* is preposed (and since the NP within it is negative we have subject–auxiliary inversion). As it belongs to two of the information-packaging constructions, this example has to satisfy two constraints. The constraint on passivisation will be satisfied because the subject *the question* will not be less familiar in the discourse than *none of them* – the definite article in *the question* will reflect prior mention. The constraint on preposing requires firstly that *none of them* provide a link to the prior discourse (which it does through the anaphoric pronoun *them*) and secondly that the open proposition “The question was answered satisfactorily by *x*-number of them” be discourse-old, i.e. previously evoked or inferrable.

### ■ Short passives

As in long passives, the subject of the short variety may be discourse-old or discourse-new, but this time there can of course be no requirement that it not be less familiar than the internalised complement NP, because there is no such NP present:

[62] i *I was going to show you my new car [but yesterday it was stolen].* [old]  
 ii *Did you hear the news? [A shop-keeper downtown was shot last night].* [new]

The crucial difference between a short passive and an active clause is that the information expressed in the subject of the active is omitted in the passive. There may be a variety of reasons why a speaker might wish to omit such information, as illustrated in [63]:

[63] i *The house was built in 1924.*  
 ii *Very little is known about the cause of the disease.*  
 iii *Application forms can be obtained from the Departmental Secretary.*  
 iv *Mom! The vase got broken!*

- v *The delay in attending to this matter is regretted.*
- vi *The solution was drained under a hydrogen atmosphere, the deposits were washed with water and methanol and dried. A film of formvar was then cast on the deposit . . .*

A likely reason for the use of a short passive in [i] is that the speaker doesn't know who built the house – similarly in [62]. The most natural interpretation of [63ii] is that it is concerned with human knowledge in general. Example [iii] is comparable to *You/One can obtain . . .*: the short passive provides an alternative means of expressing general propositions of this kind. The short passive can also be used to avoid identifying the person responsible for some situation, as is quite likely to be the case in [iv]. Example [v] is from a letter from the Taxation Office illustrating the common use of short passives in material from government and similar institutions. The letter was ostensibly from the Deputy Commissioner but no doubt written by some relatively junior member of staff; the active *I regret . . .* would imply too direct and personal an involvement on the part of the signatory. Finally, [vi] is from a report of a scientific experiment. It is a well-known feature of scientific writing that it has a higher proportion of passives than most registers; many of the short passives, like those in this example, serve to avoid making explicit reference to the writer, and this is widely believed to give the writing a more objective flavour than is found in texts with 1st person references.

A somewhat different type of case is illustrated in [64]:

- [64] i *Our solar system was formed billions of years ago.*
- ii *The boat capsized and over twenty passengers were drowned.*
- iii *In view of these losses Smithson is reluctantly closing his Fifth Avenue shop. He admits he feels as if his dream has been shattered.*

Here the cause of the event is too general and diffuse to name, and neither a long passive nor a transitive active would seem appropriate. Note that [i–ii], and for some speakers [iii], could be replaced by **intransitive** actives with hardly any change in meaning: *Our solar system formed billions of years ago; Over twenty passengers drowned; %His dream has shattered.*

### ■ Prepositional passives

Consider finally the pragmatic constraints applying to passives like [20ivb] above, *This bed has been slept in*, where there is stranding of a locative preposition that is not specified by the verb. Passives of this kind are felicitous only if the VP indicates either a significant property or a change in a significant property of the subject-referent. Compare:

- [65] i a. *This bed was slept in by George Washington.*
- b. *The valley could be marched through in less than two hours.*
- c. *My new hat has been sat on.*
- ii a. *#The river was slept beside.*
- b. *#The village hall could be met in.*
- c. *#The roof has been sat on all day.*

The fact that George Washington slept in the bed gives it some historical interest, so [ia] satisfies the constraint. Similarly in [ib]: if the valley could be marched through in less than two hours, this tells us something significant about its length and the terrain.

As for [ic], if someone has sat on my new hat it will presumably have been squashed or otherwise affected, so there will have been a change in a significant property of the hat. Our original example, *This bed has been slept in*, is of this latter kind: sleeping in a bed results in an important change, for it becomes ruffled and the sheets are likely to be treated as no longer clean enough for someone else to use them. No such factors motivate the use of the passive in [ii], though the corresponding actives are of course acceptable: *We slept beside the river*; *We could meet in the village hall*; *The protesters have sat on the roof all day*. Sleeping beside a river doesn't affect it or distinguish it in any significant way from other rivers. Village halls are quite generally used for meetings, so to say that we could meet in one doesn't say anything noteworthy about it. And merely sitting on a roof doesn't normally have any effect on it.

# Deixis and anaphora

## 1 Preliminaries

### 1.1 The concept of deixis

The reference of certain kinds of expression is determined in relation to features of the utterance-act: the time, the place, and the participants, i.e. those with the role of speaker or addressee. This phenomenon is known as **deixis** and the expressions concerned are called **deictic**. Examples of such expressions are given in:

- [1] i *I bought a new stereo system yesterday.*  
 ii *Do you feel any pain here now?*  
 iii *Could you pick this up and put it with those boxes, please?*

*Yesterday* in [i] and *now* in [ii] are interpreted in relation to the time of the utterance: *now* refers to a time including that of the utterance, while *yesterday* refers to the day before that on which the utterance takes place. This is a matter of **temporal deixis**.

*Here* in [iii] refers to a location close to the speaker, and in [iii] *this* refers to something located close to the speaker and *those boxes* to boxes that are further away. This is **locative deixis**.

Finally, *I* in [i] refers to the speaker, and *you* in [ii–iii] to the addressee. This is called **person deixis**.

It will be recalled that we are using such terms as ‘utterance-act’ and ‘speaker’ to cover written as well as spoken language. Example [i] could be used with the same interpretation as readily in writing as in speech; the others are unlikely to be used in writing because the reference of *here*, *this*, and *those boxes* is determined by very local features of the utterance-act, whereas it is characteristic of writing that writer and addressee are in different places. But of course they don’t have to be: if I had lost my voice, for example, I might communicate [ii–iii] to you in writing in your presence.

#### ■ Varying reference

It follows from what we have said that the reference of deictic expressions potentially varies from one utterance to another. This of course applies to referring expressions generally: different utterances of *Where’s Kim?* potentially involve reference to different people called Kim. What is significant for deixis is that the shifting reference is systematically tied to features of the utterance-act itself. The meaning of deictic expressions explicitly relates them to features of the utterance-act; for example, the difference in meaning between deictic **this** and **that** is primarily a matter of relative closeness to the speaker. Variation in the reference of *Kim*, by contrast, is simply due to the fact that many different people bear that name.

### ■ Deictic vs non-deictic location in space and time

Location in space and time may be indicated by deictic or non-deictic means:

[2]	DEICTIC	NON-DEICTIC
	i a. <i>She lives <u>here</u>.</i>	b. <i>She lives <u>in Paris</u>.</i>
	ii a. <i>He went to Spain <u>last week</u>.</i>	b. <i>He went to Spain <u>the day after the exam</u>.</i>

In [ia] the place where she lives is identified deictically in relation to the utterance-act: it might be the house where I'm speaking, the town, perhaps the country, but some area conceived of as including the place of utterance. In [ib] *in Paris* is non-deictic, and could in principle be used to refer to the same place wherever I am talking. Similarly *last week* in [iia] is deictic in that it identifies the time in relation to the time of speaking: it is the week preceding that in which the utterance-act takes place. In [2iib], by contrast, *the day after the exam* is non-deictic: it identifies the day in relation to the time of the exam, not to the time of speaking.

We noted above that referring expressions in general have varying reference, and this applies to *Paris* and *the exam* in these examples (in addition to the Paris in France there are several places named *Paris* in the USA), but there is nothing in the meaning of these expressions that relates them to the place or time of the utterance-act as there is in the meaning of *here* and *last week*.

### ■ Deictic expression and deictic marker

In [1iii] it is the whole NP *those boxes* whose referent is determined in relation to the location of the speaker. It is *those boxes*, therefore, that counts as the **deictic expression**. Nevertheless, it is just the demonstrative determiner *those* that incorporates the meaning “relatively distant from the speaker”. We will call *those* the **deictic marker**. Deictic marker and deictic expression often coincide. What distinguishes *those boxes* in [1iii] from the other cases in [1] is that the marker does not constitute the whole referring expression. Similarly, in [2iia] the deictic expression is *last week*, while *last* is the deictic marker.

### ■ Indexing acts

Deictic expressions are frequently accompanied by **indexing acts** performed by the speaker in order to clarify their reference: gestures towards the intended referent by pointing with the fingers, head, or other body parts, touching or brandishing the referent, or merely eye-movements.<sup>1</sup> In some cases the indexing act is required for the deictic expression to be fully interpretable:

[3]	<i>She's about <u>so tall</u>.</i>	<i>He shook his head <u>thus</u>.</i>	<i>Just put it down <u>there</u>.</i>
-----	------------------------------------	---------------------------------------	---------------------------------------

Similarly, some such indication would be needed to make clear just which area is intended by *here* in [1ii]. A less obvious but nevertheless important use of indexing acts is to pick out the addressee when there are other people present – for example, by eye contact. The necessity for an indexing act depends on the characteristics of the referent to some extent: if an object is large and in your field of vision, there will be less perceived need for me to point to it.

<sup>1</sup>The etymology of *deixis*, from a Greek word meaning “pointing/showing”, reflects the close relation between deictic expressions and indexing acts. And an alternative term for ‘deictic expression’ is ‘indexical (expression)’, commonly used in the philosophy of language, with ‘indexical’ etymologically related to the Latin word meaning “pointing finger”.

Pointing, eye-movements, and the like are prone to be somewhat vague in themselves, and we commonly find that an indexing act and a deictic expression work together in such a way that each clarifies the other. Suppose, for example, that I am in a room where there are a number of books, including several red ones, scattered around, and I say *Could you pass me that red book* with an accompanying gesture. The indexing act picks out which of the red books I'm referring to, while the nominal *red book* distinguishes the object I'm referring to from various other objects in the area I'm pointing at.

As noted above, in the case of writing the addressee usually does not witness the utterance-act, and hence there is much less scope for indexing. Nevertheless diagrammatic devices such as arrows can be used for indexing: *Our hotel room here ↗*; *This way up↑*.

### Deictic centre

Deixis is for the most part centred on the speaker. Consider, for example:

- [4] i *This bowl holds twice as much as that one.*  
 ii *I started this letter two hours ago but I keep getting interrupted.*  
 iii A: *I'm going to sit here.* B: *I'd rather sit here.*

In [i] the two bowls are distinguished in terms of their location, and it is a matter of relative proximity to me, the speaker. In [ii], *two hours ago* measures the temporal distance between the time the letter was begun and now, and this 'now' is my time, the time at which I am writing. Your time – the time at which you read the letter – is irrelevant. Example [iii] illustrates the way in which the **deictic centre** switches from one speaker to another in conversation. The first *I* refers to speaker A and the second to B; and the first *here* is oriented with respect to A, the second with respect to B.

There are, however, conditions under which the deictic centre for some deictic expressions shifts from speaker to addressee or to some other person:

- [5] i *Now wash your hands.*  
 ii *She realised Ed must have left at least a week ago.*

Example [i] appears as a notice in a public toilet; in this case *now* refers not to the time of writing the notice but to the time of reading it – and hence is constantly shifting with the passage of time. In [ii] *at least a week ago* could be interpreted at face value as “at least a week before the time of the utterance”, but it is also possible for it to have the interpretation “at least a week before the time of her realisation”. In this case I adopt the perspective of the person whose thoughts and experiences I am reporting (see §10.2).

## 1.2 Anaphora: anaphors and antecedents

Prototypical examples of anaphora are given in:

- [6] i *Max claims he wasn't told about it.*  
 ii *The idea was preposterous, but no one dared say so.*

**Anaphora** is the relation between an **anaphor** and an **antecedent**, where the interpretation of the anaphor is determined via that of the antecedent. In the reading of [i] that we are concerned with, *he* is the anaphor and *Max* the antecedent, and *he* is understood to refer to the same person as *Max* by virtue of this relationship. Similarly, in [ii] we have

an anaphoric link between *so* and the first clause, with *so* being thereby interpreted as “that the idea was preposterous”.

In [6i] it happens that both anaphor and antecedent are subject of their respective clauses, but that is a fortuitous feature of the example: the same anaphoric relation is found in *Max claims that they didn't tell him about it* (antecedent *Max* as subject, anaphor *him* as object), or in *I told Max that he was wrong* (antecedent as object, anaphor as subject), and so on. Indeed, in most (but not all) kinds of anaphora it is possible for the antecedent to be in a separate sentence from the anaphor. For these reasons there will often be more than one potential antecedent for a given anaphor, leading to ambiguity:

- [7] *I've just been talking to Max. I understand that Ed has told Frank that the Commission's report has exonerated him completely.*

As far as the grammar is concerned, any of *Max*, *Ed*, and *Frank* could serve as antecedent for *him* here. A thoughtful writer would tend to avoid such examples, at least in careful style, unless it was clear from the context which was the intended antecedent.

In the examples used in this chapter, and elsewhere in the book, we will commonly indicate the intended antecedent by underlining (*Max claims he wasn't told*) and/or by co-indexing (*Max<sub>i</sub> claims he<sub>i</sub> wasn't told*); this will make it unnecessary to keep qualifying our remarks by saying that they apply only in a particular interpretation.

### ■ Anaphoric marker and anaphor

In our introductory discussion of deixis we drew a distinction between deictic marker and deictic expression, so that in *Put it with those boxes*, the determiner *those* is the deictic marker and the whole referring NP *those boxes* is the deictic expression. A corresponding distinction for anaphora is needed to handle examples like:

- [8] *We'd been listening to Paul: that guy certainly knows how to stir things up.*

It is the whole NP *that guy* that derives its interpretation from the antecedent *Paul*; *that guy* therefore counts as the anaphor, while *that* (as used here) serves as an **anaphoric marker** indicating that the interpretation of the NP is to be obtained from an antecedent. In the more frequent case illustrated by *he* and *so* in [6], the anaphoric marker constitutes the whole anaphor.

Our terminology is not quite parallel for deixis and anaphora: we use ‘anaphor’ in preference to ‘anaphoric expression’. We make such frequent use of the concept of anaphor in this chapter that it is convenient to have a single-word term.

### ■ The close relation between anaphora and deixis

Anaphora and deixis are treated together in this chapter because they have a great deal in common. The nature of the relation between them will be clarified as we proceed, but two initial points can be made here.

#### (a) Forms may be simultaneously deictic and anaphoric

- [9] i *Sue is coming over later; we are having lunch together.*  
 ii *I was born in London and have lived here all my life.*  
 iii *I was born in London and have lived there all my life.*

In the salient interpretation of [i] *we* refers to the set consisting of Sue and me: the speaker component of this is determined deictically by virtue of *we* being a 1st person pronoun, while the inclusion of Sue in the set is determined anaphorically by virtue of

the previous mention of her. In [ii] *here* is anaphoric in that it obtains the interpretation “in London” from the preceding PP, but at the same time it is deictic in that it refers to a place which includes that where the utterance-act takes place. Similarly with [iii], except that this time the deictic component of *there* indicates that the place is relatively distant from where I am speaking. Because they have the same antecedent, the *here* of [ii] and the *there* of [iii] refer to the same place, but the different deictic meanings indicate that the utterance of [ii] takes place in London while that of [iii] does not.

(b) Some items can serve either as deictic markers or as anaphoric markers

[10]	DEICTIC	ANAPHORIC
i	a. What's <u>that</u> he's got in his hand?	b. He wants \$30, but <u>that's</u> too much.
ii	a. She lives <u>only half a mile away</u> .	b. I didn't see her very often when I was at College: she lived <u>too far away</u> .
iii	a. They'll be <u>here soon</u> .	b. She was stunned, but <u>soon</u> recovered.

In [ia] *that* will be interpreted deictically as referring to some object present in the situation of utterance and relatively distant from me, whereas in [ib] it obtains its interpretation anaphorically, from the antecedent \$30. The two uses of **that** are clearly related, and it is plausible to regard the anaphoric use as derivative from the deictic and in fact it retains some residual deictic meaning.

Spatial *away* in [10ii] is understood relationally, i.e. as away from some place, the source. In the salient or default reading of [iia] this is the location of the speaker at the time the utterance takes place: “only half a mile away from here”, so *away* is implicitly deictic. In [iib] we understand “too far away from College”: here the implied source is recovered anaphorically. Similarly, *soon* is interpreted in [iiia] as “in a short time from now”, and in [iiib] as “in a short time after being stunned”. In the deictic cases, therefore, the place or time referred to is identified relative to the place or time of the utterance-act, whereas in the anaphoric ones it is identified relative to a place or time given in the preceding text.

### ■ Retrospective and anticipatory anaphora

The examples of anaphora considered so far have in common that the anaphor follows the antecedent. It is also possible, however, for the anaphor to come first. Compare:

[11]	i	When <u>the headmaster</u> saw the damage, <u>he</u> called in the police.	[retrospective]
	ii	When <u>he</u> saw the damage, <u>the headmaster</u> called in the police.	[anticipatory]

We refer to the two cases as **retrospective** and **anticipatory** anaphora respectively.<sup>2</sup> In [i] the anaphor *he* looks back, as it were, to find the antecedent that provides its interpretation, whereas in [ii] it looks forward into what follows.<sup>3</sup> Retrospective anaphora

<sup>2</sup>Etymologically, the term ‘anaphora’ is based on the retrospective case, and some writers restrict it to this, using ‘cataphora’ for the anticipatory case. ‘Endophora’ is sometimes used as a more general term applying to both. ‘Antecedent’ also has an etymology associated with retrospective anaphora, but its generalisation to the anticipatory case is quite standardly accepted.

<sup>3</sup>The term ‘backwards anaphora’ is commonly used for anticipatory anaphora. This seemingly perverse usage stems from early transformational analyses under which an example like [11ii] was assigned an ‘underlying structure’ like ‘When the headmaster<sub>i</sub> saw the damage, the headmaster<sub>j</sub> called in the police’. A transformational operation (‘pronominalisation’), sensitive to identity of form and reference and certain other conditions, replaced the first occurrence of *the headmaster* by a pronoun, thus looking backwards from the unchanged occurrence to the ‘pronominalised’ one. Such analyses have long been abandoned, but the terminology has survived.

is much the more common and can be regarded as the default case, with anticipatory anaphora permitted only under quite restricted conditions (see §2.4).

#### Types of anticipatory anaphora: integrated vs non-integrated antecedent

We distinguish two cases where the anaphor precedes the antecedent, as illustrated in:

- [12] i *None of those who actually saw it said the film should be banned.* [integrated]  
 ii *It's official: Bill Gates is now the richest man in the world.* [non-integrated]

In [i] the antecedent *the film* is integrated into a larger construction: it is subject of the clause *the film should be banned*. But in [ii] the antecedent is *Bill Gates is now the richest man in the world*, which is a supplement rather than a constituent of some larger syntactic construction. The order of antecedent and anaphor cannot be reversed in the latter type – compare:

- [13] i *None of those who actually saw the film thought it should be banned.*  
 ii *\*That Bill Gates is now the richest man in the world is official: it.*

But the two types cannot be distinguished simply by reversibility, for we shall see that under certain conditions the integrated antecedent type is non-reversible. What distinguishes the non-integrated type of anticipatory anaphora is that it is non-reversible for a particular reason: when we replace the anaphor by the antecedent there ceases to be any work for the anaphor to do. This is why [13ii] is incoherent: the *it* appears to be referring to something, but I'm neither saying nor implying anything further about what is stated in the antecedent clause. In [12ii] the *it* acts as a provisional subject and the clause *Bill Gates is now the richest man in the world* then serves to provide an interpretation for it. So if we replace the anaphor by the antecedent we no longer need the anaphor.

#### ■ Ellipsis

The concept of anaphor can be readily extended to cover various kinds of ellipsis. Compare:

- [14] i *If you want me to invite Kim as well, I will \_\_\_.* [retrospective ellipsis]  
 ii *If you want me to \_\_\_, I will invite Kim as well.* [anticipatory ellipsis]

In [i] the infinitival complement of *will* is ellipted,<sup>4</sup> being recoverable from that of *want* in the conditional adjunct, whereas in [ii] the ellipsis is within the complement of *want*, with that of *will* providing the interpretation. *Invite Kim as well* can therefore be analysed as the antecedent, and the elliptical 'gap' as the anaphor. The retrospective vs anticipatory contrast seen here is the same as that in [11], so that [14i] illustrates the default case where the anaphoric gap follows the antecedent from which it derives its interpretation, while in [14ii] we have the less usual case – subject, we will see, to the same quite stringent grammatical conditions as generally apply with overt anaphors – where the gap precedes the antecedent. As with most kinds of overt anaphors, the antecedent for an elliptical gap may be in a preceding sentence:

- [15] A: *Why don't you invite Kim as well?* B: *I don't want to \_\_\_.*

<sup>4</sup>We use 'ellipt' as the verb corresponding to the noun 'ellipsis'; it is not found in traditional grammar, but has become reasonably well established in modern grammatical studies.

### ■ Anaphoric chains

In the examples so far we have had a single anaphoric link between an anaphor and its antecedent, but very often we find a sequence of such links forming what we will call an **anaphoric chain**:

- [16] i *My daughter<sub>i</sub> tells me that her<sub>i</sub> car has been giving her<sub>i</sub> a lot of trouble recently. She<sub>i</sub> thinks she<sub>i</sub> may have to start cycling to work.*  
 ii *If he<sub>i</sub> hurts himself<sub>i</sub>, Max<sub>i</sub> will undoubtedly blame you.*  
 iii *Ann<sub>i</sub> regretted \_\_<sub>i</sub> committing herself<sub>i</sub> to the project.*

In [i] *my daughter* is antecedent to the first *her* (a genitive pronoun), and this in turn is antecedent to the second *her* (an accusative pronoun), and so on. In this example, each anaphor refers to the same person as its antecedent, so all the underlined NPs have the same reference. Similarly, in [ii] *Max* is antecedent for *he* (this being a case of anticipatory anaphora), and *he* is antecedent for *himself*. Elliptical gaps can also figure in anaphoric chains; for simplicity they were not marked in [i], but an elementary example is given in [iii]. Here the anaphor *herself* is linked to the covert subject of the *commit* clause, and this in turn is linked to *Ann*.

We talk in terms of a chain of anaphoric relations between anaphor and antecedent rather than say that in such an example as [16i] all the pronouns are related directly to *my daughter* as antecedent. There are a number of factors that support the chain treatment.

#### (a) Restrictions on permitted type of anaphor

The most important concerns various restrictions on the location of the antecedents of certain types of anaphor, most notably reflexive pronouns. In [16ii], for example, *himself* has *he* as antecedent, and *he* has *Max* as antecedent: *himself* cannot be directly related to *Max*. This is evident from the ungrammaticality of, say, *\*If they hurt himself<sub>i</sub>, Max<sub>i</sub> will undoubtedly blame you*. Similarly, *herself* in [iii] could not be directly linked to the subject of the matrix clause: compare *\*Ann<sub>i</sub> regretted my committing herself<sub>i</sub> to the project*.

#### (b) Progressive changes in the nature of the entity referred to

A second point is that the nature of the referent being talked about may change during a sequence of events described:

- [17] *Wash a bunch of fresh spinach well and then shred it finely. Sauté it in a little butter until it is wilted, drain \_\_, then put a little into each ramekin.*

*A little* here is interpreted not as referring to a little of the bunch of fresh spinach, but rather to a little of the spinach that results after the shredding, sautéing, wilting, and draining.

#### (c) Potential distance between antecedent and anaphor

There can be a very large distance between the first antecedent in a chain and the final anaphor, greater than would typically be permitted for a direct link: it is the intermediate links that keep the referent salient in the context of discourse so that reference to it can be made by means of a personal pronoun or other anaphor with little intrinsic content.

## 1.3 The relationship between an anaphor and its antecedent

Traditionally an anaphor is said to refer to its antecedent, but that is a very different sense of ‘refer’ from that in which we say that an NP refers to a person or other entity in the outside world. We will not use ‘reference’ for the relation between anaphor and

antecedent. ‘Anaphora’ itself is the term that names this relation. We will describe an anaphoric pronoun as **anaphoric to**, or **anaphorically linked to**, an antecedent. Our concern in the present section is therefore to give a brief account of the nature of this relationship.

### (a) Coreference between NPs

The simplest and prototypical relation between anaphorically linked NPs is that of coreference:

[18] *The drummer was late because he had overslept again.*

In the intended interpretation, *he* is anaphoric to *the drummer* and by virtue of that relation refers to the same person as the latter phrase: we say then that antecedent and anaphor are **coreferential**. This underscores the point just made concerning the term ‘refer’: *he* in [i] refers to a person in the outside world, not the linguistic expression *the drummer*.

### (b) Anaphorically linked NPs that are not coreferential: the bound variable interpretation

Two NPs can be coreferential only if both of them are referring expressions, but very often an anaphor and/or its antecedent do not satisfy this condition:

[19] i *No one put their hand up.*  
 ii *Every car had its windscreen smashed.*

Neither *no one* nor *their* has reference in [i]; the anaphoric relation here can best be described in terms of a bound variable, with the meaning represented roughly as “There is no person *x* such that *x* put *x*’s hand up” (see §2.3.2 below). Similarly for [ii]: “for every car *x*, *x* had *x*’s windscreen broken”.

### (c) NP anaphors with antecedents that are not NPs

Another important case where the relation between an anaphoric NP and its antecedent cannot properly be described as coreference is that where the antecedent is a clause, VP, or some similar expression:

[20] i *His digestion was upset, and this led him to the discovery of yoghurt.*  
 ii *He smiled and stuck a large finger with white hairs sprouting on it into his ear as though that might help.*  
 iii *If you don’t go while you have a chance, you’ll regret it.*  
 iv *They may bring the dog with them, which would make things difficult for us.*

Again, there cannot be coreference here because the antecedent is not a referring expression. The NP anaphors refer to various kinds of abstract entity such as states of affairs, actions, facts, propositions, etc. It is very often not possible to identify a constituent or sequence of the preceding text that can be said to express precisely the content of the anaphor. In [iv], for example, it is not the possibility of their bringing the dog but their actually bringing it, that would make things difficult. In [ii] the smiling is presumably irrelevant, but the fact that the finger had white hairs sprouting on it could well be irrelevant too, the issue being simply whether sticking a finger in his ear might help.

The relation between anaphor and antecedent in such cases is characteristically of a somewhat looser kind than we have in cases (a)–(b) above. The task of interpreting such anaphors cannot be reduced to that of identifying an antecedent. Nothing would

be gained, for example, by saying that the antecedent for *which* in [iv] is *they... bring their dog with them*, rather than the continuous sequence underlined above.

#### (d) Anaphors that are not NPs

In many cases the anaphor is not an NP. A few examples of this kind are given in:

- [21] i *I asked for a green shirt, but he gave me a white one.* [noun]  
 ii *If you want me to stay on I will do so.* [VP]  
 iii *Liz will complain, or at least I think she will    .* [VP gap]

In [i] the anaphoric relation is not between the NPs *a green shirt* and *a white one*, but between the nouns *shirt* and *one*. These are not referring expressions: we understand the antecedent and anaphor here to have the same denotation, not the same reference. Nor, of course, is there a relation of coreference between the NPs that have the anaphorically linked expressions as their heads, namely *a green shirt* and *a white one*. The relation in [ii–iii] is similarly one of like denotation: we understand “I will stay on” and “she will complain”. In both of these the antecedent is a VP; in [ii] the anaphor is a VP too, while [iii] is one of a wide range of types of elliptical anaphora.

Although the relation between anaphor and antecedent in [21] is not itself one of coreference, there may be coreference between an NP **contained** within the antecedent and one implied by the anaphor:

- [22] i *There’s only one photograph of the children here: where’s the other one?*  
 ii *If you want me to invite Kim I will do so.*  
 iii *Liz will win the prize, or at least I think she will    .*

In [i] we could replace the anaphor *one* by *photograph of the children*, with the understanding that it is the same children as are referred to in the first clause. Similarly, in [ii–iii] we can replace the anaphors by *invite Kim* and *win the prize*, and again it is the same Kim, the same prize as is referred to within the antecedent. But it is not always so:

- [23] i *He’s got lots of photographs of lions: why does he need to take another one?*  
 ii *I’ve never lodged a complaint before, but I’m going to     now.*  
 iii *Ed always gets his kids to help in the kitchen: why don’t you    ?*

*Lions* in [i] does not refer to any particular lions, and so it is not a question of whether he needs to take another photograph of the same lions. Note, moreover, that neither antecedent nor anaphor indicates explicitly whether individual photographs are of one or more than one lion. In [ii], *a complaint* is non-referential (there is no prior complaint to refer to), so again there is no coreference.

Example [23iii] is different, since here we have an ambiguity between the following interpretations:

- [24] i “Why don’t you get his kids to help in the kitchen?” [implicit coreference]  
 ii “Why don’t you get your kids to help in the kitchen?” [implicit bound variable]

In the first interpretation the VP gap implicitly refers to Ed’s kids, so that there is implicit coreference with the NP *his kids* contained within the antecedent. In the second interpretation (pragmatically more likely) it is a matter of getting your own kids to help in the kitchen. To account for this reading we again need the concept of bound variable. It follows from the first clause that “*x* gets *x*’s kids to help in the kitchen” holds where *x* = Ed, and my question is about why it does not also hold where *x* = you.

With a reflexive pronoun as the contained NP, only the implicit bound variable reading is available. *Max had hurt himself and Ed had \_\_ too* does not have a reading in which Ed had hurt Max: the meaning is that  $x$  had hurt  $x$  holds for Ed as well as for Max. Gender makes no difference: we can say *Max had hurt himself and Julie had \_\_ too*, meaning that Julie had hurt herself.<sup>5</sup>

### (e) Split and ‘missing’ antecedents

- [25] i *Kim<sub>i</sub> is better than Pat<sub>j</sub> but neither of them<sub>i+j</sub> is really suitable for the position.*  
 ii *I hadn't taken an umbrella with me<sub>i</sub>, but Liz had \_\_<sub>i</sub>, and she was good enough to let me borrow it<sub>j</sub>.*

The antecedent for an anaphor may be split into two or more separate parts. This is illustrated in [i], where the antecedent for *them* consists of *Kim* and *Pat* together. The first clause introduces Kim and Pat into the context of discourse (or maintains their salience if they have been introduced earlier), and this makes it possible to refer to the set comprising them both by means of the pronoun *they*: whether or not they were introduced by means of a single constituent is irrelevant. Example [ii] shows that the antecedent for an anaphor may be merely implied by another anaphor. The clause *Liz had* contains an elliptical gap which is anaphoric to the underlined complement in the first clause: we interpret it therefore as “Liz had taken an umbrella with her”. This introduces an umbrella into the context of discourse which can subsequently be referred to by the pronoun *it*. The term **missing antecedent** is commonly applied to constructions like [ii]: there is nothing that can, strictly speaking, be identified as the antecedent of *it*.

### ■ Discourse deixis

One case that needs to be distinguished from anaphora is discourse deixis:

- [26] i *Take the bus to Murwillumbah. Shall I spell that for you?*  
 ii A: *It was a great lurk.* B: *Is that another Australianism?*  
 iii A: *Is this a dagger that I see before me?* B: *That was too loud.*

*That* in [i] refers to *Murwillumbah* the word, not *Murwillumbah* the town. *Murwillumbah* is not the antecedent but the referent. This, then, is not anaphora but deixis. It is comparable to the central deictic use of *What's that you're holding?*, differing, however, in that the referent is not physically present in the situation of utterance but is located in the discourse itself.<sup>6</sup> *That* in [ii] is very similar, referring to the word *lurk*; *lurk*, however, is

<sup>5</sup>Reading [24ii] is commonly labelled as involving ‘sloppy identity’ between anaphor and antecedent. The idea is that for the VP to be understood as “gets his kids to help in the kitchen” involves an exact match with the antecedent *gets his kids to help in the kitchen*, but for it to be understood as “get your kids to help in the kitchen” involves only an inexact or sloppy match (“your” does not match *his*). Likewise the match between “hurt herself” and *hurt himself*. We avoid this term because it runs the risk of being misconstrued as making a stylistic judgement. There is nothing stylistically sloppy about this kind of anaphora, even for the most authoritarian of prescriptivists.

<sup>6</sup>An alternative term for discourse deixis is textual deixis. With both terms it is to be understood that the discourse or text in question is the one that is currently ongoing. It is of course also possible to refer to entities in some other text that happens to be present in the context of utterance, normally in writing. Thus I might say, indicating a word in my son's school assignment, *This word is incorrectly spelt*. But there is nothing special about this phenomenon, which is more obviously distinct from anaphora than the examples in [26].

a common noun, and hence is not itself a referring expression in A's utterance. Again, then, *lurk* and *that* are not coreferential: rather *that* refers deictically to a word in the discourse. In [iii] *that* refers not to a word, or sentence, but to A's utterance (in a rehearsal of 'Macbeth', let us assume, with A the actor and B the director).

Discourse deixis is most clearly distinct from anaphora when the reference is to a word or phrase, as in [26i–ii]. Less obvious are cases like the following:

- [27] i A: *Kim has been falsifying the accounts.* B: *That's terrible.* [anaphoric]  
 ii A: *Kim has been falsifying the accounts.* B: *That's a lie.* [discourse-deictic]

In [i] A's utterance is the antecedent for B's *that*, which refers to the situation that A has described. This belongs to the type illustrated in [20] above, where an NP anaphor has a clause as its antecedent. But in [ii] *that* refers to A's speech act, to a linguistic entity in the prior discourse.

The form *hereby* has the special property that it is used only in discourse deixis, as in *I hereby pronounce you husband and wife* or *You are hereby invited to forward any amendments to the secretary*. The meaning is essentially "by virtue of this speech act". The reference therefore is to the utterance that contains the deictic expression. Self-reference of this kind is also found in examples like *I should warn you that this conversation is being recorded*. But of course *this conversation* is not restricted to the discourse-deictic use.

## 1.4 Pro-forms

### ■ Pro-forms and pronouns

The traditional term 'pronoun' is based on the idea that words of this class 'stand for' nouns. Traditional grammar does not work with a constituent structure model like that assumed in this book, and hence does not draw the distinction we do between nouns and NPs. When adapted to the present framework, therefore, the traditional idea is that pronouns are words that 'stand for' NPs.

The most obvious kind of 'stand for' relation is anaphoric, with the pronoun used instead of repeating the antecedent, as in elementary examples like:

- [28] i *Liz thinks she may be able to help.*  
 ii *The woman next door thinks she may be able to help.*

Example [ii] brings out the point that *she* stands for (is anaphoric to) an NP, not a noun: [i] illustrates the special case where the antecedent NP happens to consist of just a noun.

In the present grammar we retain the traditional category of pronoun, but introduce a further category based on the idea of 'standing for' – the category of **pro-form**. A pro-form is an anaphor with little inherent semantic content of its own: the interpretation derives from the antecedent, so that the anaphor need contain little descriptive information itself. Pro-forms are single words (or in a few cases idioms, such as *do so*): they constitute a subclass of anaphors. Thus *she* is a pro-form in [28], but in [8] above (*We'd been listening to Paul: that guy certainly knows how to stir things up*) the anaphor *that guy* is not a pro-form: it is a phrase with lexical content of its own.

The sets of pronouns and pro-forms overlap, but neither set is wholly contained within the other.

#### (a) Not all pronouns are pro-forms

Clear cases of pronouns that are not anaphors are interrogative *who* and *what*. To the extent that they can be said to stand for an NP, it is in the sense that they take the place in a question that would generally be filled by an NP in the answer. This falls outside the scope of anaphora: the interpretation of these pronouns is not mediated by an antecedent expression, and hence the interrogative pronouns do not qualify as anaphors. In addition, the 1st and 2nd person pronouns, especially singular *I* and *you*, are predominantly used deictically rather than anaphorically.

From a syntactic point of view, *who*, *what*, *I*, and *you* belong with *she*, *he*, etc., in that they function as head in NP structure, differing from other words in this function in that they exclude determiners. This is what makes them all pronouns. Note, however, that while pronouns are traditionally regarded as a distinct part of speech, we are treating them as a subclass of nouns: they belong in the noun class by virtue of occurring as head in NP structure.

#### (b) Not all pro-forms are pronouns

Probably the most obvious pro-form that doesn't qualify as a pronoun is *so*, while another clear (but not so obvious) example is *one*, as used in [29ii]:

- [29] i *Kim may be too ill to attend; if so I'll have to ask you to chair the meeting.*  
 ii *This copy of the notice is blurred, but the other ones appear to be satisfactory.*

*So* is clearly a pro-form here, being interpreted anaphorically as “Kim is too ill to attend”. But it could not be replaced by an NP, and there is no basis for saying that it constitutes an NP, hence none for saying that it is a pronoun. *Ones* in [ii] is anaphoric to the nominal *copy of the notice*, and like the latter functions as head in NP structure. It nevertheless fails to qualify as a member of the syntactic class of pronouns because it occurs readily with determiners: it is a common noun. Note, moreover, that like most common nouns, but unlike pronouns, it inflects for number.

Other pro-forms that are not pronouns include spatial *there* and temporal *then*:

- [30] i *I put your letter in the top-drawer; I hope it is still there.*  
 ii *They are coming at around five o'clock; will you still be here then?*

We take these to be (intransitive) prepositions: they could be replaced by transitive PPs and typically have PPs as antecedents.<sup>7</sup>

### ■ Kinds of pro-form

Instead of talking simply of ‘pro-forms’, we will often use more specific terms such as ‘**pro-NP**’ for an anaphor with an NP antecedent, ‘**pro-clause**’ with a clausal antecedent, ‘**pro-nominal**’ where the antecedent is of the nominal category,<sup>8</sup> etc.:

<sup>7</sup> *Then* and *there* are traditionally described as pronominal adverbs. ‘Pronominal’ is to be interpreted in this context as “resembling a pronoun”: they are like (some central) pronouns in that they are used anaphorically (or deictically too).

<sup>8</sup> Notice that our hyphenated term ‘pro-nominal’ is distinct from the unhyphenated word ‘pronominal,’ often used as an adjective related to the noun ‘pronoun.’

- [31] i *The car is being serviced at the moment but it should be ready soon.* [pro-NP]  
 ii *If he was disappointed by her response he did not show it.* [pro-clause]  
 iii *This photo of Ann is much better than the other one.* [pro-nominal]  
 iv *I think she'll be there – I certainly hope so.* [pro-clause]  
 v *I met her last time I was in Paris but she doesn't live there now.* [pro-PP]

In [i] *it* has an NP as antecedent, and if it were replaced by an equivalent expression that was not a pro-form, this too would be an NP (*the car should be ready soon*). Similarly in [ii] the antecedent is a clause, and we could replace *it* by a clause (*he did not show that he was disappointed by her response*).

We will use this 'pro-X' formulation only when both the antecedent and the potential replacement belong to the same category X. This is the usual case, but there are some places where it does not apply:

- [32] i *She had expected to find the church empty, but three women were there.*  
 ii *The Opposition vehemently objected to any increase in the powers of local government, so much so that the new system which was inaugurated in April 1934 was thrown out in August of the same year.*

The antecedent in [i] is an NP, but the anaphor *there* is a PP, and its replacement would require a preposition: *three women were in the church*. Example [ii] represents a more restricted case: when modified by *so much* in this way the pro-form *so* cannot be replaced by any matching form, whether a clause like the antecedent or not.

## 2 The personal pronouns

The full set of personal pronouns is given in Ch. 5, §10.1.1; the ones we will be concerned with here are as follows:

[1]		SINGULAR	PLURAL
	1ST PERSON	<i>I</i>	<i>we</i>
	2ND PERSON	<i>you</i>	<i>you</i>
	3RD PERSON	<i>he, she, it</i>	<i>they</i>

In this section we are generally concerned with the pronouns as lexemes, with *I* subsuming the forms *I, me, my, mine, and myself*, and so on. The distinction between reflexive *myself* and the non-reflexive forms is closely bound up with anaphora and will be taken up in §3 below, but that between nominative *I*, accusative *me*, dependent genitive *my*, and independent genitive *mine* is a matter of case, and not of concern in the present chapter.

Personal pronouns are so called because they are the ones to which the grammatical system of **person** applies. This is the system whose terms are differentiated by reference to the utterance-act roles of speaker and addressee:

- [2] i 1ST PERSON      Characteristically used for the speaker or a group including at least one speaker.  
 ii 2ND PERSON      Characteristically used for the addressee or a group including at least one addressee but no speaker.  
 iii 3RD PERSON      The residual category – not 1st or 2nd.

## 2.1 3rd person as the default category

Any NP that is not explicitly marked as 1st person by *I* or *we* or as 2nd person by *you* is 3rd person. *He*, *she*, *it*, and *they* are given in [1] as personal pronouns because they belong in the same syntactic class as 1st and 2nd person *I*, *we*, *you*, but pronouns of other categories such as interrogative *what* and *who*, and NPs that are not pronouns (*Kim*, *the doctor*, *those boxes*) are 3rd person too.

At the language-particular level 3rd person is defined by the absence of the 1st and 2nd person markers *I*, *we*, and *you*. It should be emphasised, however, that 3rd person NPs do not explicitly exclude reference to the speaker or addressee: unlike 1st and 2nd person, 3rd person is not a deictic category. Thus it is perfectly possible to refer to oneself or to the addressee in the 3rd person:

- [3] 3RD PERSON REFERENCE TO THE SPEAKER/WRITER
- i A: *Ann is going to volunteer.* B (Ann): *She/Ann* is going to do no such thing.
  - ii *The writer* has to admit that he cannot see the logic of this argument.
  - iii *Your reviewer* is unable to find any merit in this film.
- [4] 3RD PERSON REFERENCE TO THE ADDRESSEE
- i *And how is young Francis this morning?*
  - ii *Does Madam / His Lordship require anything further?*
  - iii *The reader* no doubt recalls that this issue also arose in Ch. 2.

In [3i] the speaker refers to herself as *she* or *Ann*, following A's reference to her as *Ann*. One plausible context for this usage is where A was unaware that Ann was present or able to hear: Ann uses the form that would be appropriate if A's assumption were correct, but the fact that it is she herself who is using it draws attention to A's mistake. It could equally be that Ann is known to be present: her use of the 3rd person here matches A's 3rd person *Ann* and draws attention to A's failure to use a 2nd person form, A's failure to consult her. In either case, *she* acquires its referential interpretation anaphorically, not by person-deixis. In [3ii–iii] the underlined NPs can likewise be used to refer to the speaker/writer: they permit self-reference without the use of 1st person *I*. And in the intended interpretations of the examples in [4] the underlined NPs are used to refer to the addressee. Note also that a 3rd person NP can be used to refer to one member of a group of addressees. In a seminar discussion, for example, I might say *Emily's suggestion sounds promising: would you like to elaborate?*, with the first clause addressed to the group as a whole, the second to Emily in particular.

That the underlined NPs in [3–4] are all 3rd person, not 1st or 2nd, is evident from the form of the verb, which agrees in person and number with the subject: in [3i] we have *is* not *am*, in [ii] *has*, not *have*, and so on. As so often, therefore, it is necessary to distinguish carefully between meaning or reference and grammatical form: the reference here is to speaker/writer or addressee, but the form is 3rd person. Thus 3rd person does not mean that the reference is to an entity other than speaker or addressee: it means only that the reference is not derivable from the person feature, as it is with 1st and 2nd person.

The same applies where there is reference to a set rather than an individual:

- [5] i *All members of the cabinet* support this proposal.
- ii *Do all members of the cabinet support this proposal?*
  - iii *The McCarthys* have owned this estate for five generations.
  - iv *Everyone in the team* is going to have to improve their performance.

It is perfectly possible for [i] to be said by a member of the cabinet and for [ii] to be addressed to one. Analogously for [iii–iv]. There is nothing in the form or meaning of these NPs to indicate whether the speaker or addressee is included in the set referred to. They contrast in this respect with NPs like *all of us/you in the cabinet*, *we McCarthys*. Note also that it may be possible to explicitly indicate inclusion of speaker or addressee by means of an anaphoric 1st or 2nd person pronoun: *Everyone in the team is going to have to improve our/your performance*.

## 2.2 1st and 2nd person

### 2.2.1 Primary uses

We look first at what we will call the primary uses of **I**, **we**, and **you** – the uses which match the general definitions given in [2]. Here the interpretation is determined deictically.

#### ■ Singular **I** and **you**

- [6] a. *I have just finished my assignment.*      b. *Have you hurt yourself?*

**I** refers straightforwardly to the speaker, **you** to the addressee: no further commentary is needed.

#### ■ Plural **we**

##### (a) Single speaker vs plurality of speakers

**We** refers to a set of two or more that includes a speaker.

- [7] i *Hurry up! We are going to be late.*  
 ii *Why are we waiting?*  
 iii *We accept your offer subject to the conditions stated below.*

Usually the set consists of a single speaker together with one or more others, as in the likely interpretation of [i]. The relation between **we** and **I** is thus very different from that between *books* and *book*, and we take them to be distinct lexemes, not plural and singular forms of a single lexeme. It is, however, perfectly possible for the group to contain a plurality of speakers, as in plausible interpretations of [ii–iii]. In the case of speech this use involves speaking in unison, as in singing, praying, chanting, and the like: [ii], for example, is commonly chanted by a crowd of spectators when the start of the event they have come to watch has been delayed. In the case of writing, it may be a matter of joint signatories, of a letter, contract, petition, etc., as in [iii] (note the formula *we, the undersigned, . . .*), or joint authorship, as of a book, for example.

##### (b) Inclusive and exclusive

A second issue is whether or not the set includes one or more addressees in addition to the speaker:

- [8] i *Why don't we go together instead of taking two cars?* [inclusive]  
 ii *We could lend you a couple of hundred dollars if that would help.* [exclusive]

In the natural interpretation of [i] it is a matter of you and me (and possibly others too) going together, whereas in [ii] it is unlikely that you are a member of the set that would lend you the money. The terms **inclusive** and **exclusive** are standardly used to distinguish these cases: inclusive or exclusive of the addressee, that is. We noted in §1.1 that deixis

is generally centred on the speaker, and the priority accorded to the speaker over the addressee (which leads us to call them respectively 1st and 2nd person) is reflected in the fact that a set containing both speaker and addressee is referred to by 1st person *we*, not 2nd person *you*.

Many languages have distinct pronouns for inclusive and exclusive 1st person plural reference, but as far as English is concerned there is just one place where the distinction is grammaticalised. The 1st person plural imperative, marked by a special use of *let*, is always interpreted inclusively, and here *us* can be, and almost always is, reduced to the clitic form 's. Compare:

- [9] i *Let's finish this off tomorrow.* [1st person imperative]  
 ii *Please let us have our ball back.* [2nd person imperative]

In [i] the 's necessarily includes the addressee(s) as well as the speaker. In [ii], *let* has its ordinary meaning of "allow" and *us* cannot be reduced to 's.

### (c) Variation in the size and specificity of the set referred to

*We* stipulates that the set referred to contains someone with the role of speaker, but this leaves great scope for variation with respect to who else is included. Compare, for example:

- [10] i *I went out to dinner with my uncle and aunt on Monday: it cost us nearly \$300.*  
 ii *When we were trying to sell our home we had it valued independently.*  
 iii *We have lived here for three generations.*  
 iv *When I was at school we had to share the oval.*  
 v *How did you get on during that storm we had at the week-end?*  
 vi *We are seriously overtaxed as it is.*  
 vii *We have many more back problems than other primates.*

In [i] the remaining membership is determined anaphorically, via the antecedent *my uncle and aunt*. In [ii] the group probably consists of me and my partner, while in [iii] *we* may apply to a family – with the predication applying jointly to the set as a whole, not to the members individually. In [iv] I'm talking about the school population, and in [v] about those present in the area affected by the storm. As we move to [vi] the set grows: I'm here probably talking about the population of a country. And in [vii] *we* refers to humankind in general.

## ■ Plural *you*

The 2nd person plural is distinct from the singular only in the reflexive form *yourselves*.<sup>9</sup> It applies to a set consisting of an addressee and one or more other non-speakers. The size and specificity of the group can vary in the same way as was illustrated above for *we*. Compare:

- [11] i *I saw Jill the other day – have you two had a fight?*  
 ii *Did you have your house valued independently before you sold it?*  
 iii *I'm told you have lived here for three generations.*  
 iv *Did you get any rain over in Whittlesea?*  
 v *You seem to be even more heavily taxed in this country than we are back home.*

<sup>9</sup>There are dialectal forms that distinguish a plural non-reflexive: *youse* (found in North America, Australia, Scotland, Ireland) and *you-all*, or *y'all* (primarily US Southerners).

## 2.2.2 Secondary uses

### (a) Authorial *we*

Written works authored by a single person often use *we* as a means of involving the reader and/or avoiding the 1st person singular pronoun *I*. Many people feel that *I* should be used very sparingly, if at all, in certain types of writing, particularly scientific papers or books: the idea is that reference to the speaker as an individual may make the text appear inappropriately personal and subjective.

- [12] i *We have seen in Ch. 3 that this methodology has a number of drawbacks.*  
 ii *In the next chapter we will describe the methodology used.*

It can be argued that in examples like [i] *we* has plural reference to the author + readers and hence is an instance of the primary use of *we*. Such an explanation is harder to justify in [ii], for it will in fact be the author alone who will describe the methodology. No sharp boundary can be drawn between the two cases, however, and even in [ii] there remains some suggestion that the reader is being invited to engage in a joint enterprise.

### (b) *We* for single speaker

- [13] *Give us a lick of your icecream.*

This can be interpreted with *us* referring to the speaker alone; as such it is a very colloquial form characteristic of the speech of children or intimates. It applies only with accusative and perhaps genitive forms. At the opposite end of the stylistic spectrum is the honorific singular *we* of Queen Victoria's *We are not amused*, but this usage is no longer current.

### (c) *We* for addressee or third party

- [14] i *How are we feeling this morning? Have we taken our medicine?*  
 ii *Oh dear, we are a bit cranky this morning, aren't we?*

Example [i] might be used to ask about the addressee: "How are you feeling this morning? Have you taken your medicine?" This usage is generally found in contexts of illness (doctor, nurse, etc., to patient) or tuition (teacher to pupil: *We need to practise our scales*); it runs the risk of being construed as patronising.<sup>10</sup> Examples like [ii] convey mockery; they might be used in talking to or about the person concerned. The latter is likely to be someone I have a regular association with: my boss or teacher, perhaps, or a child I have in my care.

### (d) Non-referential *you*

- [15] i *You can get fined for parking on the footpath.*  
 ii *I think Smith's a really great speaker, whether you agree with him or not.*  
 iii *You have to avoid that sort of thing when you're eight months pregnant.*  
 iv *You couldn't hear yourself talk, it was so noisy.*

Singular *you* is commonly used as a less formal variant of *one*: compare *One can get fined for parking on the pavement*, and so on. Unlike singular *you* in its primary use, this *you* does not refer to a specific person, the addressee, but is used to talk about people in

<sup>10</sup>In the attested example *Let's just hop up on the couch and have a look at you, eh?* we have an unusual switch in interpretation between the coordinates: it is the patient who is to hop onto the couch but the doctor who is to have a look (note the ordinary 2nd person *you* here).

general. There can be a fairly clear ambiguity according as **you** is interpreted referentially or not. Take [ii], for example. With referential **you** this could be used (though of course does not have to be) in a context where you have expressed disagreement with Smith: in this case I convey that in spite of your disagreeing with him I myself think he's a great speaker. With non-referential **you**, by contrast, what I convey is that one doesn't have to agree with him to recognise that he is a great speaker. The non-referential **you** in [iv] is used in talking about some particular event in the past, and is understood as applying to those present at the time (most likely including the speaker).

The connection between the two uses of **you** is that what holds for people in general will characteristically hold for you personally. If one can be fined for parking on the footpath, then you personally may be fined if you park there. However, a general statement involving non-referential **you** need not apply in fact to the addressee: [15iii], for example, could be addressed to a man. Note also the apposition in the following attested example, spoken by an actor: *Playing these slightly unsavoury characters that I do, I think it tends to leave an aroma on you, the actor.*

### (e) Play-acting

[16] *I commit suicide before they discover it was you who murdered the duke.*

In a highly restricted set of contexts the 1st and 2nd person pronouns can be used to refer not to the actual speaker and addressee themselves but to characters in a play or the like.

## 2.3 3rd person

### 2.3.1 Anaphoric and non-anaphoric uses

While the 1st and 2nd person pronouns are generally used deictically, the characteristic use of the 3rd person personal pronouns **he**, **she**, **it**, and **they** is anaphoric:

- [17] i *If you see Paul, please tell him that the lawn needs mowing.*  
 ii *I've just been talking to your sister. She seems rather depressed.*  
 iii *What's that you've got there? Give it to me.*  
 iv *I'd made several mistakes, but fortunately they weren't very serious.*

The pronouns here are definite referring expressions, and in this subsection we will confine our attention to such uses. The use of a definite referring expression implies that the speaker takes the referent to be identifiable without further description, and in these cases it is identifiable by virtue of having been introduced into the context of discourse by the antecedent.

#### ■ Agreement between pronoun and antecedent

The 3rd person pronouns can be classified in terms of number and gender as follows:

[18]	MASCULINE SINGULAR	FEMININE SINGULAR	NEUTER SINGULAR	PLURAL
	<b>he</b>	<b>she</b>	<b>it</b>	<b>they</b>

The number and gender provide descriptive information about the referent, and at the same time narrow down the range of possible antecedents:

- [19] *Liz<sub>i</sub> had bought the tickets<sub>j</sub> for Tom<sub>k</sub> but he<sub>k</sub> hadn't yet paid her<sub>i</sub> for them<sub>j</sub>.*

The masculine singular feature links *he* to *Tom*, the feminine singular links *her* to *Liz* and the plural feature links *them* to *the tickets*. We follow the traditional account and say that the pronoun agrees with its antecedent in person, number, and gender, but as pointed out in the more detailed description given in Ch. 5, §17.2, it is a somewhat loose sense of agreement because the information encoded in the pronoun need not be encoded in the antecedent too:

- [20] i *Did you know the Vice-Chancellor was getting married on Saturday? Her former husband died only a few months ago.*  
 ii *We've just appointed a new chief executive, but she won't be starting until June.*

The nouns *vice-chancellor* and *executive* are neutral as to sex, but the pronouns indicate that the referents are female. The extra information conveyed by the pronoun may be already known to the addressee, as is likely to be the case in [i], where you probably know who the Vice-Chancellor is, or it may be new, as is likely in [ii]. What is required, then, is not that the antecedent encode all the meaning of the pronoun, but that it be consistent with it. *The Vice-Chancellor*, for example, is consistent with either **he** or **she** – but not with **it**. Note, however, that as far as the category of person is concerned we have agreement in the strict sense: a 1st or 2nd person pronoun cannot be the antecedent for a 3rd person one.

Because of the minimal descriptive information contained in the pronoun, there will often be more than one NP to which the pronoun could be anaphorically linked. Typically, however, the content of the clause containing the pronoun will strongly favour one of the potential antecedents:

- [21] *Liz told Jill that she was going to Paris at the week-end.*

Though it is certainly possible for *Jill* to be the antecedent, *Liz* is a far stronger candidate: it is commonplace for me to tell you what I will be doing, whereas it is only under restricted conditions that I tell you what you will be doing. Where there are no comparable factors favouring one NP as the antecedent, ambiguity is occasionally avoided by repeating the intended antecedent NP in apposition to the pronoun.

- [22] *Ed told me that he had been informed by Max that he, Max, had been nominated for an excellence in teaching award.*

## ■ Non-anaphoric uses

Although the 3rd person pronouns are usually interpreted via an antecedent, they certainly do not have to be. We group these non-anaphoric uses under four headings.

### (a) Reference to contextually salient entity

- [23] i *Isn't she lovely!*  
 ii *She looks as if she's going to fall.*  
 iii *Why's the meal so late? Isn't he home yet?*  
 iv [Pointing at a painting] *He certainly knew how to paint.*

The intended context for [i] is where I'm admiring a baby, say, that I have just encountered. There is no need for any prior mention: *she* can be interpreted directly by virtue of the presence of the referent in the situation of utterance. A possible context where [ii] might be used in this kind of way is one where we are watching a tightrope walker at a circus. The prominence of the person on the high wire together with the content of the

predication makes it obvious who I'm referring to without the need for an antecedent or a more contentful referring expression. Note that the *she* that is applied to ships or other inanimates can be used in this way: *Here she comes*.

Contextual salience does not require that the referent be actually present in the situation of utterance. Thus [23iii], for example, might be used in a family context with *he* referring to the father. If the regular family routine is for the meal to be served when the father returns from work, the delay suggests that he may not have returned yet, and in this context the content of *he* ("male one") is sufficient to make clear who I'm talking about.<sup>11</sup> In [iv] I point at a painting and use *he* to refer to the painter. This case has been called 'indirect ostension': ostension is showing or indicating, as by pointing, and it is indirect in that what I am pointing at is not the painter but something closely associated with him. By drawing attention to the painting I create a context in which the painter is salient and hence can be referred to by a mere pronoun.

Some works subsume the use of pronouns illustrated in [23] under the concept of deixis, on the grounds that the referent is identified by virtue of features of the context of utterance. There is, however, a crucial difference between these pronouns and genuine deictic expressions such as *I, you, this, those boxes*, etc. In their deictic use these expressions encode the relation between the referent and features of the situation of utterance: *I* refers to the speaker of the utterance, *this* to something relatively close to the speaker, and so on. But there is no such meaning expressed in the 3rd person personal pronouns. They are merely **definite** and this is not a deictic category. The referential use of a definite NP indicates that the speaker takes the referent to be identifiable by the addressee, and in the case of the pronouns in [23] the identifiability results from the contextual salience of the referent, not from anything in the meaning of the pronouns that relates the referent to features of the situation.

This use of 3rd person pronouns is comparable to that of the underlined NPs in:

- [24] i *Please close the door.*  
 ii *The Prime Minister is being interviewed on TV tonight.*  
 iii [Host at dinner party] *Would you like to sit next to Angela.*

In [i] the intended referent will normally be the door of the room in or outside which the utterance takes place, and in the salient non-anaphoric interpretation of [ii] reference will be to the prime minister of the country in which the utterance takes place. Similarly with the proper name *Angela* in [iii]: there are innumerable people with this name, and in the context given the intended referent is identifiable by virtue of her presence at the dinner table. As in [23], there is nothing in the meaning of these expressions that relates them to the situation of utterance. We believe, therefore, that it would represent an unnecessary and undesirable dilution of the sense of deixis to extend it to cover cases like [23–24].

#### (b) Quasi-anaphoric uses

- [25] i *I went to the corner shop but he wouldn't sell me any stamps.*  
 ii *Tom's getting married at the week-end. She's already three months pregnant.*  
 iii *I heard from Sue yesterday. Did you know they had moved again?*  
 iv A: *How's baby?* B: *Oh, she's crying now.* A: *Yes, they do tend to cry.*

<sup>11</sup>It can seem rude to someone to assume that they are so salient that they need no name or title. Children who refer to their mother as *she* with no other identification are sometimes rebuked for it (*Who's 'she' – the cat's mother?*).

*He* in [i] refers to the person serving at the corner-shop, *she* in [ii] to the person Tom is going to marry, *they* in [iii] to Sue's family, and *they* in [iv] is interpreted generically as "babies". *The corner shop* in [i] is not the antecedent for *he*, but it serves the same kind of role as an antecedent: once I have introduced the corner shop into the universe of discourse I can refer to entities associated with it without needing to use a descriptive NP that includes a reference to the shop. We will say therefore that this use of *he* is **quasi-anaphoric**.

The case is closely parallel to the indirect ostension in [23iv]: there pointing at the painting makes the painter conceptually accessible enough to be referred to with a pronoun, while here mention of the corner shop achieves the same result with respect to the person serving there. Similarly *marry* cannot be regarded as the antecedent for *she* but it creates a context of discourse involving a marriage partner, and this person can then be referred to by a pronoun. In [25iii] there is again an association between Sue and the referent of *they*: *Sue* is a member of the set referred to (a couple, perhaps), making the set salient. And in [iv], *baby* is straightforwardly an antecedent for *she*, but talk of one baby makes it an easy conceptual move to talk of babies in general.

Examples like those in [25] belong to informal or relatively casual style: in more carefully monitored speech or writing one would be more likely to use more explicit expressions.

The boundary between anaphora proper and quasi-anaphora is not entirely clear-cut. One borderline case is illustrated in:

[26] *We've just joined the local squash club, but they won't let schoolkids play on Saturday and Sunday afternoons.*

*They* refers to the people who run the local squash club, so that we have an association between the referent of the pronoun and the entity introduced into the context of discourse by the NP *the local squash club*: from this point of view this case is like the quasi-anaphoric ones in [25]. But it would also be possible to replace *they* by *the local squash club*, which makes the latter very much like an antecedent. This is especially so for speakers (more in BrE than in AmE) who treat it as a collective allowing a plural verb: *The local squash club don't let schoolkids play on Saturday and Sunday afternoons.*

(c) *He who...*

[27] *He who committed this infraction of taste would promptly discover how little mercy liberals were disposed to allow to libertarians who appeared to them libertines.*

This use is now rare (though familiar from proverbs and the Bible). It is mostly found with non-referential uses of what we have called the purportedly sex-neutral **he**; but **he** is in principle possible with its primary "male" sense, and likewise **she** with the "female" sense. Neuter **it** and plural **they**, however, are not used in this way: instead we have demonstrative **that** (cf. §5.4).

(d) Institutional and non-referential **they**

- [28] i *They've closed the bridge for repairs following last week's floods.*  
 ii *They've increased the cost of a passport from \$50 to \$100.*  
 iii *I think this is what they call a 'fait accompli'.*  
 iv *I don't know what they use alfalfa for.*

*They* is commonly used to refer vaguely to some unspecified institution or authority: the department of transport or the local council perhaps in [i], the government in [iii]. The bridge has been repaired and the cost of a passport increased by the people who have the authority to do this. This use may merge with those described in (a) and (b) above in examples like *They won't let you in without a tie*, said in the context of a proposed visit to a yacht club. The referent of *they* here will be the people with the authority to refuse you entry and these people are associated with an establishment in the context of discourse by virtue of our being on our way there and/or by virtue of having been mentioned in the preceding text.

In [28iii–iv] *they* conveys very much the same as non-referential *you*. The 3rd person version may have a slight distancing effect. Example [iii] may suggest (as the version with *you* would not) that *fait accompli* is not an expression that I myself regularly use. Syntactically *they* is much less versatile than *you*, being for the most part restricted to the nominative form. Note, for example, that *you* could not be replaced by *them* in such examples as *This wine gives you a terrible hangover, doesn't it?*

Clauses with institutional or non-referential *they* as subject are generally pragmatically equivalent to short passives (i.e. those without a *by* phrase): *The bridge has been closed for repairs following last week's floods; I think this is what is called a 'fait accompli';* etc.

### 2.3.2 Semantic relations between pronoun and its antecedent

#### (a) Coreference with a definite antecedent

- [29] i *My father says he can lend us the money.*  
 ii *The police wanted to speak to the manager, but she was out.*  
 iii *We tried the door, but it was locked.*  
 iv *I can't find my shoes. Have you seen them?*

This represents the most elementary case: antecedent and anaphor are definite referring expressions with the same referent.

#### (b) Coreference with an indefinite antecedent

- [30] i *One of your friends phoned while you were out, but she didn't give her name.*  
 ii *I bought some little cakes, but nobody liked them.*  
 iii *I've written a letter to Kim's solicitor. Would you mind reading it over?*

Another common case is where the antecedent is indefinite. The antecedent introduces some entity into the context of discourse, and the pronoun refers to that entity.

#### (c) Reference to a hypothetical entity introduced by the antecedent

- [31] i *If she caught a fish, she will no doubt have given it to her father.*  
 ii *I want to buy a filing-cabinet. We could keep all these papers in it.*  
 iii *Dig a large hole and hide these bones in it.*

The antecedents here do not have reference: existence of actual fish, filing-cabinets, or holes is not entailed. But in each case I envisage a hypothetical situation in which an entity of the kind described does exist, and this makes it possible to refer to this hypothetical entity.

## (d) Anaphor falls within the quantificational or interrogative scope of its antecedent

## Singular antecedents

- [32] i *Every woman in the group* said *she* supported the proposal.  
 ii *Each boy* was asked to talk about *his* favourite game.  
 iii *Nobody* thought *they* had been unfairly treated.  
 iv Has *anyone* got *their* copy of ‘Macbeth’ here?  
 v *Who* thinks *they* can solve the problem?

In [i] *she* has *every woman in the group* as its antecedent, but could not be replaced by a repetition of the antecedent: the meaning is quite different from that of *Every woman in the group said that every woman in the group supported the proposal*. The difference can most easily be brought out by considering the direct speech counterparts. According to this latter example, every woman said: *Every woman in the group supports the proposal*, but what every woman said in [i] was: *I support the proposal*. This is the kind of reading for which we invoke the concept of a variable: “*x* said that *x* supported the proposal” holds for every woman in the group. One way of representing this is to attach the first instance of the variable to the antecedent NP: “Every woman in the group *x* said that *x* supported the proposal”. Syntactically, therefore, the quantifier belongs in the NP functioning as subject of the matrix clause, but semantically it has scope over the pronoun *she*. Because the variable expressed by *she* is within the scope of a quantifier, it is said to be **bound** by that quantifier: the pronoun here therefore expresses a **bound variable**. There is of course a reading of *Every woman in the group said she supported the proposal* in which *she* has an antecedent in a preceding sentence, and is not in the scope of *every*. In this case, what every woman said was: *She supports the proposal*.

*Each* behaves in just the same way as *every*, so that the meaning of [32ii] can be given as “Each boy *x* was asked to talk about *x*’s favourite game”. These first two examples were chosen as ones where the head of the antecedent NP is feminine or masculine, so that the pronoun required is simply *she* and *he* respectively. *Nobody* and *anyone* in [iii–iv] are neutral as to sex and require a pronoun which likewise has a sex-neutral interpretation. The various possibilities (*they*, *he* or *she*, *he*, *she*, etc.) are discussed in Ch. 5, §17.2.4; here we have opted for *they*, which is now much the most common choice. Again, then, we represent the meaning of [iii–iv] as “Nobody *x* thought *x* had been unfairly treated” and “Has anyone *x* got *x*’s copy of ‘Macbeth’ here?” Interrogative phrases in variable questions work in the same way, so that for [v] we have “Who *x* thinks *x* can solve the problem?”

## Plural antecedents

- [33] i *All the suspects* had *their* fingerprints taken.  
 ii *Many of them* acknowledged that *they* had not given the matter enough thought.  
 iii *The visitors* had taken *their* coats off.

The anaphors here likewise have bound variable interpretations. In [i], for example, “*x* had *x*’s fingerprints taken” holds for all the suspects. In [iii] the quantification that binds the variable is just plural number: “*x* had taken *x*’s coat off” holds for members of the set of visitors. We understand that it holds for all members of this set, or at least more or less all. Note that although they (presumably) had only one coat each the plural form *coats* is required since together they removed a plurality of coats.

It is also possible in principle for a pronoun anaphorically linked to a plural NP like these to have a coreferential interpretation. The examples given in [33] were chosen as ones that (perhaps with the exception of [iii]) pragmatically force or favour the bound variable interpretation, but there are others where a coreferential reading is required or more likely. Compare [ii] with *Both candidates said they should be interviewed simultaneously*: what they said here was not *I should be interviewed simultaneously*, but *We should be interviewed simultaneously*. Or compare [iv] with *The visitors said they would have to leave at six*. Notice that the latter does not convey that each visitor spoke: it is quite likely that just one person spoke on behalf of them all.

#### (e) Variable interpretations with other kinds of quantification

- [34] i *Anyone who thinks they could be of help is requested to contact the secretary.*  
 ii *If he sees a dog that isn't on a lead he is terrified that it is going to attack him.*  
 iii *Every time we had gone overseas we had brought back a souvenir, but it had always languished unused in the cupboard afterwards.*  
 iv *Everyone who has a cat should ensure that it is kept indoors at night.*

These are similar to the examples given under (d) in that they involve quantification, but here the quantification is not expressed in the antecedent NP. In [i] the anaphoric link falls within a relative clause functioning as modifier within a quantified NP. The antecedent of *they* is the relative pronoun *who*, and this itself expresses a bound variable within the scope of *any*. The meaning can be given as “Any person *x* such that *x* thinks *x* could be of help is requested to contact the secretary”.

Example [34ii] is a conditional construction, like [31i], but whereas the latter involves a singular situation, [34ii] expresses a multiple situation. *If* here means more or less the same as *whenever*: we are concerned with repetition of the subsituation in which he sees a dog that isn't on a lead and is terrified that it, the dog, is going to attack him. Neither antecedent nor anaphor refers to any one dog, so again it is a matter of linked variables, not coreference between constants. We also have a multiple situation in [iii], this time with the quantification explicitly expressed by *every time*. For each instantiation of the multiple situation there is some particular souvenir that we brought back and that languishes unused in the cupboard. Example [iv], like [i], has a relative clause integrated into the structure of a quantified NP, but this time only the antecedent (*a cat*), not the anaphor (*it*), falls within the relative clause. Again we have a multiplicity of cats, and the meaning is that, for each cat *x*, *x*'s owner should keep *x* indoors.<sup>12</sup>

#### (f) Variable is associated with an NP contained within the antecedent

- [35] *The brother who left his estate to charity will be remembered longer than the one who left it to his children.*

Here we have two brothers and two estates, so that *it* is not coreferential with its antecedent *his estate*. This example is like [23iii] of §1 (*Ed always gets his kids to help in the kitchen: why don't you \_\_?*) except that the anaphor is a personal pronoun, not an elliptical gap. The common

<sup>12</sup>Examples like [34iv] are sometimes referred to as ‘donkey sentences’, after an example commonly used in discussing them: *Every farmer who owns a donkey beats it*. They have received considerable attention in the logical and formal semantic literature because the meaning cannot be represented by means of the standard predicate calculus.

factor is that we have two layers of anaphora: at the upper level *his estate* is antecedent and *it* anaphor, but *his estate* contains the anaphor *his* with the first *who* as antecedent. *It* is interpreted as “his estate”, but with the genitive pronoun now having the second *who* as antecedent. A rough way of indicating the meaning would be: “The brother *x* such that *x* left *x*’s estate to charity will be remembered longer than the brother *y* such that *y* left *y*’s estate to his children”.<sup>13</sup>

This use of the personal pronouns is rare and subject to severe constraints. It remains unclear, however, what the constraints are, and we merely give two examples here where this kind of interpretation is not permitted:

- [36] i *Jill adores her son, but Liz doesn’t like him at all.*  
 ii *Jill gets on very well with the people she works with, and Liz gets on with them quite well too.*

*Him* in [i] is understood as referring to Jill’s son, not Liz’s. And in [ii] the people Liz gets on with quite well must be the same as those Jill gets on very well with.

### (g) Antecedent is a clause (or sequence of clauses)

- [37] i *Tom’s just phoned to say we’ve won the case. I can hardly believe it.*  
 ii *Bruce has finally been sacked. I can’t understand why it took them so long.*  
 iii *If you don’t go while you have a chance, you’ll regret it. (= [20iii] of §1)*  
 iv *I’d like to come with you, but it would cost too much.*

The antecedents here are not referring expressions, and hence can’t be coreferential with the pronoun. The *it* serves a nominalising role, making it possible to refer to propositions, facts, events, actions, and the like that have been introduced into the context of discourse by means of clauses.

## 2.4 Order of anaphor and antecedent

### ■ Retrospective anaphora as the default type

Most of our examples so far have involved retrospective anaphora, where the pronoun follows its antecedent. This is the default order: it is almost always permitted, and in many cases it is the only possible order. The following constructions, for example, do not normally allow anticipatory anaphora:

- | [38]      RETROSPECTIVE  | ANTICIPATORY  |
|--|---|
| i a. <i><u>Ann</u> wrapped a towel around <u>her</u>.</i>                      | b. * <i><u>She</u> wrapped a towel around <u>Ann</u>.</i>                     |
| ii a. <i><u>Ann</u> applied for a grant and they gave <u>her</u> \$50,000.</i> | b. * <i><u>She</u> applied for a grant and they gave <u>Ann</u> \$50,000.</i> |
| iii a. <i><u>Ann</u> realised <u>she</u> couldn’t win.</i>                     | b. * <i><u>She</u> realised <u>Ann</u> couldn’t win.</i>                      |

The asterisk in the [b] examples indicates that they do not admit an interpretation where *she* is anaphorically linked to *Ann*. Example [i] illustrates the case where antecedent and anaphor are in the same clause, related to the verb directly or via a preposition. In [ii] they are in separate coordinate clauses. In [iii] the second element is in a clause that is subordinate to the one containing the first element.

<sup>13</sup>The term ‘pronoun of laziness’ is often applied in the theoretical literature to pronouns like *it* as used here: *it* is simply a shorter way of saying *his estate*. The classic example, on which ours is closely modelled, is *The man who gave his paycheck to his wife was wiser than the man who gave it to his mistress*. As with the ‘donkey’ type mentioned in footnote 12 above, the anaphoric links cannot be formalised in the predicate calculus.

Our focus in this section will therefore be on cases where anticipatory anaphora is permitted or obligatory. We confine our attention here to the non-reflexive forms of the personal pronouns. Reflexives are dealt with separately in §3, and non-pronoun cases follow the general principles outlined here and will be dealt with briefly, where appropriate, in the relevant sections.

### ■ First-mention vs repeat-mention anticipatory anaphora

We have anticipatory anaphora when a pronoun is anaphorically linked to a full NP (or other constituent type) that follows. In some cases, as in [39i], the pronoun will represent the first mention of the entity concerned, but often it will also have been mentioned earlier in the discourse, as in [39ii]:

- [39] i *Susie Connor says that from the moment she began working for him, her boss sexually harassed her.*  
 ii *A go-ahead was recently given for a documentary to be made about Peter Bland, the first Australian to reach both the South and North Magnetic Poles. The documentary should screen on the ABC in January and will have the potential to be seen in about 75 million homes worldwide.*

*It is remarkable that Bland reached the North Magnetic Pole only 12 months after major heart surgery. This was in February 1998 when he and four British men pulled sledges across the frozen Arctic Sea for 650 kilometres.*

*Two years before, he and others had sailed to the South Magnetic Pole in an 18 metre sloop. During this trip he risked his life by diving overboard into the icy waters to cut a line free from the yacht's propeller.*

*On his return, Bland began to plan a visit to the North Magnetic Pole.*

Example [i] is a newspaper synopsis of a film scheduled to be broadcast on television: the sentence constitutes the whole of the synopsis, so that the first mention of Susie Connor's boss is by means of the pronoun *him*. In [ii] the person under discussion is first referred to as *Peter Bland* and then *Bland*; there follow three instances of retrospective *he*; then in the final sentence quoted we have *his* in the initial PP and *Bland* in subject position. The *his* is anaphorically linked to *Bland*, so that this is a case of anticipatory anaphora, but it is a special case of it because of the previous mentions, by proper name or pronoun.

We will distinguish these two cases as **first-mention** and **repeat-mention** anticipatory anaphora. The repeat-mention type is acceptable in a somewhat broader range of contexts than the more constrained first-mention type, as illustrated in this further attested example (where B's *was* is understood as "was completely feral"):

- [40] A: *I was talking to Michael's dad and he said: 'He's completely feral.'*  
 B: *What, his dad said Michael was?*

Here anaphoric *his* is determiner within the subject NP. This would be unacceptable if there had been no previous mention of Michael. Similarly, examples like the following (which follow the general pattern of the inadmissible [38iiib]) are widely judged to be acceptable only if there has been a previous mention of the person concerned:

- [41] i *He would have been like a son to both of us, if my wife and I could have kept Paul away from the influence of his family.*  
 ii *He'll do it, because Paul always does what I tell him to do.*

In what follows it is to be assumed that the construction under consideration permits both types of anticipatory anaphora unless otherwise stated.

### ■ Anaphoric chains

We have noted that a link between anaphor and antecedent is often part of a chain of such relations, and it is important to bear this in mind when distinguishing between retrospective and anticipatory anaphora. Compare, for example:

- [42] i \_\_\_ *Realising she couldn't win, Ann withdrew from the competition.*  
 ii \* \_\_\_ *Realising Ann couldn't win, she withdrew from the competition.*

In [i] the missing subject of *realising* has *Ann* as its antecedent: this is a common case of anticipatory anaphora. At the same time, the missing subject is antecedent for the pronoun *she*; the anaphora here is retrospective, just as it is in *Ann realised she couldn't win*. There is no direct anaphoric link between *she* and *Ann*, so this *she* is not an instance of an anticipatorily anaphoric pronoun. The fact that [ii] is inadmissible does not therefore mean that we have here a case of a pronoun obligatorily preceding its antecedent. The inadmissibility of [ii] follows from that of \**She realised Ann couldn't win* ([38iiib]): it has nothing to do with the fact that *Ann* precedes the *she* of the *withdrew* clause.<sup>14</sup>

## 2.4.1 Central cases of anticipatory anaphora

### ■ Three major constructions

Most of the central cases of anticipatory anaphora belong to the following constructions:

#### (a) Anaphor is located within a subordinate clause

- [43] i *If [she has any sense], your mother will hang on to the shares.*  
 ii *The news [he had received that morning] depressed my father more than I would have expected.*  
 iii *As [he moves through life], each man seeks the same kind of reward.*  
 iv *When [she was 5 years old], a child of my acquaintance announced a theory that she was inhabited by rabbits.*  
 v *[Her parents being overseas,] Ann has to deal with these problems herself.*  
 vi *The news [that his application had been rejected] sent Ed into a paroxysm of rage.*

Here the anaphor is inside a clause (marked off by the square brackets) that is subordinate, directly or indirectly, to the one containing the antecedent. It is also possible for the antecedent to be located within another subordinate clause, as in:

- [44] i *Although [it is over 400 pages long], everyone agrees [that the Commission's report contains very little that is new].*  
 ii *Even though [it is not absolutely certain], there are very good grounds for [believing that Ann was responsible for the change of policy].*

As the examples show, the subordinate clause containing the pronoun can have a range of functions: complement of a preposition ([43i]), modifier of a noun ([ii]), non-finite adjunct in the matrix ([v]), and so on. Cases where the subordinate clause is subject, as in [*That he wasn't invited*] *didn't bother Tom at all*, are hardly possible except with repeat-mention anticipatory anaphora.

<sup>14</sup>The same applies to nominalisations like \**The realisation that Ann couldn't win led her to withdraw from the competition*: the noun *realisation* still implies an experiencer argument, just as in the construction with an overt subject-determiner, \**her realisation that Ann couldn't win*.

Most examples of anticipatory anaphora have definite antecedents, but indefinites are also found, as in [43iii–iv]; [44ii] illustrates the case where the antecedent is a clause rather than an NP. The examples also show that genitive forms of pronouns are admissible in this construction as well as non-genitives – see [43v–vi].

(b) Pronoun occupies a subordinate position within a larger NP

- [45] i [The repeated attacks on him] had made Max quite paranoid.  
 ii [These rumours about him] made us wonder whether Ed would have to resign.  
 iii [His demotion] had left my brother completely demoralised.  
 iv Most of [her colleagues] thought that Sue was quite outstanding.  
 v We told [his wife] that Frank would be travelling on the later flight.  
 vi In [his first report to a meeting of 120 union members yesterday], Mr Combet proposed setting up five internal departments in the ACTU.

These are similar to those in [43–44] in that the anaphor is in a subordinate position, but this time it is located within an NP rather than a subordinate clause. Often, indeed, the NP concerned can be replaced by one of very similar meaning containing a subordinate clause – e.g. *the fact that people were repeatedly attacking him* and *the rumours that were circulating about him* for [45i–ii]. Example [vi] illustrates a particularly common case of this type of anticipatory anaphora: the pronoun is genitive determiner in the NP complement of a preposed PP (cf. also [39ii]).<sup>15</sup>

(c) Anaphor within a preposed PP: anticipatory anaphora may be obligatory

- [46] i a. [Around her] Ann wrapped a towel.      b. \*[Around Ann] she wrapped a towel.  
 ii a. [Only a few inches away from her] Ann noticed a red-back spider.      b. \*[Only a few inches away from Ann] she noticed a red-back spider.  
 iii a. [Not far from her house] Ann had found an injured koala.      b. \*[Not far from Ann's house] she had found an injured koala.  
 iv a. [Without the support of her mother,] Ann would not have survived.      b. \*[Without the support of Ann's mother,] she would not have survived.

Here the order anaphor + antecedent is not only permitted but required: the [b] versions are inadmissible with *Ann* as antecedent for *she*. The PP is here in non-canonical position, and the versions with canonical order (*Ann wrapped a towel around her*, etc.) likewise have the pronoun in the locative phrase; note further that the non-genitive type [ia/iia] is also exceptional in that in constructions where, as here, antecedent and anaphor are related to the same verb, directly or via a preposition, the anaphor is usually reflexive (see §3).

The examples in [46] all have the second element in subject function; elsewhere retrospective anaphora is generally permitted: *Without the support of Ann's mother, I wouldn't have been able to persuade her to seek medical help*. Even with subjects the retrospective type may be acceptable, as in *In view of Paul's special circumstances, he was given extra time*. The clearest cases where it is excluded are those with locative PPs, as in [i–iii].

<sup>15</sup> Instead of being inside a larger NP, the pronoun is occasionally simply subordinated within an AdvP ([*Unfortunately for them,*] *the bandits' plans had been leaked to the police*) or PP ([*According to her,*] *Sue had been warned not to ask any awkward questions*).

### ■ Qualifications and extensions

The account presented above represents something of an oversimplification, for the possibility or necessity of anticipatory anaphora is not determined by purely syntactic properties, and it should also be borne in mind that judgements of the acceptability of many examples show considerable variation among different speakers.

#### Restrictions on anticipatory anaphora

Anticipatory anaphora is not acceptable in all cases having the structures described in (a)–(b) above. Compare, for example:

- [47] i \**[One of them] suggested that the boys should complain.*  
 ii \**[Her problem] is that your mother is rather set in her ways.*  
 iii \**If [there's a problem with her], it's that your mother is rather set in her ways.*

In [i–ii] the pronoun occupies a subordinate position within a larger NP like the acceptable cases in [45]. *One of them* belongs to the partitive construction, and this systematically excludes anticipatory anaphora. It is less clear why [47ii] should differ in acceptability from [45]. It may be related to the fact that in [47ii] there is less semantic independence between the NP containing the pronoun and the antecedent than there is in [45]: the problem necessarily involves your mother. In [47iii] the pronoun is located within a subordinate clause, like those in [43], and again it is not clear why it should differ in acceptability from the latter. It may be due to the fact that [47iii] implicates [ii], with the inadmissibility of the latter carrying over to it.

#### The effect of distance and complexity

Increasing the distance between pronoun and antecedent, and thus the complexity of the construction, can make anticipatory anaphora more acceptable:

- [48] i ?*Her husband had supported Ann throughout the ordeal.*  
 ii *All her friends and relatives had supported Ann throughout the ordeal.*

The type shown in [i], with the pronoun determiner in a simple subject NP, is hardly admissible ([40] is a rare example, but requires stress on the antecedent); increasing the length and complexity of the subject NP, as in [48ii], makes it significantly better, certainly for the repeat-mention case. Note also that a similar increase in complexity can make retrospective anaphora more acceptable in the construction with a preposed locative PP illustrated in [46]. The unacceptable [b] versions of [46] may be compared with, for example, the appreciably better *Just behind the shed that Ann had been repairing she noticed a red-back spider.*

#### Coordination that is pragmatically comparable to subordination

We noted at the outset that anticipatory anaphora is not normally permitted when the linked NPs are in separate coordinate clauses – see [38ii]. Exceptions to this syntactic constraint are found, however, in examples like the following:

- [49] i [*She was only in office for ten months,*] but [*Sue achieved a remarkable amount in that time.*]  
 ii [*They may still call Australia home*] but [*for 300,000 Australians 'home' is really an address overseas*].  
 iii [*Make even the slightest criticism of him*] and [*Max will lose his temper*].

What makes the anticipatory anaphora admissible here is that the coordinates are not of equal status from a pragmatic point of view. In [49i–ii] the first clause is interpreted as

concessive and in [iii] it has a conditional role. Although formally coordinate, therefore, the constructions behave for the purposes of anaphora like the subordinative constructions to which they are pragmatically equivalent, namely:

- [50] i *Although [she was only in office for ten months], [Sue achieved a remarkable amount in that time].*  
 ii *Although [they still call Australia home], [for 300,000 Australians 'home' is really an address overseas].*  
 iii *If [you make even the slightest criticism of him], Max will lose his temper.*

#### 2.4.2 Further cases of anticipatory anaphora

In this section we introduce three special cases of anticipatory anaphora beyond the more general ones considered so far.

##### (a) Anticipatory anaphora for rhetorical effect

It is a quite common feature of journalism and novels to use anticipatory anaphora as a device to catch the listener's or reader's attention: pronouns are used to tempt the curious reader or listener into continuing to pay attention – so that they can find out who or what the pronoun refers to. In these cases reference by pronoun may continue across a number of sentences before a full NP provides the required identification. Two newspaper examples are as follows:

- [51] i *Peter Costello calls her a Labor Party hireling, but she could be the academic that ultimately saves the Government's bacon on the goods and services tax. Ann Harding will today become one of only two witnesses in the five-month Senate ordeal on the GST that all sides want to hear from.*  
 ii *They started a penchant for expensive cars and real estate and their respective business enterprises – the Rebels and the Bandidos – turned a healthy profit. Both lived in the fast lane, but police records show that, unlike most executives, they preferred the black market to the stock exchange.*  
*But despite their similarities, there was not much love lost between millionaire Rebels boss Alex Vella and Bandidos president Michael Kulakowski.*

##### (b) Anticipatory anaphora with a following main clause as antecedent

- [52] i *It's ridiculous! They've given the job to Pat.*  
 ii *It's a complete mystery to me: Why did he turn down such a marvellous offer?*  
 iii *It's a tremendous nuisance! How could he have cancelled the meeting at such short notice?*  
 iv *I think it disgraceful. He's given the job to his son.*  
 v *There's no doubt about it: you've done us proud.*

This is the type of anticipatory anaphora, mentioned in our initial survey in §1.2, where the antecedent is not integrated into a larger construction but is a main clause standing on its own. Examples [i–ii] represent the central and most straightforward case. *It* is in subject position, and the predicate expresses a judgement or evaluation about the state of affairs or whatever that it refers to. The interpretation of *it* is given by the second clause (declarative in [i], interrogative in [ii]): what is ridiculous is that they've given the job to Pat, what is a complete mystery to me is why he turned down such a marvellous offer.

The second clause has no structural relation to the first and, being syntactically a main clause, cannot be substituted for the anaphor without modification. However, in this example all we need to do is to add the subordinator *that* in [i] and drop the inversion in [ii]: we get *That they've given the job to Pat is ridiculous* from [i], and *Why he turned down such a marvellous offer is a complete mystery to me* from [ii]. When we do this the anaphor is simply dropped: it does not take the place of the antecedent (cf. *\*That they've given the job to Pat is ridiculous. It.*). This is what distinguishes this construction from the central cases of anticipatory anaphora discussed in §2.4.1.

In [52iii] the interpretation of *it* is not the content of the second clause itself, but rather its presupposition – namely, that he cancelled the meeting at such short notice. In [iv] *it* is in direct object position, while in [v] it is object of a preposition: replacement of *it* by the antecedent would here require greater modification, and in the case of [iv] at least would most likely involve a change in the construction of the first clause – e.g. *I think his giving the job to his son was disgraceful*.

The clause containing the *it* normally has to be asserted by the speaker. It would be quite impossible for *it* to be anaphorically linked to a following independent clause in constructions like *\*Kim insists that it is a disgrace: he's given the job to his son*.

### (c) Right dislocation

- [53] i *They've really taken a dislike to me, your parents.*  
 ii *What did you think of it, that suggestion of Paul's?*

Here too we have an anaphoric link between a 3rd person pronoun and a following expression, this time normally an NP. The latter could replace the pronoun, and the pronoun would then again be simply dropped, giving the canonical versions *Your parents have really taken a dislike to me*, *What did you think of that suggestion of Paul's?*

This construction is discussed in Ch. 16, §8.2; here it is sufficient to note summarily that it differs from (b) in the following respects:

- [54] i The antecedent is attached to the clause in postnuclear position, rather than being structurally independent.  
 ii All 3rd person personal pronouns are found, and the antecedent is normally a coreferential NP.  
 iii The antecedent represents discourse-old information, not new information.

## 2.5 Special uses of *it*

In this section we review briefly those uses of *it* that are not anaphoric (or at least not clearly so), and do not refer directly to contextually salient entities. We are concerned here, therefore, with constructions where *it* cannot be replaced by other 3rd person personal pronouns.

### (a) Extrapositional and impersonal *it*

- [55] i *It's ridiculous that they've given the job to Pat.*  
 ii *I think it disgraceful for him to have given the job to his son.*  
 iii *It seemed that / as if things would never get any better.*

The extraposition construction of [i–ii] is discussed and compared with right dislocation in Ch. 16, §§7–8; for the impersonal construction illustrated in [iii], see Ch. 11, §4.3.1.

We take *it* as a dummy, semantically empty pronoun, an obligatory and non-contrastive feature of the constructions, though there is clearly some resemblance here to the use of *it* in anticipatory anaphora illustrated in [52] and [53ii].

(b) **The *it*-cleft construction**

- [56] i A: *It was your father who was driving.* B: No *it* wasn't, *it* was me.  
 ii *It was precisely for that reason that the rules were changed.*

No independent meaning can be assigned to *it* here, and no part of the construction can be regarded as its antecedent: we again regard it as a dummy subject. It is an invariable part of a distinct grammatical construction, which we describe in Ch. 16, §9.

(c) **Weather, time, place, condition**

- [57] i *It is raining. It became very humid.*  
 ii *What time/date/day is it? It is five o'clock / 1 July / Monday.*  
 iii *It is only two weeks since she left / until we go on holiday.*  
 iv *It is very noisy in this room.*  
 v *It is more than five miles to the nearest post office.*  
 vi *It would be wonderful if you could spend the week-end with us.*  
 vii *It is a crime when families are starving because a man cannot get a job.*  
 viii *I don't like it when you behave like this.*

*It* is used as a dummy subject with verbs and predicative adjectives denoting weather conditions, as in [i]. It does not represent a semantic argument and cannot be replaced by any other NP: it has the purely syntactic function of filling the obligatory subject position.<sup>16</sup> *It* is also used with various expressions of time as predicative complement, as in [ii]; compare also *I don't even know what month/year it is*. For clock-time and date *it* is replaceable by *the time/date*: *The time is five o'clock*; *The date is 1 July*. But we do not say, with a corresponding meaning, *\*The day is Monday*; *\*The month is July* (though we can say *Today is Monday*). In [iii] *it* is an invariable subject with a predicative of temporal extent together with an adjunct expressing the starting-point or endpoint; the two are found together in *It is only three weeks from now until Christmas*. In [iv] the predicative describes the condition applying in a certain place – cf. also *It can be very cold in Edinburgh*. Example [v] is the spatial counterpart of [iii].

The last three examples in [57] bear some resemblance to extraposition inasmuch as what would be wonderful would be your being able to spend the week-end with us, what is a crime (understood here as, roughly, “a scandal”) is the fact that families are starving because a man (the father) can't get a job, and what I don't like is your behaving like this. But they differ from extraposition in that the final elements are not content clauses, not potential replacements for *it*, and it is for that reason that we include them under the present heading.

<sup>16</sup>There are some rather marginal constructions in casual style where *it* behaves more like a semantically contentful pronoun. *It is trying to rain* involves a kind of personification with *it* assigned an agent role by virtue of being subject of *try*; in <sup>16</sup>*It rained and flooded the basement*, the *it* is subject of a VP-coordination that includes a non-weather verb.

An important difference between complement and adjunct reflexives is that only the former are in competition, as it were, with non-reflexive forms: non-reflexive personal pronouns do not have a comparable emphatic use. In complement function we can have either reflexive or non-reflexive forms, and we need to investigate the factors influencing the choice between them. This is the issue that we will be concerned with in §3.1, and we will then return to emphatic reflexives in §3.2.

### 3.1 Reflexive pronouns in complement function

While the choice between the different cases of the personal pronouns – nominative, accusative, and genitive – depends on the function of the pronoun in the construction containing it, the choice between reflexive and non-reflexive forms depends primarily on the structural relationship between the pronoun and its antecedent. Compare, for example:

- [3] i *Ann<sub>i</sub> blames herself<sub>i</sub> for the accident.* [reflexive form]  
 ii *Ann<sub>i</sub> realises that they blame her<sub>i</sub> for the accident.* [non-reflexive form]

In [i] the pronoun is a complement of the same verb as the antecedent, whereas in [ii] it is a complement of a different verb. Broadly speaking, reflexives are used when there is a close structural relation between pronoun and antecedent. From a communicative point of view, the reflexive provides a more specific indication as to the location of the antecedent. In [i], for example, *Ann* is the only possible antecedent for the pronoun, and conversely the absence of a reflexive in *Ann blames her for the accident* excludes *Ann* as a possible antecedent for the pronoun. In [ii] we have attached indices to show the intended interpretation, but it would also be possible for *her* to have its antecedent in a preceding sentence, or indeed for its intended reference to be determined non-anaphorically, e.g. by pointing.

#### ■ Status of the reflexive: mandatory, optional, and inadmissible

With respect to the choice between reflexive and non-reflexive forms we have the three possibilities illustrated in [4], where the labels give the status of the reflexive:

- [4] i *Ann<sub>i</sub> blames herself<sub>i</sub>/\*her<sub>i</sub> for the accident.* [mandatory]  
 ii *Ann<sub>i</sub> tied a rope around herself<sub>i</sub>/her<sub>i</sub>.* [optional]  
 iii *Ann<sub>i</sub> realises that they blame \*herself<sub>i</sub>/her<sub>i</sub> for the accident.* [inadmissible]

A reflexive form is **mandatory** if it cannot normally be replaced by a non-reflexive form with the same antecedent. The reflexive *herself* in [i] is thus mandatory since, as we have observed, *Ann blames her for the accident* cannot be interpreted with *Ann* as antecedent for the pronoun. A reflexive is **optional** if it is replaceable by a non-reflexive form with the same antecedent, as in [ii]. And a reflexive is **inadmissible** in contexts like [iii] where only the non-reflexive form is permitted.

#### ■ Overrides

The mandatory and optional reflexives in [4i–ii] we take to be **basic** reflexives, as opposed to the **override** reflexives in:

- [5] i *The draft had been prepared by Ann and myself.*  
 ii *Ann claimed that junior lecturers like herself were being exploited.*

The idea behind the term is that the default form of a pronoun in these contexts is non-reflexive, and the reflexive can therefore be regarded as overriding the default or normal form; mandatory reflexives are thus always basic, while optional ones may be either basic or override. Override reflexives do not require the close structural link between pronoun and antecedent that characterises basic reflexives. Indeed, they can occur without any antecedent at all in the 1st and 2nd person, as in [5i], where the pronoun is interpreted in a purely deictic way.<sup>17</sup> We take this to be the major criterial feature distinguishing override from basic reflexives. A further factor supporting the distinction, however, concerns the distribution of the reciprocal pronouns *each other* and *one another*. As we will see in §4, these are like reflexives in that they require a close structural relation with their antecedent – and we find that they occur in the environments that permit basic reflexives but not in those limited to override reflexives.

Override can also work in the opposite direction, with a non-reflexive form appearing instead of the normal reflexive:

[6] *Why don't you buy something for YOU for a change, instead of spending all your money on your kids?*

The normal form here would be reflexive *yourself*: non-reflexive *you* is used to emphasise the contrast between you and your kids, though reflexive forms can also be used contrastively. It was to allow for such overrides that we defined mandatory reflexives as those which cannot **normally** be replaced by the non-reflexive counterpart: we take the reflexive in *You bought it for yourself* to be mandatory, clearly different in status from the optional reflexive of [4ii]. Override non-reflexives like [6] are largely restricted to informal style, and much less common than override reflexives: we need not consider them further.

### ■ The domain of a reflexive pronoun

We have said that basic reflexives require a close structural link between pronoun and antecedent, and we must turn now to the task of clarifying what is meant by that.

#### Verb domain reflexives

In a large and central class of cases, the reflexive and its antecedent are related to the same verb, directly or by means of a preposition. This is illustrated in [7], where single underlining marks the pronoun and its antecedent, double underlining the head verb:

- [7] i Sue defended herself.  
 ii *The fact [that Sue bought herself a new car] is irrelevant.*  
 iii *Sue lives by herself.*

In [i] the pronoun and its antecedent are complements of the verb *defended*, and similarly in [ii] both are complements of *bought*. In [iii] the antecedent is a complement of *lives*, while the reflexive is complement of the preposition *by*, with the whole PP being a dependent of *lives*. We refer to the pronouns here as **verb domain** reflexives: pronoun and antecedent are linked via their relationship to a verb. It doesn't make any difference

<sup>17</sup>In examples like *I hurt myself* we take the reflexive to be simultaneously deictic and anaphoric. The deictic feature links it to the speaker while the anaphoric feature links it to the antecedent *I*. It stands in the same structural relation to *I* as *herself* does to *Ann* in *Ann hurt herself*; this relation, unlike that in *They asked me if I needed help* and *They asked Ann if she needed help*, is one which makes the reflexive obligatory. The crucial property of [5i] is thus that there is no such anaphoric link to a 1st person pronoun antecedent.

whether the verb is head of a main clause, as in [i/iii], or of a subordinate clause, as in [ii].

### Noun domain reflexives

We also find reflexives that are linked to their antecedent via their relationship to a noun, and we speak here of **noun domain** reflexives:

[8] *They rejected [Ed's representation of himself as a victim].*

Here the antecedent, the genitive NP *Ed's*, is subject-determiner of the noun *representation* to which the reflexive is related via the preposition *of*.

### Dual-head domain reflexives

Consider next such an example as:

[9] *Max found a photograph of himself in Jill's wallet.*

Here the relationship between pronoun and antecedent is not as close as in [7–8]. The antecedent *Max* is a complement of the verb *found*, while the pronoun is related via the preposition *of* not to the verb but to the noun *photograph* which is head of the object of *found*. Pronoun and antecedent are thus not related to a single head element, and we therefore speak here of the reflexive as occurring in a **dual-head domain**. This particular example has a verb–noun domain, but other types will be introduced below.

## ■ Summary classification of complement reflexives

By contrast with [9], the earlier examples [7] and [8] can be grouped together as having a **single-head** domain. This then gives the following classification of complement reflexives, where the annotation on the right gives the number of the example used above to illustrate the type in question:

[10]	Basic reflexives	{	single-head domain	{	verb domain (e.g. [7])	}	}	noun domain (e.g. [8])
			dual-head domain				}	(e.g. [9])
	Override reflexives							(e.g. [5])

These four types will be examined further in §§3.1.1–4 respectively.

Verb and noun are the only two categories that figure in single-head domains. Only they have a sufficiently rich array of dependents to cover both antecedent and pronoun; more particularly, only they take external complements – subjects.

## ■ Ellipted antecedents and anaphoric chains

Reflexives often occur in subjectless clauses with the same relation to the understood subject as they have to an overt subject in other clauses:

[11]	OVERT SUBJECT		COVERT SUBJECT
	i a. <i><u>Sue defended herself</u>; /*her<sub>i</sub>.</i>		b. <i><u>Sue</u><sub>i</sub> tried <u>  </u><sub>i</sub> to <u>defend herself</u>; /*her<sub>i</sub>.</i>
	ii a. <i><u>She tied a rope around herself</u>; /her<sub>i</sub>.</i>		b. <i><u>  </u><sub>i</sub> <u>Tie a rope around yourself</u>; /you<sub>i</sub>.</i>

Example [ib] contains an anaphoric chain in the sense of §1.2: *Sue* is antecedent for the missing subject of *defend*, and this missing subject is the antecedent for the pronoun. Such examples are thus verb-domain reflexives. Note that the reflexive is here mandatory, just as it is in [ia]. We likewise have a verb domain reflexive in [iib], the antecedent being the covert subject, recoverable non-anaphorically as *you* by virtue of the imperative construction. The reflexive here is optional, just as it is in [iia]. In the discussion which

follows we will include such examples as [ib/iib] under verb domain reflexives without special comment – and without marking the gap.

### 3.1.1 Basic reflexives in verb domains

Where antecedent and pronoun are related to the same verb, a reflexive form is almost always admissible; when they are both related to it directly, rather than via a preposition, the reflexive is (with one minor exception) mandatory.

In clauses with canonical constituent order, a reflexive must follow its antecedent. For this reason, the antecedent is usually the subject of the clause – and the subject cannot itself be reflexive:

- [12] i *Sue defended herself.* [subject as antecedent]  
 ii *\*Herself defended Sue.* [subject as reflexive anaphor]

We will review in turn the various functions where verb domain reflexives occur in the simplest constructions, and then turn briefly to clauses with non-canonical order.

#### (a) Reflexive pronoun in direct object function

Here the antecedent is subject and the reflexive mandatory:<sup>18</sup>

- [13] i *The protesters chained themselves to the Embassy railings.*  
 ii *Tim considered himself a victim of the system.*  
 iii *Liz believes herself to be suitable for the job.*  
 iv *Everyone committed themselves to continuing the fight.*  
 v *Sue was the only one [who defended herself].*

These examples illustrate reflexive objects in a range of transitive constructions. Example [i] represents the elementary case where antecedent and pronoun represent arguments of the same verb. In [ii] we have a complex-transitive clause with the object *himself* predicand for the following predicative complement. In [iii] *herself* is a raised object (Ch. 14, §3.1.1). These first three examples have the pronoun coreferential with the antecedent, while [iv] illustrates again the case where a pronoun expresses a bound variable, as discussed for non-reflexive forms in §2.3.2. In [v] anaphor and antecedent are located within a subordinate (relative) clause.<sup>19</sup>

#### Verbs that select mandatory reflexives

A number of verbs select objects that are required to be anaphorically linked with the subject, and these must then be reflexive in form:

- [14] i a. *He cried himself to sleep that night.* b. *Ed prides himself on his tolerance.*  
 ii a. *Ann acquitted herself extremely well.* b. *You express yourself very clearly.*

Example [ia] illustrates the special case where a reflexive object occurs with a basically intransitive verb: the object is not an argument of the verb, but enables it to take a

<sup>18</sup>In the ditransitive construction it is in principle possible for the direct object to have the indirect object as antecedent, but in practice pragmatic factors normally exclude an anaphoric relation between the two objects, so that examples like *\*They sold the slave himself* (“They sold the slave to himself”) are at best highly contrived. With some verbs a reflexive object can be omitted without loss of meaning: *Ed shaved*, for example, is generally interpreted as equivalent to *Ed shaved himself*: see Ch. 4, §8.1.3.

<sup>19</sup>The feminine gender of the pronoun in [13v] matches that of *Sue* although there is no anaphoric link (not even an anaphoric chain) between *Sue* and *herself*: the matrix clause specifies identity between *Sue* and the referent of the second NP, so that the feature “female” is assigned to *one* and hence to the relative pronoun *who*, the antecedent of the reflexive.

resultative goal or predicative (see Ch. 4, §5.3). *Pride*, used as in [ib], doesn't allow a non-reflexive object at all. *Acquit* does allow non-reflexive objects, but only in a different sense (*They acquitted her*), and *express* with a human-denoting object also belongs in this class (we don't find *\*You express me perfectly*). Other verbs of this kind are given in [15]; some take PP complements as indicated in addition to the object, as *pride* in [ib] takes an *on* phrase. Those marked † are like *pride* in having a reflexive as the only (or virtually the only) type of object permitted:

[15]	<i>absent (from)</i> †	<i>apply (to)</i>	<i>avail (of)</i> †	<i>behave</i> †	<i>busy</i> †
	<i>comport</i> †	<i>compose</i>	<i>conduct</i>	<i>content</i>	<i>demean</i>
	<i>enjoy</i>	<i>excel</i>	<i>exert</i>	<i>ingratiate</i> †	<i>perjure</i> †

### (b) Indirect object

- [16] a. *Liz didn't leave herself enough time.*      b. *I bought myself a new car.*

Again, the antecedent is subject, and the reflexive mandatory – except that in some dialects, mainly US, an accusative is found in informal style as a variant of the reflexive. This usage occurs predominantly with a 1st person pronoun: *%I bought me a new car*; *%Let's get us a hamburger*.<sup>20</sup>

### (c) Predicative complement

- [17] a. *I'm not feeling myself today.*      b. *You should just try to be yourself.*

Once more, the antecedent is subject and the reflexive mandatory. It is, however, relatively rare for the predicative complement to be anaphorically linked to the subject, and both [i] and [ii] here are idiomatic. Example [i], with the verb *feel*, means roughly “I'm not feeling completely well” or “I'm not feeling in good spirits”, while [ii], with *be*, means “You should just try to act naturally”. There is one case where the non-reflexive is strongly favoured, namely where the proposition is concerned with identity: *If you weren't you, who would you like to be?*

### (d) Object of preposition

We turn now to constructions where the pronoun is related to the verb not directly but via a preposition. The structural relation between pronoun and antecedent is thus not so close as in (a)–(c), and here a reflexive may have any of the three statuses we have defined: mandatory, optional, or inadmissible. These are illustrated in [18i–iii] respectively:

[18]	REFLEXIVE FORM	NON-REFLEXIVE FORM
i	a. <i><u>He</u> was beside <u>himself</u> with anger.</i>	b. <i>*<u>He</u> was beside <u>him</u> with anger.</i>
ii	a. <i><u>Liz</u> wrapped the rug around <u>herself</u>.</i>	b. <i><u>Liz</u> wrapped the rug around <u>her</u>.</i>
iii	a. <i>*<u>I</u> haven't any money on <u>myself</u>.</i>	b. <i><u>I</u> haven't any money on <u>me</u>.</i>

#### Mandatory reflexives

This represents much the most common pattern and can be regarded as the default case. Further examples are given in [19], where the pronoun cannot be replaced by a non-reflexive form with the same antecedent.

<sup>20</sup>The meaning, however, is not always quite the same. While *I caught myself some fish* implies that the fish were specifically for me, *%I caught me some fish* does not. There is also a non-standard use of *me* where the standard dialect would not have an indirect object at all: *!I seen me a mermaid once*; *!I want me a house by the beach*.

- [19] i a. *He* doesn't look after himself.                      b. *She* believes in herself.  
 ii a. *He* thinks of himself as overworked.                  b. Can't you do anything for yourself?  
 iii a. *I* never get any time to myself.                      b. *Max* had done it by himself.

This case includes PPs functioning as complement of prepositional verbs (Ch. 4, §6.1) – for example, *after* in [1a] is selected by *look*, *in* in [1b] by *believe*, and so on. Also in this category are constructions where the object of the preposition is predicand for a predicative complement, as in [1ia]. In [1iia–b], and also [18ia], the complement is required to be anaphorically linked to the subject: the reflexive is selected by the preposition, or the idiom containing it. Thus *\*I never get any time to him* is impossible, while *Max had done it by me* and *He was beside her* have only the literal locative senses of *by* and *beside*.

The antecedent in all these examples is the subject; it is also possible, though very much less usual, for the antecedent to be the object of the verb or even of a preposition:

- [20] i *I had to save Mary from herself*.  
 ii [*Tim praises Mary to herself*] but criticises her to everyone else.  
 iii *He told Mary about herself as a young girl*.  
 iv *Liz talked to Tim about himself*.

These are still in accordance with the general rule that the antecedent precedes the reflexive anaphor. In the double PP construction [iv], the *to* phrase normally precedes the *about* phrase (*?Liz talked about Tim to himself*), but the reverse order is possible in a context of contrast (*Liz talked about Tim to himself very differently from the way she talked about him to her friends*).

#### Optional reflexives

- [21] i *Rhiana* saw a spider near her/herself.  
 ii *Phil* kept the radio next to him/himself the whole trip.  
 iii *Mary* made sure [*she* directed the stream of champagne away from her/herself].

The governing prepositions indicate spatial location, with the PPs being either adjuncts, as in [i], or complements, as in [ii–iii]; the antecedent is in all cases subject. There is variation across speakers and also particular examples, but for many the non-reflexive form is preferred except in contexts of contrast (e.g. *Tim wanted the radio but Phil insisted on keeping it next to himself the whole trip*).

#### Inadmissible reflexives

- [22] i *She* looked about/around her/\*herself.  
 ii *He* liked having children around him/\*himself.  
 iii *They* took their cousin with them/\*themselves.  
 iv *You* have your whole adult life before you/\*yourself.

The prepositions again involve spatial location (though with a metaphorical interpretation in [iv]). The complements of the preposition are required to be anaphorically linked to the subject, so that we can't say, with the same interpretation of verb and preposition, *\*She looked about him*, *\*He liked having children around me*, and so on. In this respect they are like [18ia] and [19iia–b], but this time it is the non-reflexive form that is required.

### ■ Non-canonical constituent order

The basic rule, we have noted, is that a reflexive pronoun must follow its antecedent. It can precede the antecedent, however, in cases of preposing:

- [23] i To *herself*, *the coordinator* allocated the first watch.  
 ii *Himself*, *he* excused from these onerous duties.

These correspond to the canonical structures:

- [24] i *The coordinator* allocated the first watch to *herself*.  
 ii *He* excused *himself* from these onerous duties.

In [24] the order is determined by the basic rule, and in [23] the choice as to which of the linked NPs is treated as anaphor and which as antecedent is the same as in the corresponding canonical structure. Again, then, we cannot have a reflexive as subject of a main clause: \*To *the coordinator*, *herself*, had allocated the first watch.

Where the antecedent is object rather than subject (as in [20i], *I had to save Mary from herself*) such a reversal of the order of a reflexive and its antecedent is in principle possible in clauses with heavy-object postposing, but in practice examples of this kind are of questionable acceptability:

- [25] ?*Tim was not able to save from herself even the ordinary middle-class girl he had met in the drug rehabilitation clinic.*

### ■ Coreference with and without an anaphoric link

Consider now the contrast between reflexive and non-reflexive forms in:

- [26] i *Paul* voted for *himself*.  
 ii A: Who voted for *Paul*? B: Well, *Paul himself* voted for *him*, but I doubt whether many others did.

Example [i] is a straightforward case of a mandatory reflexive of the kind we have been considering. It might appear from [ii] that the reflexive of [i] is optional, since here we have non-reflexive *him* in the same environment. The reason why we have *him*, however, is that the antecedent is not the subject *Paul himself* but the previous occurrence of *Paul* in A's question. The fact that *him* and the subject are coreferential is incidental, not a consequence of any anaphoric link between them. This is evident from the fact that *Paul* can appear as object without reduction to a pro-form at all; compare, for example:

- [27] i *Only Paul* voted for *himself*. [anaphoric coreference]  
 ii *Only Paul* voted for *Paul*. [non-anaphoric coreference]

Because of the quantification expressed by *only*, there is a sharp difference of meaning between these: [i] says that nobody else voted for themselves, [ii] that nobody else voted for Paul. We can give the meaning roughly as “*x* voted for *x* is true only for *x* = Paul” and “*x* voted for Paul is true only for *x* = Paul”. The repetition of *x* in “*x* voted for *x*” in the first indicates an anaphoric relation between the corresponding NPs *Paul* and *himself*: hence the reflexive form. And conversely the absence of such repetition in “*x* voted for Paul” in the second indicates that there is no anaphoric link and we therefore have a full NP in both positions.

## (a) Verb or noun + predicative adjective

- [31] i *I was thoroughly ashamed of myself.*  
 ii *She found him rather too preoccupied with himself.*  
 iii *I don't accept [your description of Bill as completely preoccupied with himself].*

The reflexive is mandatory and the antecedent is predicand – subject in complex-intransitive clauses like [i], object in complex-transitives like [ii], complement of a preposition in the nominalisation [iii]. Semantically, the predicand is an argument of the adjective, and hence there is a close semantic link between pronoun and antecedent. Syntactically, however, the predicand is not a dependent of the adjective, but of a verb or noun which takes the adjective as complement (immediate or oblique).

## (b) Verb + noun

- [32] i *Sir Harry presented [a bust of himself] to the Library.*  
 ii *For a moment he had [a vision of himself at primary school].*  
 iii *I've had [a horrible revelation about myself].*  
 iv *[The photograph of himself] he has on his web page makes Ed look like a crook.*

Here the antecedent is complement of the verb (subject in [i–iii], object in [iv]), while the reflexive is an oblique dependent of a noun heading another complement of that verb (object in [i–iii], subject in [iv]). Unlike the examples in [28], these latter NPs do not have a subject-determiner, the favoured function for the antecedent in the noun domain case.

The reflexives in [32] are mandatory, but there are other cases of the same general form where they are optional:

- [33] i *Sue found a picture of herself/her taped to the notice-board.*  
 ii *Ed was angered by the rumours about himself/him published in the local press.*  
 iii *He turned the worst things about himself/him to cheery self-mocking dazzle for the delectation of people at parties.*  
 iv *A voice within herself/her was urging her to press on in spite of these setbacks.*

It remains unclear what factors determine whether the reflexive is mandatory or merely optional, and judgements may differ as to which type we have in particular examples. As illustrated in [32iv] and [33iv], it is possible in both cases for the reflexive to precede the antecedent. The nouns heading the NPs containing the reflexive commonly denote representations of various kinds, such as pictures, photographs, etc., and for this reason these reflexives are often referred to as ‘picture noun reflexives’.

## (c) Verb + verb

The final case to consider is that where pronoun and antecedent are dependents of different verbs, and are hence located in different clauses:

## Reflexive is subject of non-finite clause

- [34] i *Harry arranged for himself to be arrested.*  
 ii *Sue hadn't called for herself to be nominated.*  
 iii *Paul disapproved of himself being pilloried in the press.*

The pronouns in this construction are not in the same clause as their antecedents, for they are subjects of their own clause. Nevertheless we have mandatory reflexives here: it is as

though the pronoun were being treated like a phrase within the matrix clause rather than as part of a subordinate clause. This construction is, however, quite rare and generally requires that the pronoun be contrastive. Without such contrast we would normally have ellipsis of the subject, as in *Harry<sub>i</sub> arranged \_\_\_<sub>i</sub> to be arrested*; *call* is exceptional in not allowing a subjectless complement, but it is still rare for the subject of the infinitival to be anaphorically linked to the subject of *call*.

#### Clefts and related constructions: antecedent in subordinate clause

- [35] i *It wasn't for himself that Ed had bought the shares.*  
 ii *I tend to favour the opinion that when young men do well it is because of their parents, and [when they do badly it is because of themselves].*  
 iii *The only one Ed embarrassed was himself/HIM.*

Here the reflexive is, or falls within, the complement of *be* in its specifying use, while the antecedent is in a subordinate clause.<sup>21</sup> Examples [i–ii] belong to the *it*-cleft construction, and here the reflexive is mandatory; in [iii] the antecedent is in a relative clause within the subject NP, and the reflexive is optional, a non-reflexive being permitted if stressed.

With respect to the structural relation between pronoun and antecedent this construction is highly exceptional, in that the antecedent is in a subordinate position relative to the pronoun. It is plausible to see the reflexive here as derivative from that found in the more elementary structures that are entailed:

- [36] i *Ed didn't buy the shares for himself.*  
 ii *They do badly because of themselves.*  
 iii *Ed embarrassed himself.*

#### ■ Basic reflexives: summary

If we set aside this last construction, which we have suggested is best accounted for as derivative from more elementary constructions, the following generalisations can be made about the structural relation between a reflexive and its antecedent:

- [37] i The antecedent is related to a verb or noun as head; the reflexive is related (directly or via a preposition) to that same head or to a dependent thereof.  
 ii Generally, the antecedent is superordinate to, and precedes, the reflexive.

Point [i] caters for the distinction between the single-head and dual-head domains. As for [ii], the antecedent is generally superordinate in the sense that it occupies a higher position in the constituent structure. The prototypical antecedent is subject, in the structure of a clause or NP, and as such it is higher than other dependents of the head verb or noun. Antecedent and pronoun can be at the same structural level when they are both related to the head verb or noun via a preposition, but this is relatively rare. The only case where the reflexive is structurally higher than the antecedent is when it is preposed in clause structure (as in [23ii], *Himself, he excused from these onerous duties*), and we suggested that this too should be regarded as derivative from a more elementary structure. Note, then, that in a dual-head construction where the heads are verb and noun, it is the antecedent that is related to the verb, not the reflexive. Examples like the following are thus quite inadmissible:

- [38] \* [*The bride's father*] / \* [*The father of the bride*] put *herself* first.

<sup>21</sup>In [35ii] the relative clause of the cleft is omitted: we understand *It is because of themselves that they do badly*.

A reflexive in the position of *herself* must take the whole subject NP as antecedent, not a subordinate element within it – compare the single-head construction *The bride's father / The father of the bride put himself first*.

### 3.1.4 Override reflexives

Override reflexives are those that occur in place of a more usual non-reflexive in a restricted range of contexts where there is not the close structural relation between reflexive and antecedent that we find with basic reflexives. Crucially, the constructions concerned admit a 1st or 2nd person reflexive with no antecedent at all, and this represents the most frequent and central case of the override. The use of override reflexives, especially 1st person singular *myself*, has been the target of a good deal of prescriptive criticism; there can be no doubt, however, that it is well established, though there is a good deal of variation among speakers as to how commonly and in how wide a range of syntactic contexts it occurs.

#### ■ Types of override constructions

##### (a) Coordination

- [39] i *Both the local authority and myself have gone to the minister.*  
 ii *Ann suggested that the reporter pay both the victim and herself for their time.*  
 iii *They had invited Tim as well as myself.*

There is of course no override in coordinations like *He trusts only himself and his wife*, for here the reflexive is mandatory and is identical with the form that would appear in the corresponding non-coordinate construction, *He trusts only himself*. But in [39] the reflexive is optional and in [i–ii] it would be inadmissible without the coordination: \**Myself have gone to the minister*; \**Ann suggested that the reporter pay herself for her time*.

##### (b) Comparatives

- [40] i *They were all much better qualified than myself.*  
 ii *A doctor such as yourself would be welcome in any rural town.*  
 iii *She told him he should marry a woman like herself.*  
 iv *Now Abel turned his head to look at his brother. Mark held the wheel loosely, . . . Mark looked easily older than himself, settled, his world comfortably categorised.*

##### (c) Inclusion, exclusion; as for and what/how about?

- [41] i *Everybody, including yourself, will benefit from these changes.*  
 ii *Liz couldn't understand why nobody except herself had complained.*  
 iii *As for myself, it doesn't worry me which one they choose.*  
 iv A: *What did you think of the play?* B: *I enjoyed it – how about yourself?*

##### (d) Complement of specifying *be* or of a preposition in predicative complement function

- [42] i *The only one they didn't invite was myself.*  
 ii *I confess [that the novel is really about myself].*  
 iii *All Ann's novels are really about herself.*

Note that in [iii] the antecedent is just part of the subject NP: as illustrated in [38] this is not possible with basic reflexives. Compare, similarly, *An individual's genes are unique to itself*.

## (e) With ‘picture nouns’

- [43] i *The photo of myself that he'd chosen for the brochure was hardly flattering.*  
 ii *Tim knew that the letters about himself were libellous.*  
 iii *The Lord Mayor sighed. The portrait of himself newly presented to the gallery had been hung in an obscure alcove.*

These differ from examples like [32–33] in that the pronoun has an extraclausal antecedent or no antecedent at all. In [32–33], moreover, the reflexive is either mandatory or at least as highly favoured as the non-reflexive form, whereas in the present case the non-reflexive can reasonably be regarded as the default form.

## (f) Some exceptional extensions of the override

Normally, override reflexives do not occur as object of the verb or object of those prepositions that in verb domain anaphora take mandatory reflexives:

- [44] i *\*They will try to persuade yourself to go with them.*  
 ii *\*Liz didn't realise that I was talking to herself.*

Nevertheless, there are examples where an override in these positions is at least marginally acceptable:<sup>22</sup>

- [45] i *The fact [that Paul had nominated myself for the position] didn't please Frank.*  
 ii *Liz couldn't hide her elation. The fact that Paul had nominated herself for the position was a huge vote of confidence.*  
 iii *It was Kennett's flamboyant self-indulgence that allowed himself to become an election issue at the expense of his own achievements.*

## ■ Factors favouring or disfavouring reflexive override

## (a) 1st person

Much the most common override is 1st person *myself*. The reflexive avoids the choice between nominative *I* and accusative *me*, and this may well favour its use in coordinate and comparative constructions, where there is divided usage and hence potential uncertainty for some speakers as to which is the ‘approved’ case (see Ch. 5, §16.2).

## (b) Perspective

Overrides with 3rd person reflexives characteristically occur in contexts where the antecedent refers to the person whose perspective is being taken in the discourse. Typical are such free indirect style examples as [40iv] and [43iii], which can be seen as an extension of the central 1st person case. Compare, then:

- [46] i *Paul was determined to be promoted ahead of Sue. That profile of himself in the company newsletter would certainly help.*  
 ii *Sue was surprised at how many people had heard Paul's name. That photograph of him/himself in the company newsletter must have reached a wide audience.*

In [i] it is Paul's perspective on events that is being taken, whereas in [ii] it is Sue's. As a result, a reflexive linked to *Paul* is acceptable in [i] but not in [ii].

<sup>22</sup>We have even found an example in subject function: *Each side proceeds on the assumption that itself possesses infinite courage, but that the other side consists of poltroons who can be frightened by bluster.* This is highly exceptional in that a deictic 1st or 2nd person reflexive could not occur in subject function.

## (c) Intervening NP

Override reflexives may be disfavoured or excluded if an NP is located between the antecedent and the pronoun, especially one with the same gender and/or number features:

- [47] i *Sue* knew that there was a photograph of herself on the noticeboard.  
 ii \**Sue* knew that Mary had put a photograph of herself on the noticeboard.  
 iii ?*Sue* knew that Paul had put a photograph of herself on the noticeboard.  
 iv *Sue* knew that the BBC had put to air an interview with herself which she had done in Nairobi in 1988.

The override is fully acceptable in [i], where only the dummy *there* intervenes between *Sue* and the picture NP, but it is inadmissible in [ii], because *Mary* pre-empts the role of antecedent. More acceptable is [iii], because of the gender incompatibility between *Paul* and *herself*, while [iv] is again more or less fully acceptable, given that *the BBC* refers to an organisation, and hence is manifestly not a potential antecedent for the reflexive.

## (d) Contrast

Acceptability of the override reflexive is increased if it is contrastive. For example, [45ii] requires stress on the reflexive to contrast Liz with other possible nominees; in [iii] we have a contrast between Kennett (Kennett's personality) and his achievements. Similarly, in the example of footnote 22 there is contrast between one side and another. Consider finally the result of combining stress with foregrounding by means of the cleft construction:

- [48] i ?*She* had wanted him to marry herself.  
 ii It was herself she had wanted him to marry.

Here [ii] is fully acceptable even though the canonical counterpart [i] is questionable.

## 3.2 The emphatic use of reflexive pronouns

## ■ Four positions

Emphatic reflexives occur in one of the four positions illustrated in:

- [49] i *I myself* do not regard it as important. [modifier in NP structure]  
 ii I do not myself regard it as important. [central]  
 iii I do not regard it as important myself. [end position]  
 iv Myself, I do not regard it as important. [front position]

In [i] *myself* functions as modifier within the structure of the larger NP *I myself*, while in [ii–iv] it is an adjunct in clause structure (see Ch. 8, §20.1, for explanation of the three positions). Reflexives in front position are predominantly 1st person, and the reflexive on its own here is hardly distinguishable from the PP *as for myself*. In clauses with no auxiliary and a 2nd/3rd person subject, there are generally just two possibilities:

- [50] i *The manager herself* detected the error. [modifier in NP structure]  
 ii *The manager* detected the error herself. [end position]

### Clause adjuncts

Emphatic reflexives functioning in clause structure always have the subject as antecedent:

- [51] i \_\_\_<sub>i</sub> *Having read the report herself<sub>i</sub>, Liz<sub>i</sub> was able to confirm what I said.*  
 ii \**They gave Max the key himself.*

The subject antecedent is overt in [49ii–iv], missing but understood in [51i]. Example [51ii], with *himself* anaphoric to the indirect object, is inadmissible.

### Modifiers in NP structure

NPs containing a reflexive as modifier can occur in most NP functions:

- [52] i [*The President himself*] *had made the decision.* [subject]  
 ii *We saw [the President himself].* [object of verb]  
 iii *She had addressed the letter to [the President himself].* [object of preposition]

The predicative complement function, however, is very restricted. In *Liz is an engineer herself*, for example, the reflexive is a clause adjunct with *Liz* as antecedent, not a modifier in the NP headed by *engineer*. Nevertheless, predicative complement function is possible in examples like *You will be the President himself* (where 3rd person *himself* cannot have *you* as antecedent). One absolute restriction is that neither the antecedent nor the whole NP can be genitive. Compare:

- [53] \**I met Mary's herself son / Mary herself's son / Mary's herself's son.*

To express the intended meaning we need an *of* phrase rather than a genitive: *I met the son of Mary herself*. Note, then, that the subject of a gerund-participial cannot be genitive if it contains a reflexive modifier:

- [54] i *They objected to Tom/Tom's doing it himself.*  
 ii *They objected to Tom/\*Tom's himself doing it.*

### ■ Emphasis and contrast

The emphatic effect of the reflexive may be comparable to that of *none other than* or *no less than*; these items could be added with little change to the meaning in, for example, [52]. Very often there is explicit or implicit contrast:

- [55] i *Funds should be provided for the maintenance of both the dwellings themselves and the spaces between them.*  
 ii *The rules of conduct which must be enforced on the inferior masses do not apply to the rulers themselves.*  
 iii *Then, in chronological order, Mr White covers the primary campaigns, the conventions, and the presidential campaign itself.*  
 iv *When his father told stories about the war a curious happiness came over him which the stories themselves did not explain.*

The contrasting terms may be alike or different with respect to the predication. In [i], for example, the funds are for the dwellings and the spaces between them, while in [ii] the rules apply to the inferior masses but not to the rulers. In cases of explicit contrast such as [i–iii], the reflexive will tend to attach to the term that is in some sense more important, either inherently or in terms of the context of discourse. In [iii] for example, the primaries and conventions are preliminaries, while the presidential campaign is the major stage in the election of the president.

### ■ Special use: direct involvement

In addition to what we will call the ‘ordinary use’ illustrated above, the emphatic reflexive may be used to indicate the direct involvement of the subject referent. Compare:

- |      |                                     |   |
|------|-------------------------------------|---|
| [56] | ORDINARY USE                        | DIRECT INVOLVEMENT USE                        |
| i    | a. <i>Liz had a swim herself.</i>   | b. <i>Liz had solved the problem herself.</i> |
| ii   | a. <i>Did you like it yourself?</i> | b. <i>Did you make these cakes yourself?</i>  |

The salient interpretation of [ib] is that Liz solved the problem without help, that this was her own accomplishment. Similarly in [iib] the implied contrast will most likely be between your making the cakes and simply buying them ready-made (or getting someone else to make them). This kind of meaning can be expressed more explicitly by means of such PPs as *by oneself* or *on one’s own*: *Liz had solved the problem by herself / on her own*. Compare also *I want to see the evidence myself* and *I want to see the evidence for myself*.

The direct involvement sense strongly favours end position: [56ib], for example, is considerably more likely for the sense described than *Liz herself had solved the problem* or *Liz had herself solved the problem*. In negative clauses an ordinary emphatic reflexive falls outside the scope of negation, whereas one with the direct involvement sense falls inside the scope. Compare:

- |      |    |   |                                       |
|------|----|---|---------------------------------------|
| [57] | i  | <i>I don’t feel hungry myself.</i>                    | [reflexive outside scope of negation] |
|      | ii | <i>I didn’t write the report myself: Jo wrote it.</i> | [reflexive inside scope of negation]  |

Example [i], with an ordinary emphatic reflexive, can be glossed as “Personally, I don’t feel hungry”: the negative applies to the feeling hungry but not to *myself*. In [ii], however, what is negated is my direct involvement in writing the report. Where a direct involvement reflexive is inside the scope of negation, there will generally be an implicature that the action or whatever was, is, or will be performed by someone else. In [ii] this implicature is explicitly confirmed in the following clause (included in the example precisely to force the direct involvement reading), but it is also conveyed by the relevant reading of *Liz hadn’t solved the problem herself*, and the like: other things being equal you will infer that the problem was solved, with someone helping Liz or doing it for her.

A further difference between the two uses is illustrated in the following pair:

- |      |    |   |                          |
|------|----|---|--------------------------|
| [58] | i  | <i>*Any mother herself will understand what I mean.</i> | [ordinary use]           |
|      | ii | <i>Any mother should be able to do this herself.</i>    | [direct involvement use] |

In the ordinary use the antecedent is usually definite and normally has to be referential: hence the anomaly of [i]. But no such restriction applies with the direct involvement use.

### ■ Emphatic reflexives in ascriptive supplements

- |      |    |   |
|------|----|---|
| [59] | i  | a. <i>John, [<u>himself</u> a religious man,] defended the exhibition.</i>                  |
|      |    | b. <i>John, [a religious man <u>himself</u>,] defended the exhibition.</i>                  |
|      | ii | a. [ <u>Himself</u> a bachelor,] <i>Ed knew well how to entertain his bachelor friends.</i> |
|      |    | b. [A bachelor <u>himself</u> ,] <i>Ed knew well how to entertain his bachelor friends.</i> |

Ordinary emphatic reflexives commonly occur in ascriptive supplements (cf. Ch. 15, §5.2). They may precede the predicative element, as in [ia/iiia], or follow, as in [ib/iib].

In either case, the supplement can follow or precede the antecedent, as in [i] and [ii] respectively.<sup>23</sup>

## 4 Reciprocals

### 4.1 Form and meaning

#### ■ Compound vs split constructions

Reciprocal meaning is expressed by *each* or *one* in combination with *other*. The two components may form a compound reciprocal pronoun (*each other* or *one another*) or remain separate, with *each* and *one* determinatives, **other** a common noun: we will speak of **compound** and **split** constructions. Compare, then:

- [1] i *They are required to consult with each other / one another.* [compound]  
 ii *They are each required to consult with the other.* } [split]  
 iii *They are required to consult one with the other.* }

The pronouns *each other* and *one another* are semantically equivalent, with *each other* the more frequent of the two.<sup>24</sup> In the split construction, however, *each* and *one* differ both syntactically and semantically, and we will therefore compare them separately with the compound construction.

#### ■ The split construction with *each* compared with the compound construction

- [2] i a. *Each girl trusted the others.*  
 b. *Each of the girls trusted the others.*  
 c. *The girls each trusted the others.* } [split]  
 d. *\*The girls trusted each the others.* }  
 ii *The girls trusted each other / one another.* [compound]

*Each* can occur within the subject NP itself (as pure determiner in [ia], fused determiner-head in [ib]) or as an adjunct following the subject, as in [ic]. *Each* can follow an auxiliary verb (*The girls had each trusted the others*), but it cannot immediately precede the NP containing *others*: instead of [id] we have the compound construction [ii], with *each other* or *one another* a pronoun functioning as head of the object NP. The distributive determinative *each* behaves in just the same way as in non-reciprocal constructions: compare *Each girl* / *Each of the girls* / *The girls each* won a prize. Similarly *the others* is quite independent of *each*: compare *I trusted the others* or *Only a few of the girls trusted the others*.

The same patterns are found where *the others* is object of a preposition:

- [3] i a. *Each girl / Each of the girls / The girls each shook hands with the others.*  
 b. *\*The girls shook hands each with the others.*  
 ii *The girls shook hands with each other / one another.*

<sup>23</sup> Alternatively, we might say that the construction has an ellipted subject, and in this case the reflexive would not be directly linked to the following *Ed* but to the preceding covert subject.

<sup>24</sup> There has been a prescriptive tradition of saying that *each other* is appropriate for sets of two, *one another* for sets of three or more: *Kim and Pat like each other* but *Kim, Pat, and Alex like one another*. The empirical evidence, however, does not support this rule and there is not even any historical basis for it; most modern usage manuals recognise that the pronouns cannot be distinguished along these lines.

Suppose there are three girls, Sue, Jill, and Pam. It then follows from [2ia–c] that Sue trusted Jill and Pam, Jill trusted Sue and Pam, and Pam trusted Sue and Jill. And the compound version [2ii] conveys the same. Notice, however, that the split version allows for a more precise expression of the relationships where larger sets are involved:

- [4] i *Each of the girls trusted a few / some / most of the others.*  
 ii *Each of the girls trusted each of the others.*

The compound version [2ii] is obviously not equivalent to [4i], but it is not equivalent to [4ii] either: the latter specifies that the relationship holds between every pair of girls, but given a reasonably large set of girls the truth conditions for [2] would be somewhat less stringent. That is, each girl trusted the rest of the set as a whole, but not necessarily every individual one of them. We should also observe that the split construction differs from the compound one in that it distinguishes between sets of two and sets of three or more. For a set of two we would have singular *other*: *Each of the girls trusted the other.*

### ■ The split construction with *one* compared with the compound construction

- [5] i *They were placed one on top of the other.* [split]  
 ii *They were placed on top of each other / one another.* [compound]

The split construction with *one* usually has *one* as adjunct preceding a PP containing *other*, as in [i]. It will be noted that the syntactic position of *one* in the split construction is different from that of *each*: see [1ii–iii]. *One* occurs after rather than before the verb: compare [5i] with \**They were one placed on top of the other*. A further difference is that the *one* construction doesn't allow *one* as adjunct to combine with *the other* as object – compare \**They followed one the other through the tunnel* with the *each* counterpart in [2ic] (*The girls each trusted the others*).

#### Kinds of reciprocity

In the split construction *one* is used for a broader range of reciprocal relations than *each*. Compare the following:

- [6] i *They were placed one on top of the other.* (= [5i]) [linear: asymmetric]  
 ii *They were sitting one beside the other in the back row.* [linear: symmetric]  
 iii *They are required to consult one with the other.* (= [1iii]) [non-linear]

Suppose *they* refers to a set of four: A, B, C, and D (they might be mattresses in [i], people in [ii–iii]). The relation in [i–ii] is **linear** in that A–D are ordered: in [i] A is on top of B, B is on top of C, C is on top of D, and in [ii] A is beside B, B is beside C, and C is beside D. A is thus not (immediately) on top of or beside C, and B is not (immediately) on top of or beside D. The relation in [iii], by contrast, is **non-linear**. Here there is no ordering, and A consults directly or immediately with all of B, C, and D, B consults with all of A, C, and D, and so on. Within the linear type we then have a distinction between **asymmetric** and **symmetric**. *On top of* expresses an asymmetric relation in that *A is on top of B* entails *B is not on top of A*; and *beside* expresses a symmetric relation because *A is beside B* entails *B is beside A*. The compound reciprocal pronouns, like the split construction with *one*, can be used for all three kinds of relation, but the split construction with *each* is restricted to the non-linear type, the most central case of reciprocity.

In our contextualisation of the asymmetric [6i]/[5], the intermediate mattresses B and C are both on top of some mattress and have a mattress on top of them: this is what makes the situation like more central cases of reciprocity. But the outer mattresses A and

D do not have this property of entering into the relation in both directions: A doesn't have any mattress on top of it and D is not on top of any mattress. If the set in question contains only two members, there won't be any member that enters into the relation in both directions, and the situation will not then qualify as reciprocal. In this case the compound construction is inappropriate:<sup>25</sup>

- [7] i *The two jars had been placed one inside the other.* [split]  
 ii *\*The two jars had been placed inside each other / one another.* [compound]

Even with sets of more than two, the compound construction is less readily used for asymmetric linear reciprocity than for the other kinds. Compare, for the meaning "They were slaughtered in turn":

- [8] i *They were slaughtered one after another / the other.* [split]  
 ii *\*They were slaughtered after each other / one another.* [compound]

#### One within the subject NP

The examples of the split *one* construction considered so far have had *one* as a post-verbal adjunct. It is also possible for *one* to occur within the subject:

- [9] i *One crisis followed another at frequent intervals.*  
 ii *Crises followed each other / one another at frequent intervals.*

In [i] the NP *one crisis* is interpreted non-referentially: it doesn't refer to any one crisis. Examples where an NP of this form is used referentially, as in *One girl criticised the others*, have non-reciprocal interpretations.

#### ■ Antecedent of reciprocal pronouns must denote a set of two or more

A reciprocal relation necessarily involves at least two entities, and the antecedent for the reciprocal pronouns must therefore denote a set of two or more. Usually it is a plural NP (as in the examples given so far) or an *and*-coordination of NPs (*Kim and Pat mistrust each other*). In a few cases, however, it can be syntactically singular:

- [10] i *Everyone knew each other.*  
 ii *One couple clearly hated each other's guts.*

Singular *everyone* implies some contextually given set of people, and the reciprocal relation of knowing each other holds over this set. Notice, however, that NPs with *every* as determiner do not behave in the same way. We cannot have, for example, *\*Every girl knew each other*: a plural such as *all the girls* would be used instead. In [10ii] *couple* is a singular collective noun denoting a set of two people, and the relation of hating each other's guts holds for this set. The acceptability of such examples varies somewhat according to the particular collective noun involved; [10ii] seems better, for instance, than *The cabinet/government didn't like each other very much*, where many speakers would prefer an explicit plural such as *members of the cabinet/government*.

<sup>25</sup> Examples are occasionally found, but they are generally regarded as mistakes – cf. this letter to the editor of a London newspaper: *We read the instructions on 'How to condense milk by magic' in last week's Colour Magazine, but we can't find two jam jars which will fit loosely inside each other. We have found two jam jars one of which will fit loosely inside the other. Will the magic still work?* The lack of reciprocal meaning is not restricted to cases where the set has just two members. Consider *The jars had been stored one inside another*. It could be that there are ten jars, five of one size and five slightly larger, with each of the smaller ones stored inside one of the larger ones. No one jar would then be both inside a second jar and have a third jar inside it, and again, then, there would be no reciprocity.

## 4.2 The distribution of reciprocal pronouns

### ■ Reciprocals and reflexives

Our concern in the remainder of this section will be with the compound construction. Reciprocal pronouns have it in common with reflexives that there has to be a close structural relation between pronoun and antecedent. Thus both types of pronoun are inadmissible in contexts like:

- [11] i \**Kim and Pat claim that I misled themselves.*  
 ii \**Kim and Pat claim that I favoured each other.*

Just as the meaning “Kim and Pat claimed that I misled Kim and Pat” cannot be expressed by [i], so the meaning “Kim claimed that I favoured Pat and Pat claimed that I favoured Kim” cannot be expressed by [ii].

At the same time, reciprocals differ from reflexives in several ways, the most important of which are as follows:

- [12] i Reciprocals always function as complement: there is no emphatic use.  
 ii Unlike reflexives, reciprocals have genitive forms, *each other's*, *one another's*.  
 iii Reflexive is an inflectional property, but reciprocal is not.

Point [i] is illustrated by the ungrammaticality (and semantic incoherence) of examples like \**We each other enjoyed the show* or \**The girls solved the problem each other*. Point [ii] is illustrated by the contrast between *They blamed each other's parents* and \**They blamed themselves' parents*.

Point [12iii] concerns the different status of reflexives and reciprocals in the system of pronouns: the reflexives are inflectional forms of the personal pronouns, while the reciprocals are independent pronouns. This difference has a number of consequences. Note in the first place that we can correct [11i] by replacing the reflexive form of *they* by the accusative form: *Kim and Pat claim that I misled them*. But we cannot correct [11ii] by adjusting the inflectional form of the pronoun: we need a more radical change that eliminates the pronoun altogether, as in the split construction *Kim and Pat each claimed that I favoured the other*. A second consequence is that the mandatory vs optional distinction that we need for reflexives is inapplicable to reciprocals. Compare:

- [13] i a. *They hurt themselves/\*them.*                      b. *They hurt each other.*  
 ii a. *They tied the ropes around themselves/them.*                      b. *They tied the ropes around each other.*  
 iii a. *They say I misled \*themselves/them.*                      b. \**They say I favoured each other.*

With reflexives, the issue is which form of the pronoun we get in a given context, reflexive or non-reflexive. There are three possible answers: in [ia] only the reflexive is permitted, so it is mandatory; in [iia] both forms are permitted, so the reflexive is optional; in [iiaa] only the non-reflexive is permitted, so the reflexive is inadmissible. With reciprocals, the issue is simply whether the pronoun is admissible ([ib/iib]) or inadmissible ([iib]).

### ■ Syntactic contexts admitting reciprocal pronouns

Reciprocal pronouns occur in essentially the same range of contexts as those where we find basic reflexives. These have been described in §§3.1.1–3, and hence need only a summary treatment here. We illustrate with *each other*, with the understanding that *one another* would also be possible.

## (a) Verb-domain reciprocal pronouns

- [14] i *Kim and Pat love each other.* [subject; direct object]  
 ii *They never gave each other presents.* [subject; indirect object]  
 iii *We sat opposite each other.* [subject; comp of prep]  
 iv *We must protect them from each other.* [object; comp of prep]  
 v *I talked to Kim and Pat about each other.* [comp of prep (both)]

The annotations on the right give the functions of the antecedent and pronoun respectively; in [v] both have the function of complement of a preposition.<sup>26</sup> As with reflexives, the pronoun cannot have subject function: \**Each other love Kim and Pat.*

## (b) Noun-domain reciprocals

- [15] i *We were alarmed at [their growing hostility to each other].*  
 ii *She wrote a poem about [the love of Karl and Sophie for each other].*  
 iii *The story is about [the love for each other of two teenage students who had both been rejected by their parents].*

Here antecedent and anaphor are related to the same noun, the pronoun by means of a preposition, the antecedent by genitive case or a preposition. Example [iii] shows that in this construction the pronoun can precede the antecedent.

## ■ Extensions

The same types of extension are found with reciprocals as with reflexives, except that reciprocals are hardly possible as complement in the *it*-cleft construction: ?*It was each other that they criticised most harshly.*

## (a) Predicative adjective domain

- [16] i *They seem very fond of each other.*  
 ii *The competition had made them somewhat antagonistic towards each other.*

The pronoun is oblique complement of a predicative adjective, and the antecedent is the predicand – subject in [i], object in [ii].

## (b) Subject of non-finite complement of verb

- [17] *They arranged for each other to be nominated by one of the directors.*

## (c) Mixed verb–noun domain

- [18] i *They had had [nightmares about each other].*  
 ii *Lady Mary and Sir Harry had presented [portraits of each other] to the Gallery.*  
 iii *Kim and Pat sued [each other's parents].*

Examples [i–ii] are comparable to the reflexive examples [32–33]. In [18iii] the reciprocal is genitive subject-determiner to the noun *parents*, while the antecedent is subject of the verb *sue*; this pattern is much more common than that of [i–ii] but, as we have observed, has no reflexive counterpart because reflexives do not have genitive forms. Note that in the mixed verb–noun domain it is not possible for the antecedent to be a genitive (\**The girls' assignments had been typed by each other*); genitive antecedents are found only in noun-domain anaphora, as in [15i].

<sup>26</sup>As with reflexives, the preferred order in [14v] has the *to* phrase before the *about* phrase: ?*I talked about Kim and Pat to each other.*

### ■ Ellipted antecedents

- [19] i *Now* \_\_ hug each other.  
 ii \_\_ *Keeping a wary eye on* each other, they woo *Concordia*.

As with reflexives, the antecedent (typically the subject) may be ellipted. In the imperative [i] we understand *you* as antecedent, while in [ii] the covert subject of the subordinate clause is itself anaphorically linked to the following *they* in the matrix clause.

### ■ Coordination

Reciprocal pronouns can be coordinated with a reflexive or some other NP:

- [20] i *They no longer respected* themselves or each other.  
 ii *You must help not only* each other *but also* your families.

## 5 Demonstratives

### 5.1 Preliminaries

#### ■ Forms

There are two demonstratives, proximal **this** and distal **that**. Both inflect for number:

[1]		SINGULAR	PLURAL
i	PROXIMAL	<i>this</i>	<i>these</i>
ii	DISTAL	<i>that</i>	<i>those</i>

#### ■ Dependent and independent uses

The demonstratives have both **dependent** and **independent** uses, as illustrated in:

- [2] i DEPENDENT: [This milk] *is sour*. *Where's* [that boy of yours] ? [These two] *are mine*. *Please pass* [those knives]. *He's not often* [this late]. *It didn't cost* [that much].  
 ii INDEPENDENT: [All this] *is mine*. [That] *'s not true*. *Can I have a few of* [those] ? *His manner was like* [that of a schoolmaster].  
 [Those who broke the law] *could expect no leniency*.

In the dependent use they function as pre-head determiner or degree modifier; in the independent use they function as fused determiner-head in NP structure (see Ch. 5, §§7.1, 9.2).

#### ■ Singular independent demonstratives mostly restricted to inanimates

Independent *this* and *that* cannot in general be used of humans or animals:

- [3] i Those *who obtain a score of 90% will win a prize*.  
 ii \*That *who obtains the highest score will win a prize*.  
 iii *He/That* *saved my life*.  
 iv *The population of Victoria far exceeds* that *of Queensland*.  
 v \**The premier of Victoria will be meeting with* that *of Queensland*.

*Those* in [i] is understood as denoting a set of people, but the corresponding singular *that* in [ii] is inadmissible. In [iii] *he* and *that* contrast in animacy, *he* referring to a person or

animal, *that* to an inanimate. And in the anaphoric cases in [iv–v] *that* is acceptable with the interpretation “the population” but not “the premier”. No such restriction applies to dependent *this* and *that*: *This guy* / *That guy saved my life*.

*This* and *that* can have animate reference, however, when they function as subject of the verb *be*:

- [4] i *This is my husband, Peter.*  
 ii *Look over there. Isn't that your biology tutor?*

Such examples normally involve the specifying use of *be*: we can't have \**This isn't very well today* or \**That is President*.<sup>27</sup> Note also that the singular forms are used even when more than one person is involved: *This is Alice and Robert Penfold*; *That's your parents over there*.

## 5.2 The central deictic use

The primary use of the demonstratives is in NPs referring to objects present in the situation of utterance, with *this* applying to objects relatively close to the speaker (proximal), and *that* to objects relatively distant from the speaker (distal):

- [5] i *This apple looks riper than that one.*  
 ii *Is this yours?*  
 iii *What's that you're eating?*

If the demonstrative NP contains a postmodifier that itself participates in the proximal vs distal distinction, demonstrative and postmodifier must agree: *this book here*, *those flowers over there*, but not \**this book there*.

What counts as proximal and what as distal is not determined by purely objective features of spatial location: there may be a subjective element involved. For example, I might be holding something in my hand and still have a choice between saying *What is this?* and *What is that?* In this context *this* would be the default choice, but *that* could be used to indicate some negative attitude such as disapproval. Or suppose we are in a department store looking for a jacket: I might refer to one quite close to me, saying *How about this one?* or *How about that one?* One possible factor in the choice could be whether I am the one wanting to buy (favouring *this*) or whether you are (favouring *that*).

Demonstratives can be used deictically not only to pick out physical objects in the situation of utterance, but also in reference to properties of such objects or to actions taking place or other abstract features of the situation of utterance:

- [6] i *I hadn't expected there to be this much damage. I've never seen a computer this small before. I'm not comfortable like this. Hold your head up like this. This is what he was doing. When we first travelled with Matthew he was younger than this.*  
 ii *Stop that. I'm looking for something about that size. Don't look at me like that / that way. That is not how to do it.*

As observed in §1, deictic demonstratives are often accompanied by indexing acts such as pointing – as in the last example of [i], where the speaker points at the child whose

<sup>27</sup>The ascriptive *be* construction is permitted under certain circumstances with an NP as predicative complement: *That is an extraordinarily tall man over there; This is a beautiful baby*.

age is compared with Matthew's. For the use of *this* in temporal deixis (as in *this week*, etc.), see §10.1.2 below.

Demonstratives are also commonly found in discourse deixis (see [26] of §1):

- [7] i A: *You look about fifteen.* B: *Is that meant to be a compliment?*  
 ii *I hope this conversation isn't being recorded.*  
 iii *Taking the Waltz first, a group of figures that really must be included are Natural Turn, Closed Change, and Reverse Turn, danced in that order.*

In [i] *that* refers to A's statement; in [ii] *this conversation* refers to the one in which the utterance of *this conversation* takes place; and in [iii] *that order* refers to the order in which the three figures have just been mentioned.

### 5.3 Anaphoric uses

#### (a) With NP as antecedent

- [8] i *There was a glass pane in the front door, and through this he could see into a hallway where a plump woman with red hair was arranging flowers.*  
 ii *I raised some money by hocking the good clothes I had left, but when that was gone I didn't have a cent.*  
 iii *It appears Tom did most of the damage. That boy's becoming quite a problem.*  
 iv *I bought another copy, but that one was defective too.*  
 v *The 1978 Report recommended that a State Plan be adopted to develop 99 public libraries throughout South Australia over an eight-year period. The development programme to achieve this State Plan has been highly successful.*

A demonstrative NP and its antecedent NP are characteristically coreferential, as in [i–iv]; in [v] *a State Plan* is non-referential, but we understand that the recommendation was adopted, so that there does exist an actual plan for the anaphoric NP to refer to. The demonstratives in [i–ii] are independent, the others dependent. In these dependent cases, the demonstrative determines a nominal which in [iii] (*boy*) represents new information; in [iv] (*one*) is itself an anaphor with the nominal *copy* as antecedent; and in [v] (*State Plan*) is repeated from the antecedent NP. Note that in [iv] we have one anaphoric link at the level of nominals between *one* and *copy*, and another at the level of NPs between *that one* and *another copy*.

As evident from the examples cited, both **this** and **that** can be used anaphorically – and in general one could be replaced by the other with very little effect on the meaning. Note that **this** and **that** cannot be used contrastively in the anaphoric use as they can in the deictic use: *#I went Christmas shopping and bought a t-shirt<sub>i</sub>; and a CD<sub>j</sub>; that<sub>i</sub> is for Kim, and this<sub>j</sub> is for Pat.* It would be possible to replace the demonstrative NPs in [8] by personal pronouns, and indeed personal pronouns are very much more commonly used as anaphors to coreferential NPs than are demonstratives.

The anaphoric and deictic uses of demonstratives are not mutually exclusive:

- [9] A: *Look at the necklace she's wearing.* B: *That's the one I gave her.*

*That* is here anaphoric to *the necklace she's wearing*, but as the necklace is present in the situation *that* also has distal deictic force.

## (b) Antecedents with the form of clauses

- [10] i *Harold would be absent in Salonika for some days; this made the arrangement for her own timetable much simpler.*  
 ii *He discovered that she had slept with several other boyfriends before him. That shocked him a good deal, and they had a quarrel about it.*  
 iii *A fire had just been lighted and things had been set out for drinks, and his response to these comforts was instantaneous.*  
 iv *At first he took no notice of their taunts, but he was soon forced to abandon that approach.*  
 v *He chopped part of Pa's door down before he stopped. He might not have gone that far if Pa hadn't been locked in laughing fit to shake the house.*

Except in [v], where *that* is a degree modifier, the anaphor is an NP, and hence has a nominalising role. We noted that where the antecedent is an NP, as in [8], independent demonstratives are less common than personal pronouns, but the reverse is the case here. While *it* would be possible in [10i–ii], demonstratives are more likely. Note that [10ii] contains an anaphoric chain, with *that* anaphoric to the preceding clause but antecedent to the following *it*.

## (c) Antecedents with the form of AdjPs or AdvPs

- [11] i *She was incredibly depressed. In this mood she couldn't do anything.*  
 ii *They had a blue rug, but that isn't the colour I wanted.*  
 iii *They were running very slowly. At that speed they didn't have a hope of catching the train.*  
 iv *Her skin is brown and so clear. No one in Europe ever had skin that clear.*

The anaphor is again an NP except in [iv], and hence has the same kind of nominalising role as in [10].

## (d) Independent demonstratives with nominals as antecedent

While the antecedent of an independent demonstrative can be a full NP, as in [8i–ii] and [9] above, it can also be just a nominal. There are two subcases to be distinguished, one involving deictic **this** and **that**, the other non-deictic **that**.

Deictic **this** and **that** with nominal antecedents

- [12] i [This copy] is clearer than [that].  
 ii [The wine we had yesterday] was too sweet for my taste but [this] is perfect.

*That* in [i] and *this* in [ii] are clearly deictic, referring to entities in the situation of utterance, and with distal and proximal senses respectively. At the same time, however, they are anaphoric, for we understand “that copy” and “this wine”. We analyse independent **this** and **that** as realising a fusion of determiner and head functions (as explained in Ch. 5, §9.5), and it is here just the head component that is interpreted anaphorically, as having the same denotation as the underlined antecedent. These examples thus differ clearly from independent *that* in [9], which is also simultaneously deictic and anaphoric. In [9] the anaphoric relation is between *that* and the NP *the necklace she's wearing*, with the relation interpreted as coreference; in [12], however, the anaphoric relation is between *that* or *this* (or the head function component of them) and the nominals, or nouns, *copy* and *wine*: there is no anaphoric relation and no coreference between the bracketed NPs.

### Non-deictic *that* with nominal antecedent

- [13] i *Their names weren't on [the list of the dead], nor on [that of the missing].*  
 ii *[The shops in the suburban shopping centres] resemble [those of an English village].*  
 iii *[The speech she actually made] was quite different from [that which had been released to the media].*

Again, the antecedent is a nominal rather than a full NP, but this time *that* lacks the deictic meaning that it has in [12]. Non-reduced versions of the NPs here would contain *the* rather than *that*: *the list of the missing, the shops of an English village, the speech which had been released to the media*. This correlates with the fact that there is no distal–proximal contrast in the present construction, for *this* is inadmissible: cf. *\*Their names weren't on the list of the dead, nor on this of the missing*. In this use, *that* has been bleached of its primary distal demonstrative meaning and as far as its determiner function is concerned it serves as a pure marker of definiteness, like *the*. *The* itself is one of the few determinatives that cannot function as a fused determiner-head (we cannot have *\*Their names weren't on the list of the dead, nor on the of the missing*, with *the* interpreted as “the list”): *that* in this bleached, non-deictic sense can therefore be regarded as filling this gap in the system.

In each of the examples in [13] the bracketed NPs are referentially distinct: *the list of the dead* and *that of the missing* refer to distinct lists, and so on. The relation between the NP containing the antecedent and the one containing *that* is not always of this kind, however:

- [14] i *[His image of her] was [that of a woman in her early thirties].*  
 ii *Penalties, too, have a more severe impact on [Aboriginal people]. An appreciable number of [those convicted and fined] go to jail rather than pay the fine.*

In [i] there is just one image: the second NP, in predicative complement function, provides further descriptive information about the referent of the first. In [ii] we have a subset relation: the second bracketed NP, interpreted as “the Aboriginal people (who are) convicted and fined”, refers to a subset of Aboriginal people in general.<sup>28</sup>

### Independent demonstratives and the pro-form *one*

Independent *this* and *that* are often equivalent to NPs with the pro-form *one* as head. An alternant of [12i], for example, is *This copy is clearer than that one*, and similarly [13iii] is equivalent to *The speech she actually made was quite different from the one which had been released to the media*. The general relationship between the fused determiner-head construction and NPs with pro-form *one* as head is discussed in §6.1 below, but we will comment briefly here on the special case where the fused determiner-head is *that*. The main differences between the present use of *that* and *one* are as follows:

- [15] i *That* incorporates a definite determiner.  
 ii Non-deictic *that* requires a post-head dependent.  
 iii *That* allows a singular non-count antecedent.

Point [i] reiterates our analysis of independent *that* as representing a fusion of determiner and head functions; *one* by contrast functions simply as head and as such combines with

<sup>28</sup> Like most fused determiner-heads (see §6.1 below) non-deictic *that* can take an explicit or implicit partitive: *[The houses on the agent's list] – or at least [those (of them) that were within our price range] – weren't big enough for our needs*. Here the full NP *the houses on the agent's list* is antecedent, but it is antecedent for the explicit or implicit partitive.

separate determiner elements (obligatorily so in the singular). Thus *that* in [12i] and [13iii] corresponds not to *one* alone but to *that* + *one* and *the* + *one*. As for point [ii], both **one** and **that**, in the uses we are concerned with here, require the presence of a dependent, but while **one** allows both pre-head and post-head dependents (e.g. *the earlier one*, *the one from Sydney*), with **that** it can only be in post-head position.<sup>29</sup> Point [iii] is illustrated in:

[16] *The crockery reminds me of [that which we used to have in College].*

The demonstrative NP here could not be replaced by *the one that we used to have in College*, which requires a count antecedent.

### ■ Anticipatory anaphora

**This** occurs in anticipatory anaphora with a separate, non-integrated antecedent:

- [17] i *There are still these candidates to interview: Lugton, Barnes, Airey, and Foster.*  
 ii *This is what I want you to do: Pick up Sue from the airport (she's arriving on Qantas flight 122) and take her to the Astoria Hotel in Brunswick Street...*

If we replace the anaphor by the antecedent in [i] the anaphor is simply dropped (instead of switching places with the antecedent), giving *There are still Lugton, Barnes, Airey, and Foster to interview*. The length of the antecedent in [ii] makes it an unsuitable replacement for *this*, but a shorter expression (such as *Pick up Sue at the airport*) could occur as subject, with consequent dropping of *this*.

Instead of *these candidates* in [17i] we could have non-anaphoric *four candidates*. In both cases the following names serve to identify the candidates, but there is a significant difference between the two constructions. The indefinite *four candidates* does not require any further specification: the names could be omitted without affecting the coherence of the utterance. But *these candidates* is definite and its use implies that the referent is identifiable: the following names provide that identification, and for this reason can be regarded as having the status of antecedent.

We distinguish between an antecedent and mere elaboration or clarification, although the boundary is not clear-cut. Compare [17] with, for example:

- [18] i *The next day he was caned for six for wagging school, but he never told. That was the good thing about Herbie: no matter what happened to him, he never told.*  
 ii *This/That is strange: the door is unlocked.*

In [i] *no matter what happened to him, he never told* clarifies how *that* is to be interpreted, but *that* is nevertheless anaphoric to what precedes and the clarification is not obligatory: we therefore treat cases like this as ordinary retrospective anaphora. In [ii] the second clause again clarifies the reference of the demonstrative, but what is strange is something in the situation of utterance, and hence the demonstrative is deictic; again the clarificatory clause might be omitted. Note that instead of the second clause we could have *I'm sure I locked the door when I went out*: this doesn't itself say what is strange (and hence couldn't plausibly be analysed as an antecedent), but it likewise serves to clarify what is strange about the current situation. It would seem that there are no cases of distal **that** that can properly be regarded as involving anticipatory anaphora.

<sup>29</sup>It will be apparent from some of our examples that **that** permits a somewhat wider range of post-head dependents than **one**. Note, for example, that we could not substitute *the* + **one** in [13ii] or [14i].

## 5.4 Other uses of the demonstratives

### (a) Recognitional uses

- [19] i *You never wore that scarf I bought you.*  
 ii *He'd look at you with those big, brown scowling eyes, and he'd look right into you.*  
 iii *It's time something was done about these blackouts we've been having.*  
 iv *What's all this I hear about you and Alex getting into trouble at school?*

In the intended contextualisations of these examples, the demonstrative NP refers to an entity that is not present in the situation of utterance and has not been mentioned in the preceding discourse, but I assume you can identify it on the basis of specific past shared experience or knowledge. Such recognitional uses mostly involve dependent **that**, as in [i–ii], with the distal element of meaning motivated by the fact that the shared experience occurred at some time in the past. However, **this** is also possible, as in [iii–iv], when the shared grounds for identification are current. The demonstrative cannot stand alone in this use: some elaboration is needed, normally in the form of a head nominal, as in [i–iii], or a postmodifier, as in [iv].

### (b) False definite dependent **this**

- [20] i <sup>%</sup>*He's been married and got this half-grown kid.*  
 ii <sup>%</sup>*I was in Penang and I met this man, and he gave me your address and a present for you.*  
 iii <sup>%</sup>*She was wearing these enormous earrings that she'd bought at the duty free.*

The demonstrative NPs here are **false definites** in that they have the form of a definite NP but do not satisfy the conditions for the felicitous use of one. They introduce new entities into the discourse and do not have sufficient descriptive content to identify the referent for the addressee. This usage is characteristic of very informal conversation; although extremely common in that style, there are many speakers who would use indefinite *a* or *some* rather than **this** in such contexts: hence the ‘%’ annotation.

### (c) **That** with post-head dependents

- [21] i *Amy intended to reap [that share of life's experiences that was her due].*  
 ii *She was certainly not one of [those people you could talk with easily].*  
 iii *We always prefer [that which is familiar] to [that which is not].*  
 iv *The council will show no leniency towards [those who break its laws].*

The demonstrative NPs here are again neither deictic nor anaphoric: the dependents themselves contain sufficient information to identify the referent, so that these are genuine definites. **That** is dependent in [i–ii], independent in [iii–iv], with the singular in [iii] inanimate, and plural *those* in [iv] human. *That which* is relatively formal, the fused relative construction being much more usual: compare *What he said was nonsense* with the very unlikely *That which he said was nonsense*. This use, like the anaphoric one with obligatory dependent illustrated in [13], is restricted to **that**, which here has little of its central distal meaning.

### (d) **That** as non-deictic, non-anaphoric degree modifier

- [22] i *I'm not feeling (all) that well today.*  
 ii <sup>%</sup>*The movie was that boring I fell asleep.*

As degree modifiers of adjectives or adverbs the demonstratives are usually either deictic (as in *I hadn't expected it to be that big*, said as I point at the object in question) or anaphoric (*Kim is 6 foot and Pat is nearly that tall too*), but those in [22] do not belong to either of these types. In [i] the meaning of *that* (or *all that*) is roughly “particularly”, while in [ii] (with a following resultative clause) *that* is a variant of *so*; both cases belong to informal style, and [ii] is predominantly BrE.

## 6 Other types of reduced NP: pro-nominals, fused heads, and ellipsis

Our main concern in this section will be with NPs headed by the pro-forms **one** and **other**, and with NPs where the head is fused with the determiner or a modifier:

- |     |     |   |                         |
|-----|-----|---|-------------------------|
| [1] | i   | <i>I asked for a <u>key</u> but he gave me [the wrong <u>one</u>].</i>      | } [pro-nominal head]    |
|     | ii  | <i>There are only four <u>cups</u> here: where are [the <u>others</u>]?</i> |                         |
|     | iii | <i>She wanted some <u>bread</u> but we didn't have [<u>any</u>].</i>        | [fused determiner-head] |
|     | iv  | <i>This <u>bus</u> is full: we'll have to wait for [the <u>next</u>].</i>   | [fused modifier-head]   |

*Any* in [iii] and *the next* in [iv] could be replaced by *any bread* and *the next bus*, and hence appear to be elliptical; we argued in Ch. 5, §9.5, however, that an analysis in terms of ellipsis does not provide a satisfactory general account of this construction, and we are accordingly saying that *any* combines the functions of determiner and head, and similarly that *next* is here functioning simultaneously as modifier and head.

The pro-nominal and fused-head constructions have it in common that they do not have a separate head filled by an ordinary noun with inherent lexical content. The interpretation thus generally requires that the content of the head be filled out from the context. In the examples given in [1] the interpretation is determined anaphorically – as “the wrong key”, “the other cups”, “any bread”, “the next bus”. We thus refer to the bracketed phrases as **reduced NPs**. They differ from those considered in §§2–4 in that the head is not a pronoun (recall the distinction between pronoun and pro-form drawn in §1.4), but we have encountered one case of the fused determiner-head construction in §5, with the independent demonstratives as fused head. The fused-head and pro-nominal **one** constructions are very similar in their uses and are often interchangeable. For this reason we will consider them together in §6.1, and then return to pro-nominal **other** in §6.2.

Ellipsis plays a relatively minor role in NP reduction and does not require extended discussion. It is limited to the omission of post-head dependents, as in

- |     |    |  |
|-----|----|--|
| [2] | i  | <i>The plays <u>she directed</u> were more successful than [the musicals ____].</i>              |
|     | ii | <i>There were <u>lots of books</u> in the attic, but [the majority ____] were trashy novels.</i> |

In the salient interpretation of [i] there is ellipsis of the relative clause *she directed*. Example [ii] illustrates one of the most common types of ellipsis, that of a partitive complement (*of them*).

### 6.1 Pro-nominal **one** and the fused-head construction

These two constructions, we have observed, are often interchangeable. Examples of this kind were noted in our discussion of demonstratives – compare *This copy is clearer than*

[*that one*] and *This copy is clearer than [*that*]*. Other cases where one can be replaced by the other without any change in meaning are seen in:

- [3] i a. *These seats are still available: [*Which one(s)]* do you want?* [one as head]  
 b. *These seats are still available: [*Which*] do you want?* [fused head]  
 ii a. *What seats have you got? I want [*the cheapest one(s) available*].* [one as head]  
 b. *What seats have you got? I want [*the cheapest available*].* [fused head]

In each pair, example [a] has pro-nominal **one** as head, while [b] has the head fused with a dependent, the determiner *which* in [ib], and the modifier *cheapest* in [iib]. And in each pair both examples are interpreted anaphorically with *seats* as antecedent, giving “which seat(s)” and “the cheapest seat(s) available”. Instead of repeating *seats* we either substitute the pro-form **one** or simply omit it, letting the dependent (determiner or modifier) incorporate the head function. The contrast between singular and plural is marked inflectionally on **one** but is not expressed in the fused-head NP.

### ■ Limitations on interchangeability

The overlap between the constructions is only partial, primarily because of limitations on the elements that, like *which* and *cheapest* in [3], can occur in both, i.e. immediately preceding pro-nominal **one** and as a fused head.

#### Modifiers

As described in Ch. 5, §9.3, there are severe limitations on the modifiers that can occur in the fused-head construction. They include ordinal numerals, comparative and superlative adjectives or AdjPs, and certain adjectives describing physical properties; they are more acceptable following the definite article or cardinal numerals as determiner than after the indefinite article and other determinatives. For example, **one** cannot be omitted in:

- [4] i *It was, frankly, a hypothesis – albeit [*an excellent one]*.*  
 ii *The present company is a combination of [*several smaller ones]*.*

#### Determiners

Some determiners permit both constructions, others only one or the other:

- [5] i *These are excellent biscuits. Can I have [*another*] / [*another one*]?*  
 ii *We have two keys but we need [*three*] / \**[three ones]*.*  
 iii *He asked for some paper clips, but we had [*none*] / \**[no ones]*.*  
 iv *We’ve ten glasses left, but \**[every]* / [*every one*] is cracked.*

*Another* admits both constructions, *three* and **no** only the fused head,<sup>30</sup> *every* only pro-nominal *one*. The restrictions on **one** here apply only where the determiner immediately precedes: *three extra ones*, *no fresh ones*, and so on, are completely well-formed. Determinatives can then be classified as to which construction they occur in:

- [6] i BOTH: **this, that, which, another, each, any, either, neither**  
 ii FUSED ONLY: cardinal numerals, *all, both, many, some, several, a few, few, no*  
 iii ONE ONLY: *every, the, a*

<sup>30</sup>**No** appears in the independent form *none* in the fused-head construction; most of the genitive personal pronouns likewise have an inflectional contrast between independent forms (*mine, yours*, etc.) and dependent ones (*my, your*, etc.): see Ch. 5, §16.4.

The status of genitive NP determiners is somewhat problematic. They are occasionally found with *one*, but such examples are of rather questionable acceptability: *?She's finished her assignment, but I've only done half of [my one]*. Instead of *my one* we would normally have *mine*.

*The* cannot normally occur with pro-nominal *one* unless the latter is accompanied by a dependent, except in predicative complement function:

- [7] i *This fish isn't as big as [the one I caught].*  
 ii *A: I can't find that letter from the tax office. B: Is this [the one]?*  
 iii *\*I can't find that letter from the tax office. I'm sure I left [the one] on my desk.*

Instead of *the one* in [iii] we need the personal pronoun *it* (which could also be used in [ii]).<sup>31</sup>

A *one* is generally restricted to non-affirmative contexts in informal style:

- [8] i *We turn them on at 6 in the morning and off at 5.30 every night, six days a week, and not a one of them has ever gone down on us.*  
 ii *I have never met another woman like her, you see, and I do not suppose I shall ever meet such a one again.*

In [i] a form with an attributive adjective would usually be preferred: *not a single one*.<sup>32</sup>

#### ■ Pro-nominal *one*<sub>ct</sub> vs determinative *one*<sub>d</sub>

The singular form of pro-nominal *one* is homonymous with the determinative *one*, and since the latter (like cardinal numerals in general) can occur as a fused head, it is sometimes difficult to distinguish between the homonyms. Pro-nominal *one* belongs to the category of common nouns – more specifically, of count nouns – and we will represent it, for convenience, as *one*<sub>ct</sub>, with the determinative represented as *one*<sub>d</sub>.<sup>33</sup>

The main syntactic differences between *one*<sub>ct</sub> and *one*<sub>d</sub> are as follows:

- [9] i ***One***<sub>ct</sub> functions only as (non-fused) head in NP structure; *one*<sub>d</sub> functions as determiner or modifier, either with a following head or in fusion with the head.  
 ii ***One***<sub>ct</sub> inflects for number (with *ones* as plural form); *one*<sub>d</sub> does not.  
 iii Singular *one*<sub>ct</sub>, like other count singular nouns, requires a preceding determiner.  
 iv *One*<sub>d</sub> cannot normally follow a modifier in NP structure.

It is because of [ii] that we are representing *one*<sub>ct</sub> in boldface, to highlight the distinction between it and *one*<sub>d</sub>. The following instances of *one* and *ones* can be assigned unequivocally to one or other category by virtue of these four properties respectively:

- [10] i *She had taken [only one<sub>d</sub> book].* [not in head function]  
 ii *These cakes are better than [the ones<sub>ct</sub> I made].* [plural form]  
 iii *This brush won't do: I want [one<sub>d</sub> with a handle].* [no preceding determiner]  
 iv *This knife is blunt: have you got [a sharper one<sub>ct</sub>]?* [follows modifier]

<sup>31</sup>A less general exception to the rule that *the one* requires a dependent is seen in *I know the one*; like the predicative complement case, this is concerned with identification. We understand: "I know the/which one you are referring to".

<sup>32</sup>There is also a non-anaphoric use of *a one* which belongs with the 'special' interpretation case of *one* illustrated in [20iv] below: *I'm not much of a one for exercise*, and the colloquial *You're a one!* (an idiomatic use where I pretend to be slightly shocked by your behaviour, but convey amused approval).

<sup>33</sup>There is also homonymy with the plain form of the personal pronoun *one*<sub>p</sub>, as in *One can't be too careful, can one?* However, the meaning and syntax of the latter (described in Ch. 5, §10.1.1) make it easy to distinguish it from *one*<sub>ct</sub> and *one*<sub>d</sub>, and we can confine our attention here to these two.

The bracketed NP in [i] has *book* as head and hence is not reduced. Of the three reduced NPs, [ii] and [iv] belong to the pro-nominal head construction, while [iii] has a fused determiner-head. The major difference is that if we expand to a non-reduced NP we simply replace *one<sub>ct</sub>* by a new, non-reduced head (*the cakes I made, a sharper knife*), whereas *one<sub>d</sub>* is replaced by a sequence of determiner + head (*a brush with a handle*). This of course matches the difference in syntactic analysis that we have proposed. *One<sub>ct</sub>* is a count noun occupying head position, and expansion of the reduced NP simply involves replacing it with a head that has more intrinsic content. *One<sub>d</sub>* is a determinative combining here the functions of determiner and head, and expansion results in a structure with separate determiner and head.

The result of expanding fused determiner-head *one<sub>d</sub>* may have either *one<sub>d</sub>* itself as the determiner or else the indefinite article *a*. Compare:

- [11] i *We need three keys, but at the moment we've [only one<sub>d</sub>].*  
 ii *I've foolishly come without a pen: can you lend me [one<sub>d</sub>]?*

In [i] *only one* is equivalent to *only one key*: here *one<sub>d</sub>* contrasts with larger cardinal numerals. In [ii], on the other hand, fused *one* is equivalent to *a pen*: here *one<sub>d</sub>* is not in contrast with cardinal numerals, but behaves like a stressed form of the indefinite article. As we have noted, the indefinite article cannot itself function as fused determiner-head, and this gap in the system is filled by *one<sub>d</sub>* in a way which is analogous to that in which *that* fills the gap resulting from the inability of the definite article *the* to function as fused determiner-head.<sup>34</sup>

#### *One<sub>d</sub> as fused modifier-head*

In [10iii] and [11] *one<sub>d</sub>* functions as fused determiner-head, and such cases are easy to distinguish from the pro-nominal *one<sub>ct</sub>* construction by virtue of property [9iii]: singular *one<sub>ct</sub>* cannot occur without a preceding determiner. More difficult to distinguish from the pro-nominal construction is that where *one<sub>d</sub>* is fused modifier-head, i.e. a fused head following a determiner. Cardinal numerals can occur in this position, as is evident from examples like *any two, those three*, etc., and *one<sub>d</sub>* follows this general pattern. A *one* in head position following a determiner, therefore, could in principle be either *one<sub>d</sub>* or *one<sub>ct</sub>*: the properties given in [9] do not suffice to resolve the issue of which *one* we have in this context. Compare, then:

- [12] i *Six issues declined for [every one<sub>d</sub> that advanced] on the Paris Stock Exchange.*  
 ii *It's a small victory, but the industry needs [every one<sub>ct</sub> it can get].*

We can expand [i] to *every one issue that advanced*, but we cannot similarly expand [ii] to *#every one victory it can get*: we would have, rather, *every victory it can get*. On this basis, therefore, we take *one* to be the determinative in [i] and the pro-nominal in [ii]. We noted in our commentary on [11] that in fused determiner-head function *one<sub>d</sub>* may correspond to either *one<sub>d</sub>* or the indefinite article *a* in the expanded counterpart, but in fused modifier-head function the expanded counterpart will always have *one<sub>d</sub>*, for the indefinite article does not occur in modifier function. This means that in fused modifier-head function *one<sub>d</sub>* is always in contrast with larger cardinal numerals (and as such is always stressed). This is what distinguishes the examples in [12]: there is no such contrast in [ii], whereas in [i] there is – cf. *Six issues declined for every five that advanced*.

<sup>34</sup>In Ch. 5, §7.6, we distinguished the two uses of *one<sub>d</sub>* illustrated in [11] as respectively numerical and singulative; as noted in that earlier discussion, the distinction applies also to dependent uses of *one<sub>d</sub>*, i.e. those where there is a following head.

Compare similarly the following attested examples with *any*:

- [13] i *Notice 88-38 now says that after figuring the withdrawal amount for each account, you may take the total minimum from [any one<sub>d</sub> or more of them].*  
 ii *They could have sent their child to [any one<sub>ct</sub> of the many integrated private or public schools in their neighbourhood].*

The coordination *one or more* in [i] requires that *one* be taken as cardinal numeral. In [ii], however, there is no numerical contrast, and the closest non-partitive counterpart would be *any integrated private or public school . . .* rather than *any one private or public school . . .*; we accordingly take the *one* here to be *one*<sub>ct</sub>. An instance of *one* in head position immediately following a determiner is most likely to be *one*<sub>ct</sub>, but we will analyse it as *one*<sub>d</sub> in those cases where it is replaceable by a higher cardinal numeral.

#### ■ Restrictions on the distribution of *one*<sub>ct</sub>

##### (a) Antecedent must be a count noun or nominal

*One*<sub>ct</sub> is a count noun, and hence cannot take non-count nouns or nominals as antecedent:

- [14] i *\*The advice you gave was more useful than [the one I received from the Dean].*  
 ii *\*The arrival of the king was followed by [the one of the queen].*

These can be corrected by using *that* (*that which I received from the Dean, that of the queen*), though this is quite formal, and other reformulations would generally be preferred (e.g. *Your advice was more useful than the Dean's*).

##### (b) *One*<sub>ct</sub> requires elaboration: it cannot occur without one or more dependents

*One*<sub>ct</sub> cannot constitute an NP by itself, even in the plural, where there is no requirement for a determiner:

- [15] i *\*I'm looking for travel guides: do you sell ones?*  
 ii *\*Kim has doubts about the proposal, and Pat may have ones too.*

It would be possible to repeat the underlined phrases here (*do you sell travel guides?*; *Pat may have doubts about the proposal too*), but it is not possible to reduce them to *ones*. (The most likely anaphor in [i] would be *them* and in [ii] the fused determiner-head *some*, or else we would have ellipsis of the complement of *have*: *Pat may have \_\_ too*.) *One*<sub>ct</sub> must be accompanied by some dependent – and, as noted above, this must normally have more content than simply *the* and *a*, pure markers of definiteness and indefiniteness.

##### (c) Restrictions on complementation with relational noun antecedents

Although *one*<sub>ct</sub> requires one or more dependents, there are restrictions on what kinds are permitted. Compare:

- [16] i a. A: *Which movie did you like best?* B: *The one about dinosaurs.*  
 b. A: *Which house did they choose?* B: *The one you recommended.*  
 ii a. A: *Which king did you see?* B: *\*The one of Belgium.*  
 b. A: *Which sleeve did you mend?* B: *\*The one of the dress.*  
 c. A: *Whose mother is she?* B: *\*The one of Kim.*  
 d. A: *Which proposal do you prefer?* B: *\*The one that we hold a referendum.*

The examples in [i] illustrate the default case: the expanded versions are *the movie about dinosaurs* and *the house you recommended*, and the reduced versions simply have *one*<sub>ct</sub> in head position and the same dependents. But [ii] departs from this pattern: *the King of Belgium*, *the sleeve of the dress*, *the mother of Kim*, *the proposal that we hold a referendum* are all perfectly good NPs, but this time we cannot replace the head by *one*<sub>ct</sub>. The post-head dependent in

[iid] is a content clause complement, and dependents of this kind are quite generally excluded from occurring with *one<sub>ct</sub>*. The inadmissible dependents in [iia–c] are complements with the form of PPs, and the acceptability of complements of this kind depends on the nature of the antecedent noun, for such complements are permitted in examples like:

- [17] i [This *proof of Taylor's theorem*] is better than [the *one of Parzival's inequality*].  
 ii [The *production of Madame Butterfly*] was better than [the *one of Tosca*].

The cases where complementation is inadmissible, as in [16ii], include antecedent nouns of the following kinds:

- [18] i Role nouns: *boss, friend, dean, king*  
 ii Nouns denoting a part–whole relationship: *cover, leg, sleeve*  
 iii Kinship nouns: *mother, father, sister*  
 iv Agent nominalisations: *designer, student, supporter*

### ■ Uses of the fused-head and pro-nominal *one* constructions

In Ch. 5, §9.1, we distinguished three main uses of the fused-head construction, simple, partitive, and special, with the partitive subdivided into implicit and explicit cases. The same classification applies to the pro-nominal *one* construction. Compare, then:

- [19] THE FUSED-HEAD CONSTRUCTION  
 i *How many glasses do we need? Will [ten] be enough?* [simple]  
 ii *We have twenty glasses, but [several] are cracked.* [implicitly partitive]  
 iii [*Most of these glasses*] are cracked. [explicitly partitive]  
 iv *He's considered a prophet, by [some].* [special]
- [20] THE PRO-NOMINAL ONE CONSTRUCTION  
 i *That glass is OK, but [this one<sub>ct</sub>] is cracked.* [simple]  
 ii *There were five apples left, and Ed took [the biggest one<sub>ct</sub>].* [implicitly partitive]  
 iii [*Every single one<sub>ct</sub> of the glasses*] was cracked. [explicitly partitive]  
 iv *Kim's not [the one<sub>ct</sub> responsible for the delay].* [special]

It is the simple and implicitly partitive uses that are of relevance to the primary concerns of this chapter, and little need be said about the others. *One<sub>ct</sub>* does not commonly occur in explicit partitives, and in particular the plural form *ones* is of questionable acceptability. *Which of the apples*, for example, is strongly preferred over *which ones of the apples*.

The special interpretation of *one<sub>ct</sub>* is “person”: [20iv] can be glossed as “Kim’s not the person responsible for the delay”. This is comparable to the interpretation of *some* in [19iv] as “some people”, though the fused-head construction has a range of special interpretations, depending on the determinative concerned.

#### Anaphoric interpretations

In the simple and implicitly partitive uses the interpretation is usually determined anaphorically, from an antecedent. In the simple use, the antecedent is the head element in an NP, a nominal – *glasses* in [19i] (*ten* is understood as “ten glasses”), *glass* in [20i] (*this one* = “this glass”). The implicitly partitive case is not so straightforward. Here we take the antecedent to be a full NP, but it provides the interpretation of the missing partitive oblique. *Several* in [19ii] is equivalent to *several of them*, where the antecedent for *them* is the NP *twenty glasses*. Similarly, *the biggest one* in [20ii] is equivalent to *the biggest one of them*, with *them* having *five apples* as its antecedent. In the implicitly partitive case

the reduced NP denotes a subset of the set denoted by the antecedent, whereas there is no such relation in the simple case.

#### Non-anaphoric interpretation: contextually salient denotation

It is also possible for such examples to be interpreted non-anaphorically, with the denotation derivable from something present in the context of utterance but not actually mentioned. Suppose, for example, there is a plate of little cakes on the table and I have just had one. I might then say *Can I have another?*, with the “cake” meaning coming from the context rather than from an antecedent. I might similarly pick up a glass and say *This one is cracked*, or I might see Ed take the biggest apple on the plate and say *He’s taken the biggest one, as usual*. The distinction between the simple and implicitly partitive constructions tends to be neutralised in such cases, for expansion could involve adding either a noun (*Can I have another cake?*) or a partitive PP (*Can I have another of these cakes?*).

#### Extent of the antecedent in anaphoric interpretations of the simple constructions

Since one nominal can occur inside another there may be more than one possible antecedent in the simple use of the fused-head and pro-nominal *one* constructions. Compare:

- [21] i [Jill’s first semantics book] was clearer than [her second (one)].  
 ii [Sue’s first semantics book] was clearer than [Jill’s].  
 iii [Sue’s first book on semantics from CUP] was clearer than [Jill’s].

The salient interpretation of [i] has *semantics book* as the antecedent, with the comparison being between Jill’s first and second semantics books. *First* cannot be part of the antecedent because it contrasts with *second* in the reduced NP. There is no such contrasting element in the reduced NPs in [ii–iii], and here the most salient interpretations include *first* in the antecedent: “Jill’s first semantics book” and “Jill’s first book on semantics from CUP”. In general, the preferred interpretation is the one where the antecedent is the largest nominal that does not contain contrastive material (like the *first* in [i]).

Other interpretations are possible, especially with appropriate placement of the main stress. Compare, for example, *Sue’s FIRST semantics book was clearer than Jill’s, but her SECOND certainly wasn’t*, where we understand “Jill’s semantics book” (or perhaps even “Jill’s book”). It is not possible, however, for the antecedent to be discontinuous. Thus *Jill’s* cannot be interpreted in [21ii] as “Jill’s first book”, because in the preceding NP *first* and *book* are separated by *semantics*, and hence do not constitute a nominal. Similarly, *Jill’s* in [iii] cannot be interpreted as “Jill’s book from CUP”, and so on.

## 6.2 Pro-nominal *other*

Pro-nominal *other* occurs in all four of the constructions discussed above for the fused-head and pro-nominal *one* constructions:

- [22] i *These boxes are more suitable than [the others].* [simple]  
 ii *One of the plates was broken and [the other] was chipped.* [implicitly partitive]  
 iii *He focussed on international monetary policy while [others of his colleagues] embraced protectionism.* [explicitly partitive]  
 iv *Kim doesn’t show much consideration for [others].* [special]

In [i] *others* is interpreted anaphorically as “other boxes”: here it takes the nominal *boxes* as antecedent. The simple construction also allows a non-anaphoric interpretation, with the denotation retrievable from the situation of utterance: you offer me a biscuit, and I say *No thanks, I prefer the others*. In [ii] the full NP *the plates* provides the interpretation of the understood partitive: “the other (one) of the plates”. In [iii] we have an overt partitive complement, which is quite rare with *other*. And in [iv] *others* has the special interpretation “other people”.<sup>35</sup> In [i] *other* is subject to the same restrictions on complementation that we have noted for *one*<sub>ct</sub>. Thus *all the others of this opera* is permissible with an antecedent such as *production*, but we can’t have *\*all the others of England* interpreted with *king* as antecedent.

### ■ Relationship with the pro-nominal *one* and fused-head constructions

The construction with *other* as head is in some respects like the pro-nominal *one* construction and in others like the fused modifier-head construction. *Other* is like *one*<sub>ct</sub> in that it inflects for number, with *others* as the plural form. This establishes quite clearly that it is a noun: we will represent it as *other*<sub>ct</sub> to distinguish it from *other*<sub>a</sub>, the adjective from which it is derived by conversion. Like *one*<sub>ct</sub>, *other*<sub>ct</sub> occurs only in head function; the structure of *the others* in [22i], for example, is simply determiner + head – there is no syntactic fusion of two functions.

At the same time, the *other*<sub>ct</sub> construction resembles the fused-head one semantically in that when we expand to a non-reduced form we retain *other*: *the other boxes*. What is retained, however, is not the noun *other* but the lexical base, which is now syntactically an adjective. Note also that although the plural inflection shows that *other*<sub>ct</sub> has been converted into a noun, it retains some distributional properties of the adjective *other*<sub>a</sub>, as illustrated in:

- [23] a. *\*the red other boxes*                      b. *\*the red others*

Attributive *other*<sub>a</sub> cannot follow an adjective, and the same applies to the head *other*<sub>ct</sub>. Instead of [a] we have *the other red boxes*, and hence the only pro-form available is *one*<sub>ct</sub>: *the other red ones*.

#### *Other*<sub>ct</sub> vs *other*<sub>a</sub> + *one*<sub>ct</sub>

Pro-nominal *other*<sub>ct</sub> is in competition with *other*<sub>a</sub> + pro-nominal *one*<sub>ct</sub>: we can have either *the other(s)* or *the other one(s)*, either *one other* or *one other one*, and so on. As far as the singular is concerned, both constructions are common following the determiners *the* and *one*<sub>d</sub>, with the *one*<sub>ct</sub> construction generally preferred elsewhere, often quite strongly: *your other one* is preferred over *your other*, *that other one* over *that other*, and so on.<sup>36</sup> In the plural, both constructions are generally available, except that *other ones* cannot replace *others* in the special “other people” interpretation illustrated in [22iv].

<sup>35</sup> It would be a mistake to argue that the “people” meaning is determined anaphorically from *Kim*, the name of a person. We cannot say *I prefer London to others* with the interpretation “I prefer London to other cities” unless there is an antecedent *city* in the text: the mere fact that London is a city is not sufficient. It is thus a special fact about *others*<sub>ct</sub> that it can mean “other people”: this is why we have treated [22iv] as belonging to the ‘special’ construction.

<sup>36</sup> Neither construction is available after the indefinite article (*\*an other*, *\*an other one*): instead, we have the compound determinative *another*, which can function by itself as a fused head or else as determiner to *one*<sub>ct</sub>.

## 7 Reduced VPs and clauses, and related constructions

The last four sections have been concerned almost exclusively with NPs, and we turn now to reduced constituents of other categories. We will be concerned primarily with constituents headed by verbs, i.e. VPs and clauses, but there is also a limited amount of reduction of AdjPs, AdvPs, and DPs to be considered. As with NPs, reduction may be a matter of ellipsis or the use of pro-forms, though there are places where the distinction between those two devices is somewhat unclear, namely with certain uses of **do** and **so**.<sup>37</sup>

### 7.1 Stranding of auxiliary verbs

We say that an auxiliary verb is **stranded** when it occurs before a structural gap – in the simplest case, an ellipsis site. In the following examples, the stranded auxiliary is marked by double underlining, while single underlining indicates the antecedents which provide the interpretation of the ellipsis:

- [1] i I couldn't hear what he was saying, but fortunately Kim could \_\_\_\_.  
 ii Sue will help me, won't she \_\_\_\_?  
 iii A: They may have mended it by now. B: I certainly hope they have \_\_\_\_.  
 iv Everyone expects her to perform well, and I'm sure she will \_\_\_\_.  
 v Kim is on the committee, I think, but Pat is not \_\_\_\_.  
 vi He thinks there is a mistake in the program; is there \_\_\_\_?  
 vii A: It is important to keep them informed. B: Yes, it is \_\_\_\_.  
 viii She says she'd rather stay at home, and indeed I would \_\_\_\_ too.

The auxiliary occupies the position immediately before the gap or else is separated from it by a narrow range of dependents, primarily the subject ([ii/vi]) or the negative marker *not* ([v]). Very often the antecedent is complement of the same auxiliary verb as is stranded, e.g. **can** in [i], **will** in [ii], and so on. This is not a condition for stranding, however, as is evident from [iv]: here the antecedent, together with the infinitival marker *to*, is complement of **expect**, but what is ellipted is the complement of **will**.<sup>38</sup>

In [i–iv] we have ellipsis of the non-finite complement of an auxiliary verb. In [v–viii] the stranded verb is **be**, which enters into a wider range of constructions than other auxiliaries. In [v] there is ellipsis of a locative complement, and in [vi–vii] of sequences of two complements: displaced subject + locative, and predicative + extraposed subject. In [viii] what is ellipted is *rather* (which is part of the idiom *would rather*) and the infinitival complement. The last three examples show that what is ellipted need not be a syntactic constituent.<sup>39</sup> Where the auxiliary immediately precedes the ellipsis site, the VP consists just of the auxiliary as head; where the auxiliary is followed by the subject, the structure involves subject–auxiliary inversion, so that the VP is completely empty: the head position is empty because the auxiliary is in prenuclear position, while the dependent positions are empty because of the ellipsis.

<sup>37</sup>Because we will be quite often concerned with inflection we use the boldface representation of lexemes throughout this section, except when displaying lists of lexemes.

<sup>38</sup>In Ch. 3, §2.1.4 we distinguished between 'old-verb stranding', for cases where the auxiliary is repeated, and 'new-verb stranding' for cases like [iv] where it is not – and we noted that the range of items that can be stranded is slightly more restricted in the latter type.

<sup>39</sup>Auxiliary-stranding ellipsis is often called 'VP deletion' or 'VP ellipsis', but it is clear from these examples that what is ellipted need not be a VP.

### ■ Inclusion of dependents in the reduced VP

The usual pattern is for all dependents in the VP to be ellipted, as in [1]. It is also possible, however, for some to be retained:

- [2] i A: *You had better stay at home.* B: Yes, I [d better \_\_\_\_].  
 ii A: *Could you wash the car? B: OK, I [will \_\_\_\_ after lunch].*  
 iii A: *Can you come on Monday? B: Yes, I [can \_\_\_\_ on Monday], but I'll be away from Tuesday to Saturday.*  
 iv A: *Could you mow the lawn this afternoon? B: No, but I [will \_\_\_\_ tomorrow].*  
 v A: *Have you invited Max? B: No, but I [have \_\_\_\_ his brother].*

In [i], *better* is part of the idiom *had better*, and is retained even though it is present in A's utterance too: it could also be ellipted, giving *Yes, I had \_\_\_\_*. Retention is of course obligatory if *better* could not be recovered anaphorically: *I haven't read the report, but I suppose I [d better \_\_\_\_]*. In [ii] there is ellipsis of *wash the car* and *after lunch* is added as an adjunct. In [iii] *on Monday* is present in A's utterance and could be ellipted along with the verb *come*; it is repeated for reasons of contrast: speaker B can come on Monday but not on subsequent days. In [iv–v] the adjunct *tomorrow* and the object *his brother* contrast with *this afternoon* and *Max* respectively in the VP containing the antecedent for the gap. Note that in [ii–v] the dependent in the reduced VP is not a dependent of the stranded auxiliary that is head of the VP, but of the verb that is understood as filling the elliptical gap.

There are quite severe restrictions on the construction illustrated in [2iv–v], where the dependent in the reduced VP contrasts with one of the same kind in the VP containing the antecedent. This is especially so where the element concerned is a complement rather than an adjunct. Compare:

- [3] i \**Kim had seemed fairly confident even though Pat [had \_\_\_\_ extremely pessimistic].*  
 ii \**I haven't put the TV in the bedroom: I [have \_\_\_\_ in the lounge].*

Ellipsis is inadmissible in [i] because *extremely pessimistic* is a predicative complement. And in [ii] *in the lounge* is a PP complement; PPs are generally admissible in this construction only if they are adjuncts, as in *You can't cut that with scissors though you probably [could \_\_\_\_ with a razor blade].*

### ■ Sequences of auxiliaries

If the unreduced form of a VP would have a sequence of two or more auxiliaries it is in principle possible for any one of them to be stranded:

- [4] i a. A: *They must have made a mistake.* B: Yes, they must \_\_\_\_.  
 b. A: *They must have made a mistake.* B: Yes, they must have \_\_\_\_.  
 ii a. A: *It should have been checked by the dean.* B: Yes, it should \_\_\_\_.  
 b. A: *It should have been checked by the dean.* B: Yes, it should have \_\_\_\_.  
 c. A: *It should have been checked by the dean.* B: Yes, it should have been \_\_\_\_.

### ■ Minor differences between antecedent and expanded version of the reduced VP

In all the examples considered so far the gap could be replaced by an exact copy of the antecedent. In [2], for example, we could have *I'd better stay at home, I will wash the car after lunch, I can come on Monday, I will mow the lawn tomorrow, I have invited his*

*brother*.<sup>40</sup> This is not an absolute requirement of the auxiliary stranding construction, however: certain kinds of difference between antecedent and potential replacement are found. We consider first two minor cases that have little or no effect on acceptability, and then take up the issue of major differences.

### (a) Inflection

The inflectional form of the verb that would fill the gap is determined by the stranded auxiliary: modals select a plain form, perfect *have* a past participle, and so on. The form of the verb in the antecedent depends on the construction containing it, which, as we have noted, need not be the same as that containing the gap. Inflectional differences are illustrated in [5], where the form required to fill the verb position in the gap is given on the right:

- [5] i a. *He says he likes it, but I'm sure he doesn't \_\_.* [like]  
 b. *She hasn't written it yet, but I'm sure she soon will \_\_.* [write]  
 c. A: *Are you going by car?* B: *Don't I always \_\_?* [go]  
 ii a. *<sup>?</sup>Kim may be questioning our motives, but Pat hasn't \_\_.* [questioned]  
 b. *I'm sure Bob will tell her soon, but he hasn't \_\_ yet.* [told]  
 iii a. *<sup>?</sup>Kim won't enter the competition, but Pat is \_\_.* [entering]  
 b. *<sup>?</sup>They may all move south, and in fact some of them already are \_\_.* [moving]

In [i] the verbs required in the context of the gap are all plain forms, while the antecedent verbs are respectively 3rd person singular present tense, past participle, and gerund-participle; differences of this kind do not in general affect the acceptability of the reduced VP.<sup>41</sup> In [ii] the gap context requires a past participle, while the antecedents are a gerund-participle and a plain form. Here there is some loss of acceptability. Thus [iia] is quite marginal: one would generally prefer a form such as *Pat hasn't done so*, where the perfect is marked more explicitly. However, [iib] is appreciably better: it is acceptable in informal contexts though some speakers would avoid it in more formal ones. It is more acceptable than [iia] because there is a simple contrast concerning the time of Bob's telling her, whereas in [iia] there is also a difference in aspect, progressive vs non-progressive. In [iii] there is necessarily a difference in progressive aspect, and the examples are of somewhat marginal status, though the adjunct *already* in [iiib] improves it slightly; fuller marking of the progressive (e.g. *is/are doing so*) would generally be preferred.

*Be* and perfect *have* tend to resist ellipsis when there are inflectional differences of any of the above kinds. In the following examples they follow another auxiliary verb, but omitting them to leave this other verb stranded would lead to unacceptable (or at best very marginal) results:

- [6] i *Ed was being interrogated when I left and soon Max will be \_\_.*  
 ii *He has been sick several times, and doubtless will be \_\_ again.*  
 iii *Kim was interrogated yesterday and is being \_\_ again today.*  
 iv *It will be demolished soon, if it hasn't been \_\_ already.*  
 v A: *Have they made a mistake?* B: *They must have \_\_.*

<sup>40</sup>There are some constructions where the gap cannot be filled, where the ellipsis is obligatory. This is so, for example, in the interrogative tag of [1iii]. But this doesn't affect the general point being made here, for we can make a small change to the construction, replacing the interrogative tag by an ordinary interrogative clause, and then it would be possible to replace the gap with an exact copy of the antecedent: *Won't she help me?*

<sup>41</sup>Also fully acceptable are cases where there is an implicit difference in the number of an NP in predicative complement function: *Kim and Pat are already members, and I will be \_\_ soon* (where we understand singular "a member").

## (b) Polarity-sensitive items

- [7] i You said there wasn't any milk in the fridge, but there was \_\_\_\_.  
 ii You may not be able to see anything wrong with it, but I can \_\_\_\_.  
 iii He says they haven't finished the report yet, but I rather think they have \_\_\_\_.  
 iv Jill won't resign until she's found another job, but I think Sue will \_\_\_\_.  
 v ?Kim won't be working in this section any longer, though of course Pat will \_\_\_\_.

The gap in [i] cannot be filled by *any milk in the fridge*: instead we need *some milk in the fridge*, with the positively-oriented *some* instead of the negatively-oriented *any* (see Ch. 9, §4, for the concept of polarity-sensitive items). This switch is quite automatic, and does not affect acceptability. Similarly, expansion of [ii] gives *I can see something wrong with it*, with *something* instead of the antecedent *anything*. In [iii] the full form would be *they have already / (by) now finished the report*. In [iv] we would have *Sue will resign before she's found another job* – and in formal style *before* might well be preferred to *until* in the antecedent. Example [v] is slightly different from the others since there is no positively-oriented item closely corresponding to negatively-oriented *any longer*. As a result the example is not so clearly acceptable: at least in formal style, a more explicit form such as *Pat will be carrying on* is likely to be preferred.

### Major differences between antecedent and expanded version of the reduced VP

Examples are occasionally found where the antecedent and the expanded version of the reduced VP differ more radically, for example in voice:

- [8] i ?A cyclone of that degree of ferocity was expected to damage property, but not to the extent that the council houses were \_\_\_\_.  
 ii ?We have implemented it on a Mac, but it doesn't have to be \_\_\_\_.

The interpretations of the reduced VPs are passive (“were damaged” and “to be implemented on a Mac”), although the antecedents are active. We have marked these with a question mark even though they are attested examples, because we do not believe they can be considered fully grammatical. Speakers vary in their judgements about such examples, and there is no doubt that such changes of voice are not systematically permitted, as is evident from the clear ungrammaticality of examples like:

- [9] i A: *Have the police been informed?* B: \**I don't know; I certainly haven't \_\_\_\_.*  
 ii A: *You ought to notify the police.* B: \**Why? They don't need to be \_\_\_\_.*

The reason is that voice is a property of the clause as a whole, whereas auxiliary stranding concerns the form and interpretation of VPs. In [i] the intended interpretation is “I haven't informed the police”, but there is no VP in A's utterance to provide the necessary antecedent, for *the police* is in subject function. In [ii] the VP in A's utterance is *notify the police*, and again this is not a suitable antecedent for a gap interpreted as passive “notified”.

### Restrictions on stranding of gerund-participle forms of auxiliaries

- [10] i %*They have all volunteered*, but I think some of them regret having \_\_\_\_.  
 ii %*Kim is being investigated by the police*, and I think Pat is being \_\_\_\_ too.  
 iii A: *When is the building going to be demolished?* B: %*It already is being \_\_\_\_.*  
 iv %*I've been Rex's mistress for some time now, and I shall go on being \_\_\_\_, married or not.*

The only auxiliaries with gerund-participle forms are **be** and **have**, and the stranding of these forms is subject to dialect variation. Very few speakers accept the stranding of *having*, as in [i]. Stranded *being* is inadmissible in AmE, but accepted in some varieties of BrE. In [ii] *being* can itself be ellipted, since it heads the complement of another instance of auxiliary **be** and is recoverable from the preceding clause. It could not be ellipted in [iii] (since *It already is* \_\_ would be interpreted as “It is already demolished”) or in [iv] (where it does not follow an auxiliary verb).

### ■ Anticipatory anaphora and non-anaphoric use

The antecedent for the elliptical VP can follow the gap under the conditions for anticipatory anaphora described in §2.4:

- [11] i *If I can \_\_, I'll speak to him.*  
 ii *I shouldn't \_\_, but I'll let you have the key if you want to pay your last respects.*

It is also found occasionally with the interpretation of the gap provided by the non-linguistic context rather than by an antecedent expression, but this use is very unusual. It is basically limited to a few phrases with special conventionalised senses. Thus *Shall we?* is conventionally used to ask someone if they wish to dance, *May I?* can be used to request permission to take something (the salt and pepper, another cake, a spare chair), *Don't!* can be used to warn people away from something they are about to do, and so on with a few other cases. But in general, VP ellipsis demands that a suitable VP meaning should be found in the immediate linguistic context.

### ■ Stranding of auxiliaries in supplementary relatives

The examples of stranding considered so far have contained an elliptical gap, but there is also a type of supplementary relative construction which strands auxiliary verbs. Compare:

- |      |   |   |
|------|---|---|
| [12] | ELLIPSIS  | SUPPLEMENTARY RELATIVES   |
| i    | a. <i>He says she'll win, and she <u>will</u> __.</i>                           | b. <i>He says she'll win, <u>which she will</u> __.</i>                           |
| ii   | a. <i>He says there's plenty of milk in the fridge, and there <u>is</u> __.</i> | b. <i>He says there's plenty of milk in the fridge, <u>which there is</u> __.</i> |
| iii  | a. <i>*She says he's ill, and he <u>seems</u> __.</i>                           | b. <i>*She says he's ill, <u>which he seems</u> __.</i>                           |

In [ia/ii] the auxiliary occurs before a gap created by ellipsis, while in [ib/iib] the gap results from relativisation, so that instead of post-verbal complements we have *which* in the prenuclear position. The verbs that can be stranded in the two constructions are the same: **seem**, for example, is not an auxiliary verb and, as shown in [iii], cannot be stranded in either construction.

## 7.2 **Do**: supportive auxiliary or lexical pro-form

The auxiliary stranded by the ellipsis described in §7.1 may be the **do** that is required in the three main **do**-support constructions when there is no semantically contentful auxiliary present (see Ch. 3, §2.1):

- [13] i *I liked it, but Kim didn't \_\_.* [primary verb negation]  
 ii *I liked it; did YOU \_\_ ?* [subject–auxiliary inversion]  
 iii *He says she doesn't like him, but she DOES \_\_.* [emphatic polarity]

The unreduced versions of the final VPs here would contain **do** (*Kim didn't like it*; *did YOU like it?*; *she DOES like him*); it is clear, therefore, that such examples have ellipsis of the complement of the supportive auxiliary **do**. Our concern in the present section will be with reduced VPs headed by a **do** that would not be present in the non-reduced version:

[14] *I liked it, and Kim did too.*

Here the non-reduced version would be simply *Kim liked it too*: the **do** in [14] is thus specifically attributable to the use of a reduced form.

In this construction we find important dialect differences, with some dialects admitting only the primary inflectional forms of **do**, others admitting the secondary forms as well:

[15] PRIMARY FORMS OF **DO** (All dialects)

- i *Jill complained, or at least I think she did.*
- ii *I like it and I think Kim does too.*
- iii *A: Did you like them? B: I did most of them.*
- iv *If Kim does, will you accept nomination too?*

[16] SECONDARY FORMS OF **DO** (BrE, but not AmE)

- i *%I didn't tell you at the time; I wish now that I had done.* [past participle]
- ii *%I wasn't enjoying the course then, but I am doing now.* [gerund-participle]
- iii *%I haven't written the letter yet, but I will do soon.* }
- iv *%I like it now, but I didn't do then.* } [plain form]

In both cases, the antecedent cannot have an auxiliary verb as its head:

- [17] i *\*Jill will be here soon, or at least I think she does.*
- ii *\*I hadn't been very well at the time, and Jill hadn't done either.*

Thus *does* cannot be interpreted as “will be here soon”, nor *done* as “been very well at the time”.

We suggested in Ch. 3, §2.1.4, that in the dialect which allows only primary forms this **do** is best regarded as a special case of the supportive auxiliary **do**. In this dialect, the auxiliary-stranding construction, like primary verb negation, subject–auxiliary inversion, and emphatic polarity, requires the presence of an auxiliary verb; if the non-reduced version of the VP does not contain an auxiliary then **do** must be added to allow elliptical reduction, leaving **do** as the stranded auxiliary. For example, the rules governing ellipsis do not permit the omission of the underlined sequence in *I liked it and Kim liked it too*: instead we introduce supportive **do** to occupy the position before the elliptical gap and to carry the verbal inflection, as in [14].

In dialects which accept secondary as well as primary forms, this **do** is a pro-form, substituting for a verb alone (e.g. *complained* in [15i]) or a verb together with internal dependents (e.g. *likes it* in [15ii] or *told you at the time* in [16i]). Pro-form **do** is a lexical verb, and combines with supportive auxiliary **do** in constructions like the negative [16iv]. As a pro-form functioning as head in VP structure, **do** is comparable to the pro-form **one** which functions as head in NP structure, and substitutes for a noun alone or together with internal dependents.

### ■ Reduced VPs with primary forms of *do*

Reduced VPs headed by primary forms of *do* allow the same range of possibilities as we have surveyed in §7.1. This is illustrated by the examples in [15]. In [iii] *do* has a dependent that is understood as a complement of the unexpressed verb retrieved from the antecedent: “I liked most of them”. Example [15iv] has anticipatory anaphora.

### ■ Reduced VPs with secondary forms of *do*

Content clause and main clause examples of this construction are given in [16]; it is also commonly found in comparative clauses:

- [18] i %*He was working harder than he had ever done before.* [past participle]  
 ii %*She was making faster progress than her son was doing.* [gerund-participle]  
 iii %*I'd like to travel more than I've been able to do in the past.* [plain form]

The dialect that does not permit reduced VPs with secondary forms of *do* can generally avoid them by simply dropping *do*, giving an equivalent construction with ellipsis; for [16i–iii], but not [16iv] or [18], there is also an alternant with *do so*. Compare, then, [16i] and [18i] with:

- [19] i *I didn't tell you at the time; I wish now that I had \_\_\_ / had done so.*  
 ii *He was working harder than he ever had \_\_\_ before.*

Of the three secondary forms, the most widely acceptable is the past participle. It is normally restricted to perfect uses: compare the passive \**Most of them were rejected but a few of them weren't done*. The gerund-participle form *doing* is found only in a subset of the dialects that have *done* – those that allow stranding of the gerund-participle of auxiliary verbs. The plain form *do* occurs after modal auxiliaries, as in [16iii], or infinitival *to*: %*She doesn't play much golf now, though she certainly used to do*.<sup>42</sup>

### ■ Minor and major differences between antecedent and non-reduced counterpart of the *do* VP

In many cases the *do* VP could be replaced by a full form identical with the antecedent – e.g. *complained* in [15i], *enjoying the course* in [16ii]. Elsewhere, we find minor differences in inflection (e.g. *liked* rather than *like* in [15iii]) or polarity-sensitive items (e.g. *Kim didn't make any mistakes, but Pat did*, where we would have *Pat made some mistakes*). And again we find examples of major differences between the antecedent and the understood VP:

- [20] i ?*This problem was to have been looked into, but obviously nobody did.*  
 ii ?*This complaint deserves a response, but before you do, check with our legal department.*

In [i] the antecedent is passive, while the reduced VP is equivalent to active *looked into it*. And in [ii] the antecedent is an NP, while the non-reduced version of *do* is a VP, *respond* or *make a response*. Such examples are of the same status as those in [8]: they are

<sup>42</sup>In the *to*-infinitival case there is some evidence that acceptability varies to some extent according to the verb governing the infinitival complement: *used to do* or *wanted to do*, for example, seem to be more widely acceptable than *is going to do* or *happened to do*.

certainly found in unmonitored speech (and occasionally in writing), but they represent extensions of the normal patterns, not constructions that are systematically admissible.

### 7.3 Reduction of VPs with infinitival *to*

#### ■ Stranding of *to*

Like auxiliary verbs, infinitival *to* can be stranded before a structural gap:

- [21] i *I haven't submitted a formal complaint yet, but I still intend to \_\_.*  
 ii *If you'd like to \_\_, we could have a stopover in Singapore.*  
 iii *She wants to finish her thesis this year, but it's not clear she'll be able to \_\_.*  
 iv *She invited me to go with them, which I'd quite like to \_\_.*

In [i–iii] the gap arises from the ellipsis of a VP, while in [iv] the VP is relativised (cf. [12]). Unlike auxiliary verbs, *to* must immediately precede the ellipsis site: compare *They suggested I call the police but I decided not to \_\_ / \*to not \_\_*.

#### *Be and have*

Where the non-reduced form of the infinitival would begin with **be** or perfect **have**, the verb will normally be retained, giving stranding of the auxiliary rather than of *to*:

- [22] i A: *Will Jill be there?* B: *She's quite likely to be \_\_.*  
 ii A: *Had they forged his signature?* B: *They aren't likely to have \_\_.*

#### Restrictions on *to* stranding

*To*-stranding ellipsis is subject to fairly severe constraints, though again there is considerable variation in judgements. The infinitival clause is generally internal complement of a verb or adjective, such as *intend*, *like*, and *able* in [21]. Compare:

- [23] i *\*She wants to sell it, but I'm sure that to \_\_ at this stage would be a mistake.*  
 ii *\*If you complete the course, you'll be the first teenager to \_\_.*  
 iii A: *How does she do it?* B: *\*I don't know: her ability to \_\_ amazes me.*

In [i] the infinitival clause is subject (thus external rather than internal complement of the verb), in [ii–iii] it is a dependent of a noun (modifier and complement respectively), rather than of a verb or adjective. Ellipsis is not possible here: instead we would have the complex pro-form **do so**: *to do so at this stage would be a mistake*, and so on.

Negating the infinitival clause or adding a subject, however, often makes the ellipsis acceptable. Compare, [23i], for example, with:

- [24] i *You'll have to sell your shares; not to \_\_ could lead to a conflict of interest.*  
 ii *You'd better do it yourself; for anyone else to \_\_ would be too hazardous.*

#### ■ Stranding of auxiliaries and the pro-form **do** after *to*

The constraints illustrated in [23–24] apply not only to the construction where *to* is stranded, but also to those where *to* is followed by a stranded auxiliary or by the pro-form **do**. Compare:

- [25] i *\*He hadn't resigned; to have \_\_ would have been to admit liability.*  
 ii *\*He hadn't resigned; to have done would have been to admit liability.*  
 iii *He had resigned; not to have \_\_ would have been dishonourable.*  
 iv *°He had resigned; not to have done would have been dishonourable.*

## 7.4 Ellipsis of complement of lexical verbs and adjectives

Various lexical verbs and adjectives that take complements can occur with the complement left unexpressed when retrievable anaphorically:<sup>43</sup>

- [26] i *I asked Max to tidy up his room, but he refused \_\_\_.*  
 ii *She said she didn't touch it, but I saw her \_\_\_.*  
 iii *A: Have you finished your assignment yet? B: I haven't even started \_\_\_.*  
 iv *The meeting was a waste of time. I blame Kim \_\_\_.*  
 v *A: I can't come with you. B: But you promised \_\_\_.*  
 vi *A: Have they appointed a new director yet? B: I don't know \_\_\_.*

The second clauses here are equivalent to the following expanded forms:

- [27] i *He refused to tidy up his room.*  
 ii *I saw her touch it.*  
 iii *I haven't even started my assignment.*  
 iv *I blame Kim for the fact that the meeting was a waste of time.*  
 v *You promised to come with me / that you would come with me.*  
 vi *I don't know whether they have appointed a new director yet.*

Although a wide range of complement types can be left understood in this way, only a relatively small number of head items permit it. This is especially so in the case of direct objects, as in [26iii]; the verbs that allow anaphoric ellipsis of the object hardly extend beyond such aspectuals as *begin*, *start*, *finish*, where an NP object is pragmatically equivalent to an infinitival clause: *I've started my assignment* is understood as ‘I've started doing / working on my assignment’, and so on. We will confine our attention in this section to the ellipsis of non-finite and content clause complements.

### ■ Ellipsis of non-finite complements

- [28] i *I don't know whether I'll be able to do it by the week-end, but I'll try \_\_\_.*  
 ii *I hadn't wanted to lead the procession, but they made me \_\_\_.*  
 iii *They wanted Jill to introduce the guest speaker, but she wasn't willing \_\_\_.*

Where the missing complement is a *to*-infinitival, there is alternation with the much more widely available type of reduction with stranded *to*: *I'll try to*; *she wasn't willing to*.

*Try* enters into the simple catenative construction: *I'll try to do it by the week-end*; *make* enters into the complex one (with an object as well as the non-finite complement): *They made me lead the procession*. Other verbs which behave like *try* and *make* respectively are given in [29i–ii]:

- [29] i *agree*          *begin*          *continue*          *refuse*          *stop*          *volunteer*  
 ii *beg*              *force*          *hear*              *let*              *see*              *stop*

While verbs with like meaning often have like syntactic properties, we find a sharp contrast in the present construction between *try*, which allows ellipsis, and *attempt*, which does not: *\*I don't know whether I'll be able to do it by the week-end but I'll attempt*.

<sup>43</sup>The term ‘null complement anaphora’ has been used for this construction in some of the linguistics literature.

### ■ Differences from auxiliary-stranding ellipsis

The following examples are similar in that they both have an ellipsis site following a verb which licenses the ellipsis:

- [30]      AUXILIARY-STRANDING ELLIPSIS                      LEXICAL VERB COMPLEMENT ELLIPSIS  
 a. *They've asked me to mend the fuse, but I can't \_\_\_.*      b. *They've asked him to mend the fuse, but he won't even try \_\_\_.*

There are, however, a number of differences which lead us to recognise distinct constructions.

#### (a) No relative counterpart to lexical verb complement ellipsis

- [31]      a. *They've asked me to mend the fuse, which I can't.*                      b. *\*They've asked him to mend the fuse, which he won't even try.*

We saw in §7.1 that we can form supplementary relative clauses corresponding to the auxiliary-stranding ellipsis construction, but this is not possible with lexical verb complement ellipsis.

#### (b) Lexical verb complement ellipsis requires ellipsis of full complement

- [32]      a. *I can't attend the first session, but I can \_\_\_ the others.*                      b. *\*I won't try to attend the first session, but I will try \_\_\_ the others.*

Here [a] is interpreted as “I can attend the others”: what is ellipsed is just the verb, not the full VP, and *the others* is understood as the object of the missing verb. The asterisk in [b] applies to the corresponding interpretation of this example: “I will try to attend the others”.

#### (c) Lexical verb complement ellipsis allows change of voice

- [33]      a. *\*The program needs to be corrected: why won't Jill \_\_\_?*                      b. *The program needs to be corrected: why won't Jill try \_\_\_?*

We cannot interpret [a] as “why won't Jill correct the program?”, whereas the corresponding interpretation of [b], “why won't Jill try to correct the program?” is available. We noted in §7.1 there there are some marginal cases where auxiliary stranding does occur with a change of voice, but in general this is not possible; lexical verb complement ellipsis allows it much more readily.<sup>44</sup>

### ■ Ellipsis of finite complements

- [34]      i *I suggested the price was too high, and she agreed \_\_\_.*                      [declarative]  
           ii *I don't know if she's going to buy it: she didn't say \_\_\_.*                      [closed interrogative]  
           iii A: *How long will it last?*      B: *You can't tell \_\_\_.*                      [open interrogative]

We interpret [i] as “she agreed that the price was too high”, with a declarative complement; [ii] as “she didn't say whether she's going to buy”, with a closed interrogative complement; and [iii] as “You can't tell how long it will last”, with an open interrogative complement.

<sup>44</sup>A further point is that with lexical verbs a missing complement can in general be more readily retrieved non-anaphorically, from the situation of utterance. For instance if I see you struggling to open a window I might say simply: *Let me try*.

Verbs and adjectives that take this kind of ellipsis include the following, where the annotations ‘D’ and ‘I’ indicate whether the ellipsed complement clause is understood as declarative or interrogative.<sup>45</sup>

[35]	<i>agree</i> D	<i>ask</i> I	<i>convince</i> D	<i>explain</i> I	<i>forget</i> D/I	<i>hear</i> D/I
	<i>inquire</i> I	<i>know</i> D/I	<i>mind</i> D/I	<i>persuade</i> D	<i>recall</i> D/I	<i>remember</i> D/I
	<i>say</i> I	<i>see</i> I	<i>suppose</i> D	<i>tell</i> D/I	<i>certain</i> D/I	<i>sure</i> D/I

In [34] the type of clause understood to be ellipsed is derivable directly from the antecedent (the underlined clause). In other cases, the clause type and other features of the interpretation are less straightforwardly retrievable. Compare:

- [36] i *He may have committed suicide. We’ll never know* \_\_.  
 ii *You could take it home and return it in the morning. No one would know* \_\_.  
 iii *I did everything I could: ask Kim* \_\_.

In [i] modal *may* is sufficient to trigger an interrogative interpretation, “whether he committed suicide or not”. In [ii] we again have the modality of possibility, but this time the interpretation is that if you took it home and returned it in the morning no one would know that you had done so. *Ask* in [iii] doesn’t allow a declarative complement, so we interpret the ellipsed complement as the closed interrogative counterpart of the declarative antecedent: “ask Kim whether I did”, the implicature being that Kim’s answer will confirm what I have said.

### Some special cases

There are a number of places where we find ellipsis following verbs that do not normally permit it. One common case is in the complement of conditional *if*: *Take a taxi if you want \_\_*; *We could make it Tuesday if you prefer \_\_*; similarly *if they like, if you choose*. Compare the non-conditional \**I didn’t go because I didn’t want \_\_*, and so on. We also find various fixed phrases, such as *Allow me*, expressing a polite offer to help – to open a door, carry something heavy, or the like.

## 7.5 Do so

In addition to functioning on its own as a pro-form in certain dialects, **do** functions as head of complex pro-forms. We look first at **do so**, and then turn to those where **do** combines with NPs such as *it* and *that*.

The complex pro-form **do so** serves as an anaphoric VP which in many cases is a slightly more formal alternant to the types of reduced VPs considered in §§7.1–3. Compare, for example, the following responses to such a question as *Has he informed the police?*:

[37]	ELLIPSIS OR PRO-FORM DO	PRO-FORM DO SO
i a.	<i>No, but he <u>will</u> __ tomorrow.</i>	b. <i>No, but he will <u>do so</u> tomorrow.</i>
ii a.	<i>No, but he still intends <u>to</u> __.</i>	b. <i>No, but he still intends to <u>do so</u>.</i>
iii a.	<i>He may <u>have</u> __.</i>	b. <i>He may have <u>done so</u>.</i>
iv a.	<i>%He may have <u>done</u>.</i>	

<sup>45</sup> There are some dialect differences here. *Suppose* allows ellipsis in AmE and AusE, whereas BrE has the pro-form *so* (*I suppose so*); *know* allows declarative ellipsis in BrE and AusE, whereas AmE would have a pro-form such as *it*.

Like the **do** of the earlier constructions, **do so** is inadmissible if the head of the antecedent is an auxiliary:

- [38] a. \**I told him to be tactful and he did.* b. \**I told him to be tactful and he did so.*

Nevertheless, the constructions are by no means always interchangeable. There are contexts where, relative to ellipsis or pro-form **do**, the **do so** construction is excluded or disfavoured, and some where it is required or preferred.

### ■ Contexts where **do so** is excluded or disfavoured relative to ellipsis (or pro-form **do**)

#### (a) **Do so** does not admit contrastive complements

- [39] *I didn't invite Kim, but I did Pat / \*but I did so Pat.*

The *did* of *I did Pat* does not correspond to a full VP, but only to the verb, and *Pat* is object of an understood *invite*, contrasting with *Kim* in the preceding clause; **do so**, however, must substitute for a VP consisting at least of the verb and its complements.

#### (b) **Do so** is inadmissible in comparative constructions

- [40] i. *She earns more than I do / \*than I do so.*  
 ii. *He thought it was good, as I did / \*as I did so.*

#### (c) **Do so** cannot in general be anaphoric to a stative VP

- [41] *He liked it; at least he said he did / \*did so.*

**Like** denotes a state, and as such cannot head the antecedent of **do so**, which must be dynamic.

#### (d) **Do so** excluded or disfavoured in various tags and responses, and in non-anaphoric use

- [42] i. *Jill had written it, hadn't she? / \*hadn't she done so?*  
 ii. A: *Jill had written it.* B: *Had she? / \*Had she done so?*  
 iii. A: *Jill had written it.* B: *No she hadn't. / \*No she hadn't done so.*  
 iv. A: *Had Jill written it?* B: *Yes, she had. / \*Yes, she had done so.*  
 v. [No antecedent] *Don't! / \*Don't do so!*

Ellipsis (or primary forms of pro-form **do**) must be used in preference to **do so** in interrogative tags ([i]), and in responses such as those illustrated in [ii–iv]. In [ii] B responds to A's statement with the corresponding polar question, either to acknowledge that the information is new and somewhat surprising or to challenge the truth of A's statement. In [iii] B contradicts A's statement, and in [iv] answers A's polar question. In all of [i–iv], then, the issue is simply yes or no, and in such contexts the version with the greater reduction of the VP is required. Similarly in the non-anaphoric use of reduction illustrated in [v], where the interpretation derives from salience in the context of utterance rather than from a linguistic antecedent: it may be, for example, that you are about to hit your young brother and I'm telling you not to. We have noted that this use of ellipsis is rare, but **do so** does not permit it at all.

(e) *Do so* is disfavoured in chaining and with crossed anaphoric links

- [43] i A: Are you going to help them? I think you should \_\_. B: I may \_\_; I'd certainly like to \_\_, but I'm not sure I can \_\_.
- ii A: You should phone her<sub>i</sub> and ask if she has finished<sub>j</sub>. B: I will \_\_<sub>i</sub>, but I'm pretty sure she hasn't \_\_<sub>j</sub>.

Ellipsis lends itself to repetition much more readily than *do so*, which would be unnatural though not ungrammatical in examples like these. In [i] we have an anaphoric chain, while in [ii] the anaphoric links cut across each other: the missing complement of *will* is linked to *phone her* and that of *hasn't* to *finished*.

■ Contexts where *do so* is required or preferred relative to ellipsis (or pro-form *do*)

## (a) Reduced VP contains a non-contrastive adjunct

- [44] i She agreed to help, but she did so / \*did reluctantly.
- ii Those who take part do so / \*do at their own peril.

In [i] the adjunct *reluctantly* adds a specification of manner but does not contrast with anything in the previous clause. Similarly in [ii] the adjunct *at their own peril* does not contrast with anything in the relative clause which contains the antecedent.

## (b) Various kinds of non-finite clause

- [45] i We didn't complain: there was no point in doing so / %doing.
- ii We didn't complain: we knew that to do so / \*to do would be pointless.

In [i] we have a gerund-participial clause and, as we have noted, pro-form *do* on its own would be inadmissible for all but a minority of speakers. In [ii] the clause headed by *do* is infinitival; in such clauses pro-form *do* by itself or the stranding of *to* is subject to constraints dealt with in §7.3 above. See also the discussion of [5ii–iii] above.

■ Minor and major differences between antecedent and the non-reduced counterpart of *do so*

Differences between the antecedent and the full VP that could replace the reduced form are tolerated somewhat more readily by *do so* than by the auxiliary-stranding and pro-form *do* constructions. Example [45i] illustrates the case where we have a minor difference in inflection (*complain* vs *complaining*): such cases are completely acceptable because the required inflection – here the gerund-participle inflection – is overtly carried by *do* rather than being lost with the ellipsed verb, as in [5ii] above. Major differences are seen in:

- [46] i The intention behind the legislation was to ensure that the money should be used for reinstatement where it was possible and economic to do so.
- ii The financially secure can contemplate travel alone when it was unseemly for a woman who was not a suspect adventuress to do so in previous generations.

In [i] the antecedent is passive, while the non-reduced form would be active, *use the money for reinstatement*. And in [ii] the antecedent *travel alone* is an NP while the full form would be a VP (though homonymous with the NP). Such examples would be widely regarded as stylistically infelicitous, but they are certainly attested, and are more acceptable than comparable forms in ellipsis – compare [8] and [20].

### ■ Function and position of *so*

*So* functions syntactically as complement but it is not an object, and hence there is no passive with *so* as subject (\**The papers had to be filed and so was done by Kim*). *So* is usually positioned immediately after **do**, but it can also precede the verb in gerund-participials and (rarely) *to*-infinitivals, a highly exceptional position for a complement:

- [47] i *We don't want to initiate an inquiry but we are in the process of so doing.*  
 ii *The lease may be terminated by Council after having given not less than 12 months' notice in writing of its intention so to do.*

### 7.6 *Do it, do that, etc.*

**Do** enters into a number of complex pro-forms in which it takes an NP as object, mainly the 3rd person personal pronoun *it* and the demonstratives *that* and *this*:

- [48] i *If we are going to live together, we may as well do it properly.*  
 ii *There are times when I'd just like to go down to the library and get some books, but often you can't do that on the spur of the moment.*  
 iii *We need to make absolutely clear what the goals of the various courses are: only if we do this will people be able to make an informed choice between them.*

### ■ Restriction to agentive situations

One difference between these combinations and **do so** is that they require an agentive interpretation whereas **do so** can denote a non-agentive dynamic situation. Compare, then:

- [49] *When the tree fell, it did so / #did it with a loud crash.*

The tree's falling is dynamic rather than stative, and hence **do so** is permitted; but the tree does not have the role of agent, and this excludes **do it**, **do that**, and the like. Note, however, that like other uses of **do**, this one does not allow an antecedent headed by **be** even when the latter has an agentive interpretation: \**You must be more tactful – if you don't do that, you won't get anywhere.*

### ■ The non-idiomatic nature of these combinations

**Do so** is an idiom: its meaning and syntactic properties cannot be derived by combining those of **do** and *so*. **Do it** and **do that/this**, however, are not idioms: their meaning and properties can be predicted from those of **do** and the NP as used in other combinations. The anaphoric nature of the VPs headed by **do** in [48] is attributable to *it* and the demonstratives, for **do** occurs with the same meaning in non-anaphoric VPs, as in *I've just done something very stupid* or *They can't do anything about it*. We have seen that the demonstratives are often used deictically, and this carries over to their use in combination with **do**, as in *Don't do that* (with **do that** understood as denoting the action you are currently performing) or *He was doing this* (said as I demonstrate the action in question). And because the NPs are objects, there can be corresponding passives in which they function as subject: *They climbed all four peaks in one day – it/this had never been done before.*

The **do** we have here is thus a verb of very general meaning that can be used of a great range of actions that could be expressed by verbs with more specific meanings; we will

call it the general agentive verb **do**, and represent it as **do<sub>ga</sub>**. English has no verb that is itself interrogative or relative, but **do<sub>ga</sub>** can be used in combination with interrogative or relative pronouns to permit questioning or relativisation of a VP:<sup>46</sup>

- [50] i *What will they do?* [open interrogative]  
 ii [*What they did*] *was clearly wrong.* [fused relative]  
 iii *There are several things [we ought to do].* [integrated relative]  
 iv *They climbed all four peaks in one day, [which had never been done before].* [supplementary relative]

Similarly there is no general deictic verb and no anaphoric verb (except for the dialect-restricted pro-form **do**), and **do<sub>ga</sub>** combines with appropriate NPs to form deictic and anaphoric VPs. It also combines with various comparative expressions such as *the same* (*thing*), *likewise*, or *otherwise*, and these retain the semantic and syntactic properties that they exhibit elsewhere.

#### To obliques with patient role

**Do<sub>ga</sub>** can take other complements in combination with those mentioned above. Most importantly it can take a *to* PP with the oblique NP associated with the semantic role of patient:

- [51] *They questioned Jill for over an hour before letting her go: I hope they don't do that to me.*

The interpretation here is “I hope they don’t question me for over an hour before letting me go”; the oblique *me* contrasts with the object *Jill* in the VP containing the antecedent. Such *to* PP complements are found with the full range of **do<sub>ga</sub>** constructions: compare deictic *Don't do that to me* or interrogative *What did they do to you?*, etc.

#### Happen as a general dynamic verb

Very similar to the general agentive verb **do** is the general dynamic verb **happen**:

- [52] i *I was hoping that they wouldn't speak English so I would have been forced to use Chinese but unfortunately it didn't happen.*  
 ii *If you do too much last minute cramming you can end up too tired to do the exam. That happened to me last week because I studied pretty late for it.*  
 iii *I can't believe this is happening to me.*  
 iv *What's happening?*  
 v *We came back early because it started to snow, which happens sometimes even in May.*  
 vi *What happened was we didn't have a quorum, so the meeting was adjourned.*

While **do<sub>ga</sub>** combines with such NPs as *it* and the demonstratives as object to form VPs, **happen** combines with them as subject to form clauses. In [i–ii] the **happen** clause is anaphoric, interpreted as “They didn’t not speak English so that I was forced to use Chinese” (i.e. they spoke English, so I was not forced to use Chinese) and “I ended up too tired to do the exam”, whereas in [iii] the clause is interpreted deictically. Similarly,

<sup>46</sup>Relativisation with the general agentive verb **do** is to be distinguished from that discussed in §7.4; the latter occurs with auxiliary verbs and pro-form **do**, needn't be agentive (*He said it would rain, which indeed it did*), and cannot be passivised.

while *do<sub>ga</sub>* combines with *what* or *which* to permit questioning or relativisation of the VP, *happen* combines with them to permit questioning or relativisation of the clause, as in interrogative [iv], supplementary relative [v], and fused relative [vi]. *Happen* indicates that the situation was dynamic rather than stative, but unlike *do<sub>ga</sub>* it does not imply agentivity.

### ■ Comparison between *do so*, *do it*, and *do that*

Two differences between *do so* and the *do<sub>ga</sub>* constructions have emerged from the above discussion: *do so* need not be agentive whereas *do<sub>ga</sub>* always is, and *do so* is always anaphoric, whereas *do<sub>ga</sub>* has a much wider range of uses. Within the anaphoric use, a further difference relates to the fact that *it* and *that* are definite NPs. Anaphoric *do it* and *do that* characteristically denote specific events, either the same event as that denoted by the antecedent VP or at least the same action involving the same participants as those expressed by the internal complements of the antecedent VP. In contrast, *do so* VPs often denote merely the same **kind** of event as the antecedent. Compare, for example:

- [53] i a. *Jill nearly caught a fish yesterday.*                      b. *Tomorrow she's sure she will do so.*  
       ii a. *Jill nearly caught that fish yesterday.*                      b. *Tomorrow she's sure she will do it.*

In the salient interpretation of [ia] there is no particular fish that I have in mind as one Jill nearly caught, and [ib] is then a more likely continuation than [iib]. *Do so* is here interpreted as “catch a fish”, with no requirement that it be the same fish as the one she nearly caught yesterday. In [iia] I am referring to a particular fish that I take to be identifiable to you (probably by virtue of previous mention), and here the more likely continuation is [iib]; *do it* is interpreted as “catch that fish”, where it must be the same fish as she nearly caught yesterday. The issue in the sequence [iia] + [iib] is Jill’s ongoing battle with a certain fish, where in the sequence [ia] + [ib] it is the more general situation of catching a fish.

The *it* of *do it* (like the *so* of *do so*) is unstressed, while the *that* of *do that* readily takes stress, giving contrastive focus on the action concerned. Compare, for example:

- [54] i A: *I've sent in my resignation.*                      B: *Why did you do it?*  
       ii A: *I've sent in my resignation.*                      B: *Why did you do that?*

The exchange in [i] is likely to occur in a context where the possibility of A’s resigning is already in the air. B’s question, with stress on *do*, then asks why A went through with it. The exchange in [ii], by contrast, is likely in a context where the issue of A’s resigning is new.

### ■ Summary of different uses of *do*

We conclude this section by listing summarily the different uses of *do* that we have distinguished in this grammar:

- [55] i *She doesn't regret it.* [auxiliary]  
       ii <sup>o</sup>*I like it more than I used to do.* [pro-form]  
       iii *I enrolled for the course but soon regretted doing so.* [head of pro-form *do so*]  
       iv *You shouldn't do that. What is he doing?* [general agentive verb]  
       v *She did a somersault. She does a lot of writing.* [light verb]  
       vi *She did well. That'll do. They are doing 'Macbeth'.* [ordinary lexical verb]

The auxiliary is used only in the four **do**-support constructions; it has only tensed forms, except that plain *do/don't* occur in emphatic or negative imperatives. **Do** in [ii–vi] is a lexical verb, and combines with auxiliary **do** in the **do**-support constructions: *%I like it now, but I didn't do then; He didn't do so*; and so on. The pro-form **do** is found in BrE but not normally in AmE; it is restricted to anaphoric use. **Do so** is an idiom, likewise used anaphorically. The **do** of [iv] associates an agent role with its subject; it generally combines with an NP object, permitting the formation of anaphoric and deictic VPs, the questioning and relativisation of VPs, and so on. The **do** of [v] is a light verb, like the **make** of *They made an offer*, the **take** of *She took a decision*, the **give** of *He gave a grunt*, and so on: see Ch. 4, §7. There is nothing grammatically special about the **do** of [vi], an ordinary lexical verb with a range of senses; the examples given illustrate intransitive and monotransitive constructions, and it can also be ditransitive, as in *They did me a favour*.

## 7.7 *So*

*So* has a very wide range of uses, only some of which are deictic or anaphoric. Given the concerns of this chapter, it is these we will focus on here, in §§7.7.1–2 respectively, but we will then summarily review other uses in §7.7.3.

### 7.7.1 Deictic *so*

Adverbial *so* can be used deictically, indicating degree (generally modifying an adjective) or manner (as an adjunct to a clause):

- [56] i *She was about so tall.*  
 ii *You then fold the paper in two, so.*

In the degree sense, *so* must be accompanied by an appropriate indexing act; in saying [i], for example, I will indicate, typically by hand, how tall she was. In the manner sense *so* is accompanied by the performance of the action in the manner concerned. Degree *so* is equivalent to demonstrative *this* or *that*, and manner *so* to the relatively formal *thus*. An alternant of the manner adverb *so* is the PP *like so* (cf. *like this*).<sup>47</sup>

The use of *so* as predicative complement of such verbs as *name* and *call* is a case of discourse deixis (§1.4):

- [57] *The ark module is so named in keeping with the distributors' talmudic interests.*

*So* here stands not for the denotation of *ark module*, but for that linguistic expression: “The ark module is named *ark module* . . .”.

### 7.7.2 Anaphoric *so*

*So* combines with **do** in the complex pro-form **do so** discussed in §7.5 above. Other anaphoric uses are as follows.

<sup>47</sup>The idiom *so far* can be used either deictically or anaphorically. The deictic use is seen in *I have so far marked about half of them* (“up to now”); the anaphoric use in *I had so far marked about half of them* (“up to then”).

(a) Pro-clause complement with finite antecedent: *I think so*

- [58] i A: *Are they putting the price up?* B: *I think so. / I'm afraid so. / It seems so.*  
 ii *She thought he was wrong but was too polite to say so.*  
 iii *She was totally opposed to the idea and told the premier so.*  
 iv *Will she accept the recommendations, and if so how will they affect us?*

So here stands for a clause in complement function: we understand “I think they are putting the price up”, and so on. The understood clause is always declarative, though the antecedent can be interrogative, as in [i/iv]. This construction is found with the conditional preposition *if*, the adjective *afraid*, and a fair number of verbs, a sample of which are given in:

- [59] *appear*      *assume*      *believe*      *fear*      *gather*      *guess*  
          *hope*      *imagine*      *presume*      *reckon*      *regret*      *say*  
          *seem*      *suppose*      *suspect*      *tell*      *think*      *trust*

*Appear* and *seem* take impersonal *it* as subject: *it seems so*. Many of the others allow passivisation, with *so* then in extraposed subject position: *It is believed so*, etc. Verbs which, by contrast, do not allow *so* to substitute for a clausal complement include *confirm*, *doubt*, *realise*, *resent*.<sup>48</sup>

A number of the verbs in [59] also allow *it* or *that* as a pro-clause anaphor. In most cases there is a fairly clear difference in meaning between *so* and these NPs. It is particularly clear in 1st person singular present tense examples like *I believe so* vs *I believe it/that*. With *I believe so* the main issue is the truth of the antecedent proposition: I might well use this in response to a polar question to give a modally qualified positive answer. With *I believe it/that* the main issue is whether I believe the proposition concerned (and this time the antecedent could hardly be interrogative). The difference emerges very sharply if we add *yes*. In *Yes, I believe so*, the *yes* relates to the proposition expressed by *so*; in *Yes, I believe it/that* the *yes* relates to the matrix proposition: “Yes I do believe”. Or take the verb *regret*. *I regret so* is understood as “Yes, regrettably”, while in *I regret it/that* the truth of the proposition expressed by the complement is taken for granted, and what is asserted is that my attitude to it is one of regret.

**Polarity: *so* and *not***

*So* normally expresses a positive proposition, with *not* being used as the corresponding negative pro-form. In response to *Will Kim be there?*, for example, *I hope so* is understood as “I hope Kim will be there” and *I hope not* as “I hope Kim will not be there”.<sup>49</sup> There is likewise a straightforward contrast with *if* between positive *so* and negative *not*. With *say* and *tell*, however, *so* readily substitutes for a negative clause and *not* is quite rare and often inadmissible outside responses to questions:

- [60] i *She didn't approve of the idea and told them so/\*not.*  
 ii A: *Will they be accepting the proposal?* B: *She says not.*

<sup>48</sup>In general *know* belongs with these, but there is an established somewhat jocular use of *know so* when an explicit contrast is being made between knowing and merely thinking – e.g. A: *Do you think so?* B: *I KNOW SO.*

<sup>49</sup>A number of the verbs in [59] occur in the negative with what we have called increased specificity of the negation (Ch. 9, §5), so that *I don't think so* is typically interpreted as equivalent to the less frequent *I think not*.

### Preposed *so*

- [61] i *They seem diametrically opposed, or so I thought until I investigated further.*  
 ii *The optical and mechanical first principles could be inferred directly from experiments – or so Newton would have his readers believe.*  
 iii *Five of us, so I believe, have had fiction published in magazines or anthologies.*  
 iv A: *The clock has stopped.* B: *So I see.*  
 v *So wrote a ten-year-old student in a letter to his parents from St Aidan's.*  
 vi *Nor, so did I believe, had anyone yet effectively caught the gaping contrast between the heedless flow of time and the fleeting evanescence of existence.*

Most of the verbs in [59] (but not the preposition *if* or the adjective *afraid*) allow *so* to be fronted, and indeed there are a few verbs, such as *see* and *write* in [61iv–v], that occur with *so* in front but not end position (cf. \**I see so*). Examples [i–iv] have the default subject + predicator order, and [i–ii] illustrate one of the most common uses of this construction – in an *or*-coordinate that serves to qualify the speaker's commitment to the proposition expressed in the first coordinate. It is also possible for preposing of *so* to be accompanied by subject postposing, as in [v], or (rarely) subject–auxiliary inversion, as in [vi]. Preposed *so* does not contrast with *not*, and can have a negative antecedent.

### (b) *So* in lieu of non-finite complement of lexical verb

- [62] *You can, if you so wish/choose, join for a trial period of three months.*

The interpretation here is “if you wish/choose to join for a trial period of three months”. This construction characteristically occurs in the complement of *if* and with *so* in preverbal position; it is found with only a small number of verbs, the most common being *wish*, *choose*, *desire*. We also find past-participial passives: *if so ordered*, etc.

### (c) Pro-predicative

- [63] i *They were very happy at that time, or at least they seemed so.*  
 ii *The bible was already a symbol of class struggle, and remained so for a long time.*

*So* here functions as predicative complement; the antecedent is most often an AdjP, but other categories are possible, as in the NP of [ii]. With the verb *be* comparable reduction usually takes the form of ellipsis (*Kim was enthusiastic and Pat was \_\_\_ too*), but *so* is not altogether excluded: *In the general sense of ‘political’ – having to do with the distribution and exercise of political power – jury trials and the legal system are very clearly so*. Note also its use with a dependent modifier in *or*-coordinations: *Because nets cannot be projected any great distance, they are generally stationary, or nearly so, when in use*.

### (d) *So* as head of clause with dependent modifiers or complements

- [64] i *Step-parents have to break through a layer of resistance, [more so than other people trying to join any close-knit community].*  
 ii *The Coo-ee cordial factory prospered almost at once, [so much so that my father bought a new house at Coorparoo].*  
 iii *He was respected in international political forums, [and properly so].*  
 iv A: *Did they get permission from the Dean?* B: [*Probably so*].  
 v *Jo was hard-working and well regarded by her colleagues; [not so her brother].*

The bracketed sequences here are reduced main clauses, with *so* as head, accompanied by one or more dependents. One common type has a degree modifier, with a following

comparative or resultative complement, as in [i–ii]. In [iv] *so* is accompanied by a modal adjunct; this construction is like that covered under (a) in that we have a polarity contrast between positive *Probably so* and negative *Probably not*. Other modal adjuncts found in this pattern include *perhaps*, *maybe*, *necessarily*, *allegedly*, while *certainly* allows *not* but not *so*. Compare, similarly, *Why so?* and *Why not?* In [v] *her brother* contrasts with *Jo* in the first clause, and hence is understood as subject: “Her brother was not hard-working and well regarded by his colleagues”.<sup>50</sup>

(e) *So* as anaphoric manner adjunct

[65] *Employment in services of one kind or another may be expected to increase as the towns approach maturity; indeed, in the country generally the proportion of people so employed is growing steadily.*

Anaphoric *so* can function as a manner adjunct, characteristically in combination with a past participle in its passive use, and equivalent to *thus* or *in this way*; it is interpreted in this example as “in services of one kind or another”.

(f) *So* as complement of auxiliary verb: exclamatory confirmation

[66] A: *Jill has misspelt our name.* B: *So she has!*

B’s response here serves to confirm A’s statement and to express some emotive meaning – that the fact is surprising or remarkable. Syntactically *so she has* is a special case of the emphatic polarity construction, and hence requires supportive *do* in the absence of any auxiliary in the preceding clause: the response to *Jill misspelt our name* would be *So she did*. It is not possible to repeat the full VP: *So she has misspelt it!* belongs to a quite different construction, with *so* meaning “therefore” (as in [71] below). For this reason we take the *so* of [66] as complement of *has*, interpreted anaphorically as “misspelt our name”. The antecedent will most often be a non-finite clause, but with *be* and *have* can be non-clausal (A: *Jill is in the attic.* B: *So she is!*).<sup>51</sup>

■ Category status of anaphoric *so*

The *so* discussed in this section does not fit readily into our system of word categories, except for the manner adjunct use seen in [65], which can be classified as an adverb. The predicative use of [63] can substitute for predicatives of a range of categories, AdjP, NP, PP, and there seems to be no good reason to treat it as the head of any one of these categories. The *so* that substitutes for a clausal complement, as in [58], is classified in dictionaries as a pronoun, but that reflects the traditional analysis of content clauses as ‘noun clauses’, which we have argued against in Ch. 11, §8.2. Certainly, the distribution of this *so* is very different from that of anaphoric NPs such as *it* or *that* – for example, it cannot occur in subject function. In [64] *so* is the head of a clause; clauses normally have a verb as head, but *so* lacks the important inflectional properties of verbs. Overall, then, we prefer to classify anaphoric *so* simply as a pro-form; its properties are unquestionably unique, and we do not believe that anything is gained by forcing it into one or more of our general part-of-speech categories.

<sup>50</sup>Two idioms contain *so* as head in a use which bears some resemblance to the one considered here: *quite so*, said as an expression of agreement, and *even so*, “nevertheless”.

<sup>51</sup>Some varieties allow *so* to follow the auxiliary verb, the effect this time being to deny a negative statement, as when A says *Jill didn’t sign the petition* and B responds %*She did so!* (“That’s not true: she HAS signed it”). This differs prosodically from the idiomatic *do so* construction of §7.5 in that the *so* is strongly stressed; moreover, this *so* occurs with other verbs than *do*, so that to A’s *Jill hasn’t signed the petition* B could respond %*She has so!* As a complement of auxiliary verbs *so* is comparable to *that* in some regional dialects: %*That it is* or %*It is that*, said in response to *It’s an absolute swindle*.

7.7.3 Other uses of *so*(a) Initial *so* in correlation with *as*

- [67] i *Just as Renaissance scholars had to reconcile Platonism with Christianity, so the Victorian Platonist dons had their particular reconciliation to do too.*  
 ii *As infections increased in women, so did infections in their babies.*

*As* and *so* indicate likeness between the situations expressed in the subordinate clause (the complement of *as*) and the main clause (introduced by the adjunct *so*). Subject–auxiliary inversion is optional: for [i] we could have *so did the Victorian Platonist dons have . . .*, and for [ii] *so infections increased in their babies*. The *so* is optional (with inversion permitted of course only when it is present): it serves to reiterate the likeness expressed by *as*. *So* is here at most only marginally anaphoric, indicating likeness with what has gone before: “in the same way / at the same time as that”.

(b) Other cases of initial *so* with subject–auxiliary inversion

- [68] i *Jill will certainly notice the mistake, and so will Max.*  
 ii A: *Tom is very nervous.* B: *So would you be in his position.*

In these examples there is a very clear anaphoric relation between the second clause and the first: we understand “Max will certainly notice the mistake” and “You would be very nervous in his position”. It is probably best, however, to attribute this to ellipsis, with *so* then being a connective adjunct indicating likeness between the two clauses.

*So* is restricted to positive clauses: \**Jill won’t notice the mistake and so won’t Max*. The corresponding negative construction has *neither* or *nor*: *Jill won’t notice the mistake, and neither will Max*. There are, however, significant differences between *so* and *neither/nor*. In the first place, *so* can combine with *too* (itself a connective adjunct with positive orientation), as in *and so too can Pat*: there is no comparable combination for the negatives. Secondly, the clause introduced by *so* must contrast with the preceding one with respect to its subject, whereas *neither/nor* appear in a wider range of contexts:

- [69] i a. \**He can play the piano, and so can he sing.* b. *He can’t play the piano, and neither can he sing.*  
 ii a. \**She has invited Max, and so does she intend to invite Paul.* b. *She hasn’t invited Max, and neither does she intend to invite Paul.*

The VP following *so* is almost invariably reduced. It would be at best highly unidiomatic, for example, to add *notice it* at the end of [68i]. It is possible under certain circumstances, however, to have a full VP:

- [70] *This forecast is admittedly way above the estimate of most analysts in several recent surveys. But so is reality generally far off from the consensus.*

It is for this reason that we analyse this construction differently from that in [66], taking *so* as an adjunct rather than an anaphoric complement.

## (c) Connective adjunct of reason, consequence

- [71] i *There had been a power failure, so all classes had had to be cancelled.*  
 ii *I’ve no more to say, so I suggest we move on.*

Here *so* functions as a connective adjunct, this time marking reason or consequence. As with many other connective adjuncts, there is a slight anaphoric component in the meaning: “for this reason, as a result of this”.

## (d) Manner, purpose, result, licensing a content clause complement

- [72] i *The timetable had been so arranged that Fridays were kept free of lectures.*  
 ii *We usually cut up her spaghetti so (that) she can eat it with a spoon.*  
 iii *There had been a power failure, so that all classes had had to be cancelled.*

In [i] *so* is an adverb functioning as manner adjunct in clause structure in pre-verbal position and licensing the *that* clause following the verb (cf. Ch. 11, §4.6); without such a following clause, manner *so* is deictic or anaphoric, as in [56i] and [65] above. In [72ii–iii] *so* is a preposition functioning as head of a purpose and result adjunct respectively; here the content clauses are complement of *so*. With purpose adjuncts the complement can have the form of *as* + infinitival: *so as to enable her to eat it with a spoon* (see Ch. 8, §12.2, for discussion of these constructions).

In [72ii] the subordinator *that* is optional, as indicated. If we drop the *that* from [iii], however, we no longer have clause subordination, as evident from the fact that the coordinator *and* can be added before *so*. This is why quite different structures are assigned to [72iii] and [71i]: in the latter *so* does not have a complement but functions as adjunct in a main clause (see Ch. 15, §§2.11).

(e) *So* in idiomatic coordinates: *or so*, *and so on*

*Or so* is often combined with expressions of measure or quantification, as in *a week or so*, *fifteen or so candidates* / *fifteen candidates or so*, to give the meaning “approximately”: “approximately a week”, “about fifteen candidates”. There is an evident connection to the productive anaphoric uses, in that we can gloss it as “or something like that”. Similarly for other coordinative idioms *and so on/forth*, “and more / other things of this kind”.

## 7.8 Further cases of ellipsis

## 7.8.1 Ellipsis of grammaticised words at the beginning of a main clause

A range of grammaticised items, such as personal pronouns and auxiliaries, can be omitted from the beginning of a main clause in casual style. In general, this type of ellipsis is not dependent on the presence of an antecedent.

## (a) Ellipsis of personal pronoun subject

- [73] i *Hope you're right. Can't think what I was doing.* [I]  
 ii *Doesn't matter. Serves you right. Must be time for bed, isn't it?* [It]  
 iii *Should be a screwdriver on the bench.* [There]

This occurs mainly with 1st person *I* and the dummy pronouns *it* and *there*, as in these examples. Ellipsis of other pronouns is also possible, however: *Looks a bit put out, doesn't he?* There may also be a preceding antecedent, as when you ask *What's the new guy like?*, and I reply, *Can't play at all*, with ellipsis of *he*.

A number of the reduced forms, such as *Serves you right*, have something of the character of fixed phrases. *Thank you* allows *I* as subject in some contexts, but hardly when it follows *yes* or *no*, for example. The omission of *you* from imperatives is different from the subject ellipsis illustrated in [73], in that it is not a feature of casual style but is the default form.

## (b) Ellipsis of subject pronoun + auxiliary

- [74] i *Glad you think so. Never seen anything like it!* [I + am/have]  
 ii *Strange how the ants come in when it's about to rain.* [It + is]

The omitted material is shown on the right. The most likely pronoun is 1st person *I* or dummy *it*, while the most likely auxiliary is **be**. Perfect **have** is retrievable in [i] by virtue of the past participle *seen*. *Sorry* is particularly common here: *Sorry to have kept you waiting*. Without a complement and used as an apology, *sorry* is hardly to be regarded as elliptical: its status is comparable to that of *thank you*.

## (c) Ellipsis in closed interrogatives of auxiliary or auxiliary + subject pronoun

- [75] i *Anyone seen my glasses? Anyone at home? That you, Liz?*  
 ii *Want any more beer? Ever driven a Porsche? Feeling any better?*

These are reduced versions of questions with closed interrogative form: the initial auxiliary is missing, and in [ii] the subject is too. The auxiliary is retrievable from the form of the verb when there is one: **do** with a plain form (*want*), **have** with a past participle (*seen*, *driven*), **be** with a gerund-participle (*feeling*); when the predicate is verbless (*at home*, *you*) the understood auxiliary is **be**. The pronoun ellipsed in subject position will normally be understood as *you*, and if understood as 3rd person virtually requires an indexical act.

## (d) Determiner in NP structure

- [76] i *Trouble is, we have to be there by six. Friend of mine's been there.* [The; A]  
 ii *Pity you can't stay. Car still in hock?* [It's a; Is your]

In [i] the subject NP has lost its determiner, *the* and *a* respectively. The examples in [ii] show that this kind of ellipsis can combine with types (b) and (c) above.

## 7.8.2 Radical ellipsis in open interrogatives

Open interrogative clauses can be reduced to the interrogative phrase – or this phrase + a stranded preposition:

- [77] i A: *I've decided to withdraw.* B: *Why/When?*  
 ii A: *I sold my bicycle this morning.* B: *Who to?*  
 iii A: *We've included 'Macbeth' in the syllabus.* B: *And what else?*  
 iv A: *That woman is a saint.* B: *What woman?*

In [i] the interrogative clause is reduced to an adjunct: B is asking for information about the reason or time. The rest of the clause is recoverable anaphorically: “Why/When have you decided to withdraw?” Example [ii] illustrates the case where a preposition is stranded: the non-reduced version would be *Who did you sell your bicycle to?* The fronted counterpart, *To whom?*, would be markedly formal, but stranding is somewhat more restricted in the reduced construction than elsewhere: it is not possible when the interrogative word is determiner in NP structure. Thus while *Which car will you be travelling in?* is fully acceptable, *\*Which car in?* is inadmissible as a response to, say, *We'll be following later* – we need the non-stranded version *In which car?* In [iii] the interrogative phrase contains the modifier *else*: “What else besides ‘Macbeth’ have you included in the syllabus?” Emotive modifiers such as *on earth*, *the hell*, *ever* are not permitted unless followed by a stranded preposition, *else*, or (in the case of *why*) *not*: *Who ever to?*, *And what on earth else?*, *Why ever not?*, but not *\*Why ever?*

Example [77iv] is somewhat different from the others. While it is possible to expand the interrogative phrase in the same way as in [i–iii], i.e. *What woman is a saint?*, a more natural expansion would be *What woman do you mean / are you referring to?* A's use of the definite NP *that woman* implies an assumption that B will be able to identify the referent, and B's response indicates that this assumption was false.

### ■ Subordinate clauses

This type of anaphoric reduction is also common in subordinate interrogatives:<sup>52</sup>

- [78] i A: *They got in without a key.* B: *I wonder how.*  
 ii *There's going to be a special meeting, but when I don't know.*  
 iii *The police had been tipped off, but she didn't say who by.*

### 7.8.3 Radical ellipsis in declarative responses

Responses to questions are very often reduced to a single element of clause structure:

- [79] i a. A: *When did she get home?* B: *Yesterday morning.*  
 b. A: *Why did they sack him?* B: *Because he's incompetent.*  
 c. A: *What did she give you?* B: *A t-shirt.*  
 d. A: *What were they doing?* B: *Playing cards.*  
 ii a. A: *Did you read them all?* B: *No, only the first three.*  
 b. A: *Were they fighting?* B: *No, just shouting at each other.*

In [i], B's response gives an answer to A's question. In [ia–c] it has the form of a phrase with the same function as the interrogative phrase in the question, so that [ia] is an elliptical version of *She got home yesterday morning*, and so on. The question in [id] concerns the complement of progressive **be** and the response serves as a replacement for **do** + *what* (cf. §7.6): *They were playing cards*. In [ii] B gives a negative answer to A's polar question, and then asserts a contrasting positive proposition. B's responses are thus equivalent to *I didn't read them all: I read only the first three* and *They weren't fighting: they were just shouting at each other*.

Radical reduction is also found with contrastive negation, as in:

- [80] i A: *They've invited Jill.* B: *Yes, but not her husband.*  
 ii A: *They were shouting at each other.* B: *But not fighting.*

*Her husband* is contrasted with *Jill*, so that we understand "They have not invited her husband". And similarly for [ii]: "They were not fighting".

### 7.8.4 Gapping

'Gapping' is the name given to the construction where the medial segment of a clause is ellipted when anaphorically retrievable:

- [81] i *Kim lives in Perth, Pat \_\_ in Melbourne.*  
 ii *Tom will play the guitar and Mary \_\_ sing.*  
 iii A: *I will now show you how to make clafouti.* B: *And I \_\_ custard.*

<sup>52</sup>There are also a few fixed phrases where the missing material is not recoverable anaphorically: *Say when* ("when to stop pouring" – typically used as I pour you a drink); *I'll tell you what* (roughly "what we should do" – used to announce a suggestion); *Guess what* ("what has happened", or the like – invites the response *What?*, enabling me to go on to impart some new information). The subordinate interrogative construction illustrated in [78] is sometimes referred to in formal grammar as 'sluicing'.

In the simplest cases, the ellipted segment is just the verb, as in [i–ii], equivalent to *Pat lives in Melbourne* and *Mary will sing*. Often, however, what is ellipted consists of the verb together with following material, as in [iii]: *I will now show you how to make custard*. Note that in this case the ellipted material, shown by the underlining, does not form a syntactic constituent. In some cases the ellipted material is not a continuous sequence:

[82] *I had expected the Indians to win, Peter \_\_ the Sri Lankans \_\_.*

A distinctive property of this construction is that the gap (the first gap in cases like [82]) is flanked on either side by contrastive material: *Pat* and *in Melbourne* contrast with *Kim* and *in Perth*, while *Mary* and *sing* contrast with *Tom* and *play the guitar*. Note, then, that we cannot have *\*Tom will play the guitar and he \_\_ sing too*, for there is no contrast between *Tom* and the coreferential *he*. In [81iii] the subject has the same form *I* in both clauses, but it has a different reference (to speaker A and speaker B respectively), and this is what matters for the contrast requirement.

The gapping construction is almost entirely restricted to coordinative constructions, and for that reason our main discussion of it is presented in Ch. 15, §4.2.

## 8 Comparatives

Anaphora contributes to the interpretation of comparative expressions in three main ways:

- [1] i *The result wasn't as good as [I'd thought it would be \_\_].*  
 ii *There were three apples on the plate; Ed took [the biggest].*  
 iii *I'd rather talk to Jill than Max: she is [more approachable].*

In [i] the bracketed sequence is a comparative clause, and such clauses are generally structurally incomplete relative to main clauses. In this case there is a missing predicative complement, which we interpret anaphorically as an AdjP headed by *good*. In [ii] the bracketed sequence is an NP with a superlative adjective as fused modifier-head; it is implicitly partitive, and we interpret it anaphorically as “the biggest of the three apples”. In [iii] the bracketed sequence is a comparative phrase without a *than* complement expressing the secondary term in the comparison: this, however, can be recovered anaphorically as “than Max (is)”. We will look very briefly at the first two cases, and then take up the issue of the recovery of an implicit secondary term.

### ■ Comparative clauses

Comparative clauses form a distinct subclass of subordinate clauses by virtue of the special kind of reduction they exhibit:

- [2] i *Jill can run faster than [Ed can \_\_].*  
 ii *She certainly went to more countries than [I went to \_\_] / [I did].*  
 iii *The debate lasted longer than [\_\_ was necessary].*

*Ed can* might appear to be an instance of the elliptical auxiliary stranding construction discussed in §7.1 above, where it could be used, say, as a response to the question *Who can run fast?* There is, however, an important difference in interpretation. In this latter context it is a reduced version of *Ed can run fast*, but that is not how it is interpreted in [i]. The comparative clause contains an implicit degree modification of *fast*, the comparison

being between how fast Jill can run and how fast Ed can run, and there is no entailment that Ed can run fast. Analogously with *I did* in [ii], where **do** can be either the supportive auxiliary or the pro-form, as discussed in §7.2 above. The interpretation of *I did* when used as a response to *Did you go to many countries?* is “I went to many countries”, but again that is not how it is interpreted in [ii], where the comparison is between how many countries she went to and how many I went to. Moreover, *I went to* in [ii] (with missing complement of the preposition) and *was necessary* in [iii] (with missing subject) could not occur as elliptical main clauses at all. For these reasons, the form and interpretation of comparative clauses has to be described separately from the constructions of §7: it is dealt with in Ch. 13, §2.

### ■ Fused-head NPs and related constructions

Comparative and superlative adjectival expressions can function as fused modifier-head, as described in §6.1 above. They normally have a partitive interpretation, with the partitive phrase either expressed overtly (*the younger of the boys*; *the most useful of their suggestions*) or merely implicit. In the latter case, the understood partitive is generally recovered from an antecedent, as in [iii]. It can also be recovered non-anaphorically when the set concerned is salient in the situation of utterance, as when Ed takes an apple from a bowl on the table and I say *Look: he’s taken the biggest again*. Closely related to the fused-head construction, as we have seen, is that with pro-form **other** as head: *Two of the apples are rotten, but you can have the others*, “the other apples (in that set)”.

### ■ Recovery of an implicit secondary term in the comparison

When the secondary term in a comparison is overtly expressed, it takes the form of a PP headed by *than*, *as*, *to*, *from*, etc. Very often, however, the secondary term is not expressed in the comparative phrase, but is inferred from the context. Thus in [iiii] *more approachable* is interpreted as involving a comparison with Max. In this example, it would be possible to insert an overt *than* phrase (*she is more approachable than him*), and we can therefore legitimately talk of ellipsis of the comparative complement. But there are other cases where a secondary term is understood but could not be expressed within a comparative complement. In *Max and her other friends*, for example, the second NP refers to friends of hers other than Max, but this construction doesn’t admit a *than* phrase: \**Max and her other friends than him*. We won’t analyse such cases in terms of ellipsis, therefore, but we can still say that *her other friends* is interpreted anaphorically – in the sense that it involves comparison with a secondary term which is recovered from an antecedent expression.

We will review here the way the comparison is interpreted when the secondary term is merely implicit, whether or not it could be expressed overtly within a comparative complement.

#### (a) Scalar comparison

- [3] i *John works very hard, but Jill works even harder.*  
 ii *It’s two metres long, maybe a little longer.*  
 iii *He has had three accidents in as many months.*  
 iv *I played a lot of tennis when I was younger.*  
 v *Can’t you go any faster?*

In [i–iii] the secondary term is recovered anaphorically. Example [i] illustrates the elementary case of what we have called variable comparison. Here we could supply a comparative clause as complement of *than*: *even harder than John works*. In [ii] we have an implicit variable–constant comparison, with *a little longer* understood as “a little longer than two metres”. The secondary term is also a constant in [iii], but here it would be at best highly unidiomatic to express the secondary term overtly: *#He has had three accidents in as many months as threethat*.

The implicit secondary term in [3 iv–v] is recovered not anaphorically but from some aspect of the current situation. The comparison is with how young I am now and with how fast you are going now.

(b) *Same*

- [4] i *She flew over to Paris at daybreak and returned to London later the same day.*  
 ii *While one arm of the US government was secretly selling arms to Iran, another arm was endeavouring to trap 17 individuals doing the same thing.*  
 iii *Suppose that instead of Irene leaving Soames for Bosiney, Soames had left Irene on account of that same young architect.*  
 iv *You find businesses going down the gurgle one week and almost immediately the same people bob up under a new name without any repercussions.*  
 v *Current sales and earnings are well up on the results achieved during the same period last year.*

Examples [i–iii] are straightforwardly anaphoric. In [i] we understand “the same day as (the day) she flew over to Paris at daybreak”. In [ii] the interpretation is “the same thing as the first arm was doing”; *the same thing* is object of the general agentive verb **do**, and the VP *doing the same thing* is interpreted as “secretly selling arms to Iran”. In [iii] the underlined NP is coreferential with its antecedent *Bosiney*; where, as here, the NP has a demonstrative as determiner rather than the definite article it cannot be expanded to include an overt *as* phrase. Example [iv] illustrates what we have called the quasi-anaphoric use of expressions: there has been no prior mention of people as such, but the first clause does mention businesses, and *the same people* is understood as the people associated with those businesses – or, more specifically, the people running them. In [v] the secondary term is recovered from the situation of utterance: “the same period last year as we are now in”.

In [4] *same* functions as modifier to a following head noun, but it is also commonly found as fused modifier-head or as head of an AdjP:

- [5] i *Managers in commerce and industry must increase efficiency to help get us out of the economic slump, and the same applies to public-service managers.*  
 ii *If we give Kim a second chance, we’ll have to do the same for Pat.*  
 iii A: *Jill’s more interested in schoolwork than in boys.* B: *Sue is just the same.*

In the fused-head construction of [i–ii] *same* has a special interpretation, essentially “the same thing”, in an abstract sense. The secondary term is in all three examples derivable anaphorically – “as applies to managers in commerce and industry”, “as we do for Kim”, “as Jill is”.<sup>53</sup>

<sup>53</sup>There are some idiomatic uses where the comparative sense is largely bleached away – e.g. *I’m going all the same*, “nevertheless”.

(c) *Such*

- [6] i *His first film was a major hit, but this one has not been [such a success].*  
 ii *I've never had to wait [such a long time] before.*  
 iii *Cricket, football, and [such games] are played with the aim of instilling team spirit in the children.*  
 iv *Duvern wrote scripts for the Crawford police dramas and it was on [one such script] that he met Lynn Bayonas.*  
 v *Sure, it was tough financially to go on the road with the Socceros but [such sacrifices] came with the job.*

Here *such* is an adjective functioning as modifier in NP structure. It may be concerned with either degree or kind.<sup>54</sup> The degree sense is seen in [i–ii] – compare *so great a success, so long a time*. In [i] the secondary term is retrieved anaphorically: “such a success as his first film”. In [ii] (or at least the intended contextualisation of it) the secondary term is retrieved from the situation of utterance: “such a long time as this, i.e. as the time I’m currently having to wait”.<sup>55</sup>

Examples [6iii–v] illustrate the ‘kind’ sense of *such*: we understand “games of this kind”, and so on. All three are interpreted anaphorically; the antecedent is here in the same sentence, but very often it is in the preceding one. In [iii–iv] the antecedent is an NP; by virtue of the coordination in [iii] we understand *such games* as other games like cricket and football, whereas in [iv] *one such script* refers to a member of the set denoted by the antecedent, so that it is equivalent to *one of these scripts*. In [v] the antecedent is a clause, with the head noun *sacrifices* serving to categorise the act of going on the road with the Socceros in a way which matches the predicative AdjP *tough financially*.

It is also possible, though less common, for *such* to occur without a head noun:

- [7] i *Stories of Renamo ‘slave camps’ compete with those of Frelimo ‘work camps’. Refugees fear both armies. But [such] is the nature of war in Africa.*  
 ii *Christ, Mahomet, [such] are the names that shepherds here have long invoked.*

Compare also the fixed expression *Such is life!* This use of *such* is found only with the verb *be* followed by an NP: the latter is subject and *such* is an adjectival predicative meaning approximately “like that, of that kind”. But the non-canonical inverted order is obligatory: we can’t have *\*But the nature of war in Africa is such*.

A special case of *such* forming a phrase on its own is as complement of *as*:

- [8] i *This substance is poisonous and should be labelled as such.*  
 ii *It offers valid clues, even if they are only seen as such in retrospect.*  
 iii *He says that her stories are ‘first-rate melodrama’, though he thinks as such they’re ‘period pieces’, as if melodrama had no twentieth-century cultural history.*  
 iv *We don’t have a secretary as such.*

In this construction *such* is bleached of its usual comparative meaning. In [i–iii] it behaves like a non-comparative anaphor: we understand “labelled as poisonous”, “seen as valid

<sup>54</sup>In legal register *such* may be concerned simply with identity: *This agreement shall be for an initial term of two years from the commencement date and may be terminated at the expiration of [such term] by either party giving to the other at least six months written notice in advance of its intention to do so. Such here means much the same as this*: there can hardly be said to be any comparison.

<sup>55</sup>In the degree sense there need be no implied comparison at all: *It’s such a pity Jill can’t be with us*, “It’s a great pity . . .”; the same applies with the degree adverb *so*, as in *It’s so hot today*.

clues”, “as (first-rate) melodrama”. In [iv] *as such* has an idiomatic and metalinguistic sense: “We don’t have a secretary in the strict sense of that term”.

(d) *Different, differently*

- [9] i *Older than Ed by two years, Tim was [very different in looks and temperament].*  
 ii *It is also important that the standards developed overseas will be suited to [the different conditions experienced by vehicles in Australia].*  
 iii *I’ve described massage with the recipient lying down, but this time we’ll do it [differently] – sitting up.*  
 iv *Last time I came here I got [a very different reception].*  
 v *Things would have been [very different] if only they’d appointed Jo as manager.*  
 vi *You always like to be [different], don’t you?*

Examples [i–iii] have *different* as a predicative or attributive adjective and *differently* as a manner adverb; in all three the secondary term in the comparison is recoverable anaphorically: “different from Ed”, “different conditions from those obtaining overseas”, “differently than with the recipient lying down”. The salient interpretation of [iv] has the secondary term derived from the situation of utterance: “a very different reception from the one I’m getting now”. Example [v] might occur in a context where its interpretation is anaphoric: it may be that I have just described how things actually were, so that *very different* would be understood as “very different from this, from what I’ve just described”. But there need not have been any such description, the interpretation being simply “very different from what they are/were”. Finally, [vi] has a special interpretation: we understand “different from other people”.

(e) *Other and related forms*

- [10] i *We were heading to Thursday Island and [the various other islands thereabouts].*  
 ii *When the film was shown to American troops fighting the Second World War, Conway’s self-doubts were snipped, as were [other overtly anti-war scenes].*  
 iii *In Bombay itself this reformer ferreted out extortionists, embezzlers, and those guilty of [other corruption].*  
 iv *Haven’t you got [any other shoes] you could wear?*

*Other* is here an adjective functioning as modifier in NP structure. In [i–iii] the secondary term is again recovered anaphorically – e.g. “other islands than Thursday Island”. The head noun denotes a property common to both terms in the comparison, and hence serves to categorise the secondary term as well as the primary one: [ii], for example, conveys that the scene of Conway’s self-doubts was an overtly anti-war scene. In [iii] the secondary term is not given directly by the nouns *extortionists* and *embezzlers* but by the abstract nouns morphologically related to them: we understand “other corruption than extortion and embezzlement”. A natural contextualisation of [iv] illustrates the case where the secondary term is derived from the situation of utterance: “any other shoes than those you are wearing”.

The following examples have the count noun **other** as head in NP structure:

- [11] i *I was feeding the cat with one hand and pulling on my tights with [the other].*  
 ii *Each of the countless levels of the multi-storey car-hell is just like [the others].*  
 iii *No thanks, I prefer [the others].*

Example [i] is doubly anaphoric. In the first place, the secondary term is retrieved from the antecedent NP *one hand*: I was pulling my tights on with the other hand than the one I was feeding the cat with. Secondly, *other* is a pro-form interpreted from the antecedent nominal *hand* as “other hand”. Similarly in [ii], though here the interpretation is complicated by the quantification expressed by *each*: we need to invoke the concept of bound variable, giving (in simplified form) “Each level *x* was just like the levels other than *x*”. In the intended contextualisation of [iii] both the implicit secondary term and the denotation of pro-nominal *other* are derived from the situation of utterance – as, for example, “the other cakes, as distinct from these”.

The compound *another* is a determinative; it can occur with a following head or else fuse with the head, but the interpretation follows the same principles as apply with the above adjective and noun forms:

- [12] i *Whether she or [another terrorist] fired the fatal shot is unclear.*  
 ii *He has two children and his wife is expecting [another].*

These illustrate the alternative and additive senses of *another*: see Ch. 5, §7.9.

*Otherwise* rarely occurs with a *than* complement, and in many cases does not allow one. It has a range of uses, as illustrated in:

- [13] i *You must certify that you will not sell or otherwise dispose of the property.*  
 ii *You'd better leave now; otherwise you'll get caught up in the rush-hour traffic.*  
 iii *It may have been an accident, but the evidence suggests otherwise.*  
 iv *I'll assume you'll be joining us unless you let me know otherwise.*  
 v *A person is presumed innocent until proved otherwise.*  
 vi *I wouldn't have wished it otherwise.*  
 vii *We are not yet able to determine the correctness or otherwise of this hypothesis.*

In [i] *otherwise* is a manner adjunct and can be glossed straightforwardly as “in any other way than by selling”. In [ii] it is a conditional adjunct, equivalent to *if*+ negative: “if you don't leave now”. In [iii–iv] it serves as a pro-clause anaphor, with some resemblance to *so* and *not* as discussed in §7.7 above (though we noted that *know* does not admit the latter): “that it wasn't an accident”, “that you won't be joining us”. There is also a similarity with *so* in [v–vi], where *otherwise* is a pro-predicative: “proved not innocent (i.e. guilty)”, “wished it (to be) other than it was”. Finally, in [vii] *otherwise* appears as the second term in an *or*-coordination, indicating the opposite or negation of the first term, here “incorrectness”. The part-of-speech classification of *otherwise* raises problems similar to those discussed for *so* at the end of §7.7.2.

#### (f) *Else*

- [14] i *They don't realise that tastes differ just as much in sex as in [anything else].*  
 ii *Like [everything else in Rome, ruins and monuments alike], this house is lived in.*

As a comparative marker, *else* is semantically like *other*, but syntactically it occurs only as post-head dependent to certain fused determiner-heads and pronouns (*all*, *much*, *someone*, *nobody*, *what*, etc.).<sup>56</sup> The examples cited are interpreted anaphorically: “anything else than sex”, “everything else besides this house”.

<sup>56</sup> *Else* is also used to reinforce the disjunctive coordination expressed by *or*: see Ch. 15, §4.1.

## 9 Spatial location and change of location

Adjuncts and complements expressing location and change of location in space have been discussed in some detail in Ch. 8, §4; here we return to them with a view to examining the role that deixis and anaphora play in this area, beyond that covered in our discussion of the demonstratives.

### 9.1 *Here and there*

The intransitive prepositions *here* and *there* are distinguished as proximal and distal, like the demonstratives **this** and **that** respectively.

#### ■ Deictic use

- [1] i *Shall we put it here, or would you rather leave it over there?*  
 ii *Could you put it herethere, on the coffee table.*  
 iii *I've got a terrible pain just herethere.*  
 iv *You can't grow strawberries herethere.*  
 v *You come here to learn the piano, not to meet boys.*  
 vi *We'll have to stop herethere and continue next week.*

*Here* and *there* are commonly used deictically. *Here* refers to a location close to the speaker, *there* to one that is further away: [i] is an elementary example of this contrast. Both *here* and *there* can be followed by another locative expression that specifies the place more precisely, as in [ii], and likewise both are often accompanied by indexing gestures achieving the same effect, as would typically be the case in [iii]. As with the demonstratives, the proximal vs distal distinction is not a matter of purely objective physical location: there is a subjective element involved. In [ii–iii], for example, either could be used in reference to the same place, with different conceptualisations of it as close or not. One difference between *here* and *there* is illustrated in [iv]. These could both be used with quite local reference to a garden bed, for example, again relatively near with *here* or further away from me with *there*. But *here* could also be interpreted in a broader sense as “in this region, in this part of the world”, whereas a corresponding interpretation for *there* (“in that region, in that part of the world”) would generally be achieved anaphorically, by previous mention of the area, rather than deictically.

Expressions denoting spatial location often refer not primarily or exclusively to some physical place but rather to the institution, event, or activity associated with the place. This is seen for deictic *here* in [1v], where the reference might be to a piano class, say. In [vi] we have a temporal use of spatial *here* and *there*, interpreted as “at this/that point (in the progression of our activity)”. Compare also *Christmas is here again*. Discourse deixis is illustrated in the interpretation of *You have a point there* where *there* refers to what you have just said. For the construction with initial *here* and *there*, as in *Here's/ There's your money*, see Ch. 16, §5.3.

#### ■ Anaphoric uses

- [2] i *I put the keys in the top drawer; they should still be there.*  
 ii *The dog chased the boy up a gum tree and kept him there for an hour before going away.*

- iii *Many Australians do not yet understand how much China has changed and what great trade opportunities exist there for Australia.*
- iv *At the age of twenty-five he had walked into the mission as if he belonged here and had become a Christian.*
- v *The main stadium was almost finished. Here, on the opening day of the games, participants from every country would parade.*

Anaphoric uses mainly involve *there*, *here* being primarily deictic. *There* in [i–iii], though primarily anaphoric, retains a distal deictic component of meaning, for it still indicates a place relatively removed from where I am now. In [iv] *here* is likewise simultaneously deictic and anaphoric: the utterance takes place in the mission, so that *here* has its primary deictic sense, but the antecedent provides a more specific referential interpretation. In the intended contextualisation of [v] the utterance takes place elsewhere than in the stadium: *here* is in this case non-deictic, purely anaphoric. It is debatable whether spatial expressions following *here* and *there* such as *herethere on the coffee table* in [iii] should likewise be regarded as antecedents: if so, this will involve anticipatory anaphora as well as deixis.

*Here* and *there* can occur as complement to a preposition: *in here*, *from/to there*, and so on. When there is no governing preposition, they may be interpreted with the same reference as a prepositional antecedent. In [2ii], for example, *there* is interpreted as “up the gum-tree”. But they may also be understood as incorporating some relatively neutral locative preposition such as *at*, *in*, *to* that is not present in the antecedent. Thus in [2iii/v] the antecedents are simply the NPs *China* and *the main stadium*, but we understand “in China”, “in the main stadium”. Similarly, in *Kim is in Paris and wants us to go there too*, we understand “to Paris”, with “to” predictable from the goal role.

In casual style the antecedent is sometimes not even an NP but a modifier within an NP:

- [3] i *This Canadian lady, she couldn't believe how cold it was and of course you know they get minus thirty or something over there.*
- ii *Many a motel owner – when we've stopped there again – has remembered us and has said he preferred our dogs to most children.*

*There* is understood as “in Canada” in [i] and “at the motel” in [ii]; note that in this latter example the antecedent occurs within a quantified NP, and hence *there* is understood as expressing a bound variable, just like the personal pronoun *he* that follows.

### ■ Other uses

In addition to the deictic and anaphoric uses of *here* and *there* we find some specialised and more or less idiomatic uses. *Here and there* means “in various places” – compare *now and then* in §10.1.1 below. *Here's to the happy couple / the bride and groom / . . .* is used for toasts. In *I want to climb the mountain simply because it is there* we understand “because it exists (as a challenge)”.

## 9.2 Come and go

Deixis plays a major part in accounting for the relation between the verbs *come* and *go*, and certain similar pairs, such as *bring* and *take*. *Come* and *go* are verbs of motion and

A second variable factor concerns what we have called the deictic centre. So far we have considered only the default case where the deictic centre is the speaker, where the goal is identifiable with my location now, then (at the time of the event), or typically. But the deictic centre can instead be the addressee. Here I present the matter from your perspective:

- [8] i *OK, I'm coming.*  
 ii *I'm told Carla came to Tahiti to do a commercial while you were holidaying there.*  
 iii *Jill says you were out when she came round to see you last night.*

Thus [i] is a typical response to a summons: the goal is where you currently are. In [ii] the goal is where you were at the time of the event. And in [iii] you weren't there then and needn't be there now: in this case the goal is your base. Your perspective and mine may of course coincide: in *Jill's coming round to see us tonight*, it may be a matter of where you and I are now, and will be then, and/or where we have our base.

It is also possible for the deictic centre to shift to someone else who is prominent in the discourse:

- [9] i *Ed wants me to come over immediately and check the proofs with him.*  
 ii *Ed says Carla came to Tahiti to do a commercial while he was holidaying there.*  
 iii *Ed says Jill came round to see him last night while he was out.*

In these examples I take Ed's perspective rather than my own. In [i] it is a matter of coming to where Ed is now; in [ii] Carla came to where Ed was then; and in [iii] (uttered, let us assume, at the workplace I share with Ed) Jill came to Ed's base.

The range of possibilities is summarised in [10], where the deictic centre is the person whose perspective is being taken, the person whose location at the goal satisfies the conditions for the use of *come*:

- [10] i The deictic centre may be the speaker, the addressee, or someone else in the context of discourse.  
 ii The person who constitutes the deictic centre may be located at the goal at utterance-time, event time, or typically.

### ■ Go

The same possibilities are available for *go*, this time applying to the source rather than the goal, but again not mutually exclusive:

- [11] i a. *Will you please go and get my slippers.*  
 b. *We went to the movies last night.*  
 c. *The children will be going to school by bus while we are in Scotland.*  
 ii a. *Could you go and check whether I turned the oven on.* (said on the telephone)  
 b. *Did you go to the movies last night?*  
 c. *Will the children be going to school by bus while you are in Scotland?*  
 iii a. *If that's Ed on the phone, ask him to go and see if I left my hat in his car.*  
 b. *Ed went to the movies last night.*  
 c. *Will Ed's children be going to school by bus while he is in Scotland?*

The deictic centre is the speaker in [i], the addressee in [ii], and Ed in [iii]. And in each set the implicit source is the place where the person constituting the deictic centre is now in [a], was at the time of the event in [b], and has their base in [c].

with a view to illustrating how the interpretation derives from the deictic and anaphoric concepts introduced above. First, *away*:

- [15] i *Don't wander away.*  
 ii *The bird perched on the balcony rail and then flew away again.*  
 iii *Next week-end is a public holiday, so a lot of people will be away.*  
 iv *Liz regretted that her parents lived so far away.*

*Away* is understood as “away from source *x*”, with this unspecified source recoverable from the context. In [i] it is implicitly deictic, with the speaker as deictic centre: “away from here, i.e. where I am now”. In [ii] the interpretation is derived anaphorically: “flew away from the balcony rail”. Example [iii] has the ‘base’ interpretation: “away from home”; there is an anaphoric component too inasmuch as it’s a matter of being away from **their** base. Example [iv] illustrates the close relation between deixis and anaphora. We can think of the interpretation as deriving anaphorically, as “away from Liz”, but we can also handle it in terms of deictic shift, with Liz the deictic centre, giving “away from the place where the person constituting the deictic centre, Liz, has their home base”.

*Back* in the following is understood with an implicit goal or location:

- [16] i *Off you go, then, but hurry back.*  
 ii *She travelled from Sydney to Melbourne by train and flew back two days later.*  
 iii *Max felt more secure now that his parents were back.*

In [i] we have an implicit deictic goal: “back here, to where I am”. The salient interpretation of [ii] is anaphoric: “back to Sydney”. Example [iii] has the ‘base’ interpretation: “back home”, but it can be Max’s home, not just the parents’.

## (b) Orientation

Certain prepositions or prepositional idioms, such as *behind* and *in front*, sometimes involve orientation with respect to an assumed observer. Compare:

- [17] i *He has parked his car behind the town-hall.*  
 ii *There's a snake behind that rock.*

A town-hall has an inherent front and back, and *behind* / *in front of the town-hall* may be interpreted with respect to that inherent orientation. The *behind* phrase in [i] can therefore be understood as, approximately, “at the back of the town-hall”. But that is not the only possibility, and for [ii] there is no interpretation of this kind because a rock, unlike a town-hall, has no inherent front and back. The natural interpretation of [ii], then, is “There’s a snake on the other side of the rock, i.e. on the side opposite that closest to me, the observer”, and the corresponding reading is available for [i]. In this case the implicit observer is the speaker, constituting the deictic centre, but again the perspective can be that of some other person involved in the situation, as in *Liz found a snake behind the rock*.

*Behind* and *in front* also allow for an understood complement to be left unexpressed. Compare, then:

- [18] *There's a huge furniture van behind.*

In the absence of further context inducing an anaphoric reading, this is likely to be interpreted along the lines discussed above for [16i/17ii], with the complement implicitly deictic, giving “behind us”. A plausible scenario is that we are travelling in a car or other

vehicle, and vehicles, like town-halls, have an inherent front and back. The back of the vehicle then provides the orientation for the interpretation of *behind*, the back being the end closer to the furniture van.

## 9.4 Location of antecedents and referents in the discourse

One special case of location is location in the discourse:

- [19] i [The *above-mentioned* processes] will be discussed more fully in Ch. 3.  
 ii There are no data to confirm [the *above* formulas].

In [i] *above-mentioned* indicates that the processes have been mentioned earlier in the discourse, and hence that there is an anaphoric link to a preceding antecedent. In [ii] *the above formulas* refers to formulas that themselves appear earlier in the discourse: this, then, is a case of what we have called discourse deixis. Location in the discourse can be conceptualised in either spatial or temporal terms: compare *mentioned above* and *mentioned earlier*. Spatial terms are generally restricted to written texts (or reading from a prepared written text), while the temporal terms are neutral as to the medium; we will cover both types in this subsection, which thus provides a transition between the present major section on spatial location and the next one on temporal deixis and anaphora.

Antecedents are, by definition, part of the discourse, but for the most part anaphors do not directly indicate where in the discourse the antecedent is to be found. Note in this connection that the demonstratives *this* and *that* express respectively proximal and distal meaning when used deictically,<sup>58</sup> but are not in their anaphoric use distinguished in terms of the relative distance between antecedent and anaphor. Our concern with anaphora here, then, is limited to those cases where the anaphor does express information about the spatial or temporal location of the antecedent.

Many spatial and temporal expressions can be used indifferently for location in discourse or for location elsewhere. We can use *the last paragraph* to refer to the preceding paragraph in the current written discourse, but we can equally have *the last president*. Similarly with terms such as *preceding* or *following*, *earlier* and *later*, *first*, *second*, *next*, and so on. But there are a few items that are specialised to the location in discourse use, and it is these we will focus on here.

### ■ Above and related expressions

*Above* is primarily a preposition (transitive or intransitive), but also belongs (by conversion) to the adjective category, where it is used either attributively or as fused modifier-head:

- [20] i *the discussion above* [preposition: post-head modifier]  
 ii *the above discussion* [adjective: pre-head modifier]  
 iii *Her conclusion is the same as [the above].* [adjective: fused modifier-head]

The preposition use is not restricted to location in the discourse, but the adjective *above* is. Thus we have *the room above* meaning ‘the room above a certain room, the one I’m in or one previously mentioned’, but *the above room* cannot be interpreted in this way. Unlike *above*, *below* has no special discourse-location use: it belongs only to the preposition

<sup>58</sup>In discourse deixis they differ in that only *this* can be used in reference to what follows.

category, so we have either *the discussion below* (location within this discourse) or *the room below* (ordinary spatial location), but not *\*the below discussion*. We do, however, have *under-mentioned* matching *above-mentioned*, both of them belonging to formal style.

Adjectival *above* is predominantly used in discourse deixis, with *above-mentioned* (or legal register *aforementioned*) used for anaphora, as in [19], but *above* is also used in the “above-mentioned” sense, as in *the above scholars*, etc.

### ■ Former and latter

- [21] i *They moved from [the old Treasury Buildings]<sub>i</sub> to Government House ballroom across the road; American military authorities were in [the former place]<sub>i</sub>.*  
 ii *Other recent papers include Voegelin & Voegelin 1977 and [Hill 1980]<sub>i</sub>; [the latter paper]<sub>i</sub> contains an extensive bibliography on the subject.*  
 iii *Many people are inclined to speak of all ‘public relations’ as ballyhoo or [propaganda]<sub>i</sub>, perhaps overlooking the early meaning of [the latter word].*  
 iv *Max never did learn what [Lee]<sub>i</sub> wanted, for [the latter]<sub>i</sub>; shook hands and moved towards the door.*  
 v *It is not easy to make an economic comparison between [clay pots]<sub>i</sub>; and [the various substitutes]<sub>i</sub>; [the former]<sub>i</sub> may last indefinitely with luck, while the [latter]<sub>i</sub> are often expendable, used only once.*

The adjectives *former* and *latter*, containing the comparative suffix *-er*, are used attributively, as in [i–iii], or as fused modifier-head, as in [iv–v]. Example [iii] is another case of discourse deixis: *propaganda* is the referent, not the antecedent, of *the latter word*; in all the other examples there is an anaphoric link between the NP containing *former* or *latter* and the bracketed co-indexed element. In the attributive use *former* and *latter* have other senses not concerned with location in the discourse (*her former husbands*; *the latter half of the nineteenth century*), but the fused-head uses are always anaphoric.

In their anaphoric or discourse deictic uses, *former* and *latter* imply a set of potential antecedents or discourse referents: *former* then picks out the first in the set (e.g. *clay pots* in [v]), while *latter* picks out the last in the set (thus *the various substitutes* in [v]). Precisely because there is a set of potential antecedents or discourse referents, the locational feature expressed by *former* and *latter* makes them more appropriate than, say, the personal pronouns: *it* in [ii], for example, would be quite incomprehensible. The set concerned usually has just two members, but it is not uncommon (at least with *latter*) for it to contain more than two. Ordinal numerals such as *first*, *second*, etc., can be used in a comparable way, but these are clearly not specialised for location in discourse in the way that *former* and *latter* are.<sup>59</sup>

<sup>59</sup>Another pair of terms occasionally used with the same effect as *former* and *latter* are *one* and *other*: [*The sublime*]<sub>i</sub>; and [*the beautiful*]<sub>j</sub> are indeed ideas of a very different nature, [*one*]<sub>i</sub>; being founded on pain, [*the other*]<sub>j</sub>; on pleasure. These, however, do not express any ordering meaning, so that the pairing of antecedent and anaphor is not determined semantically, as it would be with *former* and *latter*. Compare, for example, *Kim and Pat had both done brilliantly, one having scored 99%, the other 95%*, which does not force an interpretation where it was Kim who scored 99%.

### ■ A related phenomenon: *respective* and *respectively*

The order in which expressions occur in the discourse may also be relevant to the interpretation of clauses containing the adjective *respective* and the adverb *respectively*:

- [22] i *Hercule Poirot* and *Lord Peter Wimsey* (the *respective* creations of *Agatha Christie* and *Dorothy Sayers*) have retained Holmes' egotism but not his zest for life and eccentric habits.
- ii The letters *D*, *E*, and *X* in the column following each field of study indicate that this programme is offered as a major study by *day*, *evening*, and *external* courses, *respectively*.

*Respective* in [i] serves to pair *Hercule Poirot* with *Agatha Christie*, and *Lord Peter Wimsey* with *Dorothy Sayers*; similarly, *respectively* in [ii] pairs *D* with *day*, *E* with *evening*, and *X* with *external*. This time, however, the relation between the paired items is not that of antecedent to anaphor, nor referent to deictic referring expression. Rather, the plural in *creations* and the coordination *day, evening, and external* are interpreted distributively, and the pairing indicates how the distribution is to be understood. Thus *Hercule Poirot* is *Agatha Christie's* creation while *Lord Peter Wimsey* is *Dorothy Sayers' creation*; and similarly *D* indicates that the programme so annotated is offered as a major study by day course, that the one annotated with *E* is offered by evening course, and that the one with *X* is offered by external course.

Such pairing is not invariably found – indeed it occurs with only a small proportion of the uses of *respective*. Compare, then:

- [23] i *Liszt played this version through to Berlioz and Wagner on their respective visits to Weimar.*
- ii *Two of the children were later the celebrated eighteenth-century beauties the Gunning sisters, who became respectively Countess of Coventry and Duchess of Hamilton.*
- iii *For the two subsequent years the Government has set indicative planning levels of 110,000 and 125,000, respectively.*

In [i] *respective* merely indicates that *Berlioz* and *Wagner* visited *Weimar* separately rather than together. In [ii], one of the sisters became *Countess of Coventry* and the other the *Duchess of Hamilton*, but the sisters are not separately referred to. In [iii] 111,000 is the indicative planning level for one year and 125,000 for the other; again there is no separate reference to the two years, but we understand that 111,000 is the level for the first of them, 125,000 for the second. (Indeed, a likely but not necessary interpretation of [ii] is that it was the elder sister who became *Countess of Coventry*.)

Syntactically, *respective* functions attributively within a plural NP, while *respectively* is always associated with a coordination. In [23ii] *respectively* precedes the first coordinate and in [23iii] it follows the last coordinate, but it can also be located higher in the constituent structure than the coordination itself, as in [22ii], where it follows an NP containing the coordination as pre-head modifier.

## 10 Temporal deixis and anaphora

Deixis and anaphora play a major role in the domain of time as well as in that of space. One very important case of deixis is that of primary tense, the inflectional contrast between preterite and present tense:

- | [1] | PRETERITE                                       | PRESENT TENSE                                  |
|-----|---|--|
| i   | a. <i>I <u>promised</u> to do it this week.</i> | b. <i>I <u>promise</u> to do it this week.</i> |
| ii  | a. <i>She <u>lived</u> in Melbourne.</i>        | b. <i>She <u>lives</u> in Melbourne.</i>       |

In elementary examples of this kind, preterite indicates past time and present tense indicates present time, where past and present time are deictic concepts. In the intended interpretation of [i] we are concerned with a single act of promising; in [ia] this act is located at a time earlier than the time of utterance, whereas in [ib] the time of the act is identified as the time of utterance. The examples in [ii] are imperfective, her living in Melbourne being a state; I am not concerned with the state in its entirety but am referring to a time at which it obtained or obtains. *She lived in Melbourne*, for example, does not entail that she doesn't live in Melbourne now (cf. *She already lived in Melbourne at that time*). But again the time actually referred to in [ia] is past, prior to the time of utterance, while in [ib] it is present.

There is, of course, a great deal more to inflectional tense than this: the question is dealt with in detail in Ch. 3, §4. Our concern in this section is with other ways of locating a situation in time, with temporal expressions having the form of PPs, NPs, or AdvPs.

### 10.1 Basic uses

We look first at what we will call 'basic uses' of temporal expressions, as opposed to those where there is a shift in the deictic centre, which we take up in §10.2.

#### 10.1.1 *Now and then*

Proximal *now* and distal *then* are the temporal counterparts of spatial *here* and *there* respectively. *Now* is predominantly deictic while *then*, in its temporal sense, is usually anaphoric.

##### ■ Deictic *now*

- [2]
- i *He is now twenty-eight.*
  - ii *He estimates there'll be only half as many Europeans in 100 years as there are now.*
  - iii *Now you know why I'm so afraid of the ID card they want to introduce.*
  - iv *She was here just now.*
  - v *I want you to do it now, as soon as you've finished lunch.*

In its primary use, *now* refers to an interval of time that includes the moment of utterance, as in [i–iii]. The use of *now* often involves a contrast between the present and the past or future. Such a contrast is explicit in [ii], implicit in [iii]: we understand in the latter that recent events (typically something that has been said in the discourse) have brought about a changed situation where you know something you didn't know before. *Now* can take a content clause complement specifying what distinguishes the present time from the pre-*now* period: *Now that the exams are over, we can start enjoying ourselves again.*

The proximal meaning of *now* does not require that its reference actually include the moment of utterance. In [2iv] it refers to a time just before the moment of speech; this is hardly possible without the modifier *just*. In [v] *now* is used for the very near future. Such cases are comparable to the use of *here* for a place that does not include that where the speaker is located but is close by; this use is much commoner with *here* than with *now*, however, no doubt because the nearby location can be identified indexically, whereas that is not possible for time.

### ■ Deictic *then*

[3] A: *Did you hear a scream?* B: *When?* A: *Just then.*

Distal *then* is mostly used anaphorically, but it can refer deictically to a time in the very recent past, as here. A different case is where I am watching a film or video, or looking at a photograph depicting past events, and say, for example, *We were happier then*.

### ■ Anaphoric *then*

- [4] i *They were married in 1982; he was then just short of twenty-one.*  
 ii *He first stood for Parliament in the 1968 election, for the Mount Hagen constituency where he was then working.*  
 iii *In the lower forms, you will remember, I was a good student and already then I felt myself specially ear-marked for fame.*  
 iv *They were fighting as usual about money, and it was then I realised I had to get away.*  
 v *She did some gardening and then had a rest.*  
 vi *The review had been ordered by the then Premier, Mr Dunstan.*

Example [i] illustrates the simplest case, with the antecedent a temporal PP. In [ii] the antecedent PP refers to an event, with *then* interpreted as “at the time of the 1968 election”. In [iii] *in the lower forms* is not itself a temporal expression, but we understand “when I was in the lower forms”, and that is the time *then* refers to. In [iv] we have the common case where the antecedent is a clause; *then* is coreferential with the preterite tense of this clause. Very often *then* refers not to the same time as that of its antecedent but to a time closely following, as in [v]: we understand “after that”. As well as functioning as adjunct in clause structure, *then* can modify a noun, as in [vi] – or an attributive adjective: *It travelled at the then incredible speed of 420 mph*. The reference here is to the time of the situation expressed in the clause containing *then*.

### ■ Other uses

*Now and then* is an idiom meaning “sometimes, but not very often”. *Then* is commonly used as a conditional connective, as when you say *Kim will be at the party* and I reply *Then you can count me out* (“in that case”). Both forms are also used as pure discourse connectives: *Now, where were we up to?*; *Now then, what’s all the trouble?*

## 10.1.2 Other temporal expressions

### ■ The ternary system pre-proximal vs proximal vs post-proximal

While *now* and *then* contrast in a binary system of proximal vs distal, there is in addition a quite elaborate system of temporal deictic expressions based on a ternary contrast of

**pre-proximal vs proximal vs post-proximal.** It is illustrated initially in the pronouns:

[5]	PRE-PROXIMAL	PROXIMAL	POST-PROXIMAL
	<i>yesterday</i>	<i>today</i>	<i>tomorrow</i>

*Today* refers to the day on which the utterance takes place, *yesterday* and *tomorrow* to the days immediately before and after that day. The three terms also have secondary senses in which *today* refers more generally to the present, *yesterday* and *tomorrow* to the past and future: *Today the inflation rate is less than 3%*; *We're not interested in yesterday's designs – only the current ones will do.*

Syntactically complex expressions contain temporal nouns denoting culturally determined time-units, which fall into two classes, **non-positional** and **positional**, as in [6i–ii] respectively:

- [6] i *day, week, month, year, century, millennium*  
 ii a. *morning, afternoon, evening, night*  
 b. *Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday*  
 c. *January, February, March, April, May, June, July, August, September, October, November, December*  
 d. *spring, summer, autumn, winter*

The non-positional nouns denote time intervals that follow each other immediately, while the positional ones denote intervals that form part of a cycle: a day is followed by another day, but a morning is followed by an afternoon. 'Positional' indicates that the interval has a fixed position within the cycle.<sup>60</sup>

The regular realisation of the ternary system is by means of *last*, *this*, and *next*:

[7]	PRE-PROXIMAL	PROXIMAL	POST-PROXIMAL	
	i <i>last week</i>	<i>this week</i>	<i>next week</i>	[non-positional]
	ii <i>last Thursday</i>	<i>this Thursday</i>	<i>next Thursday</i>	[positional]

There are irregular forms for *day*, which have already been given in [5],<sup>61</sup> and for the positional nouns in [6iia], which are as follows:

- [8] i *yesterday morning*      *this morning*      *tomorrow morning*  
 ii *yesterday afternoon*      *this afternoon*      *tomorrow afternoon*  
 iii *yesterday / last evening*      *this evening*      *tomorrow evening*  
 iv *last night*      *tonight*      *tomorrow night*

Non-positional terms for shorter intervals than a day do not enter into this system, though the proximal forms *this second/minute* are readily used deictically (*You must do it this minute*). *Fortnight* (BrE) and *decade* belong semantically in the non-positional set, but hardly enter into the ternary system, though again the proximal form is possible (*I've not received my pay this fortnight*; *The problem is unlikely to be solved this decade*).

<sup>60</sup>Positional *night* also forms a cycle with *day* in a positional sense, distinct from non-positional *day*, which denotes a period of 24 hours. Similarly, positional *weekend* contrasts with *week* in a positional sense distinct from the non-positional *week*, which denotes a period of seven days – cf. *at the weekend or during the week*. (There is also a term *weekday*, but it does not form a cycle with *weekend*, and does not form deictic expressions of the kind we are concerned with here.)

<sup>61</sup>*This day* can be used instead of *today* in complement function (*This day has been one of the happiest I can remember*), and very occasionally as an adjunct (e.g. in real estate agents' notices: *Auction this day*).

### Interpretation with non-positional terms

Here the proximal form refers to the time-unit containing the moment of utterance:

- [9] i *I only learnt about it this week.*  
 ii *I promise I'll finish the job this week.*

These locate the learning and finishing situations within the week containing the day on which I utter the sentence, with other factors indicating earlier and later respectively. *Last week* and *next week* then refer to the weeks immediately preceding and following this week. There is, however, some ambiguity or indeterminacy over the boundaries between one week and another. *Week* may be interpreted calendrically, as a period beginning on a fixed day (with the added complication that while the first day is usually taken as Sunday, there are some speakers, mainly BrE, for whom it begins on Monday), or non-calendrically, as a seven-day period beginning today.

### Interpretation with positional terms

Matters are here more complex, and there are differences among speakers with respect to the use of some forms. There are also differences with respect to the sets given in [6ii].

With the four parts of the day, the forms are given in [8], whose interpretation is quite clear. *This morning* refers to the morning of today, whether I am speaking during the morning or later in the day. *Yesterday morning* refers to the morning of yesterday and *tomorrow morning* to that of tomorrow. Similarly for the other forms.

With the months of the year, a proximal form such as *this July* can be used unproblematically to refer to the month containing the day on which I am speaking. It can also be used when it is not now July to refer to a month that is relatively close to the current one (before or after) – in keeping with the ordinary proximal meaning of demonstrative *this*. It will typically fall within the current year, but it does not have to: *this February*, said in December, is more likely to refer to the February of the following year than to that of the current one. We saw in discussing the spatial demonstratives that there is no absolute, objective difference between proximal and distal, so that I might refer to an object reasonably close to me as either *this* or *that*, and the same applies with temporal deixis. If we are now in July I might refer to the April of this year as *this April* or *last April*, and to the October of this year as *this October* or *next October*. *This* will normally be used to the exclusion of *last* and *next* for a month adjacent to the current one, and will be preferred for a month one and perhaps also two steps further away, especially in the future. In such cases *last* and *next* can be used to refer to a month one year further away, i.e. to the specified month on an earlier or later cycle. A further possibility is to use the preposition *in* with the month-name by itself: *She was married /is getting married in April*. This form is not normally used for the current month, but can apply deictically to the nearest April in the past or future.

Essentially the same principles apply with the seasons and the positional term *weekend*: *They moved to Paris last autumn*; *We're getting married next weekend*. The prepositional construction, however, is not often used deictically with the seasons, and with *weekend* has *at* (BrE) or *on* (AmE, AusE) rather than *in*: *What did you do at/on the weekend?*

The days of the week work in a similar way except that such forms as *this/last/next Tuesday* are not normally used for today, yesterday, or tomorrow; and some speakers restrict *this* to future time. Many speakers would also avoid *this/last/next Tuesday*, etc.,

in reference to the days standardly referred to as *the day before yesterday* and *the day after tomorrow*. The preposition this time is *on*: *They left last/this/on Tuesday* could all be said on Friday in reference to the preceding Tuesday. It is also possible, especially in AmE, to omit the preposition: <sup>o</sup>*They left / are leaving Tuesday for Chicago*.

### ■ Complex forms involving two temporal nouns

There are also numerous expressions that are syntactically more complex, involving the embedding of one phrase within another:

- [10] i *the day before yesterday, the day after tomorrow, a week from today, the Sunday before last, the Sunday after next*  
 ii *today week, a week today, a week on Tuesday, a week last/next Saturday*

The interpretation of expressions like those in [i] is straightforwardly predictable from the form (with *last* and *next* elliptical for “last/next Sunday”). Those in [ii], however, do not fit into ordinary NP constructions. *Today week* and *a week today* both mean the same as *a week from today*, so if today is Monday they refer to next Monday. The *today week* frame allows *tomorrow* or a day-name such as *Tuesday* as replacements for *today* and (mainly in BrE) *fortnight* as a replacement for *week*. The *a week today* pattern allows quantification of the first phrase (*two weeks today*), replacement of *week* by *fortnight*, *month*, *year*, and replacement of *today* by *tomorrow*. Some speakers have the pattern <sup>o</sup>*a week Tuesday* in the sense “a week next Tuesday”.

### ■ Other deictic expressions

A sample of other temporal expressions that are or can be interpreted deictically is given in [11] (and see also the discussion of the aspectual adjuncts *already*, *still*, *yet*, *any longer* in Ch. 8, §8):

- [11] i PAST *in the past, formerly, hitherto, recently, previously, two weeks ago, in days gone by, in former/previous times, up till now*  
 ii PRESENT *at present, at this time, these days, nowadays, currently*  
 iii FUTURE *in future, later, immediately, straightaway, soon, in two weeks, in the coming weeks, in the weeks ahead, henceforth*

*Two weeks ago* and *in two weeks* are illustrative of general patterns, with other time-measures able to replace *two weeks*; *ago* measures backwards from now, while *in* measures forwards. It will be noted that the motion verbs *come* and *go* figure in some expressions, so that we have *gone* for past and *coming* for future. *Coming* also combines with proximal *this*, making explicit that reference is to the future: compare *this Tuesday* (past or future) and *this coming Tuesday* (future only). The metaphor here is of time moving past the world from the future into the past, with now the goal for *come* and the source for *go*. Compare similarly *Summer has come and gone already*, *The days are going past so quickly*, and so on. A different metaphor has time as a spatial line along which the world is moving from the past into the future: hence expressions like *the weeks ahead* – and formulations like *the tasks that lie before us* or *These problems are now behind us*.

### ■ Anaphoric uses and counterparts

Some of the expressions mentioned above can be used anaphorically as well as deictically, while for others there are distinct anaphoric counterparts. Compare:

- |      |  |  |
|------|--|--|
| [12] | DEICTIC                                      | ANAPHORIC  |
|      | i a. We will <u>soon</u> be home.            | b. He ran off and was <u>soon</u> out of sight.  |
|      | ii a. She's going to Bath <u>next week</u> . | b. She arrived in London on 3 June and planned to go to Bath <u>the following week</u> . |

*Soon* refers to a time shortly after some time of orientation, which can be the time of utterance, as in [ia] (“soon after now”), or a time defined in the context of discourse, as in [ib] (“soon after then – i.e. after the time when he ran off”). In [ii] *next week* refers to the week after the one containing today, but for the week after the one containing 3 June we need *the following week* (or *the next week*).

Other expressions which follow the pattern of *soon* are given in [13], while contrasting deictic and anaphoric forms are shown in [14]:

- |        |  |  |
|--------|--|--|
| [13]   | <i>at this time, afterwards, before, previously, later, recently, in April</i> |  |
| [14] i | <i>yesterday, last week</i>  | <i>the previous day/week, the day/week before</i>      |
| ii     | <i>today, this week</i>  | <i>that day/week</i>                                   |
| iii    | <i>tomorrow, next week</i>   | <i>the next/following day/week, the day/week after</i> |
| iv     | <i>a week ago</i>  | <i>a week before/earlier/previously</i>                |

*In + month-name* is predominantly deictic, but is included in [13] because anaphoric examples like *They went to Washington in January 1978 but came home again in April* (i.e. “April 1978”) are also possible. Very often, however, a distinctively anaphoric expression would be preferred, such as *in the April of that year* or *the following April*. With days of the week, only this latter type of expression is possible: *They arrived on Monday 10 January and left on the (following) Friday. On Friday* here would have only a deictic interpretation (“last Friday”).

Expressions with demonstrative *that* are virtually restricted to anaphoric use;<sup>62</sup> the predominantly deictic *this* can also be used anaphorically, but not normally in NPs like *this week* in adjunct function (as indicated in [14ii]):

- |        |  |  |
|--------|--|--|
| [15] i | <i>1934 was a bad year. <u>That summer</u> the gambling houses were closed, . . .</i>  |  |
| ii     | <i>She lost her job soon after her father died. She was still in her fifties <u>at this time</u>, much too young for retirement.</i> |  |

## 10.2 Shift of deictic centre

So far we have been concerned with cases where deictic expressions are interpreted in relation to the speaker’s ‘now’, the time of utterance. But it is also possible for the deictic centre to be shifted away from the speaker. One rather minor instance of such a shift is where *now* is interpreted in relation to the time of decoding rather than encoding. This has been illustrated with examples of written notices such as *You are now leaving West Berlin* or *Now wash your hands*.

More important is the deictic shift that occurs in free indirect style:

<sup>62</sup>The qualification ‘virtually’ is to allow for cases like *There were a lot of jacarandas out that November, weren’t there?*, said while watching a video of a November wedding (cf. the similar example given for *then* in §10.1.1 above).

- [16] *Cheryl . . . had turned into such boring company; the suggestion that she come back to Robertson with Emma for a couple of days she treated as if she was being asked to take a canoe down the Limpopo. And to think that only four years ago her friend had been the epitome of sixth form rebellion.*

This passage from a work of fiction is reporting the thoughts of the main character, Emma, and the time referred to by *only four years ago* is four years before the time at which she was having these thoughts – not four years before the time of writing. Emma's perspective is also reflected in the use of *come* (cf. §9.2) – but the shift doesn't affect the category of person, so that we have *Emma*, not *me*, and *her friend* (i.e. Emma's friend Cheryl), not *my friend*. It is precisely the use of a deictic rather than anaphoric expression (*only four years before*) that indicates that the passage is in free indirect style, taking the perspective of the person involved rather than of the narrator. *Now* can be used in the same way:

- [17] *They had stripped him of his musket and equipment and now they were pulling his boots and jacket off.*

# Inflectional morphology and related matters

## 1 Preliminaries

This chapter and the next are concerned with morphology, that part of a grammar that deals with the form of words. As explained in Ch. 1, §4.3, morphology is divided into two subcomponents: we look first at inflectional morphology and then in Ch. 19 turn to lexical word-formation.

### ■ Inflectional morphology vs lexical word-formation

The distinction between these two subcomponents of morphology may be illustrated with reference to a set of words such as the following:

- |     |     |                      |                   |                    |                    |
|-----|-----|----------------------|-------------------|--------------------|--------------------|
| [1] | i   | <i><b>simple</b></i> | <i>simpler</i>    | <i>simplest</i>    |                    |
|     | ii  | <i>simpleton</i>     | <i>simpletons</i> | <i>simpleton's</i> | <i>simpletons'</i> |
|     | iii | <i>simplify</i>      | <i>simplifies</i> | <i>simplified</i>  | <i>simplifying</i> |

The three words in [i] are forms of the same lexeme, which we represent in bold face as ***simple***. *Simpleton* and *simplify*, however, are not forms of this lexeme: they are forms, together with the other words in [ii–iii] respectively, of the lexemes ***simpleton*** and ***simplify***.

As is implied by saying that they are forms of the same lexeme, *simple*, *simpler*, and *simplest* represent the same lexical item, the same vocabulary item. They are forms of this item that are required or permitted in different syntactic constructions. In the frame ‘*This is \_\_\_ than that*’, for example, only the comparative form *simpler* is permitted, and similarly the frame ‘*This is the \_\_\_ of them all*’ requires the superlative form *simplest*. And if we replace the lexeme ***simple*** by another adjective, we will still need a comparative and superlative form in these constructions: *This is cheaper than that* and *This is the cheapest of them all*, and so on.

*Simpleton* and *simplify*, by contrast, represent different vocabulary items, different lexemes. From a syntactic point of view, the fact that *simpleton* is formed by adding an affix to *simple* is irrelevant: its syntactic distribution is no different from that of nouns that are not derived from an adjective. *Simpleton* and *fool*, for example, are syntactically alike: the grammatical difference between them is purely morphological. Similarly, the morphological structure of *simplify* is of no syntactic significance: the grammatical difference between *I'll simplify the problem* and, say, *I'll solve the problem* is again purely morphological.

The various forms of a lexeme are, more specifically, its **inflectional forms**, and it is with the morphological description of these that the bulk of this chapter is concerned. However, we also include in the final section of the chapter a description of various

non-inflectional variations in form that involve different pronunciations for certain grammaticised words – variation such as that between strong and weak forms of certain auxiliaries, personal pronouns, prepositions, etc. There is, for example, a clear difference between the pronunciations of *at* in *What are you looking at?* (the strong form, /æt/) and *Look at this!* (the weak form, /ət/). This is not a difference in inflection, but the phenomenon has it in common with inflection that it is concerned with a difference in form that depends in part at least on the grammatical context.

## 1.1 Lexical base, morphological operations, and alternation

### ■ Lexical base

The starting-point for the description of the inflectional forms of a lexeme is the **lexical base**. A lexical base may be **simple**, as with *dog*, or **complex**, as with *worker*, which is divisible into smaller morphological units, *work* and *·er*.<sup>1</sup> The difference between simple and complex lexical bases is, however, of hardly any relevance to inflectional morphology, and that is why we can leave the description of complex lexical bases to the next chapter. Note, for example, that the plurals *dogs* and *workers* are formed from the lexical base in the same way.

In English it is almost always the case that one of the forms of a variable lexeme is identical with the lexical base. In [1], for example, the first word in each of [i–iii] is identical to the lexical base. Exceptions are to be found among certain **defective** lexemes, i.e. lexemes which do not have the full set of inflectional forms found with other lexemes of the same syntactic category. For example, the plural noun-form *dregs* has no singular counterpart, but it nevertheless has *dreg·* as its lexical base. Moreover, there are lexemes where more than one inflectional form is identical with the lexical base. An obvious example is *sheep*, where the (plain, or non-genitive) plural form as well as the singular is identical with the lexical base. Lexical base is thus a distinct concept: it cannot be subsumed under that of inflectional form.

### ■ Morphological operations

The plural forms *dogs*, *workers*, and *dregs* are formed by adding *·s* to the lexical bases. We refer to this as a **morphological operation** – specifically, the operation here is that of **suffixation**. This is in fact the major type of operation involved in English inflectional morphology. However, it is not the only one. The plural *teeth*, for example, is formed by changing the vowel of the base *tooth*, and the same applies to the preterite form *rang*, formed from the base *ring*. In the case of *knives*, suffixation is accompanied by modification of the base (with voicing of the final consonant in speech and corresponding replacement of *f* by *v* in writing). Other, relatively minor, operations will be introduced as they are needed.

Present-day English has a very simple system of inflection – much simpler than Latin, for example, or indeed than earlier stages of English such as Old English. There are few inflectional categories and relatively few types and combinations of operation are involved in their formation. Most inflectional forms are either identical with the lexical

<sup>1</sup>We use the notation ‘·’ when citing suffixes (like *·er*) or prefixes (like *un·*) and, where relevant, for marking morphological divisions within words (*dog·s*).

base or formed directly from it, as in the above examples. There are some, however, where two steps are involved. One obvious example is the genitive plural, with *children's*, say, formed by suffixation from the plural *children*, not from the base *child*. A second example is provided by a small subset of past participles like *trodden*: this is formed not from the base *tread*, but from the preterite form *trod*, by suffixation of *·en* (with doubling of the final *d* in the spelling).

### ■ Alternations

We speak of **alternation** when a morphological unit has different realisations depending on the context in which it appears. For example, the plural ending is realised in writing as *s* in *cats* but as *es* in *boxes*: there is alternation between the suffixes *·s* and *·es* in the formation of plural nouns. A good deal of this chapter will be devoted to the description of such alternations.

### ■ Regular and irregular forms

An inflectional form is **regular** if it is formed in accordance with a general rule applying without reference to particular lexemes. *Cats* and *boxes*, for example, are regular plurals (and the alternation they exhibit between *·s* and *·es* is likewise said to be regular), and similarly the verb-form *talked* is a regular preterite and past participle. *Children* and *bought*, however, are **irregular**: the dictionary entries for **child** and **buy** must contain specific information about the plural and preterite forms respectively. *Thieves* too is irregular, for although the suffixation of *·s* follows the general rule, the voicing of the base-final consonant, together with addition of *e* in the spelling, is not general throughout the language; we have *thief* ~ *thieves* but not *chief* ~ \**chieves*, *hoof* ~ *hooves* but not *proof* ~ \**prooves*, etc. For lexemes like **thief** and **hoof** the dictionary must record that the plural suffix is added to a special alternant of the base. Note, by contrast, that the preterite and past participle *knitted* is fully regular, for the modification of the written base by doubling the final *t* does follow a general rule.

### ■ Syncretism

When two or more inflectional forms of a lexeme are pronounced or spelled alike, we say that there is **syncretism** between them, or that they are **syncretised**. To return to the example used above, *sheep* has syncretism between the singular and plural forms.

## 1.2 Overview of inflectional categories

### (a) Nouns

Prototypical nouns inflect for number and case:

[2]		SINGULAR	PLURAL
	PLAIN (NON-GENITIVE)	<i>dog</i>	<i>dogs</i>
	GENITIVE	<i>dog's</i>	<i>dogs'</i>

The non-genitive singular is identical with the base, and the plural is formed from it as described in §4.1; the genitives are formed from the corresponding non-genitives (§4.2). The two demonstrative determinatives **this** and **that** also inflect (irregularly) for number. The forms are *this* ~ *these* and *that* ~ *those*; they do not require further discussion here.

### Pronouns

Most of the personal pronouns have nominative and accusative case forms, separate dependent and independent genitive forms, and reflexive forms in which number functions as an inflectional category in all three persons. The nominative–accusative contrast is also found with relative/interrogative *who*. The forms have been listed in Ch. 5, §10.1.1. The reflexive forms are morphologically compounds, formed with *self* (singular) or *selves* (plural) combining with the dependent genitive in the 1st and 2nd persons, and with the accusative in the 3rd person. There are no other significant morphological generalisations to be made about pronouns, so they are not dealt with further in this chapter.

### (b) Grade

The system of grade applies to many adjectives and a few other lexemes:

[3]	PLAIN	COMPARATIVE	SUPERLATIVE	
	<i>weak</i>	<i>weaker</i>	<i>weakest</i>	[adjective]
	<i>soon</i>	<i>sooner</i>	<i>soonest</i>	[adverb]

The plain form is identical with the lexical base, and the inflectional comparative and superlative are formed, for the bases that permit inflection, by simple rules of suffixation, with very few irregularities in either speech or writing. Our discussion, in §3, also deals with the distinction between, on the one hand, inflectional comparatives and superlatives, such as those in [3], used with a large but restricted class of bases, and, on the other, analytic ones, such as *more careful*, *most careful*, used with all other bases.

### (c) Verbs

For the great majority of verbs six inflectional forms must be distinguished, as argued in Ch. 3, §1, and illustrated here for *take*:

[4]	PLAIN PRESENT	3RD SG PRESENT	PRETERITE	PLAIN FORM	GERUND- PARTICIPLE	PAST PARTICIPLE
	<i>take</i>	<i>takes</i>	<i>took</i>	<i>take</i>	<i>taking</i>	<i>taken</i>

The plain present tense and the plain form are identical with the lexical base: *be* is the only verb without syncretism between the base and a present tense form. In addition to the categories in [4], auxiliary verbs have negative forms.

## 1.3 Speech and writing

Syntactic description of English can quite often ignore not only interdialectal differences but also the distinction between spoken and written English. Morphological analysis cannot. To a small but not negligible extent we find different morphology in the spoken and written forms of the language. Spoken forms will be represented here in terms of the transcription system presented in Ch. 1, §3.1.2; when citing individual words we normally indicate stress only if the lexical base contains more than one syllable.

### ■ Different alternations in speech and writing

The most obvious point that must be made regarding the differences in inflectional morphology between written and spoken English is that in numerous cases the alternations found in writing are different from those found in speech. Consider, for example, these preterite verb-forms:

- [5] i *sighed*   *kissed*   *waited*                    /saɪd/   /kɪst/   /weɪtɪd/  
 ii *sighed*   *rubbed*   *tried*   *loved*   /saɪd/   /rʌbd/   /traɪd/   /lʌvd/

In [i] the three forms are all alike in writing in that they involve the addition of *·ed* to the lexical base, but the three spoken forms are all different, with three suffixes added: /d/, /t/, and /ɪd/. In [ii] it is the other way round; the spoken forms have the same suffix /d/, while the written forms are different. All again involve the addition of *·ed*, but in those other than *sighed* the lexical base is modified: in *rubbed* the final consonant of the base *rub* is doubled, in *tried* the final *y* is replaced by *i*, and in *loved* the final *e* of the base is dropped before the suffix (as it also is in *lov·ing*).

### ■ Primacy of speech

In some cases the spoken rules are clearly primary, the written ones derivative. One very obvious example concerns the alternation between *·es* and *·s* in forming the plurals of words ending in a consonant:

- [6] i *gases*   *boxes*   *buzzes*   *bushes*   *churches*   *stomachs*  
 ii /gæsiːz/   /bɒksɪːz/   /bʌzɪːz/   /bʊʃɪːz/   /tʃɜːtʃɪːz/   /'stʌməks/

Bases ending in *s*, *x*, *z*, *sh*, and (usually) *ch* take *·es* rather than *·s*, but this reflects the fact that the spoken forms have /ɪz/. In speech the presence of the vowel /ɪ/ in the suffix depends on the phonological properties of the base. If the immediately preceding sound is one of the subclass of consonants called sibilants, comprising /s/, /z/, /ʃ/, /ʒ/, /tʃ/ and /dʒ/, then the vowel /ɪ/ is required in the suffix. The presence of *e* in the written suffix, on the other hand, depends on how the suffix is pronounced in speech. Note, for example, that while most bases ending in *ch* take *·es*, as in the above *churches*, there are a few that take *·s*, as in *stomachs*, *epochs*, *eunuchs*. The choice depends not on the spelling but on the pronunciation: in the former case *ch* corresponds to sibilant /tʃ/, so that the suffix in speech is /ɪz/, whereas in the latter case it corresponds to non-sibilant /k/, which takes /s/ as the suffix in speech. There is nothing about the letters *ch* (or indeed *s*, *x*, etc.) that calls for *·es*: it is simply a matter of matching the pronunciation.

### ■ Inflectional classes in speech and writing

For the most part, we will be able to deal with matching written and spoken forms together in the same sections, because there is close correspondence between the membership of the inflectional classes of the written and spoken language. The nouns and verbs that have regular morphology in the written language generally have regular morphology in the spoken, and vice versa. But there are some exceptions:

- [7] i *say* ~ *says*   *pay* ~ *paid*   *house* ~ *houses*   *money* ~ *moneys*, *monies*  
 ii /seɪ/ ~ /sez/   /peɪ/ ~ /peɪd/   /haʊs/   /haʊzɪz/   /'mʌni/ ~ /'mʌnɪz/

The 3rd person singular (henceforth '3rd sg') present tense form of *say* is regular in writing but irregular in speech, where there is a change in the vowel of the base. Conversely,

the preterite (and past participle) of *pay* is regular in speech, but irregular in writing, where *y* is changed to *i* and the suffix is *-d*, not regular *-ed* (contrast the regular *play* ~ *played*). Again, the plural of *house* is regular in the written form, but irregular in the spoken, since the final consonant of the base is voiced in the plural, changing from /s/ to /z/. And while *money* is regular in speech, in writing there is variation between regular *moneys* and irregular *monies* (irregular because replacement of *y* by *i* normally applies only if *y* is preceded by a letter representing a consonant).

In ordering the material in this chapter we have given priority to the spoken forms: the sections on regular plurals and verb-forms deal with those that are regular in speech, and cover the corresponding written forms whether regular or not.

Forms that are irregular in both writing and speech can usually be assigned to the same subclasses. The verb *read* is an exception, however, as we see from these preterites and past participles:

- [8] i *meet* ~ *met*      *hit* ~ *hit*      *read* ~ *read*  
 ii /mi:t/ ~ /met/      /hit/ ~ /hit/      /ri:d/ ~ /red/

*Meet* belongs to a subclass where there is a change in the base from /i:/ to /e/ in speech and *ee* to *e* in writing, while *hit* belongs to a subclass where the preterite and past participle are identical with the base in both speech and writing. With *read*, however, we see that it belongs with *meet* in speech but with *hit* in writing. Again, it proves easier and more illuminating to base the classification on the spoken form. The divergent case of *read* will therefore be handled primarily in the appropriate spoken class, i.e. with *meet*, but it will also be given a secondary mention in the discussion of the class to which it belongs in writing, i.e. with *hit*.

### ■ Symbols and letters, vowels and consonants

As explained in Ch. 1, §3.2, we use the term **symbol** for the minimal unit of writing that corresponds to a unit of speech. Symbols may be **simple**, consisting of a single letter, or **composite**, consisting of two or more letters. *Through*, for example, contains three symbols: composite *th* + simple *r* + composite *ough* (corresponding to /θ/, /r/, and /u:/ respectively). The categories **vowel** and **consonant** apply primarily to speech and only derivatively to writing. Except where there could be no possible confusion we will not use these terms on their own when referring to writing: instead we will talk of **vowel symbol** and **consonant symbol** – or **vowel letter** and **consonant letter**, for the case where the symbols are simple. Note, then, that *y* is a vowel letter in *fully* (representing /i/), a consonant letter in *yes* (/j/), and just part of a composite vowel symbol in *boy* (/ɔɪ/). Similarly, *u* is a vowel letter in *fun* (/ʌ/), a consonant letter in *quick* (/w/), and part of a composite symbol in *mouth* (/aʊ/).

## 2 General phonological and spelling alternations

Before looking in turn at the various lexeme categories mentioned in §1.2, we introduce a number of phonological and spelling alternations which apply independently of particular categories.

## 2.1 Phonological alternations

In this section we look at the main phonological rules relating generally to alternation in inflectional suffixes or in the bases to which they are attached.

### 2.1.1 The sibilant suffixes: /ɪz/ ~ /s/ ~ /z/

There are three places in the inflection of nouns and verbs where we have a suffix containing an alveolar fricative, indicated in the spelling by *s*: the plural of regular nouns, the genitive, and the 3rd sg present tense of verbs. There are three alternants, with the alternation conditioned by the phonological features of the final consonant of the base.

- [1] i /ɪz/ after sibilants (/s/, /z/, /ʃ/, /ʒ/, /tʃ/, and /dʒ/)  
 ii /s/ after all other voiceless consonants (/p/, /t/, /k/, /f/, /θ/)  
 iii /z/ after all other sounds

Thus the vowel /ɪ/ is present only where it separates two sibilants; and in its absence elsewhere the remaining consonant is subject to **voicing assimilation**, that is, it assumes the same voicing as the immediately preceding sound.

We illustrate the alternation in [2], where most of the examples can belong to any of the three categories of plural, genitive, and 3rd sg present:

[2]	PLURAL	GENITIVE	3RD SG PRES
i /mɪs·ɪz/	<i>misses</i>	<i>miss's</i>	<i>misses</i>
/gɛɪz·ɪz/	<i>gazes</i>	<i>gaze's</i>	<i>gazes</i>
/wɪʃ·ɪz/	<i>wishes</i>	<i>wish's</i>	<i>wishes</i>
/ruːʒ·ɪz/	<i>rouges</i>	<i>rouge's</i>	<i>rouges</i>
/mætʃ·ɪz/	<i>matches</i>	<i>match's</i>	<i>matches</i>
/dʒʌdʒ·ɪz/	<i>judges</i>	<i>judge's</i>	<i>judges</i>
ii /kʌp·s/	<i>cups</i>	<i>cup's</i>	<i>cups</i>
/reɪt·s/	<i>rates</i>	<i>rate's</i>	<i>rates</i>
/reɪk·s/	<i>rakes</i>	<i>rake's</i>	<i>rakes</i>
/naɪf·s/		<i>knife's</i>	<i>knives</i>
/deθ·s/	<i>deaths</i>	<i>death's</i>	
iii /klʌb·z/	<i>clubs</i>	<i>club's</i>	<i>clubs</i>
/men·z/		<i>men's</i>	
/sjuː·z/			<i>sues</i>

### 2.1.2 The alveolar plosive suffix of the preterite and past participle:

/ɪd/ ~ /t/ ~ /d/

This suffix, written *ed*, attaches to regular verb bases, and has the three alternants shown in [3], with examples in [4]:

- [3] i /ɪd/ after alveolar plosives (/t/ and /d/)  
 ii /t/ after all other voiceless consonants (/p/, /k/, /f/, /s/, /ʃ/, /tʃ/)  
 iii /d/ after all other sounds

[4] i /heɪt·ɪd/	<i>hated</i>	/lænd·ɪd/	<i>landed</i>
ii /lɑːf·t/	<i>laughed</i>	/hɪs·t/	<i>hissed</i>
iii /lʌv·d/	<i>loved</i>	/steɪ·d/	<i>stayed</i>

Again /ɪ/ is present just where it prevents the juxtaposition of two similar sounds (this time two alveolar plosives) and where it is absent there is voicing assimilation between the consonant of the suffix and the final sound of the base. The alternation thus matches that for the sibilant suffixes, and hence has been included in this section even though the suffix attaches only to verbs.

### 2.1.3 Bases ending in syllabic /l/ (/ˈhʌmbəl/ ~ /ˈhʌmbəlɪŋ/)

For many speakers words like *humble*, *couple*, *rattle* are pronounced with a syllabic /l/ following the plosive – i.e. the /l/ (represented below as /l/) forms a syllable by itself. When a suffix beginning with a vowel is added to the base, however, the /l/ loses its syllabicity, becoming simply the initial consonant of the syllable containing the suffix. This is found with the comparative suffix /əʳ/, superlative /ɪst/, or gerund-participle /ɪŋ/,<sup>2</sup> but not with suffixes beginning with a consonant such as preterite or past participle /d/ and plural or 3rd sg present /z/. Compare, then, the forms in [5i], with non-syllabic /l/, and those in [5ii], where syllabic /l/ is retained:

- [5] i /ˈhʌmbəl/    /ˈhʌmbəlɪst/    /ˈhʌmbəlɪŋ/    (*humbler humblest humbling*)  
 ii /ˈhʌmbəl/    /ˈhʌmbəlɪst/    /ˈhʌmbəlɪz/    (*humble humbled humbles*)

Other speakers have /ə/ instead of syllabic /l/ (/ˈhʌmbə/ ~ /ˈhʌmbəd/ ~ /ˈhʌmbəz/), but the /ə/ drops before the vowel-initial suffixes, so that the forms are again as in [i].

Bases such as *cudgel*, *funnel*, *quarrel*, *pummel*, and *squirrel*, where a vowel letter preceding the *l* appears in the spelling and the preceding consonant is an affricate or sonorant rather than a plosive, tend (though there is interspeaker variation) to have /ə/ throughout the paradigm: <sup>?</sup>/ˈkʌdʒəlɪŋ/ for *cudgeling* would be unusual compared to /ˈkʌdʒəlɪŋ/.

### 2.1.4 Bases ending in post-vocalic /r/: alternation in non-rhotic accents (/reəʳ/ ~ /reərə/)

As discussed in Ch. 1, §3.1.1, non-rhotic accents such as BrE have the sound /r/ only in pre-vocalic position: in these accents the forms we are representing with superscript /ʳ/ are pronounced without any base-final /r/ sound. Thus *rare* and *mar*, for example, which we represent as /reəʳ/ and /mɑːʳ/ are actually pronounced /reə/ and /mɑː/. When a suffix beginning with a vowel is added to a base of this kind, the /r/ becomes pre-vocalic, and hence is not lost. Lexical bases like *rare* and *mar* thus have two alternants in non-rhotic accents, one with final /r/ occurring before a vowel, and one without /r/ occurring in other positions.

- [6] i **rare** /reə/    /reərə/    /reərəɪst/    *rare rarer rarest*    [adjective]  
 ii **mar** /mɑː/    /mɑːd/    /mɑːrɪŋ/    *mar marred marring*    [verb]

With adjectives, the alternant with /r/ appears in both the comparative and superlative forms. With a verb, it appears in the gerund-participle – but not in the preterite and past participle, where the suffix is /d/.<sup>3</sup>

<sup>2</sup> See §3.1 for some exceptions. Compare also the past participle suffix *-en*, which is pronounced as syllabic /n/ after certain consonants: see §5.3.3.

<sup>3</sup> The /r/ that appears before the vowel-initial suffix is a special case of linking /r/. Some speakers also have an intrusive /r/ in forms like *drawing*, *sawing*, and *thawing*: again, see Ch. 1, §3.1.1.

## 2.2 Spelling alternations

There are likewise spelling alternations – or spelling rules – that apply across different lexeme classes; for most of them, however, there are exceptions, which we will deal with in the appropriate sections. Three rules affect the final letter of the base, while one involves alternation in the form of the inflectional suffix itself:

[7]	i	CONSONANT DOUBLING	<i>hop</i> ~ <i>hopp·ing</i>	} [alternations in base]
	ii	e-DELETION	<i>hope</i> ~ <i>hop·ing</i>	
	iii	y-REPLACEMENT	<i>pity</i> ~ <i>piti·ed</i>	
	iv	·s ~ ·es ALTERNATION	<i>cat·s</i> ~ <i>fox·es</i>	[alternation in suffix]

The three rules affecting the base apply in both lexical and inflectional morphology: we focus here on inflection and take up these rules again, more briefly, in the context of lexical word-formation (Ch. 19, §5.1.5).

### 2.2.1 Consonant doubling (*bat* ~ *batt·ing*)

The general case of this rule applies to bases ending in a single consonant represented by a single consonant letter; the letter is doubled before suffixes beginning with a vowel under the following conditions:

- [8] i The final syllable of the base must have a single-letter vowel symbol.  
 ii The base must be stressed on its final syllable.

Monosyllabic bases necessarily have the stress on the final syllable and hence always satisfy [8ii]. The examples in [9i] illustrate doubling of the base-final consonant letter, while those in [9ii] have no doubling because one or other of the conditions in [8] is not satisfied:<sup>4</sup>

[9]	i	a.	<i>bat</i>	<i>batt·ed</i>	<i>batt·ing</i>	} [monosyllabic base]
		b.	<i>trod</i>	<i>trodd·en</i>		
		c.	<i>fat</i>	<i>fatt·er</i>	<i>fatt·est</i>	
		d.	<i>prefer</i>	<i>preferr·ed</i>	<i>preferr·ing</i>	} [disyllabic base with final stress]
		e.	<i>forgot</i>	<i>forgott·en</i>		
		f.	<i>unfit</i>	<i>unfitt·er</i>	<i>unfitt·est</i>	
	ii	a.	<i>bleat</i>	<i>bleat·ed</i>	<i>bleat·ing</i>	} [condition [8i] not satisfied]
		b.	<i>beat</i>	<i>beat·en</i>		
		c.	<i>neat</i>	<i>neat·er</i>	<i>neat·est</i>	
		d.	<i>offer</i>	<i>offer·ed</i>	<i>offer·ing</i>	[condition [8ii] not satisfied]

Bases like *equip* satisfy condition [8i] because *u* is here a consonant symbol representing /w/, so the doubling rule applies to give *equipp·ed* and *equipp·ing*.

The inflectional suffixes that trigger the doubling in [9i] are the preterite or past participle *·ed*, the irregular past participle *·en*, the gerund-participle *·ing*, the comparative *·er*, and superlative *·est*. For historical reasons, as noted in Ch. 1, §3.2, *·ed* counts as a vowel-initial suffix even when it corresponds to phonological /t/ or /d/, and base-final *r* counts as a consonant letter even in non-rhotic accents, where post-vocalic /r/ has been lost in speech.

<sup>4</sup>The verb *combat* may be stressed on either syllable and the suffixed forms are accordingly spelled with or without doubling: *combated/combatted*; *combating/combattning*.

In addition the plural or 3rd sg present suffix begins with a vowel when the base ends in a sibilant (§2.1.1), and hence we have the following patterns of doubling:

[10]	i	<i>quiz</i>	<i>quizzes</i>	<i>quizzed</i>	<i>quizzing</i>	[verb]
	ii	<i>fez</i>	<i>fezzes</i>			[noun]

### ■ The letters *h*, *w*, *y*, and *x* are not doubled

It follows from the account of the rule given above that base-final *h*, *w*, *y*, and *x* will not be doubled: they do not represent single consonants. Compare, then:

[11]		VERBS			ADJECTIVES		
	i	<i>hurrah</i>	<i>hurrahed</i>	<i>hurrahing</i>	[no adjectives ending in <i>h</i> ]		
	ii	<i>saw</i>	<i>sawed</i>	<i>sawing</i>	<i>raw</i>	<i>rawer</i>	<i>rawest</i>
	iii	<i>stay</i>	<i>stayed</i>	<i>staying</i>	<i>coy</i>	<i>coyer</i>	<i>coyest</i>
	iv	<i>box</i>	<i>boxed</i>	<i>boxing</i>	<i>lax</i>	<i>laxer</i>	<i>laxest</i>

On the traditional classification of all letters other than *a*, *e*, *i*, *o*, *u* as consonants, examples like these have to be treated as exceptions. But they are not exceptions on the account given here. The letters *h*, *w*, and *y* are never consonant symbols when they occur at the end of a base with final stress: they are always parts of composite symbols (*ah* /ɑː/, *aw* /ɔː/, *ay* /eɪ/, *oy* /ɔɪ/ in the examples of [11]). As for *x*, in base-final position this too is not a consonant symbol; it is a single-letter symbol representing the two-consonant sequence /ks/, and hence it does not fall within the scope of the rule either.

### ■ Exceptions to the consonant doubling rule

There are two exceptions to be stated for the doubling rule.

#### (a) Doubling in bases with non-final stress

[12]	i	<i>travel</i>	<i>travelled</i>	<i>travelling</i>	<i>cruel</i>	<i>crueller</i>	<i>cruellest</i>	[BrE]
	ii	<i>travel</i>	<i>traveled</i>	<i>traveling</i>	<i>cruel</i>	<i>crueler</i>	<i>crueldest</i>	[AmE]

For certain kinds of base, condition [8ii] is waived. The most general case is with bases ending in *l*, where doubling applies in BrE, but not AmE. Condition [8i] on the type of vowel still holds, so that there is no doubling with *travail* (which can take stress on either syllable), just as there isn't with *prevail* (which has final stress), because the vowel symbol is the composite *ai*. For further cases of doubling with non-final stress, see §5.1.

#### (b) Bases ending in *s*

With these (unlike those in *z*, as illustrated in [10]) doubling is not always found before *·es* in bases satisfying conditions [8i–ii]. There are, however, significant differences between nouns and verbs, with doubling much less usual in nouns. **Gas** as a noun has *gases* as its plural form, while as a verb it has *gasses* as its 3rd sg present. The noun **bus** has the plural form *buses*, while with the verb both *busses* and *buses* occur. We will thus take up this matter in the separate sections on the noun and the verb.

### 2.2.2 E-deletion (*like* ~ *lik-ing*, *subdue* ~ *subdu-ing*)

A base-final *e* is generally dropped before suffixes beginning with a vowel. *Like*, for example, loses its final *e* in *lik-ing* but retains it in *like-s*.

We distinguish three cases of base-final *e*:

[13]	i	SIMPLE VOWEL SYMBOL	<i>ac<u>e</u></i>	<i>ac<u>e</u></i>	<i>be</i>	<i>ca<u>e</u></i>	<i>th<u>e</u></i>
	ii	COMPOSITE VOWEL SYMBOL	<i>bl<u>ue</u></i>	<i>dy<u>e</u></i>	<i>ey<u>e</u></i>	<i>fr<u>ee</u></i>	<i>sort<u>ie</u></i>
	iii	MUTE <i>e</i>	<i>ed<u>e</u></i>	<i>hop<u>e</u></i>	<i>lov<u>e</u></i>	<i>pl<u>ane</u></i>	<i>simpl<u>e</u></i>

The *e* in [i] constitutes a vowel symbol by itself, corresponding to /i/, /i:/, /eɪ/, or /ə/. In [ii] the *e* is part of a composite two- or three-letter vowel symbol at the end of the base: *ue*, *ye*, *eye*, etc. **Mute** *e* in [iii] is the residual case, including any base-final *e* not covered in [i–ii].

The *e*-deletion rule does not apply to case [i]; there are few words of this kind and very few places where such bases occur before a vowel-initial suffix, but note the retention of the *e* of *be* in *be-ing* and *be-en*. The main place where *e*-deletion occurs is thus case [iii], where there are few exceptions, at least in inflectional morphology. We take this case first, and then turn to case [ii]; nothing further needs to be said about [i].

### (a) Mute *e*

Application of *e*-deletion is illustrated in:

[14]	i	<i>ed<u>e</u></i>	<i>edg-ing</i>	<i>edg-ed</i>			
	ii	<i>hop<u>e</u></i>	<i>hop-ing</i>	<i>hop-ed</i>			
	iii	<i>take</i>	<i>tak-ing</i>		<i>tak-en</i>		
	iv	<i>simple</i>				<i>simpl-er</i>	<i>simpl-est</i>
	v	<i>square</i>	<i>squar-ing</i>	<i>squar-ed</i>		<i>squar-er</i>	<i>squar-est</i>

As with consonant doubling, *·ed* counts as beginning with a vowel even when it represents /d/ or /t/, as in *edged* and *hoped*, and post-vocalic *r* counts as a consonant in non-rhotic as well as rhotic accents, so that bases like *square* end in mute *e* and undergo the rule.<sup>5</sup>

*E*-deletion applies before the same suffixes as consonant doubling. The result is that with such verb-base pairs as *hope* and *hop* or *plane* and *plan*, distinguished by the presence or absence of mute *e*, the forms with vowel-initial suffixes are distinguished instead by absence or presence of doubling: *hope* ~ *hoping* ~ *hoped* vs *hop* ~ *hopping* ~ *hopped*, or *plane* ~ *planing* ~ *planned* vs *plan* ~ *planning* ~ *planned*.<sup>6</sup>

With the suffixes other than *·ing* we have assumed that the morphological division is before the *e*, e.g. that *hoped* is analysed as *hop-ed*, not *hope-d*. On this account the alternation is in the base, not the suffix. There are two arguments in favour of this analysis.

First, the omission of *e* before *·ing* shows that there is unquestionably alternation in the base: the proposed analysis is simply a generalisation of the rule of *e*-deletion needed for the gerund-participle form. Note here that *e* also drops before non-inflectional suffixes beginning with *i*: compare *pure* ~ *pur-ity*, *simple* ~ *simpl-ify*, etc.

Second, with *·er*, *·est*, and *·en* the proposed division matches the pronunciation: *nic-er*, *nic-est*, *tak-en*, for example, match /naɪs·əʔ/, /naɪs·ɪst/, /teɪk·ən/, and the same holds for *·ed* for bases ending in an alveolar plosive, as in *hat-ed* /heɪt·ɪd/ and *sid-ed* /saɪd·ɪd/. The only troublesome case is *·ed* corresponding to /t/ or /d/, but we have already noted that this behaves like a vowel-initial suffix with respect to consonant doubling, so the present analysis again involves a generalisation of rules motivated elsewhere.

<sup>5</sup>BrE has mute *e* in bases like *centre*, whereas AmE has the spelling *center*, with non-final *e*; the *e* therefore drops in the inflected forms of BrE (*centr-ing* ~ *centr-ed*), but not in AmE (*center-ing* ~ *center-ed*).

<sup>6</sup>Note, however, that in the much rarer type of pair seen in *bathe* vs *bath* the distinction is lost in the inflected forms *bathing* and *bathed*: *e*-deletion applies to *bathe* but consonant doubling cannot apply to *bath* because it doesn't end in a single consonant letter.

(b) The *e* is part of a final composite vowel symbolBases ending in *ue*

[15]	i	<i>subdue</i>	<i>subduing</i>	<i>subdued</i>		
	ii	<i>blue</i>	<i>bluing/blueing</i>	<i>blued</i>	<i>bluer</i>	<i>bluest</i>

Most such bases undergo *e*-deletion, with no *e* appearing in the gerund-participle form: compare *arguing*, *ensuing*, *imbuing*, *pursuing*, *rescuing*, *ruing*. There are, however, a few monosyllabic bases where the rule is optional, as with *blue*: others of this kind are *clue*, *cue*, *glue*.<sup>7</sup>

Bases ending in *ee*, *oe*, *ye*

[16]	i	<i>free</i>	<i>freeing</i>	<i>freed</i>	<i>freer</i>	<i>freest</i>
	ii	<i>hoe</i>	<i>hoeing</i>	<i>hoed</i>		
	iii	<i>dye</i>	<i>dyeing</i>	<i>dyed</i>		

Deletion does not apply here, except that with *eye* (where final *e* is part of a three-letter vowel symbol) it is optional: *eying/eyeing*.

Bases in *ie*

[17]	i	<i>sortie</i>	<i>sortieing</i>	<i>sortied</i>
	ii	<i>lie</i>	<i>lying</i>	<i>lied</i>

In [i] *ie* represents /ɪ/, and the *e* is retained, as with *ee*, *oe*, *ye*; other examples are *birdieing* and *stymieing*. In [ii] *ie* represents /aɪ/; what we have here is not *e*-deletion, but alternation between *ie* and *y*: we return to this case in §2.2.3 below.

## Problems of segmentation

We have not indicated the morphological boundaries in the above forms because in a number of cases the morphological analysis is problematic. The problem arises with those verbs such as *free* which retain *e* before *·ing*: where does the boundary fall in the other forms? Take *freed*, for example. *Fre-ed* is implausible precisely because we do not have \**fre-ing*. But *free-d* has the disadvantage of requiring alternation in the suffix, which otherwise is invariably *·ed* in regular verbs. A possible explanation, perhaps, is in terms neither of *fre-ed* nor of *free-d*, but rather that one *e* has to be omitted because the sequences *eee*, *oee*, *yee*, and *iee* are not permissible in English (\**freed*, \**hoed*, \**dyeed*, \**sortieed*), so that the situation is quite different from that of *·ing* – and it is then immaterial which *e* it is that is said to be omitted. Similar arguments hold for the adjectives *freer* and *freest*, and also with forms like *died* in [20ii].<sup>8</sup>

2.2.3 Y-replacement (*silly* ~ *silli-er*, *try* ~ *trie-s*)

Bases ending in a *y* as a single-letter vowel symbol show the following alternation:

[18]	i	before a suffix beginning with <i>i</i>	<i>y</i> is retained	<i>try</i> ~ <i>try-ing</i>
	ii	before plural or 3rd sg present <i>·s</i>	<i>y</i> is replaced by <i>ie</i>	<i>try</i> ~ <i>trie-s</i>
	iii	elsewhere	<i>y</i> is replaced by <i>i</i>	<i>silly</i> ~ <i>silli-er</i> , <i>silli-est</i>

The inflectional suffixes that trigger replacement of *y* by *i* all begin with *e*, but other types work the same way in lexical word-formation (*deny* ~ *deni-al*, *embody* ~ *embodi-ment*,

<sup>7</sup> The loss of *e* in *catalogue* ~ *catalogu-ing* falls under the mute *e* case, with *gue* a composite consonant symbol, while the retention of *e* in *segue* ~ *segueing* is due to its being a single letter vowel symbol, representing /eɪ/.

<sup>8</sup> Notice that spelling facts from lexical word-formation reinforce this: while *freelance* and *freewheeling* are spelled as unhyphenated words, in *free-enterprise system* a hyphen is called for to prevent the impossible \**freenterprise*.

etc.). Note that *y*-replacement does not apply where *y* is part of a composite vowel symbol. Compare, then, the verbs in [19i], the adjectives in [ii], and the nouns in [iii]:<sup>9</sup>

	SINGLE VOWEL SYMBOL			COMPOSITE VOWEL SYMBOL				
[19]	i a.	<i>try</i>	<i>tries</i>	<i>tried</i>	b.	<i>stay</i>	<i>stays</i>	<i>stayed</i>
	ii a.	<i>silly</i>	<i>sillier</i>	<i>silliest</i>	b.	<i>coy</i>	<i>coyer</i>	<i>coyest</i>
	iii a.	<i>city</i>	<i>cities</i>		b.	<i>guy</i>	<i>guys</i>	

Again it must be emphasised that the rule cannot be stated simply in terms of letters: we need to consider what sounds they represent. Both *guy* and *soliloquy*, for example, end in *uy*, but whereas *y*-replacement does not apply to the former because *uy* is a composite vowel symbol (representing /aɪ/) it does apply to *soliloquy* since *u* is here a consonant symbol (representing /w/) and *y* a simple vowel symbol: the plural form is therefore *soliloquie-s*.

A handful of verbs have final *ie* rather than *y* in the base: ***die***, ***lie***, ***tie***, ***vie***. The other forms, however, are the same as for ***try***:

[20]	i	<i>try</i>	<i>trying</i>	<i>tried</i>	<i>tries</i>
	ii	<i>die</i>	<i>dying</i>	<i>died</i>	<i>dies</i>

For ***die*** the *ie* is the default spelling, so that the replacement works in the opposite direction: *ie* is replaced by *y* before the *-ing* suffix.

#### ■ Analysis of the plural and 3rd sg present forms

It will be noticed that in [18ii] we have analysed the form *tries* as *trie-s* rather than *tri-es*, even though this necessitates special mention of the plural or 3rd sg present suffix: if we had *tri-es* it could be subsumed under the general case of replacement of *y* by *i*. There are two reasons why we have opted for *trie-s*. In the first place, we have just seen that such verbs as ***die*** clearly have an alternation between *ie* and *y* – and note that these spellings also alternate as variants of the diminutive suffix, as in *aunty* ~ *auntie*. Secondly, *-s* is the default alternant of the plural and 3rd sg present suffix (as will be demonstrated in the next section), and there is no reason why the *-es* alternant should appear in such words as *tries* and *cities*: note that it doesn't normally occur in words with a base ending in *i*, as we see from *alibis* and *taxis*.

### 2.2.4 Alternation between *-s* and *-es* in the plural and 3rd sg present tense

This alternation can be most economically described by stating the conditions under which *-es* is used, and then saying that *-s* appears everywhere else: it is in this sense that *-s* can be regarded as the default alternant. This suffix is very different from the default preterite and past participle suffix *-ed*. The difference is particularly clear in pairs like *sip-s* and *sipp-ed*, where *-ed* triggers doubling of the base-final consonant letter *p*.

#### (a) Bases which in speech end in a sibilant

Bases with a final sibilant take *-es*, matching the /ɪz/ of speech. There is no difference between the noun plural suffix and the verb 3rd sg present.

##### Bases spelled with final *s*, *x*, *z*, or *sh*

These are the most straightforward cases, always taking *-es*:

[21]	<i>gas-es</i>	<i>box-es</i>	<i>buzz-es</i>	<i>wish-es</i>
	<i>miss-es</i>	<i>fix-es</i>	<i>fizz-es</i>	<i>lash-es</i>

<sup>9</sup>For some exceptions among the verbs, see §5.1.

The bases here end in /s/, /z/, or /ʃ/ (*x* represents /ks/, the second component of which is sibilant /s/). We have seen that a single *z* doubles and a single *s* may do so, but the suffix is still *·es*: *fezz·es*, *gas(s)·es*.

#### Bases spelled with final *ch*

These take *·es* when the base ends in sibilant /tʃ/ but *·s* in the less common case where *ch* represents non-sibilant /k/:<sup>10</sup>

- [22] i *bench·es*    *branch·es*    *catch·es*    *coach·es*    *lunch·es*    [(t)ch = /tʃ/]  
 ii *epoch·s*    *eunuch·s*    *monarch·s*    *stomach·s*    *triptych·s*    [ch = /k/]

#### Bases ending in mute *e*

Bases ending in the sibilant /dʒ/ have mute *e* in the spelling: *edge*, *judge*, *age*, *change*.<sup>11</sup>

The same applies to the relatively small number ending in /ʒ/ (*mirage*, *barrage*, *rouge*), and to some of those in /s/ (*dose*, *niece*), or /z/ (*gaze*, *nose*), and a small number in /ʃ/ (*douche*, *niche*). This *e* drops before a suffix beginning with a vowel by the *e*-deletion rule (§2.2.2), giving *edg·es*, *mirag·es*, *dos·es*, etc.

An alternative analysis is *edge·s*, which does not involve loss of the base-final *e*. We adopt the analysis *edg·es*, however, since this both matches the pronunciation (/edʒ·ɪz/) and allows a more general statement of the alternation, namely that *·es* occurs with all bases ending in a sibilant. Note, moreover, that these bases do lose the *e* when they are followed by the *·ing* suffix: *edg·ing*, *chang·ing*, *gaz·ing*, etc. (see §5.1 for a few exceptions).

#### (b) Bases ending in *o*

Bases with final *o* take the *·es* alternant if the *o* is preceded by a symbol representing a consonant sound; otherwise they take the default *·s*:

- [23] i *echo·es*    *go·es*    *hero·es*    *potato·es*    *veto·es*    [*o* follows consonant]  
 ii *boo·s*    *embryo·s*    *radio·s*    *studio·s*    *zoo·s*    [no preceding consonant]

The default [ii] covers cases where *o* follows a vowel symbol (*i* or *y*) and those where it is part of a composite vowel symbol (*oo*). There are some exceptions to this rule, with *·s* used after consonant + *o*; almost all involve plural nouns where there is no homophonous verb, such as ***dynamo***: see §§4.1.1, 5.1.

### 3 Grade

The inflectional system of grade applies primarily to adjectives, but also to a few adverbs that do not end in the *·ly* suffix and a handful of determinatives and prepositions (see Ch. 6, §2.2). We look first at the inflectional forms, and then at the distinction between inflectional comparatives and superlatives (e.g. *taller*, *tallest*) and analytic ones (*more distinct*, *most distinct*).

<sup>10</sup>Bases ending in *nch* can be pronounced with /nʃ/ instead of /ntʃ/ (except that in *nudibranch* and *elasmobranch* – types of mollusc and fish – it represents /ŋk/, so these take *·s*). The base *loch* may be pronounced with a velar fricative rather than /k/, but in either case the base does not end in a sibilant and hence takes *·s*.

<sup>11</sup>Foreign words like *hadj* and *raj* are exceptions, but the plurals of these words rarely occur and have somewhat questionable status.

### 3.1 Inflectional comparative and superlative forms

The inflectional suffixes marking comparative and superlative are /əʳ/ and /ɪst/ in speech, ·*er* and ·*est* in writing. The spelling alternations illustrated in [1] have been described in §2.2 and need not be repeated in this section:

[1]	i	<i>big</i>	<i>bigg·er</i>	<i>bigg·est</i>	[consonant doubling]
	ii	<i>nice</i>	<i>nic·er</i>	<i>nic·est</i>	[e-deletion]
	iii	<i>pretty</i>	<i>pretti·er</i>	<i>pretti·est</i>	[y-replacement]

Monosyllabic *dry* and *shy* are optionally exceptions to the *y*-replacement rule, allowing either *y* or *i* before the suffix: *dry* ~ *dryer/drier* ~ *dryest/driest* and *shy* ~ *shyer/shier* ~ *shyest/shiest*.

#### ■ Phonological changes in the base

Addition of the suffixes affects the base as follows:

##### (a) Syllabic /l/

We noted in §2.1 that a base-final syllabic /l/ loses its syllabicity before the suffixes, as they begin with a vowel. The adjectives *little* and *brittle*, however, are exceptions in that the /l/ may optionally remain syllabic – compare:

[2]	i	/ˈsɪmpl/	/ˈsɪmplə/	/ˈsɪmplɪst/	( <i>simple simpler simplest</i> )
	ii	/ˈlɪtl/	/ˈlɪtlə/, /ˈlɪtlə/	/ˈlɪtlɪst/, /ˈlɪtlɪst/	( <i>little littler littlest</i> )

##### (b) Irregular adjectives in /ŋ/

There are only three adjectives with bases ending in /ŋ/ that normally inflect for grade, and all three are irregular in speech (though not in writing), adding /g/ before the comparative and superlative suffixes:

[3]	i	/lɒŋ/	/lɒŋ·əʳ/	/lɒŋ·ɪst/	( <i>long longer longest</i> )
	ii	/strɒŋ/	/strɒŋ·əʳ/	/strɒŋ·ɪst/	( <i>strong stronger strongest</i> )
	iii	/jʌŋ/	/jʌŋ·əʳ/	/jʌŋ·ɪst/	( <i>young younger youngest</i> )

These forms are described as irregular, rather than as following a regular rule of /g/ addition between /ŋ/ and a suffix. This is because there is no evidence of any such rule in standard dialects.<sup>12</sup> Verb bases ending in /ŋ/ take vowel-initial affixes such as /ɪŋ/, as in /sɪŋ·ɪŋ/ (*singing*) and never add /g/, even when they are phonologically identical with the bases in [3] (e.g. /lɒŋ·ɪŋ/, *longing*). Non-inflectional suffixes beginning with a vowel never induce addition of /g/ after /ŋ/, even when they are phonologically identical with the comparative suffix (e.g. /ˈsɪŋ·ə/, *singer*). Regular adjective bases ending in /ŋ/ that are semantically eligible to inflect for grade happen to be almost entirely absent. *Wrong* does not occur in the inflectional comparative or superlative (it may be best treated as a lexical exception), but native speakers read the spelling *wronger* as /rɒŋəʳ/ (and the noun *wronger* /rɒŋəʳ/ “one who wrongs someone”, which is attested, is so pronounced). *Cunning* is likewise seldom if ever found inflected, but the pronunciation /ˈkʌnɪŋɪst/ seems reasonably plausible in comparison with \*/ˈkʌnɪŋgɪst/.

<sup>12</sup>In the dialects of the north of England, there is no irregularity, because /ŋg/ is found instead of final /ŋ/: *long* is pronounced /lɒŋg/, and the comparative and superlative /lɒŋgə/ and /lɒŋgɪst/ are regular. What has happened in all other dialects is that word-final /g/ has been lost after /ŋ/ but retained in the inflected forms of *long*, *strong*, and *young*, creating a mismatch with the base.

### ■ Irregular inflection

The following have irregular forms:

[4]	i	<i>good, well</i>	<i>better</i>	<i>best</i>
	ii	<i>bad, badly</i>	<i>worse</i>	<i>worst</i>
	iii	<i>much, many</i>	<i>more</i>	<i>most</i>
	iv	<i>little</i>	<i>less</i>	<i>least</i>
	v	<i>far</i>	<i>farther/further</i>	<i>farthest/furthest</i>

As indicated in [i–iii], the distinction between *good* and *well*, *bad* and *badly*, *much* and *many* is lost in the comparative forms. *Well* and *badly*, moreover, can be adjectives or adverbs. Compare, for example:

[5]	i	a. <i>This one is <u>good</u>.</i>	b. <i>That one is <u>better</u>.</i>	[adjective]
	ii	a. <i>I'm feeling <u>well</u>.</i>	b. <i>I'm feeling <u>better</u>.</i>	
	iii	a. <i>They played <u>well</u>.</i>	b. <i>They played <u>better</u> than ever.</i>	[adverb]

*Better* in [iib], moreover, is ambiguous between the ordinary comparative sense “better than before”, and the sense “recovered, well again”.

In addition, **old** has the regular forms *older* and *oldest*, but also irregular *elder* and *eldest*, as used in:

[6]	i	<i>my elder brother</i>	<i>her eldest daughter</i>
	ii	<i>the elder (of the two)</i>	<i>the eldest (of them)</i>

These forms are highly restricted both semantically and syntactically. Semantically, they indicate relative order of birth within a family – contrast *\*the elder of the two editions*. Syntactically, they modify a following noun, as in [i], or appear in fused modifier-head function, as in [ii]. *Elder* can't be used predicatively (*\*Which one is elder?*) or with *than* (*\*an elder brother than Max*). The regular forms can be used as variants of the irregular ones in [6]. *Elder* is also used in the idioms *elder statesman/ stateswoman* and is the source for the converted noun **elder**.

## 3.2 Inflectional vs analytic comparatives and superlatives

### ■ Adjectives

Many adjectives allow both types, many others only the analytic type, and a few only the inflectional:

[7]		INFLECTIONAL		ANALYTIC	
	i	<b><i>lively</i></b>	<i>livelier</i>	<i>liveliest</i>	<i>more lively</i> <i>most lively</i>
	ii	<i>public</i>	<i>*publicer</i>	<i>*publicest</i>	<i>more public</i> <i>most public</i>
	iii	<b><i>good</i></b>	<i>better</i>	<i>best</i>	<i>*more good</i> <i>*most good</i> <sup>13</sup>

There is no simple set of rules to indicate which adjectives take which type: in many cases it is a matter of more or less likely rather than possible or impossible.

<sup>13</sup>The asterisks here apply to the use of these expressions as ordinary comparatives/superlatives. *More good* is possible in metalinguistic comparison, where inflectional comparatives are excluded: *I'd say it was more good than excellent* (“more properly classified as good than as excellent”). *Most good* has *most* as an intensifier, not a strict superlative marker: *It was most good of you to invite us*.

There are some generalisations that can be made, however. One is that participial adjectives, as illustrated in [8], take only analytic forms:

- [8] i *amazing amusing boring frightening pleasing wearing worrying*  
 ii *amazed amused bored frightened pleased worn worried*

(A marginal exception is *tired*, though *more tired* is much more usual than *tireder*.)

The remaining generalisations are best dealt with by separating adjectives out into sets according to the syllabic composition of the base.

#### (a) Monosyllables

Adjectives with monosyllabic bases almost always have inflected forms, but there are some that do not. First, the generalisation mentioned just above overrides monosyllabicity: participial adjectives do not have inflected forms even when they are monosyllabic. Second, there are also a few morphologically simple exceptions:

- [9] *cross, fake, ill, like, loath, prime, real, right, worth, wrong*

These do not inflect – or at least, their inflected forms are in practice virtually never encountered. This is not because these adjectives do not express gradable properties: there can certainly be degrees to which one can be cross with someone, loath to do something, or in error; yet *\*crosser*, *\*loather*, and *\*wronger* appear never to occur.

Most monosyllables allow analytic forms, either as an alternative to inflection or as the only way to express comparative or superlative degree, but the irregular inflectional forms *better*, *worse*, *further* pre-empt use of *\*more good*, *\*more bad*, *\*more far*, and the inflectional forms are very much more usual with such common adjectives as ***big, large, small, high, low, fat, thick, thin, long, tall, short, fast, slow, hot, cold, cool, old, young, clean, great, wide***.

#### (b) Disyllables

With disyllables the analytic forms are always possible, while the inflectional ones are sometimes possible and sometimes not. Many of the conditions making inflection impossible relate to the ending of the lexical base. With initially stressed bases, the endings in [10i] (only the first two of which have the status of suffixes) generally permit inflection, while those in [10ii] reliably exclude it:

- [10] i *·y angry, dirty, early, easy, funny, happy, hungry, noisy, pretty, silly*  
*·ly beastly, costly, deadly, friendly, ghastly, ghostly, likely, lovely, manly*  
*le able, ample, feeble, gentle, humble, little, noble, purple, simple, subtle*  
*ow hollow, mellow, narrow, sallow, shallow, yellow*  
 ii *·ful bashful, careful, cheerful, faithful, graceful, harmful, skilful, useful*  
*·ish boorish, boyish, brutish, fiendish, foolish, priggish, sheepish, ticklish*  
*·al focal, global, legal, lethal, local, moral, primal, rural, venal, vital, vocal*  
*·ic caustic, chronic, comic, cyclic, epic, magic, manic, public, septic, tragic*  
*·ous anxious, bumptious, callous, cautious, conscious, famous, jealous, porous*

There can be no doubt, however, that the matter is very much lexically determined, and certainly not a matter of phonology; note, for example, the following contrasts

between pairs of disyllabic initially stressed bases with phonologically identical endings:

- [11] i *stupid handsome common clever wicked pleasant* [inflection allowed]  
 ii *placid awesome wanton eager rugged mordant* [no inflection]

The above examples all have the stress on the first syllable, but we find the same differences among bases with stress on the final syllable. Thus *demure, mature, obscure, polite* can inflect but *secure, superb, effete, and replete* do not. It should also be borne in mind that there is no hard and fast boundary between those that can inflect and those that can't: speaker judgements are by no means wholly uniform.<sup>14</sup>

### (c) Bases with more than two syllables

These normally allow only the analytic forms.<sup>15</sup> One systematic exception is where the prefix *un-* is added to a disyllabic adjective that inflects: *unhappy ~ unhappier ~ unhappiest*. There are one or two other exceptions, such as *shadowy* and *slippery*, but the forms *shadowier, slipperier*, etc., are rare and perhaps only marginally acceptable.

## ■ Adverbs

Most gradable adverbs take analytic forms: *softly ~ more softly ~ most softly*. Only a handful of adverbs have regular comparative and superlative inflection:

- [12] *early fast hard late long often soon*

The majority of gradable adverbs have bases formed with *-ly*, and the inflectional endings are never attached to bases of this kind: *early* of course is not an exception, since it is not formed from an adjective base *\*ear*.

All the adverbs in [12] except *often* and *soon* are homonymous with adjectives. *Often* is a somewhat marginal member of this class: the analytic forms are much more frequent and for some speakers are the only possibility. With the others, however, only the inflectional forms are normally possible: *The meeting lasted longer / \*more long than usual*.

*Earlier* and *later* have a wider range of meaning than the corresponding plain forms. In such examples as *Earlier he had adopted a rather aggressive position* and *I later realised he had been joking*, where a *than* complement could not be added, the meanings are approximately “previously” and “subsequently”; the plain forms have no corresponding use.

### Adverb pairs of the type *loud ~ loudly*

There are a number of pairs of adverbs where one is formed from the adjective by *-ly* suffixation and the other by conversion: *loud ~ loudly, easy ~ easily, slow ~ slowly, quick ~ quickly*. The ones with simple bases have regular inflection (*loud, louder, loudest*), while those with the *-ly* suffix take analytic *more/most* (*loudly, more loudly, most loudly*). The former are of more limited distribution than the latter, and are commonly subject to

<sup>14</sup>Historically, there has been a trend to move increasingly towards the analytic, though with fluctuations in the treatment of disyllabic adjectives during the twentieth century. Early Modern English used the inflectional type more freely (*apter, privatest*) and sometimes allowed both types to be combined (*the most unkindest cut of all*) – a doubling damned out of existence by prescriptivists – and even in the nineteenth century there were occasional examples like *properer, playfullest, scornfullest, sociablest*.

<sup>15</sup>Lewis Carroll's *\*curiouser and curiouser*, involving a trisyllabic base in *-ous*, is ungrammatical, and was intended jocularly, or as indicating that his young heroine Alice had not quite grasped the limitations of the inflectional system yet.

prescriptive criticism. The inflected forms, however, tend to be somewhat less restricted and more acceptable than the plain form without *-ly*:

- [13] i a. *They complained loudly/\*loud about the service*  
       b. *They complained louder than anyone else*  
 ii a. *He was walking quite slowly/\*slow because of his injury*  
       b. *He was walking slower than usual*

## 4 Nouns

Prototypical nouns inflect for number and case. The singular non-genitive is identical with the lexical base, and genitive marking is added after the plural marking: we will therefore look first at plural formation and then at genitives.

### 4.1 Plural formation

There are a number of types of plurals: regular *-s* plurals, *-s* plurals accompanied by modification of the base (as in *wives*), base plurals (identical in form to the singular, and hence to the base, such as *species*), plurals with vowel change (such as *geese*, from base *goose*), a small set with the suffix *-en* (*oxen*, etc.), and foreign plurals of various kinds.

#### 4.1.1 Regular *-s* plurals (*cats, dogs, horses*)

We begin with nouns whose plural is regular in speech, presenting first the phonological alternation, and then the spelling ones.

##### ■ Plurals in speech: the alternation between /ɪz/, /s/, and /z/

This alternation (already described in §2.1) is entirely predictable in terms of the final consonant of the base:

- [1] i /ɪz/ after the sibilants /s/, /z/, /ʃ/, /ʒ/, /tʃ/, and /dʒ/  
       ii /s/ after other voiceless consonants  
       iii /z/ after other voiced sounds (including all vowels)
- [2] i /hɔːɾs·ɪz/ /bʊʃ·ɪz/ /mɪrɑːʒ·ɪz/ /tʃɜːtʃ·ɪz/ (*horses bushes mirages churches*)  
       ii /kʌp·s/ /kæt·s/ /wɪk·s/ /klɪf·s/ (*cups cats wicks cliffs*)  
       iii /kʌb·z/ /rɒd·z/ /hɪərəʊ·z/ /zuː·z/ (*cubs rods heroes zoos*)

##### ■ Plurals in writing: spelling alternations

###### Nouns ending in *y*

As we noted in [19] of §2.2.3, *y* remains intact when it forms part of a composite vowel symbol; otherwise (when it represents a vowel sound on its own) the *y* drops and the plural has *ies*:

- [3] i *guy* ~ *guys*      *quay* ~ *quays*      *donkey* ~ *donkeys*      *honey* ~ *honeys*  
       ii *lady* ~ *ladies*      *baby* ~ *babies*      *city* ~ *cities*      *soliloquy* ~ *soliloquies*

Two optional exceptions are *money* and *trolley*: the plurals can be spelled *monies*, *trollies* as well as *moneys*, *trolleys*. And the replacement rule does not apply to compounds in *-by* (*laybys*, *standbys*); to the informal *poly*, a clipping formed from *polytechnic* (*polys*); or to proper nouns (see §4.1.8).

### The alternation between *-s* and *-es*

(a) Bases ending in a sibilant take *-es*, matching spoken /ɪz/, as described in §2.2.4; where the base ends in *e* it is deleted before the vowel of the suffix:

[4] *bench-es box-es bush-es buzz-es judg-es kiss-es ros-es*

(b) With bases ending in *o*, where *o* does not follow a consonant symbol (i.e. where it is preceded by a vowel or is part of the composite vowel symbol *oo*), the plural takes *-s*:

[5] *bamboos, cameos, embryos, folios, kangaroos, patios, radios, studios, zoos*

(c) Where *o* does follow a consonant, the plural has to be specified for the lexeme concerned. There are three classes:

[6] i *-es* only: *echo ~ echoes*. Also ***domino, embargo, hero, mango, negro, potato, tomato, torpedo, veto***

ii *-s* or *-es*: *motto ~ mottos/mottoes*. Also ***archipelago, banjo, buffalo, cargo, dado, dodo, grotto, halo, innuendo, manifesto, mulatto, proviso, tornado, volcano***

iii *-s* only: *bistro ~ bistros*. Also ***calypso, do, dynamo, beano***; clippings such as ***demo, kilo, memo, photo***; nouns of Italian origin: ***cello, concerto, contralto, libretto, maestro, piano, quarto, solo, soprano, virtuoso*** (but see also §4.1.6); and names of ethnic groups: ***Chicano, Eskimo, Filipino, Texano*** (see also §4.1.3).

***Cargo*** and ***volcano*** are marginal members of class [ii]: they usually take *-es*, but the forms *cargos* and *volcanos* are sometimes found.<sup>16</sup>

(d) Other bases take the default alternant *-s*. This includes bases ending in a vowel other than *o*: *arenas, cafés, alibis, tutus*. A marginal exception is that *taxies* is very occasionally found instead of the more normal *taxis*.

### Doubling of final consonant of the base

The general rule of final consonant doubling (§2.2.1) is of very limited relevance to plural formation, since the default suffix *-s* does not begin with a vowel. Doubling is found only before *-es*; after base-final *z* it is obligatory, while after *s* it is sometimes available as a less favoured alternant, but most often excluded:

[7] *quiz ~ quizzes plus ~ pluses/plusses bus ~ buses*

In accordance with the general rule, doubling is not normally permitted in bases like *atlas* or *surplus* that have non-final stress; *biasses* and *focusses* are very occasionally found, but these spellings are very largely restricted to the 3rd sg present verb-forms.

### Plurals with 's

An apostrophe may be used to separate the plural suffix from the base with letters, numbers (notably dates), symbols, abbreviations, and words used metalinguistically:

[8] i *p's and q's, 1960's, &'s, Ph.D.'s, if's and but's*  
ii *She got four A's and two B's.*

<sup>16</sup>For ***do*** in the colloquial sense of “social event”, which is converted from the verb and pronounced /duː/, the plural is sometimes spelled *do's*, with the apostrophe separating the suffix from the base, so that it is not misconstrued as affecting the pronunciation of *o* (cf. also [8]).

This practice is less common than it used to be; with dates and abbreviations ending with an upper case letter, the form without the apostrophe is now more usual: *in the 1960s, two candidates with Ph.D.s*.

#### 4.1.2 Irregular -s plurals: modification of the base (*wives, mouths, houses*)

We turn now to nouns where the plural is irregular in speech in that it involves an unpredictable change from a voiceless to a voiced final consonant. The consonants concerned are /f/, /θ/, and (one example only) /s/; only with /f/ is the change reflected in the spelling, with *f* being replaced by *v* or *ve*.

##### (a) Bases with final /f/

There are three classes of noun here: those where voicing is obligatory, those where it is optional, and those where it is excluded.

[9]	i	<b>knife</b>	/naɪf/		/nɑ:vz/	<i>knife</i>		<i>knives</i>		[/v/ only]
	ii	<b>wharf</b>	/wɔ:ɾf/	/wɔ:ɾfs/	/wɔ:ɾvz/	<i>wharf</i>	<i>wharfs</i>	<i>wharves</i>		[/f/ or /v/]
	iii	<b>chief</b>	/tʃi:f/	/tʃi:fs/		<i>chief</i>	<i>chiefs</i>			[/f/ only]

While native-English bases with final /f/ can have *f* or *fe* in the spelling, those with final /v/ always have *ve*. When modification applies, therefore, final *f* is replaced by *ve*, as in *wharve*-s. Membership of the three classes is illustrated in:

[10]	i	/v/ only	<b>calf, elf, knife, leaf, life, loaf, self, sheaf, shelf, thief, wife, wolf</b>
	ii	/f/ or /v/	<b>dwarf, half, handkerchief, hoof, roof, scarf, wharf</b>
	iii	/f/ only	<b>belief, chief, cliff, muff, oaf, photograph, proof, safe, tough, waif</b>

Nouns with compound bases such as *cloverleaf* and *housewife* generally belong in the same class as the final base, i.e. class [i] for these examples. However, *cloverleaf* in the sense of a complicated road junction would normally belong in [iii], with the regular plural *cloverleaves*, as would the expression *still life*. *Dwarf* is a rather marginal member of [ii]: the voiced variant is comparatively rare. With *half*, by contrast, voicing (shown in the spelling *halves*) is normal in the sense “half-portions”, with the plural in /fs/ restricted to various other senses, such as “half-backs” in soccer or rugby. *Handkerchief* and *roof* belong in [ii] only with respect to speech: in writing they belong in [iii]. Nouns spelled with anything other than a single final *f* or *fe* are all regular, belonging in [iii].

##### (b) Bases with final /θ/

Voicing may be obligatory, optional, or excluded, with no change in the spelling:

[11]	i	<b>mouth</b>	/maʊθ/	/maʊðz/	<i>mouth</i>	<i>mouths</i>			[/ð/ only]
	ii	<b>oath</b>	/oʊθ/	/oʊθs/, /oʊðz/	<i>oath</i>	<i>oaths</i>			[/θ/ or /ð/]
	iii	<b>death</b>	/deθ/	/deθs/	<i>death</i>	<i>deaths</i>			[/θ/ only]
[12]	i	/ð/ only	<b>mouth</b>						
	ii	/θ/ or /ð/	<b>lath, moth, oath, sheath, truth, wreath, youth</b>						
	iii	/θ/ only	<b>berth, birth, breath, death, length, strength</b>						

*Path* belongs to [i] in BrE but to [ii] in AmE, and *hearth* belongs to [ii] in BrE but to [iii] in AmE. For *youth* in the sense “boy, young man” the plural is normally /ju:ðz/, with /ju:θs/ confined to the sense “period of age” (e.g. *in our youths*).

## (c) Bases with final /s/

There is just one noun, **house**, that has obligatory voicing, but no change in the spelling; all other such nouns are regular:<sup>17</sup>

- |        |              |        |          |          |              |               |
|--------|--------------|--------|----------|----------|--------------|---------------|
| [13] i | <b>house</b> | /haʊs/ |          | /haʊzɪz/ | <i>house</i> | <i>houses</i> |
| ii     | <b>dose</b>  | /doʊs/ | /doʊsɪz/ |          | <i>dose</i>  | <i>doses</i>  |

4.1.3 Base plurals (*cod, bison, series, Chinese, craft*)

With some nouns, the plural has the same form as the singular and is thus identical with the base: we speak here of **base plurals**. Compare, for example: *A sheep has escaped* (singular), *Two sheep have escaped* (plural). This case is to be distinguished from that where a noun has no plural form: **sheep** has syncretism between singular and plural, **equipment** has only a singular form. We also exclude items like **cattle** and **police** which are invariably plural. Finally, we take examples like *She's six foot tall* to involve a special use of the singular form rather than a base plural: the difference between this and *How many feet are there in a mile?* is a matter of syntax rather than of inflectional morphology. These exclusions leave the following cases of base plurals.

## (a) Nouns denoting edible and game fish

- [14] **carp, cod, haddock, hake, mackerel, perch, roach, salmon, trout, turbot**

These (and others of the same semantic class) almost always have base plurals: *We caught three salmon*. However, with some, if not all, the regular *-s* plural might be used when referring to fish being purchased for food, especially when there is reference to individuals, as in *three herrings* – as well as with reference to “kinds of”, as with count uses of basically non-count nouns (Ch. 5, §3.1). The noun **fish** itself, with base plural *fish* and regular *fishes*, is also of this type, and similarly such compounds as **goldfish** and **swordfish**.

## (b) Nouns denoting game animals and birds

This is an area where there is a good deal of variation in usage, but we can broadly distinguish the following classes:

- |        |   |                          |
|--------|---|--------------------------|
| [15] i | <b>bison, deer, grouse, moose, swine</b>            | [base plural only]       |
| ii     | <b>elk, quail, reindeer</b>                         | [base or regular plural] |
| iii    | <b>elephant, giraffe, lion, partridge, pheasant</b> | [base plural restricted] |

The nouns in [i] do not have a regular *-s* plural, only the base plural. Those in [ii] allow both types: *We saw three elk/elks*.<sup>18</sup> Those in [iii] normally have a regular plural as the only possibility, as in *The three elephants/\*elephant were the main attraction*; base plurals, however, are found in the context of hunting and shooting (*They were hunting elephant*) or when referring to collections of them (*a herd of elephant*). It is arguable, however, that the latter construction involves not a base plural, but a special use of the singular in certain syntactic contexts (comparable to the *six foot tall* construction mentioned above).

<sup>17</sup>Including **spouse**, since here there is alternation between /s/ and /z/ in both singular and plural.

<sup>18</sup>**Swine** belongs in [ii] when used as a term of abuse, usually applied to humans.

## (c) Nouns with bases ending in /s/ or /z/

Regular nouns of this kind take the /ɪz/ suffix (e.g. *loss* ~ *losses*), but there are various kinds which have the same form as the singular:

- [16] i *barracks, crossroads, dice, gallows, headquarters, innings, kennels, links, means, mews, oats, series, species, works*  
 ii *Chinese, Japanese, Lebanese, Maltese, Portuguese, Vietnamese; Swiss*

Many of those in [i] look like ordinary plural forms, but in fact can be used as either singular or plural: *There is one more crossroads* ~ *There are two more crossroads*; *She played a good innings* ~ *two good innings*; *It is the biggest meatworks in the state* ~ *There are few meatworks still operating*. The *·s* element in such cases is therefore to be interpreted as part of the lexical base (see Ch. 5, §3.2.3). *Dice* is etymologically the plural of *die*, but the latter is virtually no longer in use (outside the fixed phrase *The die is cast*), with *dice* reanalysed as the lexical base: *another dice* ~ *a pair of dice*.

The items in [ii] are nationality terms in *·ese*, together with *Swiss*. In some varieties of English, these behave as singular nouns with base plurals: *a Chinese/Swiss* ~ *two Chinese/Swiss*. However, this usage is lessening in frequency, and count noun usages like *a Chinese* sound old-fashioned or even slightly offensive to some speakers, for whom plurals like *the Chinese* and *the Swiss* are acceptable but have the structure of generic plural constructions with nationality adjectives, like *the French* or *the English* (cf. *\*a French, \*two English*); see Ch. 19, §5.6.2.

## (d) Tribal and ethnic names

Such names as the following have both base and regular plurals (*The Kikuyu/Kikuyus do not share these beliefs*):

- [17] *Apache, Bantu, Bedouin, Hopi, Inuit, Kikuyu, Navaho, Sotho, Xhosa, . . .*

*Sioux* has only a base plural in writing, but in speech the singular is /su:/ and the plural /su:/ or /su:z/.

## (e) Other cases

*Craft* and *offspring* have only base plurals: *One craft was damaged* ~ *Two craft were damaged*. The usual plural of *ski* is the regular *skis*, but *ski* is also found. Compounds in *·man* also belong here in speech, with *policeman* and *policemen* both pronounced with /mən/, and conversely such French borrowings as *chassis* and *corps* have base plurals in writing but not in speech (§4.1.6).

4.1.4 The vowel change plurals (*teeth, mice, men*)

There are seven nouns where the plural is formed by changing the vowel of the base:

- [18] i a. /tu:θ/ /ti:θ/ *tooth teeth* b. /mæn/ /men/ *man men*  
 ii a. /gu:s/ /gi:s/ *goose geese* b. /'wʊmən/ /'wɪmɪn/ *woman women*  
 iii a. /fʊt/ /fi:t/ *foot feet*  
 iv a. /laʊs/ /laɪs/ *louse lice*  
 v a. /maʊs/ /maɪs/ *mouse mice*

The only generalisation that can be made about these is that the [a] examples involve alternations between a back vowel in the singular and a front vowel in the plural – in

[ia–iia] /u:/ or /ʊ/ alternating with /i:/, and in [iva–va] /aʊ/ alternating with /aɪ/ (where it is just the second component of the diphthong that alternates). For the [b] items *man* and *woman*, the changes in the written form are alike (*a* to *e*), but they are quite different in the spoken form (/men/ and /wɪmɪn/). In complex bases in *·man* the vowel difference between /æ/ and /e/ is normally lost, with both reduced to /ə/: the result is that these therefore have base plurals in the spoken language, as noted above.<sup>19</sup>

#### 4.1.5 The *·en* plurals (*oxen, children, brethren*)

Three nouns show fossilised remnants of an Old English weak ending *·en*:

[19] i	/ɒks/	/ɒksən/	<i>ox</i>	<i>oxen</i>
ii	/tʃaɪld/	/tʃɪldrən/	<i>child</i>	<i>children</i>
iii	/'brʌðəʃ/	/'breðrən/, /'breðrɪn/	<i>brother</i>	<i>brethren</i>

Only the first has a simple addition of *·en* to the base. With *children* there is also the addition of *r* and a vowel change in speech, while *brethren* has vowel change in both speech and writing. *Brother* also has a regular plural, *brothers*: the form *brethren* is restricted in its application to members of an organisation or religious group.

#### 4.1.6 Foreign plurals (*formulae, curricula, phenomena, crises*)

Many words borrowed from other languages have been completely anglicised and have only regular plurals. Others have the plurals of the languages from which they are taken, either as the only possibility or as a variant of a regular plural. Many of the foreign plurals are restricted to scientific or technical genres or to formal style. In informal speech the regular plural forms tend to be preferred where they exist; except in specialised contexts, use of the more exotic foreign plurals is often regarded as pedantic or affected.

One problem is that there is no way of identifying foreign words from the form of the base. Although some endings are found with one type of foreign word, others are found with words of quite varied origin – for example, final *a* is characteristic of one class of nouns in Latin, but is also found in such words as *algebra* (from Arabic) and *phobia* (from Greek). Furthermore, an ending may be indicative of a particular foreign language origin, but not restricted to the class of nouns having a certain type of plural. While *us*, for example, is found with a fair number of nouns from Latin that have *i* in the plural (e.g. *alumnus* ~ *alumni*), *corpus* (plural *corpora*) does not belong to this class; nor do *foetus* and *prospectus*. Similarly, *polygon* does not belong to the same class as *phenomenon* in Greek.

Some words that are etymologically foreign plurals have been reanalysed as singulars in English: this has happened where the original singular form is relatively uncommon or no longer in use at all (see Ch. 5, §3.2.4). The reanalysis may be complete, as with *agenda*, which is no longer used as a plural (and is in fact the base for a regular plural *agendas*), or incomplete, with singular and plural uses co-existing, as with *data*. See the comments below on *algae, data, insignia, candelabra, bacteria, strata, media, criteria, confetti, macaroni*.

<sup>19</sup>Pluralisation by vowel change is now effectively dead, and new uses and adaptations of the above words are beginning to show regular plurals. Thus when *louse* is used to mean “despicable person” it has the plural *louses*, and *mouses* is becoming increasingly common as the plural of *mouse* in the sense of a computer cursor-movement peripheral.

## ■ Latin plurals

From Latin there are four common patterns:

[20]	LATIN PLURAL	REGULAR PLURAL
i <i>formula</i>	<i>formulae</i>	<i>formulas</i>
ii <i>radius</i>	<i>radii</i>	<i>radiuses</i>
iii <i>curriculum</i>	<i>curricula</i>	<i>curriculumms</i>
iv <i>index</i>	<i>indices</i>	<i>indexes</i>

The Latin plural involves changing the ending of the base, while the regular plural adds the plural suffix to the base. For patterns [i–iii] there are some words which allow only the Latin plural, some that allow either, and others that allow only the regular plural. Thus for [i] *larva* takes only the Latin plural, replacing *a* by *ae* (*larvae*/\**larvas*); *formula* takes both (*formulae*/*formulas*); and *arena* takes only the regular English plural (*arenas*/\**arenae*). For pattern [iv] we have only the second and third of these possibilities.

### (a) Bases ending in *a*

Bases of the three types just distinguished are shown in [21], those in [i] taking only the Latin plural, those in [ii] allowing either, and those in [iii] taking only the regular English plural:

[21] i <i>ae</i> only	<i>alga, alumna, larva</i>
ii <i>ae</i> or <i>s</i>	<i>amoeba, antenna, fibula, formula, lacuna, nebula, persona, retina, tibia, vertebra</i>
iii <i>s</i> only	<i>algebra, area, arena, dilemma, encyclopedia, guerrilla, phobia, quota, replica, rumba</i>

The nouns in [iii] have a variety of origins – Arabic (*algebra*), Greek (*phobia*), Spanish (*rumba*): only *area* and *arena* belong etymologically with those in [i–ii]. The normal pronunciation of *ae* is /i:/, but /aɪ/ is found as a variant in *algae, formulae, lacunae*, and /eɪ/ in *vertebrae*. Singular *alga* is uncommon and *algae* is often reanalysed as non-count singular.

### (b) Bases ending in *us*

The Latin plural of bases ending in *us* replaces this ending by *i*; the default pronunciation of this is /aɪ/, but the nouns marked † in [22] have a variant pronunciation with /i:/.

[22] i <i>i</i> only	<i>alumnus, bacillus</i> †, <i>homunculus, locus, rectus, stimulus</i> †
ii <i>i</i> or <i>es</i>	<i>abacus, cactus</i> †, <i>focus</i> †, <i>fungus</i> †, <i>hippopotamus, narcissus, nucleus</i> †, <i>radius, stylus, syllabus, terminus, thesaurus, uterus</i>
iii <i>es</i> only	<i>apparatus, census, excursus, foetus, hiatus, impetus, prospectus, status, virus</i>

*Foci* with the /aɪ/ suffix usually has /s/ rather than /k/ in the base. None of the nouns in [iii], apart from *virus*, belongs etymologically with those of [i–ii]. Similarly, *corpus, genus*, and *opus* do not belong in this group etymologically; they have either the Latin plurals *corpora, genera, opera*, or the regular ones in *es*. *Octopus* does not belong here etymologically either (it derives, indirectly, from Greek); it behaves like the nouns in [ii], though *octopuses* is more common than *octopi* (which is often criticised by prescriptivists).

(c) Bases ending in *um*

The Latin plural here replaces *um* by *a*, normally pronounced /ə/. Again we have three classes:

- [23] i *a* only      ***addendum, bacterium, corrigendum, datum, desideratum, erratum, labium, ovum, pinetum, quantum***  
 ii *a* or *s*      ***aquarium, candelabrum, curriculum, honorarium, maximum, memorandum, millennium, moratorium, plectrum, podium, referendum, spectrum, stadium, stratum, symposium, ultimum album, asylum, chrysanthemum, conundrum, forum, geranium, harmonium, mausoleum, museum, pendulum, premium***  
 iii *s* only

*Agenda* and *insignia* belong here etymologically but the forms in *um* are no longer used: *agenda* is now a count singular with a regular plural and *insignia* is treated as either plural or non-count singular. *Candelabrum* is also rare: for many people it is no longer in use, with *candelabra* now a singular like *agenda*. Similarly, singular *bacterium* is rare outside scientific contexts and *bacteria* is elsewhere often used as either singular or plural. *Strata* can also be found reanalysed as a singular with the meaning “level in society” and with *stratas* as plural, but this usage is widely regarded as non-standard. **Medium** in the sense “spiritualist” belongs in [iii], with *mediums* as plural; *media* is used in a range of senses, most commonly as a cover term for television, radio, and the press: here it is either plural (but with singular *medium* extremely rare) or non-count singular.

(d) Bases ending in *ex* or *ix*

The Latin plural replaces these endings by *ices*. This time we distinguish just two classes; the nouns in [24i] allow either the Latin or the regular plural, and those in [ii], which do not belong to the same etymological class, have only regular plurals:

- [24] i *ices* or *es*      ***apex, appendix, cervix, codex, cortex, helix, ibex, index, latex, matrix, tortix, vortex***  
 ii *es* only      ***annex, crucifix, reflex, spinifex***

Dictionaries give only *codices* for **codex**, but the term is an uncommon and technical one and without reference to a dictionary one might well use *codexes* (and similarly for **tortix**). There are no examples comparable to *larva* in [21], **stimulus** in [22], **desideratum** in [23], where regular plurals are quite clearly out of the question. With **index** the two plurals usually correspond to different senses, *indexes* applying to alphabetical reference lists in publications, *indices* to raised numerals in mathematics. With **appendix** the Latin plural is commonly used for additions included at the end of a publication and the regular plural for parts of the body, but the correlation is a good deal weaker than with **index**.

There are also a few nouns in *x* that have *ges* in the plural: *larynx* ~ *larynges*; similarly **pharynx** and **coccyx**. These are also found with regular plurals.

## ■ Greek plurals

There are two types to be considered.

- [25] i *basis*              *bases*              /'beɪsɪs/              /'beɪsɪːz/  
 ii *phenomenon*      *phenomena*      /fə'nɒmɪnən/      /fə'nɒmɪnə/

For the spoken versions of type [ii] the plural simply drops the final /n/ of the base.

### ■ Plural marked on both elements

This is found when the first base is *man* or *woman* and it stands in an ascriptive type of relation to the second: *menservants*. *Menservants* should be contrasted with *man-eaters*, where the relationship is not ascriptive: menservants are men, but man-eaters are (generally) not.

### 4.1.8 Proper nouns (*Joneses, Marys*)

Proper nouns may be used in the plural in constructions like *The Hudsons have invited us over*; *We must keep up with the Joneses*; *There are five Davids in the class* (Ch. 5, §20.4). In such cases the base always remains unchanged in both speech and writing, and takes the regular suffixes: the Wolf family are referred to as *the Wolfs* (not as *\*the Wolves*), people called *Mary* can be referred to collectively as *Marys* (not *\*Maries*).

This principle extends to common nouns used as proper names. For instance, three copies of the publication ‘Woman’ would be referred to as *three Womans*.

## 4.2 The genitive

In this chapter we are concerned solely with head genitives, those that are marked on the head noun of the genitive NP, as in [*the duke's*] *children*; phrasal genitives like [*the Duke of York's*] *children* are discussed in Ch. 5, §16.6.

From the point of view of inflectional morphology there are two types of genitives, which we call **'s genitives** (as in *dog's*) and **bare genitives** (as in *dogs'*).

### ■ The 's genitive

This is the default alternant: it occurs except in the special circumstances described below where the non-genitive ends in /s/ or /z/. In speech the ·'s suffix has the same three alternants as we have in regular plurals and 3rd person sg present tense verbs – /ɪz/ after sibilants, /s/ after voiceless non-sibilants, and /z/ after voiced non-sibilants:

[33] /hɔːɾs·ɪz/ *horse's*    /kæt·s/ *cat's*    /dɒg·z/ *dog's*

In writing it is invariantly 's. The apostrophe separates the suffix from the base, which does not undergo any of the regular or irregular modifications that apply in plural formation:

[34] i *wife's*    *lady's*    *potato's*    *quiz's*    [genitive singulars]  
 ii *wives*    *ladies*    *potatoes*    *quizzes*    [non-genitive plurals]

### ■ The bare genitive

In writing this has the form of an apostrophe at the end of the word: *dogs'*. In speech it has no realisation at all, such genitives being identical with the non-genitive: /dɒgz/. Notice then that, as spoken, /dɒgz/ is ambiguous between genitive singular *dog's*, non-genitive plural *dogs*, and genitive plural *dogs'*.

The bare genitive is normally restricted to nouns ending in s. It is either obligatory or else optional, with the 's genitive as a variant:

[35] i *cats'*    *dogs'*    *horses'*    *wives'*    *indices'*    *theses'*    *species'*    [obligatory]  
 ii *Socrates'*    *Xerxes'*    *Moses'*    *Jesus'*    *Burns'*    *Jones'*    *James'*    }  
 iii *Socrates's*    *Xerxes's*    *Moses's*    *Jesus's*    *Burns's*    *Jones's*    *James's*    } [optional]

The bare genitive is obligatory with plural nouns ending in *s*, regular or irregular, including foreign plurals like *indices*. Nouns like *species* which have identical singular and plural forms with final *s* take a bare genitive in the singular as well as the plural, and in writing this will apply to nouns like *chassis* too (§4.1.6). The bare genitive is likewise the only possibility in more or less fixed phrases with *sake*: *for goodness'/convenience' sake* (the latter having spoken /s/ but not written *s*).

An optional bare genitive is found in certain types of proper names, where it is more likely in writing than in speech, in formal style than in informal. There is a good deal of variation here and it is not possible to give hard and fast rules. The bare genitive is most widely used with classical, religious, and literary names like the first five in [35ii]. Elsewhere it is normally restricted to names pronounced with voiced /z/ rather than voiceless /s/ (as in all the names in [35ii] except *Jesus*). Examples like *Ross'* are sometimes attested but they are of questionable acceptability: *Ross's* is the normal form, and in speech the /tɪz/ is required. Even with final /z/, a bare genitive is hardly possible if /z/ is preceded by a vowel, as in *Les* or *Ros*.

## 5 Verbs

All non-defective verbs other than *be* have syncretism between the plain form and the plain present tense, both identical with the lexical base. Many verbs, including all regular ones, also have syncretism between the past participle and the preterite. And a few have syncretism between these last two and the plain form. Lexical verbs thus have five, four, or three overtly distinct forms:

[1]

PLAIN FORM	PLAIN PRESENT	PRETERITE	PAST PARTICIPLE	3RD SG PRESENT	GERUND-PARTICIPLE
<i>take</i>		<i>took</i>	<i>taken</i>	<i>takes</i>	<i>taking</i>
<i>love</i>		<i>loved</i>		<i>loves</i>	<i>loving</i>
		<i>cut</i>		<i>cuts</i>	<i>cutting</i>

The gerund-participle is regular in speech for all verbs, and the 3rd sg present for all but four: our major focus will therefore be on the preterite and the past participle.

We begin in §5.1 with the forms of regular verbs, and then deal briefly in §5.2 with the irregular present tense forms, before turning to the preterite and past participle forms in §5.3. In these first three sections we consider only verbs with simple bases, but the analysis extends very straightforwardly to verbs with complex bases, as shown in §5.4. Finally, in §5.5 we examine the formation of negative auxiliary verbs.

### 5.1 Regular forms

In this section we consider those inflectional forms that are regular in speech: with some of them there are spelling alternations that make them irregular in writing.

### ■ The gerund-participle

This is regular in speech for all verbs, even **be**; it is formed by means of the suffix *·ing*, phonologically /ɪŋ/:<sup>21</sup>

[2] /laɪk·ɪŋ/ *lik·ing*    /pleɪ·ɪŋ/ *play·ing*    /biː·ɪŋ/ *be·ing*

### ■ The 3rd sg present tense

The suffix here is identical with that of regular plural nouns and has been discussed in §2.1. It is written as *s* or *es* and in speech has the alternants /ɪz/, /s/, and /z/, depending on the phonological features of the base:

[3] /wɪʃ·ɪz/    /sɪp·s/    /rɒb·z/    *wish·es*    *sip·s*    *rob·s*

### ■ The preterite and past participle

Regular forms of these are always the same, and have the suffix written as *ed* and pronounced /ɪd/, /t/, or /d/, depending again on the phonological features of the base:

[4] /heɪt·ɪd/    /laɪk·t/    /pleɪ·d/    *hat·ed*    *lik·ed*    *play·ed*

### ■ Spelling alternations

Four sets of spelling alternations were discussed in §2.2, but there is a little more to be said about each of them.

#### Doubling of base-final consonant letter before suffixes beginning with a vowel

The general rules given in §2.2.1 account for such forms as those in [5], where doubling applies to the final consonant letter of a base preceded by a vowel symbol consisting of a single letter and stressed on the final syllable.

[5] i *bat*            *batted*            *batting*  
 ii *occur*          *occurred*        *occurring*  
 iii *gas*            *gassed*           *gassing*        *gasses*

Doubling extends to some bases meeting the above conditions except that they have non-final stress:

[6] i *level*            *levelled/leveled*        *levelling/leveling*  
 ii *focus*          *focussed/focused*        *focussing/focusing*        *focusses/focuses*  
 iii *worship*        *worshipped/worshipped*    *worshipping/worshipping*  
 iv *handicap*      *handicapped*            *handicapping*

We noted in §2.2.1 that bases of this kind ending in *l*, as in [i], take doubling in BrE but not AmE. This applies quite systematically, except that BrE doubling is optional with **parallel** (no doubt because the base already contains one instance of double *ll*). The base in [ii] ends in *s*: **bias** is the one other verb of this kind.

**Worship** and **handicap** are representative of a number of other verbs taking optional or obligatory doubling respectively; further examples are as follows:

[7] i Optional:        ***bayonet, benefit, diagram, kidnap, program***  
 ii Obligatory:      ***format, hobnob, humbug, leapfrog, sandbag, waterlog***

<sup>21</sup>In non-standard dialects in both the BrE and AmE families, and also in some now largely extinct upper-class dialects in Britain, the *·ing* suffix is pronounced /ɪn/ in the gerund-participle use (but much less so where it is part of the lexical base, as in *belongings, planking, railings*, etc.).

Where both forms are used, the one with doubling tends to be characteristic of BrE, the other of AmE.<sup>22</sup> For the most part these verbs have, or look as though they have, complex bases – and the doubling can then be seen as following the pattern of complex bases with a verb as final element, such as **wiretap**. In the latter, the inflection matches that of the simple verb, irrespective of the stress, so that we have obligatory doubling, as with **tap**: *wiretap* ~ *wiretapped* ~ *wiretapping* (see §5.4). Note the contrast with such items as the following (likewise with non-final stress) where doubling does not occur: **develop, dollop, gallop, gossip, hiccup, scallop**.

Comparable to consonant doubling is the (obligatory) addition of *k* after final *c*, as in:

[8] *picnic*    *picnicked*    *picnicking*

Other verbs of this kind include: **bivouac, frolic, magic** (*away/up*), **panic, tarmac, traffic**.<sup>23</sup>

### ■ Presence or absence of base-final *e*

The earlier rules (§2.2.2) deal with such cases as:

[9] i *hope*    *hoped*    *hoping*  
 ii *hoe*    *hoed*    *hoeing*

With verbs ending in *inge*, mute *e* is retained before *·ing* in some, optional in others, and omitted (in accordance with the general rule) in others:

[10] i *singe*    *singeing*    Also: **swinge**    [*e* retained]  
 ii *tinge*    *tinging/tingeing*    Also: **binge, hinge, whinge**    [*e* optional]  
 iii *cringe*    *cringing*    Also: **fringe, impinge, syringe**    [*e* dropped]

The *ge* of the base indicates that the final consonant is /dʒ/, and so marks the distinction in the gerund-participle between *singeing* (/sɪndʒɪŋ/) and *singing* (/sɪŋɪŋ/), *swingeing* (/swɪndʒɪŋ/) and *swinging* (/swɪŋɪŋ/). Another example of the retention of *e* before *·ing* is BrE *routeing* /ruːtɪŋ/: the *e* serves to distinguish *routeing*, a form of **route**, from *routing*, a form of **rout**. (AmE has the pronunciation /raʊtɪŋ/ and the spelling *routing* for the former.) With **age**, both *ageing* and *aging* are found, with the former more usual in BrE (contrast the regular **wage**, where *e* is obligatorily dropped).

### ■ Alternation between *y* and *i(e)*

We have noted that, following a consonant symbol, *y* is changed to *i* before *·ed*, but not before *·ing*, and that *ie* is changed to *y* before *·ing*:

[11] i *deny*    *denied*    *denying*  
 ii *lie*    *lied*    *lying*

However, there is a mixed situation with two verbs that end in *i*: **taxi** and **ski** (both formed by conversion from nouns):

[12] i *taxi*    *taxied*    *taxiing/taxying*  
 ii *ski*    *skied/ski'd*    *skiing*

<sup>22</sup>In BrE the base *program* is used only in the sense relating to computers; for other senses the base is *programme*, which itself contains double *mm*.

<sup>23</sup>**Arc**, where the *c* follows *r*, optionally takes *k*: *arced/arcked, arcing/arcking*.

*Taxying* is clearly formed by analogy with *lying*, while the use of the apostrophe with *ski'd*, to establish that the base is *ski*, may be motivated by a recognition that *skied* might be taken to be the preterite or past participle of the verb **sky**.<sup>24</sup>

Where *y* forms part of a composite vowel symbol, it normally remains unchanged, but there are three verbs in *ay* which have *aid* in the preterite and past participle – compare:

[13]	i	REGULAR	<i>pray</i>	<i>prayed</i>	<i>praying</i>	Also: other regular verbs
	ii	IRREGULAR	<i>pay</i>	<i>paid</i>	<i>paying</i>	Also: <b>lay, say</b>

**Say** does not strictly belong here, for it is an irregular verb in speech by virtue of a vowel change not matched in the spelling (/seɪ/ ~ /sed/): see [54].

### ■ Alternation between *-s* and *-es* with bases ending in *o*

We have seen (§4.1.1) that there are a considerable number of nouns ending in *o*, some of them forming their plurals in *-s*, others in *-es*, others again in either. There are only a few verbs in *o*, and all are homonymous with nouns. Apart from **radio** (which takes *-s* because the *o* is preceded by a vowel symbol) almost all the verbs take the *-es* suffix, like the corresponding nouns:

[14]	<i>echoes</i>	<i>embargoes</i>	<i>goes</i>	<i>torpedoes</i>	<i>vetoos</i>
------	---------------	------------------	-------------	------------------	---------------

(*Does*, from the verb **do**, also has *-es*, though the verb is irregular and its 3rd sg present is pronounced differently from the plural of the noun **do**.) One exception is *photos* with *-s* in both verb and noun – but the verb **photo** is quite rare: for the verb we usually use the non-clipped **photograph**.

## 5.2 Irregular present tense forms

### ■ Irregular 3rd sg present

Just four verbs have irregular forms in the 3rd sg present:

[15]	i	<b>be</b>	/bi:/	/ɪz/	<i>be</i>	<i>is</i>
	ii	<b>have</b>	/hæv/	/hæz/	<i>have</i>	<i>has</i>
	iii	<b>do</b>	/du:/	/dʌz/	<i>do</i>	<i>does</i>
	iv	<b>say</b>	/seɪ/	/sez/	<i>say</i>	<i>says</i>

The first two are irregular in both speech and writing; the 3rd sg present of **be** is suppletive (phonologically unrelated to the base), while that of **have** drops the base-final /v/, as do the preterite and past participle. The 3rd sg present forms of **do** and **say** are irregular only in speech, where they have a different vowel from the base.

### ■ Non-3rd sg present forms of **be**

**Be** differs from all other verbs in having a distinct form for the 1st sg, *am* /æm/. The default present tense form, used for all person–number combinations other than 1st/3rd sg, is also suppletive: *are* /ɑːʔ/.

### ■ Modal auxiliaries

The modals are highly irregular in that they show no person–number distinctions at all, and may be treated as having neither the plain present nor the 3rd sg present, but

<sup>24</sup>An apostrophe is also optionally found in *mascara'd*, where the motivation seems to be merely to avoid the unusual sequence *aed*.

just a single undifferentiated present tense form. *Must* and *ought* derive historically from preterite forms.

### 5.3 Irregular preterite and past participle forms

We have seen that with all regular verbs the preterite and the past participle are identical; the same holds for many irregular verbs too, and we therefore treat the two forms together in this section (and where they are identical we will normally give the form only once in the examples below). Some verbs have regular forms as variants of the irregular ones: these are indicated by the notation ‘r’ in the lists that follow.

The classification is based on the spoken forms, as explained in §1.3. We have four broad classes, each with several subclasses. An index to the classification is given in §5.3.5.

#### 5.3.1 Class 1 verbs: secondary *·ed* formation (*burn, keep, hit, lose*)

A number of common verbs are clearly somewhat irregular, but can nevertheless be treated in terms of the *·ed* formation, supplemented by four other operations: devoicing of the suffix, vowel shortening, consonant reduction, and devoicing in the base. Seven subclasses of these verbs may be recognised, each involving one or more of these operations. In all cases the preterites and past participles are the same.

##### ■ Class 1A: devoicing of the suffix

With eight verbs ending in /l/ or /n/ there is both a regular form with /d/ and one in which the suffix is /t/, despite the voicing of the final consonant of the base. The variation is normally reflected in the spelling, with *t* instead of *ed* (and *ll* reduced to *l*).

[16]	<b>smell</b>	/smel/	/smeld/, /smelt/	<i>smell</i>	<i>smelled, smelt</i>
	<b>burn</b>	/bɜːn/	/bɜːnd/, /bɜːnt/	<i>burn</i>	<i>burned, burnt</i>

[17] Also: *dwelt, earned, learnt, spent, spilled, spoiled*

*Earn* is an exception orthographically: it has only the regular form *earned*.

##### ■ Class 1B: vowel shortening

With several monosyllabic verbs there is a change in the vowel from /i:/ to /e/; this is matched in the spelling by the change from *ee* to *e*, though *ea* remains unchanged:

[18]	<b>keep</b>	/ki:p/	/kept/	<i>keep</i>	<i>kept</i>
	<b>leap</b>	/li:p/	/lept/	<i>leap</i>	<i>leapt</i>

[19] Also: *creep, sleep, sweep, weep*

This can be treated in terms of ‘vowel shortening’: /i:/ is a member of the class of long vowels and /e/ a member of the class of short vowels, and the long vowel is replaced by a short one when followed by two consonants. In addition to the vowel shortening there is a change in the vowel quality (/i:/ is close and /e/ is half open), but the spelling (generally using the same vowel letters) indicates that there has been a historical change. This change is reflected elsewhere in the language, as in /səˈri:n/ (*serene*) vs /səˈrenɪti/ (*serenity*). All the verbs in this class end in /p/ and therefore have the /t/ alternant of the suffix.

### ■ Class 1C: consonant reduction

With some verbs the preterite and past participle form is identical with the base:

[20]	<b>hit</b>	/hɪt/	/hɪt/	<i>hit</i>	<i>hit</i>
	<b>spread</b>	/spred/	/spred/	<i>spread</i>	<i>spread</i>

[21]	Also:	<b>bet</b> <sub>R</sub> , <b>bid</b> <sub>1</sub> , <b>burst</b> , <b>bust</b> <sub>R</sub> , <b>cast</b> , <b>cost</b> <sub>1</sub> , <b>cut</b> , <b>fit</b> <sub>R</sub> , <b>hurt</b> , <b>let</b> , <b>put</b> , <b>quit</b> <sub>R</sub> , <b>rid</b> <sub>R</sub> , <b>set</b> , <b>shed</b> , <b>shut</b> , <b>slit</b> , <b>split</b> , <b>thrust</b> , <b>wed</b> <sub>R</sub> , <b>wet</b> <sub>R</sub>
------	-------	---

As indicated above, the notation ‘r’ means that the verb has regular forms as variants: *He had wet/wetted it*. BrE has only regular forms for **fit**; otherwise, there is generally a preference for the irregular forms, especially in BrE. The regular forms of the colloquial **bust** are found primarily in AmE or when it has the sense “arrest”. Irregular **rid** is required in adjectival passives like *At last we were rid of them*. The taboo verb **shit** (again with regular alternants) also belongs here, but it has an additional preterite variant with vowel change, *shat*.

There are phonologically similar verbs such as **knit**, **shred**, **sweat** that have only the regular forms. Similarly, although **cost**<sub>1</sub> “be priced” is in class 1C, **cost**<sub>2</sub> “estimate the cost of” is always regular. **Bid**<sub>1</sub> “make an offer” has different forms from the **bid**<sub>2</sub> of **bid** farewell, **bid** *someone do something*, which belongs in Class 3E. In writing **read** belongs here too, but in speech it is like **bleed** and is therefore listed in Class 1F.

The identity of the preterite and past participle with the base might seem to suggest that there is no suffix and that these verbs are like the base plural nouns of §4.1.3, but it may be argued that it is significant that all of these verbs end in an alveolar plosive /t/ or /d/. An alternative analysis, therefore, is that these verbs are irregular by virtue of having the suffixes /t/ and /d/ rather than regular /ɪd/ – just like verbs with bases ending in consonants other than /t/ and /d/. Addition of /t/ and /d/ to the bases here would give \*/hɪtt/ and \*/spredd/, but English phonology does not permit doubled consonants at the end of a word, so these forms would be reduced to /hɪt/ and /spred/. This is plausible in itself, and it also receives support from the discussion of Class 1F below.

### ■ Class 1D: vowel shortening with devoicing of the suffix

Six verbs have both devoicing of the suffix and reduction of /i:/ to /e/, reflected in the spelling change from *ee* to *e*, with *ea* again remaining unchanged. The bases end with alveolar /l/ or /n/, except for one instance of /m/:

[22]	<b>feel</b>	/fi:l/	/felt/	<i>feel</i>	<i>felt</i>
	<b>mean</b>	/mi:n/	/ment/	<i>mean</i>	<i>meant</i>

[23]	Also:	<b>deal</b> , <b>dream</b> <sub>R</sub> , <b>kneel</b> , <b>lean</b> <sub>R</sub>
------	-------	---

### ■ Class 1E: consonant reduction with devoicing of the suffix

Six verbs combine these two operations:

[24]	<b>bend</b>	/bend/	/bent/	<i>bend</i>	<i>bent</i>
	<b>build</b>	/bild/	/bilt/	<i>build</i>	<i>built</i>

[25]	Also:	<b>lend</b> , <b>rend</b> , <b>send</b> , <b>spend</b>
------	-------	--

The verbs in this class all end in an alveolar sonorant plus voiced plosive (/n/ or /l/ followed by /d/) in the base, but in a sonorant plus voiceless /t/ in the preterite and

past participle. This can be accounted for by the combination of consonant reduction (\**/bendd/* and \**/bidd/* giving \**/bend/* and \**/bild/*) and devoicing of the suffix (giving */bent/* and */bilt/*). The archaic *gird* (with *girt* /gɜːrt/ as its preterite and past participle) is similar but would need to be explained in terms of another sonorant, /r/; this would be correct for rhotic accents but, as we have noted, the /r/ has been lost in modern BrE and is reflected by vowel quality alone.

### ■ Class 1E: vowel shortening with consonant reduction

These operations combine in:

[26]	<b>bleed</b>	/bli:d/	/bled/	<i>bleed</i>	<i>bled</i>
	<b>lead</b>	/li:d/	/led/	<i>lead</i>	<i>led</i>

[27] Also: **breed, feed, meet, read, speed**

These verbs have vowel shortening from /i:/ to /e/, like those in Classes 1B and 1D above. The bases also end in an alveolar plosive, /d/ or /t/, which appears to be unchanged in the preterite and past participle, but can again be accounted for in terms of consonant reduction, with \**/bledd/* becoming */bled/*, and so on. Indeed these verbs provide further evidence for consonant reduction. The vowel shortening in Classes 1B and 1D applies before two consonants (thus not, for example, with bases ending in a vowel, such as *free*), so that vowel shortening in the present class is explained if we postulate forms with two consonants like \**/bledd/*, with reduction to */bled/* following from the prohibition on double consonants.

In writing *ee* again changes to *e*; this time *ea* also becomes *e* in *lead*. In *read*, on the other hand, the spelling remains unchanged in the preterite and past participle, as in the verbs of Classes 1B and 1D. Thus in writing *read* shows no change at all, and belongs in Class 1C.

There are three other verbs that can be handled in terms of vowel shortening and consonant reduction, but the vowels are different from the above:

[28]	<b>slide</b>	/slaɪd/	/slɪd/	<i>slide</i>	<i>slid</i>
	<b>light</b>	/laɪt/	/lɪt/	<i>light</i>	<i>lit</i>
	<b>shoot</b>	/ʃu:t/	/ʃɒt/	<i>shoot</i>	<i>shot</i>

The vowel changes in the first two from /aɪ/ to /ɪ/, and in the third from /u:/ to /ɒ/. Both can be seen as vowel shortening, since diphthongs such as /aɪ/ are phonologically long vowels – and this particular change is found elsewhere in English, e.g. in /drɪ'vaɪn/ (*divine*) vs /drɪ'vɪnɪti/ (*divinity*). The same vowel changes are found with *bite* (3D) and *shoe* (4A). All three verbs in [28] end in an alveolar plosive and so fit in with the account in terms of consonant reduction. *Light* is often regular in AmE, or in the idiom *light upon*.

### ■ Class 1G: devoicing in the base with vowel shortening

These operations apply in:

[29]	<b>leave</b>	/li:v/	/left/	<i>leave</i>	<i>left</i>
	<b>lose</b>	/lu:z/	/lɒst/	<i>lose</i>	<i>lost</i>

*Leave* and *lose* are the only clear examples of this pattern. *Bereave* and *cleave* are usually regular (*bereaved, cleaved*); the irregular forms /bɪ'reft/ and /kleft/, *bereft* and *cleft*, also

occur, but they are more often found as participial adjectives than as verbs (and see 3F for *cloven*).

### 5.3.2 Class 2 verbs: vowel alternations (*drink, dig, find, come*)

With many of the irregular verbs there is a change in the stressed vowel of the base to form the preterite and/or the past participle. Usually there is a front vowel in the base but a back vowel in the preterite or past participle, a pattern we will speak of as the **back vowel formation**. Most again have syncretism between the preterite and the past participle, but the forms are distinct in Classes 2A and 2E.

#### ■ Class 2A: /ɪ/ ~ /æ/ ~ /ʌ/

Nine verbs have the vowels /ɪ/, /æ/, and /ʌ/ (spelled *i*, *a*, and *u*) for base, preterite, and past participle respectively:

[30]	<b>drink</b>	/drɪŋk/	/dræŋk/	/drʌŋk/	<i>drink</i>	<i>drank</i>	<i>drunk</i>
	<b>ring</b>	/rɪŋ/	/ræŋ/	/rʌŋ/	<i>ring</i>	<i>rang</i>	<i>rung</i>
	<b>begin</b>	/bɪ'ɡɪn/	/bɪ'ɡæn/	/bɪ'ɡʌn/	<i>begin</i>	<i>began</i>	<i>begun</i>
[31]	Also: <b>shrink, sing, sink, spring, stink, swim</b>						

In the written form, the vowels suggest the basic vowel triangle *i a u*, a familiar pattern in languages that have only three vowels. But this is not reflected in the spoken form in all dialects; most have /ʌ/ instead of /ʊ/ corresponding to *u* (those of northern England being exceptional in preserving the earlier system).

#### ■ Class 2B: /ɪ ~ /ʌ/ ~ /ʌ/

The verbs in this class are similar to those in 2A except that there is syncretism between the preterite and past participle. In general, the /ʌ/ corresponds to *u* in writing; **win** is exceptional in spelling it with *o*.

[32]	<b>dig</b>	/dɪɡ/	/dʌɡ/	<i>dig</i>	<i>dug</i>
	<b>win</b>	/wɪn/	/wʌn/	<i>win</i>	<i>won</i>

[33] Also: **cling, fling, sling, slink, spin, stick, sting, string, swing, wring**

All except **dig** and **stick** (which were formerly regular) end in a nasal. There is some overlap between this class and the last. All the verbs in Class 2A are also occasionally found with the /ʌ/ vowel in the preterite, e.g., /rɪŋ/ ~ /rʌŋ/ ~ /rʌŋ/, *ring* ~ *rung* ~ *rung*; these preterites, however, are considered non-standard, in varying degrees. Conversely, **swing** from [33] may occasionally be found in speech with the preterite /swæŋ/, and there is an archaic preterite of **spin**, *span*.

#### ■ Class 2C: /aɪ/ ~ /aʊ/ ~ /aʊ/

This class has a change from front to back in the last element of a diphthong in speech, but from *i* to *ou* in writing:

[34]	<b>find</b>	/faɪnd/	/faʊnd/	<i>find</i>	<i>found</i>
------	-------------	---------	---------	-------------	--------------

[35] Also: **bind, grind, wind**,

(**Wind**<sub>2</sub>, converted from the noun **wind** and pronounced /wɪnd/, is regular.)

### ■ Class 2D: miscellaneous vowel alternations

Several other miscellaneous alternations, most of them between front and back vowels, are seen in the following dozen verbs:

[36]	<b>abide</b> <sub>R</sub>	/ə'baɪd/	/ə'boʊd/	<i>abide</i>	<i>abode</i>	Also: <b>dive</b> AmE
	<b>fight</b>	/faɪt/	/fɔɪt/	<i>fight</i>	<i>fought</i>	
	<b>get</b> BrE	/get/	/gɒt/	<i>get</i>	<i>got</i>	
	<b>hang</b>	/hæŋ/	/hʌŋ/	<i>hang</i>	<i>hung</i>	
	<b>heave</b>	/hi:v/	/hoʊv/	<i>heave</i>	<i>hove</i>	
	<b>hold</b>	/hoʊld/	/held/	<i>hold</i>	<i>held</i>	
	<b>shine</b>	/ʃaɪn/	/ʃoʊn/	<i>shine</i>	<i>shone</i>	
	<b>sit</b>	/sɪt/	/sæt/	<i>sit</i>	<i>sat</i>	Also: <b>spit</b>
	<b>sneak</b> AmE	/sni:k/	/sna:k/	<i>sneak</i>	<i>snuck</i>	
	<b>strike</b>	/straɪk/	/strʌk/	<i>strike</i>	<i>struck</i>	

**Heave** belongs here only in its nautical sense; elsewhere it is regular. **Dive** and **sneak** are regular in BrE, though *snuck* is used jocularly. In AmE **strike** has *stricken* as a variant of the past participle; in BrE this is used only in the passive (or as a participial adjective), with the sense “afflicted”, as in *He was stricken with arthritis/fear*. **Sit**, **spit**, and **hang** each have two of the vowels involved in Class 2A. **Hang** tends to be regular in the execution/suicide sense; *hung* is certainly found in this sense (e.g. *hung in effigy*), but is condemned in some usage manuals. For AmE **get**, see Class 3F.

### ■ Class 2E: vowel change in preterite, past participle identical with base

Just two verbs show this pattern:

[37]	<b>come</b>	/kʌm/	/keɪm/	/kʌm/	<i>come</i>	<i>came</i>	<i>come</i>
	<b>run</b>	/rʌn/	/ræn/	/rʌn/	<i>run</i>	<i>ran</i>	<i>run</i>

### 5.3.3 Class 3 verbs: past participles formed with the *·en* suffix (*see*, *ride*, *take*)

There are verbs in which the past participle has the suffix we refer to as *·en*. This suffix is never used for the preterite in standard English, though there are some forms, notably *done* and *seen*, that are used as preterites as well as past participles in certain non-standard dialects.

The suffix is most often added to the base, as in *eat·en*, sometimes with modification of the base, as in *swoll·en*, but there are also verbs where it is added to the preterite form, as in *brok·en*.

In speech it is pronounced /ən/, /ɪ/ (syllabic /n/), or /n/, normally under the following conditions:

[38]	i	/ən/	after /l/ or /k/	/fɔ:lən/	/teɪkən/	<i>fallen</i>	<i>taken</i>
	ii	/ɪ/	after /t/, /d/, /v/, /z/	/bi:tɪ/	/tʃoʊzɪ/	<i>beaten</i>	<i>chosen</i>
	iii	/n/	after vowels	/si:n/	/groun/	<i>seen</i>	<i>grown</i>

There is variation between /ən/ and /ɪ/ after consonants other than /l/, so that /ɪ/ can occur instead of /ən/ in *taken*, etc., and vice versa in *beaten*, *chosen*, etc.

The spelling alternations for bases taking *·en* are the same as with other vowel-initial suffixes with respect to deletion of final *e*, as in *tak·en* (formed from *take*), and doubling

of final consonant, as in *trodd-en* (formed from *trod*). We also have consonant doubling in such forms as *ridden* and *written*: the bases *ride* and *write* end in an *e* that forms part of a discontinuous symbol representing the diphthong /aɪ/, but the change to the short vowel /ɪ/ leads to the dropping of the *e*, so that the *d* and *t* are now in final position and hence subject to doubling.

In addition *·en* is reduced to *·n* after a composite vowel symbol, and *i* replaces *y* at the end of such a symbol; with bases ending in *re*, both the *e* of the base and that of the suffix are dropped, with /r/ therefore remaining post-vocalic and pronounced only in rhotic accents:

[39] i	after composite vowel symbol	<i>see</i>	<i>seen</i>	<i>sew</i>	<i>sewn</i>
ii	after composite vowel in <i>y</i>	<i>slay</i>	<i>slain</i>	<i>lay</i>	<i>lain</i>
iii	after <i>re</i>	<i>tore</i>	<i>torn</i>	<i>wore</i>	<i>worn</i>

The *e* of *·en* is retained after the single-letter vowel symbol of *be* to give *been*. With the three verbs **do**, **go**, **bear** the suffix has the exceptional spelling *ne*: *done*, *gone*, *borne*.

Some of the verbs have similar vowel changes to those that have already been considered in §§5.3.1–2. We distinguish eight subclasses.

#### ■ Class 3A: regular preterite, *·en* added to base

There are eight verbs here, all with regular alternants:

[40]	<b>show</b> <sub>R</sub>	/ʃoʊ/	/ʃoʊd/	/ʃoʊn/	<i>show</i>	<i>showed</i>	<i>shown</i>
[41]	Also: <b>hew</b> <sub>R</sub> , <b>mow</b> <sub>R</sub> , <b>prove</b> <sub>R</sub> , <b>saw</b> <sub>R</sub> , <b>sew</b> <sub>R</sub> , <b>sow</b> <sub>R</sub> , <b>strew</b> <sub>R</sub>						

Apart from **prove**, all have bases ending in a vowel; in writing they have a composite vowel symbol in *w*, and hence the suffix *·n*. With some, notably **show**, **sow**, **strew**, the irregular past participle is preferred, but **prove** is again the odd one out: in BrE *proved* is much more common than *proven* as a verb (as distinct from the participial adjective of *a proven friend*, etc.).<sup>25</sup> *Proven* can be pronounced with /u:/ or with /oʊ/ — in the latter case the verb belongs in Class 3B.

#### ■ Class 3B: regular preterite, vowel change in past participle

Two verbs:

[42]	<b>shear</b> <sub>R</sub>	/ʃɪəʃ/	/ʃɪəʃd/	/ʃɔ:ʃn/	<i>shear</i>	<i>sheared</i>	<i>shorn</i>
	<b>swell</b> <sub>R</sub>	/swel/	/sweld/	/swoʊlən/	<i>swell</i>	<i>swelled</i>	<i>swollen</i>

#### ■ Class 3C: /aɪ/ ~ /oʊ/ ~ /ɪ/

These verbs have a different vowel in each form.

[43]	<b>ride</b>	/raɪd/	/roʊd/	/rɪdɪ/	<i>ride</i>	<i>rode</i>	<i>ridden</i>
[44]	Also: <b>drive</b> , <b>rise</b> , <b>shrive</b> <sub>R</sub> , <b>smite</b> , <sup>2</sup> <b>stride</b> , <b>strive</b> , <b>thrive</b> <sub>R</sub> , <b>write</b>						

The change from base /aɪ/ to past participle /ɪ/ might be regarded as vowel shortening, but without the two consonants that normally condition it – compare **slide** in [28]. **Stride** is marked ‘?’ because the past participle form *stridden* is very dubious and may not occur. For **strike** and the form *stricken*, see Class 2D.

<sup>25</sup> *Shaven* is used only as a participial adjective and hence is not included in our list.

### ■ Class 3D: vowel shortening in preterite and past participle

Three verbs can be treated in terms of the secondary *-ed* formation, with the preterite having consonant reduction and vowel shortening from /aɪ/ to /ɪ/:

[45] **bite** /baɪt/ /bɪt/ /bɪtɪŋ/ bite bit bitten

[46] Also: **hide** R, **hide**

The past participle might appear to be formed from the preterite, but it is simpler to treat it as formed from the base, as with most verbs: it is just that the past participle also involves vowel shortening of /aɪ/ to /ɪ/, as it does in the verbs of Class 3C (where there is no question of the past participle being formed from the preterite).

One other verb that may be considered here is **beat**:

[47] **beat** /bi:t/ /bɪt/ /bɪtɪŋ/ beat beat beaten

This too can be seen in terms of consonant reduction in the preterite, but it is unusual in that there is no vowel shortening as there is with all similar verbs: if there were vowel shortening as in **meet** or **lead** (and compare **bite**) the forms would be \*/bet/ and \*/betɪŋ/.

### ■ Class 3E: vowel change in preterite, *-en* added to base

There are some other verbs that have past participles formed by the addition of *-en* to the lexical base, with various vowel changes in the preterite:

[48] **bid**<sub>2</sub> /bɪd/ /bæd/ /bɪdɪŋ/ bid bade bidden  
**blow** /bloʊ/ /bluː/ /bloʊn/ blow blew blown  
**draw** /drɔː/ /druː/ /drɔːn/ draw drew drawn  
**eat** /iːt/ /et/ /iːtɪŋ/ eat ate eaten  
**fall** /fɔːl/ /fel/ /fɔːlən/ fall fell fallen  
**give** /gɪv/ /geɪv/ /gɪvɪŋ/ give gave given  
**see** /siː/ /sɔː/ /siːn/ see saw seen  
**slay** /sleɪ/ /sluː/ /sleɪn/ slay slew slain  
**take** /teɪk/ /tʊk/ /teɪkən/ take took taken

[49] Also: (like **blow**) **grow**, **know**, **throw**; (like **take**) **forsake**, **shake**

Alternative pronunciations of the preterites of **bid** and **eat** are /beɪd/ and (especially in AmE) /ert/. **Bid**<sub>2</sub> has the sense “give a greeting/order”, and is somewhat archaic; for **bid**<sub>1</sub>, see 1C. In BrE **know** is not quite like **blow** in that the preterite has /j/: /njuː/.

### ■ Class 3F: vowel change in preterite, *-en* added to preterite

There is another set of verbs that have past participles formed by the addition of *-en* to the preterite, rather than the lexical base, with various vowel changes:

[50] **break** /breɪk/ /broʊk/ /broʊkən/ break broke broken  
**choose** /tʃuːz/ /tʃoʊz/ /tʃoʊzɪŋ/ choose chose chosen  
**lie**<sub>1</sub> /laɪ/ /leɪ/ /leɪn/ lie lay lain  
**speak** /spiːk/ /spoʊk/ /spoʊkən/ speak spoke spoken  
**tear** /teəː/ /tɔːː/ /tɔːːn/ tear tore torn  
**tread** /tred/ /trɒd/ /trɒdɪŋ/ tread trod trodden  
**wake** /weɪk/ /woʊk/ /woʊkən/ wake woke woken

[51] Also: (like **speak**) **cleave** R, **freeze**, **steal**, **weave**; (like **tear**) **bear**, **swear**, **wear**

AmE **get** belongs here, with the forms /get/ ~ /gɒt/ ~ /gɒtp/, *get* ~ *got* ~ *gotten* (the same vowel pattern as **thead**), except that there is a variant of the past participle that is identical to the preterite, as it always is in BrE. **Lie**<sub>1</sub> has the meaning of position: **lie**<sub>2</sub> “tell a lie” is regular. The preterite of intransitive **lie**<sub>1</sub> is homophonous with the base of transitive **lay** (listed in [13ii]): compare *It lay on the floor* (**lie**<sub>1</sub>) and *He asked me to lay it on the floor* (**lay**). **Lay**, however, is often confused with **lie**<sub>1</sub> and used intransitively, but this usage is regarded as non-standard: <sup>1</sup>*He asked me to lay on the floor*. In BrE, the past participle of **bear** is spelled *born* only in the passive, in the childbirth sense (*He was born in 1900*) or metaphorical extensions thereof (*His anti-social behaviour was born of frustration at being constantly ignored*); elsewhere it is *borne* (*It has borne fruit*). **Cleave** has *cleft* as a variant for the preterite and past participle (Class 1G).

### ■ Class 3G: vowel change in both preterite and past participle

There are two verbs that have an *-en* suffix but different vowels (other than shortened vowels) in all three forms:

[52]	<b>do</b>	/du:/	/dɪd/	/dʌn/	<i>do</i>	<i>did</i>	<i>done</i>
	<b>fly</b>	/flaɪ/	/flu:/	/flaʊn/	<i>fly</i>	<i>flew</i>	<i>flown</i>

### ■ Class 3H: suppletive preterites

Two verbs have suppletive preterites, and both have past participles with a version of the *-en* suffix:

[53]	<b>be</b>	/bi:/	/wɒz/–/wɜ:z/	/bi:n/	<i>be</i>	<i>was–were</i>	<i>been</i>
	<b>go</b>	/goʊ/	/went/	/gɒn/	<i>go</i>	<i>went</i>	<i>gone</i>

**Be** is idiosyncratic in that it has two preterite forms, *was* for 1st/3rd sg and *were* elsewhere; its *-en* suffix is phonologically /n/, as normal after a vowel. (*Were* with a 1st/3rd sg subject is an irrealis mood form: see Ch. 3, §1.7.) The past participle of **go** is irregular in both speech and writing, having an idiosyncratic vowel change in speech and *ne* as the spelling of the suffix.

## 5.3.4 Class 4 verbs: other formations (*flee, hear, stand, buy, can*)

There are some verbs that have features that are not covered in the previous discussion. Most of them appear to have an *-ed* type suffix, but with vowel changes that are not typical of the secondary *-ed* formation.

### ■ Class 4A: vowel shortening and *-d* suffix

There are three verbs with bases ending in a vowel that have a /d/ suffix together with a vowel change in the preterite and past participle:

[54]	<b>flee</b>	/fli:/	/fled/	<i>flee</i>	<i>fled</i>
	<b>say</b>	/seɪ/	/sed/	<i>say</i>	<i>said</i>
	<b>shoe</b>	/ʃu:/	/ʃɒd/	<i>shoe</i>	<i>shod</i>

**Flee** has the same vowel change as **keep** (1B), while **shoe** has the same change as **shoot** (1F). **Say** has a completely idiosyncratic vowel change – the same, however, as in the 3rd sg present form /sez/. The vowel change in all three verbs might be regarded as vowel shortening, but again we do not here have the two final consonants that condition vowel shortening in the central cases, such as **keep**.

### ■ Class 4B: vowel change and ·d suffix

Very similar, but with vowel changes that clearly do not involve shortening, are:

[55]	<b>hear</b>	/hɪəʔ/	/hɜːɹd/	<i>hear</i>	<i>heard</i>	
	<b>sell</b>	/sel/	/soʊld/	<i>sell</i>	<i>sold</i>	Also: <b>tell</b>

### ■ Class 4C: loss of consonant

There are three verbs of this type:

[56]	<b>have</b>	/hæv/	/hæd/	<i>have</i>	<i>had</i>
	<b>make</b>	/meɪk/	/meɪd/	<i>make</i>	<i>made</i>
	<b>stand</b>	/stænd/	/stʊd/	<i>stand</i>	<i>stood</i>

**Have** and **make** would be regular except for the loss of /v/ and /k/. **Stand** has both vowel change and loss of /n/; the final /d/ can be taken to be either the final consonant of the base or the suffix /d/ with consonant reduction.

### ■ Class 4D: forms with *ought* and *aught*

There are seven verbs, with various types of base, that have preterite and past participle forms ending in /ɔ:t/ (*ought* or *aught*):

[57]	<b>beseech</b>	/bɪ'si:tʃ/	/bɪ'sɔ:t/	<i>beseech</i>	<i>besought</i>
	<b>bring</b>	/brɪŋ/	/brɔ:t/	<i>bring</i>	<i>brought</i>
	<b>buy</b>	/baɪ/	/bɔ:t/	<i>buy</i>	<i>bought</i>
	<b>catch</b>	/kætʃ/	/kɔ:t/	<i>catch</i>	<i>caught</i>
	<b>seek</b>	/si:k/	/sɔ:t/	<i>seek</i>	<i>sought</i>
	<b>teach</b>	/ti:tʃ/	/tɔ:t/	<i>teach</i>	<i>taught</i>
	<b>think</b>	/θɪŋk/	/θɔ:t/	<i>think</i>	<i>thought</i>

**Fight** has been listed in Class 2D as its base ends in /t/, but it could also be included here.

### ■ Class 4E: preterites of the modals

Four of the modal auxiliaries have preterite forms, though not past participles; all are highly irregular, three of them ending in /ʊd/ (*ould*), with an *l* that does not correspond to a phonological /l/ in any extant dialect.

[58]	<b>can</b>	/kæn/	/kʊd/	<i>can</i>	<i>could</i>
	<b>may</b>	/meɪ/	/maɪt/	<i>may</i>	<i>might</i>
	<b>shall</b>	/ʃæl/	/ʃʊd/	<i>shall</i>	<i>should</i>
	<b>will</b>	/wɪl/	/wʊd/	<i>will</i>	<i>would</i>

## 5.3.5 Index to the classification

<i>abide</i> 2D	<i>be</i> 3H	<i>bear</i> 3F	<i>beat</i> 3D	<i>begin</i> 2A	<i>bend</i> 1E	<i>bereave</i> 1G
<i>beseech</i> 4D	<i>bet</i> 1C	<i>bid</i> <sub>1</sub> 1C	<i>bid</i> <sub>2</sub> 3E	<i>bind</i> 2C	<i>bite</i> 3D	<i>bleed</i> 1F
<i>blow</i> 3E	<i>break</i> 3F	<i>breed</i> 1F	<i>bring</i> 4D	<i>build</i> 1E	<i>burn</i> 1A	<i>burst</i> 1C
<i>bust</i> 1C	<i>buy</i> 4D	<i>can</i> 4E	<i>cast</i> 1C	<i>catch</i> 4D	<i>chide</i> 3D	<i>choose</i> 3F
<i>cleave</i> 1G	<i>cling</i> 2B	<i>come</i> 2E	<i>cost</i> 1C	<i>creep</i> 1B	<i>cut</i> 1C	<i>deal</i> 1D
<i>dig</i> 2B	<i>dive</i> 2D	<i>do</i> 3G	<i>draw</i> 3E	<i>dream</i> 1D	<i>drink</i> 2A	<i>drive</i> 3C
<i>dwell</i> 1A	<i>earn</i> 1A	<i>eat</i> 3E	<i>fall</i> 3E	<i>feed</i> 1F	<i>feel</i> 1D	<i>fight</i> 2D

<i>find</i> 2C	<i>fit</i> 1C	<i>flee</i> 4A	<i>fling</i> 2B	<i>fly</i> 3G	<i>forsake</i> 3E	<i>freeze</i> 3F
<i>get</i> 2D,3F	<i>gird</i> 1E	<i>give</i> 3E	<i>go</i> 3H	<i>grind</i> 2C	<i>grow</i> 3E	<i>hang</i> 2D
<i>have</i> 4C	<i>hear</i> 4B	<i>heave</i> 2D	<i>hew</i> 3A	<i>hide</i> 3D	<i>hit</i> 1C	<i>hold</i> 2D
<i>hurt</i> 1C	<i>keep</i> 1B	<i>kneel</i> 1D	<i>know</i> 3E	<i>lead</i> 1F	<i>lean</i> 1D	<i>leap</i> 1B
<i>learn</i> 1A	<i>leave</i> 1G	<i>lend</i> 1E	<i>let</i> 1C	<i>lie</i> 3F	<i>light</i> 1F	<i>lose</i> 1G
<i>make</i> 4C	<i>may</i> 4E	<i>mean</i> 1D	<i>meet</i> 1F	<i>mow</i> 3A	<i>put</i> 1C	<i>quit</i> 1C
<i>read</i> 1F	<i>rend</i> 1E	<i>rid</i> 1C	<i>ride</i> 3C	<i>ring</i> 2A	<i>rise</i> 3C	<i>run</i> 2E
<i>saw</i> 3A	<i>say</i> 4A	<i>see</i> 3E	<i>seek</i> 4D	<i>sell</i> 4B	<i>send</i> 1E	<i>set</i> 1C
<i>sew</i> 3A	<i>shake</i> 3E	<i>shall</i> 4E	<i>shear</i> 3B	<i>shed</i> 1C	<i>shine</i> 2D	<i>shoe</i> 4A
<i>shoot</i> 1F	<i>show</i> 3A	<i>shrink</i> 2A	<i>shrive</i> 3C	<i>shut</i> 1C	<i>sing</i> 2A	<i>sink</i> 2A
<i>sit</i> 2D	<i>slay</i> 3E	<i>sleep</i> 1B	<i>slide</i> 1F	<i>sling</i> 2B	<i>slink</i> 2B	<i>slit</i> 1C
<i>smell</i> 1A	<i>smite</i> 3C	<i>sneak</i> 2D	<i>sow</i> 3A	<i>speak</i> 3F	<i>speed</i> 1F	<i>spell</i> 1A
<i>spend</i> 1E	<i>spill</i> 1A	<i>spin</i> 2B	<i>spit</i> 2D	<i>split</i> 1C	<i>spoil</i> 1A	<i>spread</i> 1C
<i>spring</i> 2A	<i>stand</i> 4C	<i>steal</i> 3F	<i>stick</i> 2B	<i>sting</i> 2B	<i>stink</i> 2A	<i>strew</i> 3A

<i>wed</i> 1C	<i>weep</i> 1B	<i>wet</i> 1C	<i>will</i> 4E	<i>win</i> 2B	<i>wind</i> 2C	<i>wring</i> 2B
<i>write</i> 3C						

## 5.4 Verbs with complex bases (*underpin*, *become*)

### ■ Regular verbs

Where a verb with a complex base is formed from a regular verb, it too is regular. Moreover, if there are spelling alternations, they match those of the verb from which it is formed. This is seen in the doubling of the final consonant in:

- [59] i *underpin*    *underpinned*    *underpinning*  
 ii *wiretap*    *wiretapped*    *wiretapping*

The stress pattern of the complex base verb cannot account for the doubling in [ii], because the last syllable is not stressed; there is doubling because there is (predictable) doubling in the simple form.<sup>26</sup> As suggested in §5.1, this probably also accounts for such verbs as *hobnob*, *humbug*, *worship*, *handicap*, *kidnap*, etc., which likewise have doubled consonants before *-ed* and *-ing*, even though the last syllable is not stressed. Whatever their actual status, these are apparently treated as if formed from *nob*, *bug*, *ship*, *cap*, and *nap* (and with *kidnap* this analysis would appear to be etymologically correct).

### ■ Irregular verbs

The same applies here: the complex verb has irregular forms matching those of the simple verb in final position. For example, *arise* has the forms *arise* ~ *arose* ~ *arisen*, matching those for *rise*, the preterite and past participle of *retell* is *retold*, and so on. This pattern

<sup>26</sup>Compare the two verbs *relay*. In the sense “lay again” it is a derivative of *lay* and shares its irregular preterite and past participle: *relaid*. In the sense “send by relay” it has no morphological connection with *lay*, and is regular: *relayed*.

applies even where the meaning of the complex verb is relatively opaque. For example, *mistake* is like *take* and *understand* like *stand*, in spite of the fact that there is no evident semantic relation between the simple and complex verbs:

[60]	i	<i>take</i>	<i>took</i>	<i>taken</i>	<i>mistake</i>	<i>mistook</i>	<i>mistaken</i>
	ii	<i>stand</i>	<i>stood</i>	<i>stood</i>	<i>understand</i>	<i>understood</i>	<i>understood</i>

The inflectional-morphological relationship is thus maintained long after the semantic connection has been lost. A sample of complex verbs of this kind is given in:

[61]	<i>become</i>	<i>befall</i>	<i>behold</i>	<i>beset</i>	<i>betake</i>	<i>forbear</i>
	<i>forbid</i>	<i>forecast</i>	<i>forgive</i>	<i>forgo</i>	<i>forswear</i>	<i>hamstring</i>
	<i>overbear</i>	<i>overcome</i>	<i>oversee</i>	<i>overtake</i>	<i>partake</i>	<i>undergo</i>
	<i>undertake</i>	<i>uphold</i>	<i>upset</i>	<i>withdraw</i>	<i>withhold</i>	<i>withstand</i>

*Forbid* derives from *bid*<sub>2</sub> “order” of Class 3E: *forbid* ~ *forbade* ~ *forbidden*. *Forget* has the forms *forget* ~ *forgot* ~ *forgotten*, following the model of *get* in AmE, except that the past participle has only the form with *·en*. *Beget* normally follows the same model (*beget* ~ *begot* ~ *begotten*), but it also has a distinct archaic preterite *begat*.

### ■ Exceptions

There are a very small number of exceptions, where a complex verb has regular forms even though the simple one is irregular. One example is *gainsay*, which differs from irregular *say* in that it retains the vowel /ei/ of the base in the 3rd sg present tense (/geɪnseɪz/ vs /sez/) and optionally does so in the preterite and past participle too (/geɪnsed/ or /geɪnseɪd/ vs /sed/ only); in writing *gainsay* follows the pattern of *say* (with irregular change of *y* to *i*).

A second exception is *broadcast*, which in addition to the irregular preterite and past participle *broadcast*, matching that of *cast*, has the regular form *broadcasted*; likewise the more recent *telecast*. Similar is *deepfreeze*, but here the irregular *deepfroze* and *deepfrozen* are the normal forms and the regular form *deepfreezed* is of only marginal acceptability.

## 5.5 Negative forms of auxiliaries

A distinctive property of the English auxiliary verbs is that they have negative forms, marked by the suffix /nt/, spelled *n't*. The verbs concerned are *be*, *have*, *do*, the modals, and (for some speakers) aspectual *use*. The negative suffix appears only in finite clauses: on preterite and present tense forms (and the irrealis form of *be*), and in the auxiliary *do* used in imperatives.

### ■ Regular forms

Most of the negative auxiliary forms are regular, with the suffix simply added to the preterite or present tense form. This applies with the following:

[62]	<i>aren't</i>	/ɑːr̩nt/	<i>couldn't</i>	/kʊdnt/	<i>daren't</i>	/deə̃r̩nt/	<i>didn't</i>	/dɪdnt/
	<i>doesn't</i>	/dʌznt/	<i>hadn't</i>	/hædnt/	<i>hasn't</i>	/hæznt/	<i>haven't</i>	/hævnt/
	<i>isn't</i>	/ɪznt/	<i>mighn't</i>	/maɪnt/	<i>needn't</i>	/niːdnt/	<i>oughtn't</i>	/ɔːtnt/
	<i>shouldn't</i>	/ʃʊdnt/	<i>wasn't</i>	/wɒznt/	<i>weren't</i>	/wɜːr̩nt/	<i>wouldn't</i>	/wʊdnt/

We omit <sup>2</sup>*mayn't* (/meɪnt/, /meɪənt/); though current in the earlier part of the twentieth century, it has now virtually disappeared from the language.

### ■ Irregular forms

Half a dozen negative auxiliary forms are irregular, either in speech alone or in both speech and writing.

#### Forms that are regular in writing but irregular in speech

[63]	i	<i>do</i>	<i>don't</i>	/duː/	/dəʊnt/
	ii	<i>must</i>	<i>mustn't</i>	/mʌst/	/mʌsɪt/
	iii	<i>used</i>	<sup>%</sup> <i>usedn't</i>	/juːst/	<sup>%</sup> /juːsɪt/

In [i] there is a change of vowel, and in [ii–iii] the final /t/ is lost before the negative suffix. *Usedn't* is the only form where the suffix is added to a preterite with the *·ed* suffix, and it has a variant irregular spelling *usen't* in which the final consonant is dropped in writing too (see Ch. 3, §2.5.9).

#### Forms that are irregular in both speech and writing

[64]	i	<i>can</i>	<i>can't</i>	/kæn/	/kɑːnt/ (BrE), /kæːnt/ (AmE)
	ii	<i>shall</i>	<i>shan't</i>	/ʃæl/	/ʃɑːnt/ (BrE), /ʃæːnt/ (AmE)
	iii	<i>will</i>	<i>won't</i>	/wɪl/	/wɔʊnt/

All the negative forms in this group lose the base-final consonant, and with **will** there is also a change of vowel, in both speech and writing. In BrE, *can't* and *shan't* have a change of vowel in speech.

#### The form *cannot*

**Can** has an additional variant form *cannot*, unique in that *not* (the etymological source of the /nt/ suffix), complete with its vowel, is attached to the lexical base. This form is more common in the written language than in speech, though the distinction in writing between the single word *cannot* and the word sequence *can not* is matched in speech by that between /'kænɒt/ (one /n/ and stress on the first syllable) and /kən'nɒt/ (two /n/'s and stress on the second syllable). In *cannot*, as in *can't*, the negative is invariably external, having scope over the modality, whereas this is not so with the analytic negative *can not*: see Ch. 3, §9.10.

*Cannot* is more formal in style than *can't*. It is hardly possible in pre-subject position: *Can't /<sup>?</sup> Cannot we stay a little longer?*; *Not only can't / \*cannot he find the key, he's not even sure the papers are in the office anyway!*

### ■ The form *ain't*

This form, pronounced /eɪnt/, serves as the negative of any of the present tense forms of **be** and **have**: *am, are, is, have, has*. There is a long tradition of prescriptive condemnation of it. In BrE it is reasonably called non-standard,<sup>27</sup> occurring (for example) in working-class speech but not (except jocularly) in academics' discourse; but in AmE it is more widely used and accepted in informal style. Educated American speakers use it not only in ordinary informal speech but also at times in writing.

<sup>27</sup>Until the nineteenth century or even later, however, *ain't* was common in colloquial upper-class BrE speech. Its effective proscription has been one of the greatest successes of prescriptivists.

### ■ The negative of *am*

The regular negative form %*amn't* is restricted to certain dialects, notably of Scotland and Ireland. In interrogatives with subject–auxiliary inversion /ɑ:rnt/ is widely used: *Aren't I going to be invited?*; *I'm right, aren't I?* The earlier spellings *a'n't* and *an't* have given way to *aren't*, reflecting its homophony with the negative of *are*. *Aren't I* is fully established in BrE or AmE, though in informal AmE *ain't I?* would often be substituted.

However, in uninverted constructions \**I aren't* is not admissible even in informal style. Those who have *ain't*, use that here, while others use analytic negation: *I am not* or *I'm not*.

## 6 Phonological reduction and liaison

Inflectional morphology is concerned with the form of grammatically distinct words that belong to a single lexeme, but we turn now to certain cases of phonological variation in the form of a single grammatical word. Compare, for example:

- [1] a. *I think Pat has seen it.* /əz/      b. *I haven't seen it, but Pat has.* /hæz/

We are dealing here with the same word *has* (the 3rd sg present tense form of *have*), but a natural pronunciation in the context of [a] is /əz/, whereas in [b] it is pronounced /hæz/. These are called **weak** and **strong** forms respectively.

The weak form can be regarded as phonologically reduced relative to the strong form, but this kind of reduction is found on a much larger scale in rapid casual speech. Compare, for example, the three pronunciations of *What do you want?* shown in:

- [2] i /'wɒt du: ju: 'wɒnt/  
 ii /'wɒt dʊ ju 'wɒnt/  
 iii /'wɒdzə 'wɒʔ/

Version [i] contains strong forms of *do* and *you*, and represents a somewhat unnatural pronunciation, involving unusually careful or emphatic enunciation. Version [ii] contains weak forms of *do* and *you*, and represents a natural pronunciation in ordinary connected speech. Version [iii] involves a much greater degree of reduction (with /ð/ indicating a nasalised vowel in place of vowel + nasal sequence, and /ʔ/ indicating a glottal stop in place of /t/) and is restricted to casual style.

There are of course more than three possible pronunciations of the sentence, showing varying degrees of phonological reduction. The study of pronunciation in rapid casual style belongs to the field of phonology, and is outside the scope of this book. Weak forms do merit some consideration, however, for two reasons. In the first place, they are used, as we have said, in ordinary connected speech and in many cases represent the default or stylistically neutral pronunciation. The natural pronunciation of *Look at the cat*, for example, is /lʊk ət ðə kæt/; the version with strong forms of *at* and *the*, namely /lʊk ət ði: kæt/, would generally be unnatural to the point of unacceptability, sounding like a sequence of disconnected words. Secondly, the use of weak forms interacts with the grammar in that it is subject to grammatical restrictions: it is not possible, for example, to have a weak form of *has* in [1b].

We will also consider in §6.2 **clitic** forms, which represent a somewhat greater degree of reduction. A clitic is a form which merges phonologically with an adjacent word, as when the first two words of *Pat has seen it* are pronounced /pæts/ (the written language indicates this with the spelling *Pat's seen it*).

## 6.1 Weak forms

There are around fifty words that have one or more weak forms as well as a strong form, as shown in the following table:<sup>28</sup>

[3]	ITEM	STRONG	WEAK	ITEM	STRONG	WEAK
	<i>a</i>	/eɪ/	/ə/	<i>me</i>	/mi:/	/mi/
	<i>am</i>	/æm/	/əm/	<i>must</i>	/mʌst/	/məst/, /məs/
	<i>and</i>	/ænd/	/ənd/, /ən/	<i>my</i>	/maɪ/	/mɪ/
	<i>are</i>	/ɑːr/	/ə/	<i>of</i>	/ɒv/	/əv/
	<i>as</i>	/æz/	/əz/	<i>shall</i>	/ʃæl/	/ʃəl/
	<i>at</i>	/æt/	/ət/	<i>she</i>	/ʃi:/	/ʃi/
	<i>be</i>	/bi:/	/bi/	<i>should</i>	/ʃʊd/	/ʃəd/
	<i>been</i>	/bi:n/	/bɪn/	<i>sir</i>	/sɜːr/	/sə/
	<i>but</i>	/bʌt/	/bət/	<i>some</i>	/sʌm/	/səm/
	<i>can</i>	/kæn/	/kən/	<i>than</i>	/ðæn/	/ðən/
	<i>could</i>	/kʊd/	/kəd/	<i>that</i>	/ðæt/	/ðət/
	<i>do</i>	/du:/	/dʊ/, /də/	<i>the</i>	/ði:/	/ði/ ~ /ðə/
	<i>does</i>	/dʌz/	/dəz/	<i>them</i>	/ðem/	/ðəm/
	<i>for</i>	/fɔːr/	/fə/	<i>there</i>	/ðeə/	/ðə/
	<i>from</i>	/frɒm/	/frəm/	<i>to</i>	/tu:/	/tʊ/, /tə/
	<i>had</i>	/hæd/	/həd/, /əd/	<i>us</i>	/ʌs/	/əs/
	<i>has</i>	/hæz/	/həz/, /əz/	<i>was</i>	/wɒz/	/wəz/
	<i>have</i>	/hæv/	/həv/, /əv/	<i>we</i>	/wi:/	/wi/
	<i>he</i>	/hi:/	/hi/, /i/	<i>were</i>	/wɜːr/	/wə/
	<i>her</i>	/hɜːr/	/hə/, /ɜː/, /ə/	<i>who</i>	/hu:/	/hʊ/, /ʊ/
	<i>him</i>	/hɪm/	/ɪm/	<i>will</i>	/wɪl/	/wəl/, /əl/
	<i>his</i>	/hɪz/	/ɪz/	<i>would</i>	/wʊd/	/wəd/, /əd/
	<i>is</i>	/ɪz/	/ɪz/	<i>you</i>	/ju:/	/jʊ/, /jə/

Except for *sir*, these words belong to one (or more) of the grammatical categories auxiliary verb, pronoun, determinative, preposition, coordinator, and subordinator. The weak form /ðət/ applies to *that* as a subordinator, not a determinative; /ðə/ applies to *there* as a dummy pronoun, not a locative preposition; /hʊ/ and /ʊ/ apply to *who* as a relative rather than interrogative pronoun.

With the definite article *the*, the weak form /ðə/ is generally used before consonants and /ði/ before vowels: /ðə 'peə/ (*the pear*) and /ði 'æpl/ (*the apple*). There is, however, a certain amount of variation: some speakers use /ðə/ throughout – and there are also those who have this as a strong form.

<sup>28</sup> Forms containing /ə/ followed by /l, m, n/ have an alternate possible pronunciation with no vowel and syllabic /l, /m, /n; these phonologically predictable alternants are not shown in the table.

### ■ Distribution of strong and weak forms

Strong forms are used when the word is stressed, weak forms when it is unstressed.

One completely general factor that leads to a word being stressed is emphasis or contrast, as with the articles in [4i] or the verb *was* in [ii]:

- [4] i *I didn't say I'd found THE missing key: I said I'd found A key.*  
 ii *I never said I WAS a member.*

As far as the articles are concerned, the strong forms are found only under conditions of this kind (see Ch. 5, §6), where they are not only stressed but also the informational focus.

For the rest, there are certain grammatical contexts that require strong forms:

- [5] i a. *Who did you give it [to \_\_\_]?*  
 b. *We'll help you if we [can \_\_\_].*  
 c. *They want me to resign, but I don't intend [to \_\_\_].* } [stranding]  
 ii *How long will it be before she comes [to]?* [intransitive use]  
 iii *I haven't any money: can you lend me some?* [fused-head]  
 iv *Thank you, sir.* [not the appellation use]

In [i] we have stranding of a preposition, auxiliary verb, or infinitival *to*; in [ia] *to* is followed by a gap linked to interrogative *who*, while [ib–c] are elliptical. In [ii] the preposition has no complement at all; this use of *to* is highly restricted, and there are no comparable uses of the other prepositions in [3]. The generalisation covering cases [i–ii] is that prepositions, auxiliaries, and infinitival *to* are stressed when they are the sole or final element in a phrase-level constituent, a PP or VP.<sup>29</sup>

Examples [5iii–iv] illustrate more specific conditions. Determinative *some* is always stressed when in fused-head function; for its pre-head use, see Ch. 5, §7.5. The weak form of *sir* is used only in pre-head position in a proper name, as in *Sir James*; the same applies to *saint*, whose weak form /sənt/ is found only in names like *Saint/St Joan*.

## 6.2 Clitic versions of auxiliary verbs

Certain tensed forms of auxiliary verbs have, in addition to their weak forms, **clitic** versions, which merge phonologically with an adjacent word, their **host**. Thus *we've* is pronounced like *weave*, and *he'll* like *heel*, while *I'm* rhymes with *time*, and so on. For the most part, as in these examples, the clitics attach to a preceding word: they are then called, more specifically, **enclitics**. There is, however, one **proclitic**, attaching to a following host: this is the clitic version of *do*, which merges with *you* in examples like *D'you like it?*

Clitic forms are more restricted in their syntactic distribution than weak forms – but in varying degrees. The most restricted is the proclitic form of *do*, which attaches only to the pronoun *you* in clauses with subject–auxiliary inversion: *D'you want it?*; *What d'you want?* The enclitics we will consider under three headings.

<sup>29</sup>This statement may need to be qualified to cater for constructions where the gap is preceded by a sequence of two (or more) auxiliaries or prepositions, as in *I didn't tell her, though I realise I probably should have \_\_\_ or What did she make it out of \_\_\_?* While strong forms are required for the first element (*should* and *out*), both strong and weak forms are found for the second (*have* and *of*). The strong version is the more usual, however, and it may be that the weak forms are confined to the rapid casual style that falls beyond the scope of this book.

(a) Most restricted: clitic forms of *am*, *are*, *have*, and *will*

These attach only to a preceding subject pronoun, as in:

[6] /aɪm/ I'm /wɪəʔ/ we're /ðeɪv/ they've /hi:l/ he'll

The clitic forms of *am*, *have*, and *will* consist of a single consonant: /m, v, l/. In the case of *are* it is not possible to give a satisfactory representation for the clitic itself, as the host + clitic combination may not be phonologically divisible into two corresponding parts. For example, *they're* in BrE is usually homophonous with locative *there*. Matters are complicated by the rhotic vs non-rhotic contrast and by the fact that the host + clitic combination may itself have strong and weak forms. Thus *you're* has a number of strong forms, including /jɔ:ʔ/ (rhyming with *sore*) and /jʊəʔ/ (rhyming with *pure*), but also a weak form /jə/.

The distributional restrictions on these clitics can be seen by comparing the examples in [6] with those in [7], where cliticisation is not normally possible:

- [7] i *Jo and you are in for a shock.*  
 ii *Both of you have been pretty inconsiderate.*  
 iii *The Smiths will be there, and so will I.*

In [i–ii] *you* is not itself the subject, only part of the subject; and in [iii] *so* is a connective adjunct. We are concerned here with the phonology: *so will*, for example, can't be reduced to /səʊl/ (homophonous with *soul*). In writing, the use of contraction marked by an apostrophe is somewhat more extensive, at least for 'll and 've. In *Pat'll do it*, for example, 'll corresponds to the weak form /əl/, and in *You could've been hurt* the 've corresponds to weak /əv/.

The contrast between [6] and [7] is very clear. The difference between clitics and weak forms can, however, be quite slight, and there would seem to be some variation among speakers concerning the use of these clitics. Some, for example, accept non-subject interrogative words as host, as in *Where have you put the keys?* (°/wəəʔv/).

(b) Least restricted: the clitic forms of *is* and *has*

The clitic form of both these verbs is /z/ (or /s/, after a voiceless consonant). Thus in *Jean's here* and *Jean's taken it* we have /dʒi:nz/, homophonous with the plural form *jeans*. The loss of the distinction between the two auxiliaries can lead to ambiguities: *It's finished*, for example, can mean either “It is finished” or “It has finished”.<sup>30</sup>

These clitics place fewer requirements on what may serve as their host, allowing hosts that are not subject pronouns; but they are still interestingly restricted. Compare:

- [8] i *Which dog's been on the sofa?* [NP subject]  
 ii *That they're wet's obvious enough.* [clausal subject]  
 iii *Get the one that's up in the bedroom.* [subordinator *that* in relative]  
 iv *What do you think's going to happen?* [matrix clause + subject gap]  
 v *Ed, I think, is going, and so's Sue.* [connective *so* (or *neither/nor*)]  
 vi *Here's what you need. There's the bus.* [locative *here/there*]  
 vii *Why's this happening?* [monosyllabic interrogative word]  
 viii *What the hell's she doing?* [interrogative + emotive modifier]

<sup>30</sup>In examples like *What's it matter?* the /s/ is a clitic version of *does*, but this use belongs to a more casual style of speech than we are concerned with here.

- ix % *What salad's that man over there eating?* [multi-word interrogative]  
 x % *Don't use more force than's absolutely necessary.* [comparative *than*]  
 xi \**She often's right about things.* [central adjunct]  
 xii \**Never's it going to be easier.* [other preposed constituent]

The clitic may attach to the last word of the subject, which does not have to be an NP. In [iii–iv] it attaches to the word preceding a subject gap: the subordinator *that* in relative clauses, or the last word of the matrix in content clause complements (in [iv] ‘*—’s going to happen*’ is complement of *think*: compare *I think something absolutely terrible's going to happen*, where the subject is present in the content clause). The elliptical construction shown in [v] may have *neither* or *nor* instead of *so*: *Ed isn't going and neither's/nor's Sue*. With prenuclear non-subject interrogative phrases, the clear cases are those consisting of a monosyllabic interrogative word, alone or followed by one of the emotive modifiers *the hell*, *on earth*, *ever*, etc. Some speakers allow other interrogative phrases, as in [ix]. There is also variation with respect to comparative *than* in [x]. But [xi–xii] illustrate constructions where cliticisation is excluded: following an adjunct in central position (between the subject and the verb), and preposed constituents other than interrogatives and the connectives of [v].

### (c) Intermediate: the clitic forms of *had* and *would*

These auxiliaries have /d/ as their clitic form: in *He'd gone* and *He'd go* we have /hi:d/, homophonous with *heed*. Again, then, ambiguities can arise: *I'd put it away* can mean either “I had put it away” or “I would put it away”. Such ambiguities, however, are much rarer than with *is* and *has* because there is less overlap in the distribution of *had* and *would*.

The clitic /d/ occurs only after vowels: in *Jan had seen it*, for example, the auxiliary can't be cliticised to yield a form rhyming with *sand*. Syntactically, it is less restricted than the clitic forms of *am*, *are*, *have*, and *will*: it may, for example, attach to *to* in *The person you were talking to'd been in prison*. But it seems somewhat more restricted than /z/: for example, it can hardly attach to connective *so* in *and so had/would I*. For many speakers *had* cliticises somewhat more readily than *would*, so that reduction to /d/ would be more likely in *Who had she been seeing?*, say, than in *Who would you vote for?*

## 6.3 Incorporation of the infinitival marker *to*

In some varieties, especially in AmE, the initial *to* of an infinitival catenative complement may, in informal speech, be morphologically incorporated into the preceding head word. This is found with the seven items listed in [9]; it is often shown in very informal styles of writing (typically the written representation of casual speech) by non-standard spellings:

- |       |                      |             |  |
|-------|----------------------|-------------|--|
| [9] i | <i>going + to</i>    | /ˈɡəʊnə/    | <i>She's gonna fall.</i>               |
| ii    | <i>got + to</i>      | /ˈɡɒtə/     | <i>You've gotta help me.</i>           |
| iii   | <i>have + to</i>     | /ˈhæftə/    | <i>We'll hafta give it away.</i>       |
| iv    | <i>ought + to</i>    | /ˈɔ:tə/     | <i>You oughta tell them the truth.</i> |
| v     | <i>supposed + to</i> | /səˈpəʊstə/ | <i>He's supposta be at work.</i>       |
| vi    | <i>used + to</i>     | /ˈju:stə/   | <i>I usta like her.</i>                |
| vii   | <i>want + to</i>     | /ˈwɒnə/     | <i>They wanna get a new car.</i>       |

This phenomenon is to be distinguished from the regular phonological reduction of *to* (infinitival marker or preposition) to the weak form /tə/, as in:

- [10] a. *I hope to see her.* /hoʊp tə/      b. *They drove to Paris.* /drouv tə/

The most significant difference is that the forms in [9] can be stranded, whereas the reduction to a weak form illustrated in [10] does not take place in this kind of context (cf. [5i] above). Compare, then:

- [11] i a. %*He doesn't want me to tell her but I'm gonna* \_\_\_\_.  
       b. %*I asked them to help but they don't wanna* \_\_\_\_.  
 ii a. *I'm not sure I'll see her, but I hope to* \_\_\_\_      [/hoʊp tuː/, /not \*/hoʊp tə/]  
       b. *That's not the place they drove to* \_\_\_\_      [/drouv tuː/, not \*/drouv tə/]

In this respect the case is similar to that of negative forms like *can't* or *isn't* (§5.5), and we again regard it therefore as a matter of morphology, not mere phonological reduction. But it is much less systematic than the negative case, applying to just seven words which do not in other respects belong together as a class; it thus falls within the sphere of lexical morphology, not inflection.

This is to say that the forms in [9] are morphological compounds. And because the infinitival marker has been incorporated into the compound the catenative complement is a bare infinitival, not a *to*-infinitival. For the same reason they can only enter into the simple catenative construction, not the complex one. The ordinary verb *want* can enter into either: *They want to get a new car* (simple) or *They want me to get a new car* (complex). There is naturally no compounded counterpart of the latter example because *want* and *to* are not adjacent. But even when the object NP is fronted so that the *to* does immediately follow *want*, the compound is still excluded. Compare, then:

- [12] i a. %*Who do you want to invite* \_\_\_\_?      b. %*Who do you wanna invite* \_\_\_\_?  
       ii a. *Who do you want* \_\_\_\_ *to win*?      b. \**Who do you wanna* \_\_\_\_ *win*?

In [ia] *who* is object of *invite*, whereas in [iia] it is object of *want*. Example [ia] thus belongs to the simple catenative construction (like *I want to invite Kim*) and hence allows incorporation of *to*, as in [ib]; [iia] belongs to the complex construction (like *I want Kim to win*) and hence has no counterpart with *wanna*, for the compound verb licenses only a single complement, a subjectless bare infinitival.<sup>31</sup>

Two of the seven compounds display the inflectional contrast shown in:

[13]		3RD SG PRESENT	PLAIN PRESENT OR PLAIN FORM
i	<b>hafta</b>	/hæstə/	/hæftə/
ii	<b>wanna</b>	/wɒnstə/	/wɒnə/

The inflectional marking of the 3rd sg present form is on the head element, the verb base, just as in plural compounds like *passers-by* it is on the noun base. In contexts requiring some other inflectional form, only the ordinary, non-compounded construction is available: *They had to leave*; *We're having to sell it*. Note that in ellipsis these behave like [11ii], not [11i], so that in *We asked them not to leave but they had to*, for example, we have /hæd tuː/, not \*/hædə/. In addition, /juːstə/ can be either a preterite form (*I usta like it*) or a plain form (*I didn't*

<sup>31</sup>A minority of speakers appear to allow the pronunciation /wɒnə/ in [12iib], but we would regard that not as a case of morphological compounding but a matter of phonological reduction. The complex catenative construction provides no evidence for a morphological explanation of the kind illustrated in [11].

it is unstressed. The [iia] words never take the liaison form: we have *a hero*, not \**an hero*, in accordance with the general rule. The initial /h/ of an unstressed syllable, however, may optionally be dropped in connected speech, as in *Did you see him?*, *this habitual criminal*, *its historical development*, and so on. Loss of the /h/ results in a word beginning with a vowel, thus providing the context for the liaison form, again in accordance with the rule: /ənə'bitʃʊəl 'krɪmɪnəl/.

This is unproblematic as far as speech is concerned, but in writing the status of expressions like *an habitual criminal*, *an heroic trek*, *an historical novel*, *an hysterical outburst* is less clear. Usage manuals generally agree that *an* is permissible, but not obligatory, in such cases – which reflects the fact that /h/ is optionally, but not obligatorily, omitted in speech. The manuals suggest, however, that the present trend is towards always using *a* before words of type [15iib]: *a habitual criminal*, *a heroic trek*, *a historical novel*, *a hysterical outburst*. *A hotel* is often mentioned as a special case, with the suggestion that *an hotel* is now old-fashioned and to be avoided.

This is the second of two chapters dealing with the form of words. The main topic of Ch. 18 was the formation of inflected words from their lexical base, while the present chapter is concerned with the form of lexical bases, i.e. with the lexical side of word-formation.

## 1 Preliminaries

### 1.1 Established words and potential words

To a very large extent speakers know words as individual items of vocabulary. We know, for example, that the word for the area over which a bishop has charge is *bishopric*, not *\*bishopdom* – and conversely that the word denoting the area over which a king rules is *kingdom*, not *\*kingric*; that there are words *unfaithfulness* and *infidelity*, but not *\*infaithfulty* or *\*unfidelness*; and so on. Words like *bishopric*, *kingdom*, *unfaithfulness*, *infidelity* we will refer to as **established** words: they are recognised as part of the vocabulary of the language.

Established words are individually familiar to speakers of the language and can be found in standard dictionaries. The inventory of items included in such dictionaries is not, however, identical to the set of words. A dictionary includes many multi-word expressions that have idiomatic meanings or are otherwise known as individual items (*give in*, *take advantage of*, *the more the merrier*, and so on). Conversely, and more importantly for the purposes of this chapter, not all words are established words. In speaking or writing we do not always restrict ourselves to established words: we can create new words or use words we have heard before but which have not yet become established.

Creating new words is in general subject to rules or constraints. For example, the rules of Present-day English word-formation allow *policeability* as a word, but not *\*priestric* or *\*pick-basket*. People vary in their subjective reaction to new words, and some will find *policeability* inelegant or otherwise open to criticism, but it nevertheless differs very clearly in its linguistic status from *\*priestric* and *\*pick-basket*. *Policeability* is formed from the established verb *police* by adding the adjective-forming suffix *·able*, and then adding a further suffix, with modification of *·able*, to yield a noun that might be used in such a sentence as *The Commissioner questioned the policeability of the new regulations*. But *\*priestric* and *\*pick-basket* do not conform to the present-day rules; *\*priestric* is analogous to *bishopric* but *·ric* is no longer available as an element for forming new words, and the pattern seen in *pickpocket* (plain form of the verb + noun in a direct

object relation) is likewise no longer available for forming new words so *\*pick-basket* is not admissible.<sup>1</sup>

Words which conform to the rules of word-formation we will call **grammatical**, extending this term from syntax to morphology. Similarly, words that do not conform to these rules and which are not established we call **ungrammatical** and mark with the familiar asterisk notation. Grammatical words like *policeability* which are not established will be referred to as **potential words**: they have the potential to become established.<sup>2</sup> Words which have been used but have not become established are commonly called ‘nonce-words’; as we have defined ‘potential’ word as a grammatical word that is not established the category will cover nonce-words as well as words that have not in fact been used.

An ordinary dictionary deals with the established words more or less item by item, whereas a grammar describes the structural patterns and interrelationships within the full set of established and potential words, and the principles and rules governing the formation of new words: this is our concern in the present chapter.

## 1.2 Morphological structure

### ■ Complex and simple words

A **complex word** is one that is analysable into a sequence of smaller units, while a word that is not so analysable is **simple**:

[1]	i	<i>trap</i>	<i>child</i>	<i>father</i>	<i>elephant</i>	[simple words]
	ii	<i>mouse-trap</i>	<i>child-care</i>	<i>father-figure</i>	<i>elephant-tusk</i>	[complex words]
	iii	<i>en-trap</i>	<i>child-ish</i>	<i>father-ly</i>	<i>elephant-ine</i>	

### ■ Bases and affixes

The two main morphological categories that figure in the structure of words are **bases** and **affixes**. In English bases are characteristically **free** while affixes are normally **bound**, where an element is free if it can stand alone as a word and bound if it can't. Among the minimal units in [1] the bases are *trap*, *child*, *father*, *elephant*, and *mouse*, *care*, *figure*, *tusk*. Note that although the bases *mouse*, *trap*, etc., do not form words by themselves in [ii] and [iii] they have the potential to do so, and hence satisfy the definition we have given for ‘free’. The affixes in [1] are *en-*, *-ish*, *-ly*, and *-ine*. These cannot normally stand alone as words but attach to a base;<sup>3</sup> affixes which precede the

<sup>1</sup>We continue to use the ‘.’ notation introduced in the last chapter to mark suffixes (like *-able*) or prefixes (like *pre-*) and, where appropriate, for marking morphological divisions within words except when there is a hyphen in the orthography.

<sup>2</sup>Established words like *bishopric* and *pickpocket* which do not conform to the present-day rules of word-formation could be called ‘agrammatical’; we return to them below in discussing the concept of lexicalisation. In the morphological literature the term ‘grammatical word’ is commonly used in other senses (generally contrasting with lexical word, lexeme, orthographic word, and so on), but these senses are so different from that adopted here that there can be no danger of confusion.

<sup>3</sup>The qualification ‘normally’ is added to cater for cases like that where one responds to the question *Was it small?* by simply saying *Ish*. This represents a jocular ellipsis of *small* and doesn't affect the status of *-ish* as an affix rather than a base. More problematic is the case of items such as *mega-*, *mini-*, *anti-*, *pro-*, which are historically affixes but have developed uses where they can stand alone as words: *She was wearing a mini* or *I'm very anti that sort of behaviour*, etc. Since these uses come from the bound form and are probably still felt as related to it, there seems little point in reanalysing *mini-dress* and the like as consisting of two bases.

base, like *en-* in *en-trap*, are **prefixes**, and those which follow, like the other three, are **suffixes**.

### Bound bases

We have said that English bases are characteristically free, but we also find bound bases, bases which cannot stand alone as a word. Compare:

- [2] i perish·able starv·ation abus·ive pre·judge dis·aggregate [free base]  
 ii dur·able dur·ation aggress·ive pre·empt dis·perse [bound base]

The underlined elements in [2i] are straightforward bases of the kind illustrated in [1]: they have the potential to stand alone as words. (*Starve* and *abuse* lose their final *e* when followed by a vowel-initial suffix, but that is simply a matter of spelling alternation.) But there are no words *dure*, *aggress*, *empt*, and *perse* in English, so the underlined elements in [2ii] are bound. We nevertheless classify them as bases, not affixes, because they fill the same role in the structure of the word as the central type of base seen in [i] – the examples are chosen to show the same affixes attaching now to a free base, now to a bound one. All words contain at least one base, and since *·able*, *·ation*, *·ive*, *pre·*, and *dis·* are clearly affixes, there is no problem in identifying the underlined elements in [i] as the base of these words.

*Dur·*, *aggress·*, *·empt*, and *·perse* are quite unlike affixes in that they do not attach to free bases to form words. The reason the [2ii] words have bound bases is historical: they were not created by the word-formation processes of English itself. *Durable*, for example, was borrowed into English from Old French, and the Old French word in turn came from Latin; the *·able* part, however, is easily identifiable with that of *perishable* and this enables us to analyse the whole into base + suffix. Precisely because *dur·* is bound, however, *durable* does not conform to the rules of Present-day English word-formation, and the same applies to the other words in [ii].

### ■ Combining forms

The underlined elements in [3] are known as **combining forms**:

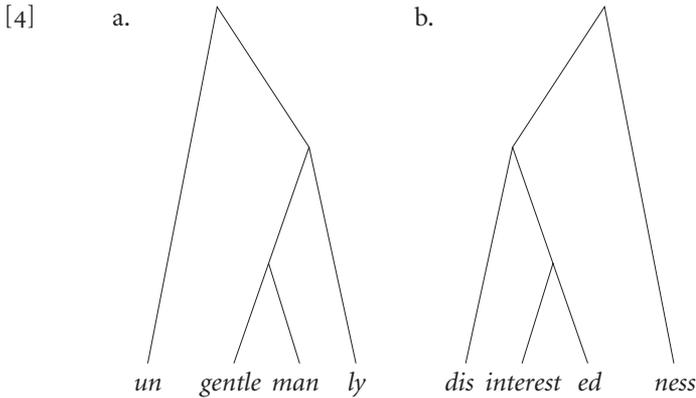

- [3] i anglo·phobe aster·oid auto·gamy electro·lyte pseudo·carp  
 ii Anglo·Soviet meteor·oid auto·hypnosis electro·magnet pseudo·science

Combining forms generally have their origin in one of the classical languages, usually Greek. Prototypically, one such form combines with another to form a word, as in [i] (and many of them must combine in this way), but some can also combine with a free base, as in [ii]. We will take combining forms to be a special case of bound bases, though they are less clearly distinct from affixes than other bases; they are discussed more fully in §4.5.

### ■ Constituent structure

Words containing three or more elements have a hierarchical constituent structure comparable to that of larger grammatical units. The **immediate constituents** (ICs) of *un-gentle-man-ly*, for example, are *un* + *gentlemanly*: it is formed by adding the negative prefix *un·* to the adjective *gentlemanly*, not by adding the adjective-forming suffix *·ly* to a non-existent noun *\*ungentleman*. At the next layer of structure, the ICs of *gentlemanly* are *gentleman* + *·ly* (not *gentle* + *manly*). And finally *gentleman* is divisible into *gentle* + *man*. The constituent structure can be represented in the familiar type of tree-diagram,

as in [4], where we also give an analysis of *disinterestedness*:

In complex words one base occurs as a constituent of another. *Boy-ish*, for example, is a base that contains the base *boy* within it. In [4] the bases in [a] are *gentle*, *man*, *gentleman*, *gentlemanly* and *ungentlemanly*, and in [b] *interest*, *interested*, *disinterested* and *disinterestedness*. Note that while a base may be contained within a larger base, we do not speak of a word being contained within a larger word. *Gentle* and *man*, for example, are bases but not words when they occur in the word *gentleman*. The sentence *He behaves like a gentleman*, for example, contains just five words: *gentleman* is here both a base and a word, while *gentle* and *man* are just bases. In *He is a very gentle man*, by contrast, *gentle* and *man* are simultaneously bases and words.

We can now define various kinds of base as follows:<sup>4</sup>

- [5] i **Compound base**: one whose ICs are themselves bases  
 ii **Derivative base**: one with an affix as an IC  
 iii **Simple base**: one not divisible into smaller morphological constituents  
 iv **Lexical base**: one that is not part of a larger base formed by a process of lexical word-formation

*Gentleman* is therefore a compound base, but *gentlemanly* and *ungentlemanly* are derivative bases; *gentle* and *man* are simple bases. Compound and derivative bases are defined by their internal structure, and simple bases by their lack of any such structure. A base of any of these three types may or may not be a lexical base, depending on the larger morphological structure, if any, in which it is contained. *Gentleman*, for example, is a lexical base in *He behaves like a gentleman*, but not in *He behaves in a gentlemanly way*.

### ■ Morphophonological alternation

Bases and affixes often exhibit variation in phonological form depending on the structure of the base in which they occur: this phenomenon is known as **morphophonological alternation**. In [4i], for example, *man* has a reduced vowel /ə/ instead of the full vowel /æ/ that it has when it is not part of a compound. The final consonant of *electric* is normally /k/, but in *electricity* we have /s/ instead. Commonly, as in these examples, the morphophonological alternation is not reflected in the spelling, but there are also

<sup>4</sup>An alternative term for 'base' is 'stem' (though the latter is also used in other senses); and 'root' is commonly used for a simple base. We allow the term 'base' to apply to words as well as to parts of words in order to achieve greater generality. For example, as far as the internal structure of 'gentlemanly' is concerned, it doesn't make any difference whether it is standing alone as a word or is merely part of the larger word 'ungentlemanly': in either case it is a derivative base.

cases where it is, as with the negative prefix seen in *inattentive*, *impossible*, *illegal*, *irrelevant*. Morphophonological alternation is particularly frequent in derivative bases, and is discussed in that context in §5.1.2.

### ■ Morphological analysability vs etymology

Words are most clearly analysable into constituent parts when the latter occur with the same or similar meaning elsewhere, as with *bed-room*, *un-kind*, *soft-ness*, etc. But this is by no means a necessary condition for analysability. There is no difficulty in recognising *straw-berry* and *draw-ing-room* as compounds even though the meaning of the whole is not predictable from the meanings of the component bases: it is enough that the second base is formally and semantically identifiable with the *berry* and *room* that occur as separate words or in semantically more transparent compounds like *black-berry* and *bed-room*. Similarly with derivative bases like *dur-able* and the others listed in [2ii], even though affixes characteristically have less specific meanings than bases.

There are even cases where neither component contributes a clearly separable component of meaning to the whole. The meaning of *black-mail*, for example, is not predictable from the meanings of *black* and *mail* as independent words, but *black* remains easily recognisable as a separate morphological unit because it occurs in a considerable number of compounds and phrases where it likewise does not have its literal meaning: *blackleg*, *blacklist*, *blacksmith*, *black magic*, *black mark*, *black market*, *black spot*, and so on.

The case of *blackmail* is to be distinguished from that of *blackguard*. *Blackmail* is morphologically analysable but semantically opaque as a result of historical change. (The original meaning of the *mail* component was “coin, rent” and with *black* having the meaning “illicit” still seen in *black market*: the compound was interpretable as “illicit money”). But with *blackguard* historical change has resulted in the loss of /k/ from *black*, and /blægɑːɾd/ is now a simple base, not a compound: the first syllable is neither phonologically nor semantically identifiable with /blæk/.<sup>5</sup> The original base *black* is retained in the spelling, but this can be seen as a reflection of the historical source rather than as a justification for treating *blackguard* as a compound. Compare, similarly, /kʌbəd/ *cupboard*, /brekfəst/ *breakfast*, and so on. With *husband* even the orthography gives no indication of the original compounding of *house* and *bōnda* “householder”, a word which has now vanished from the language. Any analysis of such words as *blackguard*, *cupboard*, *breakfast*, *husband*, and the like belongs therefore to the field of **etymology**, the study of the historical source of words, not to the field of **morphology**, the study of the grammatical structure of words. There is nothing in the present-day language system to motivate an analysis of such words into smaller morphological units.

Historical change may likewise yield simple bases from what were originally derivatives. *Mongrel*, for example, is not morphologically analysable even though historically it was formed by suffixation. The original suffix was also used in the formation of such words as *mackerel*, *doggerel*, *scoundrel*, but these words are too few in number and too opaque semantically to justify a base + suffix analysis in Present-day English. Again, then, we take the view that any analysis of *mongrel* is a matter of etymology, not morphology.

It is not always so easy, however, to decide whether one is doing morphology or etymology. Take again the case of *durable*. Evidence for recognising *dur* as a base is

<sup>5</sup> Some speakers pronounce *blackguard* as /blægəɾd/: here the second syllable is likewise neither phonologically nor semantically identifiable with /gɑːɾd/.

provided by the semantic relation between *durable*, *duration*, and *endure*, and evidence for taking *-able* as a suffix comes from the relation with such words as *perishable* and also from the adjective–noun relationship between *durable* and *durability* (compare *repeatable* ~ *repeatability*, *readable* ~ *readability*, and countless others). That adds up to quite a strong case for a morphological analysis. But consider now the words *stable*, *soluble*, *voluble*. These enter into the same adjective–noun relationship (compare *stability*, *solubility*, *volubility*), so we can't say there is no evidence for morphological analysis here. It is, however, very slight, even when we add in the relation between *soluble* and *solution*. In the case of *stable* a division between *st* and *able* gives a base without a vowel and the wrong vowel quality for the suffix (/eɪ/ rather than /ə/), while a division between *sta* and *ble* (which is in fact etymologically correct) doesn't have the suffix that is found in words whose morphological analysability is clear (i.e. words like *repeat-able*).

Or take the adjective *pregnant*. Etymologically it is divisible into the three components *pre-* “before in time” (cf. *prejudge*, *premature*), *gn* “having to do with begetting” (cf. *cognate* or, with an intervening vowel, *gonad*, *genus*), and the adjective-forming suffix *-ant* (cf. *expectant*, *malignant*). The division between *pre* and *gn* can safely be regarded as purely etymological: *gn* is not a phonologically possible base, and the semantic connection with *prejudge*, *cognate*, etc. is not transparent enough to sustain a morphological analysis. Evidence for a division between *pregn* and *ant* is provided by the adjective–noun relationship seen in *pregnant* ~ *pregnancy* (cf. *flippant* ~ *flippancy*, *militant* ~ *militancy*, etc.), but this is not as widespread as the *durable* ~ *durability* pattern and not accompanied by the other evidence favouring a morphological analysis of *durable*.

As a final example consider such words as *commit*, *demit*, *emit*, *compel*, etc. Evidence for a morphological analysis *com-mit*, *de-mit*, *e-mit*, *com-pel*, etc., is provided by the set of relationships between the verbs in [6i] and between these verbs and the corresponding nouns shown in [6ii]:

[6]	i	<i>commit</i>	<i>demit</i>	<i>emit</i>	<i>permit</i>	<i>remit</i>
		<i>compel</i>		<i>expel</i>	<i>propel</i>	<i>repel</i>
		<i>compose</i>	<i>depose</i>	<i>expose</i>	<i>propose</i>	<i>repose</i>
		<i>conceive</i>	<i>deceive</i>		<i>perceive</i>	<i>receive</i>
	ii	<i>commission</i>	<i>démission</i>	<i>émission</i>	<i>permission</i>	<i>remission</i>
		<i>compulsion</i>		<i>expulsion</i>	<i>propulsion</i>	<i>repulsion</i>
		<i>composition</i>	<i>deposition</i>	<i>exposition</i>	<i>proposition</i>	
		<i>conception</i>	<i>deception</i>		<i>perception</i>	<i>reception</i>

However, the number of words entering into these relationships is quite small – not remotely comparable to the number entering into the *-able* ~ *-ability* relationship (or indeed the *-ant* ~ *-ancy* one if we include the *-ent* ~ *-ency* variant seen in *consistent* ~ *consistency*, etc.). Moreover, the putative prefixes *com-/con-*, *de-*, *ex-/e-*, *per-*, *pro-*, *re-* and bases *mit*, *pel*, *pose*, *ceive* cannot be given constant independent meanings from which the meanings of the whole words could be predicted.

The view taken here is that no sharp boundary can be drawn between morphological analysis and pure etymology – and we will leave open the question as to whether forms like those in [6i] are to be taken as morphologically analysable in Present-day English. Our primary focus in this chapter will be on cases whose morphological analysability is transparent or very nearly so, but a restriction of this kind is motivated by limitations of space and is not inconsistent with a broader interpretation of the field of morphology.

### 1.3 Productivity and lexicalisation

#### ■ Productivity of a process as availability for use in the creation of new words

We say that a particular kind of morphological process, or a particular affix, is **still productive** if it is still available for the creation of new words. For example, the process of combining two nouns into a compound noun that was used in the Old English period to form the source of *husband* is still productive, enabling us to create new words such as *housemate* (cf. the established *flatmate*). Similarly, we can form new words like *policeability*, as mentioned above, so that the process of forming an adjective by adding the suffix *-able* to a verb and the process of forming a noun by adding the suffix *-ity* to an adjectival base ending in *-able* are still productive.

These examples contrast with processes that have been used in the formation of words in the past, but are no longer productive. The ungrammatical words *\*pick-basket* and *\*priestric* discussed in §1.1 provide examples. *\*Pick-basket* is ungrammatical because the type of verb + noun compounding process that gave us *pickpocket* with the meaning “person who picks pockets” is not now productive. And *\*priestric* is not a potential word because the suffix *-ric* found in *bishop-ric* and *arch-bishop-ric* is no longer productive.

#### ■ Lexicalisation

The converse of productivity is **lexicalisation**: words that are or were earlier morphologically analysable but which could not be formed with their present meaning by the current rules of word-formation are said to be lexicalised.<sup>6</sup> The implication of the term is that properties of these words have to be specified individually in the dictionary rather than being consistent with the grammatical rules of word-formation.

Numerous examples of lexicalisation are provided by words already discussed. *Bishopric* and *pickpocket* are lexicalised in that the processes by which they were formed are no longer productive. *Blackmail* is lexicalised even though the process of forming a compound by combining an adjective and noun is still productive, because the meaning of the whole is not predictable from the current meanings of *black* and *mail*. Derivatives with bound bases like *durable* and the others in [2ii] are likewise lexicalised in that the still productive use of the affixes concerned attaches them to free bases, not bound ones. The words of [6] (*commit*, *demit*, etc.) are lexicalised since, whether or not they are morphologically analysable at all, they certainly could not be formed by the current rules – hence the impossibility of filling the gaps in the table. The extreme case of lexicalisation is seen in words like *husband* and *mongrel* which are no longer morphologically complex.

Lexicalised words tend to have rather more specialised meanings than non-lexicalised ones. Compare, for example, *blackmail* with a potential compound such as *dog-radio*. Out of context it is not clear how the latter is to be interpreted. It could mean “a radio which resembles a dog”, “a radio which is attached to a dog”, “a radio for calling dogs on”, “a radio with a picture of a dog on it”, or various other things. But a lexicalised compound like *blackmail* does not have this wide range of possible meanings. It cannot mean “a type of coat of mail which is typically black”, nor “illicit post”, and so on: its central meaning is “extorting money from someone by threatening to reveal damaging information”.

Such specialisation of meaning is typical of words that are lexicalised. But it is not restricted to them: it tends to be characteristic of the larger class of established words.

<sup>6</sup>Alternative terms that can be found in the literature include ‘frozen’, ‘fossilised’, ‘petrified’; these focus on the fact that lexicalised words are fixed in meaning and not open to the range of meaning available for a newly coined word.

Take, for example, the compound *wheelchair*. In principle, it could be used for any type of chair that has some strong association with wheels – by virtue of having wheels, being made from wheels, being in the shape of a wheel, and so on. In practice, however, it is restricted to the type of chair used by invalids. A pushchair has wheels, but that does not make it a wheelchair. You can push a wheelchair, but that does not make it a pushchair. *Wheelchair* thus has a specialised meaning, but while it is an established word, it is not lexicalised: it is formed by a perfectly productive process of compounding from two nouns that are readily identifiable with the independent words *wheel* and *chair*, and its meaning is quite consistent with its having been formed by compounding *wheel* as modifier with *chair* as head.

### ■ Degree of productivity

If a word-formation process is still productive, we need also to consider its **degree of productivity**. This is a matter of how readily words can be formed by means of the process. To a large extent this is determined by the size of the class of bases available to the process.

We can illustrate this concept by comparing the suffixes *·ness* and *·ity*. Both can be added to adjectives to form nouns. Some bases allow either: *porousness* and *porosity*, for example, are both established words. Other bases allow or strongly prefer just one: *bearded* can only take *·ness* (*beardedness*, not *\*beardedity*), while *linear* strongly prefers *·ity* (*linearity*, but hardly *linearness*). But overall *·ness* is used more widely than *·ity*, and there is evidence that speakers today forming new words strongly prefer those in *·ness*: we say then that *·ness* has a higher degree of productivity than *·ity*.

Words produced by the most freely productive processes rarely become established. It would be inappropriate, for example, for a dictionary to attempt to list all words formed on the pattern of *brown-eyed*, *smooth-skinned*, *chocolate-coated*, *red-covered*, *two-bedroomed* (though some of them, such as *tight-fisted* or *small-minded* do have to be recorded because of their specialised meanings). Such highly productive processes are comparable to the rules for forming syntactic phrases: we don't need to list *brown-eyed* in the dictionary any more than we need to list *with brown eyes*. Similarly, there is no more reason for a dictionary to list the thousands of grammatical compounds in *·like* (*axe-like*, *cheese-like*, *dog-like*, *orange-like*, *dream-like*, . . .) than there is for it to list the corresponding phrases (*like an axe*, *like cheese*, . . .).

We will not try here to quantify degrees of productivity, but will work rather with broad categories such as 'highly productive', 'of low productivity', and the like, or with relative productivity, saying (as in the *·ness/·ity* example) that one process is more productive than another.

## 1.4 Introduction to the description

### ■ Processes and morphological structure

We have pointed out that a chapter dealing with the grammar of words must deal with the ways in which new words can be created as well as with the properties of existing words. At times, therefore, the focus will be on **processes**, on **word-formation**, while at others it will be on **morphological structure**, on the **form of words**. To a large extent, a description in terms of processes and one in terms of morphological structure are equivalent. Compounding, for example, is the process whereby two bases are put

together to form a third, but the result is a compound, defined in structural terms as a base whose ICs are themselves bases. Similarly, derivation is the process of attaching an affix to a base, and this yields a base with the structure of a derivative, i.e. one consisting of a base and an affix, so again a description in terms of formation process and one in terms of morphological structure are equivalent. But the relation between formation process and resultant structure is not always so straightforward: not all word-formation processes yield words of a distinct morphological structure. An obvious example is back-formation, the process by which *edit*, for example, was formed from *editor* by dropping the suffix. Here the resultant form is just a simple base and in terms of morphological structure the relation between *edit* and *editor* is the same as that between *write* and *writer*: whether the derivative is older or (as in the usual case) newer than the simple base is a purely historical question.

### ■ Organisation of the chapter

We deal first, in §§2–3, with those processes which (like back-formation) do not result in words of a distinct morphological structure. Next, §§4–5 are mainly devoted to compounding and derivation respectively. We have, however, departed from an organisation based purely on the type of process or resultant form in order to give greater weight to meaning. Thus §4 is almost completely limited to compounding involving noun, adjective, and verb bases, while compound verbs beginning with such preposition bases as *out*, *over*, *under*, etc., are dealt with in §5, along with the derivatives, and in this latter section we group together affixes that have the same kind of meaning (such as those deriving diminutives, reversatives, and so on) or have the same syntactic effect (such as deriving adjectives from nouns or verbs). It is hoped that the heterogeneity of the classification, in reflecting the heterogeneity of the material, will allow some patterns to emerge more clearly than they would with a classification based entirely on processes or one based entirely on meaning.

We will not be concerned with the borrowing of new words from other languages (as with *blitzkrieg*, from German, for example): although this enlarges the vocabulary, it does not involve **forming** a new word. Nor will we be concerned with the development of new meanings for existing words. Most attention will be given to processes that are still productive.

### ■ Data

All the examples given here are attested words. Established words have been taken from dictionaries, including various dictionaries of new words and neologisms. Words from these sources show the continued productivity of the processes they illustrate. The few nonce-words used have the same function.

### ■ Notational convention: the symbol ‘~’

The meaning of a derivative usually involves in some way the meaning of the base to which the affix is attached. In giving glosses for the meanings of such derivatives, we will make use of the swung dash symbol ‘~’ to represent the meaning of the base. For instance, one meaning of the suffix *-ise* can be glossed as “make ~”, so that *vulgarise* means “make vulgar”, *immortalise* means “make immortal”.<sup>7</sup>

<sup>7</sup>The ‘~’ symbol is commonly used in dictionaries to stand for the base itself, but as we use it within double quotes it will be evident that we are concerned with meaning.

## 2 Minor word-formation processes

This section deals with various word-formation processes that are marginal in some way. They do not yield words of a distinct morphological structure or result in new combinations of independently meaningful components. Those in §2.2, moreover, are based on spelling rather than on pronunciation, and hence irrelevant to languages without an established writing-system.

### 2.1 Manufacture

**Word manufacture** is an extremely rare process creating a new word simply on the basis of the phonological resources of the language:

[7] *nylon, quark, boff* (“have sex with”) AmE slang, *scag* (“heroin”)

From a structural point of view these are simple bases: they are not made up of smaller morphological units. The relation between form and meaning is quite arbitrary – deliberately so in a high proportion of cases. One use of this process is for tradenames, as in *Kodak* and (originally) *nylon*.

### 2.2 Initialism

This type of word-formation process has its basis in the written language: in the central cases a base is formed by combining the initial letters of a sequence of words (or of the parts of a complex word). There are two main types, **abbreviations** and **acronyms**.

#### ■ Abbreviations

[8]	i	<i>CIA</i>	<i>Central Intelligence Agency</i>
		<i>EEC</i>	<i>European Economic Community</i>
		<i>FBI</i>	<i>Federal Bureau of Investigation</i>
		<i>LA</i>	<i>Los Angeles</i>
		<i>MIT</i>	<i>the Massachusetts Institute of Technology</i>
		<i>UN</i>	<i>United Nations</i>
	ii	<i>DJ</i>	<i>disc jockey</i>
		<i>DNA</i>	<i>deoxyribonucleic acid</i>
		<i>EFL</i>	<i>English as a foreign language</i>
		<i>ESP</i>	<i>extrasensory perception</i>
		<i>HQ</i>	<i>headquarters</i>
		<i>MC</i>	<i>Master of Ceremonies</i>
		<i>MP</i>	<i>Member of Parliament</i>
		<i>TV</i>	<i>television</i>
		<i>VIP</i>	<i>very important person</i>
	iii	<i>pc</i>	<i>postcard, personal computer</i>
		<i>ps</i>	<i>postscript</i>

Abbreviations are pronounced as sequences of letters: /si:əreɪ/, /i:i:si:/, etc. They are normally written as here, or else with full stops (periods) after each letter (*C.I.A.*, etc.). Occasionally, however, they are spelled out as ordinary words, as in *deejay*, an alternative spelling of *DJ*. The full form is virtually always available as an alternant in the language

system (though individual speakers will not always be aware of it, as for example in the case of *DNA*).<sup>8</sup>

The examples in [8i] are proper names – of institutions or places. Some require the definite article when functioning as head in NP structure, while others appear without it: compare *She works at the UN* and *She works at MIT*. The use of initialisms for institutions is extremely common, but many of them are very localised or ephemeral.

Most words formed by abbreviation are written with upper-case letters, but some have lower case, as in [8iii] (where *PC* and *PS* are alternants). Abbreviations of Latin phrases such as *e.g.* (*exempli gratia* “for example”), *i.e.* (*id est* “that is”), *n.b.* (*nota bene* “note”) are written in lower case, but there is no reason to say that these abbreviations are single words. The examples in [8], however, are words: they belong to the category of noun, and behave grammatically like ordinary nouns. *MC*, *MP*, *VIP*, for example, are count nouns and inflect for plural in the regular way. Note particularly the contrast between *MCs* or *MPs* and *Masters of Ceremonies* or *Members of Parliament*; similarly *HQ* has a distinct plural *HQs* whereas the plural of *headquarters* is identical to the singular. Abbreviations, like other bases, can in principle enter into other word-formation processes, as with *ZPG-er* (“supporter of the zero population growth movement”).

In addition to the above types, we also find compounds where the first base is abbreviated, while the second is retained in full, as in *email* (← *electronic mail*) or *g-suit* (← *gravity suit*). (Here and below, we use an arrow to indicate the source of the cited word.)

## ■ Acronyms

[9] i	NATO	<i>the North Atlantic Treaty Organisation</i>
	UNESCO	<i>the United Nations Educational, Scientific and Cultural Organisation</i>
ii	AIDS	<i>acquired immune deficiency syndrome</i>
	TEFL	<i>teaching English as a foreign language</i>
	TESOL	<i>teaching English to speakers of other languages</i>
	TESSA	<i>tax-exempt special savings account</i> BrE
	WASP	<i>white Anglo-Saxon protestant</i> AmE
iii	<i>dinky</i>	<i>double income, no kids yet</i> BrE
	<i>laser</i>	<i>lightwave amplification by stimulated emission of radiation</i>
	<i>radar</i>	<i>radio detecting and ranging</i>
	<i>scuba</i>	<i>self-contained underwater breathing apparatus</i>

Acronyms differ from abbreviations in that they are pronounced like ordinary words, with the letters having their characteristic phonological value: /neɪtəʊ/, /juːneskəʊ/, /eɪdz/, /tefəl/, etc. This imposes constraints on the letter sequence that don't apply with abbreviations: *FBI*, for example, can only be an abbreviation because it is not a possible spelling of an ordinary word – though the initialism *SCSI* (*small computer system interface*) is unexpectedly pronounced as an acronym, /skʌzi/. Some abbreviations could of course be pronounced as ordinary words, and it is then a matter of convention which initials give rise to abbreviations and which to acronyms – contrast here the abbreviation *EFL* and the acronym *TEFL*.<sup>9</sup>

<sup>8</sup>One example where the full form is not used is *OK*, historically an abbreviation of *ol korrekt* (with non-standard spelling). Especially with the spelling *okay*, this is a very marginal example of initialism.

<sup>9</sup>One occasionally finds words that are part acronym, part abbreviation, as in *CD-ROM* (/si:di:'rɒm/, “compact disk with read-only memory”).

Acronyms are commonly formed from proper names, as in [9i] – and not infrequently an organisation chooses a name for itself that will yield an effective acronym. Like the initialism *MIT*, proper name acronyms stand as full NPs without the definite article: *She works for NATO/UNESCO*, not *\*the NATO / \*the UNESCO*.

Like abbreviations, some acronyms are written with upper-case letters, others with lower case – and again some can be written in either way (e.g. *UNESCO* or *Unesco*, with initial capital because it is a proper name). Full stops are not used with the lower-case letters and are less likely than with abbreviations with upper-case letters. The upper-case type are recognisable as acronyms by their written form, and again their connection with the unreduced forms is maintained by the use of the latter as alternants: in both speech and writing we can have either *NATO* or *the North Atlantic Treaty Organisation*, either *AIDS* or *acquired immune deficiency syndrome*, and so on. Lower-case acronyms are strikingly different. These are formally indistinguishable from ordinary words in both speech and writing, and in general the unreduced forms are not used as alternants. Notice in this connection that with the recent coinage *dinky* the meaning (“married couple with [double income but no kids yet]”) incorporates that of the full form rather than being identical to it: the full form could not therefore be an alternant. For these reasons, the acronym status of such words as [9iii] is largely a matter of etymology, and speakers may well be unaware of it (especially with those that have been in the language a considerable time, such as *laser*, *radar*, *scuba*).

### ■ Departures from strict initialisms

In some cases letters are used which are not the initial of a word or smaller morphological unit. In *TB* /tɪːbiː/, from *tuberculosis*, the *B* is not an initial letter, and likewise the *D* of *ID* /aɪdiː/, from *identification* (meaning “identification document” or, as a verb, “verify someone’s identity by means of such a document”). In the recent coinage *NIREX* /naɪreks/, from *nuclear industry radioactive waste executive*, the *w* of *waste* is omitted while the non-initial *x* of *executive* is included: this kind of departure from the central pattern is used to make the form fit the phonological system. As a final example, consider the form *yuppie*. This is not itself an acronym, but it is formed by adding the suffix *-ie* to the bound base *yup* (with regular doubling of the consonant letter);<sup>10</sup> this *yup* is an acronym standing for *young urban professional* or *young upwardly-mobile professional*, and in the latter interpretation the *m* of *mobile* is likewise omitted.

## 2.3 Clipping

The operation of **clipping** involves cutting off part of an existing word or phrase to leave a phonologically shorter sequence: *ad* from *advertisement*, *chute* from *parachute*, etc. We call the word that is the source of the clipping the **original**; the phonological material that is cut away will be called the **surplus**, and the remaining material that forms the new base the **residue**. Thus the original *advertisement* has the surplus material spelled *vertisement* cut away to form the residue *ad*, which is then a new base of the type known as a clipping.

The historical fact that a base was formed via the clipping operation is not a grammatically relevant fact about the present-day language. But since the clipping process is

<sup>10</sup>Compare the addition of *-ie* to various clippings, discussed in §2.3.2 below.

still productive – in some dialects extensively so – a description of the process involved is a relevant part of the grammar of Present-day English.

Clippings often have restricted uses in that they are deployed only in informal style or even constitute slang when they are first coined. Thereafter, however, they may wholly or largely displace the original, as with *mob* (from *mobile*, itself a shortening of the Latin *mobile vulgus*) or *pram* and *movie* (where the originals *perambulator* and *moving picture* are now rarely used). They can also develop special meanings that differentiate them from the original: compare *curio* and *curiosity*, *fan* (“devotee of sport, famous person, etc.”) and *fanatic*, *pants* and *pantaloons*. Clipping has been a part of English word-formation for a long time, but it is more widely used in some dialects than in others; Australian English (AusE) is particularly rich in clippings.

We divide the words formed by the clipping operation into two types, **plain clippings**, which consist of just the residue from clipping, and **embellished clippings**, in which other operations apply to the residue to produce a longer word. In the above examples, *movie* is embellished, the others plain. We will ignore the fairly extensive numbers of nicknames for places (e.g. *Brum* from *Birmingham*) and, especially, nicknames for people (e.g. *Joe* from *Joseph*, *Gussie* from *Augustus*); personal nicknames in particular often introduce extraneous complications stemming from baby-talk simplifications.

### 2.3.1 Plain clippings

We can distinguish three kinds of plain clipping, naming them by reference to the location in the original of the surplus (not the residue).

#### (a) Back-clippings: surplus removed from the back, i.e. word-final, part of the original

[10]	<i>coke</i> (← <i>cocaine</i> )	<i>deb</i> (← <i>debutante</i> )	<i>deli</i> (← <i>delicatessen</i> )
	<i>doc</i> (← <i>doctor</i> )	<i>lab</i> (← <i>laboratory</i> )	<i>mike</i> (← <i>microphone</i> )
	<i>pen</i> (← <i>penitentiary</i> )	<i>prom</i> (← <i>promenade</i> )	<i>quad</i> (← <i>quadruplet/quadrangle</i> )

#### (b) Foreclippings: surplus removed from the front

[11]	<i>bus</i> (← <i>omnibus</i> )	<i>cello</i> (← <i>violoncello</i> )	<i>chute</i> (← <i>parachute</i> )
	<i>coon</i> (← <i>raccoon</i> )	<i>phone</i> (← <i>telephone</i> )	<i>pike</i> (← <i>turnpike</i> ; AmE)

#### (c) Ambiclippings: surplus removed from both beginning and end

[12]	<i>flu</i> (← <i>influenza</i> )	<i>fridge</i> (← <i>refrigerator</i> ; BrE)	<i>tec</i> (← <i>detective</i> ; BrE)
------	----------------------------------	---	---------------------------------------

#### ■ General remarks on plain clippings

(a) Much the most common type is the back-clipping, and there are very few cases of ambiclippings (indeed *tec* is hardly in current use any more). Some back-clippings are based on the first word of a phrase rather than on a single word: *prefab* (← *prefabricated building*); *pub* (← *public house*, BrE); *ute* (← *utility vehicle* “pickup truck”, AusE/NZE); *zoo* (← *zoological garden*, with adjustment of the vowel for those who pronounce the full form /zʊʊləndʒɪkəl/). There are also cases where both words of a phrase are back-clipped to form a **clipping compound**: *elint* (← *electronic intelligence*), *kidvid* (← *kid’s video*).

(b) In some cases there may be sporadic modification of a consonant or vowel in the clipping; thus *bike* comes from *bicycle* with pronunciation of the *c* as /k/ instead of /s/, and *pram* loses the first vowel of *perambulator*.

(c) Plain clippings are almost always monosyllabic, but there are a few clear exceptions to this, such as *deli* and *cello*, cited above, *exam* (← *examination*), *medic* (← *medical student/practitioner*), *photo* (← *photograph*), *polio* (← *poliomyelitis*).

(d) Clipping normally yields nouns. Note, for example, that *ad/advert* and *exam* are clipped from *advertisement* and *examination*, not *advertise* and *examine*. *Photograph* can be either a noun or a verb, whereas *photo* is quite marginal as a verb.

### 2.3.2 Embellished clippings

Some words consist of a clipping followed by a suffix. *Turps* (← *turpentine*) has *·s*, *soccer* (← *association football*)<sup>11</sup> and *rugger* (← *rugby football*) have *·er*, while *preggers* (← *pregnant*), *shampers* (← *champagne*), *Honkers* (← *Hong Kong*) and *starkers* (← *stark naked*) have *·er* + *·s*. The words in *·ers* are semi-jocular and distinctively BrE or AusE.

#### ■ Embellished clippings in AusE

Words of this kind are particularly common in AusE. Though informal or colloquial, they often appear in print in newspapers and magazines, and thus most have orthographic forms. In addition to the above *·er*, seen (together with the plural suffix) in *bathers* (← *bathing shorts*), *swimmers* (← *swimming shorts*), the main suffixes are *·ie* (or *·y*) /i/ and *·o* /oʊ/:

- |      |    |  |                                      |  |
|------|----|--|--------------------------------------|--|
| [13] | i  | <i>barbie</i> (← <i>barbecue</i> )         | <i>blowie</i> (← <i>blowfly</i> )    | <i>frenchie</i> (← <i>French letter</i> )  |
|      |    | <i>pollie</i> (← <i>politician</i> )       | <i>rellies</i> (← <i>relatives</i> ) | <i>sunnies</i> (← <i>sunglasses</i> )      |
|      | ii | <i>garbo</i> (← <i>garbage-collector</i> ) | <i>journo</i> (← <i>journalist</i> ) | <i>rego</i> (← <i>(car) registration</i> ) |

The *·ie/y* can be identified with the diminutive suffix (see §5.2.1), but overall the suffixes have mainly rhythmic or decorative function, hence the term ‘embellished’.<sup>12</sup> A significant phonological point about the embellished clippings in AusE is that the fricatives /s/ and occasionally /f/ are often voiced when suffixation puts a residue-final fricative between two vowels: *this arvo* /tʰɑ:ɪvʊ/ (← *afternoon*); *Aussie* /ʌɔzi/ (← *Australian*); *cssie* /kɔzi/ (← *(swimming) costume*); *mozzie* /mɔzi/ (← *mosquito*); *possie* /pɔzi/ (← *position*).

### 2.4 Blending

Blending is the formation of a word from a sequence of two bases with reduction of one or both at the boundary between them, as in *brunch* from *breakfast* + *lunch* or *gues(s)timate* from *guess* + *estimate*.

From a formal point of view we can distinguish the following types:

- |      |     |   |   |
|------|-----|---|---|
| [14] | i   | <i>paratroops</i> ( <i>parachute</i> + <i>troops</i> )  | <i>televanking</i> ( <i>telephone</i> + <i>banking</i> )    |
|      | ii  | <i>breathalyser</i> ( <i>breath</i> + <i>analyser</i> ) | <i>newscast</i> ( <i>news</i> + <i>broadcast</i> )          |
|      | iii | <i>heliport</i> ( <i>helicopter</i> + <i>airport</i> )  | <i>stagflation</i> ( <i>stagnation</i> + <i>inflation</i> ) |
|      | iv  | <i>motel</i> ( <i>motor</i> + <i>hotel</i> )            | <i>sexploitation</i> ( <i>sex</i> + <i>exploitation</i> )   |

In [i] the blend consists of the first part of the first base + the whole of the second base. In [ii] it consists of the whole first base + the final part of the second. In [iii] it consists of the first part of the first base and the final part of the second. And in [iv] the central part is common to the two bases: there is overlap between them. In some cases there

<sup>11</sup> *Soccer*, however, has the vowel /ɒ/, not /oʊ/; /sɒkə/ represents a spelling pronunciation, one based on the way the form is spelled.

<sup>12</sup> A further suffix occasionally found is *·a* /ə/, as in *Maccas* (← *MacDonalds*).

may be overlap in writing but not in speech (*smog*, /smɒg/, from *smoke* + *fog*, /smoʊk + fɒg/), or in speech but not in writing (*ballute*, /bɔːluːt/, from *balloon* + *parachute*, /bəluːn + pærəʃuːt/. The blends in [i–ii] can be regarded as compounds, whereas the morphological status of the bases in [iii–iv] is somewhat indeterminate. There is some evident resemblance between clippings and blends, but what distinguishes a blend from a clipping is that it always begins with the first part of the first source base and ends with the final part of the second.<sup>13</sup>

Usually the blend is no longer than the longer of the two bases from which it is formed, but exceptions can be found among blends of type [iv], such as *musicassette* (*music* + *cassette*) or the nonce-word *glasnostalgia* (*glasnost* + *nostalgia*). The bases involved are normally free, but occasional examples are found with a bound base, a combining form, as in *electrocute* (*electro* + *execute*).

Some blends provide models for the formation of new words of the same kind. The jocular *chocaholic*, for example, is formed on the model of *workaholic* (← *work* + *alcoholic*). Similarly, *Reaganomics* (← *Reagan economics*) has been the model for numerous nonce-words, with the name of a politician as first component, such as *Thatchernomics*. Such blends effectively give rise to new morphological elements, *·aholic*, *·nomics*, falling at the boundary between affix and base.<sup>14</sup>

## 2.5 Back-formation

Back-formation is the coining of a new word by taking an existing word and forming from it a morphologically more elementary word. It is usually a matter of deleting an affix. In the following, for example, the words with affixes had already been in the language for some time when the ones without affixes were coined:

[15]	SOURCE	BACK-FORMATION	SOURCE	BACK-FORMATION
	<i>baby-sitt-er</i>	<i>baby-sit</i>	<i>edit-or</i>	<i>edit</i>
	<i>headhunt-er</i>	<i>headhunt</i>	<i>jogg-er/jogg-ing</i>	<i>jog</i>
	<i>lip-read-ing</i>	<i>lip-read</i>	<i>recycl-ing</i>	<i>recycle</i>
	<i>televis-ion</i>	<i>televise</i>	<i>underachiev-er</i>	<i>underachieve</i>
	<i>un-couth</i>	<i>couth</i>	<i>dis-abled</i>	<i>abled</i>

As far as morphological structure is concerned, back-formation does not yield a distinct type of base. *Edit* and *jog*, for example, are simple bases, just like *write* and *run*; *recycle* is a derivative base (analysable into prefix + base), just like *rebuild*; *underachieve* is a compound base like *underact*; and so on. That *television* was established in the language before *televise* is a fact of history, not something that is relevant to the structure of the language today, where the morphological relation between *televise* and *television* is the same as that between *revise* and *revision*.

Nevertheless it is clear that back-formation is one of the processes by which new words are created, and that this process is still productive today: the examples in [15] range from nineteenth-century ones like *edit* to quite recent ones like *headhunt*. Back-formation by deletion of *·ingor·er* is indeed one of the main avenues for the creation of verb compounds

<sup>13</sup>There are nevertheless places where the distinction is blurred. *Cheeseburger*, for example, might be regarded as a blend from *cheese* + *hamburger*, but since *burger* exists as an independent word, a clipping from *hamburger*, *cheeseburger* can also be analysed as a compound formed from two free bases.

<sup>14</sup>Such elements are sometimes called 'splinters'.

with the structure noun base + verb base: besides *baby-sit*, *headhunt*, and *lip-read* from the list above we have *brainwash*, *day-dream*, *house-hunt*, *house-keep*, *sleep-walk*, *spring-clean*, etc., and more recently *break-dance*, *plea-bargain*, *skateboard*, *windsurf*. One respect in which the origin of these compound verbs as back-formations is of relevance to a descriptive, non-historical study, is that irregular preterite and past participle forms are sometimes unacceptable. Compare, for example, *He had been day-dreaming all morning* (regular gerund-participle) and *\*He had day-dreamt all morning* (irregular past participle).

Back-formation may result in a base that is close in meaning to one that is already established. *Self-destruct*, for example, was formed from *self-destruction* by reversing the suffixation process seen in the derivation of words like *abduction* and *construction* from *abduct* and *construct*, and it yields a base *destruct* alongside the long-established *destroy*, but with a more restricted meaning and correspondingly limited distribution. As remarked above, back-formation usually deletes an affix from a derivative base,<sup>15</sup> but other types of reversal are occasionally found. The compound verb *spoon-feed*, for example, was formed from *spoon-fed* by reversing the process that applies in forming the simple past participle *fed* from the lexical base *feed*.

Like other productive processes, back-formation can be used in a jocular way, as with *couth* from *uncouth*.

## 2.6 Phonological modification

We consider here certain phonological changes that accompany the shift of a word from one syntactic category to another.

### (a) Stress shift

There are numerous pairs of disyllabic verbs and nouns that are spelled alike but pronounced differently, with the verb being stressed on the second syllable, the noun on the first, as in the following illustrative examples:

[16]	VERB	NOUN	VERB	NOUN
i	<i>digest</i> /dɑːdʒest/	/ˈdɑːdʒest/	<i>incline</i> /ɪnˈklaɪn/	/ˈɪnklaɪn/
	<i>insert</i> /ɪnˈsɜːt/	/ˈɪnsɜːt/	<i>insult</i> /ɪnˈsʌlt/	/ˈɪnsʌlt/
	<i>torment</i> /tɔːˈment/	/ˈtɔːment/	<i>transfer</i> /trænˈsfɜː/	/ˈtrænsfɜː/
ii	<i>accent</i> /ækˈsent/	/ˈæksənt/	<i>conduct</i> /kənˈdʌkt/	/ˈkɒndʌkt/
	<i>conflict</i> /kənˈflɪkt/	/ˈkɒnflɪkt/	<i>contest</i> /kənˈtest/	/ˈkɒntest/
	<i>convert</i> /kənˈvɜːt/	/ˈkɒnvɜːt/	<i>convict</i> /kənˈvɪkt/	/ˈkɒnvɪkt/
	<i>decrease</i> /dɪˈkriːs/	/ˈdiːkriːs/	<i>escort</i> /ɪˈskɔːt/	/ˈeskɔːt/
	<i>export</i> /ɪkˈspɔːt/	/ˈekspɔːt/	<i>fragment</i> /fræɡˈment/	/ˈfrægmənt/
	<i>permit</i> /pəˈmɪt/	/ˈpɜːmɪt/	<i>present</i> /prɪˈzent/	/ˈprezənt/
	<i>rebel</i> /rɪˈbel/	/ˈrebəl/	<i>record</i> /rɪˈkɔːd/	/ˈrekɔːd/
	<i>reject</i> /rɪˈdʒekt/	/ˈriːdʒekt/	<i>suspect</i> /səˈspekt/	/ˈsʌspekt/

In [ii] the stress difference is accompanied by a difference in vowel quality, with unstressed /ə/ corresponding to a variety of stressed vowels, and unstressed /ɪ/ to stressed /i:/ or /e/.

<sup>15</sup>In some cases a back-formation reflects an etymologically incorrect analysis of the source word. The verb *burgle* for example, was formed from *burglar*, indicating that the latter was analysed as *burgl-ar* although the *ar* was not originally a suffix.

In many of the above pairs the verb is older than the noun, the latter having been formed from the verb by a process that is like conversion except for the shift in the position of the stress (and, frequently, consequential change in vowel quality) – a shift reflecting the fact that nouns typically have the stress earlier in the word than verbs.

There are also verb–noun pairs where the noun has stress on the first syllable, while the verb can have either initial or final stress. In cases like *protest* and *refund* there is no difference in meaning, whereas in others the initially stressed verb has a more specialised meaning that matches that of the noun (or one sense of the noun). For example, the verb *abstract* in the sense “remove” is pronounced /æb'strækt/, but with the meaning “make an abstract or summary” it is /'æbstrækt/, like the noun. There are also regional differences, with AmE having, for example, /'segment/ and BrE /seg'ment/ for the verb. With *research* both noun and verb are found with either initial or final stress; the former is the usual AmE pronunciation, but has been the subject of a certain amount of prescriptive criticism in BrE.<sup>16</sup>

### (b) Vowel change

Some pairs of words that are spelled alike but belong to different syntactic categories are differentiated phonologically not by stress but just by vowel quality:

[17]	i	V or N	<i>compliment</i>	<i>document</i>	<i>implement</i>	<i>ornament</i>
	ii	V or N	<i>certificate</i>	<i>estimate</i>	<i>graduate</i>	<i>isolate</i>
	iii	V or Adj	<i>deliberate</i>	<i>desolate</i>	<i>intimate</i>	<i>legitimate</i> <i>separate</i>

In [i] *ment* is pronounced /ment/ in the verb, /mɒnt/ in the noun. In [ii–iii] *·ate* is pronounced /eɪt/ in the verb and /ət/ in the noun or adjective. In all these cases the final vowel of the noun or adjective is reduced to /ə/ while the verb has an unreduced vowel or diphthong: as with the stress differences in [16], therefore, the end part of the verb is phonologically stronger than that of nouns or adjectives.

The vowel contrasts illustrated here are found in very few items: they are remnants of differences in other languages, and have never involved productive word-formation processes in English.<sup>17</sup> Note in this connection that the words in [17i] can hardly be analysed into base + suffix, and even in [ii–iii] subtracting *·ate* as a suffix leaves predominantly bound bases.

### (c) Base-final voicing contrasts

There is a small set of noun–verb pairs where the noun ends in a voiceless fricative, and the verb in the voiced counterpart:

[18]	i	N: /f, θ, s/	<i>belief</i>	<i>sheath</i>	<i>wreath</i>	<i>mouth</i>	<i>house</i>
	ii	V: /v, ð, z/	<i>believe</i>	<i>sheathe</i>	<i>wreathe</i>	<i>mouth</i>	<i>house</i>

For the first three the difference is reflected in the spelling. We have seen that this modification is found also in inflectional morphology: there is obligatory voicing in the plurals *mouths* and *houses*, optional voicing in *sheaths* and *wreaths*. The pattern is no longer productive in lexical word-formation, and there are very few such pairs. An even

<sup>16</sup>There are also a few verb–adjective pairs differentiated by the position of the stress: *abstract* /æb'strækt/ vs /'æbstrækt/, *frequent* /fr'kwɛnt/ vs /'fri:kwɛnt/, *present* /pr'zɛnt/ vs /'prezɛnt/.

<sup>17</sup>The same applies to the vowel contrasts (reflected this time in the spelling) between the pairs of intransitive and transitive verbs *fall* ~ *fell*, *lie* ~ *lay*, *rise* ~ *raise*. The rarity of this relationship contrasts with the frequency of the case where the same verb appears in intransitive and transitive constructions (cf. Ch. 4, §8.1.4).

smaller set have a voicing contrast between the alveolar plosives /d/ and /t/: *ascend* ~ *ascent*; *descend* ~ *descent*; *extend* ~ *extent*. This reflects a French pattern and has never been productive in English.

### 3 Conversion

#### 3.1 The domain of conversion

Conversion normally involves changing a word's syntactic category without any concomitant change of form, as in the creation of the verb *humble* from the adjective *humble* or of the noun *attempt* from the verb *attempt*. It also covers the creation of a word from an affix, as in the conversion of the suffix *-ism* into a noun or the conversion of the prefix *anti-* into a preposition: this resembles the usual case of conversion in that a word is formed from a pre-existing morphological unit by simply giving it new grammatical properties.

We include conversion within the set of lexical word-formation processes because we see it as creating new words. The noun *attempt*, for example, is a different word from the verb *attempt*: it has different inflectional properties and enters into different inflectional paradigms. By generalisation, we regard any difference in primary category as sufficient to establish a difference between one word and another, and hence we take conversion to cover such cases as the creation of the preposition *contrary* (as in *Contrary to your predictions, the meeting was a great success*) from the homonymous adjective (*Such a decision would be contrary to common sense*), even though neither of these words has any inflectional property. We do not, however, take a change of secondary class as a matter of conversion. Consider the verb *frighten*, for example: this is primarily a transitive verb (*I don't want to frighten you*), but it can also appear in intransitive constructions (*I don't frighten easily*). There is nevertheless no reason to say that intransitive *frighten* is a different word from transitive *frighten*, and hence no reason to say that this extension in the use of *frighten* is a matter of lexical word-formation, more specifically of conversion. Similarly we exclude cases where common nouns arise through the establishment of new meanings for what are primarily proper nouns, as with *newton*, *pascal*, *wellington*, etc.

Also excluded from the domain of conversion, though not from that of word-formation, is the case where a word is formed by fusing a sequence of words into one, as in *his couldn't-care-less attitude*. The word *couldn't-care-less* consists of a combination of bases and hence is a compound: it is formed by the process we refer to as 'dephrasal compounding' (§4.1).

The normal effect of conversion is to create a pair of corresponding words belonging to different parts of speech, or primary categories. This same effect is very often produced by affixation, especially suffixation. Compare:

[19] CONVERSION	AFFIXATION
i <i>spy</i> <sub>V</sub> → <i>spy</i> <sub>N</sub>	<i>kill</i> <sub>V</sub> + <i>-er</i> → <i>killer</i> <sub>N</sub>
ii <i>arrest</i> <sub>N</sub> → <i>arrest</i> <sub>t</sub> <sub>N</sub>	<i>manage</i> <sub>V</sub> + <i>-ment</i> → <i>management</i> <sub>N</sub>
iii <i>humble</i> <sub>ADJ</sub> → <i>humble</i> <sub>V</sub>	<i>marginal</i> <sub>ADJ</sub> + <i>-ise</i> → <i>marginalise</i> <sub>V</sub>

The effect is the same but the means are different: affixation introduces a new morphological element whereas conversion does not. A base formed by affixation is always a derivative, whereas one formed by conversion is of the same type as the source: the noun

*spy* is a simple base, the verb *blacklist* is a compound (like the corresponding noun), and the verb *package* is a derivative (again like the noun from which it is formed). Conversion, therefore, has no effect on the morphological structure.

Because the effect of conversion is like that commonly brought about by affixation, many works treat it as a special case of affixation, ‘zero-affixation’ (or ‘zero-derivation’). This is to say that the noun *spy*, for example, is derived from the verb by the addition of an affix that happens to have no phonological realisation – a zero affix. We find this an unsatisfactory way of looking at it: we want to say that there is no affix at all, not that there is an abstract or covert affix. A major problem for the zero-affixation approach is that with ordinary affixation we have a range of different affixes, some of them producing different effects (e.g. *manager* and *management* are different kinds of nominalisation of the verb *manage*), some of them varying simply according to the base to which they are attached (e.g. *arriv-al*, *clos-ure*, *distribut-ion*, etc.). This raises the question of how many ‘zero-affixes’ are involved in conversion. If we say there is just one, then we do not in fact have a close resemblance between conversion and (ordinary) affixation. If we say there is more than one we have the problem of determining how many there are and of how to distinguish between them when they are phonologically null. A further weakness of a zero-affix analysis is that it implies a difference in morphological structure between input and output. As noted above, we want to say that the verbs *spy*, *blacklist*, and *package* have respectively a simple, compound, and derivative base, but under a zero affix analysis all would be derivatives. This is to introduce an unwarranted complication into the morphological structure: it attempts in effect to reflect the historical origin of a word in its present-day structure.

Most cases of conversion involve the three major part-of-speech categories noun, verb, and adjective. The following subsections deal with the three pairs within this set, while other cases of conversion are dealt with in the chapters on words belonging to the output category (e.g. Ch. 7 for the conversion of adjectives, nouns, and verbs into prepositions).

### 3.2 Conversion between nouns and verbs

It is a notable property of English that it has a great deal of homonymy between nouns and verbs. In a considerable number of cases it is unclear which is the earlier of the two, but there are also many examples where one is clearly semantically more basic than the other. The noun *bottle* is more basic than the verb since the verb means “put into a bottle” rather than the noun meaning “container into which something is put when it is bottled”. Conversely *arrest* is primarily a verb, with the noun denoting the event wherein someone is arrested. Examples are given in:

#### [20] i VERB TO NOUN CONVERSIONS

<i>arrest</i>	<i>attempt</i>	<i>bore</i>	<i>cheat</i>	<i>coach</i>	<i>control</i>
<i>cough</i>	<i>desire</i>	<i>flirt</i>	<i>go</i>	<i>hoist</i>	<i>laugh</i>
<i>read</i>	<i>smile</i>	<i>sneak</i>	<i>spy</i>	<i>whisper</i>	<i>whistle</i>

#### ii NOUN TO VERB CONVERSIONS

<i>butcher</i>	<i>butter</i>	<i>can</i>	<i>cash</i>	<i>duel</i>	<i>enamel</i>
<i>eye</i>	<i>finger</i>	<i>fish</i>	<i>foal</i>	<i>gesture</i>	<i>knife</i>
<i>knot</i>	<i>lamb</i>	<i>motion</i>	<i>panic</i>	<i>parody</i>	<i>parrot</i>
<i>queue</i>	<i>shepherd</i>	<i>ski</i>	<i>skin</i>	<i>trumpet</i>	<i>water</i>

Quite a number of semantic classes are involved. One involves instrumental nouns, with the more basic member of the pair usually the noun (*knife, hammer, mop*), but sometimes the verb (*hoist, whistle*). Closely related are pairs where the noun denotes a body-part and is always basic: *eye, elbow, finger, head, knee*, etc. In some pairs the noun denotes a person, defined by profession, relationship, behaviour, or character: the noun is basic in *butcher, doctor, shepherd, usher*, the verb in *bore, cheat, flirt, spy*. Another class, with the noun basic, has the verb meaning “apply ~ to” or “remove ~ from” (“apply” in the case of *enamel, grease, sugar, water*; “remove” with *hull, shell, skin, weed*). The verbs involved in noun–verb conversion (in either direction) are usually dynamic rather than stative – though there are some, such as *smell* and *taste*, which can be either.

As for formal properties, a high proportion of the paired nouns and verbs have simple bases. Derivatives tend to resist conversion, though some examples can be found: *action, package, stretcher*, etc., are primarily nouns, while *dislike* is a rare case of one that is primarily a verb. Compound nouns convert quite often to verbs: *blacklist, keyboard, network*; this is one of the main sources of compound verbs. Both directions of conversion are still productive, with noun-to-verb conversion being considerably more common.<sup>18</sup>

### 3.3 Conversion between adjectives and nouns

#### (a) From adjective to noun

A considerable number of nouns are formed by conversion of adjectives. Examples include:

[21]	<i>comic</i>	<i>dear</i>	<i>drunk</i>	<i>empty</i>	<i>female</i>	<i>heavy</i>
	<i>human</i>	<i>intellectual</i>	<i>local</i>	<i>medical</i>	<i>natural</i>	<i>original</i>
	<i>positive</i>	<i>potential</i>	<i>primary</i>	<i>private</i>	<i>professional</i>	<i>regular</i>
	<i>right</i>	<i>royal</i>	<i>short</i>	<i>social</i>	<i>special</i>	<i>sweet</i>

In most cases the resulting noun is equivalent to a nominal consisting of the adjective + an understood noun, and often there will be two or more senses differing with respect to what noun is understood, as in *comic* (“person/periodical”), *empty* (“bottle/box”), *positive* (“photograph/feature/quantity”), *regular* (“soldier/customer”), and so on. A number belong to informal style (at least in one of their senses): (*old*) *dear*, *heavy* (“minder”), *local* (“pub”, BrE), *natural*, *regular* (“customer”), *royal* (“member of royal family”). In many cases the resultant noun denotes a type of person. Another group is that of colour terms: compare *His tie is brown* (adj) and *His tie is a dark shade of brown* (noun); some of these also have other specialised meanings, as with *white* (“white part of egg”, “white part of eye”, or “person with white skin”). Time-period adjectives like *daily*, *weekly*, *monthly* convert to nouns denoting periodicals, though some have other meanings too (e.g. “cleaner who comes daily”). Some of the nouns appear normally or exclusively with the plural inflection: *basics*, *greens* (“green vegetables”), *marrieds*, *smalls* (“underwear”), *woollies*.

Conversion of an adjective into a noun is to be distinguished from the use of an adjective as a fused modifier-head, as in *Is it the new version or the old?* or *The tax will disadvantage the poor*: see Ch. 5, §9.3.

<sup>18</sup> Changes from verb to noun are often accompanied by a change in the placement of the stress, as in *recall*, and hence involve stress shift rather than conversion (§3.1). Note also that nouns like *hang-out*, *pay-back*, *take-away* involve compounding, not conversion: in *I’ll take away the food*, for example, *take away* is a two-word sequence, not a compound verb.

## (b) From noun to adjective

Conversion in this direction is, by contrast, very rare. Historically, we find examples of noun-to-adjective conversion in such words as *rose* and *orange*, where the senses of the nouns (denoting flower and fruit respectively) are clearly distinct from the colour senses of the adjectives. But there are few modern examples. School grammars tend to say that in expressions like *the Clinton policy* the word *Clinton* is (or ‘is used as’) an adjective but, as we have argued in Ch. 6, §2.4.1, this is to confuse the word-category adjective with the function modifier of a noun. Any noun (other than a pronoun) can occur in this function, given a suitable head noun, so the appropriate way to handle such data is in terms of syntax (the distribution of nouns), not in terms of word-formation (the creation of new words).

To establish that a noun has been converted into an adjective we need to show that it has acquired distinctively adjectival properties. Since the ability to modify a noun is not restricted to adjectives this will normally mean showing that it has become gradable and takes the distinctive degree modifiers that are found with adjectives but not nouns, notably *very* and *too*. One often-cited example is *fun* (and the fact that this example is cited so often reflects the paucity of clear examples): many speakers, especially younger ones, accept expressions like *a very fun person*, indicating that *fun* has been assimilated into the adjective category. Another example is *Oxbridge*: *He has a very Oxbridge accent* or *His accent is very Oxbridge*. It is arguable that we should also include certain adjectives in *-ist* and *-ite*: these suffixes primarily serve to form nouns, but such derivatives as *sexist* and *Thatcherite* satisfy the conditions for adjective status: *That remark was very sexist/Thatcherite*. But noun-to-adjective conversion is a very minor type of word-formation process.

## 3.4 Conversion between adjectives and verbs

## (a) From adjective to verb

[22]	<i>bare</i>	<i>blind</i>	<i>blunt</i>	<i>brave</i>	<i>calm</i>	<i>clear</i>
	<i>dim</i>	<i>dry</i>	<i>empty</i>	<i>free</i>	<i>humble</i>	<i>muddy</i>
	<i>narrow</i>	<i>slow</i>	<i>smooth</i>	<i>tame</i>	<i>tense</i>	<i>weary</i>

This pattern has been fairly productive for several hundred years, though there are far fewer verbs converted from adjectives than from nouns. The most common meanings of the resultant verbs are “become ~” (intransitive) and “make ~” (transitive), with some verbs, such as *clear*, *cool*, *empty*, having both these meanings. In a third type, illustrated by *brave*, *brazen*, *gentle*, *savage*, etc., the adjectival meaning applies to the manner in which something is done: to *savage* someone is to attack them in a savage way, to *brave* the storm is to endure it bravely, and so on. The bases are generally simple, but there are some derivatives in *-y* (*dirty*, *muddy*, etc.), some compounds in *-proof* (*soundproof*, *waterproof*) and – exceptionally in the field of conversion or indeed word-formation generally – cases of inflected forms (*better*, *best*).<sup>19</sup>

<sup>19</sup>Lower is even more exceptional in that inflected bases that undergo word-formation processes, whether conversion or affixation, are generally irregular ones.

## (b) Verb to adjective

A process which differs significantly from central cases of conversion is the formation of an adjective homonymous with the gerund-participle or past participle form of a verb, as in:

- [23] i *amusing*    *boring*    *entertaining*    *stunning*    *tiring*    *worrying*  
 ii *amused*    *bored*    *spoilt*    *stunned*    *tired*    *worried*

For many verbs, this applies with both forms, for others only one – for example, there are no adjectives *entertained* and *spoiling*. One important difference between this and the central cases is that here it is not the lexical base of the verb that is converted but an inflected form. A second difference is that it is very much more productive than the conversion processes involving lexical bases. Nevertheless, this process has it in common with uncontroversial cases of conversion that we have homonymous pairs of words of different primary categories. For discussion of the contrast between the verb-forms and the participial adjectives, see Ch. 3, §§1.3–4.

## 4 Compounds

## 4.1 Preliminaries

## ■ Morphological compound vs syntactic construction

A compound base, we have said, is one composed of two (or occasionally more) smaller bases. A major problem that arises in the description of compounds, however, is how to distinguish cases where two bases combine to form a single word, a compound, from those where they constitute separate words in a syntactic construction:

- [1] i *greenhouse* *sweetheart* *cotton-plant* *newspaper* [morphological compound]  
 ii *green house* *sweet taste* *cotton shirt* *quality paper* [syntactic construction]

In general the problem arises where the final component is a noun rather than an adjective or verb. With adjectives, for example, we take *tax-exempt* as a compound adjective and there is no contrasting syntactic construction where an adjective has a noun (or NP) as modifier. With verbs the distinction between, say, a compound such as *baby-sit*, and a syntactic construction *babies cry* is unproblematic. It is for this reason that our discussion of this problem is included in the chapter on the noun phrase. The contrast between the examples of [i] and [ii] is relatively sharp because a number of criteria give convergent results. Those in [i] are written as single words, while those in [ii] are written as word sequences; those in [i] are pronounced with the main stress on the first component while those in [ii] have it on the second; those in [i] exclude modification of the first component while those in [ii] allow a very wide range of modification such as is found elsewhere with phrases headed by adjectives or nouns – compare *an unusually bright green house*, *a very much sweeter taste*, *an Egyptian cotton shirt*, *a better-quality paper than I'd expected*. The examples in [1] were chosen as ones where the criteria converge, but there are places where the boundary between morphological compound and syntactic construction is unclear; this problem is discussed in Ch. 5, §14.4, and in the present chapter we confine our attention, except where otherwise stated, to uncontroversial cases of compounds.

## ■ Hyponymy

A high proportion of compounds, especially compound nouns, are **hyponymic**: the compound as a whole is a **hyponym** of the base that functions as head. Hyponymy is a semantic relation that can in the first instance be most easily explained by reference to nouns. We say that noun *X* is a **hyponym** of noun *Y* when *X* denotes a subset of what is denoted by *Y*. This relation may hold between morphologically unrelated words. For example, *tulip*, *daffodil*, and *rose* are hyponyms of *flower*, while *alsatian*, *poodle*, and *cocker-spaniel* are hyponyms of *dog*: a tulip is a kind of flower, an alsatian is a kind of dog, and so on. With compounds, the relation of hyponymy is reflected in the morphological structure: *wall-flower* consists of *wall* as dependent and *flower* as head, and denotes (in its literal sense) a kind of flower; *bulldog* has *bull* as dependent, *dog* as head, and denotes a kind of dog. We can generalise from nouns to compounds of all categories by talking in terms of entailment rather than subsets. *This is a wall-flower* entails *This is a flower*, but *This is a flower* does not entail *This is a wall-flower*. Similarly for such an adjective as *paper-thin*: *This is paper-thin* entails *This is thin*, but not conversely. And for a verb like *hand-wash*: *They hand-washed it* entails *They washed it* but again the reverse entailment does not hold.

For a compound to be hyponymic can be regarded as the default case: it is when the compound is not a hyponym of the head that we need to consider why this is so. There may be a variety of reasons why a compound fails the entailment test for hyponymy. Consider:

[2] *hotshot*, *glow-worm*, *cholesterol-free*, *sunset*, *breath-taking*, *redskin*

The informal term *hotshot* does not denote a kind of shot, but a person who is skilled or successful in some field: this illustrates the common case where the non-hyponymic property of a compound is simply a matter of lexicalisation, an idiosyncratic feature of the particular compound in question. *Glow-worm*, which denotes a kind of beetle, is also lexicalised, but in this case there has also been a historical change in the meaning of *worm*, which earlier had a broader denotation than is now current, being applicable to any animal that crawled, such as snakes, legless lizards, caterpillars, and long-bodied insects like glow-worms. *Cholesterol-free* is not lexicalised but it is non-hyponymic because *free* in the sense it has here cannot stand alone as a phrase but requires a complement. The sense of *free* in *It is free of/from cholesterol* is not the same as in *It is free*. *Sunset* involves a particular sense of *set* which occurs only as a verb (the corresponding noun being the derivative *setting*), so again *It was a beautiful sunset* doesn't entail *It was a beautiful set*. Similarly with the adjective *breath-taking*: there is no adjective *taking* (except with the specialised sense of "captivating"), and hence *His arrogance was breath-taking* does not entail *His arrogance was taking*. *Redskin* "Red Indian" is another example of lexicalisation, but it illustrates a pattern of compounding which necessarily results in a non-hyponymic form. It belongs to the pattern (discussed in §4.2.1 below) where the literal meaning gives a property of the entity the compound denotes: a redskin is not a kind of skin but a kind of person, the kind that has (or is perceived as having) red skin.<sup>20</sup>

<sup>20</sup>Compounds formed by patterns that invariably result in non-hyponymic compounds are commonly called 'exocentric', with others being, by contrast, 'endocentric'. Considerable problems arise, however, in giving rigorous definitions for these categories, and we shall not make use of this taxonomy in the present discussion.

### ■ Subordinative and coordinative compounds

The great majority of compounds are **subordinative**, in that one base can be regarded as head, the other as dependent. The head is normally the second element. Note, for example, the contrast between *birdcage* and *cage-bird*. *Birdcage* has *cage* as head and denotes a kind of cage; *cage-bird* has *bird* as head and denotes a kind of bird (one that is kept in a cage or of the sort that is customarily kept in one). In both, then, there is a clear difference in status between the component bases, the first being a dependent of the second.

There are also compounds where the component bases are of equal status: these we call **coordinative**. In, for example, the noun *secretary-treasurer*, the adjective *bitter-sweet*, or the verb *cook-chill*, neither component is dependent on, subordinate to, the other. Coordinative compounds can normally be glossed with ‘and’: a secretary-treasurer is someone who is both secretary and treasurer, not (or not just) a kind of treasurer.

### ■ Dephrasal compounds

We apply the term **dephrasal compound** to the underlined elements in:

- |     |     |  |  |                              |
|-----|-----|--|--|------------------------------|
| [3] | i   | a. <i>He's a <u>has-been</u>.</i>        | b. <i>the usual <u>rent-a-crowd</u></i>        | [noun]                       |
|     | ii  | a. <i><u>hard-core</u> pornography</i>   | b. <i>his <u>holier-than-thou</u> attitude</i> | [adjective]                  |
|     | iii | a. <i>Don't <u>cold-shoulder</u> us.</i> | b. <i>He might <u>short-change</u> you</i>     | [verb]                       |
|     | iv  | a. <i><u>old-maidish</u></i>             | b. <i>a <u>fly-by-nighter</u></i>              | [nominal base of derivative] |

Such elements, usually written with hyphens, as here, consist of a sequence of free bases and hence satisfy the definition of compounds. They arise, however, not by the normal morphological process of compounding but rather through the fusion of words within a syntactic structure into a single lexical base. The distinction is particularly clear in [ia] and [iib] since normal morphological compounding would not allow the internal inflections that are present in these words.

In the next three subsections we review in turn the patterns to be found in compound nouns, compound adjectives, and compound verbs, dealing with contrasts between hyponymic and non-hyponymic and between subordinative and coordinative as we go. The last two subsections then deal with types of compound that in part at least cut across this primary dimension of classification into noun, adjective, verb: §4.5 discusses neo-classical compounds such as *geography*, *sociology*, *ambidextrous*, *audiovisual*, while §4.6 reviews the minor category of compounds that are motivated by the phonological form, involving reduplication, rhyme, or vowel change, as in *goody-goody*, *razzle-dazzle*, *zigzag*.

## 4.2 Compound nouns

The largest number and the largest variety of compounds are to be found in the category of nouns. We discuss them here under two main headings, **noun-centred** and **verb-centred**:

- |     |    |  |                |
|-----|----|--|----------------|
| [4] | i  | <i>blackbird, egghead, footpath, girlfriend, tearoom</i>           | [noun-centred] |
|     | ii | <i>busdriver, city-dweller, fox-hunting, life-guard, take-away</i> | [verb-centred] |

The compounds in [ii] are verb-centred in that the head element is the lexical base of a verb or else formed from one by suffixation or conversion. *Driv-er*, *dwell-er*, and

*hunt-ing* are formed from verbs by suffixation, *guard* is formed by conversion, while with *take-away* (which has the first element as head) there is no reason to say that *take* itself is anything other than a verb. The meanings of such compounds depend centrally on the meanings of the verbs: a busdriver is someone who drives buses, a life-guard is concerned with guarding (protecting) lives, a take-away is a restaurant that sells cooked food that one takes away to eat elsewhere (or, in a second sense, the food itself). With the noun-centred compounds in [i], by contrast, the head element is purely or at least primarily a noun. With *girlfriend*, for example, *friend* can only be a noun, and with *egghead*, the meaning is based on that of the noun *head*, not the verb (which was formed by conversion from the noun).

#### 4.2.1 Noun-centred compound nouns

These compounds have a noun as the final base. In almost all cases the first element is a dependent, the final one the head, but there are some small-scale coordinative patterns to be noted.

We will look in turn at noun-centred compounds where the first base is a noun, adjective, verb, or some other category, but will leave until the end a special kind of non-hyponymic compound known as **bahuvrihi** compounds, where the first base can be either a noun, as in *egghead*, or an adjective, as in the *redskin* example of [2].

#### ■ Noun + noun compounds

[5]	<i>ashtray</i>	<i>bedtime</i>	<i>beehive</i>	<i>birdcage</i>	<i>breadcrumb</i>
	<i>broomstick</i>	<i>bulldog</i>	<i>cowshed</i>	<i>goldfish</i>	<i>handbag</i>
	<i>honey-bee</i>	<i>horsehair</i>	<i>liferaft</i>	<i>motorcycle</i>	<i>palm-tree</i>
	<i>pillow-case</i>	<i>placename</i>	<i>shirt-sleeve</i>	<i>steamboat</i>	<i>tearoom</i>

This is by far the most productive kind of compounding in English, and indeed the most productive kind of word-formation. There is an immense variety of semantic relationships between the component bases, as will be evident from the following few examples:

[6]	i <i>eye-rhyme</i>	“thing which appears to the eye to be a rhyme”
	ii <i>footpath</i>	“path designed for people who are on foot”
	iii <i>liferaft</i>	“raft designed to be used for saving life”
	iv <i>timberline</i>	“apparent line formed by the highest extent of timber growth”

It does not seem likely that we could devise an exhaustive classification of such compounds into a reasonably small set of types according to the semantic relationships between the bases. Rather than assume that the meaning of the compound is systematically predictable from the meanings of the component bases, we see such compounds as lexical structures designed to act as mnemonics. In hyponymic compounds, the modifying element provides a rough reminder of how the subset denoted by the compound is distinguished from the larger set denoted by the head. This kind of explanation accounts for the fact, noted in §1.3, that *wheelchair* denotes a different subset of chair from *pushchair* (a verb + noun compound) even though a wheelchair is not uniquely identified by having wheels nor a pushchair by the fact that it can be pushed. It also accounts for the fact that a new compound such as *rain-snake* may be ambiguous out of context – does it mean “a snake which comes out in the rain”, “a snake made of rain”, “a snake which causes rain”, or something else entirely?

There are many lexicalised compounds of the form noun + noun that are non-hyponymic: a shoe-tree is not a kind of tree, nor a ladybird a kind of bird. Similarly for *network*, *oilfield*, or (perhaps less obviously) *ash-tray*, *boathouse*, and so on.

#### Coordinative compounds: dvandvas and others

- [7] i *Alsace-Lorraine*    *Austria-Hungary*    *Bosnia-Herzegovina*    *Schleswig-Holstein*  
 ii *Fletcher-Challenge*    *Hewlett-Packard*    *Metro-Goldwyn-Mayer*    *Rank-Xerox*  
 iii *comedy-thriller*    *murder-suicide*    *secretary-treasurer*    *singer-songwriter*

These are coordinative in that the bases are of equal status instead of being in a relation of subordination. One feature of this type which makes it comparable to coordination as a syntactic construction is that there can be more than two bases, as in *Metro-Goldwyn-Mayer* (where the first component is clipped) or *secretary-treasurer-editor*, denoting a person filling all three offices.

The examples in [7i–ii] illustrate a special type of morphological construction known as **dvandva compounds**, a term taken from Sanskrit grammar. As far as English is concerned, this is a very minor category. Dvandva compound nouns in English are mainly proper nouns referring to the combination or union of the referents of the component parts – territories in [i], businesses in [ii]. *Alsace-Lorraine* refers to the area composed of Alsace and Lorraine together, while the business names normally result from merging two smaller businesses into a larger one.

The coordinative compounds in [7iii] differ from the dvandvas in that the components apply individually as well as jointly. *She is secretary-treasurer of the society* entails *She is secretary of the society and she is treasurer of the society*, but *She was born in Alsace-Lorraine* does not entail *She was born in Alsace and she was born in Lorraine* – on the contrary, she can't have been born in each of them separately. Similarly with the business names: *I bought it from Hewlett-Packard* does not entail *I bought it from Hewlett and I bought it from Packard*. A company merger typically involves the original companies losing their separate identities, so that the question of whether I bought it from Hewlett or from Packard would not arise. Most dvandvas are proper names, but one technical term much used in the present grammar provides an example of a dvandva compound belonging to the class of common nouns: *gerund-participle*. We coined this term precisely for the union of what is denoted by the traditional terms *gerund* and *present participle* because we do not believe the traditional distinction between them is sound: in saying that such and such a form is a gerund-participle, therefore, we are not saying that it is simultaneously a gerund and a participle, but that it belongs to a single category covering both traditional ones.<sup>21</sup>

#### Ascriptive compounds

- [8]    *apeman*            *foodstuff*            *fuel-oil*            *girlfriend*            *handlebar*  
       *houseboat*        *maidservant*        *manservant*        *pathway*            *washerwoman*

We call these **ascriptive compounds** because the relation between the first noun and the second is comparable to that between an ascriptive modifier and the head noun in NP structure, as in *handsome man*, *male servant*, etc. (cf. Ch. 6, §4.1). They are similar to coordinative compounds, more specifically to the non-dvandva ones in [7iii], since a

<sup>21</sup>Some works use the term 'dvandva' to apply to all coordinative compounds.

*manservant* is both a man and a servant just as a secretary-treasurer is both a secretary and a treasurer.<sup>22</sup> We treat them as subordinative rather than coordinative on the grounds that the components are of unlike types such that the first can be thought of as defining a subset of the set denoted by the second.<sup>23</sup> *Manservant*, for example, is comparable to the syntactic construction *male servant*, where *male* is dependent and *servant* head. Similarly, a houseboat is more a kind of boat (one fitted up for living in) than a kind of house (one that floats on water). But the distinction is not a sharp one, and not everyone will share our judgements about all the examples.

*Manservant* differs from the others in that the plural is marked on both components, not just the head – note the contrast between *menservants* and *maidservants*. This special feature of **man** is paralleled by that of **woman** or **gentleman** in syntactic constructions of the type *woman doctor* ~ *women doctors*, *gentleman farmer* ~ *gentlemen farmers*.

#### Compound with an *-s* at end of the first element

[9]	i	<i>beeswax</i>	<i>bullseye</i>	<i>hogshead</i>	<i>lambswool</i>
	ii	<i>almshouse</i>	<i>clothes-peg</i> BrE	<i>clothes-pin</i> AmE	
	iii	<i>batsman</i>	<i>headsman</i>	<i>huntsman</i>	<i>swordsman</i>

The *-s* in the examples in [i] derives from a genitive: the genitive apostrophe is dropped unless the word is written with a hyphen (e.g. *bull's-eye*). The orthographic convention of writing these elements together reflects the stress pattern, which in turn reflects lexicalisation: in examples like *hogshead* (denoting a type of cask or a unit of liquid measure) this is seen in the unpredictable meaning of the word, in *lambswool* it is merely related to frequent usage. Nevertheless, there is no apparent reason behind writing *bullseye* as a single word but *mare's nest* ('illusory discovery') as two. Nor is there any apparent reason why *hare's-foot* (denoting a type of clover) should have the *s*, while *harelip* does not.

The first base in the compounds in [9ii] is a plural-only noun (cf. Ch. 5, §3.2.1), but the forms are irregular in that the *-s* is usually missing in compounds – compare *trouser-press*, *pyjama-top*. The *-s* in [9iii] is also a plural in origin, though it no longer carries any plural meaning. There is again no obvious reason why the *-s* should be present in these *-man* compounds but lacking in *boatman*, *doorman*, *rifleman*, etc. The two versions are found with the same meaning in *lineman* and *linesman*. Both are apparently productive, with *bagman* and *locksman* being recent formations.

#### ■ Adjective + noun compounds

[10]	<i>blackbird</i>	<i>blacksmith</i>	<i>blueprint</i>	<i>busybody</i>	<i>commonwealth</i>
	<i>Englishman</i>	<i>grandmother</i>	<i>grandstand</i>	<i>greenhouse</i>	<i>greyhound</i>
	<i>handyman</i>	<i>hotbed</i>	<i>hotline</i>	<i>madman</i>	<i>mainland</i>
	<i>shortbread</i>	<i>sick-bed</i>	<i>smalltalk</i>	<i>tightrope</i>	<i>wetnurse</i>

There are many compound nouns of this form in the vocabulary, and the type is still productive, as is evident from such relatively recent formations as *freeway*, *hotline*, *software*, *wetsuit*, etc. The degree of productivity is nevertheless fairly low: this pattern is

<sup>22</sup> *Girlfriend* and *boyfriend* are somewhat marginal members of the class from this point of view since they tend to be applied to a wider age-range than the nouns *girl* and *boy* used as separate words.

<sup>23</sup> An alternate term for this type is 'appositional compound'.

not widely used for the creation of new words. We include *smalltalk* and *grandstand* in the noun-centred rather than verb-centred category because the verbs *talk* and *stand* do not enter into construction with comparable adjectives.

The great majority of adjective + noun compounds involve a quite high degree of semantic specialisation and lexicalisation: the compound differs significantly, therefore, from a syntactic construction consisting of an attributive adjective + head noun. *Black-bird*, for example, is quite different in meaning from *black bird*: it denotes a species of bird, not a bird of a certain colour, so that *white blackbird* is not contradictory. In many cases the compound is not even hyponymic: a *busybody* is not a kind of body, nor a *commonwealth* a kind of wealth, and analogously for *greenhouse*, *hotbed*, *shortbread*. In a good number of cases the property denoted by the adjective does not apply to the denotation of the noun base but to something else that is understood: with *sick-bed*, for example, it is not the bed that is sick, but the person in it. Similarly a blacksmith works with black things, a greenhouse is a building containing green plants, and so on. Adjective + noun compounds are almost always distinguishable from syntactic constructions by their phonological as well as semantic properties. They normally have the main stress on the adjective component, so that morphological 'blackbird contrasts with syntactic 'black 'bird. Exceptions (like *black'currant* for the majority of speakers) are quite rare.

The adjectives that appear as first element in compound nouns are of one or two syllables, and usually of Germanic rather than Romance origin. They are almost invariably simple bases: examples like *earthen-ware*, with a derivative adjective, are exceptional. Take *Chinese restaurant*, for example. Its meaning is comparable to that of some of the compounds discussed above since it provides a classification of the restaurant, so that *German Chinese restaurant*, like *white blackbird*, is not contradictory. Nevertheless, *Chinese* is a complex base, not a simple one, and *Chinese restaurant* is not a compound.

*Grand* is used in a specialised sense in kin terms like *grandmother* or *grandson* to indicate a further degree of lineal distance beyond that expressed in the head. Such forms can themselves be modified by *great* (with the same meaning) in a morphological construction that is recursive: there is no linguistic limit on how many *great*'s are permitted in compounds like *great-great-great-grandmother*.

### ■ Verb + noun compounds

[11]	i	<i>copycat</i>	<i>crybaby</i>	<i>driftwood</i>	<i>glow-worm</i>	<i>hangman</i>
		<i>hovercraft</i>	<i>playboy</i>	<i>screechowl</i>	<i>search-party</i>	<i>workman</i>
	ii	<i>borehole</i>	<i>call-girl</i>	<i>mincemeat</i>	<i>punch-ball</i>	<i>push-button</i>
	iii	<i>bakehouse</i>	<i>blowtorch</i>	<i>dance-hall</i>	<i>driveway</i>	<i>fry-pan</i>
		<i>grindstone</i>	<i>payday</i>	<i>plaything</i>	<i>searchlight</i>	<i>springboard</i>
		<i>swearword</i>	<i>swimsuit</i>	<i>washday</i>	<i>washroom</i>	<i>workbench</i>

These differ from the verb-centred compounds in having the verbal element in dependent position, but they are similar in that the semantic relation between the two components is comparable to that found in a clausal construction between the verb and an NP. In [i] the noun matches up with a clausal subject: compare *The baby cries*; *The man hangs* (*people sentenced to death*). In [ii] the match is with a clausal object: a punchbag is a bag that one punches, and so on. In [iii] the clausal relation would be mediated by a preposition: compare *wash* (*clothes*) *on this day* / *in this room*, *work at this bench*, etc. The

relations involved here include instrument (*grindstone*, *swearword*), location (*bakehouse*, *driveway*), time (*payday*, *washday*).

Compounds of this form are mostly hyponymic, but again there is in many cases a high degree of semantic specialisation – cf. *call-girl*, *plaything*, *searchlight*, *springboard*, and others. Non-hyponymic examples include *glow-worm* (cited in [2]) and *copycat*, which denotes a kind of person, not a cat.

A great many lexical bases in English can be either verbs or nouns, and as a result there may be uncertainty or indeterminacy as to whether a component of a compound is one or the other. For example, *payday* might be glossed as “day on which people are paid” (taking *pay* as a verb) or “day on which people receive their pay” (with *pay* as a noun). *Dance-hall* might similarly be glossed as “hall where one dances” or “hall for dances”. Our purpose here, however, is simply to illustrate the range of patterns to be found within the set of compound words, not to establish a system of classification that will yield a unique analysis for every compound; our account is therefore consistent with the fact that some words could be construed as fitting more than one pattern.

#### Verbal element has the *-ing* suffix

- [12] *chewing-gum*   *drinking-water*   *eating-apple*   *frying-pan*   *hiding-place*  
*living-room*   *talking-point*   *turning-point*   *walking-stick*   *whipping-boy*

These characteristically have a purposive meaning: “gum for chewing”, “pan for frying in”. Again such compounds are mainly hyponymic, but there are a few lexicalised exceptions, such as *whipping-boy*, “scapegoat”. In some cases there is alternation between a compound where the verbal element is morphologically simple, as in [11] above, and one where it has the gerund-participle form, as here: *frying-pan*/*fry-pan*, *swimming-costume*/*swim-suit*; BrE tends to prefer the suffixed verb, AmE the unsuffixed one.

#### ■ Other categories of first base

- [13] i *after-effect*   *backwater*   *downside*   *in-joke*   *inroad*  
*off-chance*   *outbuilding*   *outpatient*   *overcoat*   *underdog*  
 ii *six-pack*   *he-man*   *she-wolf*

The main other type of noun-centred compound has a preposition as first element, as in [1]; there are also a few beginning with a numeral or a gender-specific personal pronoun.

#### ■ Bahuvrihi compounds

- [14] i *lazybones*   *loudmouth*   *paleface*   *redhead*   *redskin*  
 ii *birdbrain*   *butterfingers*   *egghead*   *skinhead*   *suedehead*

Compounds of this type denote the entity characterised by having the property indicated: a *redhead* is a person who has red hair (and hence a red head); a *birdbrain* is a person who has (or rather who is presented as having) a brain the size of a bird’s, i.e. someone very stupid; an *egghead* is someone presented as having a head resembling an egg, i.e. a high forehead, hence an intellectual. Note that *lazybones* and *butterfingers* contain the plural suffix on the head element but they usually apply to a single person and are then syntactically singular: *He’s a lazybones/butterfingers*.

The label **bahuvrihi** again comes from Sanskrit grammar, with the meaning “having much rice”, which thus illustrates the kind of construction it denotes. The first base is an adjective in [14i], a noun in [ii]. English has only a relatively small number of compounds

of this kind but, as is evident from the last two examples in [ii], this type of formation is still productive.

Bahuvrihi compounds in English mostly denote kinds of people, and are generally derogatory. Some are readily used as vocatives: *Hey, birdbrain!* There are also compounds of this type that denote animals (*redbreast*), plants (*longleaf, whitethorn*), and inanimates (*greenback*, a type of banknote; *blackhead*, a kind of pimple; *hatchback*, a type of car).

#### 4.2.2 Verb-centred compound nouns

Verb-centred compound nouns are those where the central element is ‘verbal’, its form being identical with that of the lexical base of a verb (*hand·shake*) or derived from it by suffixation (*theatre·goer*).<sup>24</sup> One initial point to make is that the relation between the parts is characteristically comparable to that between a verb and NPs in clause structure, which is typically a relation of complementation rather than modification. For this reason, glosses in terms of ‘a kind of’ tend to be less applicable or less plausible than with noun-centred compounds. We shall hardly want to say, for example, that a handshake is a kind of shake or a theatre-goer a kind of goer. This is because *shake* and *goer* are unlikely to be used on their own with the relevant sense, so that *a kind of shake* and *a kind of goer* are pragmatically unnatural expressions.

We look first at compounds where the verbal element combines with a noun, and then at those where it combines with a preposition.

##### ■ The non-verbal element is a noun

Here the noun usually occupies first position, but we begin with a minor type with the reverse order.

##### (a) Verb + noun: *pickpocket* type

[15]	<i>breakwater</i>	<i>cut-throat</i>	<i>dreadnought</i>	<i>lickspittle</i>	<i>lockjaw</i>
	<i>makeweight</i>	<i>pickpocket</i>	<i>scarecrow</i>	<i>spoilsport</i>	<i>turnkey</i>

There are only a few established words formed on this pattern, which is no longer productive. The noun corresponds to the object of a clausal construction, and the compound as a whole denotes the person or thing that carries out the action: a pickpocket is a person who picks (“steals from”) pockets, a scarecrow is something that scares crows away. The meaning is therefore like that found in the productive pattern *letter-writer*, but the form is exceptional in that the verbal element comes first; compare also *breakwater* and *windbreak*. The V + N form is comparable to that seen in [14] above, but the meaning of the latter is very different: a call-girl, for example, is not someone who calls girls (for sex), but a girl whom people call, and this is why we have taken *call-girl* to be noun centred.<sup>25</sup>

<sup>24</sup>Compounds where one base is derived from a verb by suffixation are often called ‘synthetic compounds’. We avoid this potentially confusing term because in its primary sense ‘synthetic’ contrasts with ‘analytic’ and applies to marking by modification of the form of a word rather than by means of a separate word (e.g. *taller* is a synthetic comparative while *more intelligent* is an analytic one). In this general sense all compounds are synthetic. The motivation for calling words like *life-saver* and *fox-hunting* synthetic compounds is that the semantic relation between *save* and *life* or *hunt* and *fox* is here expressed within a single word rather than a clausal construction such as *They save lives / hunt foxes*.

<sup>25</sup>The *pickpocket* type is often classed together with bahuvrihi compounds like *paleface*: calling someone a pickpocket because they pick pockets is comparable to calling someone a paleface because they have a pale face.

(b) Noun + verbal element without suffix: *bee-sting*, *bloodshed*, *gunfight*

[16]	i	<i>bee-sting</i>	<i>bus-stop</i>	<i>cloudburst</i>	<i>daybreak</i>	<i>dogfight</i>
		<i>earthquake</i>	<i>fleabite</i>	<i>footstep</i>	<i>frostbite</i>	<i>headache</i>
		<i>heartbeat</i>	<i>landslide</i>	<i>nightfall</i>	<i>nosebleed</i>	<i>plane-crash</i>
		<i>rainfall</i>	<i>snowdrift</i>	<i>sunset</i>	<i>sunshine</i>	<i>waterfall</i>
	ii	<i>birth-control</i>	<i>bloodshed</i>	<i>car-park</i>	<i>chimney-sweep</i>	<i>dress-design</i>
		<i>haircut</i>	<i>handshake</i>	<i>life-guard</i>	<i>self-control</i>	<i>windbreak</i>
	iii	<i>boat-ride</i>	<i>daydream</i>	<i>field-work</i>	<i>gunfight</i>	<i>handstand</i>
		<i>homework</i>	<i>moon-walk</i>	<i>pub-crawl</i>	<i>table-talk</i>	

In [i] the initial noun corresponds to the subject of a clausal construction (compare *bee-sting* with *The bee stings*), in [ii] to the object (compare *bloodshed* and *They shed blood*), and in [iii] to the object of a preposition (compare *gunfight* and *They fight with guns*). There are a few cases such as *sunset* and *bloodshed* where the second base (with the sense it has in the compound) is purely verbal, but for the most part the second base can occur alone as either a verb or a noun. It may then not always be clear which is primary, and hence whether the compound belongs to the verb-centred or noun-centred pattern. Indeed it may be that the answer in a particular case will vary according to the meaning, as with ‘dress-design’, for example: compare *a new dress-design* (where the compound is a hyponym of the noun *design*) and *I’m in dress-design* (where *design* is verbal, and could be replaced by *designing* with no change of meaning).

(c) Noun + deverbal noun in *-er*: *stage-manager*, *lawn-mower*, *city-dweller*

[17]	i	<i>gamekeeper</i>	<i>life-saver</i>	<i>matchmaker</i>	<i>radio-operator</i>
		<i>rat-catcher</i>	<i>shoemaker</i>	<i>songwriter</i>	<i>stage-manager</i>
		<i>stakeholder</i>	<i>whistleblower</i>	<i>window-cleaner</i>	<i>wrong-doer</i>
	ii	<i>clothes-drier</i>	<i>dishwasher</i>	<i>honey-eater</i>	<i>lawn-mower</i>
		<i>nutcracker</i>	<i>oyster-catcher</i>	<i>pen-holder</i>	<i>place-holder</i>
		<i>record-player</i>	<i>screwdriver</i>	<i>shock-absorber</i>	<i>tongue-twister</i>
	iii	<i>city-dweller</i>	<i>factory-worker</i>	<i>freedom-fighter</i>	<i>gate-crasher</i>
		<i>grasshopper</i>	<i>house-breaker</i>	<i>theatre-goer</i>	<i>town-crier</i>

By virtue of the *-er* suffix the whole compound denotes the person or thing corresponding to the subject in a clausal construction, so this time there are no cases like [16i] where the first noun has the subject-like role. In [i] and [ii] the first noun corresponds to the object of a clause, those in [i] denoting humans (a rat-catcher is someone who catches rats), those in [ii] non-humans (a lawn-mower is a machine for mowing lawns). In [iii] the noun corresponds to the object of a preposition: a city-dweller dwells/lives in a city, a freedom-fighter fights for freedom, a theatre-goer goes to the theatre, and so on. The unexpressed preposition can be regarded as the default one for the particular verb–noun pair.

In general, this type of compound has a relatively narrow range of meanings. The fact that the semantic relation between the bases matches that found in clause structure means that *stage-manager*, for example, can only mean “one who manages the stage”: it cannot be interpreted as “phoney manager” (compare *stage whisper*), “manager who operates over particular sectors” (compare *stage-coach*), “manager intended to be seen on stage” (compare *stage-play*), and so on. Most of the established words on this pattern

are limited in their denotation to persons, animals, or machines that characteristically perform the action expressed in the verbal element.

Compounds of this kind are among those where the constituent structure is not entirely straightforward. We have assumed that the *·er* is part of the second base, so that the ICs of *shoemaker*, for example, are *shoe* and *maker*, not *shoemake* and *·er*. This reflects the fact that there is a word *maker* (which might occur in the phrase *a maker of shoes*), but not a word *shoemake*. With some of them the corresponding compound verb is established (e.g. *stage-manage*, *gate-crash*), but these are normally back-formations: the major point is that this pattern does not presuppose the existence of such a verb, and that the natural gloss is of the form “one who manages the stage / saves lives”, not “one who stage-manages/life-saves”, and so on. The IC structure of these words is therefore different from that of *first-nighter*, *flat-earther*, *left-hander*, etc., which are not compounds but derivatives formed by suffixing *·er* to the nominal expressions *first-night*, *flat-earth*, *left-hand*.

(d) Noun + deverbal noun in *·ing*: *letter-writing*, *churchgoing*

- [18] i *book-keeping* *brainwashing* *dressmaking* *fox-hunting* *housekeeping*  
*letter-writing* *peace-offering* *shadow-boxing* *sightseeing* *town-planning*  
 ii *churchgoing* *handwriting* *night-flying* *shop-lifting* *sky-writing*  
*sleepwalking* *spring-cleaning* *star-gazing* *sun-bathing* *window-shopping*

Again the first noun corresponds in [i] to an object in clause structure, and in [ii] to the object of a preposition. *Cockfighting* might seem to be a case where it corresponds to a subject, but the term applies not to the activity where cocks fight each other but to that where people set them fighting. The compound generally denotes an activity, but other meanings are seen in *peace-offering* (which differs from the others in being a count noun) and *handwriting*.

(e) Noun + other deverbal noun: *book-production*

- [19] *book-production* *car-maintenance* *heart-failure* *self-denial* *word-formation*

These are similar to the compounds in *·ing*, but involve other forms of nominalisation of the verb. In *heart-failure* the first noun corresponds to a subject, in the others to the object.

■ The non-verbal element is a preposition

(a) Unsuffixed verb + preposition

- [20] *breakthrough* *drop-out* *hang-up* *lean-to* *look-out*  
*phone-in* *pullover* *runabout* *runaway* *run-up*  
*show-off* *sit-in* *stand-off* *take-away* *take-off*

These compounds contain the lexical base of a verb followed by a preposition: this is still a productive process. In most cases (but not, for example, in *hang-up* and *lean-to*) the verb and preposition occur adjacently in related clausal constructions: *He's going to drop out of the race*; *I will run up to the wicket*; *We must phone in our results*. In such cases the process of forming the noun bears some resemblance to conversion – it differs from it, however, because the verb and preposition in the clausal construction are separate words, so that the effect of combining them into a noun is to form a compound. Note also that the stress pattern is different. While the syntactic construction has the main stress on the preposition, the compound has it on *phone*: the difference between the noun

*phone-in* and the verb + preposition sequence *phone in* matches that between noun *import* and verb *import* discussed in §2.6. These compounds have meanings ranging over persons (*drop-out*, *runaway*, *show-off*), concrete objects (*lean-to*, *pull-over*), events (*breakthrough*, *stand-off*). *Sit-in* belongs to a group widely used in the 1960s: *love-in*, *kneel-in*, *read-in*, *swim-in*, etc.

(b) Preposition + unsuffixed verb

[21]	<i>downturn</i>	<i>intake</i>	<i>offshoot</i>	<i>offspring</i>	<i>onset</i>
	<i>outlook</i>	<i>overflow</i>	<i>overkill</i>	<i>underlay</i>	<i>upkeep</i>

Here the preposition occupies initial position. A few compounds of this type match up semantically with verb + preposition constructions (e.g. *intake* with *take in*), a few are formed by conversion of compound verbs (e.g. *overflow*), but overall the relation to verbal constructions is not very systematic. *Outlook* contrasts with *look-out* in [20]: compare also *off-spin* and *spin-off*, *outbreak* and *break-out*, *out-fall* and *fall-out*. It is clear, therefore, that the choice between the verb + preposition and preposition + verb orders is determined neither by the preposition nor by the verb.

(c) Verbal element carries the *-er* suffix: *passer-by*, *bystander*

[22]	i <i>diner-out</i>	<i>hanger-on</i>	<i>looker-on</i>	<i>passer-by</i>	<i>runner-up</i>
	ii <i>bystander</i>	<i>onlooker</i>	<i>outrider</i>		

The nominalising *-er* suffix is added to the verbal base, usually giving an agentive interpretation. The preposition follows the verbal element in [i], precedes it in [ii], but carries the main stress in both cases. We exclude from [ii] examples like *underwriter*, which is a derivative from the verb *underwrite*. There are only a few compounds of the types shown in [22]; some match up closely with clausal constructions (cf. *They look on / pass by*), while others do not (verbal *run up* does not have a meaning comparable to *runner-up* “winner of second place in a competition”). Plurals are formed by adding *-s* to the noun in *-er*: for [i] this means that the plural suffix precedes the preposition: *hangers-on*, *runners-up*. This is a clear indication that the preposition is a dependent element: the plural suffix is added to the head noun, as in [ii] and in nouns generally.

The pattern in [22ii] is no longer productive, yet it appears to have left a trace behind, since non-standard nonce-words are sometimes heard with two *-er* suffixes (e.g. <sup>1</sup>*blower-upper*, “a shell which should be blown up”). In nouns of this second type the plural is marked at the end of the word, in line with the most general inflectional pattern.

(d) Verbal element carries the *-ing* suffix: *summing-up*, *upbringing*

[23]	i <i>dressing-down</i>	<i>going-over</i>	<i>summing-up</i>	<i>talking-to</i>	<i>washing-up</i>
	ii <i>infighting</i>	<i>outpouring</i>	<i>upbringing</i>	<i>uprising</i>	

As in [22], the preposition carries the primary stress whether it occurs in final or initial position. Again there are few examples of these types; we exclude from [23ii] examples like *undertaking* (a derivative from *undertake*), and from [i] we exclude the underlined sequences in *the bringing in of the furniture*, *the taking away of the rubble*, *the closing down of the store*, which we take as head + complement sequences in the structure of NPs. This syntactic construction allows a very wide range of complements, including an AdjP in *the burning alive of the missionaries* and a transitive PP in *the bringing to*

a close of these proceedings, and so on. Most of the compounds in [23] match up with clausal constructions, but not all (cf. *infighting*). Unlike the nouns in [22i], those in [23i] do not readily occur in the plural: neither *'dressings-down* nor *'dressing-downs* sounds acceptable.

#### ■ The non-verbal element is an adjective

- [24] i *best-seller*      *free-thinker*      *high-flier*      *loud-speaker*      *new-comer*  
 ii *sharp-shooter*      *shortcoming*      *shortfall*      *well-being*

There are few established compounds in this pattern: most have the *-er* suffix attached to the verb. In most cases the relation between adjective and noun is comparable to that between adverb and verb (cf. *sell best*, *think freely*), but there is a high degree of lexicalisation, so that few can be paraphrased with the corresponding clausal construction.

### 4.3 Compound adjectives

Our initial classification here is again based on the category of the central element. We distinguish three categories: adjective-centred (*cholesterol-free*, *red-hot*), verb-centred (*fun-loving*, *MIT-trained*, *germ-resistant*), and a residual category centred on nouns (*highbrow*) or having the form of preposition + noun (*upmarket*).

#### 4.3.1 Adjective-centred compound adjectives

##### ■ Noun + adjective compounds

The majority of compounds with an adjective as second component have a noun as the first. In general, there is no contrast here between a compound and a syntactic construction since adjectives take only a highly restricted type of NP as pre-head dependent (cf. Ch. 6, §3.2): the syntactic dependents of adjectives are generally pre-head adverbs or post-head PPs and clauses. Many noun + adjective compounds involve a high degree of lexicalisation, as in:

- [25] *colour-fast*      *foot-loose*      *headstrong*      *threadbare*      *top-heavy*

Although there is a more or less obvious connection between the meaning of the whole and that of the adjective head, none of these satisfy the test for hyponymy. *He is headstrong*, for example, does not entail *He is strong*, and something can be top-heavy even though it is as a whole relatively light. We will not attempt a comprehensive review of the patterns to be found, but will illustrate a selection of the more productive ones.

##### Comparative/intensifying

- [26] i *bone-dry*      *crystal-clear*      *dirt-cheap*      *dog-tired*      *feather-light*  
       *ice-cold*      *paper-thin*      *razor-sharp*      *rock-hard*      *stone-deaf*  
 ii *bottle-green*      *brick-red*      *jet-black*      *snow-white*      *steel-blue*

Here the noun indicates a standard of comparison: “dry as a bone”, “clear as crystal”, etc. Very often, as in [i], the effect is to intensify: *bone-dry* means “extremely/completely dry”, and so on. A special case of the comparative type is that of colour adjectives, as in [ii]; *jet-black* and *snow-white* are intensifying, but the others simply specify a particular shade of the colour. Compounds of this type are clearly hyponymic: if you are dog-tired, then necessarily you are tired, and so on.

### Measure terms

[27] *ankle-deep*      *shoulder-high*      *skin-deep*      *state-wide*      *week-long*

This is a productive pattern, with the noun indicating extent. *Wide* here has to do with area rather than the one-dimensional measure denoted by *wide* on its own, and *skin-deep* “superficial” is a further example of lexicalisation. Compounds formed on this pattern are non-hyponymic: *The water was ankle-deep*, for example, does not entail *The water was deep*. We noted earlier that there may be a variety of reasons why a compound might fail the hyponymy test: in the present case it is due to the fact that the adjectives are gradable ones that can apply either to the scale generally (*How deep is the water?*) or to an area of the scale greater than some relevant norm (*The water is deep*). The compound involves the first use, whereas the adjectives are generally interpreted in the second way when standing alone.

### Incorporated complement/modifier

[28] *accident-prone*    *burglar-proof*    *camera-shy*    *carsick*    *cholesterol-free*  
*class-conscious*    *girl-crazy*    *oil-rich*    *power-mad*    *praiseworthy*  
*snow-blind*    *tax-free*    *travel-weary*    *user-friendly*    *watertight*

These are comparable to syntactic constructions where the adjective has a following PP as dependent, complement, or modifier – compare *prone to accidents*, *proof against burglars*, *crazy about girls*, *rich in oil*, etc. *Free* (both in the sense “not having to pay”, as in *tax-free*, and in the sense “not containing”, as in *cholesterol-free*) is particularly productive. Some adjectives, such as *crazy*, *free*, *mad*, *rich*, *weary*, *worthy*, occur readily both in compounds and in syntactic constructions, while others, such as *proof* and *tight*, prefer or require the compound form.<sup>26</sup> Others again take syntactic complements but hardly form compounds: *fond of animals*, *keen on sport*, *eager for revenge* (compare *\*animal-fond*, *\*sport-keen*/*\*sports-keen*, *\*revenge-eager*). Where the noun corresponds to a syntactic complement, the compounds are generally not hyponymic: tax-free goods aren’t (necessarily) free, nor is a user-friendly computer manual a friendly one. With *prone* and *proof* the issue does not in fact arise since they cannot stand alone without complements – and indeed the same applies to *free* and *conscious* in the senses they have in *cholesterol-free* and *class-conscious*.

### Self-compounds

[29] *self-confident*    *self-conscious*    *self-evident*    *self-important*    *self-righteous*

There are a great many adjectives with *self* as the first component; many belong in the verb-centred category (*self-denying*, *self-declared*), but there are a considerable number which are adjective-centred, like those in [29]. A high proportion apply to humans (but cf. *self-evident*, *self-contradictory*). A few are hyponymic (*self-confident*, *self-contradictory*), while others are clearly not (*self-important*, *self-righteous*).

## ■ Adjective + adjective

There are far fewer established compounds of this form. We distinguish two cases.

<sup>26</sup> *Fail-safe* and *tamper-proof* are exceptional in that the first base is a verb rather than noun.

### Coordinative

[30] *bitter-sweet deaf-mute shabby-genteel Swedish-Irish syntactic-semantic*

The components here are of equal status. The last two illustrate highly productive patterns, both of which are predominantly used in attributive function: *Swedish-Irish trade*, *a syntactic-semantic investigation*. In general these can be glossed with coordinative *and*: “bitter and sweet”, “deaf and mute”, etc. In some, however, there is an understood “between” relation: “trade between Sweden and Ireland”.

### Subordinative

[31] *dark-blue icy-cold pale-green red-hot white-hot*

As with nouns, it is not always easy to distinguish between coordinative and subordinative types, and some analysts include these with the coordinative type. We regard them as subordinative because we take the first element to be semantically modifying the second: *icy*, *red*, and *white*, for example, have an intensifying role. *Bright*, *dark*, *light*, *pale* occur productively with colour terms. Compounds combining two colour terms, such as *blue-grey* or *orange-red* probably belong here too, with the first identifying a particular shade of the colour denoted by the second.

## 4.3.2 Verb-centred compound adjectives

### ■ Gerund-participle as head

#### Noun as first component

[32] i *awe-inspiring breath-taking heart-breaking thought-provoking*  
 ii *animal-loving cost-cutting degree-conferring fact-finding*  
 iii *law-abiding ocean-going theatre-going winter-flowering*

This is a very productive type of compound, covering a number of patterns. Usually, the noun corresponds to the object in a syntactic construction, as in [i–ii]. *Awe-inspiring* corresponds to the VP *inspire awe*, *degree-conferring* to *confer degrees*, and so on. But it is also possible for the noun to correspond to the complement of a preposition, as in [iii], where the verbs are intransitive: *abide by the law*, *go on the ocean / to the theatre*, *flower in winter*. In all cases the understood subject of the verb derives from the head of the NP when the adjective is used attributively and from its predicand when it is used predicatively: in *a thought-provoking lecture* and *The lecture was extremely thought-provoking* or *They found the lecture thought-provoking* it is the lecture that provokes thought.<sup>27</sup> Many adjectives of this kind, such as those in [i], are gradable and occur in both attributive and predicative function, while there are others, illustrated in [ii], that are normally ungradable and restricted to attributive function (with the syntactic construction being preferred to the predicative use of the compound: *This institution confers degrees* rather than *?This institution is degree-conferring*). *Self-* is a common first component: *self-respecting* (attributive only), *self-financing*, *self-pitying*.

#### Adjective/adverb as first component

[33] *easy-going far-seeing hard-working long-suffering strange-looking*

<sup>27</sup> *Mouth-watering* is exceptional in that it is one’s mouth that waters: the head or predicand is understood to have a causative role, making one’s mouth water.

Verbs like *look*, *smell*, *taste*, *seem*, etc., which take adjectival predicative complements, occur in compounds matching the clausal construction: *a strange-looking object* matches *an object that looks strange*, *a desperate-seeming suggestion* matches *a suggestion that seems desperate*, and so on. But *good-looking* and *high-sounding* are lexicalised – we can say, for example, *Your prospects look good*, but not \**Your prospects are good-looking*. With other kinds of verb there is also a good deal of lexicalisation, as in *easy-going*, *far-seeing*, *long-suffering*. *Hard-working* corresponds to *work hard*, with adverbial *hard*, but we need to distinguish between compound adjectives of this form and adverb + verb syntactic sequences like *rapidly diminishing (returns)*. One difference is that we can say *They seem hard-working*, but not \**They seem rapidly diminishing*.

### ■ Past participle as head

#### Based on passive use of past participle

[34] i	<i>drug-related</i>	<i>home-made</i>	<i>MIT-trained</i>	<i>moth-eaten</i>
	<i>safety-tested</i>	<i>sex-linked</i>	<i>taxpayer-funded</i>	<i>weather-beaten</i>
ii	<i>clean-shaven</i>	<i>French-based</i>	<i>high-set</i>	<i>new-born</i>

Those in [i] have a noun as first component, a highly productive pattern. These compounds generally correspond to syntactic passives with a PP: *related to drugs*, *made at home*, *tested for safety*, *funded by taxpayers*, etc. A relatively small proportion are gradable: *very moth-eaten/weather-beaten*. *Self* is again often found as first component, often with a high degree of lexicalisation: *self-taught*, *self-appointed*, *self-made*, *self-confessed*, *self-possessed*. Those in [ii] have an adjective or adverb as first element. For these there is generally no closely corresponding syntactic construction with adjective/adverb (‡*shaven clean*, \**based French* – compare similarly *foreign-built* but not \**built foreign*). This type is of low productivity except for the subtype illustrated by *French-based*: with proper names of countries and to some extent other locations the adjective is used in past-participial compounds when one is readily available – compare *French-based* (*French* an adjective) and *Guernsey-based* (*Guernsey* a noun), *Paris/Parisian-based* and *London-based*.

#### Based on active use of past participle

[35]	<i>plain-spoken</i>	<i>short-lived</i>	<i>well-behaved</i>	<i>well-travelled</i>
------	---------------------	--------------------	---------------------	-----------------------

These are semantically related to clauses involving the active rather than the passive use of the verb: *plain-spoken* applies to a person who speaks plainly, not to words or whatever that are spoken plainly. Similarly, a *well-travelled* person is someone who has travelled well, or widely. There are few compounds of this form, all lexicalised.

### ■ Deverbal adjective as head

Finally we find compounds of the form noun + deverbal adjective:

[36]	<i>drug-dependent</i>	<i>germ-resistant</i>	<i>self-reliant</i>	<i>tax-deductible</i>
------	-----------------------	-----------------------	---------------------	-----------------------

These match syntactic constructions involving verb + NP object (*resist germs*) or verb + PP (*depend on drugs*). They are therefore closely comparable to the compounds in [32], where we also saw that the syntactic distinction between an NP that is object of the verb, and one that is related to the verb by a preposition is lost in the morphological

compound. But they are also similar to the compounds in [28–29], since there are also paraphrases with AdjPs (*dependent on drugs*, *resistant to germs*): the initial noun of a compound adjective can represent a semantic argument whether the head is verbal or adjectival.

### 4.3.3 Other forms

We saw in Ch. 5, §14.2, that the attributive modifier function in NP structure can be realised by a very wide range of expressions. They include ordinary AdjPs (*an extraordinarily good movie*), DPs (*the almost eighty students present*), nominals (*a gold watch*), VPs (*the retreating troops*). In addition there are expressions that do not fit into the regular structures for these categories:

- [37]    *an all-time high*                      *a hands-on approach*                      *a high-rise building*  
           *inflight entertainment*            *the London–Glasgow express*            *a no-win situation*

Such expressions are typically nonce-forms, restricted to attributive modifier function. This is an area where it is difficult to draw a clear line between syntax and morphology, but it may be best to treat them as compound adjectives.

One productive type that merits mention involves measure expressions with a singular noun base: *a three-inch nail*, *a five-mile walk*, *a two-year moratorium*. These do not qualify as nominals, which have plural forms of the noun: *The nail is three inches long*; *We walked five miles*; and so on. These compound adjectives can combine with adjectives to form larger compounds (belonging with the subordinative adjective + adjective compounds of §4.3.1): *a three-metre-wide pool*, *a two-year-old child*. Those with *old* as head readily convert to nouns: cf. *two three-year-olds*.

## 4.4 Compound verbs

There are far fewer compound verbs than there are compound nouns or compound adjectives. A high proportion of them, moreover, are formed by other processes than compounding, namely back-formation and conversion. Back-formation is most commonly from nouns in *·er* (*ghostwriter* → *ghostwrite*) or *·ing* (*job-sharing* → *jobshare*), or adjectives in *·ed* (*hen-pecked* → *hen-peck*); for some, more than one source may be available (*chain-smoker/chain-smoking* → *chain-smoke*; *freeze-dried/freeze-drying* → *freeze-dry*). Conversion is generally from compound nouns (*blacklist<sub>N</sub>* → *blacklist<sub>V</sub>*). Most compound verbs that arise directly from compounding have a preposition as the first base, as in *over-react*, *outlast*, *underestimate*. Direct formation of compounds with a noun as first base is very rare, and it is not easy to establish that the verb preceded the corresponding noun in *·ing*. Verbs of this kind that do appear to have been formed directly include *speed-read*, *hand-wash*, and perhaps *gift-wrap*. There are also verbs like *cold-shoulder* that are formed by what we have called dephrasal compounding: see §4.1 above.

The following types of compound verb may be distinguished according to the component bases involved. In the lists of examples we add annotations in the case of those verbs formed by some process other than ordinary compounding: ‘B’ for back-formation, ‘CV’ for conversion, and ‘DP’ for dephrasal compounding.

- [38] i NOUN + VERB  
*baby-sit* B    *brainwash* B    *chain-smoke* B    *daydream* CV    *ghostwrite* B  
*hand-wash*    *henpeck* B    *hood-wink* B    *job-share* B    *mass-produce* B  
*nosedive* CV    *proofread* B    *sky-dive* B    *sleepwalk* B    *spoonfeed* B  
*springclean* B    *stage-manage* B    *tape-record* B    *whitewash* CV    *window-shop* B
- ii NOUN + NOUN  
*bar-code* CV    *handcuff* CV    *honeymoon* CV    *snowball* CV    *stone-wall* DP
- iii ADJECTIVE + NOUN  
*blacklist* CV    *fast-track* DP    *shortchange* DP    *soft-soap* DP    *wisecrack* CV
- iv PREPOSITION + NOUN/VERB  
*backdate*    *background* CV    *bypass* CV    *downgrade*    *downsize*  
*input* CV    *offset*    *onsell*    *outclass*    *outgrow*  
*outsource*    *overcharge*    *overdose* CV    *overflow*    *underachieve* B  
*undercharge*    *underlie*    *undersell*    *uphold*    *upstage* CV
- v VERB + VERB COORDINATIVE COMPOUNDS  
*blow-dry*    *cook-chill*    *freeze-dry*

One marginal type of compound verb formed by conversion from a noun is seen in:

- [39] *They went deer-hunting. They spent their holiday trout-fishing.*

These are defective in that there are no verb-forms other than the gerund-participle: cf. \**They deer-hunted*. Nevertheless, the forms in [39] would seem to be verbs, not nouns. *Go* in the relevant use is restricted to this kind of expression, but *spend* accepts uncontroversial gerund-participials, while not admitting NPs: *They spend their holiday touring Europe*.

## 4.5 Neo-classical compounds

A neo-classical compound is a compound where at least one of the component bases is a combining form. Combining forms are usually of Greek or Latin origin, but they appear in great numbers of compound nouns and adjectives which are not themselves of classical origin. Words like *holograph* and *hydrology*, for example, are made up of classical components but are modern coinages. Combining forms are thus used productively in English word-formation: this is why we speak of **neo-classical** compounds. Such compounds figure extremely prominently in scientific terminology and learned vocabulary generally.

The central type of neo-classical compound consists of two combining forms: *astronaut*, *autocrat*, *carnivore*, *fratricide*, *pseudonym*, *psychology*, and so on. Forms occurring in initial position we refer to as **initial combining forms** (ICFs), those in final position as **final combining forms** (FCFs). A few examples are given in [40i–ii] respectively:

- [40] i *aer(o)*    *andr(o)*    *anthrop(o)*    *audio*    *aut(o)*    *bio*  
*electro*    *geo*    *heter(o)*    *hom(o)*    *hydr(o)*    *neur(o)*  
*palae(o)*    *pseud(o)*    *psych(o)*    *quadr(i)*    *socio*    *tele*
- ii *cephaly*    *ectomy*    *emia*    *gamy*    *geny*    *icide*  
*ivore*    *(o)crat*    *(o)graph*    *oid*    *(o)logy*    *onym*  
*ophile*    *(o)phobe*    *pathy*    *phone*    *saurus*    *scope*

Many elements have alternants without the boundary vowel which appear in other morphological constructions. Compare, for example:

- [44] a. *anthropopathy* ~ *philanthropy*      b. *Anglo-Irish* ~ *Anglicist*  
       *carpophagous* ~ *pseudocarp*            *ethnography* ~ *ethnic*  
       *morphology* ~ *ectomorph*                *socio-economic* ~ *society*  
       *pathology* ~ *osteopath*                 *theology* ~ *theism*

The pairs in [a] have an element appearing as ICF in the first member and as FCF in the second: in the former case it has a vowel at the end, in the latter at the beginning. The pairs in [b] have an element which in the left member is an ICF with *o* at the boundary, and in the right member appears with an affix attached but without the *o*. (*Society* was borrowed from French rather than formed in English and is not easily analysable into base + suffix; nevertheless the first part is clearly related to the ICF *socio*.)

Instead of treating *anthropo-* and *Anglo-* as ICF alternants of *anthrop-* and *Angl-*, we could say that the *o* does not belong to the combining form itself but is simply a linking element introduced by the neo-classical compounding process. This analysis has a good deal to commend it; in particular, it provides a natural account of why the *o* follows *carp* in *carpophagous*, but precedes it in *pseudocarp*, and so on. Instead of the processes of vowel sequence reduction given in [42], we would have constraints on the insertion of a linking vowel. In general, the insertion of the linking vowel would serve to break up a sequence of consonants at the medial boundary (thus *pseud-o-carp* instead of the inadmissible *\*pseud-carp*), though there are also places where *o* follows a vowel rather than a consonant and hence has no such phonological motivation – cf. *archaeology*, *ichthyomancy*, *palaeolith*, etc.

We have preferred to analyse the vowel as belonging to one or both of the ICFs mainly because in Present-day English combining forms are commonly added to existing words (i.e. free bases), and in such cases the medial vowel generally appears irrespective of the phonological form of the free base. This was illustrated above in [43]: there seems little doubt that in Present-day English *aero-*, *auto-*, *hydro-*, *micro-*, *neo-*, *pseudo-*, *psycho-*, etc., are single units available for use in the formation of new words. Or take the case of *-ology*. Etymologically, the *log* here is the same as that in *logical*, but the fact that *-ology* attaches very readily to proper nouns to form nonce-words such as *Kremlinology*, *Buffetology*, etc., suggests that it too behaves as a word-forming unit – and the fact that *ology* exists as a word by itself (comparable to *ism*) provides strong support for this analysis. Similarly, the productivity of the process involved in such words as *fungicide*, *germicide*, *herbicide*, *insecticide*, *pesticide*, *spermicide* provides evidence that Present-day English has an element *icide* used to form words with the meaning “chemical for killing ~”. The etymological source is ultimately Latin *caedere* (or *-cidere*) “kill”, with no initial *i*, but if we took the FCF to be *cide* with the *i* a linking vowel we would need to stipulate that compounds in *cide* take *i* rather than the default *o* as the linking vowel: it is simpler just to say that the *i* is part of the FCF. Such examples may be contrasted with *quadricycle*, *quadrisyllable*, *quadrivalve*, where the *i* is clearly part of the ICF.<sup>30</sup> A further point is that there are a few cases where we do not in fact have a medial vowel at all – for example, there is a vowel before *-pathy* in *allopathy*, *antipathy*, *telepathy* but not in *sympathy*. The linking vowel analysis would add *o* in *allopathy* (and *osteopathy*, etc.); the insertion of *o* in *antipathy* and *telepathy* would be blocked by the vowel at the end of *anti*

<sup>30</sup>Some ICFs have alternants with different marginal vowels, with *quadri-* one of the clearest examples. The default alternant has *i*, but *a* is found in a few words such as *quadragenarian*, *quadrasonic* and *u* in *quadrumanus*, *quadruped*, etc.

and *tele*, but its absence in *sympathy* would require special provision. We prefer to say simply that the ICFs here are *allo-*, *anti-*, *tele-*, and *syn-* (the latter appearing in the variant *sym* before bilabial /p/). Compare, similarly, *holo-gamy*, *micro-gamy*, and *syn-gamy*.

In the default case we take a single marginal vowel to belong to the ICF: *anthrop-morphism*, *geo-mancy*, *micro-lith*, *neo-nate*, *philo-sophy*, *quadri-plegia*. For it to be assigned exclusively or jointly to the FCF we need specific evidence. There is no need to include an *o* in *geny*, for example: it doesn't occur in *eugeny* and in words like *biogeny* or *ontogeny* the *o* can be assigned to the ICF. The two main kinds of evidence that the vowel belongs (exclusively or jointly) to the FCF were mentioned in the last paragraph. One is that the vowel appears when the element combines with a free base, as in *address-ograph*, *insect-icide*, *Kremlin-ology*. Note, however, that the argument for *-ology* applies where the meaning is "science, knowledge, study related to ~": as far as English is concerned, this element can be distinguished from the FCF *-logy*, which is found, with various senses, in such words as *eulogy*, *trilogy/tetralogy*, *syllogy*. (The last of these has no medial vowel, since the ICF is an alternant of *syn-* – compare the same alternation with the prefix *in-*: *inactive*, *impossible*, *illogical*). The second case is where the FCF selects *i* as the boundary vowel, as in *insect-icide*, *herb-ivore*, *frug-iferous*.<sup>31</sup> A third, much more specific, kind of evidence is provided by the ICF *syn-*, which differs from normal ICFs in that it does not end in a vowel. Compare, then, the above *anti-pathy* and *sym-pathy* with *antonym* and *synonym*. The *o* in the latter pair must belong to the FCF, not the ICF: if the FCF were *-nym* rather than *-onym*, combination with *anti-* and *syn-* would yield forms matching the combinations with *-pathy*, namely *\*antinym* and *\*synnym*.<sup>32</sup>

### ■ Combining forms contrasted with affixes

Combining forms are generally bound, and in that respect are like affixes rather than bases, which are characteristically free. Nevertheless, there are good grounds for including them in the category of bases, not affixes.

In the first place, the prototypical neo-classical compound consists of two bound combining forms, as in many of the examples above: *astronaut*, *bibliophile*, *osteopath*, etc. Such words could not have the structure 'affix + affix' (since an affix is always attached to a base) and as there are no grounds for treating one component as base and the other as affix we take both as bases.

Secondly, although only relatively few combining forms are free, a considerable number can serve as the base to which affixes are attached: *an-anthrop-ism*, *an-emia*, *aqua-tic*, *hydr-ic*, *phon-al*, *phot-ism*, and so on (cf. also the examples in [44b]). From a semantic point of view, there is a variable relationship between the elements in a neo-classical compound just as there is in a native one, and the meanings of combining forms are generally more specific than is typical of affixes. Nevertheless, we find a number of cases where a combining form and an affix have similar meanings – compare the ICF *micro-* and the prefix *mini-*, or ICF *hyper-* and prefix *super-*.

Combining forms are most like affixes when they combine readily with ordinary free bases. Examples include *micro-* (cf. *microcard*, *microchip*, *microcircuit*, *microclimate*, *microdot*,

<sup>31</sup>It may well be that we need to make a distinction between *-icide* and *-cide* parallel to that between *-ology* and *-logy*. The meaning of words such as *fratricide*, *regicide*, *suicide* is distinguishable from that of *insecticide*, etc., and they could be analysed as *fratri + cide*; this would accommodate the fact that there is a sense of *autocide* which is equivalent to *suicide*.

<sup>32</sup>The analysis *syn-onym* reflects the etymology, with *-onym* coming from the Greek *onum* "name"; compare also *an-onymous* "with no name (known or acknowledged)".

*microfiche, microfilm, microgroove, micro-organism, micro-processor, microstructure, microwave, etc.) and bio-* (cf. *bio-contamination, biodegradable, biodestructible, bioengineer, bioethics, bioexperiment, biohazard, biomedicine, biorhythm, biosatellite, bioscience, etc.*). What makes these elements nevertheless combining forms rather than affixes is that they also combine with bound combining forms, and retain the potential to enter into new combinations of this kind: *microcosm, microphone, microscope, biogen, biognosy, biolysis*, and so on. Note also that compounds consisting of combining forms normally have a vowel at the boundary; for the most part, then, prefixes which end in a consonant or suffixes which begin with one are phonologically distinguishable from combining forms. Thus *arch-* (/ɑːˈtʃ/), for example, as in *archdeacon* or *arch-enemy*, is a prefix, although the etymologically related *archi-* (/ɑːˈki/), as in *archidiaconal, archilithic, archimage* (“chief magician”), *archinephron*, etc., is a combining form. This does not provide a necessary condition for combining form status, however, for we have noted that the ICF *syn-* does not end in a vowel: in analysing this as a combining form we have given priority to the fact that it can combine with FCFs, as in the above *sympathy, syngamy, syllog*y.

### ■ Neo-classical compounds, clippings, and blends

Neo-classical compounds, like other words, can undergo clipping and blending. *Photo*, we noted, is a clipping from *photograph*, so *photo-album* (“photograph-album”) is a compound with a clipped first base, not a neo-classical compound like *photometer* (“instrument for measuring light”). *Telephone* is neo-classical, but *telegenic* is a blend of *television* + *photogenic*, and *televanking* is a blend of *telephone* + *banking*. *Autocide* with the meaning “automobile suicide” is a blend, but we have noted that it can also be a neo-classical compound meaning “suicide”.

### ■ Attachment of suffixes to or within neo-classical compound bases

A high proportion of words containing FCFs end in suffixes. Typically, we find a family of words differing only in the suffixes:

- [45] i *theology, theologise, theologism, theologist, theologian, theologaster, theological*  
 ii *microcephaly, microcephalous, microcephalic*  
 iii *xenophobe, xenophobia, xenophobic*

The analysis of such sets poses considerable problems. Consider first set [i]. From a semantic point of view it would seem that *theology* has special status within the set, in that the meanings of the others are dependent on that of *theology*: *theologian*, for example, denotes a person skilled in theology. Instead of saying that all the forms are derived from a bound base by attachment of various affixes, we prefer to say, therefore, that the other forms are derived from *theology* by replacement of the affix *-y* by other affixes (for discussion and further illustration of this kind of affixation, see §5.1.4 below). *Theology* itself will then be a compound with *theo* as ICF and *(o)logy* as FCF, the latter being further analysable as base + the suffix *-y*. The set of affixes found in the established words is, however, specific to *theology* – for *biology* we have *biologist* and *biological*, for *psychology* we find *psychologist, psychological, psychologism*, and so on. For this reason we take the ICs of *theologian*, say, to be *theolog-* and *-ian*, which makes it a derivative, with a compound internal base. Similarly in [ii] we take the noun *microcephaly* to be a compound and the two adjectives to be derivatives from it. In [iii] it would be possible to take *xenophobia* as a derivative from *xenophobe*, but we prefer to take it too as a compound, since it corresponds to the nouns of the other sets and because *phobia* is a free base, so

that *xenophobia* can be construed as a kind of phobia, a phobia of foreigners. *Xenophobic*, however, we again take to be a derivative (from one or other of the compounds). There are other ways of handling morphologically related sets of words like those in [45] (e.g. by saying that all, other than *xenophobe*, are derivatives with bound compound bases, or that all are compounds, with the affix belonging within the second base). We do not have knock-down arguments in support of our proposed analysis, and recognise that there is a certain amount of indeterminacy as to the IC structure of such words. Certainly, the identification of FCFs is less straightforward than that of ICFs.

#### 4.6 Phonologically motivated compounds

There are a few items which, although they are treated orthographically as if they were compounds, and in some cases meet all the requirements for being ascriptive compounds, nevertheless are formed according to stipulations which are normally irrelevant in compound formation:

- [46] i *clap-trap*, *cop-shop* (BrE slang “police station”), *gang-bang*, *walkie-talkie*  
 ii *boogie-woogie*, *fuzzy-wuzzy*, *super-duper*, *teeny-weeny*  
 iii *fuddy-duddy*, *helter-skelter*, *hodge-podge*, *hoity-toity*, *hurdy-gurdy*,  
*mumbo-jumbo*, *namby-pamby*  
 iv a. *chitchat*, *shillyshally*, *tittletattle*      b. *knickknack*, *zigzag*  
 v a. *clipclop*, *crisscross*, *singsong*      b. *dingdong*, *pingpong*

The examples in [i] are normal compounds formed from two independently existing words, and it just so happens that the two words rhyme. Compounds of this kind often have the effect of trivialising what they denote: compare, for example, *gang-bang* with *gang-rape*. In the examples in [ii], this rhyming feature is maintained, but the second base has no independent meaning, and serves purely to provide a rhyme. The particular consonant that is used at the start of the second base is not generally predictable, though labial consonants (including /w/) seem to be preferred. Note that if these were normal compounds, the right-hand base would be the head, but here the only meaningful element is the left-hand one. In the examples in [iii] neither base has any independent meaning (at least in Present-day English): the rhyme is the fundamental principle involved in the creation of these words. The examples in [iv] and [v] show words motivated not by rhyme but by vowel contrast. In [iv] there is change from /ɪ/ to /æ/, in [v] from /ɪ/ to /ɒ/, either with the right-hand base being the original meaningful element, as in the [a] examples, or with neither base being independently meaningful, as in [b]. There are also a few examples like *ticktock* where the lefthand base is the meaningful element. The /ɪ/ ~ /æ/ alternation is also found in the syntactic phrases *drips and drabs* and *tit for tat*.

### 5 The core of English lexical word-formation: mainly derivation

The focus in this section is on derivation, though we shall make further reference to some of the processes already surveyed when they serve to achieve the same effect as is achieved by certain affixes.

## 5.1 Affixation and derivation: formal issues

Affixation is the process of forming a new base by the addition of an affix. Affixation is widely used in both inflectional and lexical morphology: **derivation** is then the more specific term for the formation by affixation of lexical bases, or **derivatives**. In the central type of derivation an affix is simply added to a base: *un-* + *happy* → *unhappy*; *read* + *-able* → *readable*. There are also places, however, where it is more helpful to see derivation as involving the replacement of one affix by another – to see *baptism*, for example, as deriving from *baptise* by replacement of *-ise* by *-ism*, rather than as simply involving the addition of *-ism* to the bound base *bapt*.

### 5.1.1 Kinds and combinations of affixes

#### ■ The syntactic effect of affixation

Affixes differ with respect to whether and, if so, to what extent they affect the syntactic distribution of the base to which they attach. We distinguish three main types:

##### (a) Affixes which change the primary category

One very important role of affixes, especially suffixes, is to create nouns, verbs, adjectives, etc., from bases of another category. Adding *-ness* to an adjective, for example, changes it into a noun: we refer to it as a **de-adjectival noun** and the process is a special case of **nominalisation**. Similarly, adding *-able* to a verb creates an adjective, adding *-ise* to a noun changes it into a verb, and so on:

[1]		RESULTANT BASE	PROCESS
	i	<i>wet</i> <sub>ADJ</sub> + <i>-ness</i> → <i>wetness</i> <sub>N</sub>	de-adjectival noun      nominalisation
	ii	<i>read</i> <sub>V</sub> + <i>-able</i> → <i>readable</i> <sub>ADJ</sub>	deverbal adjective      adjectivalisation
	iii	<i>terror</i> <sub>N</sub> + <i>-ise</i> → <i>terrorise</i> <sub>V</sub>	denominal verb      verbalisation

Affixes can also serve to nominalise or adjectivalise phrasal sequences, as in the *old-maidish* and *fly-by-nighter* examples of §4.1; particularly common here is the use of *-ed* to form dephrasal adjectives like *red-nosed*, *two-faced*, etc. Lexical word-formation processes of nominalisation, adjectivalisation, and verbalisation (whether by affixation or by other means) are described in §§5.7–9 respectively.

##### (b) Affixes which change the subclass

Less often, the primary category is preserved, but there is a change in the subclass:

[2]	i	a. <i>He <u>moaned</u> about the lack of funds.</i>	b. <i>He <u>bemoaned</u> the lack of funds.</i>
	ii	a. <i>She hadn't yet become a <u>star</u>.</i>	b. <i>Her rise to <u>stardom</u> was meteoric.</i>

*Moan*, as in [ia], is an intransitive verb (here taking a PP complement): prefixing *be-* makes it transitive, as in [ib]. In [ii] *star* is a concrete count noun, whereas *stardom* is abstract and normally non-count.

##### (c) Affixes which have no effect on the syntactic distribution

There are also affixes, predominantly prefixes, which leave even the subclass unchanged:

[3]	i	<i>happy/<u>un</u>happy</i>	<i>fiend/<u>arch</u>fiend</i>	<i>judge/<u>mis</u>judge</i>	<i>read/<u>re</u>-read</i>
	ii	<i>tiger/<u>tigress</u></i>	<i>kitchen/<u>kitchenette</u></i>	<i>green/<u>greenish</u></i>	<i>good/<u>goodly</u></i>

It should be borne in mind, however, that affixes do not always behave in a uniform way across all the bases to which they attach. *Be-*, for example, changes the subclass in the above example of *bemoan*, but it changes the primary category in *befriend* (a denominal

verb) and *becalm* (de-adjectival). *Pre-* generally has no syntactic effect, as in the verb *pre-heat* or the adjective *pre-human*, but in words like *pre-war* it derives an adjective from a noun.

#### ■ Restrictions on the category of base to which the affix is attached

For the most part affixes attach to free bases belonging to one or other of the three major syntactic categories, noun, verb, and adjective. Some affixes are found with bases of all three categories – cf. *counter-example* (N), *counter-act* (V), *counter-productive* (Adj). But these are very much in the minority: most affixes attach to bases of just one or two of the three categories (at least in their currently productive uses). For example, *·ity* and *·ness* attach to adjectives (*public-ity*, *wet-ness*), as does the verb-forming suffix *·en* (*light-en* – *strengthen* and *length-en* are lexicalised exceptions). Similarly, *fore-* and *re-* are normally found with verbs or (verb-related) nouns (*fore-warn*, *fore-taste*, *re-consider*, *re-birth*).

Such restrictions can provide useful evidence about constituent structure in cases where the structure is not obvious from the meaning. Consider, for example, words like *un-fair-ness*, consisting of an adjectival base together with a nominalising suffix and the negative prefix *un-*: are the ICs *unfair* + *·ness* or *un-* + *fairness*? The semantics doesn't provide a clear answer because there is no decisive contrast between “the state/condition of being unfair” and “the opposite of fairness”. There is, however, a strong formal argument in support of an analysis as *unfair* + *·ness*: this IC structure enables us to make the general statement that this *un-* (as opposed to the one with the “reversal” sense of *un-tie*, etc.) normally attaches to adjectives. There are a great many adjectives consisting of *un-* + simple base: *uncertain*, *unclear*, *uncommon*, *uneven*, *unfair*, *unhappy*, *unready*, *untidy*, and so on. Here *un-* obviously attaches to an adjective, and we can simply generalise this analysis to words like *unfairness* if we take the ICs as *unfair* + *·ness*. We find, by contrast, only a handful of nouns containing this *un-* as prefix but no nominalising suffix: *unconcern*, *unease*, *unrest*, and the like; these must be regarded as lexicalised exceptions to the general pattern.<sup>33</sup>

#### ■ Restrictions on occurrence of affixes with bound bases

Affixes generally attach to free bases – nouns, verbs, adjectives (and occasionally, in colloquial and often mildly jocular formations, to prepositions, as in *downer*, *iffy*, *uppity*). There are also words containing an affix attached to a bound base; but only a subset of affixes are found in words of this kind. Examples are given in [4i], while a sample of affixes restricted to free bases is given in [4ii]:

- [4] i ALLOW BOUND BASES: *dis-gruntled*, *en-quire*, *pre-empt*, *re-vise*,  
*dur-able*, *feas-ible*, *bapt-ism*, *evangel-ist*,  
*atroc-ity*, *aggress-ive*, *auth-or*, *visc-ous*
- ii REQUIRE FREE BASES: *fore-warn*, *un-happy*, *un-do*, *under-felt*,  
*care-ful*, *boy-hood*, *fair-ish*, *red-ness*,  
*friend-ly*, *wild-ly*, *cream-y*

Words with bound bases are characteristically loans rather than the result of English word-formation processes, and in many cases (e.g. in words like *compel*, *precede*, *resume*,

<sup>33</sup>The prefix *in-* attaches more readily to nouns than does *un-*, so that we have contrasts such as *unjust* vs *injustice*, *unequal* vs *inequality*. Note that the different IC structures of *unfairness* (*unfair* + *·ness*) and *injustice* (*in-* + *justice*) reflects the lack of any sharp semantic contrast between the nominalisation of a negative adjective and the negation of a de-adjectival noun.

etc.) it is questionable whether a word that is etymologically divisible into base + affix can properly be assigned a morphological analysis of that kind in Present-day English – see the discussion of this issue in §1.2.

### ■ Ordering of affixes

There are some affixes which appear only as first or last derivational affix. For example, the *·ly* which forms denominal adjectives like *friendly* never occurs following another suffix, although it can itself be followed by another suffix, as in *friend·li·ness*. Thus from the noun *business* we can form *businesslike*, but not *\*businessly*. Conversely, *·hood* can follow other suffixes, as in *magic·ian·hood*, but can never be followed by another derivational affix, so that forms like *\*child·hood·ic* are ungrammatical.

In addition there are constraints on the relative ordering of affixes, particularly suffixes. In general those with a Germanic source occupy more peripheral positions than those coming from Latin and Romance. For example, we have words like *nerv·ous·ness* and *hope·ful·ness*, where native *·ness* follows Romance *·ous* or native *·ful*, but not *\*care·ful·ity* or *\*king·dom·ous* with Romance *·ity* and *·ous* following native *·ful* and *·dom*.

## 5.1.2 Morphophonological alternation

Affixes can affect the phonological form of the base to which they are attached: if we add the suffix *·ion* to *persuade*, for example, the base takes the form /pəˈsweɪɹ̩/ instead of the default /pəˈsweɪd/. The different forms an element takes in different morphological environments (e.g. /pəˈsweɪd/ and /pəˈsweɪɹ̩/) we refer to as **morphophonological alternants**. Such alternants may differ in stress, in their vowels, or in their consonants: we accordingly speak of stress alternations, vowel alternations, and consonant alternations.

### ■ Affixes and stress

Affixes, particularly suffixes, may affect the position of the stress. We can distinguish the following four types of suffix, though it has to be borne in mind that suffixes do not always behave in a completely regular way, so that there are some exceptions to the patterns described below.

#### (a) Derivative follows stress rules for simple words

Consider first the simple bases *America* and *ve'randah*. In *America* the stress falls on the third syllable from the end, the **antepenult**, whereas in *ve'randah* it falls on the second syllable from the end, the **penult**. The difference in the location of the stress is due to a difference in the phonological structure of the words: although in both cases the last three syllables all have short vowels, the vowel of the penult is followed by a single consonant (/k/) in *America*, but by a two-consonant cluster (/nd/) in *verandah*. Now consider the following words in *·al*:

[5]	STRESS REMAINS CONSTANT	STRESS SHIFTS
	i a. <i>con'jecture</i> ~ <i>con'jectural</i>	b. <i>'medicine</i> ~ <i>me'dicinal</i>
	ii a. <i>'fraction</i> ~ <i>'fractional</i>	b. <i>'parent</i> ~ <i>pa'rental</i>

The position of the stress is unaffected in the [a] examples: *conjecture*, for example, has a phonological structure like that of *verandah* and hence has the stress on the penult, while *conjectural* is comparable to *America*, with the stress therefore on the antepenult. In [b], however, the addition of the affix leads to a shift in the location of the stress. In [ib] it yields a word with a phonological structure like that of *America*, so the stress shifts

## ■ Vowel alternations

There is an immense amount of vowel alternation in English, some of which has been described in the last chapter – cf. especially the discussion of the contrast between strong and weak forms. For present purposes, there are two main cases to note.

### Alternations resulting from the Great Vowel Shift

One group of alternations very common in established vocabulary were brought about by changes in the vowel system known as the Great Vowel Shift, which took place between the fifteenth and seventeenth centuries, approximately:

- |        |            |                                   |  |
|--------|------------|-----------------------------------|--|
| [11] i | /aɪ/ ~ /ɪ/ | <i>crime</i> ~ <i>criminal</i>    | <i>malign</i> ~ <i>malignant</i>             |
| ii     | /iː/ ~ /e/ | <i>gene</i> ~ <i>genotype</i>     | <i>obscene</i> ~ <i>obscenity</i>            |
| iii    | /eɪ/ ~ /æ/ | <i>profane</i> ~ <i>profanity</i> | <i i="" voracious<=""> ~ <i>voracity</i></i> |
| iv     | /aʊ/ ~ /ʌ/ | <i>abound</i> ~ <i>abundance</i>  | <i>profound</i> ~ <i>profundity</i>          |

Oversimplifying somewhat, we can say that alternations that were once simply a matter of vowel length came to be a matter of vowel quality as a result of changes in the pronunciation of the long vowels (and to some extent the short vowels). The spelling reflects the earlier pronunciation and hence the morphological relationship between the paired words is more evident in writing than in speech.

### Vowel reduction

One extremely common type of alternation is between a stressed full vowel and the unstressed reduced vowel /ə/. Alternation between full vowel and /ə/ (or sometimes /ɪ/) is therefore regularly associated with shifts in the location of the stress of the type discussed above. Compare, for example:

- |      |                                     |                                |                                   |
|------|-------------------------------------|--------------------------------|-----------------------------------|
| [12] | /ˈpeərənt/ ~ /pə'rentəl/            | /dʒə'pæn/ ~ /dʒəpə'niːz/       | /ˈpedənt/ ~ /pɪ'dæntɪk/           |
|      | ( <i>parent</i> ~ <i>parental</i> ) | <i>Japan</i> ~ <i>Japanese</i> | <i>pedant</i> ~ <i>pedantic</i> ) |

There are also cases, less widespread and systematic, where vowel reduction involves the complete loss of the vowel:

- |      |                                   |                               |                                      |
|------|-----------------------------------|-------------------------------|--------------------------------------|
| [13] | /ˈæktə/ ~ /æktərəs/               | /ˈhʌŋgə/ ~ /ˈhʌŋɡri/          | /mə'dɪsənəl/ ~ /ˈmedsən/             |
|      | ( <i>actor</i> ~ <i>actress</i> ) | <i>hunger</i> ~ <i>hungry</i> | <i>medicinal</i> ~ <i>medicine</i> ) |

## ■ Consonant alternations

A number of affixes either trigger consonantal alternation in the base or themselves undergo such alternation. Among the most important of these alternations are the following:

- |        |  |
|--------|--|
| [14] i | NASAL ASSIMILATION/OMISSION: /n/ ~ /m/ ~ Ø   |
|        | <i>inaudible</i> ~ <i>impossible</i> ~ <i>illegal/irrelevant</i>   |
|        | <i>conurbation</i> ~ <i>commixture</i> ~ <i>collateral/correlation</i>   |
| ii     | VELAR SOFTENING: /k/ ~ /s/; /g/ ~ /dʒ/   |
|        | <i>electric</i> ~ <i>electricity</i> , <i>analogous</i> ~ <i>analogue</i>  |
| iii    | ALVEOLAR PLOSIVE VERSUS FRICATIVE: /t/ ~ /ʃ/ or /s/; /d/ ~ /ʒ/ or /z/  |
|        | <i>transmit</i> ~ <i>transmission</i> , <i>hesitate</i> ~ <i>hesitation</i> ; <i>diplomat</i> ~ <i>diplomacy</i> |
|        | <i>invade</i> ~ <i>invasion</i> ; <i>divide</i> ~ <i>divisible</i>   |
| iv     | ABSENCE VERSUS PRESENCE OF PLOSIVE WITH NASAL: Ø ~ /g/ or /b/  |
|        | <i>paradigm</i> ~ <i>paradigmatic</i> , <i>sign</i> ~ <i>signify</i> ; <i>iamb</i> ~ <i>iambic</i>               |

In [i] we have certain prefixes ending in a nasal; the default alternant has alveolar /n/, but this assimilates to /m/ before a bilabial, and drops before /l/ and /r/ (with the spelling having *ll* and *rr*): /rli:gəʌl/, /r'reləvənt/. The negative prefix *in-* shown in [i] is clearly recognisable from its meaning, the prefix *con-* “with” very much less so. ‘Velar softening’, [ii], is the term standardly used for the replacement of the velar plosives /k/ and /g/ by fricative /s/ and affricate /dʒ/ respectively. This alternation applies to a base-final velar before /ɪ/ or /aɪ/; note that the spelling remains unchanged. The alternation in [iii] is between an alveolar plosive and a sibilant fricative; the sibilant generally matches the plosive in voicing, but there may also be devoicing, as (optionally) in *divide* ~ *divisive*. Two cases of [iv] may be distinguished. In the first it applies with bases spelled with final *g* + *mh*: the spoken form has /g/ only when the base is followed by a vowel. In the second case the base is spelled with *mb*: the spoken form again has /b/ only when there is a following suffix such as *-ic*.

These modifications of the base or of the affix itself apply with some affixes, but not with others. Nasal assimilation/omission, for example, does not apply to *un-*: compare *unauthorised*, *unpardonable*, *unlikely/unreasonable* with the examples in [i]. Velar softening occurs before *-ic*, *-ise*, *-ism*, *-ist*, *-ity*, noun-forming *-y* (*analogy*), but not before *-ish*, diminutive *-iey*, or adjective-forming *-y* (cf. *snakish*, *roguish*, *cookie*, *doggy*, *creaky*, *plaguy*). Similarly, the alternation in [iii] applies with *-ion*, *-ible*, noun-forming *-y*, but not with *-able* or *-ing* (cf. *understandable*, *transmitting*). And with [iv] we have /g/ in *signal*, *signatory* but not in *signer* or *signing*, and likewise /b/ in *bombard* but not in *bomber*.<sup>37</sup>

### 5.1.3 Class I and Class II affixes

The last two subsections have introduced a number of logically independent parameters with respect to which affixes can be classified, but there is in fact a very significant correlation between them. We can therefore distinguish two broad classes of affix, I and II, with the following properties:

[15]	Class I	Class II
i Can occur with bound base	Yes	No
ii Affect stress placement	Yes	No: stress-neutral
iii Occupy central or peripheral position	Central	Peripheral
iv Trigger/undergo morphophonological alternation	Yes	No

There is a tendency for Class I affixes to have their etymological source in Latin and the Romance languages and for Class II affixes to have theirs in the Germanic languages. The labels I and II are based on the ordering dimension: from the perspective of building up a complex word in stages from its minimal elements, the Class I affixes are attached first, and hence occupy more central positions than the Class II affixes. The ungrammaticality of the above *\*carefulness* and *\*kingdomous*, then, is attributable to the attachment of a Class I suffix to a base ending in a Class II affix.

It must be emphasised that the correlation between the properties is by no means complete. The division of affixes into Class I and Class II is therefore best thought of

<sup>37</sup>Exceptionally, the inflectional suffixes *-er* and *-est* trigger the appearance of /g/ in the irregular forms *longer/longest*, *stronger/strongest*, *younger/youngest* (see Ch. 18, §3.1); note that such forms as *dumber/dumbest* follow the regular pattern in having no /b/.

as providing an account of the correlation which holds in the default case. Where the various properties match in the way shown in [15] nothing further needs to be said, but cases which diverge from this pattern need to be noted. Stress-neutral *·ise*, for example, occurs before *·ation* in words like *privatisation*, although *·ation* is not stress-neutral. Similarly, stress-neutral *·er* precedes the non-stress-neutral *·ial* in *managerial* – and so on. Some morphophonological alternation differs from the cases presented in [14] in not being associated with Class I affixes. For example, the voicing of the fricatives /v/, /s/, and /θ/ which applies in some irregular inflectional forms, is also found in a few cases of lexical word-formation, as in *thief* ~ *thievish*, *glass* ~ *glazier*, *smith* ~ *smithy*, with triggering by Class II affixes. There are also places where, for historical reasons, a Class II affix is attached to a bound base. For example, we have *gormless* “stupid” but no free base *gorm*: *gormless* was originally *gaumless*, derived by ordinary attachment of *·less* to a dialectal word *gaum* “understanding”.

A second general point to make is that the classification has greater relevance to suffixes than to prefixes. Prefixes that are still productive normally behave like Class II affixes. Prefixes combine less readily than suffixes, so the question of the order in which they occur is of less importance, and since they attach at the beginning of a word they do not affect the position of syllables in the base as final, penult, or antepenult, and hence they have much less effect on the location of the stress. Forms that one might wish to regard as Class I prefixes tend to be of questionable analysability in English, such as *de*, *ex*, *re*, as in such words as *deduce*, *expel*, *refute* – and matters are complicated by the fact that the same orthographic forms are also found as productive Class II prefixes in such words as *debug*, *ex-president*, *repaint*. One reasonably clear contrast is found within the negative prefixes, with *in·* belonging to Class I, *un·* to Class II. We have noted that the nasal assimilation/omission alternation [14i] applies to *in·*, but not *un·*. And *in·*, unlike *un·*, cannot precede a productive (Class II) use of such prefixes as *re·*, etc.: compare *irrefutable* (with *re* unanalysable or Class I) and *\*irrepaintable*.

### 5.1.4 Paradigmatic relations and affix-replacement

So far in this section we have focused on **syntagmatic** relations within derivatives – on the formation of bases by combining two elements, base and affix. But it is also important to consider **paradigmatic** relations – relations of contrast or choice between sets of affixes (or sets of derivatives differing only in their affixes).

#### ■ Affix-replacement

One place where paradigmatic relations are of particular relevance has already been mentioned – the case where a set of affixes are in construction with a bound base, as in:

[16] i	<i>bapt·ise</i>	<i>hypnot·ise</i>	<i>plagiar·ise</i>
ii	<i>bapt·ism</i>	<i>hypnot·ism</i>	<i>plagiar·ism</i>
iii	<i>bapt·ist</i>	<i>hypnot·ist</i>	<i>plagiar·ist</i>

Such forms do not arise independently through the syntagmatic attachment of an affix to a bound base: rather those in [ii] and [iii] are different kinds of nominalisation of the verb in [i]. Compare also *terror·ise*, *terror·ism*, *terror·ist*, where the internal base is free, but where the nouns are semantically related more closely to the verb in *·ise* than to

the nominal base *terror*. The implication is that affixation may involve the replacement of one affix by another rather than simply the independent addition of an affix to a base.

There are in fact a great many places where this kind of derivation seems appropriate. Further examples are given in [17], those in [i] being neo-classical compounds:

[17]	i	a. <i>bigamy</i>	<i>biology</i>	<i>biography</i>	<i>philosophy</i>	<i>kleptomania</i>
		b. <i>bigamist</i>	<i>biologist</i>	<i>biographer</i>	<i>philosopher</i>	<i>kleptomaniac</i>
	ii	a. <i>aggressive</i>	<i>analogous</i>	<i>archaic</i>	<i>compulsory</i>	<i>diary</i>
		b. <i>aggression</i>	<i>analogy</i>	<i>archaism</i>	<i>compulsion</i>	<i>diarist</i>
	iii	a. <i>glory</i>	<i>hilarious</i>	<i>relevant</i>	<i>treacherous</i>	<i>vacant</i>
		b. <i>glorify</i>	<i>hilarity</i>	<i>relevance</i>	<i>treachery</i>	<i>vacancy</i>

In each of the pairs of nouns in [i] the one denoting a person, [b], is plausibly viewed as deriving by affix-replacement from its counterpart in [ia]: *bigamist*, for example, means “someone who commits bigamy”, *biologist* means “scientist working in the field of biology”, and so on.

### ■ The problem of boundaries

Very often the paradigmatic relations between words are clearer than the syntagmatic divisions within them. Take a pair such as *hesitate* and *hesitation*. *Hesitation* is obviously the abstract noun derived from the verb *hesitate*, but its division into base + affix(es) is less obvious. The ICs might be taken as *hesitate* + *ion*, but we might also say that the nominalising suffix is *·ation*, since this is certainly a noun-forming suffix in words like *causation*, *flirtation*, etc.; on this second analysis *·ation* would replace *·ate*, and there are a number of places where *·ate* is quite clearly replaced (cf. *tolerate* ~ *tolerant*, *abominate* ~ *abominable*). Again, the paradigmatic relation between *accurate* and *accuracy* is more salient than the syntagmatic division of the latter into base + affix. A plausible analysis would be *accurate* + *y*, with /t/ modified to /s/ in accordance with the alternation given in [14iii]; but there are a considerable number of nouns ending in *acy* and since this ending clearly has the status of a suffix in *supremacy* it might also be analysed as such in *accuracy*, *obstinacy*, *intimacy*, etc. Precisely because the morphological boundaries may be unclear or indeterminate we will at times refer to the last part of a word as an **ending**, a preliminary term which leaves open the question of whether or not it has the status of a suffix. Endings will be cited without the ‘·’ notation that signals a morphological boundary.

### ■ Paradigmatic dependency relations between affixes

There are also cases where the existence of one type of derivative presupposes the existence of one or more others. Compare, for example:

[18]	i	<i>atheism</i>	<i>egotism</i>	<i>naturalism</i>	<i>plagiarism</i>	<i>spiritualism</i>
	ii	<i>atheist</i>	<i>egotist</i>	<i>naturalist</i>	<i>plagiarist</i>	<i>spiritualist</i>
	iii	<i>atheistic</i>	<i>egotistic</i>	<i>naturalistic</i>	<i>plagiaristic</i>	<i>spiritualistic</i>

There is a tendency for adjectives in *·istic* to occur in sets like those in [18], where there is not only a noun in *·ist* but also one in *·ism*. Exceptions can be found (e.g. *cannibalistic*, *stylistic*), but the tendency is strong enough to confirm that there is a significant paradigmatic relation between these affixes.

### 5.1.5 Spelling alternations

In our description of inflection we presented three rules which affect the final consonant of a base when various kinds of suffix are added: consonant doubling, *e*-deletion, and *y*-replacement (Ch. 18, §2.2). The same rules apply in lexical word-formation, though with somewhat more exceptions.

#### ■ Consonant doubling

A base ending in a simple vowel symbol followed by a simple consonant symbol has the last letter doubled before a vowel provided the base is stressed on the final syllable. The derivatives in [19i] have doubling in accordance with this rule, while the other bases do not satisfy the conditions for application of the rule, those in [iia] having a complex vowel symbol, and those in [iib] having stress on a non-final syllable:

[19]	i	<i>bagg-age</i>	<i>bedd-ing</i>	<i>committ-al</i>	<i>deterr-ence</i>	<i>dogg-ie</i>	<i>fatt-y</i>
		<i>gladd-en</i>	<i>nunn-ery</i>	<i>pigg-ish</i>	<i>pott-er</i>	<i>propell-ant</i>	<i>two-legg-ed</i>
	ii a.	<i>balloon-ist</i>	<i>broad-en</i>	<i>steam-er</i>	<i>wood-en</i>		
		<i>b.human-ist</i>	<i>item-ise</i>	<i>London-er</i>	<i>utter-ance</i>		

As with inflection, the final stress condition is relaxed in BrE for *l*, so that BrE *tranquill-ity* and *travell-er* are distinct from AmE *tranquil-ity* and *travel-er*. We do not have doubling in such words as *a'tom-ic* and *E'ton-ian*, even though the stress falls just before the suffix: it is the position of the stress in the free bases *'atom* and *'Eton* that is decisive.

Exceptions to the consonant doubling rule are relatively few in number. *Johnn-y* and BrE *wooll-en* and *wooll-y* have doubling even though the preceding vowel symbol is complex. Bases with unstressed *·gram* have doubling in such derivatives as *diagrammatical* and *epigrammatic* (as also in BrE inflectional *diagrammed*) – contrast regular *problematic*. With some bases in stressed *·fer* we have variant spellings with and without doubling: *inferable/inferable*, *transferable/transferrable*. *Preferable* has no variant with doubling, though it can be stressed on either the first or second syllable. The recent nonce-word *fattism* has an irregular variant without doubling, *fatism*. And the BrE extension of *l* doubling to unstressed syllables mentioned above does not apply in such words as *equal-ity* or *verbal-ise*.

#### ■ E-deletion

Mute *e* is generally deleted before a vowel-initial suffix. The application of this rule with a range of different suffixes is illustrated in:

[20]	<i>abus-ive</i>	<i>believ-able</i>	<i>bibl-ical</i>	<i>captiv-ity</i>	<i>cliqu-ish</i>	<i>compos-ure</i>
	<i>coupl-ing</i>	<i>creat-ion</i>	<i>driv-er</i>	<i>fam-ous</i>	<i>forc-ible</i>	<i>Gladston-ian</i>
	<i>hast-en</i>	<i>lodg-ing</i>	<i>pop-ery</i>	<i>refus-al</i>	<i>restor-ation</i>	<i>Rom-an</i>
	<i>satir-ise</i>	<i>serv-ant</i>	<i>statut-ory</i>	<i>stor-age</i>	<i>tru-ism</i>	<i>typ-ist</i>

Mute *e* is a base-final *e* that is neither a vowel symbol itself (as it is in *be*) nor part of a composite vowel symbol like that in *canoe*. With such composite vowel symbols, *e* is generally deleted from *ue*, just as in inflection: *argu-able*, *constru-able*, *continu-ation*, *devalu-ation*, etc. *Blue* and *glue* retain the *e*, however, in *blue-y* and *glue-y*; this avoids the *uy* sequence which characteristically corresponds to /aɪ/ – compare *blu-ish*, where there is no comparable motivation for retaining the *e*. Other composite vowel symbols are rarely found before derivational suffixes, but we may note the different treatments of *oe* in *obo-ist* and *canoe-ist*.

### Deletion of *e* before a consonant

A few words have mute *e* exceptionally deleted before a consonant-initial suffix. Such deletion is obligatory in *du·ly*, *tru·ly*, *whol·ly*, and *aw·ful*, optional in *abridg·ment*, *acknowledg·ment*, *judg·ment*, and *fledg·ling*. Note that with *awful*, and to a lesser extent *duly*, the semantic connection with the base is tenuous, while the base *fledge* is rarely used on its own.

### Retention of *e* before a vowel

Derivatives where mute *e* is optionally or obligatorily retained before a vowel are more numerous. Examples of various types are given in:

- [21] i *enforceable*, *peaceable*; *changeable*, *manageable*, *marriageable*; *courageous*  
 ii *hireable*, *likeable*, *moveable*, *nameable*, *rateable*, *saleable*, *sizeable*, *timeable*  
 iii *cagey*, *gamey*, *grapey*, *holey*, *horsey*, *matey*, *phoney*, *pricey*  
 iv *acreage*, *mileage*; *ageism*

In [i] *e* follows *c* or *g* and is obligatorily retained before *a* and *o*. The bases concerned are pronounced with final sibilants /s/ and /dʒ/, and the motivation for keeping the *e* is that dropping it would give the sequences *calco* and *ga/go*, where *c* and *g* characteristically correspond to the plosives /k/ and /g/. Most derivatives to which this rule applies have the *·able* suffix, but there are other *·able* derivatives where *e* is optionally retained in BrE, as in [ii]. Most of these words have monosyllabic bases with long vowels or diphthongs, as with all those cited in [ii]; a few departing from this pattern are also found, such as *liveable* and *mistakeable*. The other suffix where a fair number of bases retain *e* is *·y*, as used in forming denominal adjectives, as in [iii]; again the bases are monosyllables with long vowels or diphthongs. All have variant spellings without *e*, except for *holey* (“with holes in”), which *e* distinguishes from the homophonous *holy* (“sacred”). In [iv] we give a miscellaneous set of other exceptions; for the last two the regular spellings *milage* and *agism* are also found, and are the usual forms in AmE.

### Deletion of *e* in compounds

The three spelling alternations normally apply in derivatives but not in compounds. *E*-deletion, however, is seen in *wherever* and the rare *whosever* – compare *whereabouts*, *wherein*, *whereof*, *whereupon*, etc., with a vowel letter other than *e* in the second base.

## ■ Y-replacement

A base-final *y* that itself constitutes a simple vowel symbol is normally replaced by *i* before suffixes that do not begin with *i*:

- [22] *apply* ~ *appli·cant*      *carry* ~ *carri·age*      *comply* ~ *compli·ance*  
*deny* ~ *deni·al*      *duty* ~ *duti·able*      *embody* ~ *embodi·ment*  
*glory* ~ *glori·ous*      *kindly* ~ *kindli·ness*      *likely* ~ *likeli·hood*  
*mercy* ~ *merci·less*      *plenty* ~ *plenti·ful*      *pretty* ~ *pretti·ly*

The *y* is retained in derivatives like *betray·al*, *pay·able*, *joy·ful*, where it is part of a complex vowel symbol, and in *busybody·ism*, *fairy·ism*, *Tory·ism*, etc., where the suffix begins with *i*, so that retention of *y* avoids the rare sequence *ii*. In addition *y* is exceptionally retained in a handful of words where the normal conditions for replacement are satisfied:

- [23] *baby·hood*; *busy·ness*; *fairy·dom*, *gipsy·dom*, *puppy·dom*; *lobby·ward*

*Babyhood* contrasts with regular *likelihood*, but there are no established examples where *·dom* and *·ward* trigger *y*-replacement. The *y* is retained in *busyness* to distinguish this nominalisation of *busy* from the highly lexicalised *business*.

In addition to derivatives like those in [22] where a spelling rule replaces the letter *y* by *i*, there are a considerable number where we have morphological replacement of base-final *y* by a suffix beginning with *i*, as in *pretty* ~ *prettify*, *military* ~ *militar-ist*, *scrutiny* ~ *scrutin-ise*, etc.

## 5.2 Evaluative morphology

### 5.2.1 Diminutives

The term **diminutive** applies to affixes which indicate small size and also, by extension, ones which (additionally or instead) mark the off-spring of animals, affection or informality, resemblance or imitation.

#### ■ *·ette*

This suffix marks small size in such words as *kitchenette*, *statuette*, *novelette* (often derogatory), *cigarette* (with specialisation of meaning). It can also indicate imitation, as in *flannelette*, *leatherette*, or female sex, as in *usherette* and *suffragette*.

#### ■ *·ie/y*

This is the most productive of the diminutive markers in Present-day English, especially in Scottish, Australian, and New Zealand varieties. It is found in numerous hypocoristics (pet names): *Billy*, *Betty*, *Jimmy*, *Susie*, etc. Secondly, it is commonly used in language spoken to or by children: *granny*, *daddy*, *doggie*, *piggy*, *sweetie*, etc. In both these cases the role of the suffix is to mark emotional attachment rather than small size.<sup>38</sup> In some words it serves to form a noun from an adjective (*brownie*, *goodie*, *softy*) or from a verb (*cookie*). This suffix is also found in many embellished clippings: *broly*, *hanky*, *nightie*, *tummy*, *undies*; in such cases, as also in the recent coinages *druggie*, *greenie*, *groupie*, it contributes to marking the informal style, often adding derogatory connotations.

#### ■ *·ish*

- [24] i *baldish*, *bluish*, *coldish*, *largish*, *narrowish*, *sickish*, *stupidish*, *youngish*  
 ii *bookish*, *boyish*, *brutish*, *fiendish*, *foolish*, *modish*, *prudish*, *sheepish*, *waspish*

In [i] *·ish* attaches to an adjective to form another adjective with the meaning “approximately/somewhat ~”. The same meaning applies when it is added to numbers: *tennish*, “about ten” (especially for times and ages: “about ten o’clock, about ten years old”). In [ii] *·ish* forms denominal adjectives with the meaning “resembling ~ in some way”. Uses [i] and [ii] are both still productive. For the non-diminutive *·ish* of *Danish*, etc., see §5.6.1.

#### ■ *·let* and *·ling*

These noun-forming suffixes are now only marginally productive, if at all. The first indicates small size in *booklet*, *flatlet*, *ringlet*, *tartlet*; it is used with a few animal names to denote offspring (*piglet*, *eaglet*) or a small variety (*auklet*). This suffix is occasionally

<sup>38</sup>Small size may be concomitantly involved in *piggy*. *Pinkie* (mainly AmE and ScotE) means “little finger, i.e. the smallest in the hand”, but the base *pink* itself means “small” (not “finger”).

found with other meanings (e.g. in *eyelet* it is probably best glossed as “resembling ~”, though an eyelet is also small), but the *·let* of *anklet*, *wristlet*, etc., is probably a different (and non-diminutive) suffix.

The suffix *·ling* is used to indicate small or young animals: *codling*, *duckling*, *gosling* (with phonological modification of *goose*), *spiderling*; compare also *nurseling*, *suckling*, and, for plants, *sapling*, *seedling*. Applying to adult persons it indicates contempt: *princeling*, *squireling*, *hireling* (with a verb rather than noun as base), *weaking* (adjective as base).

#### ■ *micro·* and *mini·*

These are both productive elements, used only to indicate small size:

- [25] i *mini-budget*, *minibus*, *minicab*, *minigolf*, *minipill*, *mini-series*, *miniskirt*  
 ii *microchip*, *microcosm*, *micrometer*, *microorganism*, *microscope*, *microwave*

*Mini·* is a relatively new prefix, formed by clipping from *miniature*. *Micro·* is a combining form, as evident from its ability to form compounds with such final combining forms as *cosm*, *meter*, *scope*, *phone*. But it combines readily with ordinary free bases like *cassette*, *film*, *processor* and hence is one of the combining forms that are very much like prefixes. *Micro·* indicates a significantly greater degree of smallness than *mini·*, as evident from one of the few cases where they appear with the same base: *microcomputer* and *minicomputer*.

#### ■ *·o*, *·a*, *·er*, *·s*, and irregular diminutives

We take these together as they occur in what we have called embellished clippings (§2.3.2 – cf. also *·ie* above). The first is particularly common in AusE: *arvo* (← *afternoon*), *compo* (← (*worker's*) *compensation*); but it is also found more generally: *aggro* (← *aggravation*), *ammo* (← *ammunition*). As we noted, the use of this suffix has as much to do with rhythm and decoration as with the expression of emotional attitude. The minor variant *·a* is virtually restricted to proper names: *Gazza* (← *Gascoigne*). The *·er* is seen in *rugger* and *soccer*, but more often occurs in combination with *·s*: *preggers* (← *pregnant*), *Twickers* (← *Twickenham*).

The suffix *·s* also occurs after diminutive *·ie* in such playground words as *onesies*, *twosies*, *widesies*: it is doubtful whether it is here marking plural number. In addition it is found in various terms of address, such as *ducks* or *Pops*. Finally, there are some totally irregular diminutives characteristic largely of baby-talk such as *drinky-poo*, *teeny* (as a variant of *tiny*), and the rhyme-motivated *teeny-weeny*.

#### ■ *·een*, *·en*, *·(e)rel*, *·et*, *·(i)kin*

These suffixes have been used with diminutive force during the history of English, but many of the resultant words are no longer morphologically analysable: *colleen*, *kitten*, *doggerel*, *scountrel*, *bullet*, *bumpkin*. The *·een* suffix is recognisable with the “imitation” meaning in a few words like *velveteen* and *sateen* (with modification of the base *satin*), while *·en*, *·erel*, *·et*, *·(i)kin* are separable in *maiden*, *cockerel*, *baronet*, *lambkin*, *manikin*.

### 5.2.2 Augmentatives

Augmentatives typically indicate large size or high – often excessive – degree. In all the types presented below, the augmentative marker occupies initial position, whether as prefix or first component of a compound.

### ■ *arch-* and *archi-*

The prefix *arch-* (/ɑːˈtʃ/) attaches primarily to nouns denoting humans. It can mean “chief, highest-ranking”, as in *archbishop*, *archdeacon*, *archduke*. It is also used as an intensifier, “extreme”, where it normally has very negative connotations: *arch-criminal*, *arch-hypocrite*, *arch-villain*. In this sense it is still productive, witness such recent formations as *archmonetarist*. *Arch(i)* (/ɑːˈki/) is the corresponding combining form: *archidiconal*, *archiepiscopacy*, and (with omission of the *i*) *archangel*.

### ■ *macro-*

This is a combining form with the meaning “large” or “on a large scale”: *macrocephalic*, *macrocosm*, *macroscopic* (“large enough to be seen by the naked eye”), *macro-economics*. There are not many established words with this combining form, but it is currently productive, being found in such recent coinages as *macrochange*, *macrocontract*, *macroscale*.

### ■ *maxi-*

This prefix, contrasting with *mini-*, flourished in the 1970s as the fashion for the minidress waned. It is used primarily of clothes, as in *maxicoat*, *maxidress*, but also came to mean “large” as in *maxi-series*, *maxi-taxi*, *maxi-yacht*.

### ■ *mega-*

This combining form means “of a very large size or number”, as in *megalith*, *megacephalic* (an alternant of *macrocephalic*), or in scientific usage “a million”, as in *megabyte*, *megaton(ne)*, *megahertz*. In recent years it has become very productive in colloquial style: cf. *megaschool*, *megabucks*, or, with the meaning of an intensifier (“extremely”), *megaswish*. For some speakers it has been converted into an adjective of approbation, able to be used predicatively: %*It's really mega!*

### ■ *out-*

One use of *out-* is to produce compound transitive verbs incorporating a comparative meaning of “exceed, surpass”. It generally combines with nouns ([26i]) or verbs ([26ii]):

- [26] i *outclass*, *outdistance*, *outgun*, *outnumber*, *outpace*, *outrank*, *outwit*  
 ii *outdo*, *outfight*, *outlast*, *outlive*, *outperform*, *outrun*, *outshine*, *outweigh*

In general, those formed from nouns mean “have higher/better/more ~ than”, and those formed from verbs mean “~ better/more/longer than”, but there is a good deal of lexicalisation and specialisation of meaning. For example, *outshine* means “surpass in excellence”, *outweigh* “have greater importance/influence than”, *outdistance X* “get far ahead of X”, and so on. *Outsmart* is exceptional in having an adjective as the second base, and *outsize* in being itself an adjective.

### ■ *super-*

In its augmentative sense this prefix is currently very productive. It combines with adjectives [27i] or nouns [27ii], the usual meaning being approximately “very large/great (in size or power)” or “greater than ~”:

- [27] i *superfast*, *superhuman*, *supernatural*, *super-rich*, *supersensitive*, *supersonic*  
 ii *supercomputer*, *superglue*, *superhero*, *superhighway*, *superman*, *supermarket*, *superphosphate*, *superpower*, *superset*, *superstar*, *superstate*, *supertanker*

### ■ *hyper-*

Etymologically speaking, *hyper-* is the Greek cognate of Latin *super-*, but while *super-* is a prefix, *hyper-* is a combining form, as can be seen from such technical words as *hyperaemia*, *hyperon*, *hyperosmia*, *hypertrophy*. Compounds in *hyper-* commonly have the meaning “excessive(ly) ~”, as in the adjectives *hyperactive*, *hypercritical*, *hypersensitive*, and the noun *hypertension*.<sup>39</sup> It can also mean “very large”, and can then be in competition with *super-*, as in *hypermarket*, which denotes something bigger than a supermarket. In recent computing jargon *hypertext* is used to indicate complex organisation of data in a database.

### ■ *ultra-*

One sense of *ultra-*, matching its Latin origin, is “beyond”; this is found primarily in scientific terms such as *ultrasound*, *ultraviolet* (but cf. also *ultramarathon* “footrace beyond the distance of a marathon”). In general usage, however, it has come to mean “extreme, excessive”; in this sense it has quite a high degree of productivity, attaching mainly but not exclusively to adjectives: *ultraconfident*, *ultraconservative*, *ultrafashionable*, *ultramilitant*, *ultramodern*, *ultrarational*, *ultraroyalist*, *ultraviolent*.

## 5.3 Gender-marking morphology

Gender is morphologically marked in nouns denoting females, human or animal, much more than in nouns denoting males. For this reason gender-marking is widely perceived as one of the areas where the language displays a sexist bias, and campaigns for linguistic reform from around the 1970s have certainly brought about a change in attitudes and usage, so that – especially with nouns denoting human occupations – many speakers now to a large extent avoid the use of gender-marked human nouns in favour of ones that are gender-neutral.

### ■ *-ess*

For most of the history of English this suffix has been the preferred marker of feminine gender in human nouns. *Lioness* and *tigress* are common terms for female animals, but apart from these the suffix is rarely used for non-humans.

We can distinguish two classes of human *-ess* words according as the unmarked counterpart applies to males alone or to both males and females (though there are differences within this second class as to how readily or acceptably the unmarked form can be used of females):

- [28] i *abbess, countess, duchess, empress, princess*  
 ii a. *actress, authoress, manageress, poetess, sculptress, stewardess, waitress*  
 b. *adulteress, heiress, hostess, jewess, murderess, negress, villainess*

The forms in [i] derive from *abbot, count, duke, emperor, prince*, which are restricted to males: an abbess is not an abbot, nor a countess a count, and so on. These *-ess* forms are generally considered unobjectionable. The unmarked counterparts of the derivatives in [ii] can be used of women as well as men: an authoress, for example, is an author, and a manageress is a manager. The forms in [iia] denote professions/occupations, an

<sup>39</sup>Note the semantic specialisation in the linguistic term *hypercorrect*, which involves excessive striving for correctness that leads in fact to incorrectness.

area where the case for avoiding discriminatory terms is particularly compelling: the marked term suggests some difference in status, and may imply lower standards or achievement. This is particularly clear in the case of *authoress*, *poetess*, *sculptress*, and the like; these indeed have long been recognised as disparaging terms and are rarely used. The same kind of objection can be levelled against such words as *manageress*, *stewardess*, or *ambassadress*. *Waitress* is a marginal member of class [ii] in that the unmarked *waiter* is predominantly used for males: for this reason the marked *waitress* is not easily avoidable and hence remains quite common. Gender-differentiation in the *actor* ~ *actress* pair is motivated by the fact that males and females normally play different roles; note also that while *actor* is readily applied to women when used predicatively (*She is an excellent actor*) or with a proper name appositive (*the actor Penelope Harcourt*), the singular form is not so often used referentially of a woman (*An actor who had just joined the company expressed her support for the beleaguered director*).

Among the forms in [28iib], *jewess* and *negress* risk being perceived as involving both sexual and racial bias, and hence now tend to be avoided in most contexts. One salient use of *heiress* is in the context of marriage, as in *He was hoping his brother would marry a good Irish heiress*: in such contexts the gender feature is obviously highly relevant, and substitution of the unmarked *heir* would scarcely be possible, though it would be quite normal in examples like *She was now (sole)heir to her father's vast fortune*. We should note, finally, that there are one or two derivatives like *governess* where semantic specialisation has applied to the *-ess* form but not to the unmarked counterpart: *governor* is a dual gender noun, but a *governess* is not a *governor*.

As far as the morphology is concerned, a good number of the bases to which *-ess* is attached have the *-er* suffix. The /ə/ of this suffix is often dropped (*actress*, *ambassadress*, *conductress*, *tigress*, *waitress*), but in some cases it is retained (*manageress*). With bases ending in *er-er*, the *-ess* replaces the final *-er*: *adulteress*, *murderess*, *sorceress*.

#### ■ *-ette*, *-ine*, and *trix*

We deal with these together as minor members of the set of feminine markers. The *-ette* suffix is relatively recent, the earliest attested use of it for gender-marking apparently being in *suffragette* at the beginning of the twentieth century (with *-ette* replacing the gender-neutral suffix *-ist*). Apart from this, the only place where it may still be used as an emotively neutral feminine suffix is *usherette* – and perhaps (*drum-*)*majorette* in AmE. Such words as *undergraduette* are now obsolete. However, *-ette* has retained some degree of productivity in the formation of such pejorative nonce-words as *editorette*, *reporterette*, *jockette* (from *jockey*), where the disparaging tone is connected with the primary use of *-ette* as a diminutive marker (§5.2.1) – compare *bimbette*, where in current usage the clearly derogatory base *bimbo* is itself virtually restricted to females.

The suffix *-ine* is found in a number of feminine proper names such as *Bernadine*, *Clementine*, *Pauline*. In common nouns it is clearly analysable as a gender marker in *heroine*; this has provided the basis for such relatively recent coinages as *chorine* (“chorus-girl”), but they have generally been short-lived. The ending *trix* occurs only in a handful of loanwords, especially legal terms – *administratrix*, *aviatrix*, *executrix*; all have gender-neutral counterparts ending in *tor*: *administrator*, etc. Though we have cited the form as *trix*, it is probably best analysed as a suffix *-ix* added to the ending *tor*, with dropping of the /ə/.

### ■ *he-/she-* compounds

These pronouns are used as gender-markers in such animal terms as *he-goat* and *she-ass*. This type of compounding is still productive, but the resultant forms rarely become established. The pronouns are also found in a few lexicalised human nouns: *he-man*, *she-devil* (where we may note that the former generally involves positive evaluation, the latter obviously negative).

### ■ *·man/·woman* compounds

Compounds in *·man* mostly fall into one of the three types illustrated in:

- [29] i *Englishman, Frenchman, Scotsman; businessman, policeman*  
 ii *doorman, fireman, infantryman, milkman, workman*  
 iii *chairman, ombudsman, spokesman*

In [i] the *man* element clearly introduces two components of meaning “person” and “male”: a female can’t be an Englishman or a businessman, etc. These words all have established feminine counterparts in *·woman*: *Englishwoman, businesswoman*, etc. The compounds in [ii] are likewise restricted to males but differ from those in [i] in that they do not have established feminine counterparts. They are occupational terms and the absence of feminine counterparts reflects the fact that in the past the jobs concerned were normally performed exclusively by males. The linguistic form of these compounds makes them discriminatory terms, and recognition of this fact has led to a reduction in their use, especially in the field of labour relations and recruitment. In the *Dictionary of Occupational Titles* published by the US Department of Labor in 1977, for example, all such terms were dropped in favour of gender-neutral terms: *firefighter* instead of *fireman*, and also *police officer* instead of the paired forms *policeman* and *policewoman*.

The compounds in [29iii] are commonly defined in dictionaries in terms that make no reference to gender: “the presiding officer of a meeting, committee, board, etc.”, “someone who works for a government or large organisation and deals with the complaints made against it”, “a person who is asked to speak as the representative of other people”. Such definitions reflect the usage where these terms, unlike those in [i–ii], are applied to women as well as to men: <sup>%</sup>*They’ve asked her to stay on as chairman*; <sup>%</sup>*The chairman used her casting vote to defeat the motion*; <sup>%</sup>*Madam Chairman*. The apparent loss of the “male” meaning here may have been facilitated by the phonological reduction of /mæn/ to /mən/, but it is nevertheless evident that these words are not genuinely gender-neutral terms.<sup>40</sup> Their connection with the independent word *man* is transparent in writing, reflected in the irregular plural form in *·men* and reinforced by the fact that the great majority of compounds in *·man* do have “male” as part of their meaning (as seen in [i–ii]). This incontestably gives them a strong bias towards males: they are likely to be interpreted, consciously or unconsciously, as conveying that in the absence of indications to the contrary, the holder of the office is male. These terms, particularly *chairman*, have been one of the main foci in the campaign against sexual discrimination in language, and many organisations and individuals now avoid them, while manuals of usage commonly recommend against *·man* forms other than in specific reference to males.

<sup>40</sup>It is sometimes suggested that as a result of the phonological reduction *·man* has effectively come to have the status of an affix rather than being a base in a compound – compare the relation between the suffix *·ful* and the word *full* (§5.8). However, the fact that in many words *·man* contrasts with *·woman* is compelling evidence against its classification as an affix. One word in which the vowel remains unreduced is *caveman*.

*Chairman* and *spokesman* have established counterparts in *·woman*, but since there is often no reference to any particular person, the need is for a genuinely gender-neutral term. Compounds in *·person* have been coined for this purpose, with *chair* an alternative preferred by many in the particular case of the first item. The pseudo-neutral sense of *·man* compounds seems to be more widely maintained in words formed by suffixation from the compound bases – words such as *chairmanship*, *gamesmanship*, *marksmanship*, *sportsmanlike*,<sup>41</sup> *workmanlike*. And there is one ordinary compound, *freshman*, that continues to be usually interpreted as applicable to females as well as males (though BrE tends to prefer *fresher*): *They decided to get married at the end of their freshman year.*

*Man* also occurs as the first component of compounds. In a few cases like *manservant* it has the “male” meaning, but more often it has the pseudo-neutral sense, so that such words as *manhole*, *mankind*, *manpower*, *manslaughter* again raise the issue of sexual bias in language. *Mankind*, in particular, is now commonly avoided in favour of *humankind*, though the high degree of lexicalisation in *manslaughter* makes this more resistant to change. *Woman* as first element is less clearly integrated into word structure. It may be written as a separate word or with hyphenation: *woman doctor* or *woman-doctor*. The same applies to *lady*, though the connotations of this term make it more restricted in its collocational range. For example, *lady-doctor* is often used (though found objectionable by some), but we do not find *lady-priest*.

## 5.4 Location in space and time

We have seen (Ch. 8, §7.1) that prepositions can often be used to indicate position in both space and time: *at the gate* or *at noon*, *in the lake* or *in the afternoon*, *on the roof* or *on the next day*, and so on. Prefixes, too, commonly have both a spatial and a temporal use, though there are some (as is again the case with prepositions) that are restricted to one or the other sphere. This section reviews these spatial and temporal uses of prefixes and initial combining forms, together with various extended uses where the locations are interpreted metaphorically. As with so much of English word-formation, we find elements with different etymologies (English, Latin, Greek) being used in rather different ways.

### ■ In front and before: *ante-*, *fore-*, *pre-*

*Ante-*, Latin in origin and not very common, is used with spatial meaning mainly in architectural terms like *antechamber* or *anteroom*, while its temporal meaning is found mainly with adjectives such as *antediluvian*, *antenatal*, *antenuptial*, *antepenultimate*.

*Fore-* is of English origin and is never attached to Latin bases, and rarely to French ones; it is probably no longer productive. The spatial meaning is found with noun bases, as in *forecourt* or *foreground* – especially ones denoting parts of the body or of a ship: *forearm*, *forefinger*, *forehand* (with semantic lexicalisation), *forehead*, *forelock*, *fore-skin*; *foredeck*, *foremast*. The temporal meaning is found with verbs, as in *forebode*, *foresay*, *foretell*, *forewarn*, and with nouns, mainly but not exclusively deverbal ones: *forefather*, *foresight*, *forethought*.

<sup>41</sup> *Sportsman* itself has two senses. With the sense “man who engages in sport” it belongs in group [29i], with *sportswoman* as its feminine counterpart. With the sense “one who exhibits qualities highly regarded in the world of sport” it belongs in group [iii], and here there is as yet no well established genuinely neutral term.

*Pre-* is of Latin origin and words like *precede* and *predict* are of questionable analysability. But *pre-* occurs with many free bases and is much more widely used than *ante-* or *fore-*. In some words the pronunciation /pri/ is replaced by /pre/ or /pɹi/, as in *premature* and *prescribe*, but these are not productive patterns. The most common use, clearly still productive, is temporal, where we have verbs (*pre-cook*, *prejudge*, *pre-ordain*, *pre-record*), adjectives (formed from adjectives, as in *pre-marital*, *pre-Raphaelite*, *pre-scientific*, or from nouns, as in *pre-AIDS*, *pre-war*), and nouns (*preconception*, *pre-condition*, *pre-school* “school for children below the age at which compulsory education starts”). The spatial “in front of” sense appears particularly in technical terms like *premolar* and *pre-scrutum*. *Pre-* can also mean “before” in the transferred sense of “ahead of, better than others”: *pre-eminent*, *prepotent*.

#### ■ Behind and after: *after-* and *post-*

The preposition *after* combines almost exclusively with nouns, forming compounds like *after-care*, *after-life*, *afterthought*. These examples are all hyponymic: *aftercare* is a type of *care* – *care* given after something else. *Afternoon* is non-hyponymic: *noon* is interpreted like the complement of the preposition, so that the whole denotes the period following noon. In all of these the meaning is temporal, as also in the intransitive preposition *afterwards* and the adjective *aftermost*. The spatial sense is found in a few anatomical and nautical terms: *afterbrain*, *afterdeck*.

The prefix *post-* is the opposite of *pre-*, and like the latter is most commonly used with a temporal sense. It forms verbs (*post-date*, *postsynchronise*), adjectives (again formed either from adjectives, as in *post-classical*, *post-nuptial*, or from nouns, as in *post-war*), and nouns (*post-communion*, *postgraduate*). The relatively rare and technical spatial use is seen in *post-ocular*. This prefix is clearly still productive, witness its occurrence in the names of various modern intellectual movements: *post-feminism*, *post-modernism*, etc.

#### ■ Around: *circum-* and *peri-*

The prefix *circum-* is used only with words of Latin origin and has only a spatial sense, attaching mainly to adjectives (*circumpolar*) and verbs (*circumnavigate*). A high proportion of words with this prefix, however, have bound bases and are semantically somewhat opaque, so that they are not obviously analysable in English: *circumcise*, *circumscribe*, *circumspect*, *circumstance*, *circumvent*, etc.

*Peri-* is a combining form which likewise has only the spatial sense. It is used only in scientific and learned words, combining with classical bases. A few of these coincide with English words, as in *pericranium* or *perinatal*, but more often they are bound: *pericarp*, *perigee*, *perihelion*, *perimeter*.

#### ■ Above and over: *over-*, *super-/supra-*, *sur-*

The prepositional base *over-* occurs with a range of spatial meanings comparable to those it has as a separate word: *overarch* (“form arch over/above”), *overcoat* (“coat worn over / on top of another”), *overturn* (“cause to fall over / to an inverted position”), and so on. Much the most common meaning in compounds, however, is “to excess”. In this sense it attaches mainly to adjectives (*over-eager*, *over-zealous*) and verbs (*over-charge*, *over-eat*).

The prefixes *super-* and *supra-* are variants in Latin. *Super-* has spatial meaning (“above, on top of”) mainly in scientific words: nouns (*superaltar*, *superstratum*, *superstructure*) or

adjectives (*superglacial*, *superjacent*, *supermarine*). More often it expresses high degree/size/power (*super-rich*, *supercomputer*) or powers that go beyond those associated with the base (*superhuman*): this use has been covered in our discussion of augmentatives. The “excessively” meaning noted for *over-* is sometimes found, but it is much less prevalent. Compare, for example, *overheat* with the technical term *superheat* (“heat (a liquid) above its boiling-point without vaporisation”); in *super-sensitive* it can mean either “extremely” or “excessively”, whereas *over-sensitive* has only the latter meaning. *Supra-* is much less common, and generally attaches to adjectival bases; the spatial sense is seen in technical terms such as *supraorbital*, *suprarenal*, while the “beyond, transcending” sense applies in *supranational*. The Greek equivalent, *hyper-*, discussed in §5.2.2 above with the augmentatives, is not used with a spatial sense; in some cases, as we saw, it has the “excessively” meaning: *hyper-sensitive*, for example, is equivalent to *over-sensitive*.

The prefix *sur-* is found in very few words, mostly borrowed directly from French. In some cases it has a spatial meaning, as in *surtitled* and one sense of *surmount*, but more often it indicates “going beyond, exceeding” in a non-spatial sense (*surpass*, *surreal*) or “additional” (*surcharge*, *surtax*).

#### ■ Below, underneath: *hypo-*, *infra-*, *sub-*, *under-*

The combining form *hypo-* is the Greek opposite of *hyper-*, but is not used in English formations outside the scientific sphere, where it is mainly used in a spatial sense, as in *hypodermic* “introduced beneath the skin”. The common terms *hypocrisy* and *hypochondria* are loans where the connection with the spatial sense is purely etymological.

*Infra-* is an uncommon prefix of Latin origin. It is used with a spatial sense contrasting with *supra-* in such words as *infraorbital*, *infrarenal*. It occasionally contrasts with *ultra-*, as in *infrasonic*. The two most common words are the lexicalised *infra-red* and *infrastructure*.

The spatial meaning of the much more widely used prefix *sub-* is seen in *subjacent*, *suborbital* (= *infraorbital*), *subterranean*, *subway*. There are a considerable range of extended senses, such as “less than” (*subhuman*, *subnormal*), “lower in rank/importance” (*subdean*, *sublieutenant*, *sub-editor*), “lower in a hierarchy of classes” (*subbranch*, *subclass*, *subdivision*, *subheading*).

*Under-* is a prepositional base contrasting with *over-* and forming compounds with a range of senses overlapping those of *sub-*. There is a tendency for *sub-* to prefer Latinate bases and *under-* other bases. The spatial sense of *under-* is seen with nominal and verbal bases in *underclothes*, *underground*, *undergrowth*, *underlie*. Matching the “lower rank” sense of *sub-treasurer* we find *under-clerk*, *under-secretary*, and the like. But, unlike *sub-*, *under-* is commonly found with the sense “inadequately/insufficiently”, attaching to verbs, as in *undercharge*, *underestimate*, *underexpose*, *undervalue*.

#### ■ Inside, internal: *endo-*, *in-*, *intra-*, *mid-*

*Endo-* is a combining form of Greek origin having the spatial sense “internal”; it occurs in technical terms such as *endogamy*, *endoplasm*, *endoskeleton*.

Prepositional *in-* is sometimes used as a compound element, nearly always with monosyllabic bases (*income*, *indoor(s)*, *inflow*, *inroad*, *insight*) or with gerund-participle and past participle forms of monosyllabic verbal bases (*inbreeding*, *incoming*, *infighting*, *ingrowing*, *indebted*). This pattern is still productive (*in-car*, *in-country*, *in-patient*), but

recent formations are often based on the use of *in* to mean “fashionable, chic”, as in *Motorcycle jackets are in this year* – cf. *in-crowd*.

*Intra·*, a prefix of Latin origin, has only a spatial meaning, and is used exclusively in the formation of adjectives. It often contrasts with *supra·*, *infra·*, and *extra·*, mainly in technical terms: *intracranial*, *intramural*, *intravenous*. While this use is still productive (cf. *intracloud*), recent formations tend to contrast with forms in *inter·* – cf. *intragovernmental*, *intrastate*.

The prefix *mid·* has a more specific meaning: “in the middle of”. It attaches mainly to nouns, but is also found with adjectives, as in *mid-Victorian*. The spatial sense is seen in *midbrain*, *midship*, *midstream*, the temporal one in *mid-career*, *mid-morning*, *mid-September*, and in the semantically specialised *midday*, *midnight*, *midsummer*.

#### ■ Outside, external: *ex·/exo·*, *extra·*, *out·*

*Exo·* is a combining form of Greek origin contrasting with *endo·* and having the spatial sense “external”. Like *endo·*, it is restricted to technical terms: *exogamy*, *exoplasm*, *exoskeleton*.

*Ex·* is the corresponding prefix of Latin origin. The spatial sense is found in only a few words, such as *extraterritorial* (less common than *extraterritorial*), *exurb* (cf. *suburb*), and perhaps *ex-directory*. With the temporal meaning “former”, however, *ex·* is very productive: *ex-husband*, *ex-president*, etc.; it is the source for the informal converted noun *ex*, “former spouse/partner”.

The prefix *extra·* contrasts with *intra·* and forms comparable technical terms: *extracranial*, *extramural*, *extravehicular*, or, with a somewhat extended sense, *extramarital*, *extrasensory*.

Prepositional *out·* occurs with the meaning “outside” or “outward” in such compounds as *outcast*, *outdoor*, *outhouse*, *outlaw*, *out-patient*, *out-tray*. But its most frequent and productive use is with the sense “exceeding/excelling”, as in *outclass*, *outlast*, *out-number*, *outstare*, etc., as discussed in §5.2.2.

#### ■ Between: *inter·*

The spatial sense of this prefix is found in such words as *intergalactic*, *interstellar*, and scientific terms like *interdigital*, *intermolecular*. Besides simple location, there may be movement from one to another of the places specified in the base, as in *inter-city* (*express*), *interplanetary* (*travel*). The temporal sense is illustrated by *interglacial*, *inter-war*. In addition, *inter·* often indicates reciprocal action or mutual involvement: *interact*, *intercommunicate*, *interdependency*. It contrasts with *intra·*, and the two are often coordinated, as in *inter- and intra-departmental* (*projects*).

#### ■ Beyond, through: *meta·*, *trans·*

The “beyond” meaning is associated with a number of forms already discussed: *over·*, *super·*, *out·*, and also *ultra·* (covered under the augmentatives, but cf. also *ultra-violet*).

*Meta·* is a combining form (as is evident from such compounds as *metaphor* or *metazoa*) with a number of different meanings. In anatomical and zoological terms it commonly indicates “at the back, behind, beyond”: *metathorax*, *metacarpal*. It may indicate change (of condition, etc.), as in *metamorphosis*. One clearly productive use is in the names of sciences such as *metabiology*, *metachemistry*, *metapsychology*: the subject

matter here goes beyond, transcends, that covered in the basic science.<sup>42</sup> A compound of particular relevance to this book is *metalanguage*, “a second-order language, a language used to talk about (a) language”.

The prefix *trans-* carries the spatial meaning “beyond” or “across” in *transatlantic*, *transalpine*, *translunary*, *transcontinental*. In a few cases the meaning is “through”, as in *transpierce*. Like Greek *meta-*, it may indicate change: compare Latin-based *transformation* with the above *metamorphosis*.

#### ■ On this side of: *cis-*

The rare prefix *cis-* is the opposite of *trans-*: compare *cisatlantic*, *cisalpine*, *cislunar*. Unlike *trans*, however, it has a temporal as well as spatial sense, as in *cis-Elizabethan*, though normally *post-* would be preferred (and there are no established examples where the point of reference is in the future, making it equivalent to *pre-* rather than *post-*).

## 5.5 Negatives and reversatives

In this section we survey a number of prefixes expressing various kinds of opposite-ness and related concepts, as in *un-reasonable* (negation), *un-fasten* (reversal), *un-horse* (removal), and *anti-British* (opposition).

### 5.5.1 Negation

There are five prefixes that express negation, illustrated in [30] with adjectives:

- [30] i *a-* *amoral, apolitical, asexual, asymmetric, atonal, atypical*  
 ii *dis-* *discourteous, dishonest, disingenuous, disloyal, dispassionate, dissimilar*  
 iii *in-* *inanimate, indiscreet, inflexible, inhuman, insecure, intangible, intolerable*  
 iv *non-* *non-committal, non-essential, non-existent, non-standard, non-violent*  
 v *un-* *unclear, uncommon, unedifying, unhelpful, unintelligible, unjust, unwise*

#### ■ Phonological and spelling alternation

*In-* is a Class I prefix subject to the morphophonological process of assimilation/omission mentioned in §5.1.2. It thus has alternant forms determined by the first consonant of the base to which it attaches:

[31]	BEFORE	ALTERNANT	EXAMPLES
i	/p, b/	/ɪm/	<i>im-pure im-balance</i>
ii	/m, n, r, l/	/ɪ/	<i>im, in, ir, il im-mobile in-numerable ir-regular il-legal</i>

In [i] the nasal of the prefix is assimilated to the bilabial position of the following consonant; in [ii] it is lost in speech, while the spelling has doubling of the initial letter of the base.<sup>43</sup> We also find alternation with *a-*, which has the form *an-*, as in *an-alphabetic*, *an-iconic*; there are few words, however, where the initial *an* is still clearly analysable as an alternant of *a-*.

<sup>42</sup>The original model for these terms appears to have been *metaphysics*, although etymologically the *meta* of *metaphysics* simply meant “after” (“the works of Aristotle after the *Physics*”); note, moreover, that the relation of *metaphysics* to *physics* is certainly not the same as that of *metabiology* to *biology*, etc.

<sup>43</sup>These alternations apply in all styles for all speakers. In speech there may be further optional assimilation yielding variant pronunciations such as /ɪnkəm'pli:t/ and /ɪŋkəm'pli:t/ (*incomplete*), and so on. This kind of optional assimilation is also found with the Class II prefix *un-*: compare /ʌn'kɒmən/ and /ʌŋ'kɒmən/ (*uncommon*), /ʌn'pɒpjələ/ and /ʌŋ'pɒpjələ/ (*unpopular*), and so on.

### ■ Productivity and choice between the prefixes

Negative *in·* is no longer productive, while *a·* and *dis·* are now rarely used to create new words. *Non·* has a fairly high degree of productivity, but *un·* is much the most productive of them all. Note, however, that there are some common bases that resist prefixation by any of the negative prefixes – especially those like *good*, *bad*, *big*, *small*, *strong*, *weak*, *deep*, *shallow*, that have morphologically unrelated opposites.<sup>44</sup> Similarly, negatives of adjectives with the suffix *-ful* tend to have negative counterparts in *-less* rather than with a prefix (*useful* ~ *useless*, not *\*unuseful*), though there are certainly a fair number with *un·* (*unfaithful*, *unhelpful*, etc.).

With many bases only one of the prefixes is established and acceptable. *A·* is from Greek and is used largely with classical bases. In addition to the clearly analysable words in [301], where the vowel is /eɪ/, it is found with the pronunciation /æ/ or /ə/ in a number of scientific terms (*abranchiata*, *anaesthesia*, *anorexia*, *aphasia*) and in such words as *anarchy*, *amorphous*, *anomalous*, though it is very questionable whether these can be regarded as analysable in Present-day English. Historically, *in·* tended to be attached to Latinate bases, while English bases (and even French ones) took *un·*. This gives distinctions like *inedible* vs *uneatable*, *inadmissible* vs *unpresentable*, and so on. But there is a great deal of untidiness in the established vocabulary, as reflected in such pairs as *unable* ~ *inability*, *uncivil* ~ *incivility*, *unequal* ~ *inequality*, *unjust* ~ *injustice* (with the adjective taking *un·*, the noun *in·*). In recent formations, one place where *non·* is consistently used to the exclusion of *un·* is in forming adjectives (normally attributive) from nouns or verbs: *non-skid*, *non-standard*, *non-stick*, *non-stop*.

#### Alternation and semantic contrast

There are a number of bases which accept both *in·* and *un·* without any difference in meaning, and with varying preferences for one or the other: *advisable*, *consolable*, *controllable*, *distinguishable*, *elastic*, *escapable*, *practical*, *supportable*. We also find alternation between *a·* and *un·* in *atypical/untypical*, and between *non·* and *in·* or *un·* in *non-eligible/ineligible*, *non-aligned/unaligned*, and so on.

In some cases, different prefixes attached to the same base yield different meanings. *Non-human*, for example, means simply “not human”, whereas *inhuman* means “cruel, brutal”. *Amoral* means “without moral principles, unconcerned with morals”, while *immoral* means “morally wrong”. *Unsatisfied* means “not satisfied, unfulfilled” and characteristically applies to abstract entities (*Their need for guidance remained unsatisfied*); *dissatisfied* generally applies to humans, with the meaning “discontented” (*He remained thoroughly dissatisfied with his job*). The relation between *uninterested* and *disinterested* is less straightforward. *Uninterested* means “not interested, indifferent”, whereas *disinterested* (which is much more common) can mean either that or “impartial, not influenced by considerations of personal advantage”, as in *We can rely on her to give a completely disinterested ruling*.<sup>45</sup>

While most of the distinctions given above are lexicalised, and in principle unpredictable, distinctions between *un·* and *non·* are semantically predictable. We have such

<sup>44</sup>The opposite situation is found with such words as *inept*, *non-committal*, *ungainly*: here there is no word consisting of the base without the prefix (cf. *\*ept*, etc.).

<sup>45</sup>The use of *disinterested* in the sense “not interested” (as in *He seems quite disinterested in maintaining contact with us*) is subject to a great deal of prescriptive criticism, but is nevertheless very common.

contrasts as *non-repeatable* (“cannot be repeated”) vs *unrepeatable* (which can also mean “too foul to repeat”), *non-productive* (“not productive”) vs *unproductive* (also “fruitless”), *non-professional* (“not professional”) vs *unprofessional* (also “unbecoming for a member of the profession”). The forms with *non-* are emotively neutral and non-gradable, while those with *un-* have a wider range of meaning, so that they may convey criticism and gradability (allowing them to take such degree modifiers as *very*, *extremely*, etc.). Compare, similarly, neutral *non-American* vs *un-American*, as in *non-American behaviour* (“unlike characteristically American”), vs *un-American activities* (“hostile to America”).

### ■ Nouns and verbs

*In-* and *un-* (in its negative, as opposed to reversal, sense) attach primarily to adjectives – and are then found also in many nouns derived from those adjectives (*illegality*, *unfairness*). Only relatively rarely do they attach directly to nouns. An example for *in-* (in the bilabial alternant) is *imbalance*; for *un-* we find *unease*, *unemployment*, *unperson*, *unrest*; cf. also, for *dis-* the recent term *disinformation*. Much the most productive negative prefix for nouns is *non-*. It is especially used with nouns denoting persons (*non-member*, *non-resident*, *non-student*, *non-subscriber*) and with nouns derived from verbs (*non-adherence*, *non-payment*, *non-performance*, *non-recognition*). There is specialisation of meaning in *non-event* (“something which turned out to be insignificant, uninteresting, in spite of expectation to the contrary”) and *non-person* (“someone whose existence is denied, deleted from official registers”).

Very few verbs take negative prefixes. The one prefix that is found is *dis-*, as in *disagree*, *disallow*, *discontinue*, *dislike*, *disobey*, *distrust*.

## 5.5.2 Reversal

Although the prefixes with simply negative meaning rarely attach to verbs, two of those listed above, *dis-* and *un-*, also have a reversative sense where they readily combine with verbs, while *de-* occurs with the reversative but not the negative sense:

- [32] i *unbutton*, *unclamp*, *undress*, *unfasten*, *unfreeze*, *unfurl*, *unlock*, *unstick*, *untie*  
 ii *disaffiliate*, *disconnect*, *disengage*, *disentangle*, *disentwine*, *disestablish*, *disunite*  
 iii *decentralise*, *declassify*, *de-emphasise*, *de-militarise*, *desegregate*, *desensitise*

All these verbs occur in transitive constructions, some in intransitive ones too: *She unlocked the gate* or *The gate wouldn't unlock*. In general, the effect of adding the reversative prefix is to indicate that the affected entity returns to the state obtaining before the process expressed in the base verb took place: to unlock a gate, for example, is to return it to the state it was in before it was locked. But as so often there are numerous instances of semantic specialisation, where this simple account does not apply – cf. *disinfect*, *disqualify*, *disinherit*, etc. *De-* is used productively with verbal bases ending in *-ate*, *-ify*, and especially *-ise*, while *dis-* is generally selected before *-en*, but *un-* is again much the most productive.

## 5.5.3 Removal

Closely related to reversal is removal, where the same three prefixes are found. In the central cases they attach to noun bases:

- [33] i *unfrock, unharness, unhook, unhorse, unhouse, unmask*  
 ii *deforest, defrock, defrost, degrease, delouse, dethrone*  
 iii *disambiguate, disarm, disillusion, dismast, disrobe*

There is a clear connection between this sense and the last: for example, unharnessing a horse can be thought of as removing the harness from it or as reversing the process of harnessing it. All the above have transitive uses, but the object can refer either to the entity from which something is removed (*unharness X, defrost X* = “remove ~ from X”) or to what is removed (*unhorse X, dethrone X, dismast X* = “remove X from ~”). There are a considerable number of lexicalised words with specialised meanings related to the concept of removal: *unbalance, unnerve, devalue, disbar, disgrace, dishonour, dismember, displace*, etc.<sup>46</sup>

#### 5.5.4 Opposition

There are three prefixes to be considered under this heading.

##### ■ *anti-*

This is a very productive prefix used predominantly in the formation of adjectives ([34i]) and nouns ([34ii]):

- [34] i *anti-British, anticatholic, anti-semitic; anti-abortion, anti-missile, anti-tank*  
 ii *anti-depressant, anti-freeze, anti-hero, anti-oxidant, anti-perspirant*

A common pattern among the adjectives has *anti-* prefixed to a noun to yield an adjective that is used wholly or predominantly in attributive function (*an anti-abortion rally*). The main meaning is “against”, in the sense of “opposed/hostile to those who are ~” (*anti-British*), or “acting against, acting to prevent (damage by)” (*anti-missile, anti-coagulant*). In the first sense *anti-* contrasts with *pro-* (*pro-British, pro-abortion*). *Anti-freeze* in [ii] is exceptional in that *anti-* attaches directly to a verb base. A further sense is “the opposite of”, as in *anti-hero* (“central character in a play, etc., who lacks traditional heroic properties”); in BrE this sense is also found in the adverb *anticlockwise*, corresponding to AmE *counterclockwise*. There are numerous cases of semantic specialisation: *anti-body, anti-climax, anti-nuclear, anti-social*, and the recent *anti-choice* (“opposed to allowing the choice of abortion”).

##### ■ *counter-*

This prefix, borrowed from French, has its most productive use in nouns like *counter-attack, counter-claim, counter-culture, counter-demonstration, counter-offer, counter-espionage, counter-propaganda*, where the meaning is “~ made in reaction/opposition to (an)other ~”. The main stress is usually on the prefix, but the last two examples have it on the base. Some of the above are verbs as well as nouns, but otherwise *counter-* is found in relatively few verbs; one is *countersign*, where there is no meaning of opposition. With adjectives we have *counterfactual, counter-intuitive, counter-productive*.

##### ■ *contra-*

This comes from the Latin word meaning “against”. It is found in only a small number of words (some with bound bases, such as *contradict, contraception*, if indeed these are

<sup>46</sup>*Dis-* also has an intensifying meaning, “completely, utterly”, in combination with a few bases which themselves involve reversal, removal, etc.: *disembowel, disannul*.

morphologically analysable in English), but has nevertheless been used instead of the more frequent *counter* in a few recent formations: *contraflow* (“a temporary traffic flow system where traffic is diverted into lanes that normally carry traffic in the opposite direction”), *contra-indication*, *contra-suggestible*.

## 5.6 Words based on proper names

### 5.6.1 Adjective and noun derivatives

#### (a) *-an*, *-ian*

These suffixes are found with a great many names of persons and places. Examples where they are clearly separable from the base are:

- [35] i *Chicogoan*, *Elizabethan*, *Lutheran*, *Tibetan*, *Uruguayan*  
 ii *Christian*, *Churchillian*, *Freudian*, *Iranian*, *Jordanian*, *Wagnerian*

The *-ian* variant is still very productive, and is much more widely used than *-an*, certainly with personal names: *Elizabethan* and *Lutheran* are lexicalised exceptions. Very often, especially with geographical names, the base ends in *a*, *ia*, or *e*:

- [36] i *African*, *American*, *Jamaican*, *Kenyan*, *Nicaraguan*, *Oklahoman*  
 ii *Australian*, *Columbian*, *Hawaiian*, *Indian*, *Russian*, *Victorian*  
 iii *Chilean*, *European*, *Gricean*, *Korean*, *Zairean*, *Zimbabwean*

In [i] we have the not uncommon problem of an indeterminate boundary between base and suffix: *Kenyan* derives from *Kenya* + *-an*, with reduction of *a* + *a* to a single *a*, which cannot be assigned uniquely to base or affix. Similarly in [ii], where we also have a neutralisation of the distinction between *-an* and *-ian*, since *Australian* could be derived by reduction of *ia* + *ian* or *ia* + *an*. Likewise in *Haitian* (← *Haiti*), *Italian* (← *Italy*), etc.

A small number of bases in *a* have *-ian* in the derivative: *Canada* ~ *Canadian*, *North Carolina* ~ *North Carolinian*. In [36 iii] the *e* may or may not represent a vowel sound in the base when it stands alone (it does in *Chile*, but not in *Europe*), but in speech they all have the same ending as those in [ii]. An *e* is also found in various derivatives from Classical names, such as *Epicurean*, *Herculean*, *Promethean*. These include *Caesarean* (← *Caesar*, with no *e* in the base), though there is also a more regular spelling with *-ian*. There is occasionally variation between *-an* and *-ian*, as in *Alabaman*, *Alabamian*. Bases in *o* generally drop the *o* before *-an*: *Mexican*, *Moroccan*, *San Franciscan* (but note the exceptional *Chicogoan*).

The *-ians* suffix occurs in a good number of names in *on* (*Baconian*, *Bostonian*, *Etonian*), and this has given rise to an ending *onian* that occurs in *Aberdonian*, *Buffalonian*, *Torontonian* (← *Aberdeen*, *Buffalo*, *Toronto*). Compare also the linking *n* in *Panamanian* (← *Panama*). Other forms involving irregular changes to the base include:

- [37] *Belgian* (← *Belgium*)    *Norwegian* (← *Norway*)    *Glaswegian* (← *Glasgow*)  
*Laotian* (← *Laos*)    *Mauritian* (← *Mauritius*)    *Peruvian* (← *Peru*)

Derivatives formed with these suffixes have a range of meanings, and may be adjectives or nouns. The basic meaning is “associated with ~”. With place names, it may be a matter of where someone or something comes from: *a Scandinavian playwright*, *a Roman urn*; or it may be applied to properties or features of the place or events that take place there: *the Parisian climate*, *the Russian Revolution*. With personal nouns, the adjective

may have such interpretations as “by ~” (*a Shakespearean tragedy*), “typical of or like things produced by ~” (*a Johnsonian remark*), “from the time of ~” (*an Elizabethan manuscript*). Nouns denote inhabitants or languages (see §5.6.2 below). They may also be used for supporters, devotees, or followers of the person (*a Kantian/Wagnerian*) – cf. *·ist* and *·ite* below.

Although they attach predominantly to proper nouns, *·an* and *·ian* are also to be found on some common nouns: *publican, republican, equestrian, pedestrian*. The two main semantic categories involved are specialists or practitioners in various fields, especially in combination with *·ic* (*beautician, phonetician, theoretician, veterinarian*) and in zoological classification (*crustacean, mammalian, reptilian*).

#### (b) *·er*

One of the numerous uses of this suffix is to form nouns denoting inhabitants of the place named in the base:

[38] *Dubliner, Icelander, Londoner, New Yorker, New Zealander, Queenslander*

This suffix attaches fairly readily to place-names ending in *·land* or *Island* (*Prince Edward Islander*), and it occurs with a fair number of American names, but otherwise *·er* is quite rare in this use.

#### (c) *·ese*

The main use of this suffix is to derive adjectives from place-names:

[39] i *Genoese, Maltese, Milanese, Portuguese, Tyrolese, Viennese*  
ii *Burmese, Chinese, Japanese, Javanese, Nepalese, Vietnamese*

Those in [i] involve European, especially Italian, places, while those in [ii], to which a good few others could be added, relate to places in the Far East. A final *a* in the base drops when *·ese* is added, while *Portuguese* (a loan) drops *al*. The *·ese* derivatives are also nouns, denoting inhabitants and, where relevant, languages. This latter use is extended to apply, with negative connotations, to idiosyncratic styles of speaking/writing. The base here can be a place-name (*Brooklynese*), a personal name (*Carlylese*) or, more often and still productively, a common noun: *bureaucratese, computerese, journalese, officialese*.

#### (d) *·esque*

The main productive use of this suffix is to derive adjectives meaning “in the style of ~” from personal names: *Disneyesque, Pinteresque*. The older pattern with common nouns which gave *picturesque* (actually adapted from French *pittoresque*), *statuesque*, etc., is found in the occasional recent formation (*robotesque*), but has never been widely used.

#### (e) *·i*

This suffix is found in borrowed words attached to names of regions in or near the Middle East. It forms adjectives or nouns, the latter denoting inhabitants or (where relevant) languages:

[40] *Bangladeshi, Iraqi, Israeli, Kashmiri, Kuwaiti, Pakistani, Yemeni*

#### (f) *·iana*

This suffix is usually attached to a personal name, following the form of the adjective in *·ian*, and derives a noun meaning “the collected sayings, wisdom, or artefacts connected

with ~”: *Shakespeariana*, *Burnsiana*, etc. The most common *-iana* derivative is *Victoriana*, which now means “objects, especially ornaments and bric-à-brac, made in the Victorian period”; it may have a somewhat dismissive flavour, and this carries over to such modern coinages with common noun bases as *railroadiana*.

(g) *-ic*

This suffix is found extensively with common nouns but with only a relatively small number of proper nouns, chiefly names of countries and peoples: *Arabic*, *Celtic*, *Gallic*, *Greenlandic*, *Icelandic*, *Teutonic*. Nouns in *-ic* are used for languages, usually obscure ones or scientific names for language families – compare, for example, *Turkish* with *Turkic*, “a branch of the Altaic family, including Turkish, Azerbaijani, . . .”. The *-ic* suffix is found with only a few personal names: *Byronic*, *Miltonic* (a variant of *Miltonian*), *Socratic*.

(h) *-ish*

One major use of this suffix is to form adjectives relating to countries or ethnic groups:

- [41] i *Danish*, *Finnish*, *Jewish*, *Polish*, *Scottish*, *Swedish*, *Turkish*  
 ii *British*, *English*, *Irish*, *Spanish*

In [i] the suffix is added to a noun denoting a person from the country or group; in [ii] it attaches to a bound base relatable to the country name. *French* and *Welsh* belong here etymologically, and they are also like *English* and *Irish* in forming compounds in *-man*. *Flemish* (“pertaining to Flanders”) directly copies the Flemish word. Where applicable, the *-ish* words, as nouns, are used for the languages spoken in the countries concerned.

(i) *-ite*

This suffix attaches primarily to names of places and persons:

- [42] i *Brooklynite*, *Canaanite*, *Israelite*, *Muscovite*, *New Jerseyite*, *Wisconsinite*  
 ii *Darwinite*, *Jacobite*, *McCarthyite*, *Paisleyite*, *Thatcherite*

Derivatives from place-names are mainly nouns denoting inhabitants. Numerous such forms are found among biblical names (and note that *Israelite* applies only to biblical Israel, the corresponding form for modern Israel being *Israeli*); there are also several with the names of American states as base. *Muscovite*, “inhabitant of Moscow”, is based on *Muscovy*, a now archaic name borrowed from French. Derivatives from personal names, as in [ii], primarily denote followers or supporters of the person concerned. Especially in the case of political personages, the *-ite* word is often coined by opponents, and hence tends to have a derogatory tone which is not found with comparable suffixes such as *-ist* and *-er*; this certainly does not apply in all cases, however (cf. *Jacobite*). *Pre-Raphaelite* departs semantically from the usual pattern, applying to a group of artists/writers aiming to produce work in the spirit of that done before the time of Raphael.

A few words in *-ite* have bases other than proper names: *socialite*, *suburbanite*.

(j) **Compounding with *-man/-woman***

This type of compound, discussed in §5.3 above, forms a handful of inhabitant terms with adjectives as the first base:<sup>47</sup>

- [43] *Dutchman*, *Englishman*, *Frenchman*, *Irishman*, *Scotsman*, *Welshman*

<sup>47</sup> *Chinaman*, with a noun as first base, is no longer used other than as a non-standard offensive term.

### 5.6.2 Derivatives from the names of countries, continents, etc.

In this section we examine the formation of adjectives and of nouns denoting inhabitants from the names of countries and similar entities. Almost all the word-formation processes involved have been covered in the last section: our purpose here is to present the general patterns to be found in the sets of four terms – place-name, related adjective, individual inhabitant noun, generic. By ‘generic’, we mean the form used in definite plural generic NPs, as in *The Chinese/French/Greeks do it this way*.

With a small number of exceptions, the four-term sets fall into two major classes, each with two subclasses:

[44]	COUNTRY	ADJECTIVE	INHABITANT(S)	GENERIC
1A	<i>China</i>	<i>Chinese</i>	<i>Chinese</i>	<i>the Chinese</i>
1B	<i>Australia</i>	<i>Australian</i>	<i>Australian(s)</i>	<i>the Australians</i>
2A	<i>England</i>	<i>English</i>	<i>Englishman/men</i>	<i>the English</i>
2B	<i>Sweden</i>	<i>Swedish</i>	<i>Swede(s)</i>	<i>the Swedes</i>

In Class 1, which represents the default case, the inhabitant noun is homonymous with the adjective – and can be regarded as formed from it by conversion. In Class 2, by contrast, the inhabitant noun is distinct from the adjective. The difference between 1A and 1B is simply inflectional: in 1A the inhabitant noun has the same form in the plural as in the singular, whereas in 1B it has different singular and plural forms. The subclasses of Class 2 are distinguished by the form used for the generic: with 2A it is the adjective, whereas with 2B it is the inhabitant noun, though the adjective can generally also be used as a less favoured variant: *The Swedes/Swedish do it this way*.

#### ■ Class 1A

This class contains those sets where the adjective is formed with *·ese*, and also the set for *Switzerland*, where the adjective is the irregularly formed *Swiss*. Some speakers feel uncomfortable with the singular use of the inhabitant noun, especially in the case of *Swiss*, and avoid sentences like *They’ve appointed a Swiss as the new manager*.

#### ■ Class 1B

This is the largest set. It contains those where the adjective is formed with *·an/·ean/·ian* or with *·i*. Also belonging here are a few sets where the adjective has no suffix: *Germany* ~ *German*; *Greece* ~ *Greek*; *Thailand* ~ *Thai*.

#### ■ Class 2A

This is a small class mainly comprising those where the inhabitant noun is a compound in *·man/·woman*: compounds of this kind are never used in the definite generic construction. Also belonging here is *Britain* ~ *British* ~ *Briton* ~ *the British*. The fact that for modern Britain the adjective form is used for the generic is related to the fact that generic *the Britons* refers to the inhabitants of South Britain before the Roman conquest; *Briton* (which is homophonous with *Britain*) can also be used in a similar way and is not widely applied to inhabitants of modern Britain.<sup>48</sup> The adjective members of Class 2A sets have the *·ish* form, except for the irregular *Dutch*, *French*, and *Welsh*.

<sup>48</sup>The clipping *Brit* is a colloquial term for the modern inhabitants, which – like other colloquial nationality terms – is often pejorative.

## ■ Class 2B

This class contains all others where the adjective has the *·ish* suffix. With one exception, the inhabitant noun in these cases is the base to which *·ish* is attached: *Denmark* ~ *Danish* ~ *Dane* ~ *the Danes*. The exception is *Spain*, with *Spaniard* as the inhabitant noun. Also included in this class are those where the adjective is formed with *·ic*.

## ■ Sample lists of Class 1 and Class 2 sets

For Class 1 sets we give just the place-name and the adjective, underlining the latter for Class 1A items. We omit place-names ending in *ia* (of which there are many), as they are entirely predictable, having adjectives in *ian*.

[45] CLASS 1

<i>Afghanistan</i> ~ <i>Afghan/Afghani</i>	<i>Haiti</i> ~ <i>Haitian</i>	<i>Oman</i> ~ <i>Omani</i>
<i>Africa</i> ~ <i>African</i>	<i>Hungary</i> ~ <i>Hungarian</i>	<i>Pakistan</i> ~ <i>Pakistani</i>
<i>America</i> ~ <i>American</i>	<i>Iran</i> ~ <i>Iranian</i>	<i>Paraguay</i> ~ <i>Paraguayan</i>
<i>Argentina</i> ~ <i>Argentinian</i> <sup>49</sup>	<i>Iraq</i> ~ <i>Iraqi</i>	<i>Portugal</i> ~ <u><i>Portuguese</i></u>
<i>Bangladesh</i> ~ <i>Bangladeshi</i>	<i>Israel</i> ~ <i>Israeli</i>	<i>Senegal</i> ~ <u><i>Senegalese</i></u>
<i>Belgium</i> ~ <i>Belgian</i>	<i>Italy</i> ~ <i>Italian</i>	<i>Siam</i> ~ <u><i>Siamese</i></u>
<i>Brazil</i> ~ <i>Brazilian</i>	<i>Jamaica</i> ~ <i>Jamaican</i>	<i>Sri Lanka</i> ~ <i>Sri Lankan</i>
<i>Canada</i> ~ <i>Canadian</i>	<i>Japan</i> ~ <u><i>Japanese</i></u>	<i>Surinam</i> ~ <u><i>Surinamese</i></u>
<i>China</i> ~ <u><i>Chinese</i></u>	<i>Jordan</i> ~ <i>Jordanian</i>	<i>Switzerland</i> ~ <u><i>Swiss</i></u>
<i>Costa Rica</i> ~ <i>Costa Rican</i>	<i>Kashmir</i> ~ <i>Kashmiri</i>	<i>Taiwan</i> ~ <u><i>Taiwanese</i></u>
<i>Cuba</i> ~ <i>Cuban</i>	<i>Kenya</i> ~ <i>Kenyan</i>	<i>Tibet</i> ~ <i>Tibetan</i>
<i>Ecuador</i> ~ <i>Ecuadoran</i>	<i>Korea</i> ~ <i>Korean</i>	<i>Uganda</i> ~ <i>Ugandan</i>
<i>Egypt</i> ~ <i>Egyptian</i>	<i>Kuwait</i> ~ <i>Kuwaiti</i>	<i>Uruguay</i> ~ <i>Uruguayan</i>
<i>Europe</i> ~ <i>European</i>	<i>Lebanon</i> ~ <u><i>Lebanese</i></u>	<i>Venezuela</i> ~ <i>Venezuelan</i>
<i>Germany</i> ~ <i>German</i>	<i>Libya</i> ~ <i>Libyan</i>	<i>Vietnam</i> ~ <u><i>Vietnamese</i></u>
<i>Ghana</i> ~ <i>Ghanaian</i>	<i>Mexico</i> ~ <i>Mexican</i>	<i>Yemen</i> ~ <i>Yemeni</i>
<i>Greece</i> ~ <i>Greek</i> <sup>50</sup>	<i>Nepal</i> ~ <u><i>Nepalese</i></u>	<i>Zaire</i> ~ <i>Zairian</i>
<i>Guatemala</i> ~ <i>Guatemalan</i>	<i>Nicaragua</i> ~ <i>Nicaraguan</i>	<i>Zanzibar</i> ~ <i>Zanzibari</i>
<i>Guyana</i> ~ <u><i>Guyanese</i></u>	<i>Norway</i> ~ <i>Norwegian</i>	<i>Zimbabwe</i> ~ <i>Zimbabwean</i>

For *Saudi Arabia* we have the regular *Saudi Arabian*, but *Arabian* is commonly omitted, *Saudi* on its own being then the adjective and inhabitant noun (with plural form *Saudis*). *Arabia* refers to the peninsula between the Red Sea and the Persian Gulf, with *Arabian* as the adjective, applying for example to flora and fauna of this area. It is also the inhabitant noun, but this is very uncommon in comparison with *Arab*, which has a much wider application, covering Semitic people from the Middle East generally. *Arab* is commonly used attributively (*Arab policies/philosophy*) but hardly as a predicative adjective (*They are Arabs*, but not \**They are Arab* – compare *They are Greeks/Greek*). *Arabic* as a noun denotes the language and as an adjective relates primarily to the language, script, and literature (e.g. *Arabic lettering/numerals*), but is sometimes used also of people (*She learnt the dance from Arabic friends in Paris*).

<sup>49</sup>Also spelled *Argentinean*. The country is also known as *the Argentine Republic* or, less formally, *the Argentine*: corresponding to this term we have *Argentine* as adjective and inhabitant noun.

<sup>50</sup>There is also an adjective *Grecian* whose application is largely restricted to Ancient Greece (especially art and architecture, etc.).

For Class 2 we give place-name, adjective, and inhabitant noun, with the adjective underlined for Class 2A, and the inhabitant noun for Class 2B.

[46]	CLASS 2		
	<i>Britain</i> ~ <u><i>British</i></u> ~ <i>Briton</i>	<i>Iceland</i> ~ <i>Icelandic</i> ~ <u><i>Icelander</i></u>	
	<i>Denmark</i> ~ <i>Danish</i> ~ <u><i>Dane</i></u>	<i>Ireland</i> ~ <u><i>Irish</i></u> ~ <i>Irishman</i>	
	<i>England</i> ~ <u><i>English</i></u> ~ <i>Englishman</i>	<i>Poland</i> ~ <i>Polish</i> ~ <u><i>Pole</i></u>	
	<i>Finland</i> ~ <i>Finnish</i> ~ <u><i>Finn</i></u>	<i>Spain</i> ~ <i>Spanish</i> ~ <u><i>Spaniard</i></u>	
	<i>France</i> ~ <u><i>French</i></u> ~ <i>Frenchman</i>	<i>Sweden</i> ~ <i>Swedish</i> ~ <u><i>Swede</i></u>	
	<i>Greenland</i> ~ <i>Greenlandic</i> ~ <u><i>Greenlander</i></u>	<i>Turkey</i> ~ <i>Turkish</i> ~ <u><i>Turk</i></u>	
	<i>Holland</i> ~ <u><i>Dutch</i></u> ~ <i>Dutchman</i>	<i>Wales</i> ~ <u><i>Welsh</i></u> ~ <i>Welshman</i>	

An alternative to the place-name *Holland* is *the Netherlands*. *New Zealand* has *New Zealander* for the inhabitant, but no derivative adjective: the nominal itself is used attributively (*the New Zealand economy*), but its inability to function predicatively shows that it has not been converted to an adjective: \**Her parents are New Zealand* (we need *New Zealanders*, or *from New Zealand*). For *the United States* there is no established derivative adjective or inhabitant noun. With *Scotland* there is threefold variation in each of the other terms: *Scotland* ~ *Scots/Scottish/Scotch* ~ *Scot/Scotsman/Scotchman* ~ *the Scots/Scottish/Scotch*. *Scotch* (etymologically a contraction of *Scottish*) is not now normally used by the Scots themselves except in a number of collocations (*Scotch broth/eggs/mist/terrier/tweed/whisky*, etc.), but it is still used outside Scotland, especially outside the UK. For the adjective, *Scottish* is much more widely used than *Scots*, though the latter appears in the names of regiments such as *the Scots Guards*; as a noun *Scots* is the name of the language of the lowlands of Scotland (derived from English but not comprehensible to ordinary English speakers). For the generic, *the Scots* is much preferred over the other terms.

### ■ Combining forms

For a number of areas there are established initial combining forms which are used in neo-classical compound adjectives (*Anglo-American*) or nouns (*Anglophobia*). A sample of these, paired with the ordinary adjective, are given in:

[47]	<i>Americo</i> <sup>51</sup> ~ <i>American</i>	<i>Anglo</i> ~ <i>English</i>	<i>Austro</i> ~ <i>Austrian</i>
	<i>Franco</i> ~ <i>French</i>	<i>Germano</i> ~ <i>German</i>	<i>Graeco</i> ~ <i>Greek</i>
	<i>Italo</i> ~ <i>Italian</i>	<i>Russo</i> ~ <i>Russian</i>	<i>Sino</i> ~ <i>Chinese</i>

## 5.7 Nominalisations

As a word-formation process, nominalisation prototypically involves the formation of a noun from bases of other classes, by affixation, conversion, or phonological modification. We also include comparable cases where one type of noun is formed from another, such as abstract *friendship* from *friend* or personal *mountaineer* from *mountain*. Certain cases of compounding may also be regarded as a matter of nominalisation – most clearly, the formation of compound nouns from verb + preposition, as in *take-off*, *phone-in*, etc. The main focus in this section will be on affixation, but reference will be made to

<sup>51</sup> *Amerindian* is not a neo-classical compound but a blend of *American* and *Indian*.

other kinds of nominalisation as appropriate. We divide the material into two sections, the first dealing with processes which serve primarily to form nouns denoting persons or instruments, the second with those whose output consists primarily of nouns denoting actions, states, and processes. We omit from this section a number of elements covered elsewhere – e.g. suffixes deriving nouns for persons from certain geographic areas (covered in §5.6.2), the *·iel·y* suffix which is primarily diminutive (§5.2.1), the *·man* of compounds like *policeman*, which generally marks gender as well as serving as a nominaliser (§5.3).

### 5.7.1 Person/instrument nominalisations

We take person and instrument nominalisations together as there are some processes that are used for both. Suffixation by *·er* is a clear example: compare *bottle-washer* (person) and *dish-washer* (instrument). There are a fair number of suffixes used only for persons, but none used only for instruments.

#### (a) *·ant* and *·ent*

These suffixes, of which *·ant* is much the more frequent, attach to verbs:

- [48] i a. *assistant, complainant, informant*      b. *disinfectant, relaxant*  
 ii a. *correspondent, president, resident*      b. *absorbent*

Neither suffix appears to be productive. The basic meaning is “person who ~s” (in the [a] examples) or “instrument for ~ing” (in [b]). *Débutant*, apparently with a noun base, is a loan from French. The suffix *·ate* is dropped from the verb base in *accelerant, irritant*, etc.

#### (b) *·ard*

This is no longer productive and is still recognisable in only a handful of words, such as *drunkard, dullard, sluggard*. Forms in *·ard* generally have a deprecatory meaning.

#### (c) *·arian*

This suffix, never very widely used but still productive, attaches to abstract nouns to form nouns denoting persons: *disciplinarian, sectarian*. It frequently replaces a final *·y* or other ending: *Trinitarian, humanitarian, vegetarian*. The resultant nouns usually denote holders of a particular doctrine, but in some cases this meaning has been lost through lexicalisation, as in *parliamentarian*.

#### (d) *·ee*

This comes from a French past participle ending, and hence is generally attached to verb bases. Usually it relates to the passive use of a past participle, giving the meaning “one who is ~ed”: *appointee, employee, divorcee, payee, nominee* (again with deletion of *·ate*), *laughee* (corresponding to a prepositional passive: “laughed at”). There are also words relating to the perfect (active) use of a past participle: *escapee, retiree*. In rare cases like *patentee* and *absentee* the bases are respectively noun and adjective. Usually there is a contrasting noun in *·orl·er* (*examiner* ~ *examinee*; *interviewer* ~ *interviewee*); this facilitates the formation of *biographee*, with *·y* dropped from the noun base. The *·ee* suffix is still productive, especially in AmE, though relatively few words in *·ee* become established.

(e) *-eer*

This suffix is usually attached to nouns, deriving nouns meaning “person concerned with ~”: *auctioneer*, *engineer*, *mountaineer*. Very often they are derogatory: *profiteer*, *racketeer*, *sonneteer*. *Gazetteer*, “geographical index”, is exceptional (as a result of historical change) in not denoting a person, while *privateer* is exceptional both in meaning (it denotes a type of military ship associated with private persons) and in having an adjective base. The suffix is still productive – cf. such nonce-words as *conventioneer* and *weaponeer*. One or two earlier words belong here semantically but have the spelling *-ier* (e.g. *bombardier*).

(f) *-er*, *-or*, and *-ar*

These are probably best regarded as variants of the same suffix. The *-ar* variant is found in very few words, such as *beggar*, *bursar*, and *liar*. In general, *-or* occurs in words of Latin origin (*instructor*), following the suffix *-ate* (*activator*), in technical, especially legal, words (*adjustor*, *mortgagor*), or with bound bases (*author*, *doctor*, *tailor*, *traitor*), while the much more frequent *-er* is found in most other places, and can be taken as the default variant. The *-er* variant behaves in general like a Class II affix. One respect in which it departs from the Class II behaviour described in §5.1.3 is that it occurs with bound bases in such words as *biographer*, *philosopher*, etc.; these, however, are neo-classical, and we have suggested that they are best handled in terms of the replacement of *-y* by *-er*, rather than by simple attachment to a bound base. The *-or* variant is closer to a Class I affix: it attaches more widely to bound bases, and note also the shift of stress in the salient (legal) sense of *executor* (*\*execute* ~ *ex'ecutor*). With some bases both spellings of the suffix are found: *adapt*, *advise*, *convene*, *execute*, etc.; overall, *-or* is losing ground to *-er*. A few words have the variant *-ier* (*clothier*, *grazier*) or *-yer* (*lawyer*, *sawyer*), while *-erer* occurs uniquely in *fruiterer* (for in such words as *upholsterer* the first *er* belongs to the base).

The highly productive *-er* variant attaches to a considerable range of bases besides verbs:

- [49] i *executioner*, *golfer*, *freighter*, *petitioner*; *Londoner*, *New Yorker*  
 ii *fiveer*, *oncero*, *southerner*; *dogooder*, *fast-tracker*, *nine-to-fiveer*

The bases in [i] are nouns, or proper names, while in [ii] we have a numeral, an adverb, an adjective, and a sample of dephrasal compound bases. Deverbal *-er* nouns figure very productively in compounds such as *hairdresser*, *stage-manager*, etc. (see §4.2.2).

Nouns in *-er* exhibit a wide range of meanings. The central case is that of a deverbal noun denoting a person filling the agent role with respect to the verb: *baker*, *commander*, *singer*; many such words can be used for professions. A non-agentive reading is found in words like *admirer*, *loser*. Lexicalised animal names are seen in *pointer*, *warbler*, instruments in *boiler*, *eraser*, *silencer*, other kinds of causer in *reminder*, *eye-opener*. Some *-er* words (at least in some lexicalised senses) correspond not to the subject of the verb but to the complement of a preposition: *diner*, *sleeper* (“railway carriages to dine/sleep in”), *kneeler* (“stool to kneel on”), *slipper* (“shoe to slip your feet into”). In AusE and NZE a processual meaning is found in forms like *killer* and *bottler* (“something to be killed/bottled”).

Deverbal nouns in *-er/-or* often take complements corresponding to the object of the verb in a syntactic phrase: *the writer of the editorial*, *Kim's attacker*, *the governor of Maryland*.

(g) *-ist*

This is an extremely productive suffix, and we can illustrate here only a few of its uses:

- [50] i *atheist, baptist, evangelist, exorcist, fascist, hedonist*  
 ii *extremist, idealist, isolationist, Marxist, nationalist, socialist, transcendentalist*  
 iii *agist, classist, racist, sexist, speciesist*  
 iv *bigamist, monogamist; agronomist, economist, geologist, psychologist*  
 v *anglicist, classicist, physicist, psychiatrist, semanticist*  
 vi *cellist, cymbalist, harpist, pianist, trombonist, violinist*

As noted in §5.1.4, there is a strong paradigmatic relation between *-ist* and *-ism*: this is illustrated by the words in [i–iii], which all have counterparts in *-ism*. Those in [i] have bound bases and, we have suggested, are best regarded as deriving by affix-replacement from the *-ism* words. Words in *-ism* commonly denote various philosophies or systems of belief: the *-ist* derivative then denotes a person holding these beliefs, as in [ii] and several of those in [i]. With [iii], the words in *-ism* have the meaning “prejudice based on ~”, while the *-ist* words denote persons having such prejudice; these are relatively new creations and form a model for numerous nonce-words. There is a significant paradigmatic link between *-ist* and other suffixes besides *-ism*; this is illustrated in the words in [iv], which all have counterparts in *-y* – compare also *colonist, diarist, militarist, therapist*, etc. Several of the words in [v] show a similar relation with words in *-ics*. Many *-ist* words denote persons professionally or otherwise pursuing some field of scholarship, as in [v] and the last four words of [iv]. The *-ist* suffix is also the main way of forming nouns denoting persons playing particular musical instruments, as in [vi] (with the *o* dropped from *cello* and *piano*): *drummer* and *trumpeter* are exceptions to the usual pattern.

As evident from the above examples, *-ist* normally forms nouns from nouns. Etymologically that holds for *typist* too, but its present meaning relates more directly to *type* as a verb; note, however, that unlike *writer*, for example, it cannot take an *of* phrase corresponding to the object of the verb: *the writer*/\**typist of this letter*.

(h) *-nik*

This suffix, originally from Russian via Yiddish, started to gain popularity in English in the 1950s, but it had only a short period of high productivity. The meaning is broadly “person associated with ~”, as in the original *beatnik*, “member of the beat generation”. It is found in more or less jocular words, particularly for groups seen as anti-establishment (*peacenik, refusenik*) or fans of a certain kind of music (*folknik, jazznik*).

(i) *-ster*

In old words such as *songster, spinster* (originally gender-neutral), *webster*, this suffix again means “person connected with ~”. Later forms are often derogatory (*rhymster, punster*), with a significant group having connotations of shadiness or illegal dealings (*gangster, mobster, gamester*). The bases are generally nouns (but cf. *youngster* and *oldster*). The suffix is still productive, especially in AmE, and doesn’t necessarily have negative connotations (cf. *funkster*, “practitioner of funk music”).

## (j) Conversion

Conversion from verbs may yield nouns denoting persons (*bore, spy*) or instruments (*clip, rattle*), but neither process is very widely used. However, there are a fair number

of nouns denoting persons that are converted from adjectives (*drunk, intellectual, professional*).

### 5.7.2 Action/state/process nominalisations

This section covers actions, states, and processes together: the view taken here is that any distinction between them is more a matter of the context in which the nouns are used than of any inherent quality of the affixes or processes involved. Several of the suffixes have additional uses besides that of forming action/state/process nominalisations.

#### (a) *·age*

This suffix, originally French, occurs in a large number of nouns but is no longer productive. It attaches predominantly to nouns and verbs, but is also found with the occasional adjective (*shortage*). It has a wide range of meanings, some of which are illustrated in:

[51]	i	<i>baggage, coinage, fruitage, leafage, wordage</i>	[collectivity]
	ii	<i>bondage, parentage, peerage, pupilage, shortage</i>	[state, condition, rank]
	iii	<i>breakage, marriage, stoppage, wastage, wreckage</i>	[result]
	iv	<i>anchorage, hermitage, orphanage, parsonage, vicarage</i>	[place]
	v	<i>acreage, dosage, mileage, tonnage, voltage</i>	[amount or rate]
	vi	<i>anchorage, cartage, corkage, haulage, postage</i>	[charge]

Many words have more than one such meaning, as shown here for *anchorage*.

#### (b) *·al*

This suffix attaches to disyllabic verbs with stress on the final syllable: *a'rrival, de'nial, re'fusal, re'moval, 'trial, 'Burial*, which does not conform to this constraint, has a different etymological source. Few *·al* nouns have been created since the nineteenth century (*referral* appears to be one), and it is questionable whether the suffix is still productive.

#### (c) *·ance* and *·ence*

These suffixes, of which *·ance* is much the more common, are based on Latin models; some English formations are found (*riddance, utterance*), but the suffixes are no longer productive. They form nouns from verb or adjective bases:

[52]	VERB BASES	ADJECTIVE BASES
	i a. <i>acceptance, disturbance, performance</i>	b. <i>arrogance, fragrance, relevance</i>
	ii a. <i>emergence, interference, resurgence</i>	b. <i>prudence, sentience, violence</i>

With verbs the suffixes simply attach to the base, except that verbs in *·ate* lose this suffix: *dominate* ~ *dominance*. With adjective bases, the nominal suffixes replace the adjectival ones, so that *arrogance* is the nominalisation of *arrogant*, *prudence* of *prudent*, and so on. Some verbs form both nouns and adjectives: *dominate* ~ *dominance* ~ *dominant*, *differ* ~ *different* ~ *difference*, and similarly for *observe*, *persist*, etc. The verb bases include some prepositional verbs, and here the same prepositions occur in complements to the noun (*adhere/adherence* to, *comply/compliance* with, etc.).

No fully general rules can be given for the choice between the *a* and *e* spellings, but in many cases the spelling matches that of paradigmatically related suffixes where the vowel is not reduced to /ə/ – compare *tolerance* and *tolerate* (/eɪ/), *influence* and *influential* (/e/). In addition, *e* is predictable after *qu* (*sequence*), *sc* (*luminescence*), *c* representing

/s/ (*munificence*), or *g* representing /dʒ/ (*emergence* – contrast *extravagance*, where *g* represents /g/). For nouns in *·ancy* and *·ency*, see (n) below.

(d) *·ation, ·ion, ·ition, ·sion, ·tion, ·ution*

These suffixes occur with verb or bound bases. The only one which is English is *·ation*: all the others are virtually restricted to loan words from Latin or French (often not clearly analysable in English), as in *confus-ion, perd-ition, compul-sion, absorp-tion, sol-ution*. Examples like *demot-ion*, created from English *demote* by analogy with *promot-ion*, are very rare. Some contrasting pairs are to be found, such as *affection* and *affectation*, but both of these go back to Latin models (and at earlier periods of English, though hardly today, they could be synonyms). There are very few such contrasts, however, and on the whole we can say that these suffixes are variants of a single form, with *·ation* the only one productive in Present-day English. Established words include some where the verb base bears no suffix (*experimentation, flirtation, starvation*), but in uses where it is still productive it attaches to verbs with the following suffixes:

- [53] i *·ise*      *atomisation, civilisation, fertilisation, legalisation, privatisation*  
 ii *·ate*      *alternation, education, intimidation, metrication, moderation*  
 iii *·ify*      *glorification, justification, purification, ratification, yuppification*

In [ii] the *·ate* again drops, and in [iii] *c* is added before the suffix (as it also is with a few verbs in *·ply*: *imply* ~ *implication*). No other suffix (apart from the special case of *·ing*) is now used for nominalising verbs of these three kinds.

(e) *·dom*

Originally a noun (etymologically related to present-day *doom*), this suffix yields nouns with a number of meanings. The most general or neutral is “state/condition of being ~”, as in *boredom, martyrdom, stardom*. In such words as *dukedom* and *earldom* it means “territory under the jurisdiction of / associated with ~”. Words like *fairydome* fit in here but differ in being non-count. The suffix has also developed the sense “collectivity of ~”, as in *gangsterdom, officialdom* (where it has a deprecatory tone), and in jocular words like *puppydom*. The base is almost invariably a noun; the few exceptions include *freedom* and *wisdom* (derived from *wise* but with the vowel change making the relation less transparent). Many *·dom* words have been created, but relatively few of the older ones have survived and relatively few of the more recent ones have become established. It is clearly still productive, especially in AmE (cf. *couch potatodom, yuppiedom*).

(f) *·hood*

Like *·dom*, this suffix comes from what was originally an independent noun; the *·head* of *godhead* and *maidenhead* (not etymologically related to the present word *head*) is a variant. It is also like *·dom* in sense, yielding nouns meaning “condition of being ~”, as in *bachelorhood, sainthood, widowhood*, or “collectivity of ~”, as in *brotherhood, priesthood*; *neighbourhood* can have the latter interpretation, but its usual meaning is locative. The base is normally a noun, with de-adjectival *falsehood* and *likelihood* the main exceptions still in common use; *livelihood*, “means of living”, is not semantically based on *lively* nor etymologically formed by suffixation of *·hood*. Though much less frequently used than *·dom*, it is still available for use in new words – witness nonce-words like *bumhood*.

(g) *-ing*

We are concerned here with the lexical *-ing* that forms gerundial nouns from verbs, as in *the/his accidental killing of the birds*, as distinct from the inflectional *-ing* that forms the gerund-participle form of verbs, as in *I'd heard about him/his accidentally killing the birds*: see Ch. 3, §1.4, for this distinction.

With a good number of verbs, suffixation with *-ing* is the only way of forming a deverbal noun: *coming, feeling, forgetting, opening, painting, rendering, understanding, undertaking, writing*. In other cases, we find a difference in meaning or in the range of permitted complements between the *-ing* noun and a noun formed from the same base by another suffix or by conversion: compare such pairs as *breakage* ~ *breaking*, *laughter* ~ *laughing* (*his constant laughing*! \**laughter at me*), *knock* ~ *knocking*, *work* ~ *working*. In other cases, an *-ing* noun can substitute for some other deverbal noun without a change of meaning: *classification/classifying, completion/completing, postponement/postponing, removal/removing*. In such cases the *-ing* formation often tends to sound (in varying degrees) less idiomatic, less natural than the other, but not to the extent of being ungrammatical.

As well as being used in the formation of abstract nouns, as above, *-ing* commonly appears in nouns denoting the concrete result of some process (*building, clearing, drawing, savings*). It also attaches to noun bases in examples like *bedding, fencing, flooring, railing*. In a few cases it attaches to prepositions: *inning, outing*.

(h) *-ism*

Most *-ism* words fall into one of the three semantic groupings illustrated in:

- [54] i *Buddhism, capitalism, Darwinism, expressionism, fanaticism, federalism*  
 ii *Americanism, archaism, colloquialism, Gallicism, spoonerism, vulgarism*  
 iii *alcoholism, autism, embolism*

The nouns in [i] represent a broad range denoting doctrines, systems of philosophical, religious, or political beliefs, intellectual or artistic movements. Related senses include modes of life (*monasticism*), attitudes or conduct (*absenteeism, defeatism, favouritism*), prejudice (*racism, sexism*), and so on. The bases are nouns (including numerous proper nouns), together with some adjectives, bound bases, and dephrasal compounds (*go-it-aloneism*). As we have noted, there is a strong paradigmatic link with nouns in *-ist*, and as with *-ist*, there may be a derogatory tone. This use continues to be very productive. The words in [ii] illustrate a smaller group denoting some special linguistic usage or peculiarity of speech. The bases are mainly adjectives or proper nouns, though there are also a few bound bases, as in *euphemism, solecism*; the latter, like *mannerism*, extends from language to other forms of behaviour. A third group are used for abnormal medical conditions, as in [iii]. In addition we find a small number of words where *-ism* simply forms a de-adjectival noun with the meaning “state/condition of being ~”, as in *bilingualism* or *magnetism* (with loss of *-ic*, as also in the above *archaism*).

(i) *-ity/-ety* and *-ness*

These are the most common suffixes used in de-adjectival nouns with the general meaning “quality/state of being ~”. They contrast strikingly in their behaviour, providing prototypical examples respectively of Class I and Class II affixes. Many words in *-ity* came into English as loans from French rather than being created by an English word-formation process, and this is reflected in the fact the base very often differs significantly

in form from the free adjective. Words in *·ity* have the stress on the syllable preceding the suffix, and this frequently leads to a shift of stress relative to the adjective base:

[55] *actu'ality, besti'ality, curi'osity, eccen'tricity, no'bility*

The stress shift affects the vowel quality – and vowel change without stress shift is seen in *chastity, sincerity*, etc. Velar softening (§5.1.2) applies with bases in *·ic*: *electricity, rusticity*, etc. The adjectival ending *·(i)ous* is lost in such words as *assiduity, atrocity, hilarity, superfluity*, while *fidelity* and *humility* have no corresponding English adjectives (and *duplicitous* and *felicitous* are formed from the nouns *duplicity* and *felicity* rather than providing the base for them). It does not attach to adjectives containing a Class II suffix such as *·ed, ·ful, ·ish, ·less, ·ly*. The variant *·ety* is found in only a small number of words: *gaiety, nicety, dubiety, notoriety* (the last two with loss of *·ous*), and so on. A great many *·ity* words have adjective bases in *·able/·ible*: *amiability, compatibility*, etc. In general, *·ity* is the preferred nominalising suffix for adjectives of this form; this is especially so where the adjective has the meaning “able to be ~ ed”; with some other *·able* adjectives we find *·ness*: *charitableness, peaceableness, reasonableness*. It is most clearly with *·able* bases that *·ity* is still productive (cf. recent forms such as *deniability, sustainability*); elsewhere, *·ness* tends to be preferred for new formations, though *·ity* may appear in technical terms such as *connectivity*.

Unlike *·ity*, *·ness* does not affect the stress or induce other changes: compare *clearness* and *clarity, gentleness* and *gentility, nobleness* and *nobility*, etc. It also differs from *·ity* in its ability to attach to bases of other word classes than adjective (*nothingness, oneness, whyness*), to compound adjectives (*straightforwardness, user-friendliness, watertightness*), to dephrasal compounds (*matter-of-factness, more-than-one-ness*). The meaning is almost entirely regular, with *business, Highness* (indicating status), *wilderness*, and *witness* lexicalised exceptions. In general, *·ness* can be regarded as the default suffix for forming new de-adjectival nouns; it is sometimes used instead of other suffixes when the established form is temporarily forgotten (e.g. *saneness* for *sanity*), or to give a new meaning (e.g. *impossibleness* instead of *impossibility* for the noun corresponding to the colloquial sense of *impossible*, as applied to persons).

#### (j) *·ment*

This suffix has been very widely used in the past, but is now only marginally productive, if indeed productive at all. The suffix is of French origin, but became naturalised as English very early on, and yields nouns from French and English verb bases. It is particularly common with verbs containing the prefixes *en-/em-* and *be-*: *ennoblement, embodiment, bewilderment*. Besides abstract nouns like *astonishment, betterment, development*, etc., we find nouns in *·ment* with concrete meanings (in addition to or instead of the abstract): *advertisement, embankment, reinforcement*. There are a small number denoting location: *encampment, settlement*. In the past *·ment* was occasionally added to adjectives; *oddment* is the only survivor of this type, though *merriment*, formed from an obsolete verb *merry*, now looks to be de-adjectival.

#### (k) *·ship*

This suffix attaches primarily to nouns denoting persons, again yielding nouns with the general meaning “state or condition of / associated with ~”: *apprenticeship, companionship, friendship, kinship*. *Hardship* is an exceptional example with an adjective base.

A more specific sense found in a considerable number of words is that of office, rank, position, or of emoluments associated with such positions: *governorship*, *headmastership*, *scholarship*, *tutorship* (*lectureship* is unusual in having *lecture* rather than *lecturer* as base). *Dictatorship* can belong with these, but more often denotes a type of government. The *-ship* suffix can also carry connotations of skill or craft; this is especially common with compound bases in *-man*: *craftsmanship*, *marksmanship*, *statesmanship*. Except with such senses as are lexicalised in *township*, *Ladyship*, and the like, the suffix is still productive (cf. *chairpersonship*, for example), though it is not widely used.

#### (l) *-th*

This suffix, no longer productive, is found mainly in de-adjectival nouns such as *warmth*, but also in one or two deverbal ones (e.g. *growth*). In most cases the phonological relation between base and derivative is irregular (*long* ~ *length*, *die* ~ *death*, *bear* ~ *birth*), and in several cases the semantic relationship has been lost, so that there is no longer any morphological relationship between such pairs as *dear* and *dearth*, *foul* and *filth*.

#### (m) *-ure*

Most nouns in *-ure* are loans; there have been a fairly small number of formations in English, such as *composure*, *departure*, *enclosure*, but the suffix is probably no longer productive. It is found with bound bases (*capture*, *leisure*, *treasure*), verbs (*composure*, *failure*, *mixture*, *pressure*), and the occasional adjective (*rapture*) and noun (*candidature*).

#### (n) suffixes ending in *y*

A great number of nouns, mainly abstract, end in *y*. In some cases, such as *fury*, *glory*, *luxury*, there is no semantic evidence for analysing the word into base + suffix, while in others, such as *privacy*, the boundary between base and suffix is problematic (*priv-acy* or *privac-y*): there are many places where it is difficult to distinguish between morphological and etymological analysis. We begin with nouns unproblematically containing *-y* itself as a suffix, and then turn to various larger suffixes ending with *y* or endings where the division between base and suffix is uncertain; *-ity* (together with its variant *-ety*), however, has been dealt with already and need not be further considered here.

##### *-y*

This is most straightforwardly recognisable as a suffix forming abstract nouns when it attaches to free bases: adjectives, as in *difficulty*, *honesty*, *jealousy*, *modesty*; verbs, as in *delivery*, *entreaty*, *injury*, *perjury*; nouns, as in *beggary*, *victory*. With bound bases its status as a suffix may be established by its paradigmatic contrast with other suffixes. One large class of cases of this kind involve neo-classical compounds: compare *biography* ~ *biographer*, *euphony* ~ *euphonic*, *philology* ~ *philologist*, *philosophy* ~ *philosophise*. Others are seen in *history* ~ *historic*, *memory* ~ *memorable*, *treachery* ~ *treacherous*, *usury* ~ *usurer*.

##### *acy*, *cy*, *sy*

The ending *acy* is found in many nouns that are paradigmatically related to words ending in /t/, or /t/ + suffix. Particularly numerous are contrasts between nouns in *acy* and nouns or adjectives in *ate*: *privacy* ~ *private*, and similarly for *accuracy*, *advocacy*, *intimacy*, *obstinacy*, etc. Another group have the ending *cracy* contrasting with *crat*: *aristocracy* ~ *aristocrat*, and likewise *bureaucracy*, *democracy*, etc. Other examples include *diplomacy* ~ *diplomat*, *lunacy* ~ *lunatic*. The same kind of contrast is seen for *cy* in

*idiocy* ~ *idiotic*, and for *sy* in *ecstasy* ~ *ecstatic*, *heresy* ~ *heretic*, *hypocrisy* ~ *hypocrite*, *idiosyncrasy* ~ *idiosyncratic*, and so on.

The most plausible analysis of these cases is to say that the suffix *-y* is attached to a base in *t*, with /t/ becoming /s/ by morphophonological alternation, reflected in spelling as *cy* or *sy* (see §5.1.2). On this account *privacy* will be divided as *privac-y*. Nevertheless, there are so many words ending in *-acy* that it has something of the character of a suffix, and indeed it must have that status in *supremacy* where it attaches to a free base. (And in *conspiracy* we have a contrast both with *conspire* and with *conspiratorial*.)

We must also recognise a suffix *-cy*; it attaches to a larger group of free bases, mainly nouns denoting ranks or offices (*baronety*, *captaincy*, *chaplaincy*, etc.), but also the occasional adjective (*bankruptcy* and *normalcy*). The *-sy* of *minstrelsy* seems to be a spelling variant.

#### *-ty*

This suffix forms a small number of de-adjectival nouns such as *certainty*, *cruelty*, *loyalty*, *safety*, *subtlety*. *Admiralty* is exceptional in having a noun base.

#### *-ery* and *-ry*

These can be regarded as variants of the same suffix, with *-ery* the more common of the two. They occur in a good number of nouns, expressing such meanings as condition (*slavery*), behaviour (*debauchery*), collectivity (*machinery*, *citizenry*), location (*piggery*, *printery*). The bases may be nouns (*creamery*, *bigotry*, *dentistry*, *gimmickry*), adjectives (*bravery*, *gallantry*), verbs (*bakery*), or, in a few cases, bound (*chivalry*, *sorcery*, *surgery*).

A fair number of nouns in *-ery* are in paradigmatic relation with agentive nouns in *-er*: compare *baker* ~ *bakery*, *brewer* ~ *brewery*, etc. In some cases, the *-er* is attached to a bound base, as in *butcher*, *grocer*, *haberdasher*, *milliner*: the forms in *y*, *butchery*, *grocery*, etc., might here be analysed as having *-ery* replacing agentive *-er* or as having *-y* added after it. The latter proposal is probably preferable since it is the only one of the two that will generalise to cases like *embroidery* and *upholstery*. In these words *er* is part of the verb base, and the agentive nouns have *-er* added after it: *embroiderer*, *upholsterer*. It seems clear, then, that we must analyse the former pair as *embroider-y* and *upholster-y*, allowing that one use of the *-y* suffix is as a variant of *-ery* attaching to a base ending in *er*. This then raises the possibility that forms like *bakery* should be analysed as deriving from *baker* by affixation of the *-y* variant, rather than from *bake* by affixation of *-ery*.

#### *-ancy* and *-ency*

These are restricted to nouns in paradigmatic relation to a word in *-ant* and *-ent*, usually an adjective, as in such pairs as *blatant* ~ *blatancy*, *vacant* ~ *vacancy*, *decent* ~ *decency*, *lenient* ~ *leniency*, but occasionally a noun, as in *infant* ~ *infancy*, *vagrant* ~ *vagrancy*. We have noted that the same paradigmatic relationship holds for one use of *-ance* and *-ence*, and there is no apparent principled basis for the choice of one nominalisation over the other. In some cases both are found: *competence/competency*, *complacence/complacency*, *relevance/relevancy*; the version with *y* tends to be countable (e.g. *competencies*), and in one or two cases has a more specific meaning as in *dependency*, “territory controlled by another”, or *Excellency*, a status term.

There are two possible analyses for *-ancy* and *-ency*: one is to treat them simply as variants of the *-ance* and *-ence* suffixes, the other is to say that the suffix *-y* is added to the form in *-ant/-ent*, with /t/ modified to /s/, as suggested for *privacy*, etc.

(o) **Minor suffixes**

There are a few further suffixes that can be recognised as such in a small number of deverbal nouns but are no longer productive: *laugh-ter*, *merg-er*, *hat-red*, *complain-t*.

(p) **Phonological modification, conversion, and compounding**

A number of the word-formation processes covered in earlier sections include deverbal nouns within their output. Final consonant devoicing is seen in *belief*, *ascent*, *extent* (§2.6). A considerable number of nouns are formed from verbs by shifting the stress to the first syllable, sometimes with an associated change in vowel quality: *'digest*, *'rethink*, *'decrease*. Many others involve no phonological change at all, arising simply by conversion: *arrest*, *push*, *swallow*, *whimper*, etc. Nominalisations with the form of compounds commonly arise from lexicalised verb + preposition combinations: the preposition may be placed first and stressed, as in *'downfall*, *'intake*, *'upkeep*, or, more often, remain in second position with the stress shifted from it to the verb base, as in *'blow-out*, *'make-up*, *'stopover*.

## 5.8 Adjectivalisation

Adjectivalisation is primarily a matter of forming adjectives from words of other categories, nouns and verbs, usually by suffixation. It also covers the formation of one adjective from another when the process is the same as or similar to that applying to other bases: for example, suffixation of *·y* generally forms adjectives from nouns (*thirst-y*) or verbs (*weep-y*), but also occasionally from adjectives (*lank-y*), and we include the latter as well as the former in the category of adjectivalisation. The formation of adjectives from proper nouns and numerals is dealt with in §§5.6, 5.10, and need not be further considered here.

(a) ***a·***

The *a·* prefix we are concerned with here has its source in the preposition *on*; a high proportion of the derivatives it forms are themselves prepositions, but there are also adjectives (including some very common ones such as *afraid*, *asleep*, *awake*), and a few adverbs (*aloud*). The bases for adjectival derivatives may be nouns (*afoot*), adjectives (*askew*), or verbs (*atremble*). The formation of adjectives in *a·* is still productive, but probably only with verbal bases, in a small number of (often poetic) coinages, such as *aclutter* or *awhir*.

(b) ***·able* and *·ible***

The *·ible* member of this pair is mainly restricted to loans from Latin or forms created in English with Latin bases – compare, for example, Latin-based *edible* and *legible* with English-based *eatable* and *readable*. A very minor third variant, *·uble*, is seen in the loans *soluble* and *voluble*: compare the variation between *·ation*, *·ition*, and *·ution* in §5.7 above. With a relatively small number of bases both *·able* and *·ible* derivatives are found. In general, the meaning is the same (cf. *deductable/deductible*, *extractable/extractible*), but there are a few cases where the *·able* form has a different or more restricted sense (cf. *contractable* “liable to be contracted (e.g. of a disease)” vs *contractible* “liable to contract / be caused to contract”; *accessible* “able to be accessed (e.g. of a computer file)” vs the much more general *accessible*).

The *-ible* variant has the properties of a Class I affix. It precedes the Class I suffix *-ity*; it occurs with bound bases (*audible*, *credible*, *feasible*, etc.); it triggers morphophonological alternation in the base (*divide* ~ *divisible*, *perceive* ~ *perceptible*); and there are one or two cases of stress shift (*neg'lect* ~ *'negligible*). Adjectives in *-ible*, moreover, usually form negatives with the Class I prefix *in-* (*ineligible*, *indestructible*, *imperceptible*). The *-able* variant, however, exhibits mixed behaviour. It too precedes *-ity* and occurs with bound bases (*durable*, *vulnerable*), but it is also found with dephrasal compound bases (*get-at-able*). It often triggers omission of *-ate*, but there are a good many cases where *-ate* is optionally retained (*navigable/navigatable*, *separable/separatable*). Other alternations rarely occur with *-able*, and we find pairs like *defensible/defendable*, with alternation triggered by *-ible* but not by *-able*. There are words where *-able* triggers stress-shift but forms where the stress remains unchanged are found as alternants (*'comparable/com'parable*, *'preferable/pre'ferable*). Some negatives are formed with Class I *in-* (*irreparable*, *intolerable*, *inviolable*), others with Class II *un-* (*undeniable*, *unremarkable*).

These affixes are the only ones in English whose primary meaning is modal. The central case, clearly still productive, has *-able* attached to a transitive verb giving an adjective with the meaning “capable of being ~ -ed”. This corresponds, therefore, to a passive verbal construction. In a few cases, however, the adjective has an active interpretation, as in *perishable*, “liable to perish”. *Adaptable* and *changeable* illustrate the case where both interpretations are possible, “able to adapt / to be adapted”, etc. The modal meaning is generally like that of *can*. Sometimes, however, it is stronger, like that of *must* or *will*. Compare, for example, *It is payable at any post office* (“can be paid”) with *It is payable by 15 June* (“must be paid”) or *The question isn't answerable* (“can't be answered”) with *The minister is answerable to Parliament* (“has to answer”). Note also *The deposit is refundable* (“will be refunded”). The modal meaning may also be a matter of fitness/worthiness, as in *laughable* or one sense of *comparable* (cf. *The style is comparable with Voltaire's*). In general, the modality is of the kind we have called dynamic (Ch. 3, §9), a matter of capability or ability, but there are some cases where it is deontic, a matter of permission. *Photocopiable*, for example, may indicate feasibility (dynamic) or legality (deontic). Semantic specialisation is found (co-existing with a regular meaning) in such forms as *appreciable* and *considerable* “fairly large”, *tolerable* “fairly good”, and so on.

The bases to which *-able* attaches are generally verbs. These include a number of prepositional verbs, the usual pattern being for the preposition to be omitted: *dependable* (“on”), *dispensable* (“with”), *disposable* (“of”), *laughable* (“at”). In a few formations, however, the preposition is retained, and either precedes the suffix (*un-put-downable*) or follows (*liveable with*). The *-able* variant also occurs with nouns: *knowledgeable*, *peaceable*, *reasonable*, *seasonable*. A few of these have a passive-type meaning matching that of the deverbal adjectives: *objectionable* (“that may be objected to”), *saleable* (“fit to be sold”).

### (c) *-al*, *-ar*, *-ial*, *-ual*

These suffixes come originally from Latin and are usually found attached to Latin, Greek, or French noun bases (even where these have also been borrowed into English): *accidental*, *baptismal*, *cultural*, *monophthongal*, *pastoral*, etc. Only rarely are they added to native English words, as in *tidal*. They generally form denominal adjectives with the general meaning “pertaining/related to ~”, but there are numerous cases of semantic

specialisation, as in *familiar, occasional, singular, usual*, etc. And there are also many with bound bases, as in *medieval, regal*, etc. Some of these correspond semantically to morphologically unrelated English-based nouns – compare *oral* ~ *mouth*, *manual* ~ *hand*, *dorsal* ~ *back*, *filial* ~ *son*, etc.

The different variants are illustrated in:

- [56] i *additional, alkaloidal, central, conventional, natural, regimental*  
 ii *lunar, molecular, nuclear, oracular, polar, vulgar*  
 iii *bestial, confidential, editorial, ministerial, proverbial, substantial*  
 iv *eventual, gradual, habitual, intellectual, sensual, spiritual*

The *-al* variant is particularly productive with bases ending in *-tion*, *-ment*, and *-oid*. We find *-ar* immediately after /l/, or with /l/ in the preceding syllable, but in the latter case there may be a contrast with *-al* (*linear* vs *lineal*, *familiar* vs *familial*). Where the base ends in syllabic /l/, *u* is commonly added, as in *oracular* from *oracle*; note also the relation between adjectives in *ular* and verbs in *ulate* (*regular* ~ *regulate*, *popular* ~ *populate*). The *-ial* variant seen in [iii] commonly occurs after *-or* (but we also find others with just *-al*: *doctoral, electoral*), and in paradigmatic contrast with nominal *-ance/-ence* (*circumstance* ~ *circumstantial*, *existence* ~ *existential*). In a fair number of these latter cases there is also a semantically distinct adjective (*confidence* ~ *confident* ~ *confidential*, *difference* ~ *different* ~ *differential*). Note that in such words as *familial, secretarial, territorial*, the *i* belongs to the base, rather than to the suffix. The *u* in such words as those in [iv] is part of the suffix as far as English is concerned, but etymologically it belongs with the base in Latin and this is reflected in the fact that it is commonly found with other suffixes attaching to the same bases – compare *eventuate, graduate, habituate, sensuous, spirituous*. A few words such as *funereal* and *marmoreal* end in *eal*, but as the bases are bound the precise division into base and suffix remains uncertain. For adjectives in *-ical* see (j) below.

#### (d) *-ant* and *-ent*

Adjectives with these suffixes mostly go back to present participles in Latin or (in the case of *-ant*, but not *-ent*) French. For this reason, the base may be bound: *elegant, evident, present, virulent*. But there are also a good number where the base is an independent English word: *defiant, observant, repentant, triumphant, absorbent, excellent*. Others are in paradigmatic contrast with verbs in *-ate*: *arrogant, radiant, stagnant, tolerant*. With verbs in *-ify* we again find *c* at the boundary: *magnificent, significant*. There are others where the base differs in vowel quality from the corresponding verb: *abundant* (*abound*), *apparent* (*appear*), *errant* (*err*). These suffixes are probably no longer productive.

#### (e) *-ary*

Many adjectives with this suffix are direct loans from Latin; again, therefore, some have bound bases (*ordinary, voluntary*). In English, the suffix is added mostly to noun bases ending in *-ion*, especially *-tion* (*cautionary, discretionary, reactionary, visionary*), and *t*, especially *-ment* (*complimentary, fragmentary, parliamentary, dietary*). The pattern may still be productive with such bases, but certainly not elsewhere.

#### (f) *-ate*

This suffix has never been widely used in the creation of English adjectives. Such words as *celibate, fortunate, intricate* are loans, not English formations. There are numerous

learned words using classical bases (*corporate, degenerate, geminate*), but the clear English formations are based on nouns ending in *-ion*: *affectionate, extortionate, passionate*.

(g) *-ed*

This suffix attaches to nouns (*bearded*) or, more often, nominals consisting of a dependent + a head noun (*one-eyed, red-faced*). Plural nominals lose the plural inflection: *three-bedroomed*, not *\*three-bedroomsed*. The construction is extremely productive; the basic meaning is simply “with ~”, but there are many lexicalised examples with specialised meanings: *barefaced, blue-eyed, two-faced*, etc. The suffix is in general identical to that used in the formation of regular past participles – note in particular the alternation between /ɪd/ (*red-handed, hard-hearted*), /t/ (*humpbacked*), and /d/ (*one-armed*). The /ɪd/ variant, however, occurs exceptionally in a handful of lexicalised words (*crooked, dogged, ragged, wicked, wretched*) and in forms containing *legged* (e.g. *three-legged*, though /legd/ is an alternative pronunciation). For participial adjectives in *-ed*, see (t) below. Where the base is a noun rather than a nominal, the formation of the adjective may involve the prefix *be-* as well as the suffix *-ed*: *bejewelled, bespectacled*.

(h) *-en*

A small number of nouns denoting materials form adjectives in *-en*:

[57] a. *earthen, wooden, woollen*    b. *golden, leaden, silken*

The meaning is either “made of ~” or “resembling ~”, the latter often in a figurative sense. The adjectives in [a] are used in both ways, while those in [b] are now virtually restricted to the second. Much the most usual way of expressing the first meaning is by means of a noun, rather than a denominal adjective: *a stone wall, a copper kettle*; compare, then, *a gold watch* and *a golden age*, *a lead pipe* and *a leaden sky*, *a silk tie* and *long silken hair*. The second sense is found in both attributive and predicative function (*a wooden performance; His performance seemed rather wooden*), whereas the first sense is generally attributive (*a wooden box*).

(i) *-ful*

This suffix attaches mainly to nouns, originally yielding adjectives that can be construed as meaning “full of ~”, reflecting the etymological source of the suffix in the adjective *full*: *careful, sinful, sorrowful*. More generally, the meaning might be glossed as “having/ displaying ~” or, in some cases, “causing/exciting ~”: *delightful, fearful, shameful*. It also attaches to a number of verbs, giving the meaning “prone to ~”: *forgetful, fretful, resentful*. In the usual use of the common word *awful* (/ɔːfʊl/, “bad, unpleasant”) the connection with *awe* is lost, but it can be reinstated with the pronunciation /ɔː fʊl/ (and sometimes the spelling *awe-ful*) to mean “awe-inspiring”. Derivation with *-ful* may be no longer productive (unlike compounding with *full*, which is certainly still used).

(j) *-ic, -atic, -ific, -ical, -istic*

The suffix *-ic* is one of the most widely generalised adjectivalising suffixes, especially on noun bases of Greek or Latin origin. Some of the main types of base with which it occurs are illustrated in:

- [58] i *allergic, economic, geographic, harmonic, philosophic, telepathic*  
 ii *anaemic, bronchitic, democratic, genetic, parasitic*

A great many nouns form adjectives by replacement of final *·y* by *·ic*, as in [i]. Often the *·y* is a noun-forming suffix in neo-classical compound bases – compounds in *·graphy*, *·logy*, *·phily*, *·phony*, *·trophy*, etc. There is usually a paradigmatic relation with other suffixes too (*economy* ~ *economic* ~ *economist*, *harmony* ~ *harmonic* ~ *harmonise*). The words in [ii] exemplify patterns where *·ic* adjectives are formed from nouns in *·ia*, *·itis*, *·cracy*, *·sis*, *·ite*.

The variants *·atic* and *·ific* are seen in:

- [59] i *cinematic, dogmatic, dramatic, paradigmatic, problematic*  
 ii *beatific, horrific, scientific, terrific*

The bases in [i] end in *m* or *ma*; in the latter case, we can take the affix to be *·tic* or *·atic* with omission of base *a*; *operatic* is a rare example where the base has no *m*. Except for *scientific*, the bases in [ii] are paradigmatically related to verbs in *·ify*.

The ending *·ical* looks like a combination of *·ic* and *·al*, but is best regarded as a single suffix, a variant of *·ic*. For a great many nouns (though fewer than in the past), both formations are found: *analytic/analytical*, *fanatic/fanatical*, *ironic/ironical*, *philosophic/philosophical*. A number of such pairs exhibit differences of meaning and/or collocation, as illustrated in:

- [60] i a. *a classic example of pedantry*      b. *classical music*  
 ii a. *a comic opera*      b. *his comical appearance*  
 iii a. *economic theory*      b. *an economical use of time*  
 iv a. *an electric current*      b. *electrical appliances*  
 v a. *this historic occasion*      b. *a historical novel*  
 vi a. *lyric poetry*      b. *a lyrical description of their courtship*

The close relation between the two suffixes is reflected in the fact that the distinction is neutralised in the formation of adverbs: except for *publicly*, the adverbs corresponding to both *·ic* and *·ical* adjectives end in *·ically*.

Consider finally the ending *·istic*. As we have noted, it is usually in paradigmatic contrast with *·ism* and *·ist*: cf. *hedonism* ~ *hedonist* ~ *hedonistic*. It looks like a combination of *·ist* and *·ic*, but as with *·ical* we prefer to analyse it as a single suffix rather than a sequence of two. In the first place, there are a few adjectives in *·istic* that lack noun counterparts in *·ist*: *autistic*, *cannibalistic*, *characteristic*, *euphemistic*, *logistic*. Secondly, where there is a noun in *·ist* the meaning of the adjective tends to relate more directly to that of the noun base preceding *·ist*, or to the one in *·ism*, than to the *·ist* noun. A stylistic analysis, for example, is an analysis of the style, and need have nothing to do with a stylist. Syllogistic logic has to do with syllogisms, rather than syllogists. Note, moreover, that nouns in *·ist* that do not have counterparts in *·ism* do not in general form adjectives in *·istic*; *linguist* is one that does, but note again that *linguistic* means “pertaining to language”, not “pertaining to linguists”.

#### (k) *·ine*

This derives (via French) from a Latin suffix, and usually occurs in words borrowed from Latin or built on a Latin model: *alpine*, *bovine*, *canine*, *equine*, *feline*, *crystalline* – or, with the pronunciation /ɪn/ rather than /aɪn/, *masculine* and *feminine*. It is probably no longer productive.

(l) *·ive, ·ative*

Most adjectives in *·ive* are derived from Latinate verbs in /d/, /t/, /s/. In the case of /d/ and very often /t/, the base appears in an alternant with /s/:

[61] *attract* ~ *attractive*, *permit* ~ *permissive*, *evade* ~ *evasive*, *coerce* ~ *coercive*

The basic meaning is “tending to ~”. There is a very strong paradigmatic link with nouns in *·ion* (and its variants): compare *attraction*, *permission*, *evasion*, *coercion*. This link is also apparent in cases with bound bases, such as *aggressive* and *cognitive*. Some of the bases end in *·ate*, giving rise to derivative pairs like *appreciative* ~ *appreciation*, *decorative* ~ *decoration*, etc. – and just as *·ation* appears as a separate suffix independent of *·ate*, so too does *·ative*: compare *cause* ~ *causative* ~ *causation*, *exploit* ~ *exploitative* ~ *exploitation*. *Talkative* is exceptional in having no *·ation* counterpart. Each variant of the suffix is found with a few noun bases: *instinctive*, *sportive* (unusual also in having a native English base), *authoritative*, *qualitative*. We also find *·ive* with dephrasal compound bases, especially with subsequent nominalisation by *·ness*: *stick-to-it-iveness* (AmE).

(m) *·less*

This suffix attaches productively to nouns to derive adjectives with the meaning “without ~ / having no ~”: *careless*, *fearless*, *meaningless*. It is the negative counterpart of *·ful*, and the examples just given are among the numerous cases where there is an opposite in *·ful*: *careful*, *harmful*, *meaningful*. But just as there are adjectives in *·ful* such as *beautiful*, *respectful*, *successful*, with no established *·less* counterpart, so there are many in *·less* without an opposite in *·ful*: *headless*, *matchless*, *penniless*, *priceless*. Note also that while adjectives in *·ful* often form opposites with *un·* (*unfaithful*, *unfruitful*), the negative affixes *un·* and *·less* do not normally combine. The *·less* suffix (like *·ful*) is found with a small number of verb bases: *countless*, *fathomless*, *relentless*, *tireless*. The first two of these have modal passive paraphrases: “that can’t be counted/fathomed”.

(n) *·like*

This combines with nouns to form adjectives with the meaning “resembling ~”: *childlike*, *godlike*, *ladylike*. These examples are established words, but in general words formed in this way do not become established, though the process is available for coinages as needed: as noted in §1.3, such words can be formed as productively as the corresponding syntactic phrases (compare *cudgel-like* and *like a cudgel*, etc.). Since it occurs with the same form and meaning as a separate word, we take *like* to be a base, forming compounds, rather than a suffix, forming derivatives, but it merits inclusion in this section in that it serves an adjectivalising role in essentially the same way as an affix.

(o) *·ly*

This suffix is found mainly with noun bases: *cowardly*, *friendly*, *manly*, *rascally*. The basic meaning is “like / characteristic of / befitting ~”, but there is a considerable amount of semantic specialisation (cf. *lovely*, *orderly*, *shapely*). One special use is with nouns denoting time-periods: *daily*, *weekly*, etc., with the meaning “recurring every ~”. The suffix is also found with a number of adjective bases: *deadly*, *goodly*, *poorly*. It has not been productive since the beginning of the nineteenth century: its main semantic domain appears to have been taken over by *·like*.

(p) *·ory, ·atory*

These suffixes attach to Latinate bases, usually verbs; they are probably no longer productive. With a few exceptions such as *perfunctory* (which has a bound base) and *sensory*, adjectives in *·ory* have noun counterparts in *·ion*, and are probably best regarded as related to them by affix-replacement, especially where the base cannot stand alone as a verb: *compulsory* ~ *compulsion* (cf. also *illusory*, *satisfactory*, *transitory*). Similarly we have pairs with *·atory* and *·ation*: *accusatory* ~ *accusation* (also *condemnatory*, *explanatory*, *obligatory*, *respiratory*). The suffix *·ory* bears some resemblance to *·ary* (see (e) above), but differs in that it replaces *·ion* rather than being added to it: compare *satisfact·ion* ~ *satisfact·ory* and *react·ion* ~ *react·ion·ary*.

(q) *·ous, ·eous, ·ious, ·atious*

Many words in *·ous* are loans from French or Latin, though there are also numerous English coinages from the fourteenth through to the nineteenth centuries. In most cases *·ous* attaches to noun bases: *advantageous*, *courageous*, *hazardous*, *poisonous*, *virtuous*. With nouns in *y*, the vowel may drop (*analogous*, *blasphemous*, *monotonous*, *treacherous*) or be retained, with the suffix then spelled either *·ious* (*glorious*, *industrious*, *perfidious*, *prodigious*) or *·eous* (*beauteous*, *bounteous*, *piteous*). Both these latter variants are also found elsewhere: *spacious*, *uproarious*, *righteous*. The *·ious* variant is often in paradigmatic contrast with nominal *·ion*, as in the pair *ambitious* ~ *ambition*, and similarly for *cautious*, *rebellious*, *religious*, etc. And we have the same contrast between *·atious* and *·ation*: *disputatious* ~ *disputation*, and similarly for *flirtatious* and *vexatious*. In the form *·ious* (or *·tious*) the suffix has since at least the early twentieth century been used in jocular coinages such as *bumptious*, *rumbustious*, *scrumptious*.

(r) *·some*

This suffix is found with bases of all three major categories: nouns (*awesome*, *gamesome*), verbs (*irksome*, *meddlesome*), adjectives (*fulsome*, *wholesome*); in cases like *fearsome* and *quarrelsome*, the base could be taken as noun or verb. There were numerous words of this kind at earlier stages of the language, but many have dropped out of use, and some of those that survive no longer have recognisable bases (*handsome*, *winsome*) or indeed a recognisable base + suffix form (*buxom*, *lissom*). The suffix was being used to form new words from verb bases into the nineteenth century, but may no longer be productive.

(s) *·y, ·ey*

A great many adjectives have been formed with this suffix. It is found mainly with noun bases, generally giving the meanings “full of ~, covered with ~, having the quality of ~”: *bloody*, *cloudy*, *dirty*, *rainy*, *silky*. There are also a good number with verb bases with the meaning “inclined/apt to ~”: *floppy*, *sleepy*, *squeaky*, *sticky*. A handful have adjective bases: *lanky*, *purply*. The bases are rarely more than two syllables long, and belong to everyday vocabulary; *angry* and *hungry* have obligatory dropping of /ə/ from the base. A fair number of *·y* adjectives have an informal and rather disparaging tone (*catty*, *choosy*, *horsy*, *lanky*, *nosy*, *piggy*), but this is certainly not a necessary feature of the suffix. It is probably the most productive of the adjective-forming suffixes in current English; it is common in child language, in forms which do not become established, but it is also found in numerous neologisms: *glitzy*, *nerdy*, *trendy*, *yucky* – or *rootsy*, where *·y* follows an inflectional suffix.

The minor variant *·ey* is used when the base ends in a complex vowel symbol in *y*: *clay·ey*;<sup>52</sup> for retention of base-final *e* in the spelling of words like *cagey*, see §5.1.5.

#### (t) Conversion and phonological modification

We noted in §3.3 that there is relatively little conversion of nouns into adjectives, but that conversion of gerund-participle and past participle forms of verbs is extremely productive: *It seems very promising*; *He looked devastated*. Adjectives formed from the past participles *blessed* and *cursed* have the pronunciations /blesɪd/ and /kɜːrɪd/ as well as the unmodified /blest/ and /kɜːrst/; the forms with /ɪd/ are generally used in attributive position, as in *a blessed/cursed nuisance*.<sup>53</sup>

## 5.9 Verbalisation

Verbalisation is primarily a matter of the formation of verbs from nouns and adjectives, but as before we include cases where the same processes yield verbs from verbs.

#### (a) *·ate*

The vast majority of verbs in *·ate*, if not direct loans from Latin, were based on Latin forms rather than on English ones. Although we may recognise the *·ate* in such words as *alleviate*, *equate*, *locate*, etc., the bases are bound and can be found only in other words borrowed from Latin or founded firmly on Latin models. Even those words which appear to have English bases are frequently, from a historical perspective, either back-formations from nouns in *·ation* (*orientate*, *vaccinate*) or based on Latin (*captivate*, *domesticate*). Nevertheless, there are some genuinely English formations mainly from noun bases, such as *hydrogenate*, *hyphenate*, *orchestrate*, or (with adjective base) *activate*. This suffix has also been used in the production of mock-learned words such as *absquatulate* and *discombobulate*. In addition, there are a very few verbs where *·ate* occurs with a verb base, as in *fixate* or *prolongate*; again, however, such verbs probably did not arise by the affixation of *·ate* to the bases *fix* and *prolong*, but by back-formation from the nouns *fixation* and *prolongation*.

#### (b) *be·*

This is a very marginal member of the class of verbalising affixes, for although a good number of verbs have been formed with this prefix, in the great majority of cases the base too has been a verb. Originally *be·* was simply an unstressed form of the preposition *by*, and it is found in prepositions as well as verbs (*because*, *behind*, *beneath*, *beyond*, etc.). In some verbs historical change has resulted in its losing its morphological status as a prefix: such forms as *behave* and *believe* are not now morphologically analysable. In others the only connection with the original base is in the shared irregular inflection (*become*, *befall*, *betake*). The most salient uses of *be·* as a verbal prefix are to intensify (*bespatter*) and to form transitive verbs from intransitives (*bemoan*, *besprinkle*). The only use of *be·* that is probably still productive is in the formation of adjectives like *bejewelled* (see (g) in §5.8). The verbalising role is seen in a few de-adjectival formations such as *becalm*, *befoul*, *belittle*, and such denominals as *befool*, *behead*—and also, from a present-day perspective,

<sup>52</sup>The rarely used derivative from *sky* can be spelled *skye* or *skiey*.

<sup>53</sup>The same variation is found for *accursed* and *beloved*, though here the verbs *accuse* and *belove* which provide the historical source are no longer in use, so that the forms now have the analysis prefix + base + suffix.

*befriend* and *beguile*, though etymologically these were formed from now obsolete verbs.

(c) *·en*

This suffix is found in a good number of de-adjectival verbs: *brighten*, *dampen*, *deafen*, *harden*, *loosen*, *sicken*, *worsen*. Historically speaking, many such verbs were derived from verbs rather than adjectives, but that is no longer apparent, and not relevant to their morphological analysis. A few *·en* verbs have noun bases: *frighten*, *hearten*, *lengthen*, *strengthen*, *threaten*, but this pattern is no longer productive. Bases in the de-adjectival formation have been restricted to those ending in a plosive or a fricative, and in the last century or two the phonological restriction has been even more severe, with the only bases used ending in an alveolar plosive, /t/ or /d/. Most verbs formed by *·en* suffixation have both intransitive and transitive uses: *He weakened* ~ *This weakened his resolve*.

(d) *em·, en·, in·*

These prefixes have been used to form a considerable number of verbs, but many are now obsolete, and the pattern is probably no longer productive. Leaving aside loans with bound bases (e.g. *enamour*), the bases may be nouns, adjectives, or verbs:

- [62] i *embody*, *empower*, *encage*, *encompass*, *endanger*, *enrapture*, *enslave*  
 ii *embitter*, *enable*, *endear*, *enlarge*, *ennoble*, *enrich*, *ensure*  
 iii *enhearten*, *enliven*, *entrust*, *entwine*, *enwrap*

The main meaning for the denominal verbs in [i] is “put in ~”; there is also a type, represented here by *enslave*, with the meaning “make ~”, which is like that of the de-adjectival formations in [ii]. The verbal bases in [iii] include some containing the suffix *·en* covered in (c) above; compare also *embolden*, where the base *bolden* is no longer in use as a verb. The *em·* variant appears before bilabial /b/ and /p/. In the “put in ~” sense the prefix is semantically comparable to native *in·*, and a number of verbs have alternate spellings with *en·* and *in·*. For the most part the form with *e* is now preferred – but not, for example, in *inure* or *instate*. *Ensure* and *insure* co-exist with different meanings, and in BrE a distinction is often made between *enquire*, “ask” (e.g. about the times of trains), and *inquire*, “conduct an investigation”, with AmE having *in·* for both.

(e) *·ify*

Like *·ate*, this suffix appears mainly with Latinate bases, even if the words were coined in English rather than Latin. With adjective bases it usually means “make ~”, as in *humidify*, *purify*, *simplify*. Such verbs as *falsify* and *justify* have gained other meanings through lexicalisation. With noun bases, the meaning is generally “make into ~”, especially with technical words, such as *mummify* and *personify*. Other meanings can, however, be found in this set – for example, in *beautify*, *classify*, *glorify*. In some words the suffix has a clearly derogatory flavour, as in *countrify*, *Frenchify*, *speechify*, *preachify*. The last of these, perhaps modelled directly on *speechify*, is very unusual in being formed from a verb base (but cf. also the relatively recent *scarify*, “make scared”). The *·ify* suffix has never been used to make many words, but is still productive: witness such neologisms as *yuppyfy*. A form *·fy* is recognisable in a number of loans, such as *liquefy*, *rarefy*, *satisfy*, *stupefy* (all of which form nouns in *·faction*), but the form used in English word-formation is always *·ify* (replacing *y* in cases like *beautify*).

(f) *·ise, ·ize*

These are variant spellings of a single suffix; in BrE both are widely used, AmE has *·ize*, while AusE and NZE increasingly prefer *·ise*. The variation does not apply to words ending in an *ise* or *ize* that is not a suffix but part of the base; there are a considerable number of such words in *ise* (e.g. *advertise, advise, circumcise, comprise, despise, exercise, improvise, surprise, televise*, etc.), but very few in *ize* (*capsize, size*).

This is the most productive suffix for forming verbs in Present-day English; relatively recent examples include *colourise, computerise, walkmanise*. So productive is it, indeed, that prescriptive criticism is levelled against what some perceive as the unnecessary proliferation of *·ise* verbs.

Most *·ise* verbs are transitive, but we also find intransitives such as *deputise, philosophise, theorise*. With adjective bases the meaning is typically “make ~”: *equalise, italicise, legalise, liquidise, urbanise*. Often, however, there are more specialised meanings, as in *penalise, rationalise, visualise*. With noun bases, there is no single generalised meaning: compare *anthologise, burglarise, computerise, hospitalise, idolise, itemise, pasteurise, scrutinise, standardise, terrorise*, etc. Noun bases drop final *·y*, as in *apologise, colonise, economise*; there are also cases where *·ise* attaches to a bound base (or a bound form of one) and can be seen as replacing *·ic*: *dramatise, hypnotise, systematise*. The *·ise* suffix is in competition with other verbalising processes, and with some bases we find different formations with the same meaning (*legitimise/legitimate, syllabise/syllabify*) or with contrasting meanings (*equalise, equal, equate*).

This suffix is one of those that does not behave consistently as a Class I or Class II suffix. It is like a Class I suffix in that it regularly comes before *·ation* (as in *marginalisation*) and causes the base-final /n/ of *solemn* to be pronounced (contrast *solemnly*, with Class II *·ly*). but it is like a Class II suffix in that it can follow *·er* (as in *containerise*) and is normally stress-neutral (compare *'masculinise* and *mascu'linity*, with Class I *·ity*).

(g) *Prefixes expressing removal: de-, dis-, un-*

These prefixes were discussed in §5.5.3, but in one of their uses they have a verbalising role, creating verbs from nouns: *degrease, disarm, unhorse*. As we have observed, it is relatively unusual for prefixes to change the primary category of the base in this way.

(h) *Back-formation, conversion, and dephrasal compounding*

Several types of word-formation discussed in earlier sections may have a verbalising role. Back-formation yields verbs from nouns (e.g. compound *baby-sit*, neo-classical *televise*, simple *burgle*) and to a lesser extent from adjectives (compounds like *gobsmack* and occasionally simple bases like *laze* from *lazy*). Conversion gives verbs from nouns (recent examples being *bus, leverage, handbag*) and from adjectives (e.g. *humble* – convincing recent examples are hard to find). Dephrasal compounding is seen in such examples as *fast-track* and *soft-soap*.

## 5.10 Numerals

We use the term **numeral** for linguistic expressions and **number** for meanings. For example, *five* is a numeral expressing the number “5” – and *fifteen hundred and one thousand five hundred* are different numerals expressing the same number, “1,500”.

Numerals cut across the division between syntax and morphology: cardinal numerals expressing numbers below 100 are single words, while those expressing higher numbers are syntactically composite. The syntactic structure of the latter is to a significant extent distinct from that of other phrases, and we accordingly treat them in this chapter together with the single-word forms. We also include in this section a brief account of fractions and dates, which are also syntactically composite but closely related to numerals.

### 5.10.1 Cardinal numerals

#### ■ The single word numerals

Numerals expressing numbers below 100 are morphologically of four types: simple bases, derivatives in *-teen*, derivatives in *-ty*, and compounds:

[63]	SIMPLE		DERIVATIVE		COMPOUND
	1 <i>one</i>				21 <i>twenty-one</i>
	2 <i>two</i>		20 <i>twenty</i>		22 <i>twenty-two</i>
	3 <i>three</i>	13 <i>thirteen</i>	30 <i>thirty</i>		23 <i>twenty-three</i>
	4 <i>four</i>	14 <i>fourteen</i>	40 <i>forty</i>		24 <i>twenty-four</i>
	5 <i>five</i>	15 <i>fifteen</i>	50 <i>fifty</i>		25 <i>twenty-five</i>
	6 <i>six</i>	16 <i>sixteen</i>	60 <i>sixty</i>		26 <i>twenty-six</i>
	7 <i>seven</i>	17 <i>seventeen</i>	70 <i>seventy</i>		27 <i>twenty-seven</i>
	8 <i>eight</i>	18 <i>eighteen</i>	80 <i>eighty</i>		28 <i>twenty-eight</i>
	9 <i>nine</i>	19 <i>nineteen</i>	90 <i>ninety</i>		29 <i>twenty-nine</i>
	10 <i>ten</i>				
	11 <i>eleven</i>				
	12 <i>twelve</i>				

The suffix *-teen* indicates the addition of ten to the number expressed in the base, while *-ty* indicates its multiplication by ten.<sup>54</sup> The compound forms consist of a *-ty* derivative followed by a simple base in the range 1–9, with the meaning of addition; those in [63] are representative of the eight sets of such forms.<sup>55</sup>

The underlined forms in [63] exhibit minor irregularities:

- [64] i 13, 30: /θɜːr/, *thir-*, as a variant of /θriː/, *three*.  
 ii 15, 50: devoicing of /v/ to /f/, matched in the spelling; shortening of /aɪ/ to /ɪ/, reflected in the spelling by loss of base-final *e*.  
 iii 18, 80: reduction from double to single /t/, *t*.  
 iv 20: /twen/, *twen-*, as variant of /tuː/, *two*.  
 v 40: *forty* lacks the *u* of *four*.

Historically, *eleven* and *twelve* are complex forms too, but although this is reflected in the partial similarity between them and in the *tw* of *twelve* shared with *twenty* and (in writing) *two*, the present-day forms cannot usefully be analysed into base + suffix and

<sup>54</sup>Words in *-teen* – like many other words used attributively – have variable stress: compare *He had 'fourteen 'books / four'teen clari'nets* and *We need four'teen*. The stress falls on the base if the next word in the phonological phrase is stressed near the beginning, otherwise generally on the suffix. The suffixes /ti/ and /tiːn/ are phonetically quite similar, especially in attributive position, and it is not uncommon for speakers to take special measures (such as exaggerated enunciation of the /n/ of /tiːn/) to guard against misperception. The suffix *-teen* has given rise, by conversion, to a noun *teen*, covering numbers in the range of 13 to 19; it applies primarily to ages, as in *a boy in his teens*, *a teenager* – but cf. also *temperatures in the teens*.

<sup>55</sup>The second base can also be *something*, as in *thirty-something*, for ages in the range 31–39. Such forms can convert to nouns: *thirty-somethings*, “people in their thirties”.

are better treated as simple bases. As evident from [63], therefore, the words are not as regular and systematic as the representations in figures.

### ■ The syntactically composite numerals

The numerals expressing numbers above 99 have a syntactic structure consisting of a head obligatorily preceded by a **multiplier** and optionally followed by an **addition**:

[65]	MULTIPLIER	HEAD	ADDITION	
	i <i>five</i>	<i>hundred</i>	<i>and three</i>	503
	ii <i>five hundred</i>	<i>thousand</i>	<i>and ninety-seven</i>	500,097
	iii <i>two hundred and three</i>	<i>thousand</i>	<i>six hundred and ten</i>	203,610
	iv <i>four thousand five hundred</i>	<i>million</i>	<i>seven hundred thousand</i>	4,500,700,000

The meaning of the dependent functions is as indicated by the labels; [i] thus comes out as “ $(5 \times 10^2) + 3$ ”, [ii] as “ $(500 \times 10^3) + 97$ ”, and so on. The multiplier position is itself filled by a numeral, a single word, as in [i], or a syntactically composite one, as in [ii–iv]. The addition position is filled by what we will call an ‘additional numeral’: this consists of either *and* followed by a single-word numeral, as in [i–ii], or just another syntactically composite numeral, as in [ii–iii]. The fact that one numeral can occur within the structure of another means that the construction is recursive: just as there is no largest number, so there is no limit to how many layers of embedding there can be of one numeral within another.

### The power-of-ten words

The head position is filled by a word with a meaning involving a power of 10:

[66]	<i>hundred</i> (“ $10^2$ ”), <i>thousand</i> (“ $10^3$ ”), <i>million</i> (“ $10^6$ ”), <i>billion</i> (“ $10^{12}$ ” or “ $10^9$ ”), <i>trillion</i> (“ $10^{18}$ ” or “ $10^{12}$ ”), <i>quadrillion</i> . . .
------	---

Outside the numeral system these words appear with the plural inflection, usually with a following *of* phrase: *hundreds of dollars*, *thousands of people* (see Ch. 5, §3.3). In numerals, however, they are always uninflected: *five hundred and three*, not \**five hundreds and three*. The forms *billion*, *trillion*, etc., can be morphologically analysed into a prefix + the bound base *-illion*. The meaning of *-illion* can be given as “ $1,000 \times 1,000$ ”; the prefix indicates a power, and the ambiguity is a matter of whether it applies to “ $1,000 \times 1,000$ ” itself or just to one of the 1000’s. *Billion*, with *b-* a variant of *bi-*, “two”, can thus mean “ $(1,000 \times 1,000)^2$ ”, i.e. “a million million,  $10^{12}$ ”, or “ $1,000 \times 1,000^2$ ”, i.e. “a thousand million,  $10^9$ ”. In AmE it has the latter meaning, and in BrE this meaning is now the predominant one, with the older “million million” meaning somewhat outdated. Etymologically, *-illion* is a base extracted from *million*, and this is reflected in the fact that *million* itself is best regarded as morphologically simple, the variant of *-illion* that occurs when there is no prefix: an analysis as *m-illion* would leave us with a prefix that didn’t occur elsewhere and was semantically unmotivated.

### Restrictions on the embedded numerals

The embedding of one numeral within another is subject to the following restrictions:

- [67] i The head word in a subordinate numeral must be lower than that in the matrix, except that, with high numbers, the head word in the multiplier may be the same as that in the matrix.
- ii When the head word is *hundred* the multiplier cannot be *ten* or a *-ty* derivative.

Restriction [i] excludes [a] in favour of [b] in the following examples, where the head word of the matrix numeral is underlined:

- [68] i a. \*two thousand hundred and ten      b. two hundred thousand and ten  
 ii a. \*six hundred hundred and one      b. sixty thousand and one  
 iii a. \*one hundred two thousand and six      b. two thousand one hundred and six  
 iv a. \*two hundred one hundred and one      b. three hundred and one

The exception allowed for is illustrated in forms like *two billion billion* – in contrast to \**two hundred hundred* or \**two thousand thousand*.<sup>56</sup> Restriction [67ii] excludes forms like [69ia/iaa], but otherwise the system allows for different ways of expressing the numbers in the range 1,000–9,999:

- [69] i a. \*ten hundred      b. one/a thousand  
 ii a. \*sixty hundred and fifteen      b. six thousand and fifteen  
 iii a. nineteen hundred and ten      b. one thousand nine hundred and ten  
 iv a. sixty-one hundred and forty      b. six thousand one hundred and forty

#### A as variant of one, and omission of multiplier

The indefinite article *a* occurs as a variant of *one* when it is the first numeral word, but *a* is dropped if the matrix numeral is functioning as dependent in NP structure and is preceded by a determiner:

- [70] i a. one hundred and ten      b. a hundred and ten  
 ii a. two thousand one hundred and ten      b. \*two thousand a hundred and ten  
 iii a. the one hundred pounds I owe you      b. the hundred pounds I owe you

### 5.10.2 Ordinal numerals, fractions, and dates

Ordinals are formed from cardinals. The form depends on the final base of the cardinal, so that *twenty-one*, *two hundred and one*, etc., form ordinals in the same way as *one*, giving *twenty-first*, *two hundred and first*, etc. Similarly, *forty-five*, *three thousand and sixty-five*, etc., form ordinals in the same way as *five*: *forty-fifth*, *three thousand and sixty-fifth*. The rules applying to the final base are as follows:

[71]	BASE	CHANGE	EXAMPLES
i	<i>one</i>	replace by <i>first</i>	<i>first</i> <i>twenty-first</i> <i>thirty-first</i>
ii	<i>two</i>	replace by <i>second</i>	<i>second</i> <i>twenty-second</i> <i>thirty-second</i>
iii	<i>three</i>	replace by <i>third</i>	<i>third</i> <i>twenty-third</i> <i>thirty-third</i>
iv	<i>five, twelve</i> } <i>eight, nine</i> }	add /θ/, <i>·th</i> , and	{ <i>fifth</i> <i>twelfth</i> <i>twenty-fifth</i>
		modify base	
v	... <i>·ty</i>	add /əθ/, <i>·eth</i>	{ <i>twentieth</i> <i>thirtieth</i> <i>fortieth</i>
		( <i>y</i> → <i>i</i> )	
vi	Others	add /θ/, <i>·th</i>	<i>fourth</i> <i>sixth</i> <i>seventh</i>

The modification of base *five* in *fifth* is the same as in *fifteen* and *fifty*, while the devoicing of /v/ applies also to *twelve* (which doesn't enter into the other derivatives). With *eighth* and *ninth* the modification is purely a matter of spelling: double *t* is again reduced (whereas

<sup>56</sup>The form *a/one thousand thousand* might be used in a definition (*A million is a thousand thousand*), but hardly elsewhere (*She earns over a million / \*thousand thousand pounds a year*).

/t/ is retained in speech before /θ/, and there is irregular dropping of base-final *e* with *nine*. The replacement of *y* by *i* in the *-ty* forms follows the general rule (§5.1.5).

### ■ Fractions

Fractions are expressed by NPs in which the numerator functions as determiner and the denominator as head:

[72]	$1/2$	( <i>a</i> ) <i>half</i>	$1/3$	<i>alone third</i>	$2/3$	<i>two thirds</i>
	$3/4$	<i>three quarters</i>	$5/8$	<i>five eighths</i>	$3/200$	<i>three two hundredths</i>

The head is a noun or nominal converted from an ordinal numeral: note the contrast between singular and plural forms. The determiner is realised by a cardinal numeral, except that the indefinite article can be used instead of *one*. With *half* as head the only possible numerator is “1”, and the determiner is here omissible: *I ate half of it* (see Ch. 5, §12).

### ■ Dates

There are numerous ways of representing dates, as illustrated in:

[73]	i	2 June 1980	2nd June 1980	June 2, 1980	June 2nd, 1980
	ii	2/6/80	2.6.80	2-6-80	2.vi.80
	iii	<i>the second of June, nineteen eighty</i>		<i>June the second, nineteen eighty</i>	

In writing, the day and year are normally given in figures: written forms like those in [iii] are more or less restricted to legal documents. The month may be given as a word or figure, as in [i–ii] respectively. In recent times the versions of [i] with cardinal numerals have become increasingly favoured over those with ordinals. As shown in [i], the day may precede or follow the month, and the first three versions of [ii] are ambiguous between “2 June 1980” (BrE) and “February 6, 1980” (AmE). The fourth version is unambiguous, with roman *vi* indicating the month – but this represents very much a minority usage in English.

The most usual way of giving dates in speech is as in [73iii], but shorter versions matching the written forms of [i–ii] are also found (e.g. /tu: dʒu:n nɑnti:n ɛrti/). Forms such as *the second of June* clearly have an ordinary NP structure. *Second* functions here as fused modifier-head: compare *the second day of June*, found in legal texts.

The year, whether accompanied by day/month or not, is usually given in speech as in [73iii], but the version with a complex cardinal numeral – *nineteen hundred and eighty* – is found as a formal alternant. Note that for years in the range 1100–1999 we count in hundreds, not thousands – thus not \**one thousand nine hundred and eighty* (cf. the alternation shown in [69iii] for other uses of numerals). For years in this range ending in ‘00’, *hundred* cannot be omitted: “1900” is expressed as *nineteen hundred*. For years ending in ‘01’–‘09’, the version matching [73iii] gives the last two digits separately: /nɑnti:n ɒʊ wʌn/ for “1901”, and so on. This pattern has not been preserved into the new millennium, however: at the time of writing, we have such forms as *two thousand and one* for “2001”, but not \*/*twenti* ɒʊ wʌn/.

## 5.10.3 Words incorporating numerical elements

Many words have meanings which incorporate numbers: the numbers in such cases may be expressed by means of the ordinary English numeral bases or by elements originating from other languages, primarily but not exclusively Latin and Greek. The numerical components may be prefixes (such as *semi-* from Latin or *demi-* from French), combining

forms (all the Greek elements, and such elements as *quadri-* from Latin), or other bases (free, as with all the English elements, or bound, as with Latin *sept-*, etc.). A sample of such words is given in [74], where the numerical element is underlined and classified according to its etymological source; we have also included a few incorporating quantifying rather than numerical elements.

[74]	NO.	ENGLISH	LATIN	GREEK
	1	<i>one-sided</i>	<i>uni-lateral</i>	<i>mono-logue</i>
	2	<i>two-faced</i>	<i>bi-focal, du-plex</i>	<i>di-graph, duo-poly</i>
	3	<i>three-speed</i>	<i>tri-angle</i>	<i>tri-hedron</i>
	4	<i>four-poster</i>	<i>quart-et, quadri-plegia, quadra-phonic, quadru-ped</i>	<i>tetra-hedron</i>
	5	<i>five-star (hotel)</i>	<i>quint-et, quin-centenary, quinqu-ennium</i>	<i>penta-tonic</i>
	6	<i>six-shooter</i>	<i>sext-et, sex-foil, sexi-syllabic</i>	<i>hexa-gram</i>
	7	<i>seven-year (itch)</i>	<i>sept-uplet, septi-valent</i>	<i>hepta-meter</i>
	8	<i>eight-hour (day)</i>	<i>octo-syllabic, oct-ennial</i>	<i>octo-pus</i>
	9	<i>nine-pins</i>	<i>non-ary, nona-gon</i>	<i>ennea-hedron</i>
	10	<i>ten-gallon (hat)</i>	<i>dec-ennium, decem-pedal</i>	<i>deca-pod</i>
	20		<i>viges-imal</i>	
	100	<i>hundred-weight</i>	<i>cent-ennial, centi-grade</i>	<i>hecto-litre, heca-tomb</i>
	1,000		<i>mill-ennium</i>	<i>kilo-gram</i>
		<i>few</i>	<i>pauc-ity</i>	
		<i>many many-sided</i>	<i>multi-faceted</i>	<i>poly-math</i>
		<i>all all-powerful</i>	<i>omni-potent</i>	<i>pan-sophy</i>

In the English column we have given only lexicalised words; some word-formation processes, however, are completely productive, so that other numerals can be incorporated in such nonce-words as *thirty-two-sided*. The Latin and Greek columns involve a good few variant forms; one reason for this is that the original source may be an ordinal numeral rather than a cardinal, while another concerns the presence or absence of medial vowels in neo-classical compounds (see §4.5 for discussion of this issue). The Greek and Latin numerals for 2, 3, 8, and 10 were similar, and this is reflected in the likeness or identity between the corresponding elements in [74].<sup>57</sup>

Words incorporating the numbers 50, 60, 70, 80, 90 are based on Latin: *quinquagen-arian*, *sexagen-arian*, *septuagen-arian*, *octogen-arian*, *nonagen-arian*, where the Latin elements are themselves derived from the numerals for 5, 6, etc. Units of measure involving numbers greater than 1,000 contain combining forms based on Greek:

[75] 10<sup>6</sup>: *mega-byte* 10<sup>9</sup>: *giga-watt* 10<sup>12</sup>: *tera-bit* 10<sup>15</sup>: *peta-joule* 10<sup>18</sup>: *exa-hertz*

The Greek sources here, however, do not themselves denote large numbers: *mega-* is from *me-gas* “great”, *giga-* from *gigas* “giant”, *tera-* from *teras* “monster”, while *peta-* and *exa-* are based on the above forms for 5 and 6, *penta-* and *hexa-*.<sup>58</sup>

<sup>57</sup>Derivatives with *bi-* attaching to a temporal expression such as *weekly*, *monthly*, *yearly* are ambiguous between the interpretations “every two ~” and “twice per ~”. The meanings are, however, distinguished by the base in *biannual* “twice a year” and *biennial* “every two years”.

<sup>58</sup>The opposite case is seen in such words as *millipede* and *quintessence*: the underlined elements have numerals as their etymological source, but the meanings of these words do not incorporate numbers.

Words incorporating fractions are illustrated in:

- [76] i  $\frac{1}{2}$ : *half·time*    *semi·circle* (Lat)    *hemi·sphere* (Grk)    *demi·god* (French)  
 ii  $\frac{1}{10}$ : *deci·bel*     $\frac{1}{100}$ : *centi·metre*     $\frac{1}{1000}$ : *milli·litre*  
 iii  $\frac{1}{10^6}$ : *micro·watt*     $\frac{1}{10^9}$ : *nano·gram*     $\frac{1}{10^{12}}$ : *pico·curie*     $\frac{1}{10^{15}}$ : *femto·ampere*  
 $\frac{1}{10^{18}}$ : *atto·second*

For “ $\frac{1}{2}$ ” we have four different elements, all distinct from the terms for integral numbers; the three non-native ones combine in the word *hemidemisemiquaver* (BrE). The elements in [ii] come from Latin; leaving aside the question of the medial vowels, the forms are the same as for the corresponding whole numbers in [74], but the standard international system for units of measure systematically uses Latin elements for units involving the fractions in [76], and Greek ones for those incorporating the corresponding non-fractions, 10, 100, and 1,000, as in [74]. In [76iii] *micro·* and *nano·* are from the Greek words meaning “small” and “dwarf” respectively – the opposites of *mega·* and *giga·* in [75]; *pico* is a Spanish word meaning “beak, little bit”, while *femto* and *atto* are adapted from the Danish/Norwegian words for 15 and 18.

## 1 Preliminaries

### 1.1 The domain of punctuation

The central concern of punctuation is with the use of the various **punctuation marks**, such as the full stop, comma, semicolon, colon, question mark, quotation marks, parentheses, and so on. These serve to give indications of the grammatical structure and/or meaning of stretches of written text. The punctuation marks are all **segmental** units of writing – i.e. they fully occupy a position in the linear sequence of written symbols. There are, however, various **non-segmental** features which can serve the same kind of purpose as the punctuation marks. For example, titles of literary or other works may be italicised as an alternative to being enclosed in quotation marks. And while the end of a sentence is indicated segmentally by a punctuation mark (a full stop, question mark, or exclamation mark), the beginning of a sentence is indicated non-segmentally by capitalisation of the first letter. We will therefore regard punctuation as covering the use not only of punctuation marks but also of such non-segmental features as italics, capital letters, bold face, and small capitals. Ordinary lower-case roman represents the default form, and these non-segmental features can be regarded as **modifications** of the default form.

One other important aspect of punctuation is the use of space, notably to separate one word from the next. Space between words is a segmental unit: like the punctuation marks, it occupies the whole of one position in linear sequence. For example, in this sentence a word space occupies the fourth position, the thirteenth position, and so on. We will use the term **punctuation indicator** as a general term covering punctuation marks and the other devices that fall within the domain of punctuation. The classification is thus as follows:

On another dimension, we need to clarify the domain of punctuation with respect to the size of the unit to which the punctuation applies. The punctuation marks mentioned above generally occur within a sentence (including its final boundary) but outside the individual words. There are two punctuation marks, however, that are normally word-internal: the apostrophe and the hyphen. Words may also contain various non-segmental marks, **diacritics**, but we do not regard these as falling within the domain of punctuation. For example, accents (which do not of course appear in native English words, but are nevertheless found in some words that are otherwise fully anglicised, such as *fiancé*)

are simply a matter of word-spelling.<sup>1</sup> There are also punctuation marks that can apply beyond the sentence: parentheses and quotation marks can enclose stretches of writing longer than a sentence. In addition, the division of a text into paragraphs (marked by a new line and, usually, indentation space) can also be regarded as a matter of punctuation. It is not usual, however, and nor would it be helpful, to extend the domain of punctuation to cover the lay-out of larger units (division into chapters or sections, use and format of headings, and so on). It follows that a non-segmental feature such as italics counts as a punctuation indicator when it serves to mark quotation, a title, or emphasis, but not when it is used for a heading of a certain hierarchical level in the organisational structure of a book or comparable document.

## 1.2 Indicators and characters

In virtually all written material the apostrophe is physically – or, as we shall say, graphically – identical with a single quotation mark. We need, therefore, to distinguish between two kinds of concept which we will call **indicators** and **characters**. The characters are the graphical shapes, or symbols, that **realise** the indicators. Apostrophe and single quotation mark are then distinct indicators that may be realised by the same character.

For reasons we will discuss in §6, we take single and double quotation marks as distinct indicators, but each of them can be realised by three different characters. Quotation marks normally occur in pairs, and there is one character that is used to open the quotation (‘ or “), another which is used to close it (’ or ”), and a third that is used in both positions in fonts (such as the standard typewriter keyboard) that do not have the separate opening and closing characters ( ‘ or ’ ). We do not have opening and closing quotation marks as distinct indicators because the choice of character is predictable from the position: they are contextual variants of the same indicator. But the apostrophe has to be distinguished from the single quotation mark because it can never be realised by the character used to open a quotation – even when it is used at the beginning of a word, as in *rock ‘n’ roll* (not \**rock ‘n’ roll*).

The distinction between indicator and character is also important with respect to dashes and hyphens. We distinguish three indicators, illustrated in:

- |     |     |                   |  |
|-----|-----|-------------------|--|
| [2] | i   | DASH              | <i>He’s late – he always is.</i>       |
|     | ii  | (ORDINARY) HYPHEN | <i>non-negotiable</i>                  |
|     | iii | LONG HYPHEN       | <i>the doctor–patient relationship</i> |

We also distinguish three characters: em-rule (—), en-rule (–), and hyphen-character (-). Depending in part on the resources available (the standard typewriter keyboard has only the hyphen-character), in part on the publisher’s house style, the dash indicator may be realised by any of the three characters or by a sequence of two hyphen-characters; the en-rule and the single hyphen-character are flanked by spaces, while the other two realisations may or may not be. The ordinary hyphen is realised by a hyphen-character without flanking spaces. The long hyphen is a relatively minor punctuation mark with a very restricted use; in some styles it is not used at all, the ordinary hyphen taking over

<sup>1</sup>The diaeresis (¨) is a borderline case. In morphologically simple words like *naïve* or *Brontë*, it is again simply a matter of spelling, but in AmE *coöperate* its function is comparable to that of the hyphen (cf. *co-operate*).

its functions (as in *the doctor-patient relationship*), but when it is recognised as a distinct indicator it is normally realised by the en-rule without flanking spaces.<sup>2</sup>

Consider finally the full stop and ellipsis points. The full stop is used to mark the end of a sentence or an abbreviation (as in *Col. Blimp*), but as these always have the same realisation we regard them as different uses of a single indicator. There is, however, a distinct indicator that is used to mark omission (as in *The President said, 'We will send as many troops as it takes . . . to restore order in the region'*); this indicator, which we call **ellipsis points**, is realised by a sequence of three dot characters or a single character consisting of a sequence of three dots.

In most other cases we have a simple one-to-one relation between indicator and character. The following table lists the punctuation marks we shall be concerned with, giving their realisation and commonly used alternative terms:

[3]	INDICATOR	REALISATION(S)	ALTERNATIVE TERMS
i	full stop	.	period (AmE)
ii	question mark	?	
iii	exclamation mark	!	exclamation point (AmE)
iv	comma	,	
v	semicolon	;	
vi	colon	:	
vii	dash	—	
viii	parenthesis	( )	round bracket (BrE)
ix	square bracket	[ ]	bracket (AmE) <sup>3</sup>
x	ellipsis points	. . .	ellipsis
xi	double quotation mark	“ ”	double/single quote (mark), inverted commas
xii	single quotation mark	‘ ’	
xiii	apostrophe	’	
xiv	slash	/	stroke, solidus, virgule
xv	long hyphen	—	en-dash
xvi	ordinary hyphen	-	-
xvii	asterisk	*	

### 1.3 The status of punctuation rules

A great deal of the written material that we read is put out by publishers (of books, newspapers, journals, etc.) with the text edited by people whose profession is precisely to prepare text for publication. To a significant extent this process involves the conscious application of codified rules, set out in manuals specific to a particular publishing house or accepted more widely as authoritative guides. Those outside the publishing trade are generally likely to be unfamiliar with at least some of the more technical rules, and in

<sup>2</sup>The em-rule and en-rule are so called because their length is (approximately) that of the letters *m* and *n* respectively. The em-rule and en-rule characters are often called em-dash and en-dash respectively, but from our perspective these are unfortunate terms, blurring the distinction between characters and indicators. ‘Long hyphen’ is not a well-established term, but since its function is manifestly much more like that of an ordinary hyphen than that of a dash we prefer this term to the more usual ‘en-dash.’

<sup>3</sup>In BrE the term ‘bracket’ is commonly used as a cover term for both the indicators [3viii–ix], which are distinguished as respectively ‘round’ and ‘square’.

the context of preparing text for potential publication many writers will defer to the advice of handbooks and the like. It is true, of course, that style guides commonly deal with points of grammatical usage too, but here they have a less influential role: a very high proportion of our use of language involves spontaneous speech, with no need or opportunity to consult such works. For this reason, we ourselves in writing this chapter on punctuation have given greater weight to the prescriptions of major style manuals than we have in the chapters on grammar. But we should also note that many of the rules of punctuation that have been mastered by competent writers are part of tacit linguistic knowledge no less than the rules of spoken language are, and as such are never mentioned in usage manuals or style guides.

### ■ Variation

In spite of the codification mentioned above, punctuation practice is by no means entirely uniform. On some matters, such as whether or not to mark abbreviations with a full stop, we find variation from one publishing house to another. More important, there is some significant regional variation, most notably with respect to the interaction between quotation marks and other punctuation marks.<sup>4</sup>

It is worth noting, however, that we do not find social variation between standard and non-standard such as we have in grammar: there is no punctuational counterpart of grammatically non-standard usage like *I ain't done nothing* or *Who done that?* – that is, a repertory of variants that are used in a consistent way by one social group but not by another. Moreover, the style contrast between formal and informal is of relatively limited relevance to punctuation. One might say that the multiple question marks and exclamation marks in [4] belong to informal style:

- [4] i *They're coming for a week: what on earth are we going to do with them??*  
 ii *Thanks for inviting us – we had a wonderful time!!*

It is true that such uses of punctuation are rarely if ever found in the formal style of academic or legal writing. But we should bear in mind that there are many writers who would never use punctuation in this way: such usage is not comparable with the informal style grammar of, say, *I don't know who he's referring to*, which virtually all speakers would use in all but quite formal contexts in preference to *I don't know to whom he's referring*.

What we do find, however, is a distinction between **light** and **heavy** punctuation styles that is independent of regional and publishing house variation:<sup>5</sup>

- [5] i *On Sundays they like to have a picnic lunch in the park if it's fine.* [light]  
 ii *On Sundays, they like to have a picnic lunch in the park, if it's fine.* [heavy]

This distinction has to do with optional punctuation, especially commas: a light style puts in relatively few commas (or other marks) in those places where they are optional rather than obligatory.

<sup>4</sup>There is also an appreciable amount of historical variation. One notable change is that capital letters are no longer used for common nouns as well as proper nouns. An example of a more specific change is that the semicolon is not now admissible in the construction illustrated in, say, Jane Austen's *His good looks and his rank had one fair claim on his attachment; since to them he must have owed a wife of very superior character to any thing deserved by his own*.

<sup>5</sup>Alternative terms are 'open' and 'closed' respectively.

## 1.4 Units of syntax and units of writing

### ■ The orthographic sentence

Syntax is traditionally defined as the study of the way words combine to form sentences, but from a syntactic point of view the delimitation of the sentence is quite problematic. A sentence may have the form of a clause or of a sequence of clauses, and while sentences with the form of a clause can generally be delimited straightforwardly, it is not so clear when successive clauses are syntactically combined into a larger unit. The central cases of sentences with the form of a sequence of clauses are those where the clauses are coordinated, with at least one of them being marked by a coordinator. The syntactic construction of coordination, however, does not have to be explicitly marked by means of a coordinator: coordination can be *asyndetic* (Ch. 15, §1.1). This is evident from the examples like *Her family, her friends, her colleagues had all rallied to her support*, where the underlined NPs combine to form an *asyndetic NP-coordination* that functions as subject of the clause. Note also that the *gapping* construction can occur with *asyndetic coordination*. Compare, then:

- [6] i *Kim went to the concert, but Pat stayed at home.*  
 ii *Some went by bus, some by train.*  
 iii *Some went to the concert, some stayed at home.*

In [i] the coordination is marked by the coordinator *but*. In [ii] omission of the verb of the second clause, by *gapping*, serves to mark unequivocally that the clauses belong together in a larger syntactic unit. But in [iii] there is no overt marking of the coordinative relation between the clauses.

Coordination, moreover, is not the only syntactic relation that need not be marked by any formal device. The same applies with *supplementation* (Ch. 15, §5). Compare:

- [7] i *There's another reason why we should hesitate – (namely,) the likelihood that interest rates will rise again in a few months.*  
 ii *There's another reason why we should hesitate – (namely,) it is likely that interest rates will rise again in a few months.*

In [i] the supplement is an NP, while in [ii] it is a main clause; in both cases *namely* is optional, so that in the version of [ii] without *namely* there is no structural marking of the relation between the two clauses.

For these reasons there will often be no syntactically marked distinction between a sentence with the form of a combination of two successive main clauses and a sequence of two sentences each of which has the form of a main clause. In writing, one function of punctuation is precisely to indicate whether successive clauses belong together or are to be treated as separate. In speech, prosody also serves to convey information about the relation between successive clauses, but it is important to emphasise that punctuation cannot be described as a means of representing the prosodic properties of utterances. When we are talking about the relation between successive main clauses, therefore, we cannot be neutral between the spoken and written medium. The term **orthographic sentence** is therefore applied to the unit that is defined by punctuation: leaving aside complications that we will take up below, an *orthographic sentence* is a unit of writing that begins with a capital letter and ends with a full stop, question mark, or exclamation mark. The term 'orthographic sentence' embodies no commitment as to whether or not

the unit concerned is syntactically a sentence, a question which may have no determinate answer. Since this chapter is about punctuation, however, we will henceforth take it for granted that the term ‘sentence’ on its own is to be understood as “orthographic sentence” unless we explicitly indicate otherwise.

### ■ The orthographic word

Similar issues arise with the word. In the grammar we make a distinction between a morphologically complex word and a syntactic construction containing separate words:

- [8] i *I left the watering-can in the greenhouse.* [complex word]  
 ii *Who lives in that green house opposite?* [syntactic construction]

In [i] *greenhouse* is a single complex word (more specifically, a compound) denoting a building made of glass used for growing plants that need warmth; in [ii] *green house* is a sequence of two words forming a nominal with the structure modifier + head and denoting a house that is green in colour. The basis for drawing this distinction is discussed in Ch. 5, §14.4, but again the criteria do not always yield clear-cut results, and even where they do the grammatical analysis will not always match up with the written form. We therefore need the concept of an **orthographic word** that is defined by punctuation: leaving aside again certain complications, an orthographic word is a minimal unit of writing that is flanked by spaces which are either immediately adjacent to it or are separated from it by punctuation marks. As with ‘orthographic sentence’, the term ‘orthographic word’ is neutral as to whether or not the unit is grammatically a single whole word, and again for the remainder of this chapter the term ‘word’ on its own is to be understood as “orthographic word” unless otherwise specified.

## 1.5 Functions and classification of punctuation indicators

### ■ Four main functions

The punctuation indicators serve a range of functions which can be grouped (leaving aside a few minor special purpose uses) into four main types.

#### (a) Indicating boundaries

- [9] i *You will have to make a decision soon. It is not for me to try to influence you.*  
 ii *By all means take the book with you, but be sure to return it.*

In [i] we have a succession of two sentences, their boundaries being marked by the capital letter at the beginning and the full stop at the end. In addition, the spaces mark the boundaries between words. In [ii] the comma marks the boundary between two main clauses that are combined within a single sentence. Boundary marking can be regarded as the primary function of punctuation marks; it is not mutually exclusive with the other functions, and indeed is at least incidentally involved in virtually all uses.

#### (b) Indicating status

- [10] i *What does Frank think about it?*  
 ii *The boys’ behaviour was hardly likely to make her change her mind!*

The question mark in [i] serves to mark the sentence boundary, but at the same time it indicates that the sentence is a question; and the capital letter at the beginning of *Frank* indicates that this expression has the status of a proper name. In [ii] the apostrophe

marks the noun as genitive, while the exclamation mark combines the functions of marking the sentence boundary and indicating that the sentence has the status of an exclamation.

#### (c) Indicating omission

- [11] i *She goes on to say, ‘But Johnson . . . was willing to accept a fee for the work.’*  
 ii *‘F\*\*\* off!’ he yelled, ‘or I’ll call the police.’*

The ellipsis points indicator in [i] marks the omission from the reported speech of one or more words that occupied this position in the original. In [ii] the asterisks mark the suppression of letters from the taboo word *fuck*, while the apostrophe signals the reduction and cliticisation of the word *will*.

#### (d) Indicating linkage

- [12] i *The Management will continue to concentrate on completing the redevelopment/acquisition programme outlined above.*  
 ii *I met her in the dining-car of the London–Glasgow express.*

The slash and the two types of hyphen serve to link, to relate the items on either side of them. In [i] we understand “the programme of redevelopment or acquisition”; in [ii] the ordinary hyphen joins the two noun bases into a compound noun, while the long hyphen joins the two place-names into a single modifier of the head *express* (with the interpretation “express going from London to Glasgow”).

### ■ Prevention of misreading

We have noted that punctuation marks are often optional, with light and heavy styles differing with respect to how many of these optional marks are inserted. Even in what is overall a light style, however, such indicators will tend to be added if their omission might lead to an initial misreading of the sentence. Indeed, indicators may be inserted to prevent confusion of this kind even in places where they would not normally be permitted. Compare:

- [13] i *Liz recognised the t-shirt he took from the bag and gasped.*  
 ii *Liz recognised the man who entered the room, and gasped.*  
 iii *Most of those who can, work at home.*

While [i] has no internal punctuation, [ii] – which has the same syntactic structure in relevant respects – has a comma which serves to make clear that it was Liz who gasped, not the man. In [iii] the comma marks the boundary between subject and verb, contrary to the general rule prohibiting punctuation in this position; what makes it justifiable here is that without it *work* is likely to be at first taken as head of the complement of *can* rather than of the matrix predicate.

### ■ Organisation of this chapter

It will be evident from the brief survey with which we began this section that a number of indicators have diverse functions. Most notably, perhaps, the full stop can mark the end of a sentence or indicate an abbreviation. As a consequence, it is not possible to draw up a satisfactory unidimensional classification of the punctuation indicators. The organisation of the rest of this chapter, therefore, represents a compromise between treating them in successive subsets and dealing with them function by function.

In §2 we describe what we call the **primary terminals**: the full stop as used to end a sentence, and the question and exclamation marks. With the latter two the function of marking status is more important than that of marking a terminal boundary, and they are not constrained to occur at the end of a sentence; nevertheless, they are mutually exclusive with the terminal full stop, and hence form a natural group with it.

A second group, dealt with in §3, consists of the comma, the semicolon, and the colon, which we refer to as **secondary boundary marks**. They are secondary in the sense that they mark boundaries within a sentence, not between sentences. Or rather, that is invariably the case with the comma and the semicolon, and predominantly the case with the colon.

We turn next, in §4, to parentheses. These occur in pairs (with distinct opening and closing characters), enclosing units which are usually smaller than a sentence, but do not have to be. In §5 we turn to the dash; in most of its uses this is a secondary boundary mark, but it has considerable affinities with the parenthesis, and hence is best dealt with at this point in the exposition.

The following section, §6, covers the related functions of quotation, citation, and naming. Quotation marks, single or double, are the main indicators for these functions, but italicisation is used too, and there are also places where there is no punctuational indication at all. Square brackets and ellipsis points occur primarily within quotations and are thus dealt with in this section. Related in some respects to quotation is capitalisation, the topic of §7.

Finally, §8 deals with those aspects of word-level punctuation not already covered. By **word-level punctuation** we mean the marking of word boundaries and the use of punctuation marks (mainly hyphens and apostrophes) within a word. Other punctuation we will refer to by contrast as **higher-level punctuation**. We treat the slash as a word-level punctuation indicator on the grounds that it is not (or at least not normally) flanked by spaces.

## 2 Primary terminals

For the most part, discursive written text consists of a sequence of sentences, each beginning with a capital letter and ending with a primary terminal – a full stop, a question mark, or an exclamation mark.

The full stop that marks the end of a sentence we refer to as the **terminal full stop**, as opposed to the **abbreviation full stop** (and various more specialised uses of this indicator). We suggested above that the primary function of the question and exclamation marks is to indicate status rather than boundaries, and this is reflected in the fact that they differ from the terminal full stop in being able to occur medially, internally within a sentence, and to be followed by other punctuation marks:

- [1] i *She had finally decided – and who can blame her? – to go her own way.*  
 ii *Her son – what a scoundrel he is! – is threatening to sue her.*  
 iii *\*Southern liberals – There are a good many. – often exhibit blithe insouciance.*

Medial questions and exclamations do not normally begin with a capital letter except in the case of quotation (see §6): the expressions interpolated between the dashes in [i–ii] are thus grammatical clauses but not orthographic sentences.

### ■ Sentence terminals and clause type

In sentences with the form of a single clause, there is a significant correlation between terminals and clause type. The default relations are illustrated in:

[2]		CLAUSE TYPE	SENTENCE TERMINAL
i	<i>Kim has arrived.</i>	declarative	} full stop
ii	<i>Let me know if you need any help.</i>	imperative	
iii	<i>Have you seen my glasses?</i>	interrogative	question mark
iv	<i>What nonsense they talk!</i>	exclamative	exclamation mark

The correlation, however, is very imperfect: the punctuation marks match the meaning and illocutionary force much more directly than do the syntactic clause type categories (see Ch. 10, §3, for the concept of illocutionary force and its relation to clause type).

### ■ Question mark

As the name implies, this indicates that the constituent it terminates has the status of a question.

#### Terminal of unembedded question

In the simplest case the question mark occurs at the end of an unembedded question, in contexts where it is in contrast with the full stop and (normally) the exclamation mark. It is the default punctuation mark following an interrogative main clause, whether closed or open. It is also used after other clause types with the punctuation itself signalling the question meaning, as rising intonation does in the corresponding spoken forms:

[3]	i	<i>Have you seen today's paper?</i>	[closed interrogative]
	ii	<i>Why do fools fall in love?</i>	[open interrogative]
	iii	<i>You saw him, then?</i>	[declarative]
	iv	<i>Take it back on Saturday?</i>	[imperative]

With imperatives (and likewise exclamatives) such cases are generally restricted to echo questions.

Examples where the sentence has the form of a sequence of main clauses are:

- [4]
- i *It would be hard to criticise the measures, wouldn't it?*
  - ii *Where did you get it from and how much did it cost?*
  - iii *It certainly looks very good, but isn't it rather expensive?*

In [i] *wouldn't it?* is an interrogative tag; its effect is to make the whole sentence a question. Example [ii] is a coordination of two interrogatives but has just one question mark, at the end: it is punctuated as a compound question. In [iii] we have a coordination of declarative (statement) and interrogative (question): the semantic scope of the question mark is thus just the second clause, but it serves as terminal boundary mark for the whole sentence.

The question mark is often replaced by one of the other sentence terminals in questions that are used as indirect speech acts:

- [5]
- i *Would you tell Jill that I'll be replying to her letter shortly.*
  - ii *Why don't you try to get this report to me by tomorrow.*
  - iii *Aren't they lucky to have got away with it!*
  - iv *Who cares what I think about it, anyway!*

Examples [i–ii], with the form of a closed and open interrogative respectively, are used as indirect directives, and may be punctuated according to the illocutionary force, not the grammatical form or literal meaning. There is a considerable range of interrogative constructions used with directive force, and some accept full stop punctuation more readily than others: see Ch. 10, §9.6.1. Examples [iii–iv] have the force of exclamatory statements and again are here punctuated accordingly; there is alternation with a question mark in the open type [iv] but not normally in the closed type [iii].

### Embedded questions

When a question is embedded, the punctuation depends on the grammatical form: it normally takes a question mark if it has main clause form, but not if it has the form of a subordinate content clause. Compare:

[6]	MAIN CLAUSE SYNTAX	SUBORDINATE CLAUSE SYNTAX
i	a. <i>She asked, ‘Where is Kim going?’</i>	b. <i>She asked where Kim was going.</i>
ii	a. <i>Again the question arises: why were we not consulted?</i>	b. <i>Again the question arises as to why we were not consulted.</i>
iii	a. <i>Her son (you remember him, don’t you?) has just been arrested.</i>	b. [no subordinate version]

Note that where the question has main clause syntax it may or may not begin with a capital letter. Example [ia] is a case of direct reported speech (Ch. 11, §9.2); here a capital is required if the question is enclosed in quotation marks, but otherwise lower case is permissible, especially with relatively short questions (*I’m afraid he always asks himself, what’s in it for me?*). In [iia] the question is cited or identified, and here capitalisation is optional.<sup>6</sup> In [iiia] the question is parenthesised (and for this type there is no matching subordinate construction); here capitalisation, while not impossible, is relatively unlikely.

### Parentheticals

Sentences containing interrogative parentheticals, or parentheticals in construction with an interrogative main clause, are illustrated in:

- [7] i *There is nothing in the structure of English that prohibits us from referring to a woman as John Smith or, shall we say, George Eliot.*  
 ii *Will he tell them?, she asked.*  
 iii *Will he tell them, I wonder?*  
 iv *Will he tell them, do you think?*

Parentheticals like *shall we say, dare I say, would you believe* have interrogative main clause syntax but no inquiry force, and generally have no question mark, as in [i]. Examples [ii–iii] look alike syntactically, but they are understood, and hence punctuated, differently. In [ii] the whole sentence is a statement, reporting her asking a question. But *I wonder* in [iii] indicates that the sentence is posing a question, so the question mark

<sup>6</sup>In *And guess who they were sure inflicted them?* the question mark has scope over the matrix imperative clause, not the embedded interrogative clause, signalling that the whole sentence has the (indirect) force of a question, to which I’m asking you to guess the answer. An exclamation mark, however, is the more usual terminal for the *guess* + subordinate interrogative construction. Where the question consists simply of an interrogative phrase, the distinction between main and subordinate clause syntax is lost, and here a question mark may or may not be used: *She wondered why* or *She wondered, why?* (or *She wondered, Why?*).

goes at the end. In [iv] we have a sequence of two interrogatives, but they express a single question, and permit only a single question mark, at the end (see Ch. 10, §5.4).

#### Use of question mark to indicate doubt

- [8] i *Michaelangelo Merisi (b. 1571?, Milan? – d. July 18, 1610, Port'Ercole, Tuscany)*  
 ii *He lives with an ophthalmologist (?) in Kensington.*

Example [i] illustrates the use of the question mark to indicate uncertainty about attributed dates and places; in some cases it is placed before the item in doubt (*b. ?1571*). In [ii] the question mark is enclosed in parentheses; this belongs to relatively informal style but again indicates uncertainty about the correctness of the item concerned (I may have doubts as to whether the person is in fact an ophthalmologist – or perhaps I'm unsure about the spelling).

### ■ Exclamation mark

#### Terminal of unembedded exclamation

- [9] i *To hell with you! Up the Soccerooos! Blast! Fire! Talk about arrogance!*  
*If only we had listened to her! That it should have come to this! Quick!*  
 ii *What a mess they made of it! How kind you are!*  
 iii *Look out! Get some water!*  
 iv *That's cheating! They had come without any money!*  
 v *Isn't it fantastic! What does it matter, anyway!*

Exclamation marks are often used with sentences whose form departs from the major main clause constructions: a variety of patterns of this kind are illustrated in [i]. Replacement of the exclamation mark by a full stop in such cases would be impossible or else would completely change the interpretation (several of them, for example, could occur with a full stop when standing as an elliptical answer to a question). The remaining examples have ordinary main clause form. Those in [ii] are syntactically exclamative, and here the exclamation mark is strongly preferred over a full stop. The examples in [iii] are imperative; as noted above, the full stop is the default terminal for imperatives, but the exclamation mark is also commonly used. It may serve to impart a sense of urgency, and/or to give the directive the force of a command or an entreaty, as opposed, say, to a request. With declaratives, as in [iv], the exclamation mark indicates that the content is regarded as remarkable or sensational, something that merits or requires special noting. Exclamation marks are also found with interrogatives, as in [v], when the illocutionary force is that of a statement: see the discussion of [5iii–iv] above.

#### Embedding

Like questions, exclamations can be embedded within a matrix sentence, and may also be subclausal:

- [10] i *He replied, 'I've never been so insulted in my life!'*  
 ii *At first things went smoothly, but soon, alas!, the casualties began and we had to devise a new strategy.*

Exclamative clauses do not show the clear difference between main clause and subordinate clause internal syntax that we illustrated for interrogatives in [6]. Nevertheless, we still find that clauses identifiable as subordinate exclamatives do not take exclamation

In the present section we confine our attention to sentences containing neither parentheses nor dashes. The dash is also a secondary boundary mark in its main use, but we defer consideration of it until §5, after the discussion of parentheses.

### ■ Exception: colon marking a non-final sentence

One exception to the distributional distinction between the primary and secondary boundary marks is that the colon is sometimes followed by a capital letter:

- [2] i *Libraries have not tried hard to compete in this domain: Their collections are still dominated by books.*  
 ii *A number of questions remain to be answered: Who will take responsibility for converting the records to digital form? How are the old records to be stored? Who will have access to the digital files?*

It seems best in such cases to take the colon as marking the boundary of a sentence, so that [i] will consist of a sequence of two sentences, and [ii] as a sequence of four. Clearly, however, a sentence with a colon as terminal could never be the last sentence in a text.

## 3.1 Some formal preliminaries

### ■ Asymmetry between marking of left and right boundaries

There is an important asymmetry in the marking of boundaries:

- [3] i Constituents whose right boundary is marked very often have no marking of their left boundary.  
 ii Constituents whose left boundary is marked almost always have their right boundary marked – by a mark at least as strong as the one on the left.

Compare the following examples, where the relevant constituents are underlined:

- [4] i a. *There'll be no problem because anyone can take part, provided they're over eighteen.*  
 b. *She suggested that the most important factor had been overlooked: the cost.*  
 c. *He has written books on Babe Ruth; on Tinker, the shortstop, Evans, the second baseman, and Chance; and on Hank Aaron.*  
 d. *\*Jill was in fact, keeping her options open.*  
 ii a. *\*Anyone can take part, provided they're over eighteen so there'll be no problem.*  
 b. *\*He told the press his reason: he did not want have to renegotiate his contract, but he did not give any explanation to the team owners.*  
 c. *\*He has written books on Babe Ruth; on Tinker, the shortstop, Evans, the second baseman, and Chance; and on Hank Aaron, and they've all sold well.*  
 d. *Kim, Pat, and Alex had done most of the organising.*

Examples [ia–c] have constituents with respectively a comma, colon, and semicolon at the right boundary, but no mark at the left – and they are completely well-formed. There are certainly some cases (discussed in §3.2.5) where a comma at the right boundary requires a mark at the left too, as evident from [id]; but they do not represent the general pattern. In [iia–c] we have constituents with a comma, colon, and semicolon on the left and no mark, or a weaker one, on the right, and they are strongly deviant. The only

systematic exception involves the comma, and is virtually restricted to coordination, as in [iid].<sup>7</sup>

### ■ The strength hierarchy

It is constraint [3ii] that justifies the hierarchy of strength given in [1] above. In particular, it provides evidence that the comma is weaker than the colon and semicolon. A constituent with a colon or semicolon on the left cannot have a comma on the right, as illustrated in [4iib–c]. It is not possible to establish any categorical difference between colon and semicolon in this respect, and it is for this reason that we have placed them at the same position in [1]. Compare, for example:

- [5] i *He told the press his reason: he did not want to have to renegotiate his contract; but he did not give any explanation to the team owners.*  
 ii *With a book as complex and anarchic as this, such reductionism is misleading. You could as easily say it was about the failure of Sixties' radicalism; the decline of the dollar; the hegemony of television culture: it is all these, and more.*

In [i] we have a colon on the left and a semicolon on the right. The structure of the whole sentence, at the top level, is 'X; but Y': the semicolon marks the terminal boundary of all that precedes it, and hence can be said to have scope over the colon, which is included within the X. In [ii] we have the converse situation. The underlined NP has a semicolon on the left and a colon on the right. At the top level, the sentence has the form 'X: Y', for the part following the colon provides an elaboration on the whole of what proceeds, not just the underlined NP. This time, then, the colon has scope over the semicolon, which is included within the X. It is much more usual for a semicolon to have scope over a preceding colon than vice versa, but neither relation is formally excluded, and we cannot therefore establish any strict hierarchical ordering between these two punctuation marks.

### ■ The single level constraint on the colon and semicolon

Two colons or semicolons may not occur at different levels within a single construction (leaving aside cases where one is located within a parenthesised element). Compare:

- [6] i *I wouldn't recommend it, but he can certainly take part, provided he's eighteen.*  
 ii *\*A new policy has been instituted: the evaluation will be made by groups that will have only one responsibility: to prepare the year-end reports.*  
 iii *\*All students had to take a language; Sue took French; she already spoke it well.*

In [i] the first comma separates the two main clauses linked syntactically by *but*; the second comma then marks off an adjunct located in the second of the coordinated clauses. The second comma thus marks a boundary at a lower level than that marked by the first. This is not permitted with colons and semicolons, however, as illustrated by the unacceptability of [ii–iii]. In [ii] the second colon marks the boundary between *only one responsibility* and the supplement *to prepare the year-end reports*, which provides an elaboration of it. The first colon marks the boundary between two main clauses, and

<sup>7</sup> An unsystematic exception is seen in the second sentence of *It has been asked: what are the predominant characteristics of Scottish cookery? The answer: simplicity, good sense and an instinct for dietetic values, and what more could one ask?* Such examples are rare, and can be regarded as punctuationally ill-formed. This one can be remedied by replacing the comma after 'values' with a full stop.

since *only one responsibility* is a constituent of one of them, the second colon is at a lower level than the first. The same applies with the semicolons in [iii], though perhaps not so obviously. The second clause, *Sue took French*, provides an elaboration on the first: we infer that Sue is one of the students, and the sentence moves from a statement of a general requirement applying to all students to a particular statement concerning one student's satisfaction of the requirement. The third clause then provides an elaboration of the second: a natural interpretation is that Sue chose to take French because she already spoke it well. There is then no direct relation between the third clause and the first: the third is a supplement to the second, and the second is a supplement to the first. This means that the second semicolon is at a lower level than the first, as in [ii], and hence violates the single level constraint.<sup>8</sup>

### ■ Further constraints on the colon

The colon is subject to two further constraints. Firstly, unlike the comma and the semicolon, it is not used to separate elements in a coordinative relation, but is restricted to constructions containing just two terms. Compare:

- [7] i *Many welcomed the proposal, some were indifferent, a few strongly opposed it.*  
 ii *Many welcomed the proposal; some were indifferent; a few strongly opposed it.*  
 iii *\*Many welcomed the proposal: some were indifferent: a few strongly opposed it.*

Combined with the constraint illustrated in [6], this means that whenever a sentence contains two colons they will belong in separate constituents, as in:

- [8] *The press secretary gave them the rules: they were not allowed to speak to the committee directly; all other members were forbidden to discuss what the committee had decided: a hiring freeze would take place.*

Here the topmost constituent division is the one marked by the semicolon, and the colons thus occur in distinct constituents of the sentence. Neither has scope over the other.

Secondly, a constituent whose left boundary is marked by a colon cannot be followed by further material in the same clause:

- [9] *\*Smith has written books on the Risorgimento, which was an exciting period; on the topic of this conference: the Neapolitan Revolution of 1799; and on the 'Italiotta' period of the late nineteenth century.*

Here the colon marks a boundary within a non-final coordinate that is subclausal: only a comma (or a dash) would be admissible in this context.

## 3.2 Uses of the secondary boundary marks

We observed in §1 that the syntactic relations of coordination and supplementation need not be formally marked, so that with a sequence of main clauses there may be

<sup>8</sup>Examples are occasionally found which violate this constraint: *Several of the demonstrators and the bishops recognised one another; some had been seminary students together; others had worked together as priests.* The sense requires that we take the second and third clauses together in a coordinative relation, with the combination as a whole providing an elaboration of the first clause. Such examples are not common or systematic enough to invalidate the proposed constraint, and again, therefore, we would regard them as punctuationally ill-formed.

indeterminacy as to whether or not they are syntactically related in a coordination or supplementation construction. For this reason we will look first, in §§3.2.1–2, at these constructions in cases where they are formally marked (i.e. they are **syndetic** rather than **asyndetic**) and/or involve constituents lower in the hierarchy than main clauses (i.e. they are **subclausal**, with the understanding that this covers subordinate clauses). Then in §3.2.3 we consider asyndetic combinations of main clauses. The last two subsections, §§3.2.4–5, deal with remaining cases of subclausal boundaries, the first covering cases where there is no requirement that the left boundary be marked as well as the right, the second with what we call **delimiting** commas, where both boundaries must normally be marked.

### 3.2.1 Coordination, syndetic or subclausal

In coordination, punctuation is commonly used to separate one coordinate from the next. The comma is the default mark; under certain conditions, however, a semicolon (but not a colon) is used instead. We will look in turn at **bare** and **expanded** coordinates, i.e. those that respectively lack or contain a coordinator (see Ch. 15, §1.1).

#### ■ Non-initial bare coordinates: left boundary mark obligatory

- [10] i *The President will chair the first session, Dr Jones will chair the second, and I myself will look after the third.*  
 ii *The President, Dr Jones, and I myself will chair the first three sessions.*  
 iii *Do you call this government of the people, by the people, for the people?*  
 iv *They can, should, and indeed must make due restitution.*  
 v *It has a powerful, fuel-injected engine.*

The underlined coordinates are neither initial nor marked by a coordinator; in this context, the indicator at the left boundary is strictly obligatory. In the case of modification in the structure of nominals, as in [v], the punctuation distinguishes coordination from the stacking of modifiers (see Ch. 5, §14.2). In [v] itself, then, *engine* is modified by a coordination of adjectives, giving the meaning “engine that is both powerful and has fuel injection”. In *a powerful fuel-injected engine*, by contrast, there are two layers of modification: *engine* is modified by *fuel-injected* to form the nominal *fuel-injected engine*, and this is in turn modified by *powerful*, allowing a somewhat different interpretation – “engine that is powerful by the standards applicable to fuel-injected ones”.

#### ■ Non-initial expanded coordinates

With coordinates introduced by a coordinator, we have no categorical rule comparable to the one given for bare coordinates. This is an area where we find variation between heavy and light punctuation, the former style including more commas in this position than the latter. The major factors that influence the choice between the presence and absence of a comma are illustrated in:

- [11] i *Kim and Pat were planning a trip to France, Spain (,) and Portugal.*  
 ii *Their friendship for Augusta became rather hollow, and the news that Byron had left her practically all his money caused it to crumble to oblivion.*  
 iii *He packed up his papers and stormed out of the room.*  
 iv *I'll do my best, but I doubt whether I'll get very far.*

In the first place, a comma is more likely in multiple than in binary coordination. In [i], for example a comma is inadmissible before *and Pat*, but optional before *and Portugal*. The parenthesised comma here – one preceding the final coordinate in multiple coordination – is called a ‘serial comma’, and house styles commonly have a policy concerning the inclusion or exclusion of such commas. Secondly, punctuational marking is more likely before a long and complex coordinate than before a short and simple one. Thus, other things being equal, a comma is more likely before a clause than before a subclausal constituent: compare [ii] and [iii], and note again the inadmissibility of a comma in *Kim and Pat* in [i]. Thirdly, a comma is somewhat more likely with *but*, as in [iv], than with *and* and *or*. Punctuation may also be added to prevent misreadings, as illustrated in [13ii] of §1 (*Liz recognised the man who entered the room, and gasped*).

#### ■ Use of the semi-colon in coordination

A semicolon can be used instead of a comma, typically in relatively formal style, under conditions illustrated in:

- [12] i *In the 1890s Chicago had more Germans than any of Kaiser Wilhelm’s cities except Berlin and Hamburg; more Swedes than any place in Sweden except for Stockholm and Göteborg; and more Norwegians than any Norwegian town outside of Christiana (now Oslo) and Bergen.*
- ii *After the war, the United States produced half of the world’s goods; our manufacturers had no peers; and our military, bolstered by the atomic bomb, had enemies but no equals.*
- iii *His band members are Phil Palmer, guitar; Steve Ferrone, drums; Alan Clark and Greg Phillinganes, keyboards; Nathan East, bass; and Ray Cooper, percussion.*
- iv *Professor Brownstein will chair the first session, and the second session will be postponed; or I will chair both sessions.*
- v *He had forgotten the thing he needed most: a map; and he was soon utterly lost.*

In [i] the semicolon is motivated by the length and complexity of the coordinates. This is a rather untypical example, however, in that none of the coordinates contains a comma; usually one or more of them do, as in [ii–iv]. In such cases the punctuation helps in the perception of the hierarchical structure, with the semi-colon separating constituents higher in the tree structure than the commas. A special case is seen in [iv], where we have layering of coordination: *and* joins the first two clauses into a single unit which as a whole is coordinated to the third by means of *or*. It is *or*, then, that marks the upper layer of coordination, and which is consequently preceded by the stronger boundary indicator. In [v] the first coordinate contains not a comma but a colon. In this case a comma could not replace the semicolon (see the discussion of [4iib]), whereas it could occur as a less preferred option in [12i–iv].

### 3.2.2 Supplementation, syndetic and subclausal

#### ■ Markers of supplementation

As noted in Ch. 15, §5, supplements may be marked by such expressions as *namely*, *that is*, *that is to say*, *viz.*, *for example*, *in particular*, and so on. Supplements introduced by such items may be preceded by any of the secondary boundary markers. Examples [13i–ii]

have subclausal and main clause supplements respectively:<sup>9</sup>

- [13] i a. *The nineteenth century cases on which the Act was based were mainly sales between businessmen and organisations, that is, sales by manufacturers and suppliers.*  
 b. *This statement is still valid today, since ‘resemblances’ lead us to think in ‘as if’ terms; that is, in metaphorical terms.*  
 c. *Wittgenstein’s treatment of the ‘Other Minds’ problem is an extended illustration of a point in philosophical logic: namely, that the meaningfulness of some of the things we say is dependent on contingent facts of nature.*  
 ii a. *Mature connective tissues are avascular, that is, they do not have their own blood supply.*  
 b. *One way of speaking about this is to say that images in a dream seem to appear simultaneously; that is, no part precedes or causes another part of the dream.*  
 c. *Pneumatic bearings also have a considerable application which has not been developed outside gyroscopes: for example, a patent has recently been taken out covering the use of a pneumatic bearing for a glass polishing head.*

### ■ Asyndetic subclausal supplementation

The left boundary of subclausal supplements may be marked by a comma or a colon, though the constraints outlined in §3.1 mean that the colon is admissible only if the supplement follows the clause containing the anchor:

- [14] i *Bishop Terry Lloyd, the only Welshman in the college, had opposed the plan.*  
 ii *They went to Bill Clinton, the only man who could help them.*  
 iii *It was her face that frightened him most of all, the frosty smile, the brilliant unblinking eyes.*  
 iv *Either eat your breakfast or get dressed, one or the other.*  
 v *The ship steered between the buoy and the island: the only course that would avoid the rocky shoals.*  
 vi *Areas with a high concentration of immigrants tend also to be areas of ethnic conflict: Los Angeles, Miami, Adams-Morgan, Crown Heights.*

In [iii–v] either a comma or a colon could be used. But it is not always so: a colon would be out of order in [ii], for example. This is because the supplement provides descriptive, not identifying, information – compare *They went to the only man who could help them: Bill Clinton*, where the supplement does identify. In [vi], on the other hand, the colon could not be replaced by a comma.

### 3.2.3 Asyndetic combinations of main clauses

In combinations of main clauses with no coordinator or supplementation marker, there is no grammatical indication of the nature of the relation between the clauses. In some cases, notably where *and* or *but* could readily be inserted, they can be interpreted as coordinate; in others, the second provides an elaboration of the first – an explanation,

<sup>9</sup>The supplementation marker itself is usually followed by a delimiting comma, but examples are found with no punctuation mark on the right. It is also possible to have a comma before the marker and a colon after it, as in *Among the few arrests was one person charged with being in possession of stolen goods, to whit: 500 milk crates.*

an exemplification, a consequence, and so on. In general, the absence of any grammatical link strongly favours a stronger indicator than a comma to separate the clauses. Thus, although examples like the following occur, they would be widely regarded as infelicitous in varying degrees:

- [15] i <sup>?</sup> *The locals prefer wine to beer, the village pub resembles a city wine bar.*  
 ii <sup>\*</sup> *Your Cash Management Call Account does not incur any bank fees, however, government charges apply.*

Example [i] illustrates what prescriptivists call a ‘spliced’ or ‘run-on’ comma, with the implication that the sentence should be split into two. A special case of this is where the second clause begins with a connective adjunct such as *however*, *nevertheless*, *thus*, and the like; while [ii] is an attested example, it would generally be regarded as unacceptable.

Nevertheless, there are certainly conditions under which a comma is acceptable, and we will accordingly give in turn examples of these asyndetic main clause combinations marked by a comma, semicolon, and colon.

### ■ Comma

- [16] i *It was raining heavily, so we decided to postpone the trip.*  
 ii *To keep a child of twelve or thirteen under the impression that nothing nasty ever happens is not merely dishonest, it is unwise.*  
 iii *Some players make good salaries, others play for the love of the game.*

Example [i] might be called ‘quasi-syndetic’: although *so* here does not belong to the syntactic category of coordinators, it serves a similar linking function, and a comma is strongly preferred over a semicolon or colon. *Yet* behaves in the same way: see Ch. 15, §2.10. Example [ii] is representative of constructions where a positive clause follows a negative, especially one where the negation combines with *only*, *simply*, *merely*, or *just*. In such cases the positive clause is often introduced by *but*, giving syndetic coordination; the asyndetic construction without *but* is also common, however, and readily allows a comma (as well as other marks: see below). In [iii] the comma is justified by the close parallelism between the clauses and their relative simplicity.<sup>10</sup> The comma-linked cases are thus broadly coordinative in interpretation.

### ■ Semicolon

- [17] i *They came on the Mayflower; they came in groups brought over by colonial proprietors; they came as indentured servants.*  
 ii *The Latin, for example, was not only clear; it was even beautiful.*  
 iii *Some colonies started under the rule of private corporations that looked for the profits in fish, fur, and tobacco; some were begun by like-minded religious seekers.*  
 iv *All students had to take a language; Sue took French.*  
 v *The bill was withdrawn; the sponsors felt there was not sufficient support to pass it this session.*

The semicolon allows both coordinative and elaborative interpretations. Example [i] has three clauses at the same hierarchical level, putting it very clearly with the coordinative

<sup>10</sup>A special use of comma punctuation is seen in *Order your furniture on Monday, take it home on Tuesday*. Syntactically, this consists of a sequence of imperatives, but it is interpreted as a conditional statement, “If you order your furniture on Monday you can take it home on Tuesday” (see Ch. 10, §9.5); a semicolon would allow only the literal interpretation as a compound directive.

type. Examples [17ii–iii] are comparable to [16ii–iii], but have a semicolon instead of the comma. Again we note that here the first clause contains internal commas, so the semicolon serves to show that the boundary it marks is higher in the hierarchical structure of the sentence. These two examples can also be subsumed under the category of asyndetic coordination: the clauses could be linked by *but* and *and* respectively. In [iv–v], on the other hand, the relation is elaborative rather than coordinative, and here the semicolon could be replaced by a colon but not by a comma.

#### ■ Colon

- [18] i *Roosevelt was not a socialist: his solution was not to eliminate capital, but to tame and regulate it so that it could coexist harmoniously with labour.*  
 ii *He told us his preference: Jan would take Spanish; Betty would take French.*  
 iii *The rules were clear: they were not allowed to speak to the committee directly.*  
 iv *Brown pointed out the costs to the community on the radio last night, and McReady mentioned the political consequence in this morning's paper: the bill will cost the taxpayers more than \$100,000 in the first year, and may be seen as giving the Republicans an unfair electoral advantage.*

The colon, we have seen, is not used in syndetic coordination, and in asyndetic combinations it indicates an elaborative rather than coordinative interpretation. What it elaborates on may be a whole clause, as in [i], or a smaller element, such as *his preference* in [ii] or the non-final NP *the rules* in [iii]; indeed, there may be more than one such item, as in [iv], where the clause following the colon elaborates on both *the costs* and *the political consequence*.

Like the comma and semicolon, the colon can separate a positive–negative sequence, where the first clause contains *not + only/simply/merely/just*:

- [19] *The Romans built not only the Fort of Othona: they had a pharos, or lighthouse, on Mersea.*

This does not invalidate our statement that the colon cannot be used to separate clauses in a coordinative relation. It is, rather, that the elaboration relation makes perfect sense in this context: the second clause provides an explanation or demonstration of what is said in the first clause. Note, then, that it would be quite impossible to insert *but* after the colon.

### 3.2.4 Further cases of simple boundary marking at the subclausal level

#### ■ Between verb and direct reported speech complement: obligatory comma or colon

- [20] i *Kim asked plaintively, 'What am I going to do?'*  
 ii *He added: 'Some missiles missed their targets, resulting in collateral damage.'*

In this construction the reported speech is complement of the reporting verb – see §6 for the construction where the reporting verb is in a parenthetical. The direct reported speech complement (whether enclosed in quotation marks or not) is required to be preceded by a punctuation mark, usually a comma. A colon is also possible provided the reported speech is relatively long and complex. Note the contrast with indirect reported speech, where such punctuation is inadmissible: \**He added, that some missiles had missed their target.*

### ■ Before certain types of complement: optional colon

- [21] i *The seminar will cover: superannuation; financial planning; personal insurance; home and investment loans.*  
 ii *The question to be considered next is: ‘How long should artificial respiration be continued in the absence of signs of recovery?’*

The complement in [i] has the form of a list; this type is semantically comparable to appositive supplementation, with the list anchored to some such expression as *the following topics*. In [ii] the colon occurs before the complement of *be* in its specifying sense – a complement, moreover, which has the form of a main clause; this case has affinities with the reported speech construction. Constructions [20–21] are exceptional: in general, a verb may not be separated from its complement by punctuation.

### ■ Between the main constituents of a gapped clause: optional comma

- [22] i *The first film was released in October in just a few large cities and the second, in Christmas week in more than 400 theatres across the country.*  
 ii *Some of the immigrants went to small farms in the Midwest; others, to large Eastern cities.*

The second clauses here belong to the gapping construction (Ch. 15, §4.2), with the comma marking the place where material is missing: *was released* and *went* respectively. In short and simple cases, however, it is more usual not to mark the gap, especially if the gapped clause is itself preceded by a comma: *One of them was French, the other German*.

### ■ Between subject and verb: comma under exceptional circumstances

- [23] i *\*The right of the people to keep and bear arms, shall not be infringed.*  
 ii *What he thought it was, was not clear.*

In Present-day English there is normally a strong prohibition on punctuation separating subject and verb: examples like [i] are now completely inadmissible. The rule is relaxed, however, in certain cases. In [ii], for example, the comma prevents any confusion that might be caused by the juxtaposition of two tokens of the verb-form *was*. And in *Most of those who can, work at home* ([13iii] of §1) it prevents *work at home* being taken as complement of *can*.<sup>11</sup>

## 3.2.5 Delimiting commas

Simple examples of **delimiting commas** are seen in:

- [24] i *Some, however, complained about the air-conditioning.*  
 ii *The plumber, it seems, had omitted to replace the washer.*  
 iii *Henry, who hasn't even read the report, insists that it was an accident.*  
 iv *I suggest, Audrey, that you drop the idea.*

<sup>11</sup> Some manuals nevertheless disapprove of exceptions like [23 ii], suggesting that the problem should be solved by recasting the sentence. A similar issue arises with the boundary between VP and extraposed subject. Normally a comma is inadmissible (cf. *\*It was revealed, that our conversation had been taped*), but the rule is relaxed in examples like *It is clear to anyone who truly believes, that the power of faith is unabated even in this age*, where the comma prevents *that* from being misconstrued as introducing the complement of *believes*.

Here the commas mark both left and right boundaries of a subclausal constituent that is set apart from the main part of the sentence, usually indicating that it is in some sense less central to the message. If the left or right boundary coincides with that of a larger construction that is marked by a stronger indicator, then the comma is superseded by, absorbed into, the latter:

- [25] i *Most of them liked it. However, some complained about the air-conditioning.*  
 ii *Things are quite difficult: unlike you, I don't get an allowance from my parents.*  
 iii *We've been making good progress; even so, we've still a long way to go.*  
 iv *The plumber had omitted to replace the washer, it seems.*  
 v *They want to question Henry, who hasn't even read the report: it's quite unfair.*  
 vi *I suggest you drop the idea, Audrey; it would be better to stay where you are.*

Examples [i–iii] show the left boundary superseded by a full stop, colon, and semicolon respectively, and [iv–vi] show the same for the right boundary.<sup>12</sup> In most cases, as in these examples, this arises when the delimited constituent is initial or final in the construction containing it. It is not of course possible for both boundaries to coincide with a higher one, so a delimited constituent will normally have a comma marking at least one of its boundaries.<sup>13</sup> Colons and semicolons do not serve this function of setting a constituent apart. They could thus not replace the right commas in [i–iii] or the left commas in [iv–vi].

#### ■ Types of delimited element

The above examples illustrate the range of elements that are commonly delimited. In [25i–iii] we have an adjunct, in [iv] a parenthetical, in [v] a supplementary relative clause, in [vi] a vocative. With parentheticals and vocatives delimitating punctuation is required. Supplementary relative clauses, and similarly detached participials, are usually set off punctuationally, but (contrary to the rules given in the manuals) examples without punctuation are certainly attested.<sup>14</sup> Supplementary NPs interpolated within a clause also take delimiting punctuation, as seen earlier in [14i]. In addition, commas are obligatory with the peripheral elements in left and right dislocation structures (Ch. 16, §8): *My neighbour, she's just won the lottery* (left dislocation); *I don't think a lot of him, the new manager* (right).

<sup>12</sup>If the delimited constituent is the first element in a text, the left boundary is marked by the beginning of the text, not by a punctuation mark as such.

<sup>13</sup>In light punctuation style a left comma may be omitted when the boundary doesn't actually coincide with the clause boundary but is separated from it by a coordinator (*But if that's not convenient, you can drop them off tomorrow*) or short connective adjunct (*Thus although I have a lot of sympathy for them, there's really nothing I can do to help*). One also finds examples where the adjunct is separated from the beginning of the clause by a subordinator that is not itself preceded by punctuation (*It was clear that failing agreement, both parties would be locked in a legal battle for a considerable time*); this latter type of example, however, would be widely regarded as deviant and would tend to be corrected by professional copy editors.

<sup>14</sup>The distinction between integrated and supplementary relative clauses is not as straightforward as is often thought (see Ch. 12, §4), but published examples are attested where the relative clause is very clearly of the supplementary type and yet has no delimiting commas, as in *The temperatures in hydrogen clouds vary considerably but the mean value is about  $-175^{\circ}\text{C}$  which represents the equilibrium temperature between the heat gained on collisions between clouds and the heat lost by radiation from the material of the clouds or *I went to see Orinda who had finally returned from her weekend and answered the telephone.**

### Constituents introduced by coordinators

We have seen that commas are often used to separate coordinates but, less commonly, they have a delimiting function:

- [26] i *The students, and indeed the staff too, opposed all these changes.*  
 ii *She laughed, and laughed again.*  
 iii *He seemed to be both attracted to, and overawed by, the new lodger.*

The effect in [i] is to present the underlined NP as a parenthetical addition rather than an element on a par with the preceding element in terms of information packaging: we treat this too as a kind of supplementation rather than genuine coordination. In [ii] the second VP is clause-final, so it is not immediately obvious that the comma is delimiting; this becomes apparent, however, when we add a complement: *She laughed, and laughed again, at the antics of the little man.* Example [iii] belongs to the delayed right constituent construction (Ch. 15, §4.4); the commas, though optional, help show that *the new lodger* is understood as complement not only of *by* but also of *to*.

### Adjuncts and complements

Because the function of delimitation is to set an element off from the central part of the message, it applies in clause structure predominantly with adjuncts rather than complements. Delimitation of a complement in its basic position is normally highly deviant: \**He blamed, the accident, on his children.* With adjuncts, there is considerable variation as to when delimiting commas are used: this is the area where the contrast between the heavy and light styles of punctuation is most evident.

The main factors influencing the use of delimiting punctuation are:

- [27] i length and complexity of the constituent  
 ii whether or not there are punctuation marks nearby  
 iii the linear position of the constituent  
 iv the semantic category of an adjunct  
 v the possibility of misparsing  
 vi prosody

Other things being equal, a short simple constituent is less likely to be marked off than a long complex one (e.g. one with the form of, or containing, a subordinate clause). The influence of nearby punctuation is seen in such a pair as:

- [28] i *She was not sorry he sat by her, but in fact was flattered.*  
 ii *She was not sorry he sat by her but, in fact, was flattered.*

In [i] we have a comma before *but*, separating the coordinate main clauses, and the following adjunct *in fact* is not marked off. Conversely, in [ii] there is no comma before the coordinator and the adjunct is delimited. It would be possible to combine the comma of [i] with those of [ii], but to have three commas in such close proximity is likely to be perceived as noticeably heavy punctuation.

As for position, delimiting commas are most likely with adjuncts located internally within the clause. And they are more likely with elements in front position than at the end of the clause. This latter point applies, indeed, to complements too: in the relatively few cases where complements are delimited they are in front position. Compare,

then:

- [29] i a. *You'll have to train every day to have any chance of winning.* } [adjunct]  
       b. *To have any chance of winning, you'll have to train every day.* }  
       ii a. *He's not humble.* } [complement]  
        b. *Humble, he's not.* }

A delimiting comma before a final adjunct of a type that readily occurs without one may have the effect of presenting the content as a separate unit of information; it may also serve to mark the semantic scope of a negative. Compare:

- [30] i *He had seen her at the supermarket, only two days earlier.*  
       ii *She didn't buy it, because her sister had one.*

In [i] the comma has an information-packaging function, dividing the whole message into two units of information. In [ii] the comma indicates that the negative does not have scope over the reason adjunct: we understand “Her sister having one was the reason for her not buying it”, not “Her sister having one was not the reason for her buying it”.

Consider next the semantic category of the adjunct. We have noted that complements are not normally delimited and this reflects the fact that they are more tightly integrated into the main predication; similarly, within the very wide range of adjunct types, those that are related most directly to the verb and its complements are less likely to be marked off by commas than the semantically more peripheral ones. Within the (necessarily incomplete) list of categories given in [1] of Ch. 8, §1, the later ones thus tend to favour delimitation more than the earlier ones. Among the categories that most strongly favour commas are adjuncts of result, evaluative adjuncts (especially when non-initial), speech act-related adjuncts, and connectives:

- [31] i *They increased the rent, so that it now took 40% of our income.*  
       ii *No one had noticed us leave, fortunately.*  
       iii *Frankly, it was an absolute disgrace.*  
       iv *It now looks likely, moreover, that there will be another rate increase this year.*

The use of delimiting punctuation to forestall possible misparsings is illustrated in:

- [32] *Most of the clothes, my father had bought at Myers.*

The initial element here is a complement, and hence would not generally be marked off, but the comma serves to forestall an initial reading where *my father* is subject of a relative clause modifying *clothes*.

Consider finally the relevance of prosody. We have emphasised that punctuation cannot be regarded as a means of representing the prosodic properties of utterances, but there is no doubt that there is some significant degree of correlation between the use of delimiting commas and the likelihood that the constituent concerned would be set apart prosodically in speech. Compare, for example:

- [33] i *That is probably true. However, we should consider some alternatives.*  
       ii *That is clearly unsatisfactory. Thus the original proposal still looks the best.*

In speech an initial *however* is characteristically prosodically detached from the rest, while *thus* is not, and this correlates with the fact that delimiting punctuation is very much more frequent with *however* than with *thus*.

## 4 Parentheses

In their primary use parentheses occur in pairs and enclose what we will call a **parenthesised element**.<sup>15</sup> Their function is to present that element as extraneous to a minimal interpretation of the text, as inessential material that can be omitted without affecting the well-formedness and without any serious loss of information.<sup>16</sup> They provide an elaboration, illustration, refinement of, or comment on, the content of the accompanying text.

### ■ Range of parenthesised elements

- [1] i *Amazingly, only about 500,000 legal immigrants entered the US in the whole of the 1930s. (In those days there was little illegal immigration.)*  
 ii *Southern liberals (there are a good many) often exhibit blithe insouciance.*  
 iii *But listening to his early recordings (which have just been re-issued by Angel), one has the impression of an artist who has not yet found his voice.*  
 iv *If your doctor bulk bills (that is, sends the bill directly to the Government) you will not have to pay anything.*  
 v *It seems that (not surprisingly) she rejected his offer.*  
 vi *The discussion is lost in a tangle of digressions and (pseudo-) philosophical pronunciamentos.*  
 vii *Any file(s) checked out must be approved by the librarian.*  
 viii *One answer might be that only different (sequences of) pitch directions count as different tones with respect to the inventory.*

A very great range of expressions can be parenthesised. In [i] we have a sentence – and indeed it could be a sequence of sentences or a whole paragraph. In [ii] we have a main clause (it could not be punctuated as a sentence), and in [iii] a subordinate clause (a supplementary relative). The parenthesised element in [iv–v] is a phrase (VP and AdvP respectively), in [vi] a combining form, and in [vii] an inflectional suffix. Finally, [viii] shows that it need not be a grammatical constituent: *sequences* is head of the NP *sequences of pitch directions*, while *of* is the first word of the complement PP.

In all these examples except [ii], the parenthesised element is **integrable** in the sense that the parentheses could be omitted or (as in [iii–v]) replaced by commas (at the left or both left and right boundaries).<sup>17</sup> With the **non-integrable** type the status of the parenthesised element cannot be changed in this way. Where it is medial within the containing clause, the parentheses could only be replaced by dashes, which would make

<sup>15</sup>We use this term in preference to ‘parenthetical’ since the latter term is not tied specifically to written expressions marked off by parentheses; in this book we use it, more specifically, for expressions like *she said*, *it seems*, and so on, which are characteristically delimited by commas (see Ch. 10, §5.3). Besides the primary use that is our concern in this section, parentheses have a number of more specialised, secondary uses. One is to enclose numerals or letters used to order items in a list, as in *Our three chief weapons are: (a) fear; (b) surprise; and (c) ruthless efficiency*. In this use it is possible to omit the left parenthesis. A further use is to enclose dates in certain styles of bibliographic reference: *This point was first made by Jespersen (1924)*.

<sup>16</sup>The only systematic exception to this generalisation is that when the indefinite article precedes a parenthesised element its form (as *a* or *an*) depends on the properties of the first word within the parentheses: *She made an (interminable) movie about a (supposedly endangered) owl*. The choice between *a* and *an* is made on a phonological basis (see Ch. 18, §6.4), and always on the basis of the sentence as it would sound if read aloud with the parenthesised element included.

<sup>17</sup>In the case of [ivi] the word-space before *philosophical* would drop with the parentheses.

hardly any change to its informational status; where it is final, a colon or semicolon could be used to separate it from what precedes. The non-integrable type characteristically has the form of a main clause; we also find sequences like that in:

- [2] *The facts of her background include a beloved older brother who was institutionalised in his early twenties for ‘dementia praecox’ (schizophrenia, probably) and died there some ten years later.*

This consists of an NP followed by a modal adjunct, and if the order were reversed it would be integrable.

#### ■ Linear position

Non-integrable parenthesised elements must follow the constituent they are associated with, their anchor. Compare [1ii], for example, with *\*The committee included a group of (there are still a few around) Southern liberals*. Integrable ones occupy the same position as they would if the parentheses were dropped, but there is a constraint prohibiting parenthesisation of an element at the absolute beginning of a clause. Thus we can parenthesise an element following a clause subordinator, as in [1iv], or following a coordinator – as in *but (not surprisingly) she rejected his offer* – but not right at the beginning: *\*(Not surprisingly) she rejected his offer*.

#### ■ Combination with other punctuation marks

Punctuation within the parentheses depends mainly on the requirements of the parenthesised element itself. Thus terminal question and exclamation marks are used when it has the appropriate status. A full stop, and associated initial capital, however, is permitted only when the parenthesised element is not embedded within a sentence: compare [1i–ii]. The hyphen in *(pseudo-) philosophical* is required to be inside the parentheses because if *pseudo* were dropped the hyphen would drop too.

Punctuation outside the parentheses depends on the requirements of the containing sentence: it is the same as it would be if the parenthesised element were omitted. Any such punctuation normally follows, rather than precedes, the parentheses, as in [1iii].<sup>18</sup>

#### ■ The single layer constraint

It is normally inadmissible to have one pair of parentheses included within another (leaving aside the secondary uses mentioned in footnote 15). Some manuals recommend that where the need for such embedding arises square brackets should be used at the lower level, but this is very much a minority usage. The usual way of solving the problem is to have parentheses at one level, dashes at the other, with no constraint on which of them occurs at the higher level:

- [3] i *There was a time when the Fourth of July was an occasion for re-creating the days of the American Revolution. (I hope that it makes a comeback, despite the assaults of a misguided – and, it has to be said, self-defeating – ‘multiculturalism’.)*  
 ii *Measures by Britain – land of la vache folle (mad cow disease) – to contain the problem have been ineffective.*

<sup>18</sup>Examples where the external punctuation precedes are sometimes encountered: *Talks, strongly backed by the US, (which has most to gain) have stalled again*. Such cases conflict with the rules given in the manuals and are widely regarded as unacceptable.

### ■ The insulating effect of parentheses

Parentheses set the enclosed material apart from the main text in such a way that the latter cannot depend on it for its well-formedness or interpretation. This is why such examples as the following are inadmissible:

- [4] i \**Kim (and Pat) have still not been informed.*  
 ii \**She brought in a loaf of bread (and a jug of wine) and set them on the table.*  
 iii \**Ed won at Indianapolis (and Sue came in second at Daytona) in the same car.*  
 iv \**Languages like these (which linguists call ‘agglutinating’) are of great interest. Agglutinating languages are found in many parts of the world.*

In [i] the parenthesised element is included within the subject that determines the form of the verb. In [ii] it is included within the antecedent for the pronoun *them*. In [iii] it is included within the comparison expressed by *same*: Ed and Sue drove the same car. In [iv] it provides an explanation of the term ‘agglutinating’, which is used in the following sentence. In all these cases dropping the parenthesised element naturally maintains the anomaly, but dropping the parentheses (with commas substituted in [iv]) removes it.

## 5 The dash

Dashes occur either in pairs or singly, marking an ostensible break or pause in the production of the text. They are not used to separate coordinates, and hence, unlike the comma and the semicolon, they do not occur in open-ended series.

### ■ Paired dashes

- [1] i *There’s a difference over goals, but the end – namely freedom – is the same.*  
 ii *Exeter clearly enjoyed full employment – as full, that is, as was attainable in the conditions of the time – while Coventry languished in the grip of severe unemployment.*  
 iii *The book – and the movie – were strongly condemned by the Legion of Decency.*  
 iv *Immigrants do come predominantly from one sort of area – 85% of the 11.8 million legal immigrants arriving in the US between 1971 and 1990 were from the Third World; 20% of them were from Mexico – but services have not adapted to that reality.*  
 v *Many of Updike’s descriptions of Hollywood – the place – are nicely observed.*  
 vi *In theory – no, no theory! – ideally, both description and dialogue should forward narrative.*

When they occur in pairs they serve to set off some constituent from the rest of the text, giving it the character of an interpolation. The interpolation typically provides an elaboration, explanation, or qualification of what precedes.

In this function dashes are in competition with delimiting commas and parentheses; either could replace them in [i–ii], while commas could in [iii]. They mark a clearly stronger break from the surrounding text than commas, and allow a larger range of constituent types to be delimited – including, for example, a main clause, or combination of main clauses, as in [iv]. The distinction between integrable and non-integrable parenthesised elements drawn in §4 thus applies to dash-interpolations too.

There are also significant differences between paired dashes and parentheses. Dashes cannot enclose part of a word or a separate whole sentence: they could not, for example, replace the parentheses in [1i/vi/vii] of §4. They would also be at best very questionable in [viii], where *sequences of* is a non-constituent that is not coordinated or otherwise paired with a comparable one. No less important is the functional difference. We noted that a parenthesised element is presented as inessential to and insulated from the accompanying text. This is often not so with dash-interpolations. In [1v] of this section, for example, *the place* is understood in a semantically restrictive sense, serving to distinguish Hollywood the place from Hollywood the industry: with parentheses it would give descriptive rather than identifying information, like a supplementary relative clause (as in *Hollywood, which is a place*). In [vi] the interpolation serves to justify the correction of *in theory* to *ideally*, and the dashes are neither omissible nor replaceable by parentheses. Example [iii] shows that dashes do not insulate the interpolation: the verb-form *were* agrees with *the book* together with the interpolation. Note, then, that all but one of the deviant examples in [4] can be corrected by replacing the parentheses with dashes. The exception is [iii], where comparison with *same* requires that the coordinates be of equal status; compare, similarly, \**Kim – and Pat – are a happy couple*.

### ■ Single dashes

- [2] i *We could invite one of the ladies from next door – Miss Savage, for example.*  
 ii *Initiative, self-reliance, maturity – these are the qualities we’re looking for.*  
 iii *We’ve got to get her to change her mind; the question is – how?*  
 iv *You may be right – but that isn’t what I came here to discuss.*  
 v *But we would like your permission to do – that is, to go further if need be.*  
 vi *‘I think – ’ I’m not interested in what you think,’ he shouted.*

In many cases a single dash is like the first member of a pair of dashes with the second member being superseded by or absorbed into an indicator that marks a higher-level boundary. This is illustrated in [i], which may be compared with *One of the ladies from next door – Miss Savage, for example – could be invited*. There are other cases, however, where a single dash has a somewhat different function. Example [ii] is a special case of the left dislocation construction (Ch. 16, §8.1): the dash follows a coordination in initial position which provides the antecedent for an anaphor in the clause nucleus, typically a demonstrative, as here. A colon might be used in this construction, but a dash is the usual punctuation. In [iii] the dash matches a prosodic pause in speech, serving to highlight the final complement; this use is also found after supplementation indicators such as *namely, that is, for example*, etc. In [iv] the dash signals an abrupt change of topic, and in [v] a change in grammatical construction. Finally, in [vi] it signals simply a breaking off, an interruption with no resumption.

### ■ Relations with other indicators

A dash can follow a question or exclamation mark and a closing quotation mark or parenthesis, but otherwise it is normally mutually exclusive with other indicators – in particular, the comma:

- [3] i *\*Some of them – Sue, for example, – wanted to lodge a formal complaint.*  
 ii *\*As he had no money – he’d spent it all at the races – , he had to walk home.*

These are both corrected by dropping the comma and retaining the dash:

- [4] i *Some of them – Sue, for example – wanted to lodge a formal complaint.*  
 ii *As he had no money – he'd spent it all at the races – he had to walk home.*

The omission of the comma in [4i] is simply a further case of the absorption of the second of a pair of delimiting commas into an indicator that marks a higher constituent boundary: the comma-delimited constituent *for example* in [3i] is part of the larger dash-interpolation. But in [3ii] it is the comma that has wider scope, marking the top-level division between all that precedes and the main clause that follows. So in [4ii] we have the unusual phenomenon of an indicator that marks the boundary of one construction superseding the indicator that would be expected to mark the boundary of a larger construction. This relationship arises only between the dash and the comma; for another example, see [1ii]. It is, however, subject to severe constraints, as is evident from:

- [5] i *\*Kim and Pat, who were easily the best qualified candidates – both had Ph.D.s – were the only ones shortlisted.*  
 ii *\*Only four people came to the meeting: Ed, Mr Lake – Ed's father – Sue and me.*

In [i] the second dash occurs at the end not only of the main clause interpolation but also of the relative clause supplement, and the need for a comma to mark the latter boundary is too great to permit its absorption by an indicator at a lower level. Example [ii] is even more sharply deviant. Here the second dash marks the boundary of the supplement *Ed's father* and also of the second coordinate, which in this context requires a following comma. Both examples could most easily be corrected by substituting parentheses for the dashes and adding the comma; in [ii] we could also use semicolons to separate the coordinates, with the second dash then being absorbed into the higher boundary mark: *Ed; Mr Lake – Ed's father; Sue; and me.*<sup>19</sup>

As far as the strength hierarchy shown in [1] of §3 is concerned, the dash can be placed on a level with the colon and the semicolon. Example [4i] shows that a dash can have scope over a comma, while the impossibility of having a comma in place of the second dash of [4ii] shows that a comma cannot have scope over a dash. Both scope relations hold between dash and colon or semicolon. In [1iv] the second dash has scope over the semicolon, while the semicolon has scope over the dash in *The results are somewhat disappointing – 20% down on last year; nevertheless, we are confident that the full year's results will match last year's.* Similar pairs can be found for dash and colon.

Like the colon, the semicolon, and parentheses, the dash cannot occur at two different hierarchical levels within a single constituent. The functional similarity between dashes and parentheses, however, means that where the need for such embedding might arise, the formal constraint can be avoided by alternating between the two different indicators, as in [3] of §4.

<sup>19</sup>The ban on combining a dash with a comma, illustrated in [3], is subject to some variation. The use of a comma in examples like [3ii] was in fact explicitly advocated in some earlier manuals. One exceptional case where the combination would still be widely accepted is seen in *'I would say –,' he began, but she didn't let him finish:* i.e. in reported speech, with a dash signalling interruption.

## 6 Quotation marks and related indicators

### ■ Functions of quotation marks

Quotation marks serve to assign a special status to the stretch of text they enclose, which may be anything from a word to a sequence of paragraphs.<sup>20</sup> Usually they indicate that the wording of the matter enclosed is taken from another source instead of being freely selected by the writer, as with ordinary text. The main categories of enclosed matter are as in [1], with corresponding examples given in [2]:

- [1] i direct speech  
 ii quotation from written works  
 iii certain kinds of proper names, e.g. titles of articles, or radio/TV programmes  
 iv technical terms, or expressions used ironically or in some similar way  
 v expressions used metalinguistically
- [2] i *'Let's not bother,' he replied.*  
 ii *Fowler suggested that many mistakes made in writing result 'from the attempt to avoid what are rightly or wrongly taken to be faults of grammar or style.'*  
 iii *'Neighbours' is Channel Nine's longest-running soap.*  
 iv *Their 'mansion' was in fact a very ordinary three-bedroom house in suburbia.*  
 v *He doesn't know how to spell 'supersede.'*

### ■ Single and double quotation marks

The above functions can all be indicated by means of either single or double quotation marks. AmE predominantly uses the double marks, while usage in BrE is divided, though British manuals tend to favour single marks. Strictly speaking, then, all examples containing quotation marks should have the % annotation, but we will simplify by omitting them, allowing this general statement to stand instead. (Our practice in this book is to differentiate between the two types, with single marks used for general purposes and double marks used for the special metalinguistic function of indicating meanings.)

When quotation marks are needed at different levels there is agreement that the two kinds of quotation marks should alternate:

- [3] i *Wilson's claim that 'Shakespeare's "To be or not to be" is surely the most famous line of English literature, or any other' is disputed by French critics.*  
 ii *Wilson's claim that "Shakespeare's 'To be or not to be' is surely the most famous line of English literature, or any other" is disputed by French critics.*

In the rare cases where there are more than two levels the alternation continues: whichever type is used at level 1 is used again at level 3, while the other is used at level 2 and again at level 4, and so on. It is because of this pattern of alternation, and also the possibility of distinguishing them for special purposes, that we regard single and double quotes as distinct indicators, not merely different characters realising a single indicator (cf. §1.2 above).

### ■ The pairing of quotation marks

Quotation marks normally come in pairs, with one member marking the beginning, the other the end, of the quotation. One departure from this pattern is sometimes found in

<sup>20</sup>Very occasionally, indeed, they can enclose part of a word: *He couldn't be more un-'macho'.*

fictional writing. If a single character's speech extends over more than one paragraph, an opening quotation mark may be used at the beginning of each successive paragraph, with the closing one being reserved for the end of the final paragraph of the entire sequence. This is especially common in older (e.g. Victorian) novels, some of which have whole chapters told by a character in the 1st person, with opening quotation marks at the beginning of every paragraph. However, it is found in contemporary fiction as well.

#### ■ Quotation marks in combination with other punctuation marks

When an expression is enclosed within quotation marks inside a larger matrix sentence we need to consider the distribution of punctuation marks within the quotation itself and in the matrix sentence. This is a matter on which there is a good deal of variation, firstly between AmE and BrE, and secondly, within BrE (and other non-American varieties), between different publishing houses.

Let us begin with an untypically simple example:

[4] *She replied, 'Why are you wasting my time?' and stormed out of the room.*

We will say that the question mark is **internal**, i.e. within the quotation marks, while the comma and full stop are **external**, outside the quotation marks. And what makes the example simple is that the formal location of the punctuation marks matches the meaning. The quotation is a question and hence needs a question mark; the matrix is a (non-exclamatory) statement and hence needs a full stop, while the comma separates the matrix verb from its direct speech complement. We take this to represent the default situation even though it is unusual: we need deal only with those cases which depart from this pattern. We will examine them under four headings.

##### (a) An internal terminal full stop cannot occur medially within the matrix

- [5] i \**'I don't know.' she said, and stormed out of the room.*  
 ii \**She said, 'I don't know.' and stormed out of the room.*  
 iii \**Nor would he consider trying to join Leslie and his men, rumoured to be close at hand and making for Scotland, 'which I thought to be absolutely impossible. I decided instead to make for France', where it was hoped that Louis would back the royalist cause.*

The inadmissibility of such examples is something on which all varieties are agreed. In [i] we need to replace the internal full stop with a comma – whose position is discussed in (d) below. Example [ii] can be corrected by simply dropping the internal full stop, while [iii] requires radical reconstruction. The rule does not exclude examples like:

- [6] i *She replied, 'I don't know. Does it matter?'*  
 ii *Yet Craig remains confident that the pitching 'will come round sooner or later. We just have to hope everybody stays healthy.'*

As far as the orthography is concerned, each of these consists of a sequence of two sentences, separated by a full stop. The quotation marks thus enclose part of the first sentence and the whole of the second.

##### (b) Raising of semicolons and colons

- [7] i *We ought to get going; the train leaves in half an hour.*  
 ii *'We ought to get going,' she said; 'the train leaves in half an hour.'*

When a sentence containing a semicolon is quoted, and divided at the boundary marked by the semicolon, the latter is positioned in the matrix after the reporting frame, with a comma taking its place in the quotation. The same applies with colons. A dash can be treated in the same way, but it is more usual to place it within the second set of quotation marks:

[8] *'We ought to get going,' she said ' – the train leaves in half an hour.'*

#### (c) Quotations at end of matrix sentence: combinations of sentence terminals

With quotations in final position it is usual to suppress one of the sentence terminals:

- [9] i *She added, 'It wasn't your fault.'* } [suppression of matrix full stop]  
 ii *So I asked, 'Whose fault was it?'* }  
 iii *Did he really say 'I couldn't care less?'* [suppression of internal full stop]  
 iv *%Did he really ask, 'Whose fault was it?'*

If both terminals would be full stops, the matrix one is suppressed, as in [i]. If one is a full stop and the other a question mark, the full stop is suppressed, as in [ii–iii]. If both are question marks, there is variation: in [iv] both are retained, but it is probably more usual to drop one or other of them. Exclamation marks behave in the same way as question marks.

#### (d) Relative order of comma or full stop and closing quotation mark

AmE has a rule that when a comma or full stop is adjacent to a closing quotation mark the latter must follow, irrespective of the relative semantic scope. BrE tends to position the punctuation marks according to scope, i.e. the meaning, subject to the constraints covered in (a)–(c) above. Meaning, however, does not always provide an unequivocal criterion, so we find a certain amount of variation within BrE practice.

The following cases are straightforward and uncontroversial, with the versions given here representing uniform BrE practice:

- [10] i *He'd apparently just been trying to 'help one of my patients.'*  
 ii *Instead of doing his homework he was watching 'Neighbours.'*  
 iii *I replied, 'It was all Angela's fault.'*

In [i–ii] the quotation is subclausal and does not license any internal punctuation; the full stop thus belongs semantically in the matrix and is hence located externally (contrary to AmE practice). In [iii], the quotation is a sentence and thus sanctions a full stop; from a semantic point of view the matrix also merits a terminal full stop, but this is suppressed in accordance with (c) above, so that this time BrE matches AmE practice.

Less straightforward are cases like the following:

- [11] i *%'It was all Angela's fault,' I replied.*  
 ii *% She said, 'It was all Angela's fault,' but no one believed her.*  
 iii *% 'In that case,' she said, 'we'll do it ourselves.'*  
 iv *% 'Some of them,' she said, 'look very unsafe.'*

In [i] the quotation would have a full stop if it stood alone, but cannot have one here because of point (a): it is in medial position within the matrix. It can be argued, then, that the comma does duty for the inadmissible full stop, and hence belongs internally. In [ii] the quotation is the same, but this time it can be argued that the matrix has a stronger

claim on the comma, as it were, since it is needed to separate the coordinate clauses of the matrix compound sentence. In [iii] the quotation would quite likely have a comma after the adjunct *in that case* if it stood alone, so an internal comma is justified. In [iv], we could not have a comma after the subject *some of them* if the quotation stood alone, so this time there is no scope justification for an internal comma. Some styles will thus punctuate the examples in the way shown here; others, however, will prefer a simpler rule that locates all the commas externally (and likewise those in [7ii] and [8]) on the grounds that they are separating the quotation from other elements in the structure of the matrix sentence – a rule that gives the opposite result to the AmE one.

### ■ Marking alterations to quotations: ellipsis points and square brackets

Two indicators are used to mark alterations made to quoted matter – ellipsis points indicate omissions and square brackets indicate substitutions or additions made by the quoting writer:

- [12] i *He goes on to say, ‘But Johnson . . . was willing to accept a fee for the work.’*  
 ii *She concluded: ‘The first [model] fails the test of descriptive adequacy.’*  
 iii *According to Jones, ‘[N]o other language has such an elaborate tense system.’*  
 iv *It says that ‘the first version has been superseded [sic] by a cheaper model.’*

In [i] some of the original text has been omitted after *Johnson*. In [ii] the writer adds *model* to clarify the denotation of what in the original was presumably an anaphorically reduced NP (*the first* or *the first one*). In [iii] the square brackets round *N* indicate a change from a small to a capital letter, a change made to satisfy the requirement that a quotation with the form of a main clause begin with a capital letter, except when it follows a subordinator, as in [iv]. Example [iv] illustrates the use of square brackets to enclose a comment by the writer: *sic* indicates that (contrary to appearances – in this case the misspelling) what precedes is faithful to the original text.

### ■ Alternatives to the use of quotation marks

#### Block quotes

In expository texts, quotations of a substantial length (more than five lines, according to some style manuals) are often presented as **block quotes**, indented and set off from the surrounding text (and often in smaller type). In this case, no quotation marks are used:

- [13] *As J. P. Quincy wrote in 1876:*

*To the free library we may hopefully look for the gradual deliverance of the people from the wiles of the rhetorician and stump orator. As the varied intelligence which books can supply shall be more and more widely assimilated, the essential elements of every political and social question may be confidently submitted to that instructed common sense upon which the founders of our government relied.*

*The founders of the library movement envisioned the public library as an equal partner of the public school in achieving these goals.*

#### Italics and other modifications

For the less central functions of quotation marks given in [1iii–v], italics are often used instead. With titles, it is common to make a distinction between various categories, with quotation marks used for articles in periodicals or chapters in books, for example,

and italics for whole monographs or journals.<sup>21</sup> Bold face and small capitals provide alternative means of indicating technical terms, and works on language will typically employ a variety of indicators for different kinds of metalinguistic use, as we do in this book. Italics are also commonly used for foreign language expressions, or for emphasis:<sup>22</sup>

- [14] i *I now realise that the baroque love of trompe l'oeil had a spiritual dimension.*  
 ii *Ed is a writer – a writer! – and Sue composes crossword puzzles for magazines.*

#### Absence of overt indication

Direct reported speech – in the broad sense of the term – is not always marked as such by punctuational means, especially when it is a matter of thought or interior monologue:

- [15] i *Where can she be?, he wondered.*  
 ii *I bet she's missed the train, he thought.*

In texts consisting of dialogue, it is common practice just to give the speaker's name followed by a colon or dash.

## 7 Capitalisation

The use of capital letters has two main functions: to mark a left boundary and to assign special status to a unit. As a boundary marker, capitalisation normally applies to the first letter of the first word of a sentence, though in verse it occurs at the beginning of a new line. The use of capitals to mark sentence boundaries has already been dealt with, and in the present section we will confine our attention to capitalisation as a marker of status.

### ■ Kinds of special status

As status markers, capitals are prototypically used with institutionalised proper names and functionally comparable expressions. In addition, they can mark personal and relative pronouns anaphoric to the name of a deity (*God in His infinite mercy*), personification (*We can conceptualise this as a game played against Nature*), emphasis or loudness (*I said, Don't Do That!*; *He must be a Really Important Guy in your life*), or key terms in technical and legal texts (*the Tenant shall be responsible for all damage*). Capitals are also used in many initialisms – abbreviations (*TV, VIP*) or acronyms (*AIDS, TESOL*): see Ch. 19, §2.2. And there is the use of *I* for the nominative form of the 1st person singular pronoun.<sup>23</sup>

### ■ Grammatical categories marked by capitals

- |                      |   |
|----------------------|---|
| [1] i NP             | <i>Kim Smith, the Bishop of London, The Times</i>                             |
| ii noun (or nominal) | <i>next <u>Monday</u>, a <u>Ford Cortina</u>, a <u>Beethoven</u> symphony</i> |
| iii adjective        | <i>French, Edwardian, Pinteresque, un-American</i>                            |
| iv clause            | <i>What's Up, Doc?; Alice Doesn't Live Here Anymore</i>                       |

<sup>21</sup>Names may end in a question or exclamation mark (as for example in the film titles *What's up, Doc?* and *Oklahoma!*) and if such names occur in final position there will be obligatory suppression of a matrix full stop and optional suppression of a matrix question or exclamation mark – see [9]. If the name is set in italics rather than enclosed in quotation marks, a sequence of two punctuation marks is more likely to be avoided (by suppression or rephrasing).

<sup>22</sup>Since we are using italics for all our examples we here follow the convention of switching to roman font to mark an expression that would be in italics if the surrounding text were in roman.

<sup>23</sup>Historically this usage was introduced for typographical clarity rather than to mark special status.

The most common case is that of the NP – which may of course consist of just a noun, as in *Kim did it*. We also have nouns or nominals that are part of an NP that is not capitalised as a whole, as with the examples in [ii], the first two of which have head function, while *Beethoven* is here a modifier. Capitalised adjectives are derived from nouns that have capitals, as *French* from *France*, and so on. Both noun and adjective categories can apply to bases in complex words as well as to whole words: *mid-October*, *un-American*. Capitalised clauses are normally restricted to the titles of artistic works, which are functionally like NPs – cf. *They saw ‘What’s Up, Doc?’ three times*.

The precise way in which capitalised expressions are marked is subject to some variation, but the above examples illustrate a very common practice. Each word in a capitalised NP or clause has a capital letter except for short transitive prepositions (such as *of*, *in*, *on*), coordinators, and, under certain conditions, the articles. The latter have a capital when part of the official title of a publication (such as *The Times*) or the official name of an institution (e.g. *The European Union*), but not in reference to holders of offices (*the Bishop of London*, *the Queen*) or when not part of the official title (*the New Scientist*). With an increasing number of compound proper nouns invented as product or business names, initial capitals appear in separate bases within the word even when there is no hyphenation: *PetsMart*, *WordPerfect*.

### ■ Semantic categories

Capitalised expressions are used to refer to or denote a great range of different kinds of entity: indeed there would seem in principle to be no limit to it. Many are personal names, where surnames, given names, and initials are capitalised (*Jane Austen*, *T. S. Eliot*). A personal name may be preceded by a capitalised appellation, abbreviated or not (*Dr Jones*, *Professor Chomsky*, *Ms Greer*, *General Noriega*, *Rabbi Lionel Blum*). Capitalisation is also used with the names of places (*London*, *Steeple Bumstead*), a geographical or topographical feature (*the Thames*, *the Black Forest*, *the Gulf Stream*), a monument or public building (*The White House*, *the Cenotaph*), an organisation (*the Home Office*, *Amnesty International*, *Shell*, *Dolland and Aitchison*), a political or economic alliance (*The European Union*), a country, nation, or region (*Great Britain*, *Scotland*, *Tyneside*), languages and peoples (*English*, *Chinese*), historical or cultural periods or events (*the Renaissance*, *the South Sea Bubble*), social or artistic movements (*Chartism*, *Decorated style*), days of the week, various special days, and months (*Tuesday*, *Christmas Day*, *September*), deities (*God*), honorifics (*Her Majesty*), trademarks (*Coca-Cola*), computer software (*Word*, *Emacs*), a kind whose name is taken from a proper name (*a Chevrolet*, *an Oscar*, *a Boeing 747*), and more. Capitalisation is commonly accompanied by italicisation or quotation marks in the titles of published and artistic works, as described in §6 above.

Common nouns denoting roles or institutions are often capitalised when used in combination with the definite article in reference to a particular individual or entity:

- [2] i *Shortly afterwards, the Bishop ordered a pastoral letter to be read.*  
 ii *I hear the University has increased its student intake again.*

These may be contrasted with such examples as *In those dioceses, the bishop has considerable autonomy* or *I’m told the oldest university is Fez, in Morocco*. With such expressions as *the board of directors* or *the chief executive* the choice between capital and

small letters tends to reflect perspective: they will be capitalised when used by members of the company, especially in official material, but commonly not when used by outsiders.

## 8 Word-level punctuation

### 8.1 Word boundaries

Word boundaries are marked by space, immediately adjacent to the word or separated from it by one or more punctuation marks. Opening quotation marks, parentheses, and square brackets are located between the space and the left boundary of the word, other punctuation marks between the right boundary of the word and the following space. The dash is exceptional among the higher-level punctuation marks in that it is immediately adjacent to both the word on its left and the one on its right or is separated by space from both (as in the style used in this book). These points are illustrated in sentence [1], whose ten (orthographic) words are listed separately, in abstraction from the higher-level punctuation, in [1ii]:

- [1] i *The vice-consul – Ed’s ‘companion’ – hasn’t (I’m told) seen Oklahoma! yet.*  
 ii *the vice-consul Ed’s companion hasn’t I’m told seen Oklahoma yet*

The quotation marks in [i] enclose a single word, but this is incidental and they are not part of the word itself. Similarly, the exclamation mark is part of the punctuation of a proper name which happens to contain just one word, but need not (for the distinction between proper names and proper nouns, see Ch. 5, §20.1).<sup>24</sup> The first word is listed in [ii] as *the* because the capital letter in [i] is a matter of sentence punctuation; the initial capitals in *Ed’s*, *I’m*, and *Oklahoma*, however, are inherent features of these words.

### 8.2 Hyphens

#### 8.2.1 Some initial distinctions

There are two hyphen indicators, an ordinary hyphen and a long hyphen, which is realised by an en-rule and of very limited distribution. As noted in §1.2, when the en-rule character is not available (as in handwriting or material written on a conventional typewriter), the functions of the long hyphen are taken over by the ordinary one.

At the first level we can distinguish three uses of the (ordinary) hyphen:

- [2] i To join grammatical components in complex words: the **hard hyphen**  
 ii To mark a break within a word at the end of a line: the **soft hyphen**  
 iii To represent in direct speech either stuttering (*‘When c-c-can I come?’*) or exaggeratedly slow and careful pronunciation (*‘Speak c-l-e-a-r-l-y!’*)

The terms ‘hard’ and ‘soft’ are taken from word-processing: a hard hyphen is introduced into a document by a keystroke, while a soft one is inserted by the word-processing

<sup>24</sup>We noted in §4 that parentheses may enclose subparts of a word, as in *live(s)*: in such cases – where one of the parentheses has no space on either side – they do form part of the orthographic word. Likewise for the quotation marks in *un-‘macho’*.

program. We will devote most of our attention to the hard hyphen. Nothing further need be said about use [iii], but a few comments should be made about [ii].

### ■ The soft hyphen

The purpose of this hyphen is to allow the amount of space between words on different lines to be relatively uniform. It occurs especially, but by no means exclusively, in typeset and right-justified text, and in these cases the division is made by the printer or the word-processing program. Normally, the division is made in a manner designed to facilitate reading, based on a mixture of morphological, phonological, and purely visual criteria. The precise rules used will depend on the publishing house style or the word processing system, but there is also significant regional variation, with AmE tending to favour breaks at syllable boundaries (e.g. *democ-racy*) and BrE those at morphological or etymological boundaries (*demo-cracy*). Regional differences are likely to diminish with the increasing internationalisation of publishing, and the increasing tendency to rely on automatic word separation provided by word processing systems, which are for the most part developed in the United States and not redesigned to take account of other countries' traditional hyphenation practices.

Divisions are not normally permitted within monosyllabic words, or within components that have (or could have) a hard hyphen at one of their boundaries (thus *school-master*, but not \**schoolmas-ter*). They also tend to be disallowed if they would yield a unit spelt the same way as some unrelated word (\**of-ten*, \**the-rapist*, or \**putt-ing*, as a form of the verb *put*).

## 8.2.2 Hard and long hyphens

Among the hard hyphens we can distinguish (though not always sharply) between those that are **lexical** and those that are **syntactic**. The lexical hyphens are found in morphologically complex bases formed by processes of lexical word-formation, as described in Ch. 19. Syntactic hyphens join forms together when they occur in a specific syntactic construction, namely as attributive modifier in a nominal.

### ■ Lexical hyphens

The hyphen may join the bases of a compound (*bee-sting*) or the affix and base of a derivative (*ex-wife*).

#### Compounds

We have noted that the component bases of what from a morphological point of view is a compound may be written in three ways: **juxtaposed**, as in *blackboard*; **hyphenated**, as in *stage-manager*; or **separated**, as in *Nissan hut*. It is an area where we find a great deal of variation, with respect either to particular items (e.g. *startingpoint*, *starting-point*, or *starting point*) or to different compounds of the same morphological type (e.g. *dressmaking* vs *letter-writing*). There are two general tendencies to be noted. First, compounds which are long established are more likely to be written in juxtaposed format than more recent ones (compare *dishwasher* and *chip-maker*). Second, AmE tends to use hyphens somewhat less than BrE.

To a large extent, the choice between the three formats has to be specified individually in the dictionary. We illustrate in [3], however, a range of morphological types where hyphens are found in most or a high proportion of cases (the categories and concepts

invoked here are explained in Ch. 19):

- |       |                               |   |
|-------|-------------------------------|---|
| [3] i | compound adjective            | <i>bone-dry, oil-rich, red-hot, snow-white</i>            |
| ii    | contains transitive prep      | <i>free-for-all, sergeant-at-arms, sister-in-law</i>      |
| iii   | intransitive prep as 2nd base | <i>break-in, build-up, drop-out, phone-in, stand-off</i>  |
| iv    | coordinative compound         | <i>Alsace-Lorraine, freeze-dry, murder-suicide</i>        |
| v     | nominal compound + <i>·ed</i> | <i>one-eyed, red-faced, three-bedroomed</i>               |
| vi    | numerals and fractions        | <i>twenty-one, ninety-nine, five-eighths</i>              |
| vii   | dephrasal compounds           | <i>cold-shoulder (V), has-been (N), old-maidish</i>       |
| viii  | verb with noun as 1st base    | <i>baby-sit, gift-wrap, hand-wash, tape-record</i>        |
| ix    | 1st base is letter-name       | <i>H-bomb, t-shirt, U-turn, V-sign</i>                    |
| x     | rhyming-base compounds        | <i>clap-trap, hoity-toity, teeny-weeny, walkie-talkie</i> |

Type [iii], with the preposition at the end, may be contrasted with the type where it occupies first position and is generally juxtaposed: *downside, outbreak, uptake*. Words of type [v] are themselves derivatives (formed at the top level by suffixation of *·ed*), but they contain a compound base whose components are joined by a hyphen, and the same applies with *old-maidish* in [vii]: the hyphen in such cases does not mark the top-level morphological division within the word. Hyphens are used in compound numerals expressing numbers between “21” and “99”. With fractions there is variation between hyphenated forms (*two-thirds*) and separate words (*two thirds*); hyphens are not used if either the denominator or the numerator contains a hyphen (*thirteen twenty-eighths*), but otherwise hyphenation is more likely than separation when the denominator is greater than “4”.

There are also particular bases which always or usually take a hyphen: *great*, as used in kinship terms, always does (*great-uncle*), while *self* and the combining form *pseudo* usually do (*self-knowledge, pseudo-science*).

### Derivatives

Suffixes are almost invariably juxtaposed, whereas there are a number of prefixes which in BrE are usually or commonly hyphenated: *non-*, *pre-*, *post-*, *pro-*, *anti-*, *ex-*, *co-*, *mid-* (but compare such semantically specialised forms as *nonentity, midnight*, etc.). It is also the usual practice, in both BrE and AmE, to insert a hyphen where there might otherwise be a danger of confusion caused by successive vowel letters or repeated sequences (*re-elect, de-emphasise, de-ice, re-release*), or to distinguish a word where the prefix is used in its productive sense from one where it is no longer analysable as a separate component (e.g. *re-form*, “form again”, from *reform*; or *re-cover*, “cover again”, from *recover*). Prefixes are generally hyphenated before a base beginning with a capital letter: *un-American*.

### Conflicts of scope

In general a space marks a division at a higher level of constituent structure than a hyphen. The immediate constituents of *oil-rich kingdom*, for example, are *oil-rich* and *kingdom* not *oil* and *rich kingdom*. There are cases, however, that depart from this pattern:

- |       |  |
|-------|--|
| [4] i | <i>inter- and intrastate, pre- or post-industrial, Australian-born and -educated</i> |
| ii    | <i>ex-army officer, non-mass market, pro-United States, mass market-style</i>        |

The coordination of prefixes, as in the first two examples of [i], is not uncommon; that of bases, as in the third, much less so – and one occasionally finds this latter

type without the second hyphen. In non-coordinative examples like those in [ii] some writers resolve the conflict between punctuation and scope or constituent structure by inserting extra hyphens (e.g. *ex-army-officer*); note, however, that in *unselfconscious* (from the base *self-conscious*) the problem is solved by using juxtaposition instead of hyphenation.

### ■ Syntactic hyphens

Hyphens are also used to join into a single orthographic word sequences of two or more grammatical words functioning as attributive modifier in the structure of a nominal:

- [5] i a *well-argued* reply, a *Bradford-based* company, a *hard-drinking* man  
 ii a *four-point* plan, a *fast-food* outlet, the *small-business* sector  
 iii *out-of-town* shopping, the *Hobart-to-Sydney* classic, a *creamier-than-average* taste, a *never-to-be-repeated* offer, the *what-was-it-all-for?* factor

The forms in [i] have a past participle or a gerund-participle as their final element, those in [ii] have a noun, and those in [iii] have forms which do not freely occur as attributive modifiers (see Ch. 5, §14.2). Hyphenation is not used with AdjPs (*a very old cat*) nor, generally, with past participles and gerund-participles modified by an adverb in *-ly* (*a beautifully executed performance*, *rapidly diminishing returns*). With noun-headed modifiers, hyphens are used very commonly but by no means invariably – compare *an affirmative action policy*, *city council elections*; they are not used with proper names: *United States agents*. The hyphen explicitly indicates that the linked items form a constituent and hence may remove potential constituent structure ambiguities. Thus *small-business sector*, for example, means “sector comprising small business”, while *small business sector* can mean either that or “business sector of small size”.<sup>25</sup>

The syntactic hyphen is used with expressions in modifier function that either do not occur elsewhere in the same grammatical form (*The plan contains four points/\*point*; *The company is based in Bradford/\*Bradford-based*) or occur elsewhere without hyphens (*The reply was well argued*;<sup>26</sup> *We shop out of town*).

### ■ The long hyphen

This is used instead of an ordinary syntactic hyphen with modifiers consisting of nouns or proper names where the semantic relation is “between X and Y” or “from X to Y”:

- [6] a *parent–teacher meeting* a *French–English dictionary* the *1914–18 war*

It can be used with more than two components, as in *the London–Paris–Bonn axis*. It is also found with adjectives derived from proper names: *French–German relations*. There is potentially a semantic contrast between the two hyphens – compare, for example, *the Llewelyn–Jones Company* (a partnership) and *the Llewelyn-Jones Company* (with a single compound proper name). This hyphen is also used in giving spans of page numbers, dates, or the like: *pages 23–64*; *Franz Schubert (1797–1828)*.

<sup>25</sup>In the last example of [5iii] the question could be enclosed in quotation marks, and in that case the hyphens could be dispensed with: *the ‘what was it all for?’ factor*.

<sup>26</sup>Prescriptive manuals attach considerable weight to this distinction as it applies to *well* + past participle; there are, however, some combinations where the hyphens are lexical, occurring in predicative as well as attributive function: *The steak was well-done*; *They look very well-heeled*.

### 8.3 The apostrophe

The apostrophe has three distinguishable uses:

[7]	i	GENITIVE:	<i>Kim's</i>	<i>dog's</i>	<i>dogs'</i>	<i>Moses'</i>	<i>*it's</i>
	ii	REDUCTION:	<i>can't</i>	<i>there's</i>	<i>fo'c's'le</i>	<i>ma'am</i>	<i>o'clock</i>
	iii	SEPARATION:	<i>A's</i>	<i>Ph.D.'s</i>	<i>if's</i>	<i>1960's</i>	

The apostrophe occurs as a case marker on the last word of genitive NPs, except those with one of the core personal pronouns as head (thus *its former shape*, not *\*it's former shape*; *This is yours*, not *\*This is your's*). There are two types of genitives: 's genitives (*Kim's*, *dog's*) and bare genitives, marked in writing by the apostrophe alone and homophonous in speech with the non-genitive counterpart (*dogs'*, *Moses'*); for the choice between the two types, see Ch. 18, §4.2.

The most common uses of the abbreviating apostrophe mark are for the negative inflectional forms of auxiliary verbs, as in *can't*, and the cliticisation of auxiliary verbs, as in *There's no time* (see Ch. 18, §§5.5, 6.2). *Fo'c's'le* is an alternative spelling of *forecastle*, one which matches the pronunciation. *Ma'am* is related to *madam*, but there are differences of use/meaning between the two forms. The apostrophe in *o'clock* reflects the etymology (*of the clock*), but there is no alternation with the full form in the current language. The abbreviating apostrophe does not normally appear at the left or right boundary of a word in established spellings: such forms as *'phone* or *'flu* are now clearly archaic. The form *'n'*, however, is an abbreviation of *and* used in a small number of fixed expressions, mainly *rock 'n' roll* and *fish 'n' chips*. Omission of initial *h* (*the 'ammer*) or the final *g* of the gerund-participle suffix (*huntin'*) is found in the representation of direct speech to indicate socially distinctive pronunciations.

A minor use of the apostrophe is to separate the plural suffix from the base, as in [7iii]; this occurs when the base consists of a letter (*She got three A's in philosophy*), certain kinds of abbreviation, a word used metalinguistically, or a numeral (see Ch. 18, §4.1.1).

### 8.4 The abbreviation full stop and minor reduction markers

#### ■ The full stop as a marker of abbreviation

The full stop is commonly used to mark an abbreviation – in a broad sense of that term, covering certain kinds of contraction and acronyms. This use is subject to a great deal of variation. The omission of the abbreviation full stop is more common in BrE than in AmE, and more common in recent publications than in those of, say, the 1970s or earlier. While there are certain kinds of reduced form where a full stop is categorically excluded, it is doubtful if there are now any cases where a full stop is required in all varieties and house styles.

The alternation is illustrated in [8] for various categories of abbreviation:

[8]	i	<i>Gen/Gen. Smith</i>	<i>Mr/Mr. Smith</i>	<i>fig/fig. 3</i>	<i>5 kg/kgs/kg./kgs.</i>
	ii	<i>T S Eliot/T. S. Eliot</i>	<i>JFK/J. F. K.</i>		
	iii	<i>eg/e.g.</i>	<i>cf/cf.</i>	<i>RSVP/R.S.V.P.</i>	
	iv	<i>FBI/F.B.I.</i>	<i>pc/p.c.</i>		
	v	<i>NATO/ᶜN.A.T.O.</i>	<i>radar/*r.a.d.a.r.</i>		
	vi	<i>demo/*demo.</i>			

The abbreviations in [i] occur in a limited range of contexts: the first two with following proper names, the last two with numerals. For example we don't (normally) write \**Smith was a fine Gen(.)* or \**We need one more kg(.) of sugar*. There has been a tradition in BrE of distinguishing 'abbreviations' from contractions: in the former the last part of the full word is missing, while in the latter at least the last letter of the full word is retained. One rule is then to have a full stop for the 'abbreviations' (*Gen.*) but not for the contractions (*Mr*); this rule, however, is much less widely followed than it used to be, and BrE tends to favour *Gen* as well as *Mr*, etc. With measure terms there is variation as to whether the plural is marked with *-s*; in either case some styles specifically exclude a full stop with these terms. In [ii] we have initial letters of personal names. Where the surname follows, the version with stops (*T. S. Eliot*) is still much the more usual, whereas with full initials referring to a famous figure the stops are commonly omitted (*JFK*). Many abbreviations are based on phrases or words from foreign languages, especially Latin, as in [iii]; the version with stops is the more usual, though the other version is now by no means rare. The words in [iv–v] are formed by the process we have called 'initialism': see Ch. 19, §2.2; those in [iv] are pronounced as sequences of letters, while those in [v] are acronyms, with the letters having their usual phonological values. Full stops are becoming somewhat marginal in acronyms consisting of capital letters, and are excluded in those consisting of small letters. *Demo* in [vi] illustrates the category of back-clippings (Ch. 19, §2.3.1), and again the full stop is inadmissible.

#### ■ Terminal full stop omitted after abbreviation full stop

The abbreviation full stop is part of an orthographic word and as such can be followed by higher-level punctuation marks. A terminal full stop, however, is suppressed after an abbreviation full stop to avoid a sequence of two full stops. Compare:

[9] a. *Why did she go to Washington, D.C.?*      b. *She lives in Washington, D.C.*

#### ■ Asterisk and dash

The asterisk or dash can be used to reduce taboo words (though such reductions are much less common than they used to be); the dash is also found in other types of reduction, for example of names:

[10] *F\*\*\* off!*      *B– off!*      *Count von O–*

## 8.5 The slash

We include the slash among the word-level indicators since it usually occurs without flanking spaces:

[11] i *director/secretary*      *flat/apartment*      *and/or*      *he/she*  
 ii *the June/July period*      *staff/student relations*

In [i] it indicates an "or" relationship (an inclusive "or", in the sense of Ch. 15, §2.2.1), while in some styles it occurs as an alternant of the long hyphen, as in [ii]. A special case is *s/he*, "she or he", equivalent to the above *he/she*; the slash in effect indicates that the initial *s* is optional, and hence is here doing duty for a pair of parentheses, which are not permitted in initial position – \*(*s*)*he*. The slash is also used in a few abbreviations, such as *a/c* and *c/o*.

## Further reading

It would not be feasible for us to attempt a comprehensive guide to the vast literature on English grammar; such a work would itself fill a large volume. Even giving an account of all the works we have consulted in the preparation of this grammar would go beyond reasonable size limits. But for a few of the cases we have been significantly influenced by particular works or have drawn analytical insights of major importance, and for those topics it is appropriate to explain where the reader can turn to begin further research. We stress, however, that neither these notes nor the bibliography that follows can be regarded as even a representative sample of the literature, and that we have consulted, and profited from, many more books and articles than can be mentioned here. We should also note that the inclusion of a work in this list does not imply that we adopted its position or think its claims are correct; in some cases the value of a work lies mainly in its defending an analysis with sufficient clarity to permit the reader to see how to improve on it. In those cases, just as in the cases where we have followed other authors closely, much credit for the virtues of this grammar is due to the scholars cited below (though of course we alone are responsible for the errors and failings of this book).

### ■ The English language

Amongst the thousands of books about English and its use around the world, Trudgill & Hannah (1985) presents a useful survey of differences between major regional varieties of English, and Crystal (1997) gives an account of how English has achieved the status of a global language.

### ■ Dictionaries

The most important of all reference works on the English language is the *Oxford English Dictionary (OED)* in its second edition – the finest and most complete dictionary ever compiled for any language. A dictionary of American English with particularly good attention to controversial matters of usage is the *American Heritage Dictionary* (4th edn, 2000). The standard dictionary of Australian English, which we have also used, is the *Macquarie Dictionary of Australian English*. At least two other dictionaries have been of considerable assistance because of their excellent collections of examples from actual corpora: the *Cambridge International Dictionary of English* edited by Paul Procter (1995) and the *Collins COBUILD English Language Dictionary* edited by John Sinclair (1987).

### ■ Terminology

Two very useful guides to the terminology of linguistics that we have made considerable use of are Peter Matthews' *Concise Oxford Dictionary of Linguistics* (Matthews 1997) and Larry Trask's *Dictionary of Grammatical Terms in Linguistics* (Trask 1993).

### ■ Grammars

One of the most complete grammars for English in the first half of the twentieth century was the seven-volume work by Otto Jespersen (1909–1949), which every serious English grammarian consults on a regular basis. A somewhat earlier work of a similar sort is Poutsma (1926–1929). The fullest and most influential grammar published in the second half of the twentieth century was that of Quirk et al. (1985), the culmination of a series of grammars published from the early 1970s onward, stemming from the research of the Survey of English Usage at University College London. The corpus-based grammar by Biber et al. (1999) employs essentially the same analytical scheme but devotes an unusual amount of space to quantitative details concerning frequency of occurrence for different constructions in different styles and registers of spoken and written English. We have found the *Collins COBUILD English Grammar* useful for its numerous lists of words sharing various grammatical properties, and we also profited from consulting Renaat Declerck's *A Comprehensive Descriptive Grammar of English* (1991a). Relatively few comprehensive studies of English syntax have been produced by transformational-generative grammarians; Stockwell, Schachter, & Partee (1973) was an early collaborative project of fairly wide scope, and McCawley (1998) is the best and most detailed transformational work published since then.

### ■ Usage manuals

As an example of a fairly authoritarian traditional usage book of the sort we discuss critically in Ch. 1, see Phythian (1979). An excellent example of modern non-authoritarian empirically-based writing on usage is *Merriam-Webster's Dictionary of Contemporary English Usage* (1994), which was an occasional source of useful examples for us. The usage notes in the *American Heritage Dictionary* (2000) are also very useful. Other usage manuals we have consulted include Burchfield (1996), which is a third edition of Fowler's classic *Modern English Usage*, and *The Right Word at the Right Time*, published by the Reader's Digest (1985).

### ■ History

We stress in Ch. 1 that we do not attempt a historical account of the English language here. Jespersen (1909–1949), on the other hand, was explicitly historical in approach, and is still of great value. The *OED* is also a vast compendium of material on the history of English grammar. For research on the history of English syntax, the four-volume survey by Visser (1963–1973) is extremely important. *The Cambridge History of the English Language* (in six volumes: Hogg (1992–2002)) provides a thorough survey of the history of the English language, probably the fullest available.

### ■ Pronunciation and spelling

We do not attempt to cover the phonetics and phonology of English in this book, except to provide the transcription scheme introduced in Ch. 1, which is needed for the material on inflection in Ch. 18. For those who wish to pursue the pronunciation of English further, Wells (1990) is now the definitive pronunciation dictionary for English, covering standard versions of both British and American English. For the reader without expertise in phonetics, Pullum & Ladusaw (1996) may be useful as a reference work on phonetic symbols and their uses. Mountford (1998) is an important recent book on English spelling, introducing the important concept of written symbol, which is invoked in Ch. 18.

### ■ Verbs

The verbal system of English has been much studied. Among the most important works influencing the treatment in Ch. 3 are Palmer (1987) and Leech (1987). Comrie (1985) provides a general survey on tense, and significant works on tense in English include Binnick (1991), Declerck (1991b), and McCoard (1978). See also the articles by Huddleston (1995a, 1995b), which argue for the analysis adopted here. On the topic of aspect, see Comrie (1976) and Tobin (1993). On modal verbs and modality generally, see Coates (1983), Palmer (1990, 2001), and Duffley's (1994) discussion of the properties of *need* and *dare*. Jacobsson (1975) is a relevant study of the English subjunctive.

### ■ Complements in clause structure

From the very large literature on complements in clause structure that influenced the development of Ch. 4, we would cite Halliday (1967–1968) as an early influential work; Matthews (1981) and Dixon (1991) as useful overviews; and for an extremely useful reference catalogue of the complementation system, Levin (1993). The topic of thematic roles is developed by a number of the papers in Wilkins (1988) and by Dowty (1991); see Palmer (1994) for a general survey of this topic. Seppänen, Granath, & Herriman (1995) is a useful source on subjects in non-canonical constructions, and likewise Seppänen & Herriman (1997) on the distinction between objects and predicative complements. Declerck (1988) is particularly valuable for its detailed account of copular clauses. Other works we have made particular use of include Wierzbicka (1982) on certain light verbs. The complex subject of the prepositional verb is one on which there has been considerable previous research; we profited especially from Bolinger (1971), Cattell (1984), and Cowie & Mackin (1993), among others.

### ■ Nouns

Works on number and countability in nouns include Reid (1991), Wickens (1992), and Allan (1980). A wide-ranging cross-linguistic study of the feature of gender is presented in Corbett (1991). Bauer (1998) presents an alternative view on the relation between compound nouns and modifier + head noun constructions.

### ■ Determinatives and determiners

This grammar presents an analysis under which determinatives function in noun phrase structure not as heads but as dependents of a particular kind, namely determiners. Payne (1993) is a discussion of some of the theoretical issues that relate to this controversial point. John Hawkins (1991) studies the use of the indefinite and definite determinatives. Roger Hawkins (1981) and Alexiadou & Wilder (1998) contain useful material on genitive ('possessive') determiners. The determinatives (like *all* and *some*) that are known as quantifiers represent an extremely important topic in semantics and logic; representative studies in the modern semantics literature (generally very difficult and technical works, it should be noted) include Barwise & Cooper (1981), Keenan & Stavi (1986), and Bach, Jelinek, Kratzer, & Partee (1995).

### ■ Noun phrases

For general studies of the structure of noun phrases (NPs) in transformational-generative terms see Jackendoff (1977) and Selkirk (1977). Partitive constructions are treated extensively in the contributions to Hoeksema (1996). Reuland & ter Meulen (1987) and Christopher Lyons (1999) are devoted to definiteness and indefiniteness of NPs. Those

NPs that function semantically as definite descriptions have been intensively studied by philosophers as well as linguists; Ostertag (1998) is an anthology devoted to the topic. Several papers on generic NPs are collected together in Carlson & Pelletier (1995). Nominalisations are the topic of Lees (1960) and Koptevskaya-Tamm (1993). Apposition is studied by Acuña-Fariña (1999).

### ■ Adjectives and adverbs

Ferris (1993) is a valuable source on the complex semantic correlates of prenominal attributive adjective position. Generative works with some information on the internal structure of adjective phrases and adverb phrases include Jackendoff (1977). The title essay in Dixon (1982) discusses the interesting question of why some languages have dramatically smaller numbers of adjectives than English does.

### ■ Prepositions and preposition phrases

Two transformational-generative works have been particularly influential and important in connection with our description of prepositions and the matter of distinguishing them from adverbs: Emonds (1972), and Jackendoff (1973). Burton-Roberts (1991) and Lee (1998) also provide discussion of the distinction between prepositions and adverbs. Hill (1968) is a useful pedagogical work listing the prepositions of English and distinguishing their many different senses and uses. Our account of word sequences like *in front of* has been much influenced by Seppänen, Bowen, & Trotta (1994). Herskovits (1986) is an interdisciplinary study of prepositional meanings.

### ■ Adjuncts

Our treatment of the highly diverse material in Ch. 8 benefits from study of many works, more than can be referenced here. Ch. 9 of Jackendoff (1991), Ch. 9 of Jackendoff (1995), and Ch. 11 of Baker (1995) are useful introductions in transformational-generative terms. More advanced theoretical works on the syntax of adjuncts include Bellert (1977), Cinque (1999), and (offering an alternative to the kind of account Cinque adopts) Ernst (2001). Among the works devoted to specific types of adjunct, we should mention Parsons (1990), especially Ch. 4 (on modifiers in general) and Ch. 11 (on temporal modifiers); Bolinger (1972) on degree modifiers; Lewis (1975) on frequency modifiers; and Traugott (1986) and Dudman (1994) on conditionals.

### ■ Negation

Klima (1964) is a classic transformational syntactic treatment of negation, and Stockwell, Schachter, & Partee (1973) is another early treatment with wide coverage. McCawley (1998, Ch. 17) is a more recent transformational analysis. The notion of direction of entailment, and much of the treatment of polarity items in Ch. 9, owes a lot to Ladusaw (1980). Horn (1989) gives a thorough account of many semantic aspects of negation that is a major source for our account of increased specificity in Ch. 9, §5.

### ■ Clause type and illocutionary force

The general issue of illocutionary force derives from the philosophy of language, specifically Austin (1962). Cole & Morgan (1975) contains a number of relevant papers, Searle's contribution on indirect speech acts being particularly important. There is a fairly rich literature on interrogatives, from which we would mention in particular the following: Bolinger (1978) on the distinction between polar ('yes/no') and alternative questions;

Hirschbühler (1985) for coverage of multi-variable questions; Duffley & Enns (1996) on infinitival interrogatives; Ohlander (1986) on subordinate interrogatives; Karttunen (1977) for the semantic classification of lexemes licensing interrogative complements; and Huddleston (1994) for a fuller treatment of the distinction between the syntactic category of interrogatives and the semantic category of questions. Useful works on imperatives include Bolinger (1977, Chs. 8–9) and Davies (1986); and for exclamatives, see Elliott (1974).

### ■ Relative constructions

McCawley (1981) provides a valuable general study of relative clauses within a transformational framework, while Sag (1997) is a recent non-transformational theoretical account. Bresnan & Grimshaw (1978) deals with fused relatives ('free relatives', in their terminology). Green (1992) discusses the relation between infinitival purpose clauses and infinitival relative clauses. Auwera (1985) considers the category status of relative *that*, and Jacobsson (1994) provides valuable data concerning the distinction between (in our terminology) integrated and supplementary relative clauses.

### ■ Unbounded dependencies

Ross (1986), which originates in a 1967 doctoral dissertation, is an important early transformational-generative source on constraints relating to unbounded dependency constructions. There is a vast transformationalist literature on unbounded dependencies that we do not attempt to review here. The description given in Ch. 12 has more in common with the non-transformational treatment introduced in Gazdar (1981) and developed in Gazdar et al. (1985).

### ■ Comparative constructions

Among the useful works we consulted in studying comparatives (Ch. 13) are Bresnan (1973), a major transformational-generative study, and Kuno (1981), which utilises some functionalist notions in its description. Allan (1986) and Mitchell (1990) provide a number of insights into the semantics.

### ■ Non-finite clauses

Mair (1990) and Duffley (1992) are valuable studies of infinitival constructions. Our approach to catenative constructions in Ch. 14 owes much to Palmer (1987, Ch. 9). Postal (1974) is a full-length study of what we call the complex catenative construction, while Akmajian (1977) looks specifically at the catenative complements of verbs of perception. Pullum & Zwicky (1998) describes the syntax of certain constraints on inflection applying to verbs and the head verbs of their complements. Sag & Pollard (1991) is a useful study of control, showing how semantic the phenomenon is.

### ■ Coordination and supplementation

Oirsouw (1987) is a useful study of coordination in general, while Payne (1985) is a comparative cross-linguistic survey. Gazdar et al. (1985, Ch. 8) presents a detailed (and fairly technical) description of coordination that may be compared with the one presented in Ch. 15 of this book. Ross (1986) is the source for some of the general properties that characterise coordination. Schachter (1977) deals with the issue of the kind of likeness normally required between coordinates, and Sag et al. (1985) discusses further the cases of coordination of syntactically unlike categories. Peterson (1998) deals with some of the issues concerning what we here call supplementation.

### ■ Information packaging

The pragmatic constraints on a number of the information-packaging constructions dealt with in Ch. 16 (complement preposing, postposing, subject-dependent inversion, right dislocation, existential and presentational clauses, and long passives) are discussed in more detail in Birner & Ward (1998), which provides the basis for the account given here. Prince (1992) is the source for the distinction between discourse-new and discourse-old information, and between addressee-new and addressee-old information ('hearer-new' and 'hearer-old' in Prince's terminology); and our account of the addressee-new condition on the displaced subject of existentials is a modified version of that presented in the same work. In addition, Erdmann (1976) and Lumsden (1988) are important early studies of existential sentences. Our discussion of proposition affirmation has benefited from Horn (1991). We are indebted to Prince (1997) for discussion of left dislocation. Tomlin (1986) is a useful source on the passive. Prince (1978) and Delin (1995) provided valuable insights into the functions of clefts, and Collins (1991) was a useful source of data on these constructions. Lambrecht (1994) is an excellent general source of information on topic and focus articulation in English.

### ■ Deixis and anaphora

John Lyons (1977, Ch. 11) provides a valuable theoretical discussion of deixis and anaphora. For more on deixis see Anderson & Keenan (1985), Jarvella & Klein (1982), and Fillmore (1997). McCawley (1998, Ch. 11) provides a useful account of anaphora within a transformational framework, and Hankamer & Sag (1976) is an important work dealing with the classification of anaphoric devices. Halliday & Hasan (1976) includes a valuable detailed and comprehensive description of anaphoric constructions in English, while Wales (1996) deals specifically with pronouns. The treatment of reflexive pronouns in Ch. 17 of this book owes much to the ideas of Pollard & Sag (1992), Reinhart & Reuland (1993), and Zribi-Hertz (1989). Edmondson & Plank (1978) gives a detailed survey of the range of uses of emphatic reflexives, and for reciprocal pronouns Kim & Peters (1998) is a valuable recent contribution. Our discussion of anticipatory anaphora has benefited particularly from Carden (1982) and Mittwoch (1983). Van Hoek (1997) has useful chapters on reflexives and on anticipatory anaphora.

### ■ Inflection

The discussion of inflection requires some attention to details of pronunciation, and for this we have relied in Ch. 18 mainly on Wells (1990). An introduction to morphological analysis of the sort undertaken in Ch. 18 is provided by Matthews (1991), and a more advanced theoretical discussion of morphological theory compatible with this approach may be found in Anderson (1992). The morphology (and other aspects) of the English verb are treated in detail in Palmer (1987). Inflection of adjectives for comparative and superlative grade is discussed in Rowicka (1987). Many details concerning the syntactic conditions on pronunciation of clitic auxiliaries can be found in theoretical work on the subject by Selkirk (1980, 1984) and Kaisse (1985).

### ■ Lexical word-formation

Barnhart et al. (1990) and Knowles (1997) are dictionaries that are particularly useful in connection with lexical word-formation (Ch. 19). Standard surveys include Jespersen

(1909–1949, part vi: Morphology, 1942), Marchand (1969), Adams (1973), Bauer (1983), and Szymanek (1989). Among the relevant transformational-generative studies are Lees (1960), Aronoff (1976), and Plag (1999). On compounds, see Ryder (1994), and for a useful corpus-based study of productivity see Baayen & Renouf (1996).

## ■ Punctuation

One of the most comprehensive guides to English punctuation (Ch. 20) may be found in Ch. 5 of the *Chicago Manual of Style*. A more popular account is provided by Partridge (1953). Other useful books devoted to punctuation include Sumney (1949) and Meyer (1987), the latter containing a considerable amount of statistical information about what patterns of punctuation occur. Nunberg (1990) presents a more theoretical discussion of the topic of punctuation marks and the rules that govern their distribution. For the history of the subject, see Parkes (1992).

## References

This list of references contains only the works specifically mentioned in the notes above. Well-known dictionaries and other major reference works are listed under their names rather than the names of their general editors. City of publication is given only where it is not immediately obvious from the name of the publisher, and for works published in the USA and Australia we add the postal abbreviation for the state name if that is not obvious.
