# Addition: Spanish

## Add in Spanish!

3

**Addition** means “putting together” or adding two or more numbers to find the sum. For example,  $3 + 5 = 8$ .

“Más” means *plus* in Spanish.

**Example:** uno      más      tres = 4  
                  1            +            3

**Directions:** Add to find the answer.

siete más catorce = \_\_\_\_\_      nueve más veinte = \_\_\_\_\_

cuatro más doce = \_\_\_\_\_      once más quince = \_\_\_\_\_

dieciseis más dos = \_\_\_\_\_      ocho más uno = \_\_\_\_\_

cinco más tres = \_\_\_\_\_      diez más seis = \_\_\_\_\_

tres más diez = \_\_\_\_\_

# Subtraction

**Subtraction** means "taking away" or subtracting one number from another to find the difference. For example,  $10 - 3 = 7$ .

**Example:** Subtract the ones.      Subtract the tens.

$$\begin{array}{r} 39 \\ - 24 \\ \hline 5 \end{array}$$

$$\begin{array}{r} 39 \\ - 24 \\ \hline 15 \end{array}$$

**Directions:** Subtract.

# Place Value

The place value of a digit, or numeral, is shown by where it is in the number. For example, in the number 1,234, 1 has the place value of thousands, 2 is hundreds, 3 is tens, and 4 is ones.

Hundred Thousands	Ten Thousands	Thousands	Hundreds	Tens	Ones
9	4	3	8	5	2

**Directions:** Match the numbers in Column A with the words in Column B. The first one is done for you.

A	B
62,453	two hundred thousand
7,641	three thousand
486,113	four hundred thousand
11,277	eight hundreds
813,463	seven tens
594,483	five ones
254,089	six hundreds
79,841	nine ten thousands
27,115	five tens

# Place Value

**Directions:** Use the code to color the rings.

If the number has:

seven ten thousands, color it **red**.

one thousand, color it **blue**.

four hundred thousands, color it **green**.

six tens, color it **brown**.

eight ones, color it **yellow**.

# Addition: Regrouping

Addition means "putting together" or adding two or more numbers to find the sum. To regroup is to use 10 ones to form one ten, 10 tens to form one hundred, and so on.

## Example:

Add the ones.

$$\begin{array}{r} 88 \\ + 21 \\ \hline 9 \end{array}$$

Add the tens with regrouping.

$$\begin{array}{r} 88 \\ + 21 \\ \hline 109 \end{array}$$

**Directions:** Add using regrouping.

$$\begin{array}{r} 37 \\ + 72 \\ \hline \end{array}$$

# Subtraction: Regrouping

Subtraction means "taking away" or subtracting one number from another to find the difference. To regroup is to use one ten to form 10 ones, one hundred to form 10 tens, and so on.

**Example:**

$$\begin{array}{r} 32 = 2 \text{ tens} + 12 \text{ ones} \\ - 13 = 1 \text{ ten} + 3 \text{ ones} \\ \hline 19 = 1 \text{ ten} + 9 \text{ ones} \end{array}$$

# Rounding: The Nearest Ten

If the ones number is 5 or greater, round up to the nearest 10.  
If the ones number is 4 or less, the tens number stays the same and the ones number becomes a zero.

# Estimation

**Estimation** is useful when you don't need to know the exact amount, but a close answer will do.

When we use estimation, we use only the first number after we round the number up or down. Then, add the numbers together to get the estimate.

**Example:**

# Multiplication

**Multiplication** is a short way to find the sum of adding the same number a certain amount of times. For example, we write  $7 \times 4 = 28$  instead of  $7 + 7 + 7 + 7 = 28$ .

**Directions:** Study the example. Multiply.

**Example:**

# Order of Operations

When you solve a problem that involves more than one operation, this is the order to follow:

- ( ) Parentheses first
- x Multiplication and  $\div$  Division (left to right)
- + Addition and - Subtraction (left to right)

**Example:**

$$2 + (3 \times 5) - 2 = 15$$

$$2 + 15 - 2 = 15$$

$$17 - 2 = 15$$

**Directions:** Solve the problems using the correct order of operations.

$$(5 - 3) + 4 \times 7 = \underline{\hspace{2cm}}$$

$$1 + 2 \times 3 + 4 = \underline{\hspace{2cm}}$$

$$6 \times 3 - 1 = \underline{\hspace{2cm}}$$

$$9 \div 3 \times 3 + 0 = \underline{\hspace{2cm}}$$

$$5 - 2 + 2 = \underline{\hspace{2cm}}$$

# Order of Operations

**Directions:** Use  $+$ ,  $-$ ,  $\times$ , and  $\div$  to complete the problems so the number sentence is true.

**REMEMBER...**

**USE THE ORDER

**Directions:** Multiply or divide. Fill in the blanks with the missing numbers or  $\times$  or  $\div$  signs. The first one is done for you.

$5 \times 4 = 20$

Division is a way to find out how many times one number is contained in another number. The  $\div$  sign means *divided by*. Another way to divide is to use  $\overline{)}$ . The **dividend** is the larger number that is divided by the smaller number, or **divisor**. The answer of a division problem is called the **quotient**.

**Directions:** Study the example. Divide.

**Example:**

$$\begin{array}{ccccccc}

# Division: Remainders

Division is a way to find out how many times one number is contained in another number. For example,  $28 \div 4 = 7$  means that there are seven groups of four in 28. The **dividend** is the larger number that is divided by the smaller number, or **divisor**. The **quotient** is the answer in a division problem. The **remainder** is the amount left over. The remainder is always less than the divisor.

**Directions:** Study the example. Find each quotient and remainder.

## Rounding: The Nearest Ten

23

If the ones number is 5 or greater, round up to the nearest 10. If the ones number is 4 or less, the tens number stays the same and the ones number becomes a zero.

Examples:

15 round up to 20    23 round down to 20    47 round up to 50

Directions: Round these numbers to the nearest ten.

$$7 \rightarrow 10$$

$$58 \rightarrow 60$$

$$12 \rightarrow 10$$

$$81 \rightarrow 80$$

$$33 \rightarrow 30$$

## Rounding: The Nearest Hundred

150 round up to 200    732 round down to 700

Directions: Round these numbers to the nearest hundred.

## Estimation

25

Estimation is useful when you don't need to know the exact amount, but a close answer will do.

When we use estimation, we use only the first number after we round the number up or down. Then, add the numbers together to get the estimate.

Example:

153 → 200 apples  
225 → 200 oranges  
+ 341 → 300 bananas  
720 → 700  
actual estimate

You can even do this mentally!

Directions: Estimate the sum of these numbers.

$$\begin{array}{r} 456 \rightarrow 500 \\ 121 \rightarrow 100 \\ + 341 \rightarrow 300 \\ \hline 720 \rightarrow 700 \\ \hline 1,000 \end{array}$$

$$\begin{array}{r} 910 \rightarrow 900 \\ 280 \rightarrow 300 \\ + 320 \rightarrow 300 \\ \hline 1,500 \end{array}$$

$$\begin{array}{r} 686 \rightarrow 700 \\ 307 \rightarrow 300 \\ + 711 \rightarrow 700 \\ \hline 1,700 \end{array}$$

## Division

Division is a way to find out how many times one number is contained in another number. For example,  $28 \div 4 = 7$  means that there are seven groups of four in 28.

Directions: Study the example. Divide.

Example:

There are six oars.  
Each canoe needs two oars.

## Order of Operations

When you solve a problem that involves more than one operation, this is the order to follow:

- ( ) Parentheses first
- $\times$  Multiplication and  $\div$  Division (left to right)
- $+$  Addition and  $-$  Subtraction (left to right)

Example:  $2 + (3 \times 5) - 2 = 15$   
 $2 + 15 - 2 = 15$   
 $17 - 2 = 15$

Directions: Solve the problems using the correct order of operations.

$$6 \times 3 - 1 = \underline{17} \quad (8 \div 2) \times 4 = \underline{16}$$

### 39 Division: Remainders

Division is a way to find out how many times one number is contained in another number. For example,  $28 \div 4 = 7$  means that there are seven groups of four in 28. The **dividend** is the larger number that is divided by the smaller number, or **divisor**. The **quotient** is the answer in a division problem. The **remainder** is the amount left over. The remainder is always less than the divisor.

**Directions:** Study the example. Find each quotient and remainder.

**Example:** There are 11 dog biscuits. Put them in groups of three. There are two left over.

$\frac{3}{3} \overline{)11}$   $\frac{3}{3} \overline{)12}$  **Remember:** The remainder must be less than the divisor!

$\frac{4}{3} \overline{)13}$   $\frac{4}{4} \overline{)17}$   $\frac{5}{6} \overline{)32}$   $\frac{5}{6} \overline{)26}$

$9 \div 4 = 2 \text{ r } 1$   $12 \div 5 = 2 \text{ r } 2$   $26 \div 4 = 6 \text{ r } 2$   $49 \div 9 = 5 \text{ r } 4$

### 41 Divisibility Rules

A number is divisible...

- by 2 if the last digit is 0 or even (2, 4, 6, 8).
- by 3 if the sum of all digits is divisible by 3.
- by 4 if the last two digits are divisible by 4.
- by 5 if the last digit is a 0 or 5.
- by 10 if the last digit is 0.

**Example:** 250 is divisible by 2, 5, 10

## Money

Talk with your child about different things he or she can do to earn money.

Pose this question to your child: If we did not have money, what would we use to buy things? Tell your child about the Native American system of using wampum as money. Do research together about other monetary systems.

Make money dominoes together.

Let your child practice coins with amounts of money.

## Time

Talk with your child about different methods of keeping time, such as clocks, stopwatches, calendars, etc. Let your child make a list of as many ways to keep time as he or she can.

Have your child time how long it takes the family to eat dinner. Have him or her write down the start time, the stop time, and subtract.

Have your child make a time management chart to plan his or her time from after school until bedtime.

## Addition, Subtraction, Multiplication, Division

Have your child compute his or her age in years, in months, and in days. Then, try your age!

Purchase a blank book or notebook to serve as your child's Math Journal. As you complete pages in *Master Skills Math* together, your child can write his or her reflections about what he or she has learned. If your child wants, you can write comments to him or her in the book to give your child positive feedback and reinforce the skill learned.

Talk with your child about how math is used in your profession. Make a list of other occupations, and talk about how math is used in these professions as well.

Imagine that "National Math Day" has become a holiday. Ask your child: If you were in charge of the celebration, what math events would you plan?

## Measurement

Discuss with your child instruments, other than rulers, that are used to measure (thermometer, calendar, clock, etc.).

Let your child make predictions about the length and weight of various object around your house. Then, have him or her measure the objects to find their actual length or weight. For an extension of this activity, try measuring the same objects with metric measuring tools.

## Graphing

Graph the birthdays in your family by the months in which family members were born. Then, ask your child questions to help him or her interpret the graph: In which month(s) do most family members have birthdays? In which month(s) are there the fewest number of birthdays? etc.

Graph the favorite foods of family members, or record the foods your family has eaten over the course of a week, and graph them by food groups. Have your child suggest other things to graph.
